| 30830 | a, A | A <b>double</b> argument representing a floating-point number shall be converted in the style " <code>[-]0xh.hhhhp±d</code> ", where there is one hexadecimal digit (which shall be non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point character and the number of hexadecimal digits after it is equal to the precision; if the precision is missing and <code>FLT_RADIX</code> is a power of 2, then the precision shall be sufficient for an exact representation of the value; if the precision is missing and <code>FLT_RADIX</code> is not a power of 2, then the precision shall be sufficient to distinguish values of type <b>double</b> , except that trailing zeros may be omitted; if the precision is zero and the <code>'#'</code> flag is not specified, no decimal-point character shall appear. The letters <code>"abcdef"</code> shall be used for a conversion and the letters <code>"ABCDEF"</code> for <code>A</code> conversion. The <code>A</code> conversion specifier produces a number with <code>'X'</code> and <code>'P'</code> instead of <code>'x'</code> and <code>'p'</code> . The exponent shall always contain at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent shall be zero. |

| 30853 | s   | The argument shall be a pointer to an array of <b>char</b> . Bytes from the array shall be written up to (but not including) any terminating null byte. If the precision is specified, no more than that many bytes shall be written. If the precision is not specified or is greater than the size of the array, the application shall ensure that the array contains a null byte.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 30854 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 30857 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 30858 |     | If an <b>l</b> (ell) qualifier is present, the argument shall be a pointer to an array of type <b>wchar_t</b> . Wide characters from the array shall be converted to characters (each as if by a call to the <i>wcrtomb()</i> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first wide character is converted) up to and including a terminating null wide character. The resulting characters shall be written up to (but not including) the terminating null character (byte). If no precision is specified, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many characters (bytes) shall be written (including shift sequences, if any), and the array shall contain a null wide character if, to equal the character sequence length given by the precision, the function would need to access a wide character one past the end of the array. In no case shall a partial character be written. |

| 30882 |     | In no case shall a nonexistent or small field width cause truncation of a field; if the result of a conversion is wider than the field width, the field shall be expanded to contain the conversion result. Characters generated by <i>fprintf()</i> and <i>printf()</i> are printed as if <i>fputc()</i> had been called.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 30883 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 30884 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 30885 |     | For the <b>a</b> and <b>A</b> conversion specifiers, if <b>FLT_RADIX</b> is a power of 2, the value shall be correctly rounded to a hexadecimal floating number with the given precision.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 30890 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 30891 |     | For the <b>e</b> , <b>E</b> , <b>f</b> , <b>F</b> , <b>g</b> , and <b>G</b> conversion specifiers, if the number of significant decimal digits is at most <b>DECIMAL_DIG</b> , then the result should be correctly rounded. If the number of significant decimal digits is more than <b>DECIMAL_DIG</b> but the source value is exactly representable with <b>DECIMAL_DIG</b> digits, then the result should be an exact representation with trailing zeros. Otherwise, the source value is bounded by two adjacent decimal strings $L < U$ , both having <b>DECIMAL_DIG</b> significant digits; the value of the resultant decimal string $D$ should satisfy $L \leq D \leq U$ , with the extra stipulation that the error should have a correct sign for the current rounding direction.                                                                                                                                                                                                                                                   |
| 30892 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 30893 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 30894 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 30898 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

30899 CX The last data modification and last file status change timestamps of the file shall be marked for  
30900 update:

- 30901 1. Between the call to a successful execution of *fprintf()* or *printf()* and the next successful  
30902 completion of a call to *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*
- 30903 2. Upon successful completion of a call to *dprintf()*

#### 30904 RETURN VALUE

30905 CX Upon successful completion, the *dprintf()*, *fprintf()*, and *printf()* functions shall return the  
30906 number of bytes transmitted.

30907 Upon successful completion, the *sprintf()* function shall return the number of bytes written to *s*,  
30908 excluding the terminating null byte.

30909 Upon successful completion, the *snprintf()* function shall return the number of bytes that would  
30910 be written to *s* had *n* been sufficiently large excluding the terminating null byte.

30911 CX If an output error was encountered, these functions shall return a negative value and set *errno* to  
30912 indicate the error.

30913 If the value of *n* is zero on a call to *snprintf()*, nothing shall be written, the number of bytes that  
30914 would have been written had *n* been sufficiently large excluding the terminating null shall be  
30915 returned, and *s* may be a null pointer.

#### 30916 ERRORS

30917 CX For the conditions under which *dprintf()*, *fprintf()*, and *printf()* fail and may fail, refer to *fputc()*  
30918 or *fputwc()*.

30919 In addition, all forms of *fprintf()* shall fail if:

30920 CX [EILSEQ] A wide-character code that does not correspond to a valid character has been  
30921 detected.

30922 CX [EOVERFLOW] The value to be returned is greater than {INT\_MAX}.

30923 The *dprintf()* function may fail if:

30924 [EBADF] The *filides* argument is not a valid file descriptor.

30925 CX The *dprintf()*, *fprintf()*, and *printf()* functions may fail if:

30926 CX [ENOMEM] Insufficient storage space is available.

30927 The *snprintf()* function shall fail if:

30928 CX [EOVERFLOW] The value of *n* is greater than {INT\_MAX}.

#### 30929 EXAMPLES

##### 30930 Printing Language-Independent Date and Time

30931 The following statement can be used to print date and time using a language-independent  
30932 format:

30933 `printf(format, weekday, month, day, hour, min);`

30934 For American usage, *format* could be a pointer to the following string:

30935 `"%s, %s %d, %d:%.2d\n"`

30936 This example would produce the following message:

30937 Sunday, July 3, 10:02  
 30938 For German usage, *format* could be a pointer to the following string:  
 30939 "%1\$s, %3\$d. %2\$s, %4\$d:%5\$.2d\n"  
 30940 This definition of *format* would produce the following message:  
 30941 Sonntag, 3. Juli, 10:02

### 30942 Printing File Information

30943 The following example prints information about the type, permissions, and number of links of a  
 30944 specific file in a directory.

30945 The first two calls to *printf()* use data decoded from a previous *stat()* call. The user-defined  
 30946 *strperm()* function shall return a string similar to the one at the beginning of the output for the  
 30947 following command:

30948 `ls -l`

30949 The next call to *printf()* outputs the owner's name if it is found using *getpwuid()*; the *getpwuid()*  
 30950 function shall return a **passwd** structure from which the name of the user is extracted. If the user  
 30951 name is not found, the program instead prints out the numeric value of the user ID.

30952 The next call prints out the group name if it is found using *getgrgid()*; *getgrgid()* is very similar  
 30953 to *getpwuid()* except that it shall return group information based on the group number. Once  
 30954 again, if the group is not found, the program prints the numeric value of the group for the entry.

30955 The final call to *printf()* prints the size of the file.

```
30956 #include <stdio.h>
30957 #include <sys/types.h>
30958 #include <pwd.h>
30959 #include <grp.h>
30960 char *strperm (mode_t);
30961 ...
30962 struct stat statbuf;
30963 struct passwd *pwd;
30964 struct group *grp;
30965 ...
30966 printf("%10.10s", strperm (statbuf.st_mode));
30967 printf("%4d", statbuf.st_nlink);
30968 if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
30969     printf(" %-8.8s", pwd->pw_name);
30970 else
30971     printf(" %-8ld", (long) statbuf.st_uid);
30972 if ((grp = getgrgid(statbuf.st_gid)) != NULL)
30973     printf(" %-8.8s", grp->gr_name);
30974 else
30975     printf(" %-8ld", (long) statbuf.st_gid);
30976 printf("%9jd", (intmax_t) statbuf.st_size);
30977 ...
```

**Printing a Localized Date String**

The following example gets a localized date string. The `nl_langinfo()` function shall return the localized date string, which specifies the order and layout of the date. The `strftime()` function takes this information and, using the `tm` structure for values, places the date and time information into `datestring`. The `printf()` function then outputs `datestring` and the name of the entry.

```
#include <stdio.h>
#include <time.h>
#include <langinfo.h>
...
struct dirent *dp;
struct tm *tm;
char datestring[256];
...
strftime(datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
printf(" %s %s\n", datestring, dp->d_name);
...
```

**Printing Error Information**

The following example uses `fprintf()` to write error information to standard error.

In the first group of calls, the program tries to open the password lock file named **LOCKFILE**. If the file already exists, this is an error, as indicated by the `O_EXCL` flag on the `open()` function. If the call fails, the program assumes that someone else is updating the password file, and the program exits.

The next group of calls saves a new password file as the current password file by creating a link between **LOCKFILE** and the new password file **PASSWDFILE**.

```
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <string.h>
#include <errno.h>

#define LOCKFILE "/etc/ptmp"
#define PASSWDFILE "/etc/passwd"
...
int pfd;
...
if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
    S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
{
    fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
    exit(1);
}
...
if (link(LOCKFILE, PASSWDFILE) == -1) {
```

```

31024         fprintf(stderr, "Link error: %s\n", strerror(errno));
31025         exit(1);
31026     }
31027     ...

```

### Printing Usage Information

The following example checks to make sure the program has the necessary arguments, and uses *fprintf()* to print usage information if the expected number of arguments is not present.

```

31031 #include <stdio.h>
31032 #include <stdlib.h>
31033 ...
31034 char *Options = "hdbtl";
31035 ...
31036 if (argc < 2) {
31037     fprintf(stderr, "Usage: %s -%s <file\n", argv[0], Options); exit(1);
31038 }
31039 ...

```

### Formatting a Decimal String

The following example prints a key and data pair on *stdout*. Note use of the <asterisk> ('\*') in the format string; this ensures the correct number of decimal places for the element based on the number of elements requested.

```

31044 #include <stdio.h>
31045 ...
31046 long i;
31047 char *keyststr;
31048 int elementlen, len;
31049 ...
31050 while (len < elementlen) {
31051     ...
31052     printf("%s Element%0*ld\n", keyststr, elementlen, i);
31053     ...
31054 }

```

### Creating a Pathname

The following example creates a pathname using information from a previous *getpwnam()* function that returned the password database entry of the user.

```

31058 #include <stdint.h>
31059 #include <stdio.h>
31060 #include <stdlib.h>
31061 #include <string.h>
31062 #include <sys/types.h>
31063 #include <unistd.h>
31064 ...
31065 char *pathname;
31066 struct passwd *pw;
31067 size_t len;

```

```

31068     ...
31069     // digits required for pid_t is number of bits times
31070     // log2(10) = approx 10/33
31071     len = strlen(pw->pw_dir) + 1 + 1+(sizeof(pid_t)*80+32)/33 +
31072         sizeof ".out";
31073     pathname = malloc(len);
31074     if (pathname != NULL)
31075     {
31076         snprintf(pathname, len, "%s/%jd.out", pw->pw_dir,
31077             (intmax_t) getpid());
31078         ...
31079     }

```

### Reporting an Event

The following example loops until an event has timed out. The *pause()* function waits forever unless it receives a signal. The *fprintf()* statement should never occur due to the possible return values of *pause()*.

```

31084     #include <stdio.h>
31085     #include <unistd.h>
31086     #include <string.h>
31087     #include <errno.h>
31088     ...
31089     while (!event_complete) {
31090     ...
31091         if (pause() != -1 || errno != EINTR)
31092             fprintf(stderr, "pause: unknown error: %s\n", strerror(errno));
31093     }
31094     ...

```

### Printing Monetary Information

The following example uses *strfmon()* to convert a number and store it as a formatted monetary string named *convbuf*. If the first number is printed, the program prints the format and the description; otherwise, it just prints the number.

```

31099     #include <monetary.h>
31100     #include <stdio.h>
31101     ...
31102     struct tblfmt {
31103         char *format;
31104         char *description;
31105     };
31106     struct tblfmt table[] = {
31107         { "%n", "default formatting" },
31108         { "%11n", "right align within an 11 character field" },
31109         { "%#5n", "aligned columns for values up to 99999" },
31110         { "%=*#5n", "specify a fill character" },
31111         { "%=0#5n", "fill characters do not use grouping" },
31112         { "%^#5n", "disable the grouping separator" },
31113         { "%^#5.0n", "round off to whole units" },

```

```

31114         { "%^#5.4n", "increase the precision" },
31115         { "%(#5n", "use an alternative pos/neg style" },
31116         { "%!(#5n", "disable the currency symbol" },
31117     };
31118     ...
31119     float input[3];
31120     int i, j;
31121     char convbuf[100];
31122     ...
31123     strfmon(convbuf, sizeof(convbuf), table[i].format, input[j]);
31124
31125     if (j == 0) {
31126         printf("%s%s%s\n", table[i].format,
31127             convbuf, table[i].description);
31128     }
31129     else {
31130         printf("%s\n", convbuf);
31131     }
31132     ...

```

### Printing Wide Characters

The following example prints a series of wide characters. Suppose that "L'@'" expands to three bytes:

```

31135     wchar_t wz [3] = L"@@";           // Zero-terminated
31136     wchar_t wn [3] = L"@@";           // Unterminated
31137
31138     fprintf (stdout, "%ls", wz);        // Outputs 6 bytes
31139     fprintf (stdout, "%ls", wn);        // Undefined because wn has no terminator
31140     fprintf (stdout, "%4ls", wz);       // Outputs 3 bytes
31141     fprintf (stdout, "%4ls", wn);       // Outputs 3 bytes; no terminator needed
31142     fprintf (stdout, "%9ls", wz);       // Outputs 6 bytes
31143     fprintf (stdout, "%9ls", wn);       // Outputs 9 bytes; no terminator needed
31144     fprintf (stdout, "%10ls", wz);      // Outputs 6 bytes
31145     fprintf (stdout, "%10ls", wn);      // Undefined because wn has no terminator

```

In the last line of the example, after processing three characters, nine bytes have been output. The fourth character must then be examined to determine whether it converts to one byte or more. If it converts to more than one byte, the output is only nine bytes. Since there is no fourth character in the array, the behavior is undefined.

### APPLICATION USAGE

If the application calling *fprintf()* has any objects of type **wint\_t** or **wchar\_t**, it must also include the **<wchar.h>** header to have these objects defined.

### RATIONALE

If an implementation detects that there are insufficient arguments for the format, it is recommended that the function should fail and report an [EINVAL] error.

### FUTURE DIRECTIONS

None.

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the *l* (ell) qualifier can now be used with *c* and *s* conversion specifiers.

The *snprintf()* function is new in Issue 5.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The normative text is updated to avoid use of the term “must” for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fprintf()*, *printf()*, *snprintf()*, and *sprintf()* are updated, and the XSI shading is removed from *snprintf()*.
- The description of *snprintf()* is aligned with the ISO C standard. Note that this supersedes the *snprintf()* description in The Open Group Base Resolution bwg98-006, which changed the behavior from Issue 5.
- The DESCRIPTION is updated.

The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” consistently.

ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

An example of printing wide characters is added.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #161 is applied, updating the DESCRIPTION of the *0* flag.

Austin Group Interpretation 1003.1-2001 #170 is applied.

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #68 (SD5-XSH-ERN-70) is applied, revising the description of *g* and *G*.

SD5-XSH-ERN-174 is applied.

The *dprintf()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

Functionality relating to the *%n\$* form of conversion specification and the *<apostrophe>* flag is moved from the XSI option to the Base.

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0163 [302], XSH/TC1-2008/0164 [316], XSH/TC1-2008/0165 [316], XSH/TC1-2008/0166 [451,291], and XSH/TC1-2008/0167 [14] are applied.

31195 **NAME**

31196       fputc — put a byte on a stream

31197 **SYNOPSIS**

31198       #include &lt;stdio.h&gt;

31199       int fputc(int *c*, FILE \**stream*);31200 **DESCRIPTION**

31201 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 31202 conflict between the requirements described here and the ISO C standard is unintentional. This  
 31203 volume of POSIX.1-2008 defers to the ISO C standard.

31204       The *fputc()* function shall write the byte specified by *c* (converted to an **unsigned char**) to the  
 31205 output stream pointed to by *stream*, at the position indicated by the associated file-position  
 31206 indicator for the stream (if defined), and shall advance the indicator appropriately. If the file  
 31207 cannot support positioning requests, or if the stream was opened with append mode, the byte  
 31208 shall be appended to the output stream.

31209 CX       The last data modification and last file status change timestamps of the file shall be marked for  
 31210 update between the successful execution of *fputc()* and the next successful completion of a call  
 31211 to *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.

31212 **RETURN VALUE**

31213       Upon successful completion, *fputc()* shall return the value it has written. Otherwise, it shall  
 31214 CX       return EOF, the error indicator for the stream shall be set, and *errno* shall be set to indicate the  
 31215 error.

31216 **ERRORS**

31217       The *fputc()* function shall fail if either the *stream* is unbuffered or the *stream*'s buffer needs to be  
 31218 flushed, and:

31219 CX       [EAGAIN]       The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and  
 31220 the thread would be delayed in the write operation.

31221 CX       [EBADF]       The file descriptor underlying *stream* is not a valid file descriptor open for  
 31222 writing.

31223 CX       [EFBIG]       An attempt was made to write to a file that exceeds the maximum file size.

31224 XSI       [EFBIG]       An attempt was made to write to a file that exceeds the file size limit of the  
 31225 process.

31226 CX       [EFBIG]       The file is a regular file and an attempt was made to write at or beyond the  
 31227 offset maximum.

31228 CX       [EINTR]       The write operation was terminated due to the receipt of a signal, and no data  
 31229 was transferred.

31230 CX       [EIO]        A physical I/O error has occurred, or the process is a member of a background  
 31231 process group attempting to write to its controlling terminal, TOSTOP is set,  
 31232 the calling thread is not blocking SIGTTOU, the process is not ignoring  
 31233 SIGTTOU, and the process group of the process is orphaned. This error may  
 31234 also be returned under implementation-defined conditions.

31235 CX       [ENOSPC]       There was no free space remaining on the device containing the file.

31236 CX       [EPIPE]       An attempt is made to write to a pipe or FIFO that is not open for reading by  
 31237 any process. A SIGPIPE signal shall also be sent to the thread.

31238 The `fputc()` function may fail if:

31239 CX [ENOMEM] Insufficient storage space is available.

31240 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
31241 capabilities of the device.

#### 31242 EXAMPLES

31243 None.

#### 31244 APPLICATION USAGE

31245 None.

#### 31246 RATIONALE

31247 None.

#### 31248 FUTURE DIRECTIONS

31249 None.

#### 31253 CHANGE HISTORY

31254 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 31255 Issue 5

31256 Large File Summit extensions are added.

#### 31257 Issue 6

31258 Extensions beyond the ISO C standard are marked.

31259 The following new requirements on POSIX implementations derive from alignment with the  
31260 Single UNIX Specification:

- 31261 • The [EIO] and [EFBIG] mandatory error conditions are added.
- 31262 • The [ENOMEM] and [ENXIO] optional error conditions are added.

31263 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/37 is applied, updating the [EAGAIN]  
31264 error in the ERRORS section from “the process would be delayed” to “the thread would be  
31265 delayed”.

#### 31266 Issue 7

31267 Changes are made related to support for finegrained timestamps.

31268 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0168 [79] and XSH/TC1-2008/0169  
31269 [14] are applied.

31270 **NAME**

31271 fputs — put a string on a stream

31272 **SYNOPSIS**

31273 #include &lt;stdio.h&gt;

31274 int fputs(const char \*restrict s, FILE \*restrict stream);

31275 **DESCRIPTION**

31276 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 31277 conflict between the requirements described here and the ISO C standard is unintentional. This  
 31278 volume of POSIX.1-2008 defers to the ISO C standard.

31279 The *fputs()* function shall write the null-terminated string pointed to by *s* to the stream pointed  
 31280 to by *stream*. The terminating null byte shall not be written.

31281 CX The last data modification and last file status change timestamps of the file shall be marked for  
 31282 update between the successful execution of *fputs()* and the next successful completion of a call  
 31283 to *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.

31284 **RETURN VALUE**

31285 Upon successful completion, *fputs()* shall return a non-negative number. Otherwise, it shall  
 31286 CX return EOF, set an error indicator for the stream, and set *errno* to indicate the error.

31287 **ERRORS**31288 Refer to *fputc()*.31289 **EXAMPLES**31290 **Printing to Standard Output**

31291 The following example gets the current time, converts it to a string using *localtime()* and  
 31292 *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to  
 31293 an event for which it is waiting.

```
31294 #include <time.h>
31295 #include <stdio.h>
31296 ...
31297 time_t now;
31298 int minutes_to_event;
31299 ...
31300 time(&now);
31301 printf("The time is ");
31302 fputs(asctime(localtime(&now)), stdout);
31303 printf("There are still %d minutes to the event.\n",
31304        minutes_to_event);
31305 ...
```

31306 **APPLICATION USAGE**31307 The *puts()* function appends a <newline> while *fputs()* does not.

31308 This volume of POSIX.1-2008 requires that successful completion simply return a non-negative  
 31309 integer. There are at least three known different implementation conventions for this  
 31310 requirement:

- 31311 • Return a constant value.

- Return the last character written.
- Return the number of bytes written. Note that this implementation convention cannot be adhered to for strings longer than {INT\_MAX} bytes as the value would not be representable in the return type of the function. For backwards-compatibility, implementations can return the number of bytes for strings of up to {INT\_MAX} bytes, and return {INT\_MAX} for all longer strings.

**RATIONALE**

The `fputs()` function is one whose source code was specified in the referenced *The C Programming Language*. In the original edition, the function had no defined return value, yet many practical implementations would, as a side-effect, return the value of the last character written as that was the value remaining in the accumulator used as a return value. In the second edition of the book, either the fixed value 0 or EOF would be returned depending upon the return value of `ferror()`; however, for compatibility with extant implementations, several implementations would, upon success, return a positive value representing the last byte written.

**FUTURE DIRECTIONS**

None.

[Section 2.5](#) (on page 495), `fopen()`, `putc()`, `puts()`

XBD `<stdio.h>`

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The `fputs()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

**Issue 7**

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0170 [174,412], XSH/TC1-2008/0171 [412], and XSH/TC1-2008/0172 [14] are applied.

31340 **NAME**31341 `fputwc` — put a wide-character code on a stream31342 **SYNOPSIS**31343 `#include <stdio.h>`31344 `#include <wchar.h>`31345 `wint_t fputwc(wchar_t wc, FILE *stream);`31346 **DESCRIPTION**

31347 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 31348 conflict between the requirements described here and the ISO C standard is unintentional. This  
 31349 volume of POSIX.1-2008 defers to the ISO C standard.

31350 The `fputwc()` function shall write the character corresponding to the wide-character code `wc` to  
 31351 the output stream pointed to by `stream`, at the position indicated by the associated file-position  
 31352 indicator for the stream (if defined), and advances the indicator appropriately. If the file cannot  
 31353 support positioning requests, or if the stream was opened with append mode, the character is  
 31354 appended to the output stream. If an error occurs while writing the character, the shift state of  
 31355 the output file is left in an undefined state.

31356 CX The last data modification and last file status change timestamps of the file shall be marked for  
 31357 update between the successful execution of `fputwc()` and the next successful completion of a call  
 31358 to `fflush()` or `fclose()` on the same stream or a call to `exit()` or `abort()`.

31359 The `fputwc()` function shall not change the setting of `errno` if successful.

31360 **RETURN VALUE**

31361 Upon successful completion, `fputwc()` shall return `wc`. Otherwise, it shall return WEOF, the error  
 31362 CX indicator for the stream shall be set, and `errno` shall be set to indicate the error.

31363 **ERRORS**

31364 The `fputwc()` function shall fail if either the stream is unbuffered or data in the `stream`'s buffer  
 31365 needs to be written, and:

31366 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor underlying `stream` and  
 31367 the thread would be delayed in the write operation.

31368 CX [EBADF] The file descriptor underlying `stream` is not a valid file descriptor open for  
 31369 writing.

31370 CX [EFBIG] An attempt was made to write to a file that exceeds the maximum file size or  
 31371 the file size limit of the process.

31372 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the  
 31373 offset maximum associated with the corresponding stream.

31374 [EILSEQ] The wide-character code `wc` does not correspond to a valid character.

31375 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data  
 31376 was transferred.

31377 CX [EIO] A physical I/O error has occurred, or the process is a member of a background  
 31378 process group attempting to write to its controlling terminal, TOSTOP is set,  
 31379 the calling thread is not blocking SIGTTOU, the process is not ignoring  
 31380 SIGTTOU, and the process group of the process is orphaned. This error may  
 31381 also be returned under implementation-defined conditions.

31382 CX [ENOSPC] There was no free space remaining on the device containing the file.

31383 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by

31384 any process. A SIGPIPE signal shall also be sent to the thread.

31385 The *fputc()* function may fail if:

31386 CX [ENOMEM] Insufficient storage space is available.

31387 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the

31388 capabilities of the device.

#### 31389 EXAMPLES

31390 None.

#### 31400 CHANGE HISTORY

31401 First released in Issue 4. Derived from the MSE working draft.

#### 31402 Issue 5

31403 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*

31404 is changed from `wint_t` to `wchar_t`.

31405 The Optional Header (OH) marking is removed from `<stdio.h>`.

31406 Large File Summit extensions are added.

#### 31407 Issue 6

31408 Extensions beyond the ISO C standard are marked.

31409 The following new requirements on POSIX implementations derive from alignment with the

31410 Single UNIX Specification:

- 31411 • The [EFBIG] and [EIO] mandatory error conditions are added.
- 31412 • The [ENOMEM] and [ENXIO] optional error conditions are added.

31413 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/38 is applied, updating the [EAGAIN]

31414 error in the ERRORS section from “the process would be delayed” to “the thread would be

31415 delayed”.

#### 31416 Issue 7

31417 Changes are made related to support for finegrained timestamps.

31418 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0173 [105], XSH/TC1-2008/0174 [79],

31419 and XSH/TC1-2008/0175 [14] are applied.

31420 **NAME**31421 `fputws` — put a wide-character string on a stream31422 **SYNOPSIS**31423 `#include <stdio.h>`31424 `#include <wchar.h>`31425 `int fputws(const wchar_t *restrict ws, FILE *restrict stream);`31426 **DESCRIPTION**

31427 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 31428 conflict between the requirements described here and the ISO C standard is unintentional. This  
 31429 volume of POSIX.1-2008 defers to the ISO C standard.

31430 The `fputws()` function shall write a character string corresponding to the (null-terminated) wide-  
 31431 character string pointed to by `ws` to the stream pointed to by `stream`. No character corresponding  
 31432 to the terminating null wide-character code shall be written.

31433 CX The last data modification and last file status change timestamps of the file shall be marked for  
 31434 update between the successful execution of `fputws()` and the next successful completion of a call  
 31435 to `fflush()` or `fclose()` on the same stream or a call to `exit()` or `abort()`.

31436 **RETURN VALUE**

31437 Upon successful completion, `fputws()` shall return a non-negative number. Otherwise, it shall  
 31438 CX return `-1`, set an error indicator for the stream, and set `errno` to indicate the error.

31439 **ERRORS**31440 Refer to `fputwc()`.31441 **EXAMPLES**

31442 None.

31443 **APPLICATION USAGE**31444 The `fputws()` function does not append a `<newline>`.

31445 This volume of POSIX.1-2008 requires that successful completion simply return a non-negative  
 31446 integer. There are at least three known different implementation conventions for this  
 31447 requirement:

- 31448 • Return a constant value.
- 31449 • Return the last character written.
- 31450 • Return the number of bytes written. Note that this implementation convention cannot be  
 31451 adhered to for strings longer than `{INT_MAX}` bytes as the value would not be  
 31452 representable in the return type of the function. For backwards-compatibility,  
 31453 implementations can return the number of bytes for strings of up to `{INT_MAX}` bytes, and  
 31454 return `{INT_MAX}` for all longer strings.

31455 **RATIONALE**

31456 None.

31457 **FUTURE DIRECTIONS**

31458 None.

31459 **SEE ALSO**31460 [Section 2.5](#) (on page 495), `fopen()`31461 XBD `<stdio.h>`, `<wchar.h>`

31462 **CHANGE HISTORY**

31463 First released in Issue 4. Derived from the MSE working draft.

31464 **Issue 5**

31465 The Optional Header (OH) marking is removed from `<stdio.h>`.

31466 **Issue 6**

31467 Extensions beyond the ISO C standard are marked.

31468 The `fputws()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

31469 **Issue 7**

31470 Changes are made related to support for finegrained timestamps.

31471 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0176 [412] and XSH/TC1-2008/0177  
31472 [14] are applied.

31473 **NAME**

31474 fread — binary input

31475 **SYNOPSIS**

```
31476 #include <stdio.h>
31477 size_t fread(void *restrict ptr, size_t size, size_t nitems,
31478 FILE *restrict stream);
```

31479 **DESCRIPTION**

31480 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 31481 conflict between the requirements described here and the ISO C standard is unintentional. This  
 31482 volume of POSIX.1-2008 defers to the ISO C standard.

31483 The *fread()* function shall read into the array pointed to by *ptr* up to *nitems* elements whose size  
 31484 is specified by *size* in bytes, from the stream pointed to by *stream*. For each object, *size* calls shall  
 31485 be made to the *fgetc()* function and the results stored, in the order read, in an array of **unsigned**  
 31486 **char** exactly overlaying the object. The file position indicator for the stream (if defined) shall be  
 31487 advanced by the number of bytes successfully read. If an error occurs, the resulting value of the  
 31488 file position indicator for the stream is unspecified. If a partial element is read, its value is  
 31489 unspecified.

31490 CX The *fread()* function may mark the last data access timestamp of the file associated with *stream*  
 31491 for update. The last data access timestamp shall be marked for update by the first successful  
 31492 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, or  
 31493 *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

31494 **RETURN VALUE**

31495 Upon successful completion, *fread()* shall return the number of elements successfully read which  
 31496 is less than *nitems* only if a read error or end-of-file is encountered. If *size* or *nitems* is 0, *fread()*  
 31497 shall return 0 and the contents of the array and the state of the stream remain unchanged.  
 31498 CX Otherwise, if a read error occurs, the error indicator for the stream shall be set, and *errno* shall  
 31499 be set to indicate the error.

31500 **ERRORS**31501 Refer to *fgetc()*.31502 **EXAMPLES**31503 **Reading from a Stream**

31504 The following example transfers a single 100-byte fixed length record from the *fp* stream into the  
 31505 array pointed to by *buf*.

```
31506 #include <stdio.h>
31507 ...
31508 size_t elements_read;
31509 char buf[100];
31510 FILE *fp;
31511 ...
31512 elements_read = fread(buf, sizeof(buf), 1, fp);
31513 ...
```

31514 If a read error occurs, *elements\_read* will be zero but the number of bytes read from the stream  
 31515 could be anything from zero to *sizeof(buf)*–1.

31516 The following example reads multiple single-byte elements from the *fp* stream into the array  
 31517 pointed to by *buf*.

```
31518     #include <stdio.h>
31519     ...
31520     size_t bytes_read;
31521     char buf[100];
31522     FILE *fp;
31523     ...
31524     bytes_read = fread(buf, 1, sizeof(buf), fp);
31525     ...
```

31526 If a read error occurs, *bytes\_read* will contain the number of bytes read from the stream.

#### 31527 APPLICATION USAGE

31528 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an  
31529 end-of-file condition.

31530 Because of possible differences in element length and byte ordering, files written using *fwrite()*  
31531 are application-dependent, and possibly cannot be read using *fread()* by a different application  
31532 or by the same application on a different processor.

#### 31533 RATIONALE

31534 None.

#### 31535 FUTURE DIRECTIONS

31536 None.

#### 31537 SEE ALSO

31538 [Section 2.5](#) (on page 495), *feof()*, *ferror()*, *fgetc()*, *fopen()*, *fscanf()*, *getc()*, *gets()*

31539 XBD [<stdio.h>](#)

#### 31540 CHANGE HISTORY

31541 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 31542 Issue 6

31543 Extensions beyond the ISO C standard are marked.

31544 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 31545 • The *fread()* prototype is updated.
- 31546 • The DESCRIPTION is updated to describe how the bytes from a call to *fgetc()* are stored.

#### 31547 Issue 7

31548 Changes are made related to support for finegrained timestamps.

31549 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0178 [232] and XSH/TC1-2008/0179  
31550 [14] are applied.

31551 **NAME**

31552 free — free allocated memory

31553 **SYNOPSIS**

31554 #include &lt;stdlib.h&gt;

31555 void free(void \*ptr);

31556 **DESCRIPTION**

31557 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 31558 conflict between the requirements described here and the ISO C standard is unintentional. This  
 31559 volume of POSIX.1-2008 defers to the ISO C standard.

31560 The *free()* function shall cause the space pointed to by *ptr* to be deallocated; that is, made  
 31561 available for further allocation. If *ptr* is a null pointer, no action shall occur. Otherwise, if the  
 31562 argument does not match a pointer earlier returned by a function in POSIX.1-2008 that allocates  
 31563 memory as if by *malloc()*, or if the space has been deallocated by a call to *free()* or *realloc()*, the  
 31564 behavior is undefined.

31565 Any use of a pointer that refers to freed space results in undefined behavior.

31566 **RETURN VALUE**31567 The *free()* function shall not return a value.31568 **ERRORS**

31569 No errors are defined.

31570 **EXAMPLES**

31571 None.

31572 **APPLICATION USAGE**

31573 There is now no requirement for the implementation to support the inclusion of &lt;malloc.h&gt;.

31574 **RATIONALE**

31575 None.

31576 **FUTURE DIRECTIONS**

31577 None.

31578 **SEE ALSO**31579 *calloc()*, *malloc()*, *posix\_memalign()*, *realloc()*

31580 XBD &lt;stdlib.h&gt;

31581 **CHANGE HISTORY**

31582 First released in Issue 1. Derived from Issue 1 of the SVID.

31583 **Issue 6**31584 Reference to the *valloc()* function is removed.31585 **Issue 7**

31586 The DESCRIPTION is updated to clarify that if the pointer returned is not by a function that  
 31587 allocates memory as if by *malloc()*, then the behavior is undefined.

## NAME

freeaddrinfo, getaddrinfo — get address information

## SYNOPSIS

```
#include <sys/socket.h>
#include <netdb.h>

void freeaddrinfo(struct addrinfo *ai);
int getaddrinfo(const char *restrict nodename,
                const char *restrict servname,
                const struct addrinfo *restrict hints,
                struct addrinfo **restrict res);
```

## DESCRIPTION

The *freeaddrinfo()* function shall free one or more **addrinfo** structures returned by *getaddrinfo()*, along with any additional storage associated with those structures. If the *ai\_next* field of the structure is not null, the entire list of structures shall be freed. The *freeaddrinfo()* function shall support the freeing of arbitrary sublists of an **addrinfo** list originally returned by *getaddrinfo()*.

The *getaddrinfo()* function shall translate the name of a service location (for example, a host name) and/or a service name and shall return a set of socket addresses and associated information to be used in creating a socket with which to address the specified service.

**Note:** In many cases it is implemented by the Domain Name System, as documented in RFC 1034, RFC 1035, and RFC 1886.

The *freeaddrinfo()* and *getaddrinfo()* functions shall be thread-safe.

The *nodename* and *servname* arguments are either null pointers or pointers to null-terminated strings. One or both of these two arguments shall be supplied by the application as a non-null pointer.

The format of a valid name depends on the address family or families. If a specific family is not given and the name could be interpreted as valid within multiple supported families, the implementation shall attempt to resolve the name in all supported families and, in absence of errors, one or more results shall be returned.

If the *nodename* argument is not null, it can be a descriptive name or can be an address string. If the specified address family is AF\_INET, AF\_INET6, or AF\_UNSPEC, valid descriptive names include host names. If the specified address family is AF\_INET or AF\_UNSPEC, address strings using Internet standard dot notation as specified in *inet\_addr()* are valid.

If the specified address family is AF\_INET6 or AF\_UNSPEC, standard IPv6 text forms described in *inet\_ntop()* are valid.

If *nodename* is not null, the requested service location is named by *nodename*; otherwise, the requested service location is local to the caller.

If *servname* is null, the call shall return network-level addresses for the specified *nodename*. If *servname* is not null, it is a null-terminated character string identifying the requested service. This can be either a descriptive name or a numeric representation suitable for use with the address family or families. If the specified address family is AF\_INET, AF\_INET6, or AF\_UNSPEC, the service can be specified as a string specifying a decimal port number.

If the *hints* argument is not null, it refers to a structure containing input values that directs the operation by providing options and by limiting the returned information to a specific socket type, address family, and/or protocol, as described below. The application shall ensure that each of the *ai\_addrlen*, *ai\_addr*, *ai\_canonname*, and *ai\_next* members, as well as each of the non-standard additional members, if any, of this *hints* structure is initialized. If any of these members has a

value other than the value that would result from default initialization, the behavior is implementation-defined. A value of `AF_UNSPEC` for *ai\_family* means that the caller shall accept any address family. A value of zero for *ai\_socktype* means that the caller shall accept any socket type. A value of zero for *ai\_protocol* means that the caller shall accept any protocol. If *hints* is a null pointer, the behavior shall be as if it referred to a structure containing the value zero for the *ai\_flags*, *ai\_socktype*, and *ai\_protocol* fields, and `AF_UNSPEC` for the *ai\_family* field.

The *ai\_flags* field to which the *hints* parameter points shall be set to zero or be the bitwise-inclusive OR of one or more of the values `AI_PASSIVE`, `AI_CANONNAME`, `AI_NUMERICHOST`, `AI_NUMERICSERV`, `AI_V4MAPPED`, `AI_ALL`, and `AI_ADDRCONFIG`.

If the `AI_PASSIVE` flag is specified, the returned address information shall be suitable for use in binding a socket for accepting incoming connections for the specified service. In this case, if the *nodename* argument is null, then the IP address portion of the socket address structure shall be set to `INADDR_ANY` for an IPv4 address or `IN6ADDR_ANY_INIT` for an IPv6 address. If the `AI_PASSIVE` flag is not specified, the returned address information shall be suitable for a call to `connect()` (for a connection-mode protocol) or for a call to `connect()`, `sendto()`, or `sendmsg()` (for a connectionless protocol). In this case, if the *nodename* argument is null, then the IP address portion of the socket address structure shall be set to the loopback address. The `AI_PASSIVE` flag shall be ignored if the *nodename* argument is not null.

If the `AI_CANONNAME` flag is specified and the *nodename* argument is not null, the function shall attempt to determine the canonical name corresponding to *nodename* (for example, if *nodename* is an alias or shorthand notation for a complete name).

**Note:** Since different implementations use different conceptual models, the terms “canonical name” and “alias” cannot be precisely defined for the general case. However, Domain Name System implementations are expected to interpret them as they are used in RFC 1034.

A numeric host address string is not a “name”, and thus does not have a “canonical name” form; no address to host name translation is performed. See below for handling of the case where a canonical name cannot be obtained.

If the `AI_NUMERICHOST` flag is specified, then a non-null *nodename* string supplied shall be a numeric host address string. Otherwise, an `[EAI_NONAME]` error is returned. This flag shall prevent any type of name resolution service (for example, the DNS) from being invoked.

If the `AI_NUMERICSERV` flag is specified, then a non-null *servname* string supplied shall be a numeric port string. Otherwise, an `[EAI_NONAME]` error shall be returned. This flag shall prevent any type of name resolution service (for example, NIS+) from being invoked.

By default, with an *ai\_family* of `AF_INET6`, `getaddrinfo()` shall return only IPv6 addresses. If the `AI_V4MAPPED` flag is specified along with an *ai\_family* of `AF_INET6`, then `getaddrinfo()` shall return IPv4-mapped IPv6 addresses on finding no matching IPv6 addresses. The `AI_V4MAPPED` flag shall be ignored unless *ai\_family* equals `AF_INET6`. If the `AI_ALL` flag is used with the `AI_V4MAPPED` flag, then `getaddrinfo()` shall return all matching IPv6 and IPv4 addresses. The `AI_ALL` flag without the `AI_V4MAPPED` flag shall be ignored.

If the `AI_ADDRCONFIG` flag is specified, IPv4 addresses shall be returned only if an IPv4 address is configured on the local system, and IPv6 addresses shall be returned only if an IPv6 address is configured on the local system.

The *ai\_socktype* field to which argument *hints* points specifies the socket type for the service, as defined in `socket()`. If a specific socket type is not given (for example, a value of zero) and the service name could be interpreted as valid with multiple supported socket types, the implementation shall attempt to resolve the service name for all supported socket types and, in the absence of errors, all possible results shall be returned. A non-zero socket type value shall

limit the returned information to values with the specified socket type.

If the *ai\_family* field to which *hints* points has the value AF\_UNSPEC, addresses shall be returned for use with any address family that can be used with the specified *nodename* and/or *servname*. Otherwise, addresses shall be returned for use only with the specified address family. If *ai\_family* is not AF\_UNSPEC and *ai\_protocol* is not zero, then addresses shall be returned for use only with the specified address family and protocol; the value of *ai\_protocol* shall be interpreted as in a call to the *socket()* function with the corresponding values of *ai\_family* and *ai\_protocol*.

## RETURN VALUE

A zero return value for *getaddrinfo()* indicates successful completion; a non-zero return value indicates failure. The possible values for the failures are listed in the ERRORS section.

Upon successful return of *getaddrinfo()*, the location to which *res* points shall refer to a linked list of **addrinfo** structures, each of which shall specify a socket address and information for use in creating a socket with which to use that socket address. The list shall include at least one **addrinfo** structure. The *ai\_next* field of each structure contains a pointer to the next structure on the list, or a null pointer if it is the last structure on the list. Each structure on the list shall include values for use with a call to the *socket()* function, and a socket address for use with the *connect()* function or, if the AI\_PASSIVE flag was specified, for use with the *bind()* function. The fields *ai\_family*, *ai\_socktype*, and *ai\_protocol* shall be usable as the arguments to the *socket()* function to create a socket suitable for use with the returned address. The fields *ai\_addr* and *ai\_addrlen* are usable as the arguments to the *connect()* or *bind()* functions with such a socket, according to the AI\_PASSIVE flag.

If *nodename* is not null, and if requested by the AI\_CANONNAME flag, the *ai\_canonname* field of the first returned **addrinfo** structure shall point to a null-terminated string containing the canonical name corresponding to the input *nodename*; if the canonical name is not available, then *ai\_canonname* shall refer to the *nodename* argument or a string with the same contents. The contents of the *ai\_flags* field of the returned structures are undefined.

All fields in socket address structures returned by *getaddrinfo()* that are not filled in through an explicit argument (for example, *sin6\_flowinfo*) shall be set to zero.

**Note:** This makes it easier to compare socket address structures.

## ERRORS

The *getaddrinfo()* function shall fail and return the corresponding error value if:

[EAI\_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

[EAI\_BADFLAGS]

The *flags* parameter had an invalid value.

[EAI\_FAIL] A non-recoverable error occurred when attempting to resolve the name.

[EAI\_FAMILY] The address family was not recognized.

[EAI\_MEMORY] There was a memory allocation failure when trying to allocate storage for the return value.

[EAI\_NONAME] The name does not resolve for the supplied parameters.

Neither *nodename* nor *servname* were supplied. At least one of these shall be supplied.

[EAI\_SERVICE] The service passed was not recognized for the specified socket type.

31724 [EAI\_SOCKTYPE]  
 31725 The intended socket type was not recognized.  
 31726 [EAI\_SYSTEM] A system error occurred; the error code can be found in *errno*.

### 31727 EXAMPLES

31728 The following (incomplete) program demonstrates the use of *getaddrinfo()* to obtain the socket  
 31729 address structure(s) for the service named in the program's command-line argument. The  
 31730 program then loops through each of the address structures attempting to create and bind a  
 31731 socket to the address, until it performs a successful *bind()*.

```

31732 #include <stdio.h>
31733 #include <stdlib.h>
31734 #include <unistd.h>
31735 #include <string.h>
31736 #include <sys/socket.h>
31737 #include <netdb.h>

31738 int
31739 main(int argc, char *argv[])
31740 {
31741     struct addrinfo *result, *rp;
31742     int sfd, s;

31743     if (argc != 2) {
31744         fprintf(stderr, "Usage: %s port\n", argv[0]);
31745         exit(EXIT_FAILURE);
31746     }

31747     struct addrinfo hints = {0};
31748     hints.ai_family = AF_UNSPEC;
31749     hints.ai_socktype = SOCK_DGRAM;
31750     hints.ai_flags = AI_PASSIVE;
31751     hints.ai_protocol = 0;

31752     s = getaddrinfo(NULL, argv[1], &hints, &result);
31753     if (s != 0) {
31754         fprintf(stderr, "getaddrinfo: %s\n", gai_strerror(s));
31755         exit(EXIT_FAILURE);
31756     }

31757     /* getaddrinfo() returns a list of address structures.
31758     Try each address until a successful bind().
31759     If socket(2) (or bind(2)) fails, close the socket
31760     and try the next address. */

31761     for (rp = result; rp != NULL; rp = rp->ai_next) {
31762         sfd = socket(rp->ai_family, rp->ai_socktype,
31763                     rp->ai_protocol);
31764         if (sfd == -1)
31765             continue;

31766         if (bind(sfd, rp->ai_addr, rp->ai_addrlen) == 0)
31767             break;          /* Success */

31768         close(sfd);
31769     }
  
```

```

31770         if (rp == NULL) {           /* No address succeeded */
31771             fprintf(stderr, "Could not bind\n");
31772             exit(EXIT_FAILURE);
31773         }
31774         freeaddrinfo(result);        /* No longer needed */
31775
31776         /* ... use socket bound to sockfd ... */

```

## APPLICATION USAGE

If the caller handles only TCP and not UDP, for example, then the *ai\_protocol* member of the *hints* structure should be set to IPPROTO\_TCP when *getaddrinfo()* is called.

If the caller handles only IPv4 and not IPv6, then the *ai\_family* member of the *hints* structure should be set to AF\_INET when *getaddrinfo()* is called.

Although it is common practice to initialize the *hints* structure using:

```

struct addrinfo hints;
memset(&hints, 0, sizeof hints);

```

this method is not portable according to this standard, because the structure can contain pointer or floating-point members that are not required to have an all-bits-zero representation after default initialization. Portable methods make use of default initialization; for example:

```

struct addrinfo hints = { 0 };

```

or:

```

static struct addrinfo hints_init;
struct addrinfo hints = hints_init;

```

A future version of this standard may require that a pointer object with an all-bits-zero representation is a null pointer, and that **addrinfo** does not have any floating-point members if a floating-point object with an all-bits-zero representation does not have the value 0.0.

The term “canonical name” is misleading; it is taken from the Domain Name System (RFC 2181). It should be noted that the canonical name is a result of alias processing, and not necessarily a unique attribute of a host, address, or set of addresses. See RFC 2181 for more discussion of this in the Domain Name System context.

## RATIONALE

## CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getaddrinfo()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/19 is applied, adding three notes to the DESCRIPTION and adding text to the APPLICATION USAGE related to the term “canonical

- 31812 name". A reference to RFC 2181 is also added to the Informative References.
- 31813 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/20 is applied, making changes for
- 31814 alignment with IPv6. These include the following:
- 31815 • Adding AI\_V4MAPPED, AI\_ALL, and AI\_ADDRCONFIG to the allowed values for the
  - 31816 *ai\_flags* field
  - 31817 • Adding a description of AI\_ADDRCONFIG
  - 31818 • Adding a description of the consequences of ignoring the AI\_PASSIVE flag.
- 31819 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/39 is applied, changing "corresponding
- 31820 value" to "corresponding error value" in the ERRORS section.
- 31821 **Issue 7**
- 31822 Austin Group Interpretation 1003.1-2001 #013 is applied.
- 31823 Austin Group Interpretation 1003.1-2001 #146 is applied, updating the DESCRIPTION.
- 31824 An example is added.

31825 **NAME**

31826       freelocale — free resources allocated for a locale object

31827 **SYNOPSIS**

```
31828 CX      #include <locale.h>
31829          void freelocale(locale_t locobj);
```

31830 **DESCRIPTION**

31831       The *freelocale()* function shall cause the resources allocated for a locale object returned by a call  
31832       to the *newlocale()* or *duplocale()* functions to be released.

31833       The behavior is undefined if the *locobj* argument is the special locale object  
31834       LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

31835       Any use of a locale object that has been freed results in undefined behavior.

31836 **RETURN VALUE**

31837       None.

31838 **ERRORS**

31839       None.

31840 **EXAMPLES**31841       **Freeing Up a Locale Object**

31842       The following example shows a code fragment to free a locale object created by *newlocale()*:

```
31843       #include <locale.h>
31844       ...
31845       /* Every locale object allocated with newlocale() should be
31846        * freed using freelocale():
31847        */
31848       locale_t loc;
31849       /* Get the locale. */
31850       loc = newlocale (LC_CTYPE_MASK | LC_TIME_MASK, "locname", NULL);
31851       /* ... Use the locale object ... */
31852       ...
31853       /* Free the locale object resources. */
31854       freelocale (loc);
```

31855 **APPLICATION USAGE**

31856       None.

CHANGE HISTORY

- First released in Issue 7.
- POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0180 [283] is applied.

**NAME**

freopen — open a stream

**SYNOPSIS**

#include &lt;stdio.h&gt;

```
FILE *freopen(const char *restrict pathname, const char *restrict mode,
              FILE *restrict stream);
```

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *freopen()* function shall first attempt to flush the stream associated with *stream* as if by a call to *fflush(stream)*. Failure to flush the stream successfully shall be ignored. If *pathname* is not a null pointer, *freopen()* shall close any file descriptor associated with *stream*. Failure to close the file descriptor successfully shall be ignored. The error and end-of-file indicators for the stream shall be cleared.

The *freopen()* function shall open the file whose pathname is the string pointed to by *pathname* and associate the stream pointed to by *stream* with it. The *mode* argument shall be used just as in *fopen()*.

The original stream shall be closed regardless of whether the subsequent open succeeds.

If *pathname* is a null pointer, the *freopen()* function shall attempt to change the mode of the stream to that specified by *mode*, as if the name of the file currently associated with the stream had been used. In this case, the file descriptor associated with the stream need not be closed if the call to *freopen()* succeeds. It is implementation-defined which changes of mode are permitted (if any), and under what circumstances.

After a successful call to the *freopen()* function, the orientation of the stream shall be cleared, the encoding rule shall be cleared, and the associated **mbstate\_t** object shall be set to describe an initial conversion state.

If *pathname* is not a null pointer, or if *pathname* is a null pointer and the specified mode change necessitates the file descriptor associated with the stream to be closed and reopened, the file descriptor associated with the reopened stream shall be allocated and opened as if by a call to *open()* with the following flags:

| <i>freopen()</i> Mode                 | <i>open()</i> Flags       |
|---------------------------------------|---------------------------|
| <i>r</i> or <i>rb</i>                 | O_RDONLY                  |
| <i>w</i> or <i>wb</i>                 | O_WRONLY O_CREAT O_TRUNC  |
| <i>a</i> or <i>ab</i>                 | O_WRONLY O_CREAT O_APPEND |
| <i>r+</i> or <i>rb+</i> or <i>r+b</i> | O_RDWR                    |
| <i>w+</i> or <i>wb+</i> or <i>w+b</i> | O_RDWR O_CREAT O_TRUNC    |
| <i>a+</i> or <i>ab+</i> or <i>a+b</i> | O_RDWR O_CREAT O_APPEND   |

**RETURN VALUE**

Upon successful completion, *freopen()* shall return the value of *stream*. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

31908 **ERRORS**31909 The *freopen()* function shall fail if:

31910 CX [EACCES] Search permission is denied on a component of the path prefix, or the file  
 31911 exists and the permissions specified by *mode* are denied, or the file does not  
 31912 exist and write permission is denied for the parent directory of the file to be  
 31913 created.

31914 CX [EBADF] The file descriptor underlying the stream is not a valid file descriptor when  
 31915 *pathname* is a null pointer.

31916 CX [EINTR] A signal was caught during *freopen()*.

31917 CX [EISDIR] The named file is a directory and *mode* requires write access.

31918 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 31919 argument.

31920 CX [EMFILE] All file descriptors available to the process are currently open.

31921 CX [ENAMETOOLONG]

31922 The length of a component of a pathname is longer than {NAME\_MAX}.

31923 CX [ENFILE] The maximum allowable number of files is currently open in the system.

31924 CX [ENOENT] The *mode* string begins with 'r' and a component of *pathname* does not name  
 31925 an existing file, or *mode* begins with 'w' or 'a' and a component of the path  
 31926 prefix of *pathname* does not name an existing file, or *pathname* is an empty  
 31927 string.

31928 CX [ENOENT] or [ENOTDIR]

31929 The *pathname* argument contains at least one non-*<slash>* character and ends  
 31930 with one or more trailing *<slash>* characters. If *pathname* without the trailing  
 31931 *<slash>* characters would name an existing file, an [ENOENT] error shall not  
 31932 occur.

31933 CX [ENOSPC] The directory or file system that would contain the new file cannot be  
 31934 expanded, the file does not exist, and it was to be created.

31935 CX [ENOTDIR] A component of the path prefix names an existing file that is neither a  
 31936 directory nor a symbolic link to a directory, or the *pathname* argument contains  
 31937 at least one non-*<slash>* character and ends with one or more trailing *<slash>*  
 31938 characters and the last pathname component names an existing file that is  
 31939 neither a directory nor a symbolic link to a directory.

31940 CX [ENXIO] The named file is a character special or block special file, and the device  
 31941 associated with this special file does not exist.

31942 CX [EOVERFLOW] The named file is a regular file and the size of the file cannot be represented  
 31943 correctly in an object of type *off\_t*.

31944 CX [EROFS] The named file resides on a read-only file system and *mode* requires write  
 31945 access.

31946 The *freopen()* function may fail if:

31947 CX [EBADF] The mode with which the file descriptor underlying the stream was opened  
 31948 does not support the requested mode when *pathname* is a null pointer.

|       |    |                |                                                                                        |
|-------|----|----------------|----------------------------------------------------------------------------------------|
| 31949 | CX | [EINVAL]       | The value of the <i>mode</i> argument is not valid.                                    |
| 31950 | CX | [ELOOP]        | More than {SYMLOOP_MAX} symbolic links were encountered during                         |
| 31951 |    |                | resolution of the <i>path</i> argument.                                                |
| 31952 | CX | [ENAMETOOLONG] |                                                                                        |
| 31953 |    |                | The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a               |
| 31954 |    |                | symbolic link produced an intermediate result with a length that exceeds               |
| 31955 |    |                | {PATH_MAX}.                                                                            |
| 31956 | CX | [ENOMEM]       | Insufficient storage space is available.                                               |
| 31957 | CX | [ENXIO]        | A request was made of a nonexistent device, or the request was outside the             |
| 31958 |    |                | capabilities of the device.                                                            |
| 31959 | CX | [ETXTBSY]      | The file is a pure procedure (shared text) file that is being executed and <i>mode</i> |
| 31960 |    |                | requires write access.                                                                 |

## 31961 EXAMPLES

### 31962 Directing Standard Output to a File

31963 The following example logs all standard output to the */tmp/logfile* file.

```
31964 #include <stdio.h>
31965 ...
31966 FILE *fp;
31967 ...
31968 fp = freopen ("/tmp/logfile", "a+", stdout);
31969 ...
```

## 31970 APPLICATION USAGE

31971 The *freopen()* function is typically used to attach the pre-opened *streams* associated with *stdin*,  
 31972 *stdout*, and *stderr* to other files.

31973 Since implementations are not required to support any stream mode changes when the *pathname*  
 31974 argument is NULL, portable applications cannot rely on the use of *freopen()* to change the stream  
 31975 mode, and use of this feature is discouraged. The feature was originally added to the ISO C  
 31976 standard in order to facilitate changing *stdin* and *stdout* to binary mode. Since a 'b' character in  
 31977 the mode has no effect on POSIX systems, this use of the feature is unnecessary in POSIX  
 31978 applications. However, even though the 'b' is ignored, a successful call to *freopen*(NULL, "wb",  
 31979 *stdout*) does have an effect. In particular, for regular files it truncates the file and sets the file-  
 31980 position indicator for the stream to the start of the file. It is possible that these side-effects are an  
 31981 unintended consequence of the way the feature is specified in the ISO/IEC 9899:1999 standard,  
 31982 but unless or until the ISO C standard is changed, applications which successfully call  
 31983 *freopen*(NULL, "wb", *stdout*) will behave in unexpected ways on conforming systems in situations  
 31984 such as:

```
31985 { appl file1; appl file2; } > file3
```

31986 which will result in **file3** containing only the output from the second invocation of *appl*.

## 31987 RATIONALE

31988 None.

31989 **FUTURE DIRECTIONS**

31990 None.

31991 **SEE ALSO**31992 Section 2.5 (on page 495), *fclose()*, *fdopen()*, *fflush()*, *fmemopen()*, *fopen()*, *mbsinit()*, *open()*,

31994 XBD &lt;stdio.h&gt;

31995 **CHANGE HISTORY**

31996 First released in Issue 1. Derived from Issue 1 of the SVID.

31997 **Issue 5**31998 The DESCRIPTION is updated to indicate that the orientation of the stream is cleared and the  
31999 conversion state of the stream is set to an initial conversion state by a successful call to the  
32000 *freopen()* function.

32001 Large File Summit extensions are added.

32002 **Issue 6**

32003 Extensions beyond the ISO C standard are marked.

32004 The following new requirements on POSIX implementations derive from alignment with the  
32005 Single UNIX Specification:

- 32006 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open
- 32007 file description. This change is to support large files.
- 32008 • In the ERRORS section, the [Eoverflow] condition is added. This change is to support
- 32009 large files.
- 32010 • The [ELOOP] mandatory error condition is added.
- 32011 • A second [ENAMETOOLONG] is added as an optional error condition.
- 32012 • The [EINVAL], [ENOMEM], [ENXIO], and [ETXTBSY] optional error conditions are added.

32013 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 32014 • The *freopen()* prototype is updated.
- 32015 • The DESCRIPTION is updated.

32016 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
32017 [ELOOP] error condition is added.

32018 The DESCRIPTION is updated regarding failure to close, changing the “file” to “file descriptor”.

32019 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/40 is applied, adding the following  
32020 sentence to the DESCRIPTION: “In this case, the file descriptor associated with the stream need  
32021 not be closed if the call to *freopen()* succeeds.”.32022 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/41 is applied, adding an mandatory  
32023 [EBADF] error, and an optional [EBADF] error to the ERRORS section.32024 **Issue 7**32025 Austin Group Interpretation 1003.1-2001 #043 is applied, clarifying that the *freopen()* function  
32026 allocates a file descriptor as per *open()*.

32027 Austin Group Interpretation 1003.1-2001 #143 is applied.

32028 Austin Group Interpretation 1003.1-2001 #159 is applied, clarifying requirements for the flags set  
32029 on the open file description.

- 32030 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.
- 32031 SD5-XSH-ERN-150 and SD5-XSH-ERN-219 are applied.
- 32032 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0181 [291,433], XSH/TC1-2008/0182
- 32033 [146,433], XSH/TC1-2008/0183 [324], and XSH/TC1-2008/0184 [14] are applied.

32034 **NAME**

32035 frexp, frexpf, frexpl — extract mantissa and exponent from a double precision number

32036 **SYNOPSIS**

```
32037 #include <math.h>
32038 double frexp(double num, int *exp);
32039 float frexpf(float num, int *exp);
32040 long double frexpl(long double num, int *exp);
```

32041 **DESCRIPTION**

32042 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 32043 conflict between the requirements described here and the ISO C standard is unintentional. This  
 32044 volume of POSIX.1-2008 defers to the ISO C standard.

32045 These functions shall break a floating-point number *num* into a normalized fraction and an  
 32046 integral power of 2. The integer exponent shall be stored in the **int** object pointed to by *exp*.

32047 **RETURN VALUE**

32048 For finite arguments, these functions shall return the value *x*, such that *x* has a magnitude in the  
 32049 interval  $[\frac{1}{2}, 1)$  or 0, and *num* equals *x* times 2 raised to the power *\*exp*.

32050 MX If *num* is NaN, a NaN shall be returned, and the value of *\*exp* is unspecified.

32051 If *num* is  $\pm 0$ ,  $\pm 0$  shall be returned, and the value of *\*exp* shall be 0.

32052 If *num* is  $\pm \text{Inf}$ , *num* shall be returned, and the value of *\*exp* is unspecified.

32053 **ERRORS**

32054 No errors are defined.

32055 **EXAMPLES**

32056 None.

32057 **APPLICATION USAGE**

32058 None.

32059 **RATIONALE**

32060 None.

32061 **FUTURE DIRECTIONS**

32062 None.

32063 **SEE ALSO**

32064 *isnan()*, *ldexp()*, *modf()*

32065 XBD **<math.h>**

32066 **CHANGE HISTORY**

32067 First released in Issue 1. Derived from Issue 1 of the SVID.

32068 **Issue 5**

32069 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 32070 text was previously published in the APPLICATION USAGE section.

32071 **Issue 6**

32072 The *frexp()* and *frexpl()* functions are added for alignment with the ISO/IEC 9899:1999  
32073 standard.

32074 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
32075 revised to align with the ISO/IEC 9899:1999 standard.

32076 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
32077 marked.

32078 **NAME**

32079       fscanf, scanf, sscanf — convert formatted input

32080 **SYNOPSIS**

32081       #include &lt;stdio.h&gt;

32082       int fscanf(FILE \*restrict *stream*, const char \*restrict *format*, ...);32083       int scanf(const char \*restrict *format*, ...);32084       int sscanf(const char \*restrict *s*, const char \*restrict *format*, ...);32085 **DESCRIPTION**

32086 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 32087 conflict between the requirements described here and the ISO C standard is unintentional. This  
 32088 volume of POSIX.1-2008 defers to the ISO C standard.

32089       The *fscanf()* function shall read from the named input *stream*. The *scanf()* function shall read  
 32090 from the standard input stream *stdin*. The *sscanf()* function shall read from the string *s*. Each  
 32091 function reads bytes, interprets them according to a format, and stores the results in its  
 32092 arguments. Each expects, as arguments, a control string *format* described below, and a set of  
 32093 *pointer* arguments indicating where the converted input should be stored. The result is  
 32094 undefined if there are insufficient arguments for the format. If the format is exhausted while  
 32095 arguments remain, the excess arguments shall be evaluated but otherwise ignored.

32096 CX       Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 32097 to the next unused argument. In this case, the conversion specifier character % (see below) is  
 32098 replaced by the sequence "%n\$", where *n* is a decimal integer in the range [1,{NL\_ARGMAX}].  
 32099 This feature provides for the definition of format strings that select arguments in an order  
 32100 appropriate to specific languages. In format strings containing the "%n\$" form of conversion  
 32101 specifications, it is unspecified whether numbered arguments in the argument list can be  
 32102 referenced from the format string more than once.

32103       The *format* can contain either form of a conversion specification—that is, % or "%n\$"—but the  
 32104 two forms cannot be mixed within a single *format* string. The only exception to this is that %% or  
 32105 %\* can be mixed with the "%n\$" form. When numbered argument specifications are used,  
 32106 specifying the *N*th argument requires that all the leading arguments, from the first to the  
 32107 (*N*–1)th, are pointers.

32108       The *fscanf()* function in all its forms shall allow detection of a language-dependent radix  
 32109 character in the input string. The radix character is defined in the current locale (category  
 32110 LC\_NUMERIC). In the POSIX locale, or in a locale where the radix character is not defined, the  
 32111 radix character shall default to a <period> ('.').

32112       The format is a character string, beginning and ending in its initial shift state, if any, composed  
 32113 of zero or more directives. Each directive is composed of one of the following: one or more  
 32114 white-space characters (<space>, <tab>, <newline>, <vertical-tab>, or <form-feed>); an ordinary  
 32115 character (neither '%' nor a white-space character); or a conversion specification. Each  
 32116 CX       conversion specification is introduced by the character '%' or the character sequence "%n\$",  
 32117 after which the following appear in sequence:

- 32118       • An optional assignment-suppressing character '\*'.
- 32119       • An optional non-zero decimal integer that specifies the maximum field width.
- 32120 CX       • An optional assignment-allocation character 'm'.
- 32121       • An option length modifier that specifies the size of the receiving object.

- A *conversion specifier* character that specifies the type of conversion to be applied. The valid conversion specifiers are described below.

The *fscanf()* functions shall execute each directive of the format in turn. If a directive fails, as detailed below, the function shall return. Failures are described as input failures (due to the unavailability of input bytes) or matching failures (due to inappropriate input).

A directive composed of one or more white-space characters shall be executed by reading input until no more valid input can be read, or up to the first byte which is not a white-space character, which remains unread.

A directive that is an ordinary character shall be executed as follows: the next byte shall be read from the input and compared with the byte that comprises the directive; if the comparison shows that they are not equivalent, the directive shall fail, and the differing and subsequent bytes shall remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a character from being read, the directive shall fail.

A directive that is a conversion specification defines a set of matching input sequences, as described below for each conversion character. A conversion specification shall be executed in the following steps.

Input white-space characters (as specified by *isspace()*) shall be skipped, unless the conversion specification includes a *[*, *c*, *C*, or *n* conversion specifier.

An item shall be read from the input, unless the conversion specification includes an *n* conversion specifier. An input item shall be defined as the longest sequence of input bytes (up to any specified maximum field width, which may be measured in characters or bytes dependent on the conversion specifier) which is an initial subsequence of a matching sequence. The first byte, if any, after the input item shall remain unread. If the length of the input item is 0, the execution of the conversion specification shall fail; this condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is an input failure.

Except in the case of a *%* conversion specifier, the input item (or, in the case of a *%n* conversion specification, the count of input bytes) shall be converted to a type appropriate to the conversion character. If the input item is not a matching sequence, the execution of the conversion specification fails; this condition is a matching failure. Unless assignment suppression was indicated by a *'\*'*, the result of the conversion shall be placed in the object pointed to by the first argument following the *format* argument that has not already received a conversion result if the conversion specification is introduced by *%*, or in the *n*th argument if introduced by the character sequence *"%n\$"*. If this object does not have an appropriate type, or if the result of the conversion cannot be represented in the space provided, the behavior is undefined.

The *%c*, *%s*, and *%[* conversion specifiers shall accept an optional assignment-allocation character *'m'*, which shall cause a memory buffer to be allocated to hold the string converted including a terminating null character. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer variable that will receive a pointer to the allocated buffer. The system shall allocate a buffer as if *malloc()* had been called. The application shall be responsible for freeing the memory after usage. If there is insufficient memory to allocate a buffer, the function shall set *errno* to *[ENOMEM]* and a conversion error shall result. If the function returns EOF, any memory successfully allocated for parameters using assignment-allocation character *'m'* by this call shall be freed before the function returns.

|       |                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 32207 | x                                                                                                                    | Matches an optionally signed hexadecimal integer, whose format is the same as expected for the subject sequence of <i>strtoul()</i> with the value 16 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding                                                                                                                                                                                                                                                                                  |
| 32208 |                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 32209 |                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

argument is a pointer to **unsigned**.

a, e, f, g

Matches an optionally signed floating-point number, infinity, or NaN, whose format is the same as expected for the subject sequence of *strtod*( ). In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **float**.

If the *fprintf*( ) family of functions generates character string representations for infinity and NaN (a symbolic entity encoded in floating-point format) to support IEEE Std 754-1985, the *fscanf*( ) family of functions shall recognize them as input.

s

Matches a sequence of bytes that are not white-space characters. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to the initial byte of an array of **char**, **signed char**, or **unsigned char** large enough to accept the sequence and a terminating null character code, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a **char**.

If an l (ell) qualifier is present, the input is a sequence of characters that begins in the initial shift state. Each character shall be converted to a wide character as if by a call to the *mbrtowc*( ) function, with the conversion state described by an **mbstate\_t** object initialized to zero before the first character is converted. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of **wchar\_t** large enough to accept the sequence and the terminating null wide character, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a **wchar\_t**.

[

Matches a non-empty sequence of bytes from a set of expected bytes (the *scanset*). The normal skip over white-space characters shall be suppressed in this case. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to the initial byte of an array of **char**, **signed char**, or **unsigned char** large enough to accept the sequence and a terminating null byte, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a **char**.

If an l (ell) qualifier is present, the input is a sequence of characters that begins in the initial shift state. Each character in the sequence shall be converted to a wide character as if by a call to the *mbrtowc*( ) function, with the conversion state described by an **mbstate\_t** object initialized to zero before the first character is converted. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of **wchar\_t** large enough to accept the sequence and the terminating null wide character, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a **wchar\_t**.

The conversion specification includes all subsequent bytes in the *format* string up to and including the matching <right-square-bracket> (']'). The bytes between the square brackets (the *scanlist*) comprise the *scanset*, unless the byte after the <left-square-bracket> is a <circumflex> ('^'), in which case the *scanset* contains all bytes that do not appear in the *scanlist* between the <circumflex> and the <right-square-bracket>. If the conversion specification begins with "[ ]" or "[ ^ ]", the <right-square-bracket> is included in the *scanlist* and the next <right-square-bracket> is the matching <right-square-bracket> that ends the conversion specification; otherwise, the

|       |     |                                                                                                           |
|-------|-----|-----------------------------------------------------------------------------------------------------------|
| 32258 |     | first <right-square-bracket> is the one that ends the conversion specification. If a '-' is               |
| 32259 |     | in the scanlist and is not the first character, nor the second where the first character is a             |
| 32260 |     | '^', nor the last character, the behavior is implementation-defined.                                      |
| 32261 | c   | Matches a sequence of bytes of the number specified by the field width (1 if no field                     |
| 32262 |     | width is present in the conversion specification). No null byte is added. The normal                      |
| 32263 |     | skip over white-space characters shall be suppressed in this case. If the 'm'                             |
| 32264 |     | assignment-allocation character is not specified, the application shall ensure that the                   |
| 32265 |     | corresponding argument is a pointer to the initial byte of an array of <b>char</b> , <b>signed char</b> , |
| 32266 | CX  | or <b>unsigned char</b> large enough to accept the sequence. Otherwise, the application                   |
| 32267 |     | shall ensure that the corresponding argument is a pointer to a pointer to a <b>char</b> .                 |
| 32268 |     | If an l (ell) qualifier is present, the input shall be a sequence of characters that begins in            |
| 32269 |     | the initial shift state. Each character in the sequence is converted to a wide character as               |
| 32270 |     | if by a call to the <i>mbrtowc()</i> function, with the conversion state described by an                  |
| 32271 |     | <b>mbstate_t</b> object initialized to zero before the first character is converted. No null wide         |
| 32272 |     | character is added. If the 'm' assignment-allocation character is not specified, the                      |
| 32273 |     | application shall ensure that the corresponding argument is a pointer to an array of                      |
| 32274 | CX  | <b>wchar_t</b> large enough to accept the resulting sequence of wide characters. Otherwise,               |
| 32275 |     | the application shall ensure that the corresponding argument is a pointer to a pointer to                 |
| 32276 |     | a <b>wchar_t</b> .                                                                                        |
| 32277 | p   | Matches an implementation-defined set of sequences, which shall be the same as the set                    |
| 32278 |     | of sequences that is produced by the %p conversion specification of the corresponding                     |
| 32279 |     | <i>fprintf()</i> functions. The application shall ensure that the corresponding argument is a             |
| 32280 |     | pointer to a pointer to <b>void</b> . The interpretation of the input item is implementation-             |
| 32281 |     | defined. If the input item is a value converted earlier during the same program                           |
| 32282 |     | execution, the pointer that results shall compare equal to that value; otherwise, the                     |
| 32283 |     | behavior of the %p conversion specification is undefined.                                                 |
| 32284 | n   | No input is consumed. The application shall ensure that the corresponding argument is                     |
| 32285 |     | a pointer to the integer into which shall be written the number of bytes read from the                    |
| 32286 |     | input so far by this call to the <i>fscanf()</i> functions. Execution of a %n conversion                  |
| 32287 |     | specification shall not increment the assignment count returned at the completion of                      |
| 32288 |     | execution of the function. No argument shall be converted, but one shall be consumed.                     |
| 32289 |     | If the conversion specification includes an assignment-suppressing character or a field                   |
| 32290 |     | width, the behavior is undefined.                                                                         |
| 32291 | XSI | <b>C</b> Equivalent to <b>lc</b> .                                                                        |
| 32292 | XSI | <b>S</b> Equivalent to <b>ls</b> .                                                                        |
| 32293 | %   | Matches a single '%' character; no conversion or assignment occurs. The complete                          |
| 32294 |     | conversion specification shall be %%.                                                                     |
| 32295 |     | If a conversion specification is invalid, the behavior is undefined.                                      |
| 32296 |     | The conversion specifiers A, E, F, G, and X are also valid and shall be equivalent to a, e, f, g, and     |
| 32297 |     | x, respectively.                                                                                          |
| 32298 |     | If end-of-file is encountered during input, conversion shall be terminated. If end-of-file occurs         |
| 32299 |     | before any bytes matching the current conversion specification (except for %n) have been read             |
| 32300 |     | (other than leading white-space characters, where permitted), execution of the current                    |
| 32301 |     | conversion specification shall terminate with an input failure. Otherwise, unless execution of the        |
| 32302 |     | current conversion specification is terminated with a matching failure, execution of the                  |
| 32303 |     | following conversion specification (if any) shall be terminated with an input failure.                    |

Reaching the end of the string in *sscanf()* shall be equivalent to encountering end-of-file for *fscanf()*.

If conversion terminates on a conflicting input, the offending input is left unread in the input. Any trailing white space (including <newline> characters) shall be left unread unless matched by a conversion specification. The success of literal matches and suppressed assignments is only directly determinable via the %n conversion specification.

CX The *fscanf()* and *scanf()* functions may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetc()*, *fgets()*, *fread()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, *fscanf()*, or *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

#### RETURN VALUE

Upon successful completion, these functions shall return the number of successfully matched and assigned input items; this number can be zero in the event of an early matching failure. If the input ends before the first conversion (if any) has completed, and without a matching failure having occurred, EOF shall be returned. If an error occurs before the first conversion (if any) has completed, and without a matching failure having occurred, EOF shall be returned and *errno* shall be set to indicate the error. If a read error occurs, the error indicator for the stream shall be set.

#### ERRORS

For the conditions under which the *fscanf()* functions fail and may fail, refer to *fgetc()* or *fgetwc()*.

In addition, the *fscanf()* function shall fail if:

CX [EILSEQ] Input byte sequence does not form a valid character.

[ENOMEM] Insufficient storage space is available.

In addition, the *fscanf()* function may fail if:

CX [EINVAL] There are insufficient arguments.

#### EXAMPLES

The call:

```
int i, n; float x; char name[50];
n = scanf("%d%f%s", &i, &x, name);
```

with the input line:

```
25 54.32E-1 Hamster
```

assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string "Hamster".

The call:

```
int i; float x; char name[50];
(void) scanf("%2d%f%d %[0123456789]", &i, &x, name);
```

with input:

```
56789 0123 56a72
```

assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to *getchar()* shall return the character 'a'.

**Reading Data into an Array**

The following call uses *fscanf()* to read three floating-point numbers from standard input into the *input* array.

```
float input[3]; fscanf (stdin, "%f %f %f", input, input+1, input+2);
```

**APPLICATION USAGE**

If the application calling *fscanf()* has any objects of type **wint\_t** or **wchar\_t**, it must also include the **<wchar.h>** header to have these objects defined.

For functions that allocate memory as if by *malloc()*, the application should release such memory when it is no longer required by a call to *free()*. For *fscanf()*, this is memory allocated via use of the 'm' assignment-allocation character.

**RATIONALE**

This function is aligned with the ISO/IEC 9899:1999 standard, and in doing so a few “obvious” things were not included. Specifically, the set of characters allowed in a scanset is limited to single-byte characters. In other similar places, multi-byte characters have been permitted, but for alignment with the ISO/IEC 9899:1999 standard, it has not been done here. Applications needing this could use the corresponding wide-character functions to achieve the desired results.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the *l* (ell) qualifier is now defined for the *c*, *s*, and *[* conversion specifiers.

The DESCRIPTION is updated to indicate that if infinity and NaN can be generated by the *fprintf()* family of functions, then they are recognized by the *fscanf()* family.

**Issue 6**

The Open Group Corrigenda U021/7 and U028/10 are applied. These correct several occurrences of “characters” in the text which have been replaced with the term “bytes”.

The normative text is updated to avoid use of the term “must” for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fscanf()*, *scanf()*, and *sscanf()* are updated.
- The DESCRIPTION is updated.
- The *hh*, *ll*, *j*, *t*, and *z* length modifiers are added.
- The *a*, *A*, and *F* conversion characters are added.

The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” consistently.

32385 **Issue 7**

32386 Austin Group Interpretation 1003.1-2001 #170 is applied.

32387 SD5-XSH-ERN-9 is applied, correcting *fscanf()* to *scanf()* in the DESCRIPTION.

32388 SD5-XSH-ERN-132 is applied, adding the assignment-allocation character 'm'.

32389 Functionality relating to the %n\$ form of conversion specification is moved from the XSI option  
32390 to the Base.

32391 Changes are made related to support for finegrained timestamps.

32392 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by  
32393 *malloc()*.

32394 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0185 [302], XSH/TC1-2008/0186 [90],  
32395 and XSH/TC1-2008/0187 [14] are applied. XSH/TC1-2008/0186 [90] changes the second  
32396 sentence in the RETURN VALUE section to align with expected wording changes in the next  
32397 revision of the ISO C standard.

32398 **NAME**

32399       fseek, fseeko — reposition a file-position indicator in a stream

32400 **SYNOPSIS**

32401       #include &lt;stdio.h&gt;

32402       int fseek(FILE \*stream, long offset, int whence);

32403 CX      int fseeko(FILE \*stream, off\_t offset, int whence);

32404 **DESCRIPTION**

32405 CX      The functionality described on this reference page is aligned with the ISO C standard. Any  
 32406 conflict between the requirements described here and the ISO C standard is unintentional. This  
 32407 volume of POSIX.1-2008 defers to the ISO C standard.

32408      The *fseek()* function shall set the file-position indicator for the stream pointed to by *stream*. If a  
 32409 read or write error occurs, the error indicator for the stream shall be set and *fseek()* fails.

32410      The new position, measured in bytes from the beginning of the file, shall be obtained by adding  
 32411 *offset* to the position specified by *whence*. The specified point is the beginning of the file for  
 32412 SEEK\_SET, the current value of the file-position indicator for SEEK\_CUR, or end-of-file for  
 32413 SEEK\_END.

32414      If the stream is to be used with wide-character input/output functions, the application shall  
 32415 ensure that *offset* is either 0 or a value returned by an earlier call to *ftell()* on the same stream and  
 32416 *whence* is SEEK\_SET.

32417      A successful call to *fseek()* shall clear the end-of-file indicator for the stream and undo any effects  
 32418 of *ungetc()* and *ungetwc()* on the same stream. After an *fseek()* call, the next operation on an  
 32419 update stream may be either input or output.

32420 CX      If the most recent operation, other than *ftell()*, on a given stream is *fflush()*, the file offset in the  
 32421 underlying open file description shall be adjusted to reflect the location specified by *fseek()*.

32422      The *fseek()* function shall allow the file-position indicator to be set beyond the end of existing  
 32423 data in the file. If data is later written at this point, subsequent reads of data in the gap shall  
 32424 return bytes with the value 0 until data is actually written into the gap.

32425      The behavior of *fseek()* on devices which are incapable of seeking is implementation-defined.  
 32426 The value of the file offset associated with such a device is undefined.

32427      If the stream is writable and buffered data had not been written to the underlying file, *fseek()*  
 32428 shall cause the unwritten data to be written to the file and shall mark the last data modification  
 32429 and last file status change timestamps of the file for update.

32430      In a locale with state-dependent encoding, whether *fseek()* restores the stream's shift state is  
 32431 implementation-defined.

32432      The *fseeko()* function shall be equivalent to the *fseek()* function except that the *offset* argument is  
 32433 of type **off\_t**.

32434 **RETURN VALUE**32435 CX      The *fseek()* and *fseeko()* functions shall return 0 if they succeed.32436 CX      Otherwise, they shall return -1 and set *errno* to indicate the error.32437 **ERRORS**

32438 CX      The *fseek()* and *fseeko()* functions shall fail if, either the *stream* is unbuffered or the *stream's*  
 32439 buffer needed to be flushed, and the call to *fseek()* or *fseeko()* causes an underlying *lseek()* or  
 32440 *write()* to be invoked, and:

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

Large File Summit extensions are added.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The *fseeko()* function is added.
- The [EFBIG], [EOVERFLOW], and [ENXIO] mandatory error conditions are added.

The following change is incorporated for alignment with the FIPS requirements:

- The [EINTR] error is no longer an indication that the implementation does not report partial transfers.

The normative text is updated to avoid use of the term “must” for application requirements.

The DESCRIPTION is updated to explicitly state that *fseek()* sets the file-position indicator, and then on error the error indicator is set and *fseek()* fails. This is for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/42 is applied, updating the [EAGAIN] error in the ERRORS section from “the process would be delayed” to “the thread would be delayed”.

**Issue 7**

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0188 [79], XSH/TC1-2008/0189 [122], XSH/TC1-2008/0190 [225], and XSH/TC1-2008/0191 [14] are applied.

32508 **NAME**

32509 fsetpos — set current file position

32510 **SYNOPSIS**

32511 #include &lt;stdio.h&gt;

32512 int fsetpos(FILE \*stream, const fpos\_t \*pos);

32513 **DESCRIPTION**

32514 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 32515 conflict between the requirements described here and the ISO C standard is unintentional. This  
 32516 volume of POSIX.1-2008 defers to the ISO C standard.

32517 The *fsetpos()* function shall set the file position and state indicators for the stream pointed to by  
 32518 *stream* according to the value of the object pointed to by *pos*, which the application shall ensure is  
 32519 a value obtained from an earlier call to *fgetpos()* on the same stream. If a read or write error  
 32520 occurs, the error indicator for the stream shall be set and *fsetpos()* fails.

32521 A successful call to the *fsetpos()* function shall clear the end-of-file indicator for the stream and  
 32522 undo any effects of *ungetc()* on the same stream. After an *fsetpos()* call, the next operation on an  
 32523 update stream may be either input or output.

32524 CX The behavior of *fsetpos()* on devices which are incapable of seeking is implementation-defined.  
 32525 The value of the file offset associated with such a device is undefined.

32526 The *fsetpos()* function shall not change the setting of *errno* if successful.

32527 **RETURN VALUE**

32528 The *fsetpos()* function shall return 0 if it succeeds; otherwise, it shall return a non-zero value and  
 32529 set *errno* to indicate the error.

32530 **ERRORS**

32531 CX The *fsetpos()* function shall fail if, either the *stream* is unbuffered or the *stream*'s buffer needed to  
 32532 be flushed, and the call to *fsetpos()* causes an underlying *lseek()* or *write()* to be invoked, and:

32533 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor and the thread would be  
 32534 delayed in the write operation.

32535 CX [EBADF] The file descriptor underlying the stream file is not open for writing or the  
 32536 stream's buffer needed to be flushed and the file is not open.

32537 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

32538 XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the  
 32539 process.

32540 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the  
 32541 offset maximum associated with the corresponding stream.

32542 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data  
 32543 was transferred.

32544 CX [EIO] A physical I/O error has occurred, or the process is a member of a background  
 32545 process group attempting to perform a *write()* to its controlling terminal,  
 32546 TOSTOP is set, the calling thread is not blocking SIGTTOU, the process is not  
 32547 ignoring SIGTTOU, and the process group of the process is orphaned. This  
 32548 error may also be returned under implementation-defined conditions.

32549 CX [ENOSPC] There was no free space remaining on the device containing the file.

32550 CX [EPIPE] An attempt was made to write to a pipe or FIFO that is not open for reading  
 32551 by any process; a SIGPIPE signal shall also be sent to the thread.

32552 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket.

32553 The *fsetpos()* function may fail if:

32554 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
 32555 capabilities of the device.

#### 32567 CHANGE HISTORY

32568 First released in Issue 4. Derived from the ISO C standard.

#### 32569 Issue 6

32570 Extensions beyond the ISO C standard are marked.

32571 The normative text is updated to avoid use of the term “must” for application requirements.

32572 The DESCRIPTION is updated to clarify that the error indicator is set for the stream on a read or  
 32573 write error. This is for alignment with the ISO/IEC 9899:1999 standard.

32574 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/21 is applied, deleting an erroneous  
 32575 [EINVAL] error case from the ERRORS section.

32576 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/43 is applied, updating the [EAGAIN]  
 32577 error in the ERRORS section from “the process would be delayed” to “the thread would be  
 32578 delayed”.

#### 32579 Issue 7

32580 SD5-XSH-ERN-220 is applied.

32581 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0192 [105], XSH/TC1-2008/0193 [79],  
 32582 XSH/TC1-2008/0194 [225], XSH/TC1-2008/0195 [450], XSH/TC1-2008/0196 [450], and  
 32583 XSH/TC1-2008/0197 [14] are applied.

32584 **NAME**

32585       fstat — get file status

32586 **SYNOPSIS**

32587       #include &lt;sys/stat.h&gt;

32588       int fstat(int *fildes*, struct stat \**buf*);32589 **DESCRIPTION**32590       The *fstat()* function shall obtain information about an open file associated with the file  
32591       descriptor *fildes*, and shall write it to the area pointed to by *buf*.32592 SHM     If *fildes* references a shared memory object, the implementation shall update in the **stat** structure  
32593       pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
32594       S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
32595       valid. The implementation may update other fields and flags.32596 TYM     If *fildes* references a typed memory object, the implementation shall update in the **stat** structure  
32597       pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
32598       S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
32599       valid. The implementation may update other fields and flags.32600       The *buf* argument is a pointer to a **stat** structure, as defined in <sys/stat.h>, into which  
32601       information is placed concerning the file.32602       For all other file types defined in this volume of POSIX.1-2008, the structure members *st\_mode*,  
32603       *st\_ino*, *st\_dev*, *st\_uid*, *st\_gid*, *st\_atim*, *st\_ctim*, and *st\_mtim* shall have meaningful values and the  
32604       value of the *st\_nlink* member shall be set to the number of links to the file.32605       An implementation that provides additional or alternative file access control mechanisms may,  
32606       under implementation-defined conditions, cause *fstat()* to fail.32607       The *fstat()* function shall update any time-related fields (as described in XBD [Section 4.9](#), on  
32608       page 109), before writing into the **stat** structure.32609 **RETURN VALUE**32610       Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
32611       indicate the error.32612 **ERRORS**32613       The *fstat()* function shall fail if:32614       [EBADF]       The *fildes* argument is not a valid file descriptor.

32615       [EIO]         An I/O error occurred while reading from the file system.

32616       [EOVERFLOW]   The file size in bytes or the number of blocks allocated to the file or the file  
32617       serial number cannot be represented correctly in the structure pointed to by  
32618       *buf*.32619       The *fstat()* function may fail if:32620       [EOVERFLOW]   One of the values is too large to store into the structure pointed to by the *buf*  
32621       argument.

32622 **EXAMPLES**32623 **Obtaining File Status Information**

32624 The following example shows how to obtain file status information for a file named  
32625 **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure. The  
32626 **/home/cnd/mod1** file is opened with read/write privileges and is passed to the open file  
32627 descriptor *fildev*.

```
32628 #include <sys/types.h>
32629 #include <sys/stat.h>
32630 #include <fcntl.h>

32631 struct stat buffer;
32632 int      status;
32633 ...
32634 fildev = open("/home/cnd/mod1", O_RDWR);
32635 status = fstat(fildev, &buffer);
```

32636 **APPLICATION USAGE**

32637 None.

32638 **RATIONALE**

32639 None.

32640 **FUTURE DIRECTIONS**

32641 None.

32642 **SEE ALSO**

32643 [\*fstatat\(\)\*](#)

32644 XBD [Section 4.9](#) (on page 109), [\*<sys/stat.h>\*](#), [\*<sys/types.h>\*](#)

32645 **CHANGE HISTORY**

32646 First released in Issue 1. Derived from Issue 1 of the SVID.

32647 **Issue 5**

32648 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

32649 Large File Summit extensions are added.

32650 **Issue 6**

32651 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

32652 The following new requirements on POSIX implementations derive from alignment with the  
32653 Single UNIX Specification:

- 32654 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was  
32655 required for conforming implementations of previous POSIX specifications, it was not  
32656 required for UNIX applications.
- 32657 • The [EIO] mandatory error condition is added.
- 32658 • The [EOVERFLOW] mandatory error condition is added. This change is to support large  
32659 files.
- 32660 • The [EOVERFLOW] optional error condition is added.

32661 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
32662 shared memory object semantics apply to typed memory objects.

32663 **Issue 7**

32664 XSH-SD5-ERN-161 is applied, updating the DESCRIPTION to clarify to which file types *st\_nlink*  
32665 applies.

32666 Changes are made related to support for finegrained timestamps.

**NAME**

fstatat, lstat, stat — get file status

**SYNOPSIS**

```
OH    #include <fcntl.h>
      #include <sys/stat.h>

      int fstatat(int fd, const char *restrict path,
                  struct stat *restrict buf, int flag);
      int lstat(const char *restrict path, struct stat *restrict buf);
      int stat(const char *restrict path, struct stat *restrict buf);
```

**DESCRIPTION**

The *stat()* function shall obtain information about the named file and write it to the area pointed to by the *buf* argument. The *path* argument points to a pathname naming a file. Read, write, or execute permission of the named file is not required. An implementation that provides additional or alternate file access control mechanisms may, under implementation-defined conditions, cause *stat()* to fail. In particular, the system may deny the existence of the file specified by *path*.

If the named file is a symbolic link, the *stat()* function shall continue pathname resolution using the contents of the symbolic link, and shall return information pertaining to the resulting file if the file exists.

The *buf* argument is a pointer to a **stat** structure, as defined in the **<sys/stat.h>** header, into which information is placed concerning the file.

The *stat()* function shall update any time-related fields (as described in XBD [Section 4.9](#), on page 109), before writing into the **stat** structure.

**SHM** If the named file is a shared memory object, the implementation shall update in the **stat** structure pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the *S\_IRUSR*, *S\_IWUSR*, *S\_IRGRP*, *S\_IWGRP*, *S\_IROTH*, and *S\_IWOTH* file permission bits need be valid. The implementation may update other fields and flags.

**TYM** If the named file is a typed memory object, the implementation shall update in the **stat** structure pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the *S\_IRUSR*, *S\_IWUSR*, *S\_IRGRP*, *S\_IWGRP*, *S\_IROTH*, and *S\_IWOTH* file permission bits need be valid. The implementation may update other fields and flags.

For all other file types defined in this volume of POSIX.1-2008, the structure members *st\_mode*, *st\_ino*, *st\_dev*, *st\_uid*, *st\_gid*, *st\_atim*, *st\_ctim*, and *st\_mtim* shall have meaningful values and the value of the member *st\_nlink* shall be set to the number of links to the file.

The *lstat()* function shall be equivalent to *stat()*, except when *path* refers to a symbolic link. In that case *lstat()* shall return information about the link, while *stat()* shall return information about the file the link references.

For symbolic links, the *st\_mode* member shall contain meaningful information when used with the file type macros. The file mode bits in *st\_mode* are unspecified. The structure members *st\_ino*, *st\_dev*, *st\_uid*, *st\_gid*, *st\_atim*, *st\_ctim*, and *st\_mtim* shall have meaningful values and the value of the *st\_nlink* member shall be set to the number of (hard) links to the symbolic link. The value of the *st\_size* member shall be set to the length of the pathname contained in the symbolic link not including any terminating null byte.

The *fstatat()* function shall be equivalent to the *stat()* or *lstat()* function, depending on the value of *flag* (see below), except in the case where *path* specifies a relative path. In this case the status shall be retrieved from a file relative to the directory associated with the file descriptor *fd* instead

32713 of the current working directory. If the access mode of the open file description associated with  
 32714 the file descriptor is not O\_SEARCH, the function shall check whether directory searches are  
 32715 permitted using the current permissions of the directory underlying the file descriptor. If the  
 32716 access mode is O\_SEARCH, the function shall not perform the check.

32717 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 32718 in **<fcntl.h>**:

32719 AT\_SYMLINK\_NOFOLLOW

32720 If *path* names a symbolic link, the status of the symbolic link is returned.

32721 If *fstatat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 32722 directory shall be used and the behavior shall be identical to a call to *stat()* or *lstat()* respectively,  
 32723 depending on whether or not the AT\_SYMLINK\_NOFOLLOW bit is set in *flag*.

## 32724 RETURN VALUE

32725 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 32726 return -1 and set *errno* to indicate the error.

## 32727 ERRORS

32728 These functions shall fail if:

- |       |                |                                                                                                       |
|-------|----------------|-------------------------------------------------------------------------------------------------------|
| 32729 | [EACCES]       | Search permission is denied for a component of the path prefix.                                       |
| 32730 | [EIO]          | An error occurred while reading from the file system.                                                 |
| 32731 | [ELOOP]        | A loop exists in symbolic links encountered during resolution of the <i>path</i>                      |
| 32732 |                | argument.                                                                                             |
| 32733 | [ENAMETOOLONG] |                                                                                                       |
| 32734 |                | The length of a component of a pathname is longer than {NAME_MAX}.                                    |
| 32735 | [ENOENT]       | A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.          |
| 32736 | [ENOTDIR]      | A component of the path prefix names an existing file that is neither a                               |
| 32737 |                | directory nor a symbolic link to a directory, or the <i>path</i> argument contains at                 |
| 32738 |                | least one non- <i>&lt;slash&gt;</i> character and ends with one or more trailing <i>&lt;slash&gt;</i> |
| 32739 |                | characters and the last pathname component names an existing file that is                             |
| 32740 |                | neither a directory nor a symbolic link to a directory.                                               |
| 32741 | [EOVERFLOW]    | The file size in bytes or the number of blocks allocated to the file or the file                      |
| 32742 |                | serial number cannot be represented correctly in the structure pointed to by                          |
| 32743 |                | <i>buf</i> .                                                                                          |

32744 The *fstatat()* function shall fail if:

- |       |           |                                                                                                |
|-------|-----------|------------------------------------------------------------------------------------------------|
| 32745 | [EACCES]  | The access mode of the open file description associated with <i>fd</i> is not                  |
| 32746 |           | O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit               |
| 32747 |           | directory searches.                                                                            |
| 32748 | [EBADF]   | The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is       |
| 32749 |           | neither AT_FDCWD nor a valid file descriptor open for reading or searching.                    |
| 32750 | [ENOTDIR] | The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated |
| 32751 |           | with a non-directory file.                                                                     |

32752 These functions may fail if:

- |       |         |                                                                |
|-------|---------|----------------------------------------------------------------|
| 32753 | [ELOOP] | More than {SYMLOOP_MAX} symbolic links were encountered during |
| 32754 |         | resolution of the <i>path</i> argument.                        |

32755 [ENAMETOOLONG]  
 32756       The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 32757       symbolic link produced an intermediate result with a length that exceeds  
 32758       {PATH\_MAX}.

32759 [EOVERFLOW]   A value to be stored would overflow one of the members of the **stat** structure.

32760   The *fstatat()* function may fail if:

32761 [EINVAL]       The value of the *flag* argument is not valid.

## 32762 EXAMPLES

### 32763 Obtaining File Status Information

32764   The following example shows how to obtain file status information for a file named  
 32765   /home/cnd/mod1. The structure variable *buffer* is defined for the **stat** structure.

```
32766 #include <sys/types.h>
32767 #include <sys/stat.h>
32768 #include <fcntl.h>

32769 struct stat buffer;
32770 int      status;
32771 ...
32772 status = stat("/home/cnd/mod1", &buffer);
```

### 32773 Getting Directory Information

32774   The following example fragment gets status information for each entry in a directory. The call to  
 32775   the *stat()* function stores file information in the **stat** structure pointed to by *statbuf*. The lines  
 32776   that follow the *stat()* call format the fields in the **stat** structure for presentation to the user of the  
 32777   program.

```
32778 #include <sys/types.h>
32779 #include <sys/stat.h>
32780 #include <dirent.h>
32781 #include <pwd.h>
32782 #include <grp.h>
32783 #include <time.h>
32784 #include <locale.h>
32785 #include <langinfo.h>
32786 #include <stdio.h>
32787 #include <stdint.h>

32788 struct dirent *dp;
32789 struct stat   statbuf;
32790 struct passwd *pwd;
32791 struct group  *grp;
32792 struct tm     *tm;
32793 char          datestring[256];
32794 ...
32795 /* Loop through directory entries. */
32796 while ((dp = readdir(dir)) != NULL) {

32797     /* Get entry's information. */
32798     if (stat(dp->d_name, &statbuf) == -1)
```

```

32799         continue;

32800         /* Print out type, permissions, and number of links. */
32801         printf("%10.10s", spem (statbuf.st_mode));
32802         printf("%4d", statbuf.st_nlink);

32803         /* Print out owner's name if it is found using getpwuid(). */
32804         if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
32805             printf(" %-8.8s", pwd->pw_name);
32806         else
32807             printf(" %-8d", statbuf.st_uid);

32808         /* Print out group name if it is found using getgrgid(). */
32809         if ((grp = getgrgid(statbuf.st_gid)) != NULL)
32810             printf(" %-8.8s", grp->gr_name);
32811         else
32812             printf(" %-8d", statbuf.st_gid);

32813         /* Print size of file. */
32814         printf(" %9jd", (intmax_t)statbuf.st_size);

32815         tm = localtime(&statbuf.st_mtime);

32816         /* Get localized date string. */
32817         strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);

32818         printf(" %s %s\n", datestring, dp->d_name);
32819     }

```

### Obtaining Symbolic Link Status Information

The following example shows how to obtain status information for a symbolic link named **/modules/pass1**. The structure variable *buffer* is defined for the **stat** structure. If the *path* argument specified the pathname for the file pointed to by the symbolic link (**/home/cnd/mod1**), the results of calling the function would be the same as those returned by a call to the *stat()* function.

```

32826 #include <sys/stat.h>

32827 struct stat buffer;
32828 int status;
32829 ...
32830 status = lstat("/modules/pass1", &buffer);

```

### APPLICATION USAGE

None.

### RATIONALE

The intent of the paragraph describing “additional or alternate file access control mechanisms” is to allow a secure implementation where a process with a label that does not dominate the file’s label cannot perform a *stat()* function. This is not related to read permission; a process with a label that dominates the file’s label does not need read permission. An implementation that supports write-up operations could fail *fstat()* function calls even though it has a valid file descriptor open for writing.

The purpose of the *fstatat()* function is to obtain the status of files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *stat()*, resulting in unspecified behavior. By opening a

32843 file descriptor for the target directory and using the *fstatat()* function it can be guaranteed that  
 32844 the file for which status is returned is located relative to the desired directory.

#### 32845 FUTURE DIRECTIONS

32846 None.

#### 32847 SEE ALSO

32848 *access()*, *chmod()*, *fdopendir()*, *fstat()*, *mknod()*, *readlink()*, *symlink()*

32849 XBD Section 4.9 (on page 109), *<fcntl.h>*, *<sys/stat.h>*, *<sys/types.h>*

#### 32850 CHANGE HISTORY

32851 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 32852 Issue 5

32853 Large File Summit extensions are added.

#### 32854 Issue 6

32855 In the SYNOPSIS, the optional include of the *<sys/types.h>* header is removed.

32856 The following new requirements on POSIX implementations derive from alignment with the  
 32857 Single UNIX Specification:

- 32858 • The requirement to include *<sys/types.h>* has been removed. Although *<sys/types.h>* was  
 32859 required for conforming implementations of previous POSIX specifications, it was not  
 32860 required for UNIX applications.
- 32861 • The [EIO] mandatory error condition is added.
- 32862 • The [ELOOP] mandatory error condition is added.
- 32863 • The [EOVERFLOW] mandatory error condition is added. This change is to support large  
 32864 files.
- 32865 • The [ENAMETOOLONG] and the second [EOVERFLOW] optional error conditions are  
 32866 added.

32867 The following changes were made to align with the IEEE P1003.1a draft standard:

- 32868 • Details are added regarding the treatment of symbolic links.
- 32869 • The [ELOOP] optional error condition is added.

32870 The normative text is updated to avoid use of the term “must” for application requirements.

32871 The **restrict** keyword is added to the *stat()* prototype for alignment with the ISO/IEC 9899:1999  
 32872 standard.

#### 32873 Issue 7

32874 Austin Group Interpretation 1003.1-2001 #143 is applied.

32875 XSH-SD5-ERN-161 is applied, updating the DESCRIPTION to clarify to which file types *st\_nlink*  
 32876 applies.

32877 The *fstatat()* function is added from The Open Group Technical Standard, 2006, Extended API  
 32878 Set Part 2.

32879 Changes are made related to support for finegrained timestamps.

32880 The *lstat()* function is now required to return meaningful data for symbolic links in all **stat**  
 32881 structure fields, except for the permission bits of *st\_mode*.

32882 Changes are made to allow a directory to be opened for searching.

32883 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
32884 pathname exists but is not a directory or a symbolic link to a directory.

32885 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0198 [461], XSH/TC1-2008/0199 [324],  
32886 XSH/TC1-2008/0200 [278], XSH/TC1-2008/0201 [278], and XSH/TC1-2008/0202 [291] are  
32887 applied.

32888 **NAME**

32889 fstatvfs, statvfs — get file system information

32890 **SYNOPSIS**

32891 #include &lt;sys/statvfs.h&gt;

32892 int fstatvfs(int *fildev*, struct statvfs \**buf*);32893 int statvfs(const char \*restrict *path*, struct statvfs \*restrict *buf*);32894 **DESCRIPTION**32895 The *fstatvfs()* function shall obtain information about the file system containing the file  
32896 referenced by *fildev*.32897 The *statvfs()* function shall obtain information about the file system containing the file named by  
32898 *path*.32899 For both functions, the *buf* argument is a pointer to a **statvfs** structure that shall be filled. Read,  
32900 write, or execute permission of the named file is not required.32901 The following flags can be returned in the *f\_flag* member:

32902 ST\_RDONLY Read-only file system.

32903 ST\_NOSUID Setuid/setgid bits ignored by *exec*.32904 It is unspecified whether all members of the **statvfs** structure have meaningful values on all file  
32905 systems.32906 **RETURN VALUE**32907 Upon successful completion, *statvfs()* shall return 0. Otherwise, it shall return -1 and set *errno* to  
32908 indicate the error.32909 **ERRORS**32910 The *fstatvfs()* and *statvfs()* functions shall fail if:

32911 [EIO] An I/O error occurred while reading the file system.

32912 [EINTR] A signal was caught during execution of the function.

32913 [EOVERFLOW] One of the values to be returned cannot be represented correctly in the  
32914 structure pointed to by *buf*.32915 The *fstatvfs()* function shall fail if:32916 [EBADF] The *fildev* argument is not an open file descriptor.32917 The *statvfs()* function shall fail if:

32918 [EACCES] Search permission is denied on a component of the path prefix.

32919 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
32920 argument.

32921 [ENAMETOOLONG]

32922 The length of a component of a pathname is longer than {NAME\_MAX}.

32923 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.32924 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
32925 directory nor a symbolic link to a directory, or the *path* argument contains at  
32926 least one non-*<slash>* character and ends with one or more trailing *<slash>*  
32927 characters and the last pathname component names an existing file that is  
32928 neither a directory nor a symbolic link to a directory.

32929 The *statvfs()* function may fail if:

32930 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
32931 resolution of the *path* argument.

32932 [ENAMETOOLONG]  
32933 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
32934 symbolic link produced an intermediate result with a length that exceeds  
32935 {PATH\_MAX}.

## 32936 EXAMPLES

### 32937 Obtaining File System Information Using *fstatvfs()*

32938 The following example shows how to obtain file system information for the file system upon  
32939 which the file named **/home/cnd/mod1** resides, using the *fstatvfs()* function. The  
32940 **/home/cnd/mod1** file is opened with read/write privileges and the open file descriptor is passed  
32941 to the *fstatvfs()* function.

```
32942 #include <sys/statvfs.h>
32943 #include <fcntl.h>

32944 struct statvfs buffer;
32945 int          status;
32946 ...
32947 fildes = open("/home/cnd/mod1", O_RDWR);
32948 status = fstatvfs(fildes, &buffer);
```

### 32949 Obtaining File System Information Using *statvfs()*

32950 The following example shows how to obtain file system information for the file system upon  
32951 which the file named **/home/cnd/mod1** resides, using the *statvfs()* function.

```
32952 #include <sys/statvfs.h>

32953 struct statvfs buffer;
32954 int          status;
32955 ...
32956 status = statvfs("/home/cnd/mod1", &buffer);
```

## 32957 APPLICATION USAGE

32958 None.

## 32959 RATIONALE

32960 None.

## 32961 FUTURE DIRECTIONS

32962 None.

32965 *unlink()*, *utime()*, *write()*

32966 XBD *<sys/statvfs.h>*

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

Large File Summit extensions are added.

**Issue 6**

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *statvfs()* prototype for alignment with the ISO/IEC 9899:1999 standard.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #143 is applied.

SD5-XSH-ERN-68 is applied, correcting the EXAMPLES section.

The *fstatvfs()* and *statvfs()* functions are moved from the XSI option to the Base.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0203 [324] is applied.

32985 **NAME**

32986 fsync — synchronize changes to a file

32987 **SYNOPSIS**

```
32988 #include <unistd.h>  
32989 int fsync(int fildes);
```

32990 **DESCRIPTION**

32991 The *fsync()* function shall request that all data for the open file descriptor named by *fildes* is to be  
32992 transferred to the storage device associated with the file described by *fildes*. The nature of the  
32993 transfer is implementation-defined. The *fsync()* function shall not return until the system has  
32994 completed that action or until an error is detected.

32995 SIO If `_POSIX_SYNCHRONIZED_IO` is defined, the *fsync()* function shall force all currently queued  
32996 I/O operations associated with the file indicated by file descriptor *fildes* to the synchronized I/O  
32997 completion state. All I/O operations shall be completed as defined for synchronized I/O file  
32998 integrity completion.

32999 **RETURN VALUE**

33000 Upon successful completion, *fsync()* shall return 0. Otherwise, -1 shall be returned and *errno* set  
33001 to indicate the error. If the *fsync()* function fails, outstanding I/O operations are not guaranteed  
33002 to have been completed.

33003 **ERRORS**33004 The *fsync()* function shall fail if:

- |       |          |                                                                                          |
|-------|----------|------------------------------------------------------------------------------------------|
| 33005 | [EBADF]  | The <i>fildes</i> argument is not a valid descriptor.                                    |
| 33006 | [EINTR]  | The <i>fsync()</i> function was interrupted by a signal.                                 |
| 33007 | [EINVAL] | The <i>fildes</i> argument does not refer to a file on which this operation is possible. |
| 33008 | [EIO]    | An I/O error occurred while reading from or writing to the file system.                  |

33009 In the event that any of the queued I/O operations fail, *fsync()* shall return the error conditions  
33010 defined for *read()* and *write()*.

33011 **EXAMPLES**

33012 None.

33013 **APPLICATION USAGE**

33014 The *fsync()* function should be used by programs which require modifications to a file to be  
33015 completed before continuing; for example, a program which contains a simple transaction  
33016 facility might use it to ensure that all modifications to a file or files caused by a transaction are  
33017 recorded.

33018 **RATIONALE**

33019 The *fsync()* function is intended to force a physical write of data from the buffer cache, and to  
33020 assure that after a system crash or other failure that all data up to the time of the *fsync()* call is  
33021 recorded on the disk. Since the concepts of “buffer cache”, “system crash”, “physical write”, and  
33022 “non-volatile storage” are not defined here, the wording has to be more abstract.

33023 If `_POSIX_SYNCHRONIZED_IO` is not defined, the wording relies heavily on the conformance  
33024 document to tell the user what can be expected from the system. It is explicitly intended that a  
33025 null implementation is permitted. This could be valid in the case where the system cannot assure  
33026 non-volatile storage under any circumstances or when the system is highly fault-tolerant and the  
33027 functionality is not required. In the middle ground between these extremes, *fsync()* might or  
33028 might not actually cause data to be written where it is safe from a power failure. The

conformance document should identify at least that one configuration exists (and how to obtain that configuration) where this can be assured for at least some files that the user can select to use for critical data. It is not intended that an exhaustive list is required, but rather sufficient information is provided so that if critical data needs to be saved, the user can determine how the system is to be configured to allow the data to be written to non-volatile storage.

It is reasonable to assert that the key aspects of *fsync()* are unreasonable to test in a test suite. That does not make the function any less valuable, just more difficult to test. A formal conformance test should probably force a system crash (power shutdown) during the test for this condition, but it needs to be done in such a way that automated testing does not require this to be done except when a formal record of the results is being made. It would also not be unreasonable to omit testing for *fsync()*, allowing it to be treated as a quality-of-implementation issue.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

*sync()*

XBD <unistd.h>

#### CHANGE HISTORY

First released in Issue 3.

#### Issue 5

Aligned with *fsync()* in the POSIX Realtime Extension. Specifically, the DESCRIPTION and RETURN VALUE sections are much expanded, and the ERRORS section is updated to indicate that *fsync()* can return the error conditions defined for *read()* and *write()*.

#### Issue 6

This function is marked as part of the File Synchronization option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EINVAL] and [EIO] mandatory error conditions are added.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/44 is applied, applying an editorial rewording of the DESCRIPTION. No change in meaning is intended.

33059 **NAME**

33060 ftell, ftello — return a file offset in a stream

33061 **SYNOPSIS**

33062 #include &lt;stdio.h&gt;

33063 long ftell(FILE \*stream);

33064 CX off\_t ftello(FILE \*stream);

33065 **DESCRIPTION**

33066 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 33067 conflict between the requirements described here and the ISO C standard is unintentional. This  
 33068 volume of POSIX.1-2008 defers to the ISO C standard.

33069 The *ftell()* function shall obtain the current value of the file-position indicator for the stream  
 33070 pointed to by *stream*.

33071 The *ftell()* function shall not change the setting of *errno* if successful.

33072 CX The *ftello()* function shall be equivalent to *ftell()*, except that the return value is of type **off\_t** and  
 33073 the *ftello()* function may change the setting of *errno* if successful.

33074 **RETURN VALUE**

33075 CX Upon successful completion, *ftell()* and *ftello()* shall return the current value of the file-position  
 33076 indicator for the stream measured in bytes from the beginning of the file.

33077 Otherwise, *ftell()* and *ftello()* shall return  $-1$ , and set *errno* to indicate the error.

33078 **ERRORS**

33079 CX The *ftell()* and *ftello()* functions shall fail if:

33080 CX [EBADF] The file descriptor underlying *stream* is not an open file descriptor.

33081 CX [EOVERFLOW] For *ftell()*, the current file offset cannot be represented correctly in an object of  
 33082 type **long**.

33083 CX [EOVERFLOW] For *ftello()*, the current file offset cannot be represented correctly in an object  
 33084 of type **off\_t**.

33085 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket.

33086 **EXAMPLES**

33087 None.

33088 **APPLICATION USAGE**

33089 None.

33090 **RATIONALE**

33091 None.

33092 **FUTURE DIRECTIONS**

33093 None.

33094 **SEE ALSO**33095 Section 2.5 (on page 495), *fgetpos()*, *fopen()*, *fseek()*, *lseek()*

33096 XBD &lt;stdio.h&gt;

33097 **CHANGE HISTORY**

33098 First released in Issue 1. Derived from Issue 1 of the SVID.

33099 **Issue 5**

33100 Large File Summit extensions are added.

33101 **Issue 6**

33102 Extensions beyond the ISO C standard are marked.

33103 The following new requirements on POSIX implementations derive from alignment with the  
33104 Single UNIX Specification:

- 33105 • The *ftello()* function is added.
- 33106 • The [EOVERFLOW] error conditions are added.

33107 An additional [ESPIPE] error condition is added for sockets.

33108 **Issue 7**33109 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0204 [105], XSH/TC1-2008/0205 [421],  
33110 XSH/TC1-2008/0206 [122], XSH/TC1-2008/0207 [122], and XSH/TC1-2008/0208 [14] are  
33111 applied.

**NAME**

ftok — generate an IPC key

**SYNOPSIS**

```
#include <sys/ipc.h>

key_t ftok(const char *path, int id);
```

**DESCRIPTION**

The *ftok()* function shall return a key based on *path* and *id* that is usable in subsequent calls to *msgget()*, *semget()*, and *shmget()*. The application shall ensure that the *path* argument is the pathname of an existing file that the process is able to *stat()*, with the exception that if *stat()* would fail with [EOVERFLOW] due to file size, *ftok()* shall still succeed.

The *ftok()* function shall return the same key value for all paths that name the same file, when called with the same *id* value, and should return different key values when called with different *id* values or with paths that name different files existing on the same file system at the same time. It is unspecified whether *ftok()* shall return the same key value when called again after the file named by *path* is removed and recreated with the same name.

Only the low-order 8-bits of *id* are significant. The behavior of *ftok()* is unspecified if these bits are 0.

**RETURN VALUE**

Upon successful completion, *ftok()* shall return a key. Otherwise, *ftok()* shall return (**key\_t**)−1 and set *errno* to indicate the error.

**ERRORS**

The *ftok()* function shall fail if:

- [EACCES] Search permission is denied for a component of the path prefix.
- [EIO] An error occurred while reading from the file system.
- [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.
- [ENAMETOOLONG] The length of a component of a pathname is longer than {NAME\_MAX}.
- [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- [ENOTDIR] A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the *path* argument contains at least one non-*<slash>* character and ends with one or more trailing *<slash>* characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

The *ftok()* function may fail if:

- [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during resolution of the *path* argument.
- [ENAMETOOLONG] The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH\_MAX}.

**EXAMPLES****Getting an IPC Key**

The following example gets a key based on the pathname `/tmp` and the ID value `a`. It also assigns the value of the resulting key to the `semkey` variable so that it will be available to a later call to `semget()`, `msgget()`, or `shmget()`.

```
#include <sys/ipc.h>
...
key_t semkey;

if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
    perror("IPC error: ftok"); exit(1);
}
```

**APPLICATION USAGE**

For maximum portability, *id* should be a single-byte character.

Applications should not assume that the resulting key value is unique.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

Future versions of this standard may add new interfaces to provide unique keys.

**SEE ALSO**

[\*msgget\(\)\*](#), [\*semget\(\)\*](#), [\*shmget\(\)\*](#)

XBD [\*<sys/ipc.h>\*](#)

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

**Issue 6**

The normative text is updated to avoid use of the term “must” for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #143 is applied.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0209 [343], XSH/TC1-2008/0210 [366], XSH/TC1-2008/0211 [343], XSH/TC1-2008/0212 [324], XSH/TC1-2008/0213 [366], XSH/TC1-2008/0214 [366], XSH/TC1-2008/0215 [366], and XSH/TC1-2008/0216 [366] are applied.

33190 **NAME**

33191 ftruncate — truncate a file to a specified length

33192 **SYNOPSIS**

33193 #include &lt;unistd.h&gt;

33194 int ftruncate(int *fildes*, off\_t *length*);33195 **DESCRIPTION**33196 If *fildes* is not a valid file descriptor open for writing, the *ftruncate()* function shall fail.

33197 If *fildes* refers to a regular file, the *ftruncate()* function shall cause the size of the file to be truncated to *length*. If the size of the file previously exceeded *length*, the extra data shall no longer be available to reads on the file. If the file previously was smaller than this size, *ftruncate()* shall increase the size of the file. If the file size is increased, the extended area shall appear as if it were zero-filled. The value of the seek pointer shall not be modified by a call to *ftruncate()*.

33203 Upon successful completion, if *fildes* refers to a regular file, *ftruncate()* shall mark for update the last data modification and last file status change timestamps of the file and the S\_ISUID and S\_ISGID bits of the file mode may be cleared. If the *ftruncate()* function is unsuccessful, the file is unaffected.

33207 XSI If the request would cause the file size to exceed the soft file size limit for the process, the request shall fail and the implementation shall generate the SIGXFSZ signal for the thread.

33209 If *fildes* refers to a directory, *ftruncate()* shall fail.33210 If *fildes* refers to any other file type, except a shared memory object, the result is unspecified.

33211 SHM If *fildes* refers to a shared memory object, *ftruncate()* shall set the size of the shared memory object to *length*.

33213 SHM If the effect of *ftruncate()* is to decrease the size of a memory mapped file or a shared memory object and whole pages beyond the new end were previously mapped, then the whole pages beyond the new end shall be discarded.

33216 References to discarded pages shall result in the generation of a SIGBUS signal.

33217 If the effect of *ftruncate()* is to increase the size of a memory object, it is unspecified whether the contents of any mapped pages between the old end-of-file and the new are flushed to the underlying object.

33220 **RETURN VALUE**

33221 Upon successful completion, *ftruncate()* shall return 0; otherwise, -1 shall be returned and *errno* set to indicate the error.

33223 **ERRORS**33224 The *ftruncate()* function shall fail if:

33225 [EINTR] A signal was caught during execution.

33226 [EINVAL] The *length* argument was less than 0.

33227 [EFBIG] or [EINVAL]

33228 The *length* argument was greater than the maximum file size.

33229 [EFBIG] The file is a regular file and *length* is greater than the offset maximum established in the open file description associated with *fildes*.

33230

33231 [EIO] An I/O error occurred while reading from or writing to a file system.

33232 [EBADF] or [EINVAL]

33233 The *fildest* argument is not a file descriptor open for writing.

#### 33234 EXAMPLES

33235 None.

#### 33236 APPLICATION USAGE

33237 None.

#### 33238 RATIONALE

33239 None.

#### 33240 FUTURE DIRECTIONS

33241 None.

#### 33242 SEE ALSO

33243 *open()*, *truncate()*

33244 XBD <unistd.h>

#### 33245 CHANGE HISTORY

33246 First released in Issue 4, Version 2.

#### 33247 Issue 5

33248 Moved from X/OPEN UNIX extension to BASE and aligned with *ftruncate()* in the POSIX  
33249 Realtime Extension. Specifically, the DESCRIPTION is extensively reworded and [EROFS] is  
33250 added to the list of mandatory errors that can be returned by *ftruncate()*.

33251 Large File Summit extensions are added.

#### 33252 Issue 6

33253 The *truncate()* function is split out into a separate reference page.

33254 The following new requirements on POSIX implementations derive from alignment with the  
33255 Single UNIX Specification:

- 33256 • The DESCRIPTION is changed to indicate that if the file size is changed, and if the file is a  
33257 regular file, the S\_ISUID and S\_ISGID bits in the file mode may be cleared.

33258 The following changes were made to align with the IEEE P1003.1a draft standard:

- 33259 • The DESCRIPTION text is updated.

33260 XSI-conformant systems are required to increase the size of the file if the file was previously  
33261 smaller than the size requested.

#### 33262 Issue 7

33263 Austin Group Interpretation 1003.1-2001 #056 is applied, revising the ERRORS section (although  
33264 the [EINVAL] “may fail” error was subsequently removed during review of the XSI option).

33265 Functionality relating to the Memory Protection and Memory Mapped Files options is moved to  
33266 the Base.

33267 The DESCRIPTION is updated so that a call to *ftruncate()* when the file is smaller than the size  
33268 requested will increase the size of the file. Previously, non-XSI-conforming implementations  
33269 were allowed to increase the size of the file or fail.

33270 Changes are made related to support for finegrained timestamps.

33271 **NAME**  
33272       ftrylockfile — stdio locking functions

33273 **SYNOPSIS**  
33274 CX       #include <stdio.h>  
33275       int ftrylockfile(FILE \*file);

33276 **DESCRIPTION**  
33277       Refer to *flockfile()*.

**NAME**

ftw — traverse (walk) a file tree

**SYNOPSIS**

```
#include <ftw.h>

int ftw(const char *path, int (*fn)(const char *,
    const struct stat *ptr, int flag), int ndirs);
```

**DESCRIPTION**

The *ftw()* function shall recursively descend the directory hierarchy rooted in *path*. For each object in the hierarchy, *ftw()* shall call the function pointed to by *fn*, passing it a pointer to a null-terminated character string containing the name of the object, a pointer to a **stat** structure containing information about the object, filled in as if *stat()* or *lstat()* had been called to retrieve the information. Possible values of the integer, defined in the **<ftw.h>** header, are:

FTW\_D For a directory.

FTW\_DNR For a directory that cannot be read.

FTW\_F For a non-directory file.

FTW\_SL For a symbolic link (but see also FTW\_NS below).

FTW\_NS For an object other than a symbolic link on which *stat()* could not successfully be executed. If the object is a symbolic link and *stat()* failed, it is unspecified whether *ftw()* passes FTW\_SL or FTW\_NS to the user-supplied function.

If the integer is FTW\_DNR, descendants of that directory shall not be processed. If the integer is FTW\_NS, the **stat** structure contains undefined values. An example of an object that would cause FTW\_NS to be passed to the function pointed to by *fn* would be a file in a directory with read but without execute (search) permission.

The *ftw()* function shall visit a directory before visiting any of its descendants.

The *ftw()* function shall use at most one file descriptor for each level in the tree.

The argument *ndirs* should be in the range [1,{OPEN\_MAX}].

The tree traversal shall continue until either the tree is exhausted, an invocation of *fn* returns a non-zero value, or some error, other than [EACCES], is detected within *ftw()*.

The *ndirs* argument shall specify the maximum number of directory streams or file descriptors or both available for use by *ftw()* while traversing the tree. When *ftw()* returns it shall close any directory streams and file descriptors it uses not counting any opened by the application-supplied *fn* function.

The results are unspecified if the application-supplied *fn* function does not preserve the current working directory.

The *ftw()* function need not be thread-safe.

**RETURN VALUE**

If the tree is exhausted, *ftw()* shall return 0. If the function pointed to by *fn* returns a non-zero value, *ftw()* shall stop its tree traversal and return whatever value was returned by the function pointed to by *fn*. If *ftw()* detects an error, it shall return -1 and set *errno* to indicate the error.

If *ftw()* encounters an error other than [EACCES] (see FTW\_DNR and FTW\_NS above), it shall return -1 and set *errno* to indicate the error. The external variable *errno* may contain any error value that is possible when a directory is opened or when one of the *stat* functions is executed on

33320 a directory or file.

## 33321 ERRORS

33322 The *ftw()* function shall fail if:

33323 [EACCES] Search permission is denied for any component of *path* or read permission is  
33324 denied for *path*.

33325 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
33326 argument.

33327 [ENAMETOOLONG]

33328 The length of a component of a pathname is longer than {NAME\_MAX}.

33329 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

33330 [ENOTDIR] A component of *path* names an existing file that is neither a directory nor a  
33331 symbolic link to a directory.

33332 [EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current  
33333 programming environment for one or more files found in the file hierarchy.

33334 The *ftw()* function may fail if:

33335 [EINVAL] The value of the *ndirs* argument is invalid.

33336 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
33337 resolution of the *path* argument.

33338 [ENAMETOOLONG]

33339 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
33340 symbolic link produced an intermediate result with a length that exceeds  
33341 {PATH\_MAX}.

33342 In addition, if the function pointed to by *fn* encounters system errors, *errno* may be set  
33343 accordingly.

## 33344 EXAMPLES

### 33345 Walking a Directory Structure

33346 The following example walks the current directory structure, calling the *fn* function for every  
33347 directory entry, using at most 10 file descriptors:

```
33348 #include <ftw.h>
33349 ...
33350 if (ftw(".", fn, 10) != 0) {
33351     perror("ftw"); exit(2);
33352 }
```

## 33353 APPLICATION USAGE

33354 The *ftw()* function may allocate dynamic storage during its operation. If *ftw()* is forcibly  
33355 terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *fn*  
33356 or an interrupt routine, *ftw()* does not have a chance to free that storage, so it remains  
33357 permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has  
33358 occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next  
33359 invocation.

33360 Applications should use the *nftw()* function instead of the obsolescent *ftw()* function.

33361 **RATIONALE**

33362 None.

33363 **FUTURE DIRECTIONS**33364 The *ftw()* function may be removed in a future version.33365 **SEE ALSO**33366 *fdopendir()*, *fstatat()*, *longjmp()*, *nftw()*, *siglongjmp()*

33367 XBD &lt;ftw.h&gt;, &lt;sys/stat.h&gt;

33368 **CHANGE HISTORY**

33369 First released in Issue 1. Derived from Issue 1 of the SVID.

33370 **Issue 5**

33371 UX codings in the DESCRIPTION, RETURN VALUE, and ERRORS sections are changed to EX.

33372 **Issue 6**

33373 The ERRORS section is updated as follows:

- 33374 • The wording of the mandatory [ELOOP] error condition is updated.
- 33375 • A second optional [ELOOP] error condition is added.
- 33376 • The [Eoverflow] mandatory error condition is added.

33377 A note is added to the DESCRIPTION indicating that this function need not be reentrant, and  
 33378 that the results are unspecified if the application-supplied *fn* function does not preserve the  
 33379 current working directory.

33380 **Issue 7**

33381 Austin Group Interpretations 1003.1-2001 #143 and #156 are applied.

33382 SD5-XBD-ERN-61 is applied.

33383 The *ftw()* function is marked obsolescent.

33384 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0217 [403], XSH/TC1-2008/0218 [324],  
 33385 and XSH/TC1-2008/0219 [361] are applied.

33386 **NAME**

33387 funlockfile — stdio locking functions

33388 **SYNOPSIS**

```
33389 CX    #include <stdio.h>
33390        void funlockfile(FILE *file);
```

33391 **DESCRIPTION**33392 Refer to *flockfile()*.

## 33393 NAME

33394 futimens, utimensat, utimes — set file access and modification times

## 33395 SYNOPSIS

33396 #include &lt;sys/stat.h&gt;

33397 int futimens(int *fd*, const struct timespec *times*[2]);

33398 OH #include &lt;fcntl.h&gt; +

33399 +

33400 int utimensat(int *fd*, const char \**path*, const struct timespec *times*[2],  
33401 int *flag*);

33402 XSI #include &lt;sys/time.h&gt;

33403 int utimes(const char \**path*, const struct timeval *times*[2]);

## 33404 DESCRIPTION

33405 The *futimens()* and *utimensat()* functions shall set the access and modification times of a file to  
 33406 the values of the *times* argument. The *futimens()* function changes the times of the file associated  
 33407 with the file descriptor *fd*. The *utimensat()* function changes the times of the file pointed to by  
 33408 the *path* argument, relative to the directory associated with the file descriptor *fd*. Both functions  
 33409 allow time specifications accurate to the nanosecond.

33410 For *futimens()* and *utimensat()*, the *times* argument is an array of two **timespec** structures. The  
 33411 first array member represents the date and time of last access, and the second member  
 33412 represents the date and time of last modification. The times in the **timespec** structure are  
 33413 measured in seconds and nanoseconds since the Epoch. The file's relevant timestamp shall be set  
 33414 to the greatest value supported by the file system that is not greater than the specified time.

33415 If the *tv\_nsec* field of a **timespec** structure has the special value **UTIME\_NOW**, the file's relevant  
 33416 timestamp shall be set to the greatest value supported by the file system that is not greater than  
 33417 the current time. If the *tv\_nsec* field has the special value **UTIME\_OMIT**, the file's relevant  
 33418 timestamp shall not be changed. In either case, the *tv\_sec* field shall be ignored.

33419 If the *times* argument is a null pointer, both the access and modification timestamps shall be set  
 33420 to the greatest value supported by the file system that is not greater than the current time. If  
 33421 *utimensat()* is passed a relative path in the *path* argument, the file to be used shall be relative to  
 33422 the directory associated with the file descriptor *fd* instead of the current working directory. If the  
 33423 access mode of the open file description associated with the file descriptor is not **O\_SEARCH**,  
 33424 the function shall check whether directory searches are permitted using the current permissions  
 33425 of the directory underlying the file descriptor. If the access mode is **O\_SEARCH**, the function  
 33426 shall not perform the check.

33427 If *utimensat()* is passed the special value **AT\_FDCWD** in the *fd* parameter, the current working  
 33428 directory shall be used.

33429 Only a process with the effective user ID equal to the user ID of the file, or with write access to  
 33430 the file, or with appropriate privileges may use *futimens()* or *utimensat()* with a null pointer as  
 33431 the *times* argument or with both *tv\_nsec* fields set to the special value **UTIME\_NOW**. Only a  
 33432 process with the effective user ID equal to the user ID of the file or with appropriate privileges  
 33433 may use *futimens()* or *utimensat()* with a non-null *times* argument that does not have both  
 33434 *tv\_nsec* fields set to **UTIME\_NOW** and does not have both *tv\_nsec* fields set to **UTIME\_OMIT**. If  
 33435 both *tv\_nsec* fields are set to **UTIME\_OMIT**, no ownership or permissions check shall be  
 33436 performed for the file, but other error conditions may still be detected (including [EACCES]  
 33437 errors related to the path prefix).

Values for the *flag* argument of *utimensat()* are constructed by a bitwise-inclusive OR of flags from the following list, defined in `<fcntl.h>`:

AT\_SYMLINK\_NOFOLLOW

If *path* names a symbolic link, then the access and modification times of the symbolic link are changed.

Upon successful completion, *futimens()* and *utimensat()* shall mark the last file status change timestamp for update, with the exception that if both *tv\_nsec* fields are set to `UTIME_OMIT`, the file status change timestamp need not be marked for update.

The *utimes()* function shall be equivalent to the *utimensat()* function with the special value `AT_FDCWD` as the *fd* argument and the *flag* argument set to zero, except that the *times* argument is a **timeval** structure rather than a **timespec** structure, and accuracy is only to the microsecond, not nanosecond, and rounding towards the nearest second may occur.

## RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return `-1` and set *errno* to indicate the error. If `-1` is returned, the file times shall not be affected.

## ERRORS

These functions shall fail if:

[EACCES] The *times* argument is a null pointer, or both *tv\_nsec* values are `UTIME_NOW`, and the effective user ID of the process does not match the owner of the file and write access is denied.

[EINVAL] Either of the *times* argument structures specified a *tv\_nsec* value that was neither `UTIME_NOW` nor `UTIME_OMIT`, and was a value less than zero or greater than or equal to 1 000 million.

[EINVAL] A new file timestamp would be a value whose *tv\_sec* component is not a value supported by the file system.

[EPERM] The *times* argument is not a null pointer, does not have both *tv\_nsec* fields set to `UTIME_NOW`, does not have both *tv\_nsec* fields set to `UTIME_OMIT`, the calling process' effective user ID does not match the owner of the file, and the calling process does not have appropriate privileges.

[EROFS] The file system containing the file is read-only.

The *futimens()* function shall fail if:

[EBADF] The *fd* argument is not a valid file descriptor.

The *utimensat()* function shall fail if:

[EACCES] The access mode of the open file description associated with *fd* is not `O_SEARCH` and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither `AT_FDCWD` nor a valid file descriptor open for reading or searching.

[ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated with a non-directory file.

The *utimensat()* and *utimes()* functions shall fail if:

|       |                |                                                                                                                                                                                                                                                                                                                                                                                                                   |

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

The purpose of the *utimensat*() function is to set the access and modification time of files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *utimes*(), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *utimensat*() function it can be guaranteed that the changed file is located relative to the desired directory.

The standard developers considered including a special case for the permissions required by *utimensat*() when one *tv\_nsec* field is *UTIME\_NOW* and the other is *UTIME\_OMIT*. One possibility would be to include this case in with the cases where *times* is a null pointer or both fields are *UTIME\_NOW*, where the call is allowed if the process has write permission for the file. However, associating write permission with an update to just the last data access timestamp (which is normally updated by *read*()) did not seem appropriate. The other possibility would be to specify that this one case is allowed if the process has read permission, but this was felt to be too great a departure from the *utime*() and *utimes*() functions on which *utimensat*() is based. If an application needs to set the last data access timestamp to the current time for a file on which it has read permission but is not the owner, it can do so by opening the file, reading one or more bytes (or reading a directory entry, if the file is a directory), and then closing it.

33520 **FUTURE DIRECTIONS**

33521 None.

33522 **SEE ALSO**33523 *read()*, *utime()*

33524 XBD &lt;fcntl.h&gt;, &lt;sys/stat.h&gt;, &lt;sys/time.h&gt;

33525 **CHANGE HISTORY**

33526 First released in Issue 4, Version 2.

33527 **Issue 5**

33528 Moved from X/OPEN UNIX extension to BASE.

33529 **Issue 6**

33530 This function is marked LEGACY.

33531 The normative text is updated to avoid use of the term “must” for application requirements.

33532 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
33533 [ELOOP] error condition is added.33534 **Issue 7**

33535 Austin Group Interpretation 1003.1-2001 #143 is applied.

33536 The LEGACY marking is removed.

33537 The *utimensat()* function (renamed from *futimensat()*) is added from The Open Group Technical  
33538 Standard, 2006, Extended API Set Part 2, and changed to allow modifying a symbolic link by  
33539 adding a *flag* argument.33540 The *futimens()* function is added.

33541 Changes are made related to support for finegrained timestamps.

33542 Changes are made to allow a directory to be opened for searching.

33543 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
33544 pathname exists but is not a directory or a symbolic link to a directory.33545 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0220 [63,428], XSH/TC1-2008/0221  
33546 [278], XSH/TC1-2008/0222 [324], XSH/TC1-2008/0223 [306], and XSH/TC1-2008/0224 [278] are  
33547 applied.

33548 **NAME**

33549       fwide — set stream orientation

33550 **SYNOPSIS**

33551       #include &lt;stdio.h&gt;

33552       #include &lt;wchar.h&gt;

33553       int fwide(FILE \**stream*, int *mode*);33554 **DESCRIPTION**

33555 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 33556 conflict between the requirements described here and the ISO C standard is unintentional. This  
 33557 volume of POSIX.1-2008 defers to the ISO C standard.

33558       The *fwide()* function shall determine the orientation of the stream pointed to by *stream*. If *mode* is  
 33559 greater than zero, the function first attempts to make the stream wide-oriented. If *mode* is less  
 33560 than zero, the function first attempts to make the stream byte-oriented. Otherwise, *mode* is zero  
 33561 and the function does not alter the orientation of the stream.

33562       If the orientation of the stream has already been determined, *fwide()* shall not change it.

33563 CX       The *fwide()* function shall not change the setting of *errno* if successful.

33564       Since no return value is reserved to indicate an error, an application wishing to check for error  
 33565 situations should set *errno* to 0, then call *fwide()*, then check *errno*, and if it is non-zero, assume  
 33566 an error has occurred.

33567 **RETURN VALUE**

33568       The *fwide()* function shall return a value greater than zero if, after the call, the stream has wide-  
 33569 orientation, a value less than zero if the stream has byte-orientation, or zero if the stream has no  
 33570 orientation.

33571 **ERRORS**

33572       The *fwide()* function may fail if:

33573 CX       [EBADF]       The *stream* argument is not a valid stream.

33574 **EXAMPLES**

33575       None.

33576 **APPLICATION USAGE**

33577       A call to *fwide()* with *mode* set to zero can be used to determine the current orientation of a  
 33578 stream.

33579 **RATIONALE**

33580       None.

33581 **FUTURE DIRECTIONS**

33582       None.

33583 **SEE ALSO**

33584       XBD <stdio.h>, <wchar.h>

33585 **CHANGE HISTORY**

33586       First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 33587 (E).

33588 **Issue 6**

33589 Extensions beyond the ISO C standard are marked.

33590 **Issue 7**

33591 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0225 [272] is applied.

## 33592 NAME

33593 fwprintf, swprintf, wprintf — print formatted wide-character output

## 33594 SYNOPSIS

```

33595 #include <stdio.h>
33596 #include <wchar.h>
33597 int fwprintf(FILE *restrict stream, const wchar_t *restrict format, ...);
33598 int swprintf(wchar_t *restrict ws, size_t n,
33599             const wchar_t *restrict format, ...);
33600 int wprintf(const wchar_t *restrict format, ...);

```

## 33601 DESCRIPTION

33602 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 33603 conflict between the requirements described here and the ISO C standard is unintentional. This  
 33604 volume of POSIX.1-2008 defers to the ISO C standard.

33605 The *fwprintf()* function shall place output on the named output *stream*. The *wprintf()* function  
 33606 shall place output on the standard output stream *stdout*. The *swprintf()* function shall place  
 33607 output followed by the null wide character in consecutive wide characters starting at *\*ws*; no  
 33608 more than *n* wide characters shall be written, including a terminating null wide character, which  
 33609 is always added (unless *n* is zero).

33610 Each of these functions shall convert, format, and print its arguments under control of the *format*  
 33611 wide-character string. The *format* is composed of zero or more directives: *ordinary wide-characters*,  
 33612 which are simply copied to the output stream, and *conversion specifications*, each of which results  
 33613 in the fetching of zero or more arguments. The results are undefined if there are insufficient  
 33614 arguments for the *format*. If the *format* is exhausted while arguments remain, the excess  
 33615 arguments are evaluated but are otherwise ignored.

33616 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 33617 to the next unused argument. In this case, the conversion specifier wide character % (see below)  
 33618 is replaced by the sequence "%n\$", where *n* is a decimal integer in the range  
 33619 [1,{NL\_ARGMAX}], giving the position of the argument in the argument list. This feature  
 33620 provides for the definition of *format* wide-character strings that select arguments in an order  
 33621 appropriate to specific languages (see the EXAMPLES section).

33622 The *format* can contain either numbered argument specifications (that is, "%n\$" and "\*m\$"), or  
 33623 unnumbered argument conversion specifications (that is, % and \*), but not both. The only  
 33624 exception to this is that %% can be mixed with the "%n\$" form. The results of mixing numbered  
 33625 and unnumbered argument specifications in a *format* wide-character string are undefined. When  
 33626 numbered argument specifications are used, specifying the *N*th argument requires that all the  
 33627 leading arguments, from the first to the (*N*–1)th, are specified in the *format* wide-character string.

33628 In *format* wide-character strings containing the "%n\$" form of conversion specification,  
 33629 numbered arguments in the argument list can be referenced from the *format* wide-character  
 33630 string as many times as required.

33631 In *format* wide-character strings containing the % form of conversion specification, each  
 33632 argument in the argument list shall be used exactly once. It is unspecified whether an encoding  
 33633 error occurs if the format string contains **wchar\_t** values that do not correspond to members of  
 33634 the character set of the current locale and the specified semantics do not require that value to be  
 33635 processed by *wcrtomb()*.

33636 CX All forms of the *fwprintf()* function allow for the insertion of a locale-dependent radix character  
 33637 in the output string, output as a wide-character value. The radix character is defined in the  
 33638 current locale (category *LC\_NUMERIC*). In the POSIX locale, or in a locale where the radix

character is not defined, the radix character shall default to a <period> ( ' . ' ).

Each conversion specification is introduced by the ' % ' wide character or by the wide-character sequence "%n\$", after which the following appear in sequence:

- Zero or more *flags* (in any order), which modify the meaning of the conversion specification.
- An optional minimum *field width*. If the converted value has fewer wide characters than the field width, it shall be padded with <space> characters by default on the left; it shall be padded on the right, if the left-adjustment flag ( ' - ' ), described below, is given to the field width. The field width takes the form of an <asterisk> ( ' \* ' ), described below, or a decimal integer.
- An optional *precision* that gives the minimum number of digits to appear for the d, i, o, u, x, and X conversion specifiers; the number of digits to appear after the radix character for the a, A, e, E, f, and F conversion specifiers; the maximum number of significant digits for the g and G conversion specifiers; or the maximum number of wide characters to be printed from a string in the s conversion specifiers. The precision takes the form of a <period> ( ' . ' ) followed either by an <asterisk> ( ' \* ' ), described below, or an optional decimal digit string, where a null digit string is treated as 0. If a precision appears with any other conversion wide character, the behavior is undefined.
- An optional length modifier that specifies the size of the argument.
- A *conversion specifier* wide character that indicates the type of conversion to be applied.

A field width, or precision, or both, may be indicated by an <asterisk> ( ' \* ' ). In this case an argument of type **int** supplies the field width or precision. Applications shall ensure that arguments specifying field width, or precision, or both appear in that order before the argument, if any, to be converted. A negative field width is taken as a ' - ' flag followed by a positive field width. A negative precision is taken as if the precision were omitted. In *format* wide-character strings containing the "%n\$" form of a conversion specification, a field width or precision may be indicated by the sequence "\*m\$", where *m* is a decimal integer in the range [1,{NL\_ARGMAX}] giving the position in the argument list (after the *format* argument) of an integer argument containing the field width or precision, for example:

```
wprintf(L"%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```

The flag wide characters and their meanings are:

- ' (The <apostrophe>.) The integer portion of the result of a decimal conversion (%i, %d, %u, %f, %F, %g, or %G) shall be formatted with thousands' grouping wide characters. For other conversions, the behavior is undefined. The numeric grouping wide character is used.
- The result of the conversion shall be left-justified within the field. The conversion shall be right-justified if this flag is not specified.
- + The result of a signed conversion shall always begin with a sign ( ' + ' or ' - ' ). The conversion shall begin with a sign only when a negative value is converted if this flag is not specified.
- <space> If the first wide character of a signed conversion is not a sign, or if a signed conversion results in no wide characters, a <space> shall be prefixed to the result. This means that if the <space> and ' + ' flags both appear, the <space> flag shall be ignored.

|       |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |
|-------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| 33682 | #            | Specifies that the value is to be converted to an alternative form. For <code>o</code> conversion, it shall increase the precision, if and only if necessary, to force the first digit of the result to be zero (if the value and precision are both 0, a single 0 is printed). For <code>x</code> or <code>X</code> conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For <code>a</code> , <code>A</code> , <code>e</code> , <code>E</code> , <code>f</code> , <code>F</code> , <code>g</code> , and <code>G</code> conversion specifiers, the result shall always contain a radix character, even if no digits follow it. Without this flag, a radix character appears in the result of these conversions only if a digit follows it. For <code>g</code> and <code>G</code> conversion specifiers, trailing zeros shall <i>not</i> be removed from the result as they normally are. For other conversion specifiers, the behavior is undefined.  |  |
| 33683 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |
| 33684 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |

| 33688 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |
| 33689 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |
| 33690 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |
| 33691 | 0            | For <code>d</code> , <code>i</code> , <code>o</code> , <code>u</code> , <code>x</code> , <code>X</code> , <code>a</code> , <code>A</code> , <code>e</code> , <code>E</code> , <code>f</code> , <code>F</code> , <code>g</code> , and <code>G</code> conversion specifiers, leading zeros (following any indication of sign or base) are used to pad to the field width rather than performing space padding, except when converting an infinity or NaN. If the <code>'0'</code> and <code>'-'</code> flags both appear, the <code>'0'</code> flag shall be ignored. For <code>d</code> , <code>i</code> , <code>o</code> , <code>u</code> , <code>x</code> , and <code>X</code> conversion specifiers, if a precision is specified, the <code>'0'</code> flag shall be ignored. If the <code>'0'</code> and <code>&lt;apostrophe&gt;</code> flags both appear, the grouping wide characters are inserted before zero padding. For other conversions, the behavior is undefined. |  |

| 33724 | t            | Specifies that a following <code>d</code> , <code>i</code> , <code>o</code> , <code>u</code> , <code>x</code> , or <code>X</code> conversion specifier applies to a <b>ptrdiff_t</b> or the corresponding <b>unsigned</b> type argument; or that a following <code>n</code> conversion specifier applies to a pointer to a <b>ptrdiff_t</b> argument.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 33725 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |
| 33726 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |

|       |      |                                                                                                    |
|-------|------|----------------------------------------------------------------------------------------------------|
| 33727 | L    | Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to a <b>long</b> |
| 33728 |      | <b>double</b> argument.                                                                            |
| 33729 |      | If a length modifier appears with any conversion specifier other than as specified above, the      |
| 33730 |      | behavior is undefined.                                                                             |
| 33731 |      | The conversion specifiers and their meanings are:                                                  |
| 33732 | d, i | The <b>int</b> argument shall be converted to a signed decimal in the style "[−]dddd". The         |
| 33733 |      | precision specifies the minimum number of digits to appear; if the value being                     |
| 33734 |      | converted can be represented in fewer digits, it shall be expanded with leading zeros.             |
| 33735 |      | The default precision shall be 1. The result of converting zero with an explicit precision         |
| 33736 |      | of zero shall be no wide characters.                                                               |
| 33737 | o    | The <b>unsigned</b> argument shall be converted to unsigned octal format in the style              |
| 33738 |      | "dddd". The precision specifies the minimum number of digits to appear; if the value               |
| 33739 |      | being converted can be represented in fewer digits, it shall be expanded with leading              |
| 33740 |      | zeros. The default precision shall be 1. The result of converting zero with an explicit            |
| 33741 |      | precision of zero shall be no wide characters.                                                     |
| 33742 | u    | The <b>unsigned</b> argument shall be converted to unsigned decimal format in the style            |
| 33743 |      | "dddd". The precision specifies the minimum number of digits to appear; if the value               |
| 33744 |      | being converted can be represented in fewer digits, it shall be expanded with leading              |
| 33745 |      | zeros. The default precision shall be 1. The result of converting zero with an explicit            |
| 33746 |      | precision of zero shall be no wide characters.                                                     |
| 33747 | x    | The <b>unsigned</b> argument shall be converted to unsigned hexadecimal format in the style        |
| 33748 |      | "dddd"; the letters "abcdef" are used. The precision specifies the minimum number                  |
| 33749 |      | of digits to appear; if the value being converted can be represented in fewer digits, it           |
| 33750 |      | shall be expanded with leading zeros. The default precision shall be 1. The result of              |
| 33751 |      | converting zero with an explicit precision of zero shall be no wide characters.                    |
| 33752 | X    | Equivalent to the x conversion specifier, except that letters "ABCDEF" are used instead            |
| 33753 |      | of "abcdef".                                                                                       |
| 33754 | f, F | The <b>double</b> argument shall be converted to decimal notation in the style                     |
| 33755 |      | "[−]ddd.ddd", where the number of digits after the radix character shall be equal to               |
| 33756 |      | the precision specification. If the precision is missing, it shall be taken as 6; if the           |
| 33757 |      | precision is explicitly zero and no '#' flag is present, no radix character shall appear. If       |
| 33758 |      | a radix character appears, at least one digit shall appear before it. The value shall be           |
| 33759 |      | rounded in an implementation-defined manner to the appropriate number of digits.                   |
| 33760 |      | A <b>double</b> argument representing an infinity shall be converted in one of the styles          |
| 33761 |      | "[−]inf" or "[−]infinity"; which style is implementation-defined. A <b>double</b>                  |
| 33762 |      | argument representing a NaN shall be converted in one of the styles "[−]nan" or                    |
| 33763 |      | "[−]nan( <i>n-char-sequence</i> )"; which style, and the meaning of any <i>n-char-sequence</i> ,   |
| 33764 |      | is implementation-defined. The F conversion specifier produces "INF", "INFINITY",                  |
| 33765 |      | or "NAN" instead of "inf", "infinity", or "nan", respectively.                                     |
| 33766 | e, E | The <b>double</b> argument shall be converted in the style "[−]d.ddde±dd", where there             |
| 33767 |      | shall be one digit before the radix character (which is non-zero if the argument is non-           |
| 33768 |      | zero) and the number of digits after it shall be equal to the precision; if the precision is       |
| 33769 |      | missing, it shall be taken as 6; if the precision is zero and no '#' flag is present, no           |
| 33770 |      | radix character shall appear. The value shall be rounded in an implementation-defined              |
| 33771 |      | manner to the appropriate number of digits. The E conversion wide character shall                  |
| 33772 |      | produce a number with 'E' instead of 'e' introducing the exponent. The exponent                    |
| 33773 |      | shall always contain at least two digits. If the value is zero, the exponent shall be zero.        |

33774 A **double** argument representing an infinity or NaN shall be converted in the style of  
 33775 an **f** or **F** conversion specifier.

33776 **g, G** The **double** argument representing a floating-point number shall be converted in the  
 33777 style **f** or **e** (or in the style **F** or **E** in the case of a **G** conversion specifier), depending on  
 33778 the value converted and the precision. Let **P** equal the precision if non-zero, 6 if the  
 33779 precision is omitted, or 1 if the precision is zero. Then, if a conversion with style **E**  
 33780 would have an exponent of **X**:

33781 — If  $P > X \geq -4$ , the conversion shall be with style **f** (or **F**) and precision  $P - (X + 1)$ .  
 33782 — Otherwise, the conversion shall be with style **e** (or **E**) and precision  $P - 1$ .

33783 Finally, unless the '**#**' flag is used, any trailing zeros shall be removed from the  
 33784 fractional portion of the result and the decimal-point character shall be removed if there  
 33785 is no fractional portion remaining.

33786 A **double** argument representing an infinity or NaN shall be converted in the style of  
 33787 an **f** or **F** conversion specifier.

33788 **a, A** A **double** argument representing a floating-point number shall be converted in the  
 33789 style "**[−]0xh.hhhhp±d**", where there shall be one hexadecimal digit (which is non-  
 33790 zero if the argument is a normalized floating-point number and is otherwise  
 33791 unspecified) before the decimal-point wide character and the number of hexadecimal  
 33792 digits after it shall be equal to the precision; if the precision is missing and **FLT\_RADIX**  
 33793 is a power of 2, then the precision shall be sufficient for an exact representation of the  
 33794 value; if the precision is missing and **FLT\_RADIX** is not a power of 2, then the precision  
 33795 shall be sufficient to distinguish values of type **double**, except that trailing zeros may  
 33796 be omitted; if the precision is zero and the '**#**' flag is not specified, no decimal-point  
 33797 wide character shall appear. The letters "**abcdef**" are used for a conversion and the  
 33798 letters "**ABCDEF**" for **A** conversion. The **A** conversion specifier produces a number with  
 33799 '**X**' and '**P**' instead of '**x**' and '**p**'. The exponent shall always contain at least one  
 33800 digit, and only as many more digits as necessary to represent the decimal exponent of  
 33801 2. If the value is zero, the exponent shall be zero.

33802 A **double** argument representing an infinity or NaN shall be converted in the style of  
 33803 an **f** or **F** conversion specifier.

33804 **c** If no **l** (ell) qualifier is present, the **int** argument shall be converted to a wide character  
 33805 as if by calling the **btowc()** function and the resulting wide character shall be written.  
 33806 Otherwise, the **wint\_t** argument shall be converted to **wchar\_t**, and written.

33807 **s** If no **l** (ell) qualifier is present, the application shall ensure that the argument is a  
 33808 pointer to a character array containing a character sequence beginning in the initial  
 33809 shift state. Characters from the array shall be converted as if by repeated calls to the  
 33810 **mbrtowc()** function, with the conversion state described by an **mbstate\_t** object  
 33811 initialized to zero before the first character is converted, and written up to (but not  
 33812 including) the terminating null wide character. If the precision is specified, no more  
 33813 than that many wide characters shall be written. If the precision is not specified, or is  
 33814 greater than the size of the array, the application shall ensure that the array contains a  
 33815 null wide character.

33816 If an **l** (ell) qualifier is present, the application shall ensure that the argument is a  
 33817 pointer to an array of type **wchar\_t**. Wide characters from the array shall be written up  
 33818 to (but not including) a terminating null wide character. If no precision is specified, or  
 33819 is greater than the size of the array, the application shall ensure that the array contains a  
 33820 null wide character. If a precision is specified, no more than that many wide characters

|       |     |                                                                                                                         |
|-------|-----|-------------------------------------------------------------------------------------------------------------------------|
| 33821 |     | shall be written.                                                                                                       |
| 33822 | p   | The application shall ensure that the argument is a pointer to <b>void</b> . The value of the                           |
| 33823 |     | pointer shall be converted to a sequence of printable wide characters in an                                             |
| 33824 |     | implementation-defined manner.                                                                                          |
| 33825 | n   | The application shall ensure that the argument is a pointer to an integer into which is                                 |
| 33826 |     | written the number of wide characters written to the output so far by this call to one of                               |
| 33827 |     | the <i>fwprintf()</i> functions. No argument shall be converted, but one shall be consumed. If                          |
| 33828 |     | the conversion specification includes any flags, a field width, or a precision, the                                     |
| 33829 |     | behavior is undefined.                                                                                                  |
| 33830 | XSI | <b>C</b> Equivalent to <b>lc</b> .                                                                                      |
| 33831 | XSI | <b>S</b> Equivalent to <b>ls</b> .                                                                                      |
| 33832 | %   | Output a ' % ' wide character; no argument shall be converted. The entire conversion                                    |
| 33833 |     | specification shall be %%.                                                                                              |
| 33834 |     | If a conversion specification does not match one of the above forms, the behavior is undefined.                         |
| 33835 |     | In no case does a nonexistent or small field width cause truncation of a field; if the result of a                      |
| 33836 |     | conversion is wider than the field width, the field shall be expanded to contain the conversion                         |
| 33837 |     | result. Characters generated by <i>fwprintf()</i> and <i>wprintf()</i> shall be printed as if <i>fputwc()</i> had been  |
| 33838 |     | called.                                                                                                                 |
| 33839 |     | For a and A conversions, if FLT_RADIX is not a power of 2 and the result is not exactly                                 |
| 33840 |     | representable in the given precision, the result should be one of the two adjacent numbers in                           |
| 33841 |     | hexadecimal floating style with the given precision, with the extra stipulation that the error                          |
| 33842 |     | should have a correct sign for the current rounding direction.                                                          |
| 33843 |     | For e, E, f, F, g, and G conversion specifiers, if the number of significant decimal digits is at                       |
| 33844 |     | most DECIMAL_DIG, then the result should be correctly rounded. If the number of significant                             |
| 33845 |     | decimal digits is more than DECIMAL_DIG but the source value is exactly representable with                              |
| 33846 |     | DECIMAL_DIG digits, then the result should be an exact representation with trailing zeros.                              |
| 33847 |     | Otherwise, the source value is bounded by two adjacent decimal strings $L < U$ , both having                            |
| 33848 |     | DECIMAL_DIG significant digits; the value of the resultant decimal string $D$ should satisfy $L \leq$                   |
| 33849 |     | $D \leq U$ , with the extra stipulation that the error should have a correct sign for the current                       |
| 33850 |     | rounding direction.                                                                                                     |
| 33851 | CX  | The last data modification and last file status change timestamps of the file shall be marked for                       |
| 33852 |     | update between the call to a successful execution of <i>fwprintf()</i> or <i>wprintf()</i> and the next                 |
| 33853 |     | successful completion of a call to <i>fflush()</i> or <i>fclose()</i> on the same stream, or a call to <i>exit()</i> or |
| 33854 |     | <i>abort()</i> .                                                                                                        |
| 33855 |     | <b>RETURN VALUE</b>                                                                                                     |
| 33856 |     | Upon successful completion, these functions shall return the number of wide characters                                  |
| 33857 |     | transmitted, excluding the terminating null wide character in the case of <i>swprintf()</i> , or a negative             |
| 33858 | CX  | value if an output error was encountered, and set <i>errno</i> to indicate the error.                                   |
| 33859 |     | If <i>n</i> or more wide characters were requested to be written, <i>swprintf()</i> shall return a negative             |
| 33860 | CX  | value, and set <i>errno</i> to indicate the error.                                                                      |
| 33861 |     | <b>ERRORS</b>                                                                                                           |
| 33862 |     | For the conditions under which <i>fwprintf()</i> and <i>wprintf()</i> fail and may fail, refer to <i>fputwc()</i> .     |
| 33863 |     | In addition, all forms of <i>fwprintf()</i> shall fail if:                                                              |

33864 CX [EILSEQ] A wide-character code that does not correspond to a valid character has been  
33865 detected.

33866 In addition, *fwprintf()* and *wprintf()* may fail if: -

33867 CX [ENOMEM] Insufficient storage space is available.

33868 The *swprintf()* shall fail if:

33869 CX [EOVERFLOW] The value of *n* is greater than {INT\_MAX} or the number of bytes needed to  
33870 hold the output excluding the terminating null is greater than {INT\_MAX}.

### 33871 EXAMPLES

33872 To print the language-independent date and time format, the following statement could be used:

33873 `wprintf(format, weekday, month, day, hour, min);`

33874 For American usage, *format* could be a pointer to the wide-character string:

33875 `L"%s, %s %d, %d:%.2d\n"`

33876 producing the message:

33877 `Sunday, July 3, 10:02`

33878 whereas for German usage, *format* could be a pointer to the wide-character string:

33879 `L"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"`

33880 producing the message:

33881 `Sonntag, 3. Juli, 10:02`

### 33882 APPLICATION USAGE

33883 None.

### 33884 RATIONALE

33885 If an implementation detects that there are insufficient arguments for the format, it is  
33886 recommended that the function should fail and report an [EINVAL] error.

### 33887 FUTURE DIRECTIONS

33888 None.

### 33892 CHANGE HISTORY

33893 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
33894 (E).

### 33895 Issue 6

33896 The Open Group Corrigendum U040/1 is applied to the RETURN VALUE section, describing  
33897 the case if *n* or more wide characters are requested to be written using *swprintf()*.

33898 The normative text is updated to avoid use of the term “must” for application requirements.

33899 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 33900 • The prototypes for *fwprintf()*, *swprintf()*, and *wprintf()* are updated.

- 33901 • The DESCRIPTION is updated.
- 33902 • The hh, ll, j, t, and z length modifiers are added.
- 33903 • The a, A, and F conversion characters are added.
- 33904 • XSI shading is removed from the description of character string representations of infinity
- 33905 and NaN floating-point values.
- 33906 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion
- 33907 specification” consistently.
- 33908 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.
- 33909 **Issue 7**
- 33910 Austin Group Interpretation 1003.1-2001 #161 is applied, updating the DESCRIPTION of the 0
- 33911 flag.
- 33912 Austin Group Interpretation 1003.1-2001 #170 is applied.
- 33913 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #68 (SD5-XSH-ERN-70) is applied,
- 33914 revising the description of g and G.
- 33915 Functionality relating to the "%n\$" form of conversion specification and the <apostrophe> flag
- 33916 is moved from the XSI option to the Base.
- 33917 The [Eoverflow] error is added for *swprintf*().
- 33918 Changes are made related to support for finegrained timestamps.
- 33919 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0226 [302] and XSH/TC1-2008/0227
- 33920 [14] are applied.

33921 **NAME**

33922       fwrite — binary output

33923 **SYNOPSIS**

33924       #include &lt;stdio.h&gt;

```
33925       size_t fwrite(const void *restrict ptr, size_t size, size_t nitems,
33926                   FILE *restrict stream);
```

33927 **DESCRIPTION**

33928 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 33929       conflict between the requirements described here and the ISO C standard is unintentional. This  
 33930       volume of POSIX.1-2008 defers to the ISO C standard.

33931       The *fwrite()* function shall write, from the array pointed to by *ptr*, up to *nitems* elements whose  
 33932       size is specified by *size*, to the stream pointed to by *stream*. For each object, *size* calls shall be  
 33933       made to the *fputc()* function, taking the values (in order) from an array of **unsigned char** exactly  
 33934       overlying the object. The file-position indicator for the stream (if defined) shall be advanced by  
 33935       the number of bytes successfully written. If an error occurs, the resulting value of the file-  
 33936       position indicator for the stream is unspecified.

33937 CX       The last data modification and last file status change timestamps of the file shall be marked for  
 33938       update between the successful execution of *fwrite()* and the next successful completion of a call  
 33939       to *fflush()* or *fclose()* on the same stream, or a call to *exit()* or *abort()*.

33940 **RETURN VALUE**

33941       The *fwrite()* function shall return the number of elements successfully written, which may be  
 33942       less than *nitems* if a write error is encountered. If *size* or *nitems* is 0, *fwrite()* shall return 0 and the  
 33943       state of the stream remains unchanged. Otherwise, if a write error occurs, the error indicator for  
 33944       CX       the stream shall be set, and *errno* shall be set to indicate the error.

33945 **ERRORS**33946       Refer to *fputc()*.33947 **EXAMPLES**

33948       None.

33949 **APPLICATION USAGE**

33950       Because of possible differences in element length and byte ordering, files written using *fwrite()*  
 33951       are application-dependent, and possibly cannot be read using *fread()* by a different application  
 33952       or by the same application on a different processor.

33953 **RATIONALE**

33954       None.

33955 **FUTURE DIRECTIONS**

33956       None.

33957 **SEE ALSO**33958       Section 2.5 (on page 495), *ferror()*, *fopen()*, *fprintf()*, *putc()*, *puts()*, *write()*

33959       XBD &lt;stdio.h&gt;

33960 **CHANGE HISTORY**

33961       First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *fwrite()* prototype is updated.
- The DESCRIPTION is updated to clarify how the data is written out using *fputc()*.

**Issue 7**

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0228 [14] is applied.

## 33970 NAME

33971 fwscanf, swscanf, wscanf — convert formatted wide-character input

## 33972 SYNOPSIS

```

33973 #include <stdio.h>
33974 #include <wchar.h>

33975 int fwscanf(FILE *restrict stream, const wchar_t *restrict format, ...);
33976 int swscanf(const wchar_t *restrict ws,
33977             const wchar_t *restrict format, ...);
33978 int wscanf(const wchar_t *restrict format, ...);

```

## 33979 DESCRIPTION

33980 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 33981 conflict between the requirements described here and the ISO C standard is unintentional. This  
 33982 volume of POSIX.1-2008 defers to the ISO C standard.

33983 The *fwscanf()* function shall read from the named input *stream*. The *wscanf()* function shall read  
 33984 from the standard input stream *stdin*. The *swscanf()* function shall read from the wide-character  
 33985 string *ws*. Each function reads wide characters, interprets them according to a format, and stores  
 33986 the results in its arguments. Each expects, as arguments, a control wide-character string *format*  
 33987 described below, and a set of *pointer* arguments indicating where the converted input should be  
 33988 stored. The result is undefined if there are insufficient arguments for the format. If the *format* is  
 33989 exhausted while arguments remain, the excess arguments are evaluated but are otherwise  
 33990 ignored.

33991 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 33992 to the next unused argument. In this case, the conversion specifier wide character % (see below)  
 33993 is replaced by the sequence "%n\$", where *n* is a decimal integer in the range  
 33994 [1,{NL\_ARGMAX}]. This feature provides for the definition of *format* wide-character strings that  
 33995 select arguments in an order appropriate to specific languages. In *format* wide-character strings  
 33996 containing the "%n\$" form of conversion specifications, it is unspecified whether numbered  
 33997 arguments in the argument list can be referenced from the *format* wide-character string more  
 33998 than once.

33999 The *format* can contain either form of a conversion specification—that is, % or "%n\$" — but the  
 34000 two forms cannot normally be mixed within a single *format* wide-character string. The only  
 34001 exception to this is that %% or %\* can be mixed with the "%n\$" form. When numbered argument  
 34002 specifications are used, specifying the *N*th argument requires that all the leading arguments,  
 34003 from the first to the (*N*–1)th, are pointers.

34004 The *fwscanf()* function in all its forms allows for detection of a language-dependent radix  
 34005 character in the input string, encoded as a wide-character value. The radix character is defined  
 34006 in the current locale (category *LC\_NUMERIC*). In the POSIX locale, or in a locale where the  
 34007 radix character is not defined, the radix character shall default to a <period> ('.').

34008 The *format* is a wide-character string composed of zero or more directives. Each directive is  
 34009 composed of one of the following: one or more white-space wide characters (<space>, <tab>,  
 34010 <newline>, <vertical-tab>, or <form-feed>); an ordinary wide character (neither '%' nor a  
 34011 white-space character); or a conversion specification. It is unspecified whether an encoding  
 34012 error occurs if the format string contains **wchar\_t** values that do not correspond to members of  
 34013 the character set of the current locale and the specified semantics do not require that value to be  
 34014 processed by *wcrtomb()*.

34015 CX Each conversion specification is introduced by the '%' or by the character sequence "%n\$",  
 34016 after which the following appear in sequence:

|       |    |                                                                                                              |
|-------|----|--------------------------------------------------------------------------------------------------------------|
| 34017 |    | • An optional assignment-suppressing character ' * '.                                                        |
| 34018 |    | • An optional non-zero decimal integer that specifies the maximum field width.                               |
| 34019 | CX | • An optional assignment-allocation character ' m '.                                                         |
| 34020 |    | • An optional length modifier that specifies the size of the receiving object.                               |
| 34021 |    | • A conversion specifier wide character that specifies the type of conversion to be applied.                 |
| 34022 |    | The valid conversion specifiers are described below.                                                         |
| 34023 |    | The <i>fwscanf()</i> functions shall execute each directive of the format in turn. If a directive fails, as  |
| 34024 |    | detailed below, the function shall return. Failures are described as input failures (due to the              |
| 34025 |    | unavailability of input bytes) or matching failures (due to inappropriate input).                            |
| 34026 |    | A directive composed of one or more white-space wide characters is executed by reading input                 |
| 34027 |    | until no more valid input can be read, or up to the first wide character which is not a white-               |
| 34028 |    | space wide character, which remains unread.                                                                  |
| 34029 |    | A directive that is an ordinary wide character shall be executed as follows. The next wide                   |
| 34030 |    | character is read from the input and compared with the wide character that comprises the                     |
| 34031 |    | directive; if the comparison shows that they are not equivalent, the directive shall fail, and the           |
| 34032 |    | differing and subsequent wide characters remain unread. Similarly, if end-of-file, an encoding               |
| 34033 |    | error, or a read error prevents a wide character from being read, the directive shall fail.                  |
| 34034 |    | A directive that is a conversion specification defines a set of matching input sequences, as                 |
| 34035 |    | described below for each conversion wide character. A conversion specification is executed in                |
| 34036 |    | the following steps.                                                                                         |
| 34037 |    | Input white-space wide characters (as specified by <i>iswspace()</i> ) shall be skipped, unless the          |
| 34038 |    | conversion specification includes a [ , c, or n conversion specifier.                                        |
| 34039 |    | An item shall be read from the input, unless the conversion specification includes an n                      |
| 34040 |    | conversion specifier wide character. An input item is defined as the longest sequence of input               |
| 34041 |    | wide characters, not exceeding any specified field width, which is an initial subsequence of a               |
| 34042 |    | matching sequence. The first wide character, if any, after the input item shall remain unread. If            |
| 34043 |    | the length of the input item is zero, the execution of the conversion specification shall fail; this         |
| 34044 |    | condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented            |
| 34045 |    | input from the stream, in which case it is an input failure.                                                 |
| 34046 |    | Except in the case of a % conversion specifier, the input item (or, in the case of a %n conversion           |
| 34047 |    | specification, the count of input wide characters) shall be converted to a type appropriate to the           |
| 34048 |    | conversion wide character. If the input item is not a matching sequence, the execution of the                |
| 34049 |    | conversion specification shall fail; this condition is a matching failure. Unless assignment                 |
| 34050 |    | suppression was indicated by a ' * ', the result of the conversion shall be placed in the object             |
| 34051 |    | pointed to by the first argument following the <i>format</i> argument that has not already received a        |
| 34052 | CX | conversion result if the conversion specification is introduced by %, or in the <i>n</i> th argument if      |
| 34053 |    | introduced by the wide-character sequence "%n\$". If this object does not have an appropriate                |
| 34054 |    | type, or if the result of the conversion cannot be represented in the space provided, the behavior           |
| 34055 |    | is undefined.                                                                                                |
| 34056 | CX | The %c, %s, and %[ conversion specifiers shall accept an optional assignment-allocation                      |
| 34057 |    | character ' m ', which shall cause a memory buffer to be allocated to hold the wide-character                |
| 34058 |    | string converted including a terminating null wide character. In such a case, the argument                   |
| 34059 |    | corresponding to the conversion specifier should be a reference to a pointer value that will                 |
| 34060 |    | receive a pointer to the allocated buffer. The system shall allocate a buffer as if <i>malloc()</i> had been |
| 34061 |    | called. The application shall be responsible for freeing the memory after usage. If there is                 |
| 34062 |    | insufficient memory to allocate a buffer, the function shall set <i>errno</i> to [ENOMEM] and a              |

conversion error shall result. If the function returns EOF, any memory successfully allocated for parameters using assignment-allocation character 'm' by this call shall be freed before the function returns.

The length modifiers and their meanings are:

hh Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **signed char** or **unsigned char**.

h Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **short** or **unsigned short**.

l (ell) Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **long** or **unsigned long**; that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to **double**; or that a following c, s, or l conversion specifier applies to an argument with type pointer to **wchar\_t**. If the 'm' assignment-allocation character is specified, the conversion applies to an argument with the type pointer to a pointer to **wchar\_t**.

ll (ell-ell) Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **long long** or **unsigned long long**.

j Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **intmax\_t** or **uintmax\_t**.

z Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **size\_t** or the corresponding signed integer type.

t Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to **ptrdiff\_t** or the corresponding **unsigned** type.

L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to **long double**.

If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.

The following conversion specifier wide characters are valid:

d Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *wcstol()* with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

i Matches an optionally signed integer, whose format is the same as expected for the subject sequence of *wcstol()* with 0 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

o Matches an optionally signed octal integer, whose format is the same as expected for the subject sequence of *wcstoul()* with the value 8 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

u Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *wcstoul()* with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

| 34107 | x          | Matches an optionally signed hexadecimal integer, whose format is the same as expected for the subject sequence of <i>wcstoul()</i> with the value 16 for the <i>base</i> argument.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 34108 |            | In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to <b>unsigned</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 34109 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34110 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34111 | a, e, f, g | Matches an optionally signed floating-point number, infinity, or NaN whose format is the same as expected for the subject sequence of <i>wcstod()</i> . In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to <b>float</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 34112 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34113 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34114 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34115 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34116 |            | If the <i>fwprintf()</i> family of functions generates character string representations for infinity and NaN (a symbolic entity encoded in floating-point format) to support IEEE Std 754-1985, the <i>fwscanf()</i> family of functions shall recognize them as input.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 34117 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34118 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34119 | s          | Matches a sequence of non-white-space wide characters. If no 1 (ell) qualifier is present, characters from the input field shall be converted as if by repeated calls to the <i>wcrtomb()</i> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first wide character is converted. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to a character array large enough to accept the sequence and the terminating null character, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>wchar_t</b> .                                                             |
| 34120 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34121 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 34134 | [          | Matches a non-empty sequence of wide characters from a set of expected wide characters (the <i>scanset</i> ). If no 1 (ell) qualifier is present, wide characters from the input field shall be converted as if by repeated calls to the <i>wcrtomb()</i> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first wide character is converted. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to a character array large enough to accept the sequence and the terminating null character, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>wchar_t</b> . |

| 34148 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34149 |            | The conversion specification includes all subsequent wide characters in the <i>format</i> string up to and including the matching <right-square-bracket> (' <i>]</i> '). The wide characters between the square brackets (the <i>scanlist</i> ) comprise the scanset, unless the wide character after the <left-square-bracket> is a <circumflex> (' <i>^</i> '), in which case the scanset contains all wide characters that do not appear in the scanlist between the <circumflex> and the <right-square-bracket>. If the conversion specification begins                                                                                                                                                                                                                                             |
| 34150 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34151 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34152 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34153 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 34154 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|       |     |   |                                                                                                      |
|-------|-----|---|------------------------------------------------------------------------------------------------------|
| 34155 |     |   | with "[ ]" or "[ ^ ]", the <right-square-bracket> is included in the scanlist and the                |
| 34156 |     |   | next <right-square-bracket> is the matching <right-square-bracket> that ends the                     |
| 34157 |     |   | conversion specification; otherwise, the first <right-square-bracket> is the one that ends           |
| 34158 |     |   | the conversion specification. If a '-' is in the scanlist and is not the first wide character,       |
| 34159 |     |   | nor the second where the first wide character is a '^', nor the last wide character, the             |
| 34160 |     |   | behavior is implementation-defined.                                                                  |
| 34161 | c   |   | Matches a sequence of wide characters of exactly the number specified by the field                   |
| 34162 |     |   | width (1 if no field width is present in the conversion specification).                              |
| 34163 |     |   | If no l (ell) length modifier is present, characters from the input field shall be converted         |
| 34164 |     |   | as if by repeated calls to the <i>wcrtomb()</i> function, with the conversion state described by     |
| 34165 |     |   | an <b>mbstate_t</b> object initialized to zero before the first wide character is converted. No      |
| 34166 |     |   | null character is added. If the 'm' assignment-allocation character is not specified, the            |
| 34167 |     |   | application shall ensure that the corresponding argument is a pointer to the initial                 |
| 34168 | CX  |   | element of a character array large enough to accept the sequence. Otherwise, the                     |
| 34169 |     |   | application shall ensure that the corresponding argument is a pointer to a pointer to a              |
| 34170 |     |   | <b>char</b> .                                                                                        |
| 34171 |     |   | No null wide character is added. If an l (ell) length modifier is present and the 'm'                |
| 34172 |     |   | assignment-allocation character is not specified, the application shall ensure that the              |
| 34173 |     |   | corresponding argument shall be a pointer to the initial element of an array of <b>wchar_t</b>       |
| 34174 | CX  |   | large enough to accept the sequence. If an l (ell) qualifier is present and the 'm'                  |
| 34175 |     |   | assignment-allocation character is specified, the application shall ensure that the                  |
| 34176 |     |   | corresponding argument is a pointer to a pointer to a <b>wchar_t</b> .                               |
| 34177 | p   |   | Matches an implementation-defined set of sequences, which shall be the same as the set               |
| 34178 |     |   | of sequences that is produced by the %p conversion specification of the corresponding                |
| 34179 |     |   | <i>fwprintf()</i> functions. The application shall ensure that the corresponding argument is a       |
| 34180 |     |   | pointer to a pointer to <b>void</b> . The interpretation of the input item is implementation-        |
| 34181 |     |   | defined. If the input item is a value converted earlier during the same program                      |
| 34182 |     |   | execution, the pointer that results shall compare equal to that value; otherwise, the                |
| 34183 |     |   | behavior of the %p conversion is undefined.                                                          |
| 34184 | n   |   | No input is consumed. The application shall ensure that the corresponding argument is                |
| 34185 |     |   | a pointer to the integer into which is to be written the number of wide characters read              |
| 34186 |     |   | from the input so far by this call to the <i>fwscanf()</i> functions. Execution of a %n              |
| 34187 |     |   | conversion specification shall not increment the assignment count returned at the                    |
| 34188 |     |   | completion of execution of the function. No argument shall be converted, but one shall               |
| 34189 |     |   | be consumed. If the conversion specification includes an assignment-suppressing wide                 |
| 34190 |     |   | character or a field width, the behavior is undefined.                                               |
| 34191 | XSI | C | Equivalent to lc.                                                                                    |
| 34192 | XSI | S | Equivalent to ls.                                                                                    |
| 34193 | %   |   | Matches a single '%' wide character; no conversion or assignment shall occur. The                    |
| 34194 |     |   | complete conversion specification shall be %%.                                                       |
| 34195 |     |   | If a conversion specification is invalid, the behavior is undefined.                                 |
| 34196 |     |   | The conversion specifiers A, E, F, G, and X are also valid and shall be equivalent to, respectively, |
| 34197 |     |   | a, e, f, g, and x.                                                                                   |
| 34198 |     |   | If end-of-file is encountered during input, conversion is terminated. If end-of-file occurs before   |
| 34199 |     |   | any wide characters matching the current conversion specification (except for %n) have been          |
| 34200 |     |   | read (other than leading white-space, where permitted), execution of the current conversion          |

specification shall terminate with an input failure. Otherwise, unless execution of the current conversion specification is terminated with a matching failure, execution of the following conversion specification (if any) shall be terminated with an input failure.

Reaching the end of the string in *swscanf()* shall be equivalent to encountering end-of-file for *fwscanf()*.

If conversion terminates on a conflicting input, the offending input shall be left unread in the input. Any trailing white space (including <newline>) shall be left unread unless matched by a conversion specification. The success of literal matches and suppressed assignments is only directly determinable via the %n conversion specification.

The *fwscanf()* and *wscanf()* functions may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetwc()*, *fgetws()*, *fwscanf()*, *getwc()*, *getwchar()*, *vfwscanf()*, *vwscanf()*, or *wscanf()* using *stream* that returns data not supplied by a prior call to *ungetwc()*.

## RETURN VALUE

Upon successful completion, these functions shall return the number of successfully matched and assigned input items; this number can be zero in the event of an early matching failure. If the input ends before the first conversion (if any) has completed, and without a matching failure having occurred, EOF shall be returned. If an error occurs before the first conversion (if any) has completed, and without a matching failure having occurred, EOF shall be returned and *errno* shall be set to indicate the error. If a read error occurs, the error indicator for the stream shall be set.

## ERRORS

For the conditions under which the *fwscanf()* functions shall fail and may fail, refer to *fgetwc()*.

In addition, the *fwscanf()* function shall fail if:

[EILSEQ] Input byte sequence does not form a valid character.

[ENOMEM] Insufficient storage space is available.

In addition, the *fwscanf()* function may fail if:

[EINVAL] There are insufficient arguments.

## EXAMPLES

The call:

```
int i, n; float x; char name[50];
n = wscanf(L"%d%f%s", &i, &x, name);
```

with the input line:

```
25 54.32E-1 Hamster
```

assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string "Hamster".

The call:

```
int i; float x; char name[50];
(void) wscanf(L"%2d%f%d %[0123456789]", &i, &x, name);
```

with input:

```
56789 0123 56a72
```

assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to

34243 `getchar()` shall return the character 'a'.

#### 34244 APPLICATION USAGE

34245 In format strings containing the '%' form of conversion specifications, each argument in the  
34246 argument list is used exactly once.

34247 For functions that allocate memory as if by `malloc()`, the application should release such memory  
34248 when it is no longer required by a call to `free()`. For `fwscanf()`, this is memory allocated via use of  
34249 the 'm' assignment-allocation character.

#### 34250 RATIONALE

34251 None.

#### 34252 FUTURE DIRECTIONS

34253 None.

#### 34257 CHANGE HISTORY

34258 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
34259 (E).

#### 34260 Issue 6

34261 The normative text is updated to avoid use of the term “must” for application requirements.

34262 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 34263 • The prototypes for `fwscanf()` and `swscanf()` are updated.
- 34264 • The DESCRIPTION is updated.
- 34265 • The hh, ll, j, t, and z length modifiers are added.
- 34266 • The a, A, and F conversion characters are added.

34267 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion  
34268 specification” consistently.

#### 34269 Issue 7

34270 Austin Group Interpretation 1003.1-2001 #170 is applied.

34271 SD5-XSH-ERN-132 is applied, adding the assignment-allocation character 'm'.

34272 Functionality relating to the "%n\$" form of conversion specification is moved from the XSI  
34273 option to the Base.

34274 Changes are made related to support for finegrained timestamps.

34275 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by  
34276 `malloc()`.

34277 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0229 [302] and XSH/TC1-2008/0230  
34278 [14] are applied.

## NAME

gai\_strerror — address and name information error description

## SYNOPSIS

```
#include <netdb.h>
```

```
const char *gai_strerror(int ecode);
```

## DESCRIPTION

The *gai\_strerror()* function shall return a text string describing an error value for the *getaddrinfo()* and *getnameinfo()* functions listed in the **<netdb.h>** header.

When the *ecode* argument is one of the following values listed in the **<netdb.h>** header:

|                |                |
|----------------|----------------|
| [EAI_AGAIN]    | [EAI_NONAME]   |
| [EAI_BADFLAGS] | [EAI_OVERFLOW] |
| [EAI_FAIL]     | [EAI_SERVICE]  |
| [EAI_FAMILY]   | [EAI_SOCKTYPE] |
| [EAI_MEMORY]   | [EAI_SYSTEM]   |

the function return value shall point to a string describing the error. If the argument is not one of those values, the function shall return a pointer to a string whose contents indicate an unknown error.

## RETURN VALUE

Upon successful completion, *gai\_strerror()* shall return a pointer to an implementation-defined string.

## ERRORS

No errors are defined.

## EXAMPLES

None.

## APPLICATION USAGE

None.

## RATIONALE

None.

## FUTURE DIRECTIONS

None.

## SEE ALSO

*freeaddrinfo()*

XBD **<netdb.h>**

## CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The Open Group Base Resolution bwg2001-009 is applied, which changes the return type from **char \*** to **const char \***. This is for coordination with the IPnG Working Group.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/22 is applied, adding the [EAI\_OVERFLOW] error code.

34318 **NAME**

34319       getaddrinfo — get address information

34320 **SYNOPSIS**

34321       #include &lt;sys/socket.h&gt;

34322       #include &lt;netdb.h&gt;

34323       int getaddrinfo(const char \*restrict *nodename*,34324                      const char \*restrict *servname*,34325                      const struct addrinfo \*restrict *hints*,34326                      struct addrinfo \*\*restrict *res*);34327 **DESCRIPTION**34328       Refer to *freeaddrinfo()*.

34329 **NAME**

34330       getc — get a byte from a stream

34331 **SYNOPSIS**

34332       #include &lt;stdio.h&gt;

34333       int getc(FILE \*stream);

34334 **DESCRIPTION**

34335 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
34336 conflict between the requirements described here and the ISO C standard is unintentional. This  
34337 volume of POSIX.1-2008 defers to the ISO C standard.

34338       The *getc()* function shall be equivalent to *fgetc()*, except that if it is implemented as a macro it  
34339 may evaluate *stream* more than once, so the argument should never be an expression with side-  
34340 effects.

34341 **RETURN VALUE**34342       Refer to *fgetc()*.34343 **ERRORS**34344       Refer to *fgetc()*.34345 **EXAMPLES**

34346       None.

34347 **APPLICATION USAGE**

34348       If the integer value returned by *getc()* is stored into a variable of type **char** and then compared  
34349 against the integer constant EOF, the comparison may never succeed, because sign-extension of  
34350 a variable of type **char** on widening to integer is implementation-defined.

34351       Since it may be implemented as a macro, *getc()* may treat incorrectly a *stream* argument with  
34352 side-effects. In particular, *getc(\*f++)* does not necessarily work as expected. Therefore, use of this  
34353 function should be preceded by "#undef getc" in such situations; *fgetc()* could also be used.

34354 **RATIONALE**

34355       None.

34356 **FUTURE DIRECTIONS**

34357       None.

34358 **SEE ALSO**34359       Section 2.5 (on page 495), *fgetc()*

34360       XBD &lt;stdio.h&gt;

34361 **CHANGE HISTORY**

34362       First released in Issue 1. Derived from Issue 1 of the SVID.

34363 **Issue 7**

34364       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0231 [14] is applied.

34365 **NAME**

34366        `getc_unlocked`, `getchar_unlocked`, `putc_unlocked`, `putchar_unlocked` — stdio with explicit client  
 34367        locking

34368 **SYNOPSIS**

```
34369 CX      #include <stdio.h>
34370
34371      int getc_unlocked(FILE *stream);
34372      int getchar_unlocked(void);
34373      int putc_unlocked(int c, FILE *stream);
34374      int putchar_unlocked(int c);
```

34374 **DESCRIPTION**

34375        Versions of the functions `getc()`, `getchar()`, `putc()`, and `putchar()` respectively named  
 34376        `getc_unlocked()`, `getchar_unlocked()`, `putc_unlocked()`, and `putchar_unlocked()` shall be provided  
 34377        which are functionally equivalent to the original versions, with the exception that they are not  
 34378        required to be implemented in a fully thread-safe manner. They shall be thread-safe when used  
 34379        within a scope protected by `flockfile()` (or `ftrylockfile()`) and `funlockfile()`. These functions can  
 34380        safely be used in a multi-threaded program if and only if they are called while the invoking  
 34381        thread owns the (**FILE \***) object, as is the case after a successful call to the `flockfile()` or  
 34382        `ftrylockfile()` functions.

34383        If `getc_unlocked()` or `putc_unlocked()` are implemented as macros they may evaluate *stream* more  
 34384        than once, so the *stream* argument should never be an expression with side-effects.

34385 **RETURN VALUE**

34386        See `getc()`, `getchar()`, `putc()`, and `putchar()`.

34387 **ERRORS**

34388        See `getc()`, `getchar()`, `putc()`, and `putchar()`.

34389 **EXAMPLES**

34390        None.

34391 **APPLICATION USAGE**

34392        Since they may be implemented as macros, `getc_unlocked()` and `putc_unlocked()` may treat  
 34393        incorrectly a *stream* argument with side-effects. In particular, `getc_unlocked(*f++)` and  
 34394        `putc_unlocked(c,*f++)` do not necessarily work as expected. Therefore, use of these functions in  
 34395        such situations should be preceded by the following statement as appropriate:

```
34396      #undef getc_unlocked
34397      #undef putc_unlocked
```

34398 **RATIONALE**

34399        Some I/O functions are typically implemented as macros for performance reasons (for example,  
 34400        `putc()` and `getc()`). For safety, they need to be synchronized, but it is often too expensive to  
 34401        synchronize on every character. Nevertheless, it was felt that the safety concerns were more  
 34402        important; consequently, the `getc()`, `getchar()`, `putc()`, and `putchar()` functions are required to be  
 34403        thread-safe. However, unlocked versions are also provided with names that clearly indicate the  
 34404        unsafe nature of their operation but can be used to exploit their higher performance. These  
 34405        unlocked versions can be safely used only within explicitly locked program regions, using  
 34406        exported locking primitives. In particular, a sequence such as:

```
34407      flockfile(fileptr);
34408      putc_unlocked('l', fileptr);
34409      putc_unlocked('\n', fileptr);
34410      fprintf(fileptr, "Line 2\n");
```

34411        `funlockfile(fileptr);`  
 34412        is permissible, and results in the text sequence:  
 34413        1  
 34414        Line 2  
 34415        being printed without being interspersed with output from other threads.

34416        It would be wrong to have the standard names such as `getc()`, `putc()`, and so on, map to the  
 34417        “faster, but unsafe” rather than the “slower, but safe” versions. In either case, you would still  
 34418        want to inspect all uses of `getc()`, `putc()`, and so on, by hand when converting existing code.  
 34419        Choosing the safe bindings as the default, at least, results in correct code and maintains the  
 34420        “atomicity at the function” invariant. To do otherwise would introduce gratuitous  
 34421        synchronization errors into converted code. Other routines that modify the *stdio* (**FILE** \*)  
 34422        structures or buffers are also safely synchronized.

34423        Note that there is no need for functions of the form `getc_locked()`, `putc_locked()`, and so on, since  
 34424        this is the functionality of `getc()`, `putc()`, *et al.* It would be inappropriate to use a feature test  
 34425        macro to switch a macro definition of `getc()` between `getc_locked()` and `getc_unlocked()`, since the  
 34426        ISO C standard requires an actual function to exist, a function whose behavior could not be  
 34427        changed by the feature test macro. Also, providing both the `xxx_locked()` and `xxx_unlocked()`  
 34428        forms leads to the confusion of whether the suffix describes the behavior of the function or the  
 34429        circumstances under which it should be used.

34430        Three additional routines, `flockfile()`, `ftrylockfile()`, and `funlockfile()` (which may be macros), are  
 34431        provided to allow the user to delineate a sequence of I/O statements that are executed  
 34432        synchronously.

34433        The `ungetc()` function is infrequently called relative to the other functions/macros so no  
 34434        unlocked variation is needed.

34435        **FUTURE DIRECTIONS**  
 34436        None.

# getchar\_unlocked()

System Interfaces

## 34483 NAME

34484 getchar\_unlocked — stdio with explicit client locking

## 34485 SYNOPSIS

```
34486 CX #include <stdio.h>  
34487 int getchar_unlocked(void);
```

## 34488 DESCRIPTION

34489 Refer to *getc\_unlocked()*.

**NAME**

getcwd — get the pathname of the current working directory

**SYNOPSIS**

```
#include <unistd.h>
```

```
char *getcwd(char *buf, size_t size);
```

**DESCRIPTION**

The *getcwd()* function shall place an absolute pathname of the current working directory in the array pointed to by *buf*, and return *buf*. The pathname shall contain no components that are dot or dot-dot, or are symbolic links.

If there are multiple pathnames that *getcwd()* could place in the array pointed to by *buf*, one beginning with a single <slash> character and one or more beginning with two <slash> characters, then *getcwd()* shall place the pathname beginning with a single <slash> character in the array. The pathname shall not contain any unnecessary <slash> characters after the leading one or two <slash> characters.

The *size* argument is the size in bytes of the character array pointed to by the *buf* argument. If *buf* is a null pointer, the behavior of *getcwd()* is unspecified.

**RETURN VALUE**

Upon successful completion, *getcwd()* shall return the *buf* argument. Otherwise, *getcwd()* shall return a null pointer and set *errno* to indicate the error. The contents of the array pointed to by *buf* are then undefined.

**ERRORS**

The *getcwd()* function shall fail if:

[EINVAL] The *size* argument is 0.

[ERANGE] The *size* argument is greater than 0, but is smaller than the length of the string +1.

The *getcwd()* function may fail if:

[EACCES] Search permission was denied for the current directory, or read or search permission was denied for a directory above the current directory in the file hierarchy.

[ENOMEM] Insufficient storage space is available.

**EXAMPLES**

The following example uses {PATH\_MAX} as the initial buffer size (unless it is indeterminate or very large), and calls *getcwd()* with progressively larger buffers until it does not give an [ERANGE] error.

```
#include <stdlib.h>
#include <errno.h>
#include <unistd.h>
```

```
...
```

```
long path_max;
size_t size;
char *buf;
char *ptr;
```

```
path_max = pathconf(".", _PC_PATH_MAX);
if (path_max == -1)
```

```

34534         size = 1024;
34535     else if (path_max > 10240)
34536         size = 10240;
34537     else
34538         size = path_max;
34539     for (buf = ptr = NULL; ptr == NULL; size *= 2)
34540     {
34541         if ((buf = realloc(buf, size)) == NULL)
34542         {
34543             ... handle error ...
34544         }
34545         ptr = getcwd(buf, size);
34546         if (ptr == NULL && errno != ERANGE)
34547         {
34548             ... handle error ...
34549         }
34550     }
34551     ...
34552     free (buf);

```

#### APPLICATION USAGE

If the pathname obtained from *getcwd()* is longer than {PATH\_MAX} bytes, it could produce an [ENAMETOOLONG] error if passed to *chdir()*. Therefore, in order to return to that directory it may be necessary to break the pathname into sections shorter than {PATH\_MAX} bytes and call *chdir()* on each section in turn (the first section being an absolute pathname and subsequent sections being relative pathnames). A simpler way to handle saving and restoring the working directory when it may be deeper than {PATH\_MAX} bytes in the file hierarchy is to use a file descriptor and *fchdir()*, rather than *getcwd()* and *chdir()*. However, the two methods do have some differences. The *fchdir()* approach causes the program to restore a working directory even if it has been renamed in the meantime, whereas the *chdir()* approach restores to a directory with the same name as the original, even if the directories were renamed in the meantime. Since the *fchdir()* approach does not access parent directories, it can succeed when *getcwd()* would fail due to permissions problems. In applications conforming to earlier versions of this standard, it was not possible to use the *fchdir()* approach when the working directory is searchable but not readable, as the only way to open a directory was with O\_RDONLY, whereas the *getcwd()* approach can succeed in this case.

#### RATIONALE

Having *getcwd()* take no arguments and instead use the *malloc()* function to produce space for the returned argument was considered. The advantage is that *getcwd()* knows how big the working directory pathname is and can allocate an appropriate amount of space. But the programmer would have to use the *free()* function to free the resulting object, or each use of *getcwd()* would further reduce the available memory. Finally, *getcwd()* is taken from the SVID where it has the two arguments used in this volume of POSIX.1-2008.

The older function *getwd()* was rejected for use in this context because it had only a buffer argument and no *size* argument, and thus had no way to prevent overwriting the buffer, except to depend on the programmer to provide a large enough buffer.

On some implementations, if *buf* is a null pointer, *getcwd()* may obtain *size* bytes of memory using *malloc()*. In this case, the pointer returned by *getcwd()* may be used as the argument in a subsequent call to *free()*. Invoking *getcwd()* with *buf* as a null pointer is not recommended in conforming applications.

Earlier implementations of `getcwd()` sometimes generated pathnames like `"../../../../subdirname"` internally, using them to explore the path of ancestor directories back to the root. If one of these internal pathnames exceeded `{PATH_MAX}` in length, the implementation could fail with `errno` set to `[ENAMETOOLONG]`. This is no longer allowed.

If a program is operating in a directory where some (grand)parent directory does not permit reading, `getcwd()` may fail, as in most implementations it must read the directory to determine the name of the file. This can occur if search, but not read, permission is granted in an intermediate directory, or if the program is placed in that directory by some more privileged process (for example, login). Including the `[EACCES]` error condition makes the reporting of the error consistent and warns the application developer that `getcwd()` can fail for reasons beyond the control of the application developer or user. Some implementations can avoid this occurrence (for example, by implementing `getcwd()` using `pwd`, where `pwd` is a set-user-root process), thus the error was made optional. Since this volume of POSIX.1-2008 permits the addition of other errors, this would be a common addition and yet one that applications could not be expected to deal with without this addition.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

`malloc()`

XBD `<unistd.h>`

#### CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

#### Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The `[ENOMEM]` optional error condition is added.

#### Issue 7

Austin Group Interpretation 1003.1-2001 #140 is applied, changing the text for consistency with the `pwd` utility, adding text to address the case where the current directory is deeper in the file hierarchy than `{PATH_MAX}` bytes, and adding the requirements relating to pathnames beginning with two `<slash>` characters.

**NAME**

getdate — convert user format date and time

**SYNOPSIS**

```
XSI    #include <time.h>
      struct tm *getdate(const char *string);
```

**DESCRIPTION**

The *getdate()* function shall convert a string representation of a date or time into a broken-down time.

The external variable or macro *getdate\_err*, which has type **int**, is used by *getdate()* to return error values. It is unspecified whether *getdate\_err* is a macro or an identifier declared with external linkage, and whether or not it is a modifiable lvalue. If a macro definition is suppressed in order to access an actual object, or a program defines an identifier with the name *getdate\_err*, the behavior is undefined.

Templates are used to parse and interpret the input string. The templates are contained in a text file identified by the environment variable *DATMSK*. The *DATMSK* variable should be set to indicate the full pathname of the file that contains the templates. The first line in the template that matches the input specification is used for interpretation and conversion into the internal time format.

The following conversion specifications shall be supported:

|    |                                                                                                                                      |
|----|--------------------------------------------------------------------------------------------------------------------------------------|
| %% | Equivalent to %.                                                                                                                     |
| %a | Abbreviated weekday name.                                                                                                            |
| %A | Full weekday name.                                                                                                                   |
| %b | Abbreviated month name.                                                                                                              |
| %B | Full month name.                                                                                                                     |
| %c | Locale's appropriate date and time representation.                                                                                   |
| %C | Century number [00,99]; leading zeros are permitted but not required.                                                                |
| %d | Day of month [01,31]; the leading 0 is optional.                                                                                     |
| %D | Date as %m/%d/%y.                                                                                                                    |
| %e | Equivalent to %d.                                                                                                                    |
| %h | Abbreviated month name.                                                                                                              |
| %H | Hour [00,23].                                                                                                                        |
| %I | Hour [01,12].                                                                                                                        |
| %m | Month number [01,12].                                                                                                                |
| %M | Minute [00,59].                                                                                                                      |
| %n | Equivalent to <newline>.                                                                                                             |
| %p | Locale's equivalent of either AM or PM.                                                                                              |
| %r | The locale's appropriate representation of time in AM and PM notation. In the POSIX locale, this shall be equivalent to %I:%M:%S %p. |

|       |    |                                                                                                                                                                                                                                                                                                                                            |
|-------|----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 34652 | %R | Time as %H:%M.                                                                                                                                                                                                                                                                                                                             |
| 34653 | %S | Seconds [00,60]. The range goes to 60 (rather than stopping at 59) to allow positive leap seconds to be expressed. Since leap seconds cannot be predicted by any algorithm, leap second data must come from some external source.                                                                                                          |
| 34654 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34655 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34656 | %t | Equivalent to <tab>.                                                                                                                                                                                                                                                                                                                       |
| 34657 | %T | Time as %H:%M:%S.                                                                                                                                                                                                                                                                                                                          |
| 34658 | %w | Weekday number (Sunday = [0,6]).                                                                                                                                                                                                                                                                                                           |
| 34659 | %x | Locale's appropriate date representation.                                                                                                                                                                                                                                                                                                  |
| 34660 | %X | Locale's appropriate time representation.                                                                                                                                                                                                                                                                                                  |
| 34661 | %y | Year within century. When a century is not otherwise specified, values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.                                                                                                                      |
| 34662 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34663 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34664 |    | <b>Note:</b> It is expected that in a future version of this standard the default century inferred from a 2-digit year will change. (This would apply to all commands accepting a 2-digit year as input.)                                                                                                                                  |
| 34665 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34666 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34667 | %Y | Year as "ccyy" (for example, 2001).                                                                                                                                                                                                                                                                                                        |
| 34668 | %Z | Timezone name or no characters if no timezone exists. If the timezone supplied by %Z is not the timezone that <i>getdate()</i> expects, an invalid input specification error shall result. The <i>getdate()</i> function calculates an expected timezone based on information supplied to the function (such as the hour, day, and month). |
| 34669 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34670 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34671 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34672 |    | The match between the template and input specification performed by <i>getdate()</i> shall be case-insensitive.                                                                                                                                                                                                                            |
| 34673 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34674 |    | The month and weekday names can consist of any combination of upper and lowercase letters. The process can request that the input date or time specification be in a specific language by setting the <i>LC_TIME</i> category (see <i>setlocale()</i> ).                                                                                   |
| 34675 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34676 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34677 |    | Leading zeros are not necessary for the descriptors that allow leading zeros. However, at most two digits are allowed for those descriptors, including leading zeros. Extra white space in either the template file or in <i>string</i> shall be ignored.                                                                                  |
| 34678 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34679 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34680 |    | The results are undefined if the conversion specifications %c, %x, and %X include unsupported conversion specifications.                                                                                                                                                                                                                   |
| 34681 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34682 |    | The following rules apply for converting the input specification into the internal format:                                                                                                                                                                                                                                                 |
| 34683 |    | • If %Z is being scanned, then <i>getdate()</i> shall initialize the broken-down time to be the current time in the scanned timezone. Otherwise, it shall initialize the broken-down time based on the current local time as if <i>localtime()</i> had been called.                                                                        |
| 34684 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34685 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34686 |    | • If only the weekday is given, the day chosen shall be the day, starting with today and moving into the future, which first matches the named day.                                                                                                                                                                                        |
| 34687 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34688 |    | • If only the month (and no year) is given, the month chosen shall be the month, starting with the current month and moving into the future, which first matches the named month. The first day of the month shall be assumed if no day is given.                                                                                          |
| 34689 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34690 |    |                                                                                                                                                                                                                                                                                                                                            |
| 34691 |    | • If no hour, minute, and second are given, the current hour, minute, and second shall be assumed.                                                                                                                                                                                                                                         |
| 34692 |    |                                                                                                                                                                                                                                                                                                                                            |

- If no date is given, the hour chosen shall be the hour, starting with the current hour and moving into the future, which first matches the named hour.

If a conversion specification in the DATEMSK file does not correspond to one of the conversion specifications above, the behavior is unspecified.

The `getdate()` function need not be thread-safe.

## RETURN VALUE

Upon successful completion, `getdate()` shall return a pointer to a **struct tm**. Otherwise, it shall return a null pointer and set `getdate_err` to indicate the error.

## ERRORS

The `getdate()` function shall fail in the following cases, setting `getdate_err` to the value shown in the list below. Any changes to `errno` are unspecified.

1. The `DATEMSK` environment variable is null or undefined.
2. The template file cannot be opened for reading.
3. Failed to get file status information.
4. The template file is not a regular file.
5. An I/O error is encountered while reading the template file.
6. Memory allocation failed (not enough memory available).
7. There is no line in the template that matches the input.
8. Invalid input specification. For example, February 31; or a time is specified that cannot be represented in a **time\_t** (representing the time in seconds since the Epoch).

## EXAMPLES

1. The following example shows the possible contents of a template:
 

```
%m
%A %B %d, %Y, %H:%M:%S
%A
%B
%m/%d/%y %I %p
%d,%m,%Y %H:%M
at %A the %dst of %B in %Y
run job at %I %p,%B %dnd
%A den %d. %B %Y %H.%M Uhr
```
2. The following are examples of valid input specifications for the template in Example 1:

```
getdate("10/1/87 4 PM");
getdate("Friday");
getdate("Friday September 18, 1987, 10:30:30");
getdate("24,9,1986 10:30");
getdate("at monday the 1st of december in 1986");
getdate("run job at 3 PM, december 2nd");
```

If the `LC_TIME` category is set to a German locale that includes *freitag* as a weekday name and *oktober* as a month name, the following would be valid:

```
getdate("freitag den 10. oktober 1986 10.30 Uhr");
```

3. The following example shows how local date and time specification can be defined in the template:

| Invocation                 | Line in Template |
|----------------------------|------------------|
| getdate("11/27/86")        | %m/%d/%y         |
| getdate("27.11.86")        | %d.%m.%y         |
| getdate("86-11-27")        | %y-%m-%d         |
| getdate("Friday 12:00:00") | %A %H:%M:%S      |

4. The following examples help to illustrate the above rules assuming that the current date is Mon Sep 22 12:19:47 EDT 1986 and the *LC\_TIME* category is set to the default C or POSIX locale:

| Input        | Line in Template | Date                         |
|--------------|------------------|------------------------------|
| Mon          | %a               | Mon Sep 22 12:19:47 EDT 1986 |
| Sun          | %a               | Sun Sep 28 12:19:47 EDT 1986 |
| Fri          | %a               | Fri Sep 26 12:19:47 EDT 1986 |

## APPLICATION USAGE

Although historical versions of *getdate()* did not require that **<time.h>** declare the external variable *getdate\_err*, this volume of POSIX.1-2008 does require it. The standard developers encourage applications to remove declarations of *getdate\_err* and instead incorporate the declaration by including **<time.h>**.

Applications should use %Y (4-digit years) in preference to %y (2-digit years).

## RATIONALE

In standard locales, the conversion specifications %c, %x, and %X do not include unsupported conversion specifiers and so the text regarding results being undefined is not a problem in that case.

## FUTURE DIRECTIONS

None.

## SEE ALSO

*ctime()*, *localtime()*, *setlocale()*, *strftime()*, *times()*

XBD **<time.h>**

## CHANGE HISTORY

First released in Issue 4, Version 2.

**Issue 5**

- 34776 Moved from X/OPEN UNIX extension to BASE.
- 34777
- 34778 The last paragraph of the DESCRIPTION is added.
- 34779 The %C conversion specification is added, and the exact meaning of the %y conversion
- 34780 specification is clarified in the DESCRIPTION.
- 34781 A note indicating that this function need not be reentrant is added to the DESCRIPTION.
- 34782 The %R conversion specification is changed to follow historical practice.

**Issue 6**

- 34783 The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since
- 34784 00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time*
- 34785 functions.
- 34786
- 34787 The description of %S is updated so that the valid range is [00,60] rather than [00,61].
- 34788 The DESCRIPTION is updated to refer to conversion specifications instead of field descriptors
- 34789 for consistency with other functions.

**Issue 7**

- 34790 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 34791
- 34792 The description of the *getdate\_err* value is expanded.

**NAME**

getdelim, getline — read a delimited record from *stream*

**SYNOPSIS**

```
CX #include <stdio.h>

ssize_t getdelim(char **restrict lineptr, size_t *restrict n,
    int delimiter, FILE *restrict stream);
ssize_t getline(char **restrict lineptr, size_t *restrict n,
    FILE *restrict stream);
```

**DESCRIPTION**

The *getdelim()* function shall read from *stream* until it encounters a character matching the *delimiter* character. The *delimiter* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** of equal value that terminates the read process. If the *delimiter* argument has any other value, the behavior is undefined.

The application shall ensure that *\*lineptr* is a valid argument that could be passed to the *free()* function. If *\*n* is non-zero, the application shall ensure that *\*lineptr* either points to an object of size at least *\*n* bytes, or is a null pointer.

If *\*lineptr* is a null pointer or if the object pointed to by *\*lineptr* is of insufficient size, an object shall be allocated as if by *malloc()* or the object shall be reallocated as if by *realloc()*, respectively, such that the object is large enough to hold the characters to be written to it, including the terminating NUL, and *\*n* shall be set to the new size. If the object was allocated, or if the reallocation operation moved the object, *\*lineptr* shall be updated to point to the new object or new location. The characters read, including any delimiter, shall be stored in the object, and a terminating NUL added when the delimiter or end-of-file is encountered.

The *getline()* function shall be equivalent to the *getdelim()* function with the *delimiter* character equal to the <newline> character.

The *getdelim()* and *getline()* functions may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, or *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

**RETURN VALUE**

Upon successful completion, the *getline()* and *getdelim()* functions shall return the number of bytes written into the buffer, including the delimiter character if one was encountered before EOF, but excluding the terminating NUL character. If the end-of-file indicator for the stream is set, or if no characters were read and the stream is at end-of-file, the end-of-file indicator for the stream shall be set and the function shall return -1. If an error occurs, the error indicator for the stream shall be set, and the function shall return -1 and set *errno* to indicate the error.

**ERRORS**

For the conditions under which the *getdelim()* and *getline()* functions shall fail and may fail, refer to *fgetc()*.

In addition, these functions shall fail if:

[EINVAL] *lineptr* or *n* is a null pointer.

[ENOMEM] Insufficient memory is available.

These functions may fail if:

34836 [EOVERFLOW] The number of bytes to be written into the buffer, including the delimiter |  
34837 character (if encountered), would exceed {SSIZE\_MAX}.

## 34838 EXAMPLES

```
34839 #include <stdio.h>
34840 #include <stdlib.h>
34841 int main(void)
34842 {
34843     FILE *fp;
34844     char *line = NULL;
34845     size_t len = 0;
34846     ssize_t read;
34847     fp = fopen("/etc/motd", "r");
34848     if (fp == NULL)
34849         exit(1);
34850     while ((read = getline(&line, &len, fp)) != -1) {
34851         printf("Retrieved line of length %zu :\\n", read);
34852         printf("%s", line);
34853     }
34854     if (ferror(fp)) {
34855         /* handle error */
34856     }
34857     free(line);
34858     fclose(fp);
34859     return 0;
34860 }
```

## 34861 APPLICATION USAGE

34862 Setting *\*lineptr* to a null pointer and *\*n* to zero are allowed and a recommended way to start  
34863 parsing a file.

34864 The *ferror()* or *feof()* functions should be used to distinguish between an error condition and an  
34865 end-of-file condition.

34866 Although a NUL terminator is always supplied after the line, note that *strlen(\*lineptr)* will be  
34867 smaller than the return value if the line contains embedded NUL characters.

## 34868 RATIONALE

34869 These functions are widely used to solve the problem that the *fgets()* function has with long  
34870 lines. The functions automatically enlarge the target buffers if needed. These are especially  
34871 useful since they reduce code needed for applications.

## 34872 FUTURE DIRECTIONS

34873 None.

## 34877 CHANGE HISTORY

34878 First released in Issue 7.

34879 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0237 [14] is applied.

34880 **NAME**

34881       getegid — get the effective group ID

34882 **SYNOPSIS**

34883       #include &lt;unistd.h&gt;

34884       gid\_t getegid(void);

34885 **DESCRIPTION**

34886       The *getegid()* function shall return the effective group ID of the calling process. The *getegid()* +  
 34887       function shall not modify *errno*.

34888 **RETURN VALUE**

34889       The *getegid()* function shall always be successful and no return value is reserved to indicate an  
 34890       error.

34891 **ERRORS**

34892       No errors are defined.

34893 **EXAMPLES**

34894       None.

34895 **APPLICATION USAGE**

34896       None.

34897 **RATIONALE**

34898       In a conforming environment, *getegid()* will always succeed. It is possible for implementations to |  
 34899       provide an extension where a process in a non-conforming environment will not be associated |  
 34900       with a user or group ID. It is recommended that such implementations return (**gid\_t**)–1 and set |  
 34901       *errno* to indicate such an environment; doing so does not violate this standard, since such an |  
 34902       environment is already an extension.

34903 **FUTURE DIRECTIONS**

34904       None.

34905 **SEE ALSO**34906       *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setregid()*, *setreuid()*, *setuid()*

34907       XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

34908 **CHANGE HISTORY**

34909       First released in Issue 1. Derived from Issue 1 of the SVID.

34910 **Issue 6**

34911       In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

34912       The following new requirements on POSIX implementations derive from alignment with the  
 34913       Single UNIX Specification:

- 34914       • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
 34915       required for conforming implementations of previous POSIX specifications, it was not  
 34916       required for UNIX applications.

34917 **NAME**

34918        getenv — get value of an environment variable

34919 **SYNOPSIS**

34920        #include &lt;stdlib.h&gt;

34921        char \*getenv(const char \*name);

34922 **DESCRIPTION**

34923 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
 34924        conflict between the requirements described here and the ISO C standard is unintentional. This  
 34925        volume of POSIX.1-2008 defers to the ISO C standard.

34926        The *getenv()* function shall search the environment of the calling process (see XBD Chapter 8, on  
 34927        page 173) for the environment variable *name* if it exists and return a pointer to the value of the  
 34928        environment variable. If the specified environment variable cannot be found, a null pointer shall  
 34929        be returned. The application shall ensure that it does not modify the string pointed to by the  
 34930        *getenv()* function.

34931 CX        The returned string pointer might be invalidated or the string content might be overwritten by a  
 34932 CX        subsequent call to *getenv()*, *setenv()*, *unsetenv()*,  
 34933 XSI        or (if supported) *putenv()* but they shall not be affected by a call to any other function in this  
 34934        volume of POSIX.1-2008.

34935 CX        The returned string pointer might also be invalidated if the calling thread is terminated. +

34936 CX        The *getenv()* function need not be thread-safe.

34937 **RETURN VALUE**

34938        Upon successful completion, *getenv()* shall return a pointer to a string containing the *value* for  
 34939        the specified *name*. If the specified *name* cannot be found in the environment of the calling  
 34940        process, a null pointer shall be returned.

34941 **ERRORS**

34942        No errors are defined.

34943 **EXAMPLES**34944        **Getting the Value of an Environment Variable**34945        The following example gets the value of the *HOME* environment variable.

34946        #include &lt;stdlib.h&gt;

34947        ...

34948        const char \*name = "HOME";

34949        char \*value;

34950        value = getenv(name);

34951 **APPLICATION USAGE**

34952        None.

34953 **RATIONALE**

34954        The *clearenv()* function was considered but rejected. The *putenv()* function has now been  
 34955        included for alignment with the Single UNIX Specification.

34956        The *getenv()* function is inherently not thread-safe because it returns a value pointing to static  
 34957        data.

34958        Conforming applications are required not to directly modify the pointers to which *environ*  
 34959        points, but to use only the *setenv()*, *unsetenv()*, and *putenv()* functions, or assignment to *environ*

itself, to manipulate the process environment. This constraint allows the implementation to properly manage the memory it allocates. This enables the implementation to free any space it has allocated to strings (and perhaps the pointers to them) stored in *environ* when *unsetenv()* is called. A C runtime start-up procedure (that which invokes *main()* and perhaps initializes *environ*) can also initialize a flag indicating that none of the environment has yet been copied to allocated storage, or that the separate table has not yet been initialized. If the application switches to a complete new environment by assigning a new value to *environ*, this can be detected by *getenv()*, *setenv()*, *unsetenv()*, or *putenv()* and the implementation can at that point reinitialize based on the new environment. (This may include copying the environment strings into a new array and assigning *environ* to point to it.)

In fact, for higher performance of *getenv()*, implementations that do not provide *putenv()* could also maintain a separate copy of the environment in a data structure that could be searched much more quickly (such as an indexed hash table, or a binary tree), and update both it and the linear list at *environ* when *setenv()* or *unsetenv()* is invoked. On implementations that do provide *putenv()*, such a copy might still be worthwhile but would need to allow for the fact that applications can directly modify the content of environment strings added with *putenv()*. For example, if an environment string found by searching the copy is one that was added using *putenv()*, the implementation would need to check that the string in *environ* still has the same name (and value, if the copy includes values), and whenever searching the copy produces no match the implementation would then need to search each environment string in *environ* that was added using *putenv()* in case any of them have changed their names and now match. Thus, each use of *putenv()* to add to the environment would reduce the speed advantage of having the copy.

Performance of *getenv()* can be important for applications which have large numbers of environment variables. Typically, applications like this use the environment as a resource database of user-configurable parameters. The fact that these variables are in the user's shell environment usually means that any other program that uses environment variables (such as *ls*, which attempts to use *COLUMNS*), or really almost any utility (*LANG*, *LC\_ALL*, and so on) is similarly slowed down by the linear search through the variables.

An implementation that maintains separate data structures, or even one that manages the memory it consumes, is not currently required as it was thought it would reduce consensus among implementors who do not want to change their historical implementations.

#### FUTURE DIRECTIONS

A future version may add one or more functions to access and modify the environment in a thread-safe manner.

#### SEE ALSO

*exec*, *putenv()*, *setenv()*, *unsetenv()*

XBD Chapter 8 (on page 173), *<stdlib.h>*

#### CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

#### Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

35004 **Issue 6**

35005 The following changes were made to align with the IEEE P1003.1a draft standard:

- 35006
  - References added to the new *setenv()* and *unsetenv()* functions.

35007 The normative text is updated to avoid use of the term “must” for application requirements.

35008 **Issue 7**

35009 Austin Group Interpretation 1003.1-2001 #062 is applied, clarifying that a call to *putenv()* may  
35010 also cause the string to be overwritten.

35011 Austin Group Interpretation 1003.1-2001 #148 is applied, adding the FUTURE DIRECTIONS.

35012 Austin Group Interpretation 1003.1-2001 #156 is applied.

35013 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0238 [75,428], XSH/TC1-2008/0239  
35014 [167], and XSH/TC1-2008/0240 [167] are applied.

**35015 NAME**

35016       geteuid — get the effective user ID

**35017 SYNOPSIS**

35018       #include <unistd.h>

35019       uid\_t geteuid(void);

**35020 DESCRIPTION**

35021       The *geteuid()* function shall return the effective user ID of the calling process. The *geteuid()* +  
35022       function shall not modify *errno*.

**35023 RETURN VALUE**

35024       The *geteuid()* function shall always be successful and no return value is reserved to indicate an  
35025       error.

**35026 ERRORS**

35027       No errors are defined.

**35028 EXAMPLES**

35029       None.

**35030 APPLICATION USAGE**

35031       None.

**35032 RATIONALE**

35033       In a conforming environment, *geteuid()* will always succeed. It is possible for implementations |  
35034       to provide an extension where a process in a non-conforming environment will not be associated |  
35035       with a user or group ID. It is recommended that such implementations return (**uid\_t**)–1 and set |  
35036       *errno* to indicate such an environment; doing so does not violate this standard, since such an |  
35037       environment is already an extension.

**35038 FUTURE DIRECTIONS**

35039       None.

**35043 CHANGE HISTORY**

35044       First released in Issue 1. Derived from Issue 1 of the SVID.

**35045 Issue 6**

35046       In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

35047       The following new requirements on POSIX implementations derive from alignment with the  
35048       Single UNIX Specification:

- 35049       • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
35050       required for conforming implementations of previous POSIX specifications, it was not  
35051       required for UNIX applications.

**NAME**

getgid — get the real group ID

**SYNOPSIS**

```
#include <unistd.h>
```

```
gid_t getgid(void);
```

**DESCRIPTION**

The *getgid()* function shall return the real group ID of the calling process. The *getgid()* function shall not modify *errno*.

**RETURN VALUE**

The *getgid()* function shall always be successful and no return value is reserved to indicate an error.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

In a conforming environment, *getgid()* will always succeed. It is possible for implementations to provide an extension where a process in a non-conforming environment will not be associated with a user or group ID. It is recommended that such implementations return (**gid\_t**)–1 and set *errno* to indicate such an environment; doing so does not violate this standard, since such an environment is already an extension.

**FUTURE DIRECTIONS**

None.

XBD [\*\*<sys/types.h>\*\*](#), [\*\*<unistd.h>\*\*](#)

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

35089 **NAME**

35090       getgrent — get the group database entry

35091 **SYNOPSIS**

```
35092 XSI      #include <grp.h>
35093          struct group *getgrent(void);
```

35094 **DESCRIPTION**35095       Refer to *endgrent()*.

**NAME**

getgrgid, getgrgid\_r — get group database entry for a group ID

**SYNOPSIS**

```
#include <grp.h>

struct group *getgrgid(gid_t gid);
int getgrgid_r(gid_t gid, struct group *grp, char *buffer,
               size_t bufsz, struct group **result);
```

**DESCRIPTION**

The *getgrgid()* function shall search the group database for an entry with a matching *gid*.

The *getgrgid()* function need not be thread-safe.

Applications wishing to check for error situations should set *errno* to 0 before calling *getgrgid()*.  
If *getgrgid()* returns a null pointer and *errno* is set to non-zero, an error occurred.

The *getgrgid\_r()* function shall update the **group** structure pointed to by *grp* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the group database with a matching *gid*. Storage referenced by the group structure is allocated from the memory provided with the *buffer* parameter, which is *bufsz* bytes in size. A call to *sysconf(\_SC\_GETGR\_R\_SIZE\_MAX)* returns either -1 without changing *errno* or an initial value suggested for the size of this buffer. A null pointer shall be returned at the location pointed to by *result* on error or if the requested entry is not found.

**RETURN VALUE**

Upon successful completion, *getgrgid()* shall return a pointer to a **struct group** with the structure defined in **<grp.h>** with a matching entry if one is found. The *getgrgid()* function shall return a null pointer if either the requested entry was not found, or an error occurred. If the requested entry was not found, *errno* shall not be changed. On error, *errno* shall be set to indicate the error.

The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *getgrent()*, *getgrgid()*, or *getgrnam()*. The returned pointer, and pointers within the structure, might also be invalidated if the calling thread is terminated.

If successful, the *getgrgid\_r()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The *getgrgid()* and *getgrgid\_r()* functions may fail if:

- [EIO] An I/O error has occurred.
- [EINTR] A signal was caught during *getgrgid()*.
- [EMFILE] All file descriptors available to the process are currently open.
- [ENFILE] The maximum allowable number of files is currently open in the system.

The *getgrgid\_r()* function may fail if:

- [ERANGE] Insufficient storage was supplied via *buffer* and *bufsz* to contain the data to be referenced by the resulting **group** structure.

**EXAMPLES**

Note that `sysconf(_SC_GETGR_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with `getgrgid_r()`.

```

long int initlen = sysconf(_SC_GETGR_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct group result;
struct group *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getgrgid_r(42, &result, buffer, len, &resultp)) == ERANGE)
{
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
}
if (e != 0)
    ...handle error...
free (buffer);

```

**Finding an Entry in the Group Database**

The following example uses `getgrgid()` to search the group database for a group ID that was previously stored in a `stat` structure, then prints out the group name if it is found. If the group is not found, the program prints the numeric value of the group for the entry.

```

#include <sys/types.h>
#include <grp.h>
#include <stdio.h>
...
struct stat statbuf;
struct group *grp;
...
if ((grp = getgrgid(statbuf.st_gid)) != NULL)
    printf(" %-8s", grp->gr_name);
else
    printf(" %-8d", statbuf.st_gid);
...

```

**APPLICATION USAGE**

The *getgrgid\_r()* function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return -1 from *sysconf()* indicating that there is no maximum for *\_SC\_GETGR\_R\_SIZE\_MAX*.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*endgrent()*, *getgrnam()*, *sysconf()*

**CHANGE HISTORY**

First released in Issue 1. Derived from System V Release 2.0.

**Issue 5**

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getgrgid\_r()* function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getgrgid()* function need not be reentrant is added to the DESCRIPTION.

**Issue 6**

The *getgrgid\_r()* function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the *gid*.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

In the SYNOPSIS, the optional include of the *<sys/types.h>* header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include *<sys/types.h>* has been removed. Although *<sys/types.h>* was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-166 is applied.

- 35224 The `getgrgid_r()` function is moved from the Thread-Safe Functions option to the Base.
- 35225 A minor addition is made to the EXAMPLES section, reminding the application developer to
- 35226 free memory allocated as if by `malloc()`.
- 35227 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0241 [75] is applied.

**NAME**

getgrnam, getgrnam\_r — search group database for a name

**SYNOPSIS**

```
#include <grp.h>

struct group *getgrnam(const char *name);
int getgrnam_r(const char *name, struct group *grp, char *buffer,
               size_t bufsize, struct group **result);
```

**DESCRIPTION**

The *getgrnam()* function shall search the group database for an entry with a matching *name*.

The *getgrnam()* function need not be thread-safe.

Applications wishing to check for error situations should set *errno* to 0 before calling *getgrnam()*.  
If *getgrnam()* returns a null pointer and *errno* is set to non-zero, an error occurred.

The *getgrnam\_r()* function shall update the **group** structure pointed to by *grp* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the group database with a matching *name*. Storage referenced by the **group** structure is allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to *sysconf(\_SC\_GETGR\_R\_SIZE\_MAX)* returns either -1 without changing *errno* or an initial value suggested for the size of this buffer. A null pointer is returned at the location pointed to by *result* on error or if the requested entry is not found.

**RETURN VALUE**

The *getgrnam()* function shall return a pointer to a **struct group** with the structure defined in **<grp.h>** with a matching entry if one is found. The *getgrnam()* function shall return a null pointer if either the requested entry was not found, or an error occurred. On error, *errno* shall be set to indicate the error.

The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *getgrent()*, *getgrgid()*, or *getgrnam()*. The returned pointer, and pointers within the structure, might also be invalidated if the calling thread is terminated.

The *getgrnam\_r()* function shall return zero on success or if the requested entry was not found and no error has occurred. If any error has occurred, an error number shall be returned to indicate the error.

**ERRORS**

The *getgrnam()* and *getgrnam\_r()* functions may fail if:

- [EIO] An I/O error has occurred.
- [EINTR] A signal was caught during *getgrnam()*.
- [EMFILE] All file descriptors available to the process are currently open.
- [ENFILE] The maximum allowable number of files is currently open in the system.

The *getgrnam\_r()* function may fail if:

- [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be referenced by the resulting **group** structure.

**EXAMPLES**

Note that `sysconf(_SC_GETGR_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with `getgrnam_r()`.

```

long int initlen = sysconf(_SC_GETGR_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct group result;
struct group *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getgrnam_r("somegroup", &result, buffer, len, &resultp))
    == ERANGE)
{
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
}
if (e != 0)
    ...handle error...
free (buffer);

```

**APPLICATION USAGE**

The `getgrnam_r()` function is thread-safe and shall return values in a user-supplied buffer instead - of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return `-1` from `sysconf()` indicating that there is no maximum for `_SC_GETGR_R_SIZE_MAX`.

**RATIONALE**

None.

**CHANGE HISTORY**

First released in Issue 1. Derived from System V Release 2.0.

**Issue 5**

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The `getgrnam_r()` function is included for alignment with the POSIX Threads Extension.

A note indicating that the `getgrnam()` function need not be reentrant is added to the DESCRIPTION.

**Issue 6**

The `getgrnam_r()` function is marked as part of the Thread-Safe Functions option.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set `errno` on error is added.
- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #081 is applied, clarifying the RETURN VALUE section.

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-166 is applied.

The `getgrnam_r()` function is moved from the Thread-Safe Functions option to the Base.

A minor addition is made to the EXAMPLES section, reminding the application developer to free memory allocated as if by `malloc()`.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0242 [75] is applied.

35345 **NAME**35346 `getgroups` — get supplementary group IDs35347 **SYNOPSIS**35348 `#include <unistd.h>`35349 `int getgroups(int gidsetsize, gid_t grouplist[]);`35350 **DESCRIPTION**

35351 The `getgroups()` function shall fill in the array `grouplist` with the current supplementary group  
 35352 IDs of the calling process. It is implementation-defined whether `getgroups()` also returns the  
 35353 effective group ID in the `grouplist` array.

35354 The `gidsetsize` argument specifies the number of elements in the array `grouplist`. The actual  
 35355 number of group IDs stored in the array shall be returned. The values of array entries with  
 35356 indices greater than or equal to the value returned are undefined.

35357 If `gidsetsize` is 0, `getgroups()` shall return the number of group IDs that it would otherwise return  
 35358 without modifying the array pointed to by `grouplist`.

35359 If the effective group ID of the process is returned with the supplementary group IDs, the value  
 35360 returned shall always be greater than or equal to one and less than or equal to the value of  
 35361 `{NGROUPS_MAX}+1`.

35362 **RETURN VALUE**

35363 Upon successful completion, the number of supplementary group IDs shall be returned. A  
 35364 return value of `-1` indicates failure and `errno` shall be set to indicate the error.

35365 **ERRORS**35366 The `getgroups()` function shall fail if:

35367 `[EINVAL]` The `gidsetsize` argument is non-zero and less than the number of group IDs  
 35368 that would have been returned.

35369 **EXAMPLES**35370 **Getting the Supplementary Group IDs of the Calling Process**

35371 The following example places the current supplementary group IDs of the calling process into  
 35372 the `group` array.

35373 `#include <sys/types.h>`35374 `#include <unistd.h>`35375 `...`35376 `gid_t *group;`35377 `int nogroups;`35378 `long ngroups_max;`35379 `ngroups_max = sysconf(_SC_NGROUPS_MAX) + 1;`35380 `group = (gid_t *)malloc(ngroups_max * sizeof(gid_t));`35381 `ngroups = getgroups(ngroups_max, group);`35382 **APPLICATION USAGE**

35383 None.

35384 **RATIONALE**

35385 The related function `setgroups()` is a privileged operation and therefore is not covered by this  
 35386 volume of POSIX.1-2008.

35387 As implied by the definition of supplementary groups, the effective group ID may appear in the

array returned by *getgroups()* or it may be returned only by *getegid()*. Duplication may exist, but the application needs to call *getegid()* to be sure of getting all of the information. Various implementation variations and administrative sequences cause the set of groups appearing in the result of *getgroups()* to vary in order and as to whether the effective group ID is included, even when the set of groups is the same (in the mathematical sense of “set”). (The history of a process and its parents could affect the details of the result.)

Application developers should note that {NGROUPS\_MAX} is not necessarily a constant on all implementations.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

*getegid()*, *setgid()*

XBD <sys/types.h>, <unistd.h>

#### CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

##### Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

##### Issue 6

In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- A return value of 0 is not permitted, because {NGROUPS\_MAX} cannot be 0. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

- An explanation is added that the effective group ID may be included in the supplementary group list.

35418 **NAME**

35419       gethostent — network host database functions

35420 **SYNOPSIS**

35421       #include &lt;netdb.h&gt;

35422       struct hostent \*gethostent(void);

35423 **DESCRIPTION**35424       Refer to *endhostent()*.

35425 **NAME**

35426       gethostid — get an identifier for the current host

35427 **SYNOPSIS**

```
35428 XSI      #include <unistd.h>
35429          long gethostid(void);
```

35430 **DESCRIPTION**35431       The *gethostid()* function shall retrieve a 32-bit identifier for the current host.35432 **RETURN VALUE**35433       Upon successful completion, *gethostid()* shall return an identifier for the current host.35434 **ERRORS**

35435       No errors are defined.

35436 **EXAMPLES**

35437       None.

35438 **APPLICATION USAGE**

35439       This volume of POSIX.1-2008 does not define the domain in which the return value is unique.

35440 **RATIONALE**

35441       None.

35442 **FUTURE DIRECTIONS**

35443       None.

35449 **Issue 5**

35450       Moved from X/OPEN UNIX extension to BASE.

35451 **NAME**

35452       gethostname — get name of current host

35453 **SYNOPSIS**

35454       #include &lt;unistd.h&gt;

35455       int gethostname(char \*name, size\_t namelen);

35456 **DESCRIPTION**

35457       The *gethostname()* function shall return the standard host name for the current machine. The  
35458       *namelen* argument shall specify the size of the array pointed to by the *name* argument. The  
35459       returned name shall be null-terminated, except that if *namelen* is an insufficient length to hold  
35460       the host name, then the returned name shall be truncated and it is unspecified whether the  
35461       returned name is null-terminated.

35462       Host names are limited to {HOST\_NAME\_MAX} bytes.

35463 **RETURN VALUE**

35464       Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned.

35465 **ERRORS**

35466       No errors are defined.

35467 **EXAMPLES**

35468       None.

35469 **APPLICATION USAGE**

35470       None.

35471 **RATIONALE**

35472       None.

35475 **SEE ALSO**35476       *gethostid()*, *uname()*

35477       XBD &lt;unistd.h&gt;

35478 **CHANGE HISTORY**

35479       First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

35480       The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter from  
35481       *socklen\_t* to *size\_t*.

**NAME**

gettimer, setitimer — get and set value of interval timer

**SYNOPSIS**

OB XSI `#include <sys/time.h>`

```
int getitimer(int which, struct itimerval *value);
int setitimer(int which, const struct itimerval *restrict value,
              struct itimerval *restrict ovalue);
```

**DESCRIPTION**

The *getitimer()* function shall store the current value of the timer specified by *which* into the structure pointed to by *value*. The *setitimer()* function shall set the timer specified by *which* to the value specified in the structure pointed to by *value*, and if *ovalue* is not a null pointer, store the previous value of the timer in the structure pointed to by *ovalue*.

A timer value is defined by the **itimerval** structure, specified in **<sys/time.h>**. If *it\_value* is non-zero, it shall indicate the time to the next timer expiration. If *it\_interval* is non-zero, it shall specify a value to be used in reloading *it\_value* when the timer expires. Setting *it\_value* to 0 shall disable a timer, regardless of the value of *it\_interval*. Setting *it\_interval* to 0 shall disable a timer after its next expiration (assuming *it\_value* is non-zero).

Implementations may place limitations on the granularity of timer values. For each interval timer, if the requested timer value requires a finer granularity than the implementation supports, the actual timer value shall be rounded up to the next supported value.

An XSI-conforming implementation provides each process with at least three interval timers, which are indicated by the *which* argument:

|                |                                                                                                                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ITIMER_PROF    | Decrements both in process virtual time and when the system is running on behalf of the process. It is designed to be used by interpreters in statistically profiling the execution of interpreted programs. Each time the ITIMER_PROF timer expires, the SIGPROF signal is delivered. |
| ITIMER_REAL    | Decrements in real time. A SIGALRM signal is delivered when this timer expires.                                                                                                                                                                                                        |
| ITIMER_VIRTUAL | Decrements in process virtual time. It runs only when the process is executing. A SIGVTALRM signal is delivered when it expires.                                                                                                                                                       |

The interaction between *setitimer()* and *alarm()* or *sleep()* is unspecified.

**RETURN VALUE**

Upon successful completion, *getitimer()* or *setitimer()* shall return 0; otherwise,  $-1$  shall be returned and *errno* set to indicate the error.

**ERRORS**

The *setitimer()* function shall fail if:

|          |                                                                                                                                                                                                        |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [EINVAL] | The <i>value</i> argument is not in canonical form. (In canonical form, the number of microseconds is a non-negative integer less than 1 000 000 and the number of seconds is a non-negative integer.) |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The *getitimer()* and *setitimer()* functions may fail if:

|          |                                              |
|----------|----------------------------------------------|
| [EINVAL] | The <i>which</i> argument is not recognized. |
|----------|----------------------------------------------|

**35523 EXAMPLES**

35524 None.

**35525 APPLICATION USAGE**

35526 Applications should use the *timer\_gettime()* and *timer\_settime()* functions instead of the  
35527 obsolescent *getitimer()* and *setitimer()* functions, respectively.

**35528 RATIONALE**

35529 None.

**35530 FUTURE DIRECTIONS**

35531 The *getitimer()* and *setitimer()* functions may be removed in a future version.

**35532 SEE ALSO**

35533 *alarm()*, *exec*, *sleep()*, *timer\_getoverrun()*

35534 XBD <signal.h>, <sys/time.h>

**35535 CHANGE HISTORY**

35536 First released in Issue 4, Version 2.

**35537 Issue 5**

35538 Moved from X/OPEN UNIX extension to BASE.

**35539 Issue 6**

35540 The **restrict** keyword is added to the *setitimer()* prototype for alignment with the  
35541 ISO/IEC 9899:1999 standard.

**35542 Issue 7**

35543 The *getitimer()* and *setitimer()* functions are marked obsolescent.

35544 **NAME**35545       getline — read a delimited record from *stream*35546 **SYNOPSIS**

```
35547 CX      #include <stdio.h>
35548          ssize_t getline(char **restrict lineptr, size_t *restrict n,
35549                          FILE *restrict stream);
```

35550 **DESCRIPTION**35551       Refer to *getdelim()*.

**NAME**

getlogin, getlogin\_r — get login name

**SYNOPSIS**

```
#include <unistd.h>

char *getlogin(void);
int getlogin_r(char *name, size_t namesize);
```

**DESCRIPTION**

The *getlogin()* function shall return a pointer to a string containing the user name associated by the login activity with the controlling terminal of the current process. If *getlogin()* returns a non-null pointer, then that pointer points to the name that the user logged in under, even if there are several login names with the same user ID.

The *getlogin()* function need not be thread-safe.

The *getlogin\_r()* function shall put the name associated by the login activity with the controlling terminal of the current process in the character array pointed to by *name*. The array is *namesize* characters long and should have space for the name and the terminating null character. The maximum size of the login name is {LOGIN\_NAME\_MAX}.

If *getlogin\_r()* is successful, *name* points to the name the user used at login, even if there are several login names with the same user ID.

The *getlogin()* and *getlogin\_r()* functions may make use of file descriptors 0, 1, and 2 to find the controlling terminal of the current process, examining each in turn until the terminal is found. If in this case none of these three file descriptors is open to the controlling terminal, these functions may fail. The method used to find the terminal associated with a file descriptor may depend on the file descriptor being open to the actual terminal device, not */dev/tty*.

**RETURN VALUE**

Upon successful completion, *getlogin()* shall return a pointer to the login name or a null pointer if the user's login name cannot be found. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

The application shall not modify the string returned. The returned pointer might be invalidated or the string content might be overwritten by a subsequent call to *getlogin()*. The returned pointer and the string content might also be invalidated if the calling thread is terminated. +

If successful, the *getlogin\_r()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

These functions may fail if:

- |          |                                                                                                     |
|----------|-----------------------------------------------------------------------------------------------------|
| [EMFILE] | All file descriptors available to the process are currently open.                                   |
| [ENFILE] | The maximum allowable number of files is currently open in the system.                              |
| [ENOTTY] | None of the file descriptors 0, 1, or 2 is open to the controlling terminal of the current process. |
| [ENXIO]  | The calling process has no controlling terminal.                                                    |
- The *getlogin\_r()* function may fail if:
- |          |                                                                                                                                |
|----------|--------------------------------------------------------------------------------------------------------------------------------|
| [ERANGE] | The value of <i>namesize</i> is smaller than the length of the string to be returned including the terminating null character. |
|----------|--------------------------------------------------------------------------------------------------------------------------------|

**EXAMPLES****Getting the User Login Name**

The following example calls the *getlogin()* function to obtain the name of the user associated with the calling process, and passes this information to the *getpwnam()* function to get the associated user database information.

```
#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
#include <stdio.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
}
```

**APPLICATION USAGE**

Three names associated with the current process can be determined: *getpwuid(geteuid())* shall return the name associated with the effective user ID of the process; *getlogin()* shall return the name associated with the current login activity; and *getpwuid(getuid())* shall return the name associated with the real user ID of the process.

The *getlogin\_r()* function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

**RATIONALE**

The *getlogin()* function returns a pointer to the user's login name. The same user ID may be shared by several login names. If it is desired to get the user database entry that is used during login, the result of *getlogin()* should be used to provide the argument to the *getpwnam()* function. (This might be used to determine the user's login shell, particularly where a single user has multiple login shells with distinct login names, but the same user ID.)

The information provided by the *cuserid()* function, which was originally defined in the POSIX.1-1988 standard and subsequently removed, can be obtained by the following:

```
getpwuid(geteuid())
```

while the information provided by historical implementations of *cuserid()* can be obtained by:

```
getpwuid(getuid())
```

The thread-safe version of this function places the user name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*getpwnam()*, *getpwuid()*, *geteuid()*, *getuid()*

XBD *<limits.h>*, *<unistd.h>*

**CHANGE HISTORY**

First released in Issue 1. Derived from System V Release 2.0.

**Issue 5**

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The `getlogin_r()` function is included for alignment with the POSIX Threads Extension.

A note indicating that the `getlogin()` function need not be reentrant is added to the DESCRIPTION.

**Issue 6**

The `getlogin_r()` function is marked as part of the Thread-Safe Functions option.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

The `getlogin_r()` function is moved from the Thread-Safe Functions option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0243 [172], XSH/TC1-2008/0244 [75], and XSH/TC1-2008/0245 [172] are applied.

**NAME**

getmsg, getpmsg — receive next message from a STREAMS file (**STREAMS**)

**SYNOPSIS**

```
#include <stropts.h>

int getmsg(int fildes, struct strbuf *restrict ctlptr,
           struct strbuf *restrict dataptr, int *restrict flagsp);
int getpmsg(int fildes, struct strbuf *restrict ctlptr,
            struct strbuf *restrict dataptr, int *restrict bandp,
            int *restrict flagsp);
```

**DESCRIPTION**

The `getmsg()` function shall retrieve the contents of a message located at the head of the STREAM head read queue associated with a STREAMS file and place the contents into one or more buffers. The message contains either a data part, a control part, or both. The data and control parts of the message shall be placed into separate buffers, as described below. The semantics of each part are defined by the originator of the message.

The `getpmsg()` function shall be equivalent to `getmsg()`, except that it provides finer control over the priority of the messages received. Except where noted, all requirements on `getmsg()` also pertain to `getpmsg()`.

The `fildes` argument specifies a file descriptor referencing a STREAMS-based file.

The `ctlptr` and `dataptr` arguments each point to a **strbuf** structure, in which the `buf` member points to a buffer in which the data or control information is to be placed, and the `maxlen` member indicates the maximum number of bytes this buffer can hold. On return, the `len` member shall contain the number of bytes of data or control information actually received. The `len` member shall be set to 0 if there is a zero-length control or data part and `len` shall be set to -1 if no data or control information is present in the message.

When `getmsg()` is called, `flagsp` should point to an integer that indicates the type of message the process is able to receive. This is described further below.

The `ctlptr` argument is used to hold the control part of the message, and `dataptr` is used to hold the data part of the message. If `ctlptr` (or `dataptr`) is a null pointer or the `maxlen` member is -1, the control (or data) part of the message shall not be processed and shall be left on the STREAM head read queue, and if the `ctlptr` (or `dataptr`) is not a null pointer, `len` shall be set to -1. If the `maxlen` member is set to 0 and there is a zero-length control (or data) part, that zero-length part shall be removed from the read queue and `len` shall be set to 0. If the `maxlen` member is set to 0 and there are more than 0 bytes of control (or data) information, that information shall be left on the read queue and `len` shall be set to 0. If the `maxlen` member in `ctlptr` (or `dataptr`) is less than the control (or data) part of the message, `maxlen` bytes shall be retrieved. In this case, the remainder of the message shall be left on the STREAM head read queue and a non-zero return value shall be provided.

By default, `getmsg()` shall process the first available message on the STREAM head read queue. However, a process may choose to retrieve only high-priority messages by setting the integer pointed to by `flagsp` to `RS_HIPRI`. In this case, `getmsg()` shall only process the next message if it is a high-priority message. When the integer pointed to by `flagsp` is 0, any available message shall be retrieved. In this case, on return, the integer pointed to by `flagsp` shall be set to `RS_HIPRI` if a high-priority message was retrieved, or 0 otherwise.

For `getpmsg()`, the flags are different. The `flagsp` argument points to a bitmask with the following mutually-exclusive flags defined: `MSG_HIPRI`, `MSG_BAND`, and `MSG_ANY`. Like `getmsg()`,

*getpmsg()* shall process the first available message on the STREAM head read queue. A process may choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to MSG\_HIPRI and the integer pointed to by *bandp* to 0. In this case, *getpmsg()* shall only process the next message if it is a high-priority message. In a similar manner, a process may choose to retrieve a message from a particular priority band by setting the integer pointed to by *flagsp* to MSG\_BAND and the integer pointed to by *bandp* to the priority band of interest. In this case, *getpmsg()* shall only process the next message if it is in a priority band equal to, or greater than, the integer pointed to by *bandp*, or if it is a high-priority message. If a process wants to get the first message off the queue, the integer pointed to by *flagsp* should be set to MSG\_ANY and the integer pointed to by *bandp* should be set to 0. On return, if the message retrieved was a high-priority message, the integer pointed to by *flagsp* shall be set to MSG\_HIPRI and the integer pointed to by *bandp* shall be set to 0. Otherwise, the integer pointed to by *flagsp* shall be set to MSG\_BAND and the integer pointed to by *bandp* shall be set to the priority band of the message.

If O\_NONBLOCK is not set, *getmsg()* and *getpmsg()* shall block until a message of the type specified by *flagsp* is available at the front of the STREAM head read queue. If O\_NONBLOCK is set and a message of the specified type is not present at the front of the read queue, *getmsg()* and *getpmsg()* shall fail and set *errno* to [EAGAIN].

If a hangup occurs on the STREAM from which messages are retrieved, *getmsg()* and *getpmsg()* shall continue to operate normally, as described above, until the STREAM head read queue is empty. Thereafter, they shall return 0 in the *len* members of *ctlptr* and *dataptr*.

## RETURN VALUE

Upon successful completion, *getmsg()* and *getpmsg()* shall return a non-negative value. A value of 0 indicates that a full message was read successfully. A return value of MORECTL indicates that more control information is waiting for retrieval. A return value of MOREDATA indicates that more data is waiting for retrieval. A return value of the bitwise-logical OR of MORECTL and MOREDATA indicates that both types of information remain. Subsequent *getmsg()* and *getpmsg()* calls shall retrieve the remainder of the message. However, if a message of higher priority has come in on the STREAM head read queue, the next call to *getmsg()* or *getpmsg()* shall retrieve that higher-priority message before retrieving the remainder of the previous message.

If the high priority control part of the message is consumed, the message shall be placed back on the queue as a normal message of band 0. Subsequent *getmsg()* and *getpmsg()* calls shall retrieve the remainder of the message. If, however, a priority message arrives or already exists on the STREAM head, the subsequent call to *getmsg()* or *getpmsg()* shall retrieve the higher-priority message before retrieving the remainder of the message that was put back.

Upon failure, *getmsg()* and *getpmsg()* shall return -1 and set *errno* to indicate the error.

## ERRORS

The *getmsg()* and *getpmsg()* functions shall fail if:

|           |                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [EAGAIN]  | The O_NONBLOCK flag is set and no messages are available.                                                                                                                    |
| [EBADF]   | The <i>fildev</i> argument is not a valid file descriptor open for reading.                                                                                                  |
| [EBADMSG] | The queued message to be read is not valid for <i>getmsg()</i> or <i>getpmsg()</i> or a pending file descriptor is at the STREAM head.                                       |
| [EINTR]   | A signal was caught during <i>getmsg()</i> or <i>getpmsg()</i> .                                                                                                             |
| [EINVAL]  | An illegal value was specified by <i>flagsp</i> , or the STREAM or multiplexer referenced by <i>fildev</i> is linked (directly or indirectly) downstream from a multiplexer. |

35751 [ENOSTR] A STREAM is not associated with *fildev*.

35752 In addition, *getmsg()* and *getpmsg()* shall fail if the STREAM head had processed an  
35753 asynchronous error before the call. In this case, the value of *errno* does not reflect the result of  
35754 *getmsg()* or *getpmsg()* but reflects the prior error.

## 35755 EXAMPLES

### 35756 Getting Any Message

35757 In the following example, the value of *fd* is assumed to refer to an open STREAMS file. The call  
35758 to *getmsg()* retrieves any available message on the associated STREAM-head read queue,  
35759 returning control and data information to the buffers pointed to by *ctrlbuf* and *databuf*,  
35760 respectively.

```
35761 #include <stropts.h>
35762 ...
35763 int fd;
35764 char ctrlbuf[128];
35765 char databuf[512];
35766 struct strbuf ctrl;
35767 struct strbuf data;
35768 int flags = 0;
35769 int ret;

35770 ctrl.buf = ctrlbuf;
35771 ctrl.maxlen = sizeof(ctrlbuf);

35772 data.buf = databuf;
35773 data.maxlen = sizeof(databuf);

35774 ret = getmsg (fd, &ctrl, &data, &flags);
```

### 35775 Getting the First Message off the Queue

35776 In the following example, the call to *getpmsg()* retrieves the first available message on the  
35777 associated STREAM-head read queue.

```
35778 #include <stropts.h>
35779 ...

35780 int fd;
35781 char ctrlbuf[128];
35782 char databuf[512];
35783 struct strbuf ctrl;
35784 struct strbuf data;
35785 int band = 0;
35786 int flags = MSG_ANY;
35787 int ret;

35788 ctrl.buf = ctrlbuf;
35789 ctrl.maxlen = sizeof(ctrlbuf);

35790 data.buf = databuf;
35791 data.maxlen = sizeof(databuf);

35792 ret = getpmsg (fd, &ctrl, &data, &band, &flags);
```

35793 **APPLICATION USAGE**

35794 None.

35795 **RATIONALE**

35796 None.

35797 **FUTURE DIRECTIONS**35798 The *getmsg()* and *getpmsg()* functions may be removed in a future version.35799 **SEE ALSO**35800 [Section 2.6](#) (on page 500), [poll\(\)](#), [putmsg\(\)](#), [read\(\)](#), [write\(\)](#)35801 XBD [<stropts.h>](#)35802 **CHANGE HISTORY**

35803 First released in Issue 4, Version 2.

35805 Moved from X/OPEN UNIX extension to BASE.

35806 A paragraph regarding “high-priority control parts of messages” is added to the RETURN  
35807 VALUE section.35808 **Issue 6**

35809 This function is marked as part of the XSI STREAMS Option Group.

35810 The **restrict** keyword is added to the *getmsg()* and *getpmsg()* prototypes for alignment with the  
35811 ISO/IEC 9899:1999 standard.35812 **Issue 7**35813 The *getmsg()* and *getpmsg()* functions are marked obsolescent.

## NAME

getnameinfo — get name information

## SYNOPSIS

```
#include <sys/socket.h>
#include <netdb.h>

int getnameinfo(const struct sockaddr *restrict sa, socklen_t salen,
                char *restrict node, socklen_t nodelen, char *restrict service,
                socklen_t servicelen, int flags);
```

## DESCRIPTION

The `getnameinfo()` function shall translate a socket address to a node name and service location, all of which are defined as in [freeaddrinfo\(\)](#).

The *sa* argument points to a socket address structure to be translated. The *salen* argument contains the length of the address pointed to by *sa*.

IP6 If the socket address structure contains an IPv4-mapped IPv6 address or an IPv4-compatible IPv6 address, the implementation shall extract the embedded IPv4 address and lookup the node name for that IPv4 address.

If the address is the IPv6 unspecified address ("::"), a lookup shall not be performed and the behavior shall be the same as when the node's name cannot be located.

If the *node* argument is non-NULL and the *nodelen* argument is non-zero, then the *node* argument points to a buffer able to contain up to *nodelen* bytes that receives the node name as a null-terminated string. If the *node* argument is NULL or the *nodelen* argument is zero, the node name shall not be returned. If the node's name cannot be located, the numeric form of the address contained in the socket address structure pointed to by the *sa* argument is returned instead of its name.

If the *service* argument is non-NULL and the *servicelen* argument is non-zero, then the *service* argument points to a buffer able to contain up to *servicelen* bytes that receives the service name as a null-terminated string. If the *service* argument is NULL or the *servicelen* argument is zero, the service name shall not be returned. If the service's name cannot be located, the numeric form of the service address (for example, its port number) shall be returned instead of its name.

The *flags* argument is a flag that changes the default actions of the function. By default the fully-qualified domain name (FQDN) for the host shall be returned, but:

- If the flag bit NI\_NOFQDN is set, only the node name portion of the FQDN shall be returned for local hosts.
- If the flag bit NI\_NUMERICHOST is set, the numeric form of the address contained in the socket address structure pointed to by the *sa* argument shall be returned instead of its name.
- If the flag bit NI\_NAMEREQD is set, an error shall be returned if the host's name cannot be located.
- If the flag bit NI\_NUMERICSERV is set, the numeric form of the service address shall be returned (for example, its port number) instead of its name.
- If the flag bit NI\_NUMERICSERVICE is set, the numeric form of the scope identifier shall be returned (for example, interface index) instead of its name. This flag shall be ignored if the *sa* argument is not an IPv6 address.

- If the flag bit NI\_DGRAM is set, this indicates that the service is a datagram service (SOCK\_DGRAM). The default behavior shall assume that the service is a stream service (SOCK\_STREAM).

**Notes:**

1. The two NI\_NUMERICxxx flags are required to support the `-n` flag that many commands provide.
2. The NI\_DGRAM flag is required for the few AF\_INET and AF\_INET6 port numbers (for example, [512,514]) that represent different services for UDP and TCP.

The `getnameinfo()` function shall be thread-safe.

**RETURN VALUE**

A zero return value for `getnameinfo()` indicates successful completion; a non-zero return value indicates failure. The possible values for the failures are listed in the ERRORS section.

Upon successful completion, `getnameinfo()` shall return the *node* and *service* names, if requested, in the buffers provided. The returned names are always null-terminated strings.

**ERRORS**

The `getnameinfo()` function shall fail and return the corresponding value if:

[EAI\_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

[EAI\_BADFLAGS]

The *flags* had an invalid value.

[EAI\_FAIL]

A non-recoverable error occurred.

[EAI\_FAMILY]

The address family was not recognized or the address length was invalid for the specified family.

[EAI\_MEMORY] There was a memory allocation failure.

[EAI\_NONAME] The name does not resolve for the supplied parameters.

NI\_NAMEREQD is set and the host's name cannot be located, or both *nodename* and *servname* were null.

[EAI\_OVERFLOW]

An argument buffer overflowed. The buffer pointed to by the *node* argument or the *service* argument was too small.

[EAI\_SYSTEM]

A system error occurred. The error code can be found in *errno*.

**EXAMPLES**

None.

**APPLICATION USAGE**

If the returned values are to be used as part of any further name resolution (for example, passed to `getaddrinfo()`), applications should provide buffers large enough to store any result possible on the system.

Given the IPv4-mapped IPv6 address "`::ffff:1.2.3.4`", the implementation performs a lookup as if the socket address structure contains the IPv4 address "`1.2.3.4`".

The IPv6 unspecified address ("`:::`") and the IPv6 loopback address ("`:::1`") are not IPv4-compatible addresses.

35897 **RATIONALE**

35898 None.

35899 **FUTURE DIRECTIONS**

35900 None.

35901 **SEE ALSO**

35904 **CHANGE HISTORY**

35905 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

35906 The **restrict** keyword is added to the *getnameinfo()* prototype for alignment with the  
35907 ISO/IEC 9899:1999 standard.

35908 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/23 is applied, making various changes in  
35909 the SYNOPSIS and DESCRIPTION for alignment with IPv6.

35910 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/24 is applied, adding the  
35911 [EAI\_OVERFLOW] error to the ERRORS section.

35912 **Issue 7**

35913 SD5-XSH-ERN-127 is applied, clarifying the behavior if the address is the IPv6 unspecified  
35914 address.

35915 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0246 [284] and XSH/TC1-2008/0247  
35916 [285] are applied.

35917 **NAME**

35918 getnetbyaddr, getnetbyname, getnetent — network database functions

35919 **SYNOPSIS**

35920 #include &lt;netdb.h&gt;

35921 struct netent \*getnetbyaddr(uint32\_t net, int type);

35922 struct netent \*getnetbyname(const char \*name);

35923 struct netent \*getnetent(void);

35924 **DESCRIPTION**35925 Refer to *endnetent()*.

**NAME**

getopt, optarg, opterr, optind, optopt — command option parsing

**SYNOPSIS**

```
#include <unistd.h>

int getopt(int argc, char * const argv[], const char *optstring);
extern char *optarg;
extern int opterr, optind, optopt;
```

**DESCRIPTION**

The `getopt()` function is a command-line parser that shall follow Utility Syntax Guidelines 3, 4, 5, 6, 7, 9, and 10 in XBD [Section 12.2](#) (on page 216).

The parameters *argc* and *argv* are the argument count and argument array as passed to `main()` (see `exec()`). The argument *optstring* is a string of recognized option characters; if a character is followed by a <colon>, the option takes an argument. All option characters allowed by Utility Syntax Guideline 3 are allowed in *optstring*. The implementation may accept other characters as an extension.

The variable *optind* is the index of the next element of the *argv*[] vector to be processed. It shall be initialized to 1 by the system, and `getopt()` shall update it when it finishes with each element of *argv* []. If the application sets *optind* to zero before calling `getopt()`, the behavior is unspecified. When an element of *argv* [] contains multiple option characters, it is unspecified how `getopt()` determines which options have already been processed.

The `getopt()` function shall return the next option character (if one is found) from *argv* that matches a character in *optstring*, if there is one that matches. If the option takes an argument, `getopt()` shall set the variable *optarg* to point to the option-argument as follows:

1. If the option was the last character in the string pointed to by an element of *argv*, then *optarg* shall contain the next element of *argv*, and *optind* shall be incremented by 2. If the resulting value of *optind* is greater than *argc*, this indicates a missing option-argument, and `getopt()` shall return an error indication.
2. Otherwise, *optarg* shall point to the string following the option character in that element of *argv*, and *optind* shall be incremented by 1.

If, when `getopt()` is called:

```
argv[optind]  is a null pointer
*argv[optind] is not the character -
argv[optind]  points to the string "--"
```

`getopt()` shall return -1 without changing *optind*. If:

```
argv[optind]  points to the string "--"
```

`getopt()` shall return -1 after incrementing *optind*.

If `getopt()` encounters an option character that is not contained in *optstring*, it shall return the <question-mark> ('?') character. If it detects a missing option-argument, it shall return the <colon> character (':') if the first character of *optstring* was a <colon>, or a <question-mark> character ('?') otherwise. In either case, `getopt()` shall set the variable *optopt* to the option character that caused the error. If the application has not set the variable *opterr* to 0 and the first character of *optstring* is not a <colon>, `getopt()` shall also print a diagnostic message to *stderr* in the format specified for the `getopts` utility, unless the *stderr* stream has wide orientation, in which case the behavior is undefined.

The `getopt()` function need not be thread-safe.

**RETURN VALUE**

The `getopt()` function shall return the next option character specified on the command line.

A <colon> (':') shall be returned if `getopt()` detects a missing argument and the first character of *optstring* was a <colon> (':').

A <question-mark> ('?') shall be returned if `getopt()` encounters an option character not in *optstring* or detects a missing argument and the first character of *optstring* was not a <colon> (':').

Otherwise, `getopt()` shall return -1 when all command line options are parsed.

**ERRORS**

If the application has not set the variable *opterr* to 0, the first character of *optstring* is not a <colon>, and a write error occurs while `getopt()` is printing a diagnostic message to *stderr*, then the error indicator for *stderr* shall be set; but `getopt()` shall still succeed and the value of *errno* after `getopt()` is unspecified.

**EXAMPLES****Parsing Command Line Options**

The following code fragment shows how you might process the arguments for a utility that can take the mutually-exclusive options *a* and *b* and the options *f* and *o*, both of which require arguments:

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>

int
main(int argc, char *argv[ ])
{
    int c;
    int bflg = 0, aflg = 0, errflg = 0;
    char *ifile;
    char *ofile;
    . . .
    while ((c = getopt(argc, argv, ":abf:o:")) != -1) {
        switch(c) {
            case 'a':
                if (bflg)
                    errflg++;
                else
                    aflg++;
                break;
            case 'b':
                if (aflg)
                    errflg++;
                else
                    bflg++;
                break;
            case 'f':
                ifile = optarg;
                break;
            case 'o':
```

```

36018         ofile = optarg;
36019         break;
36020     case ':': /* -f or -o without operand */
36021         fprintf(stderr,
36022             "Option -%c requires an operand\n", optopt);
36023         errflg++;
36024         break;
36025     case '?':
36026         fprintf(stderr,
36027             "Unrecognized option: '-%c'\n", optopt);
36028         errflg++;
36029     }
36030 }
36031 if (errflg) {
36032     fprintf(stderr, "usage: . . . ");
36033     exit(2);
36034 }
36035 for ( ; optind < argc; optind++) {
36036     if (access(argv[optind], R_OK)) {
36037         . . .
36038     }

```

This code accepts any of the following as equivalent:

```

36040 cmd -ao arg path path
36041 cmd -a -o arg path path
36042 cmd -o arg -a path path
36043 cmd -a -o arg -- path path
36044 cmd -a -oarg path path
36045 cmd -aoarg path path

```

### Selecting Options from the Command Line

The following example selects the type of database routines the user wants to use based on the *Options* argument.

```

36049 #include <unistd.h>
36050 #include <string.h>
36051 ...
36052 const char *Options = "hdbt1";
36053 ...
36054 int dbtype, c;
36055 char *st;
36056 ...
36057 dbtype = 0;
36058 while ((c = getopt(argc, argv, Options)) != -1) {
36059     if ((st = strchr(Options, c)) != NULL) {
36060         dbtype = st - Options;
36061         break;
36062     }
36063 }

```

**APPLICATION USAGE**

The `getopt()` function is only required to support option characters included in Utility Syntax Guideline 3. Many historical implementations of `getopt()` support other characters as options. This is an allowed extension, but applications that use extensions are not maximally portable. Note that support for multi-byte option characters is only possible when such characters can be represented as type `int`.

Applications which use wide-character output functions with `stderr` should ensure that any calls to `getopt()` do not write to `stderr`, either by setting `opterr` to 0 or by ensuring the first character of `optstring` is always a `<colon>`.

While `ferror(stderr)` may be used to detect failures to write a diagnostic to `stderr` when `getopt()` returns `'?'`, the value of `errno` is unspecified in such a condition. Applications desiring more control over handling write failures should set `opterr` to 0 and independently perform output to `stderr`, rather than relying on `getopt()` to do the output.

**RATIONALE**

The `optopt` variable represents historical practice and allows the application to obtain the identity of the invalid option.

The description has been written to make it clear that `getopt()`, like the `getopts` utility, deals with option-arguments whether separated from the option by `<blank>` characters or not. Note that the requirements on `getopt()` and `getopts` are more stringent than the Utility Syntax Guidelines.

The `getopt()` function shall return `-1`, rather than EOF, so that `<stdio.h>` is not required.

The special significance of a `<colon>` as the first character of `optstring` makes `getopt()` consistent with the `getopts` utility. It allows an application to make a distinction between a missing argument and an incorrect option letter without having to examine the option letter. It is true that a missing argument can only be detected in one case, but that is a case that has to be considered.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

A note indicating that the `getopt()` function need not be reentrant is added to the DESCRIPTION.

**Issue 6**

IEEE PASC Interpretation 1003.2 #150 is applied.

Austin Group Interpretation 1003.1-2001 #156 is applied.

**Issue 7**

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0248 [318], XSH/TC1-2008/0249 [460], XSH/TC1-2008/0250 [189], XSH/TC1-2008/0251 [189], XSH/TC1-2008/0252 [189], and XSH/TC1-2008/0253 [460] are applied.

36106 **NAME**

36107 `getpeername` — get the name of the peer socket

36108 **SYNOPSIS**

36109 `#include <sys/socket.h>`  
36110 `int getpeername(int socket, struct sockaddr *restrict address,`  
36111 `socklen_t *restrict address_len);`

36112 **DESCRIPTION**

36113 The `getpeername()` function shall retrieve the peer address of the specified socket, store this  
36114 address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this  
36115 address in the object pointed to by the *address\_len* argument.

36116 The *address\_len* argument points to a **socklen\_t** object which on input specifies the length of the  
36117 supplied **sockaddr** structure, and on output specifies the length of the stored address. If the  
36118 actual length of the address is greater than the length of the supplied **sockaddr** structure, the  
36119 stored address shall be truncated.

36120 If the protocol permits connections by unbound clients, and the peer is not bound, then the  
36121 value stored in the object pointed to by *address* is unspecified.

36122 **RETURN VALUE**

36123 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
36124 indicate the error.

36125 **ERRORS**

36126 The `getpeername()` function shall fail if:

- |       |              |                                                                              |
|-------|--------------|------------------------------------------------------------------------------|
| 36127 | [EBADF]      | The <i>socket</i> argument is not a valid file descriptor.                   |
| 36128 | [EINVAL]     | The socket has been shut down.                                               |
| 36129 | [ENOTCONN]   | The socket is not connected or otherwise has not had the peer pre-specified. |
| 36130 | [ENOTSOCK]   | The <i>socket</i> argument does not refer to a socket.                       |
| 36131 | [EOPNOTSUPP] | The operation is not supported for the socket protocol.                      |

36132 The `getpeername()` function may fail if:

- |       |           |                                                                           |
|-------|-----------|---------------------------------------------------------------------------|
| 36133 | [ENOBUFS] | Insufficient resources were available in the system to complete the call. |
|-------|-----------|---------------------------------------------------------------------------|

36177       None.

36178 **SEE ALSO**36179       *exec*, *fork()*, *getpgrp()*, *getpid()*, *getsid()*, *setpgid()*, *setsid()*

36180       XBD &lt;unistd.h&gt;

36181 **CHANGE HISTORY**

36182       First released in Issue 4, Version 2.

36183 **Issue 5**

36184       Moved from X/OPEN UNIX extension to BASE.

36185 **Issue 7**36186       The *getpgid()* function is moved from the XSI option to the Base.

36187 **NAME**

36188       getpgrp — get the process group ID of the calling process

36189 **SYNOPSIS**

36190       #include &lt;unistd.h&gt;

36191       pid\_t getpgrp(void);

36192 **DESCRIPTION**36193       The *getpgrp()* function shall return the process group ID of the calling process.36194 **RETURN VALUE**36195       The *getpgrp()* function shall always be successful and no return value is reserved to indicate an  
36196       error.36197 **ERRORS**

36198       No errors are defined.

36199 **EXAMPLES**

36200       None.

36201 **APPLICATION USAGE**

36202       None.

36203 **RATIONALE**36204       4.3 BSD provides a *getpgrp()* function that returns the process group ID for a specified process.  
36205       Although this function supports job control, all known job control shells always specify the  
36206       calling process with this function. Thus, the simpler System V *getpgrp()* suffices, and the added  
36207       complexity of the 4.3 BSD *getpgrp()* is provided by the XSI extension *getpgid()*.36208 **FUTURE DIRECTIONS**

36209       None.

36210 **SEE ALSO**36211       *exec*, *fork()*, *getpgid()*, *getpid()*, *getppid()*, *kill()*, *setpgid()*, *setsid()*

36212       XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

36213 **CHANGE HISTORY**

36214       First released in Issue 1. Derived from Issue 1 of the SVID.

36215 **Issue 6**

36216       In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

36217       The following new requirements on POSIX implementations derive from alignment with the  
36218       Single UNIX Specification:

- 36219
- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
36220       required for conforming implementations of previous POSIX specifications, it was not  
36221       required for UNIX applications.

36222 **NAME**

36223       getpid — get the process ID

36224 **SYNOPSIS**

36225       #include &lt;unistd.h&gt;

36226       pid\_t getpid(void);

36227 **DESCRIPTION**36228       The *getpid()* function shall return the process ID of the calling process.36229 **RETURN VALUE**36230       The *getpid()* function shall always be successful and no return value is reserved to indicate an  
36231       error.36232 **ERRORS**

36233       No errors are defined.

36234 **EXAMPLES**

36235       None.

36236 **APPLICATION USAGE**

36237       None.

36238 **RATIONALE**

36239       None.

36240 **FUTURE DIRECTIONS**

36241       None.

36286 **CHANGE HISTORY**

36287       First released in Issue 1. Derived from Issue 1 of the SVID.

36288 **Issue 6**

36289       In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

36290       The following new requirements on POSIX implementations derive from alignment with the  
36291       Single UNIX Specification:

- 36292
- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
36293       required for conforming implementations of previous POSIX specifications, it was not  
36294       required for UNIX applications.

**NAME**

getpriority, setpriority — get and set the nice value

**SYNOPSIS**

```
#include <sys/resource.h>

int getpriority(int which, id_t who);
int setpriority(int which, id_t who, int value);
```

**DESCRIPTION**

The *getpriority()* function shall obtain the nice value of a process, process group, or user. The *setpriority()* function shall set the nice value of a process, process group, or user to *value*+{NZERO}.

Target processes are specified by the values of the *which* and *who* arguments. The *which* argument may be one of the following values: PRIO\_PROCESS, PRIO\_PGRP, or PRIO\_USER, indicating that the *who* argument is to be interpreted as a process ID, a process group ID, or an effective user ID, respectively. A 0 value for the *who* argument specifies the current process, process group, or user.

The nice value set with *setpriority()* shall be applied to the process. If the process is multi-threaded, the nice value shall affect all system scope threads in the process.

If more than one process is specified, *getpriority()* shall return value {NZERO} less than the lowest nice value pertaining to any of the specified processes, and *setpriority()* shall set the nice values of all of the specified processes to *value*+{NZERO}.

The default nice value is {NZERO}; lower nice values shall cause more favorable scheduling. While the range of valid nice values is [0,{NZERO}\*2-1], implementations may enforce more restrictive limits. If *value*+{NZERO} is less than the system's lowest supported nice value, *setpriority()* shall set the nice value to the lowest supported value; if *value*+{NZERO} is greater than the system's highest supported nice value, *setpriority()* shall set the nice value to the highest supported value.

Only a process with appropriate privileges can lower its nice value.

Any processes or threads using SCHED\_FIFO or SCHED\_RR shall be unaffected by a call to *setpriority()*. This is not considered an error. A process which subsequently reverts to SCHED\_OTHER need not have its priority affected by such a *setpriority()* call.

The effect of changing the nice value may vary depending on the process-scheduling algorithm in effect.

Since *getpriority()* can return the value -1 upon successful completion, it is necessary to set *errno* to 0 prior to a call to *getpriority()*. If *getpriority()* returns the value -1, then *errno* can be checked to see if an error occurred or if the value is a legitimate nice value.

**RETURN VALUE**

Upon successful completion, *getpriority()* shall return an integer in the range -{NZERO} to {NZERO}-1. Otherwise, -1 shall be returned and *errno* set to indicate the error.

Upon successful completion, *setpriority()* shall return 0; otherwise, -1 shall be returned and *errno* set to indicate the error.

**ERRORS**

The *getpriority()* and *setpriority()* functions shall fail if:

[ESRCH] No process could be located using the *which* and *who* argument values specified.

[EINVAL] The value of the *which* argument was not recognized, or the value of the *who* argument is not a valid process ID, process group ID, or user ID.

In addition, *setpriority()* may fail if:

[EPERM] A process was located, but neither the real nor effective user ID of the executing process match the effective user ID of the process whose nice value is being changed.

[EACCES] A request was made to change the nice value to a lower numeric value and the current process does not have appropriate privileges.

**EXAMPLES****Using getpriority()**

The following example returns the current scheduling priority for the process ID returned by the call to *getpid()*.

```
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int ret;

pid = getpid();
ret = getpriority(which, pid);
```

**Using setpriority()**

The following example sets the priority for the current process ID to -20.

```
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int priority = -20;
int ret;

pid = getpid();
ret = setpriority(which, pid, priority);
```

**APPLICATION USAGE**

The *getpriority()* and *setpriority()* functions work with an offset nice value (nice value -{NZERO}). The nice value is in the range [0,2\*{NZERO} -1], while the return value for *getpriority()* and the third parameter for *setpriority()* are in the range [-{NZERO},{NZERO} -1].

**RATIONALE**

None.

36374 **FUTURE DIRECTIONS**

36375 None.

36376 **SEE ALSO**36377 *nice()*, *sched\_get\_priority\_max()*, *sched\_setscheduler()*

36378 XBD &lt;sys/resource.h&gt;

36379 **CHANGE HISTORY**

36380 First released in Issue 4, Version 2.

36381 **Issue 5**

36382 Moved from X/OPEN UNIX extension to BASE.

36383 The DESCRIPTION is reworded in terms of the nice value rather than *priority* to avoid confusion  
36384 with functionality in the POSIX Realtime Extension.

36385 **NAME**

36386 getprotobyname, getprotobynumber, getprotent — network protocol database functions

36387 **SYNOPSIS**

36388 #include &lt;netdb.h&gt;

36389 struct protoent \*getprotobyname(const char \*name);

36390 struct protoent \*getprotobynumber(int proto);

36391 struct protoent \*getprotoent(void);

36392 **DESCRIPTION**36393 Refer to *endprotoent()*.

36394 **NAME**

36395       getpwent — get user database entry

36396 **SYNOPSIS**

```
36397 XSI      #include <pwd.h>
36398          struct passwd *getpwent(void);
```

36399 **DESCRIPTION**36400       Refer to *endpwent()*.

**NAME**

getpwnam, getpwnam\_r — search user database for a name

**SYNOPSIS**

```
#include <pwd.h>

struct passwd *getpwnam(const char *name);
int getpwnam_r(const char *name, struct passwd *pwd, char *buffer,
               size_t bufsize, struct passwd **result);
```

**DESCRIPTION**

The *getpwnam()* function shall search the user database for an entry with a matching *name*.

The *getpwnam()* function need not be thread-safe.

Applications wishing to check for error situations should set *errno* to 0 before calling *getpwnam()*. If *getpwnam()* returns a null pointer and *errno* is non-zero, an error occurred.

The *getpwnam\_r()* function shall update the **passwd** structure pointed to by *pwd* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the user database with a matching *name*. Storage referenced by the structure is allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to *sysconf*(*\_SC\_GETPW\_R\_SIZE\_MAX*) returns either -1 without changing *errno* or an initial value suggested for the size of this buffer. A null pointer shall be returned at the location pointed to by *result* on error or if the requested entry is not found.

**RETURN VALUE**

The *getpwnam()* function shall return a pointer to a **struct passwd** with the structure as defined in **<pwd.h>** with a matching entry if found. A null pointer shall be returned if the requested entry is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *getpwent()*, *getpwnam()*, or *getpwuid()*. The returned pointer, and pointers within the structure, might also be invalidated if the calling thread is terminated.

The *getpwnam\_r()* function shall return zero on success or if the requested entry was not found and no error has occurred. If an error has occurred, an error number shall be returned to indicate the error.

**ERRORS**

These functions may fail if:

- |          |                                                                        |
|----------|------------------------------------------------------------------------|
| [EIO]    | An I/O error has occurred.                                             |
| [EINTR]  | A signal was caught during <i>getpwnam()</i> .                         |
| [EMFILE] | All file descriptors available to the process are currently open.      |
| [ENFILE] | The maximum allowable number of files is currently open in the system. |

The *getpwnam\_r()* function may fail if:

- |          |                                                                                                                                                       |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| [ERANGE] | Insufficient storage was supplied via <i>buffer</i> and <i>bufsize</i> to contain the data to be referenced by the resulting <b>passwd</b> structure. |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

**EXAMPLES**

Note that `sysconf(_SC_GETPW_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with `getpwnam_r()`.

```

long int initlen = sysconf(_SC_GETPW_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct passwd result;
struct passwd *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getpwnam_r("someuser", &result, buffer, len, &resultp))
    == ERANGE)
{
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
}
if (e != 0)
    ...handle error...
free (buffer);

```

**Getting an Entry for the Login Name**

The following example uses the `getlogin()` function to return the name of the user who logged in; this information is passed to the `getpwnam()` function to get the user database entry for that user.

```

#include <sys/types.h>
#include <pwd.h>
#include <unistd.h>
#include <stdio.h>
#include <stdlib.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
}
...

```

**APPLICATION USAGE**

Three names associated with the current process can be determined: *getpwuid(geteuid())* returns the name associated with the effective user ID of the process; *getlogin()* returns the name associated with the current login activity; and *getpwuid(getuid())* returns the name associated with the real user ID of the process.

The *getpwnam\_r()* function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return `-1` from *sysconf()* indicating that there is no maximum for `_SC_GETPW_R_SIZE_MAX`.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 1. Derived from System V Release 2.0.

**Issue 5**

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getpwnam\_r()* function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getpwnam()* function need not be reentrant is added to the DESCRIPTION.

**Issue 6**

The *getpwnam\_r()* function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the *name*.

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

36530 **Issue 7**

36531 Austin Group Interpretation 1003.1-2001 #156 is applied.

36532 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

36533 SD5-XSH-ERN-166 is applied.

36534 The *getpwnam\_r()* function is moved from the Thread-Safe Functions option to the Base.

36535 A minor addition is made to the EXAMPLES section, reminding the application developer to  
36536 free memory allocated as if by *malloc()*.

36537 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0255 [75,428] is applied.

**NAME**

getpwuid, getpwuid\_r — search user database for a user ID

**SYNOPSIS**

```
#include <pwd.h>

struct passwd *getpwuid(uid_t uid);
int getpwuid_r(uid_t uid, struct passwd *pwd, char *buffer,
               size_t bufsize, struct passwd **result);
```

**DESCRIPTION**

The *getpwuid()* function shall search the user database for an entry with a matching *uid*.

The *getpwuid()* function need not be thread-safe.

Applications wishing to check for error situations should set *errno* to 0 before calling *getpwuid()*. If *getpwuid()* returns a null pointer and *errno* is set to non-zero, an error occurred.

The *getpwuid\_r()* function shall update the **passwd** structure pointed to by *pwd* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the user database with a matching *uid*. Storage referenced by the structure is allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to *sysconf(\_SC\_GETPW\_R\_SIZE\_MAX)* returns either -1 without changing *errno* or an initial value suggested for the size of this buffer. A null pointer shall be returned at the location pointed to by *result* on error or if the requested entry is not found.

**RETURN VALUE**

The *getpwuid()* function shall return a pointer to a **struct passwd** with the structure as defined in **<pwd.h>** with a matching entry if found. A null pointer shall be returned if the requested entry is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *getpwent()*, *getpwnam()*, or *getpwuid()*. The returned pointer, and pointers within the structure, might also be invalidated if the calling thread is terminated.

If successful, the *getpwuid\_r()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

These functions may fail if:

- [EIO] An I/O error has occurred.
- [EINTR] A signal was caught during *getpwuid()*.
- [EMFILE] All file descriptors available to the process are currently open.
- [ENFILE] The maximum allowable number of files is currently open in the system.

The *getpwuid\_r()* function may fail if:

- [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be referenced by the resulting **passwd** structure.

**EXAMPLES**

Note that `sysconf(_SC_GETPW_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with `getpwuid_r()`.

```
long int initlen = sysconf(_SC_GETPW_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct passwd result;
struct passwd *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getpwuid_r(42, &result, buffer, len, &resultp)) == ERANGE)
{
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
}
if (e != 0)
    ...handle error...
free (buffer);
```

**Getting an Entry for the Root User**

The following example gets the user database entry for the user with user ID 0 (root).

```
#include <sys/types.h>
#include <pwd.h>
...
uid_t id = 0;
struct passwd *pwd;
pwd = getpwuid(id);
```

### Finding the Name for the Effective User ID

The following example defines *pws* as a pointer to a structure of type **passwd**, which is used to store the structure pointer returned by the call to the *getpwuid()* function. The *geteuid()* function shall return the effective user ID of the calling process; this is used as the search criteria for the *getpwuid()* function. The call to *getpwuid()* shall return a pointer to the structure containing that user ID value.

```
#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
...
struct passwd *pws;
pws = getpwuid(geteuid());
```

### Finding an Entry in the User Database

The following example uses *getpwuid()* to search the user database for a user ID that was previously stored in a **stat** structure, then prints out the user name if it is found. If the user is not found, the program prints the numeric value of the user ID for the entry.

```
#include <sys/types.h>
#include <pwd.h>
#include <stdio.h>
...
struct stat statbuf;
struct passwd *pwd;
...
if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
    printf(" %-8.8s", pwd->pw_name);
else
    printf(" %-8d", statbuf.st_uid);
```

### APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid(geteuid())* returns the name associated with the effective user ID of the process; *getlogin()* returns the name associated with the current login activity; and *getpwuid(getuid())* returns the name associated with the real user ID of the process.

The *getpwuid\_r()* function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return `-1` from *sysconf()* indicating that there is no maximum for `_SC_GETPW_R_SIZE_MAX`.

### RATIONALE

## 36692 NAME

36693 getrlimit, setrlimit — control maximum resource consumption

## 36694 SYNOPSIS

```
36695 XSI      #include <sys/resource.h>
36696
36696 int getrlimit(int resource, struct rlimit *rlp);
36697 int setrlimit(int resource, const struct rlimit *rlp);
```

## 36698 DESCRIPTION

36699 The *getrlimit()* function shall get, and the *setrlimit()* function shall set, limits on the consumption  
 36700 of a variety of resources.

36701 Each call to either *getrlimit()* or *setrlimit()* identifies a specific resource to be operated upon as  
 36702 well as a resource limit. A resource limit is represented by an **rlimit** structure. The *rlim\_cur*  
 36703 member specifies the current or soft limit and the *rlim\_max* member specifies the maximum or  
 36704 hard limit. Soft limits may be changed by a process to any value that is less than or equal to the  
 36705 hard limit. A process may (irreversibly) lower its hard limit to any value that is greater than or  
 36706 equal to the soft limit. Only a process with appropriate privileges can raise a hard limit. Both  
 36707 hard and soft limits can be changed in a single call to *setrlimit()* subject to the constraints  
 36708 described above.

36709 The value RLIM\_INFINITY, defined in **<sys/resource.h>**, shall be considered to be larger than  
 36710 any other limit value. If a call to *getrlimit()* returns RLIM\_INFINITY for a resource, it means the  
 36711 implementation shall not enforce limits on that resource. Specifying RLIM\_INFINITY as any  
 36712 resource limit value on a successful call to *setrlimit()* shall inhibit enforcement of that resource  
 36713 limit.

36714 The following resources are defined:

|       |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 36715 | RLIMIT_CORE   | This is the maximum size of a <b>core</b> file, in bytes, that may be created by a process. A limit of 0 shall prevent the creation of a <b>core</b> file. If this limit is exceeded, the writing of a <b>core</b> file shall terminate at this size.                                                                                                                                                             |
| 36716 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36717 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36718 | RLIMIT_CPU    | This is the maximum amount of CPU time, in seconds, used by a process. If this limit is exceeded, SIGXCPU shall be generated for the process. If the process is catching or ignoring SIGXCPU, or all threads belonging to that process are blocking SIGXCPU, the behavior is unspecified.                                                                                                                         |
| 36719 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36720 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36721 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36722 | RLIMIT_DATA   | This is the maximum size of a data segment of the process, in bytes. If this limit is exceeded, the <i>malloc()</i> function shall fail with <i>errno</i> set to [ENOMEM].                                                                                                                                                                                                                                        |
| 36723 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36724 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36725 | RLIMIT_FSIZE  | This is the maximum size of a file, in bytes, that may be created by a process. If a write or truncate operation would cause this limit to be exceeded, SIGXFSZ shall be generated for the thread. If the thread is blocking, or the process is catching or ignoring SIGXFSZ, continued attempts to increase the size of a file from end-of-file to beyond the limit shall fail with <i>errno</i> set to [EFBIG]. |
| 36726 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36727 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36728 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36729 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36730 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36731 | RLIMIT_NOFILE | This is a number one greater than the maximum value that the system may assign to a newly-created descriptor. If this limit is exceeded, functions that allocate a file descriptor shall fail with <i>errno</i> set to [EMFILE]. This limit constrains the number of file descriptors that a process may allocate.                                                                                                |
| 36732 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36733 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36734 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 36735 |               |                                                                                                                                                                                                                                                                                                                                                                                                                   |

36736 RLIMIT\_STACK This is the maximum size of the initial thread's stack, in bytes. The  
 36737 implementation does not automatically grow the stack beyond this limit.  
 36738 If this limit is exceeded, SIGSEGV shall be generated for the thread. If the  
 36739 thread is blocking SIGSEGV, or the process is ignoring or catching  
 36740 SIGSEGV and has not made arrangements to use an alternate stack, the  
 36741 disposition of SIGSEGV shall be set to SIG\_DFL before it is generated.

36742 RLIMIT\_AS This is the maximum size of total available memory of the process, in  
 36743 bytes. If this limit is exceeded, the *malloc()* and *mmap()* functions shall fail  
 36744 with *errno* set to [ENOMEM]. In addition, the automatic stack growth  
 36745 fails with the effects outlined above.

36746 When using the *getrlimit()* function, if a resource limit can be represented correctly in an object  
 36747 of type **rlim\_t**, then its representation is returned; otherwise, if the value of the resource limit is  
 36748 equal to that of the corresponding saved hard limit, the value returned shall be  
 36749 RLIM\_SAVED\_MAX; otherwise, the value returned shall be RLIM\_SAVED\_CUR.

36750 When using the *setrlimit()* function, if the requested new limit is RLIM\_INFINITY, the new limit  
 36751 shall be "no limit"; otherwise, if the requested new limit is RLIM\_SAVED\_MAX, the new limit  
 36752 shall be the corresponding saved hard limit; otherwise, if the requested new limit is  
 36753 RLIM\_SAVED\_CUR, the new limit shall be the corresponding saved soft limit; otherwise, the  
 36754 new limit shall be the requested value. In addition, if the corresponding saved limit can be  
 36755 represented correctly in an object of type **rlim\_t** then it shall be overwritten with the new limit.

36756 The result of setting a limit to RLIM\_SAVED\_MAX or RLIM\_SAVED\_CUR is unspecified unless  
 36757 a previous call to *getrlimit()* returned that value as the soft or hard limit for the corresponding  
 36758 resource limit.

36759 The determination of whether a limit can be correctly represented in an object of type **rlim\_t** is  
 36760 implementation-defined. For example, some implementations permit a limit whose value is  
 36761 greater than RLIM\_INFINITY and others do not.

36762 The *exec* family of functions shall cause resource limits to be saved.

## 36763 RETURN VALUE

36764 Upon successful completion, *getrlimit()* and *setrlimit()* shall return 0. Otherwise, these functions  
 36765 shall return -1 and set *errno* to indicate the error.

## 36766 ERRORS

36767 The *getrlimit()* and *setrlimit()* functions shall fail if:

36768 [EINVAL] An invalid *resource* was specified; or in a *setrlimit()* call, the new *rlim\_cur*  
 36769 exceeds the new *rlim\_max*.

36770 [EPERM] The limit specified to *setrlimit()* would have raised the maximum limit value,  
 36771 and the calling process does not have appropriate privileges.

36772 The *setrlimit()* function may fail if:

36773 [EINVAL] The limit specified cannot be lowered because current usage is already higher  
 36774 than the limit.

**EXAMPLES**

None.

**APPLICATION USAGE**

If a process attempts to set the hard limit or soft limit for RLIMIT\_NOFILE to less than the value of {\_POSIX\_OPEN\_MAX} from <limits.h>, unexpected behavior may occur.

If a process attempts to set the hard limit or soft limit for RLIMIT\_NOFILE to less than the highest currently open file descriptor +1, unexpected behavior may occur.

**RATIONALE**

It should be noted that RLIMIT\_STACK applies “at least” to the stack of the initial thread in the process, and not to the sum of all the stacks in the process, as that would be very limiting unless the value is so big as to provide no value at all with a single thread.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*exec, fork(), malloc(), open(), sigaltstack(), sysconf(), ulimit()*

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

An APPLICATION USAGE section is added.

Large File Summit extensions are added.

**Issue 6**

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/25 is applied, changing wording for RLIMIT\_NOFILE in the DESCRIPTION related to functions that allocate a file descriptor failing with [EMFILE]. Text is added to the APPLICATION USAGE section noting the consequences of a process attempting to set the hard or soft limit for RLIMIT\_NOFILE less than the highest currently open file descriptor +1.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/46 is applied, updating the definition of RLIMIT\_STACK in the DESCRIPTION from “the maximum size of a process stack” to “the maximum size of the initial thread’s stack”. Text is added to the RATIONALE section.

36806 **NAME**

36807 getrusage — get information about resource utilization

36808 **SYNOPSIS**

```
36809 XSI    #include <sys/resource.h>
36810        int getrusage(int who, struct rusage *r_usage);
```

36811 **DESCRIPTION**

36812 The *getrusage()* function shall provide measures of the resources used by the current process or  
 36813 its terminated and waited-for child processes. If the value of the *who* argument is  
 36814 RUSAGE\_SELF, information shall be returned about resources used by the current process. If the  
 36815 value of the *who* argument is RUSAGE\_CHILDREN, information shall be returned about  
 36816 resources used by the terminated and waited-for children of the current process. If the child is  
 36817 never waited for (for example, if the parent has SA\_NOCLDWAIT set or sets SIGCHLD to  
 36818 SIG\_IGN), the resource information for the child process is discarded and not included in the  
 36819 resource information provided by *getrusage()*.

36820 The *r\_usage* argument is a pointer to an object of type **struct rusage** in which the returned  
 36821 information is stored.

36822 **RETURN VALUE**

36823 Upon successful completion, *getrusage()* shall return 0; otherwise, -1 shall be returned and *errno*  
 36824 set to indicate the error.

36825 **ERRORS**

36826 The *getrusage()* function shall fail if:

36827 [EINVAL]        The value of the *who* argument is not valid.

36828 **EXAMPLES**36829 **Using getrusage()**

36830 The following example returns information about the resources used by the current process.

```
36831 #include <sys/resource.h>
36832 ...
36833 int who = RUSAGE_SELF;
36834 struct rusage usage;
36835 int ret;
36836
36837 ret = getrusage(who, &usage);
```

36837 **APPLICATION USAGE**

36838 None.

36839 **RATIONALE**

36840 None.

36841 **FUTURE DIRECTIONS**

36842 None.

36843 **SEE ALSO**

36844 *exit()*, *sigaction()*, *time()*, *times()*, *wait()*

36845 XBD [<sys/resource.h>](#)

36846 **CHANGE HISTORY**

36847 First released in Issue 4, Version 2.

36848 **Issue 5**

36849 Moved from X/OPEN UNIX extension to BASE.

36850 **NAME**36851 gets — get a string from a *stdin* stream36852 **SYNOPSIS**

```
36853 OB      #include <stdio.h>
36854      char *gets(char *s);
```

36855 **DESCRIPTION**

36856 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 36857 conflict between the requirements described here and the ISO C standard is unintentional. This  
 36858 volume of POSIX.1-2008 defers to the ISO C standard.

36859 The *gets()* function shall read bytes from the standard input stream, *stdin*, into the array pointed  
 36860 to by *s*, until a <newline> is read or an end-of-file condition is encountered. Any <newline> shall  
 36861 be discarded and a null byte shall be placed immediately after the last byte read into the array.

36862 CX The *gets()* function may mark the last data access timestamp of the file associated with *stream* for  
 36863 update. The last data access timestamp shall be marked for update by the first successful  
 36864 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, or  
 36865 *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

36866 **RETURN VALUE**

36867 Upon successful completion, *gets()* shall return *s*. If the end-of-file indicator for the stream is set,  
 36868 or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *gets()*  
 36869 shall return a null pointer. If a read error occurs, the error indicator for the stream shall be set,  
 36870 CX *gets()* shall return a null pointer, and set *errno* to indicate the error.

36871 **ERRORS**36872 Refer to *fgetc()*.36873 **EXAMPLES**

36874 None.

36875 **APPLICATION USAGE**

36876 Reading a line that overflows the array pointed to by *s* results in undefined behavior. The use of  
 36877 *fgets()* is recommended.

36878 Since the user cannot specify the length of the buffer passed to *gets()*, use of this function is  
 36879 discouraged. The length of the string read is unlimited. It is possible to overflow this buffer in  
 36880 such a way as to cause applications to fail, or possible system security violations.

36881 Applications should use the *fgets()* function instead of the obsolescent *gets()* function.

36882 **RATIONALE**

36883 The standard developers decided to mark the *gets()* function as obsolescent even though it is in  
 36884 the ISO C standard due to the possibility of buffer overflow.

36885 **FUTURE DIRECTIONS**

36886 The *gets()* function may be removed in a future version.

36887 **SEE ALSO**36888 [Section 2.5](#) (on page 495), [feof\(\)](#), [ferror\(\)](#), [fgets\(\)](#)36889 XBD [<stdio.h>](#)

**CHANGE HISTORY**

36890 First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

36892 Extensions beyond the ISO C standard are marked.

**Issue 7**

36894 Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.

36895 The *gets()* function is marked obsolescent.

36897 Changes are made related to support for finegrained timestamps.

36898 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0257 [14] is applied.

36899 **NAME**

36900        getservbyname, getservbyport, getservent — network services database functions

36901 **SYNOPSIS**

36902        #include &lt;netdb.h&gt;

36903        struct servent \*getservbyname(const char \*name, const char \*proto);

36904        struct servent \*getservbyport(int port, const char \*proto);

36905        struct servent \*getservent(void);

36906 **DESCRIPTION**36907        Refer to *endservent()*.

36908 **NAME**

36909        getsid — get the process group ID of a session leader

36910 **SYNOPSIS**

36911        #include &lt;unistd.h&gt;

36912        pid\_t getsid(pid\_t pid);

36913 **DESCRIPTION**36914        The *getsid()* function shall obtain the process group ID of the process that is the session leader of  
36915        the process specified by *pid*. If *pid* is (**pid\_t**)0, it specifies the calling process.36916 **RETURN VALUE**36917        Upon successful completion, *getsid()* shall return the process group ID of the session leader of  
36918        the specified process. Otherwise, it shall return  $-1$  and set *errno* to indicate the error.36919 **ERRORS**36920        The *getsid()* function shall fail if:36921        [EPERM]        The process specified by *pid* is not in the same session as the calling process,  
36922        and the implementation does not allow access to the process group ID of the  
36923        session leader of that process from the calling process.36924        [ESRCH]        There is no process with a process ID equal to *pid*.36925 **EXAMPLES**

36926        None.

36927 **APPLICATION USAGE**

36928        None.

36929 **RATIONALE**

36930        None.

36931 **FUTURE DIRECTIONS**

36932        None.

36936 **CHANGE HISTORY**

36937        First released in Issue 4, Version 2.

36938 **Issue 5**

36939        Moved from X/OPEN UNIX extension to BASE.

36940 **Issue 7**36941        The *getsid()* function is moved from the XSI option to the Base.

36942        POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0258 [421] is applied.

36943 **NAME**

36944 getsockname — get the socket name

36945 **SYNOPSIS**

36946 #include &lt;sys/socket.h&gt;

36947 int getsockname(int socket, struct sockaddr \*restrict address,  
36948 socklen\_t \*restrict address\_len);36949 **DESCRIPTION**36950 The *getsockname()* function shall retrieve the locally-bound name of the specified socket, store  
36951 this address in the **sockaddr** structure pointed to by the *address* argument, and store the length of  
36952 this address in the object pointed to by the *address\_len* argument.36953 The *address\_len* argument points to a **socklen\_t** object which on input specifies the length of the  
36954 supplied **sockaddr** structure, and on output specifies the length of the stored address. If the  
36955 actual length of the address is greater than the length of the supplied **sockaddr** structure, the  
36956 stored address shall be truncated.36957 If the socket has not been bound to a local name, the value stored in the object pointed to by  
36958 *address* is unspecified.36959 **RETURN VALUE**36960 Upon successful completion, 0 shall be returned, the *address* argument shall point to the address  
36961 of the socket, and the *address\_len* argument shall point to the length of the address. Otherwise, -1  
36962 shall be returned and *errno* set to indicate the error.36963 **ERRORS**36964 The *getsockname()* function shall fail if:36965 [EBADF] The *socket* argument is not a valid file descriptor.36966 [ENOTSOCK] The *socket* argument does not refer to a socket.

36967 [EOPNOTSUPP] The operation is not supported for this socket's protocol.

36968 The *getsockname()* function may fail if:

36969 [EINVAL] The socket has been shut down.

36970 [ENOBUFS] Insufficient resources were available in the system to complete the function.

36971 **EXAMPLES**

36972 None.

36973 **APPLICATION USAGE**

36974 None.

36975 **RATIONALE**

36976 None.

36977 **FUTURE DIRECTIONS**

36981 XBD &lt;sys/socket.h&gt;

**CHANGE HISTORY**

- First released in Issue 6. Derived from the XNS, Issue 5.2 specification.
- The **restrict** keyword is added to the `getsockname()` prototype for alignment with the ISO/IEC 9899:1999 standard.
- Issue 7**
- POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0259 [464] is applied.

36988 **NAME**

36989       getsockopt — get the socket options

36990 **SYNOPSIS**

```
36991       #include <sys/socket.h>
36992       int getsockopt(int socket, int level, int option_name,
36993                      void *restrict option_value, socklen_t *restrict option_len);
```

36994 **DESCRIPTION**36995       The *getsockopt()* function manipulates options associated with a socket.

36996       The *getsockopt()* function shall retrieve the value for the option specified by the *option\_name*  
 36997       argument for the socket specified by the *socket* argument. If the size of the option value is greater  
 36998       than *option\_len*, the value stored in the object pointed to by the *option\_value* argument shall be  
 36999       silently truncated. Otherwise, the object pointed to by the *option\_len* argument shall be modified  
 37000       to indicate the actual length of the value.

37001       The *level* argument specifies the protocol level at which the option resides. To retrieve options at  
 37002       the socket level, specify the *level* argument as SOL\_SOCKET. To retrieve options at other levels,  
 37003       supply the appropriate level identifier for the protocol controlling the option. For example, to  
 37004       indicate that an option is interpreted by the TCP (Transmission Control Protocol), set *level* to  
 37005       IPPROTO\_TCP as defined in the **<netinet/in.h>** header.

37006       The socket in use may require the process to have appropriate privileges to use the *getsockopt()*  
 37007       function.

37008       The *option\_name* argument specifies a single option to be retrieved. It can be one of the socket-  
 37009       level options defined in **<sys/socket.h>** and described in [Section 2.10.16](#) (on page 528).

37010 **RETURN VALUE**

37011       Upon successful completion, *getsockopt()* shall return 0; otherwise, -1 shall be returned and *errno*  
 37012       set to indicate the error.

37013 **ERRORS**37014       The *getsockopt()* function shall fail if:

- |       |               |                                                                |
|-------|---------------|----------------------------------------------------------------|
| 37015 | [EBADF]       | The <i>socket</i> argument is not a valid file descriptor.     |
| 37016 | [EINVAL]      | The specified option is invalid at the specified socket level. |
| 37017 | [ENOPROTOOPT] | The option is not supported by the protocol.                   |
| 37018 |               |                                                                |
| 37019 | [ENOTSOCK]    | The <i>socket</i> argument does not refer to a socket.         |

37020       The *getsockopt()* function may fail if:

- |       |           |                                                                              |
|-------|-----------|------------------------------------------------------------------------------|
| 37021 | [EACCES]  | The calling process does not have appropriate privileges.                    |
| 37022 | [EINVAL]  | The socket has been shut down.                                               |
| 37023 | [ENOBUFS] | Insufficient resources are available in the system to complete the function. |

37036 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

37037 The **restrict** keyword is added to the `getsockopt()` prototype for alignment with the  
37038 ISO/IEC 9899:1999 standard.37039 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/47 is applied, updating the description of  
37040 SO\_LINGER in the DESCRIPTION so that it blocks the calling thread rather than the process.37041 **Issue 7**37042 Austin Group Interpretation 1003.1-2001 #158 is applied, removing text relating to socket options  
37043 that is now in [Section 2.10.16](#) (on page 528).

37044 **NAME**

37045       getsubopt — parse suboption arguments from a string

37046 **SYNOPSIS**

```
37047 CX      #include <stdlib.h>
37048          int getsubopt(char **optionp, char * const *keylistp, char **valuep);
```

37049 **DESCRIPTION**

37050       The *getsubopt()* function shall parse suboption arguments in a flag argument. Such options often  
 37051       result from the use of *getopt()*.

37052       The *getsubopt()* argument *optionp* is a pointer to a pointer to the option argument string. The  
 37053       suboption arguments shall be separated by <comma> characters and each may consist of either  
 37054       a single token, or a token-value pair separated by an <equals-sign>.

37055       The *keylistp* argument shall be a pointer to a vector of strings. The end of the vector is identified  
 37056       by a null pointer. Each entry in the vector is one of the possible tokens that might be found in  
 37057       *\*optionp*. Since <comma> characters delimit suboption arguments in *optionp*, they should not  
 37058       appear in any of the strings pointed to by *keylistp*. Similarly, because an <equals-sign> separates  
 37059       a token from its value, the application should not include an <equals-sign> in any of the strings  
 37060       pointed to by *keylistp*. The *getsubopt()* function shall not modify the *keylistp* vector.

37061       The *valuep* argument is the address of a value string pointer.

37062       If a <comma> appears in *optionp*, it shall be interpreted as a suboption separator. After <comma>  
 37063       characters have been processed, if there are one or more <equals-sign> characters in a suboption  
 37064       string, the first <equals-sign> in any suboption string shall be interpreted as a separator between  
 37065       a token and a value. Subsequent <equals-sign> characters in a suboption string shall be  
 37066       interpreted as part of the value.

37067       If the string at *\*optionp* contains only one suboption argument (equivalently, no <comma>  
 37068       characters), *getsubopt()* shall update *\*optionp* to point to the null character at the end of the  
 37069       string. Otherwise, it shall isolate the suboption argument by replacing the <comma> separator  
 37070       with a null character, and shall update *\*optionp* to point to the start of the next suboption  
 37071       argument. If the suboption argument has an associated value (equivalently, contains an <equals-  
 37072       sign>), *getsubopt()* shall update *\*valuep* to point to the value's first character. Otherwise, it shall  
 37073       set *\*valuep* to a null pointer. The calling application may use this information to determine  
 37074       whether the presence or absence of a value for the suboption is an error.

37075       Additionally, when *getsubopt()* fails to match the suboption argument with a token in the *keylistp*  
 37076       array, the calling application should decide if this is an error, or if the unrecognized option  
 37077       should be processed in another way.

37078 **RETURN VALUE**

37079       The *getsubopt()* function shall return the index of the matched token string, or -1 if no token  
 37080       strings were matched.

37081 **ERRORS**

37082       No errors are defined.

## 37083 EXAMPLES

## 37084 Parsing Suboptions

37085 The following example uses the `getsubopt()` function to parse a *value* argument in the *optarg*  
37086 external variable returned by a call to `getopt()`.

```
37087 #include <stdio.h>
37088 #include <stdlib.h>
37089 #include <unistd.h>
37090
37091 int do_all;
37092 const char *type;
37093 int read_size;
37094 int write_size;
37095 int read_only;
37096
37097 enum
37098 {
37099     RO_OPTION = 0,
37100     RW_OPTION,
37101     READ_SIZE_OPTION,
37102     WRITE_SIZE_OPTION
37103 };
37104
37105 const char *mount_opts[] =
37106 {
37107     [RO_OPTION] = "ro",
37108     [RW_OPTION] = "rw",
37109     [READ_SIZE_OPTION] = "rsize",
37110     [WRITE_SIZE_OPTION] = "wsize",
37111     NULL
37112 };
37113
37114 int
37115 main(int argc, char *argv[])
37116 {
37117     char *subopts, *value;
37118     int opt;
37119
37120     while ((opt = getopt(argc, argv, "at:o:")) != -1)
37121         switch(opt)
37122         {
37123             case 'a':
37124                 do_all = 1;
37125                 break;
37126             case 't':
37127                 type = optarg;
37128                 break;
37129             case 'o':
37130                 subopts = optarg;
37131                 while (*subopts != ' ')
37132                 {
37133                     char *saved = subopts;
37134                     switch(getsubopt(&subopts, (char **)mount_opts,
```

```

37130         &value))
37131     {
37132     case RO_OPTION:
37133         read_only = 1;
37134         break;
37135     case RW_OPTION:
37136         read_only = 0;
37137         break;
37138     case READ_SIZE_OPTION:
37139         if (value == NULL)
37140             abort();
37141         read_size = atoi(value);
37142         break;
37143     case WRITE_SIZE_OPTION:
37144         if (value == NULL)
37145             abort();
37146         write_size = atoi(value);
37147         break;
37148     default:
37149         /* Unknown suboption. */
37150         printf("Unknown suboption '%s'\n", saved);
37151         abort();
37152     }
37153 }
37154 break;
37155 default:
37156     abort();
37157 }
37158
37159     /* Do the real work. */
37160     return 0;
37161 }

```

If the above example is invoked with:

```
program -o ro,rsiz=512
```

then after option parsing, the variable *do\_all* will be 0, *type* will be a null pointer, *read\_size* will be 512, *write\_size* will be 0, and *read\_only* will be 1. If it is invoked with:

```
program -o oops
```

it will print:

```
"Unknown suboption 'oops'"
```

before aborting.

## APPLICATION USAGE

The value of *\*valuep* when *getsubopt()* returns -1 is unspecified. Historical implementations provide various incompatible extensions to allow an application to access the suboption text that was not found in the *keylistp* array.

**RATIONALE**

The *keylistp* argument of *getsubopt()* is typed as **char \* const \*** to match historical practice. However, the standard is clear that implementations will not modify either the array or the strings contained in the array, as if the argument had been typed **const char \* const \***.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*getopt()*

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

**Issue 6**

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/26 is applied, correcting an editorial error in the SYNOPSIS.

**Issue 7**

The *getsubopt()* function is moved from the XSI option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0260 [196], XSH/TC1-2008/0261 [196], XSH/TC1-2008/0262 [196], XSH/TC1-2008/0263 [196], XSH/TC1-2008/0264 [196], XSH/TC1-2008/0265 [196], XSH/TC1-2008/0266 [196], XSH/TC1-2008/0267 [196], XSH/TC1-2008/0268 [196], and XSH/TC1-2008/0269 [196] are applied.

37195 **NAME**

37196       gettimeofday — get the date and time

37197 **SYNOPSIS**

```
37198 OB XSI #include <sys/time.h>
37199 int gettimeofday(struct timeval *restrict tp, void *restrict tzp);
```

37200 **DESCRIPTION**

37201       The *gettimeofday()* function shall obtain the current time, expressed as seconds and microseconds  
37202       since the Epoch, and store it in the **timeval** structure pointed to by *tp*. The resolution of the  
37203       system clock is unspecified.

37204       If *tzp* is not a null pointer, the behavior is unspecified.

37205 **RETURN VALUE**

37206       The *gettimeofday()* function shall return 0 and no value shall be reserved to indicate an error.

37207 **ERRORS**

37208       No errors are defined.

37209 **EXAMPLES**

37210       None.

37211 **APPLICATION USAGE**

37212       Applications should use the *clock\_gettime()* function instead of the obsolescent *gettimeofday()*  
37213       function.

37214 **RATIONALE**

37215       None.

37216 **FUTURE DIRECTIONS**

37217       The *gettimeofday()* function may be removed in a future version.

37218 **SEE ALSO**

37219       *clock\_getres()*, *ctime()*

37220       XBD **<sys/time.h>**

37221 **CHANGE HISTORY**

37222       First released in Issue 4, Version 2.

37223 **Issue 5**

37224       Moved from X/OPEN UNIX extension to BASE.

37225 **Issue 6**

37226       The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since  
37227       00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time*  
37228       functions.

37229       The **restrict** keyword is added to the *gettimeofday()* prototype for alignment with the  
37230       ISO/IEC 9899:1999 standard.

37231 **Issue 7**

37232       The *gettimeofday()* function is marked obsolescent.

37233 **NAME**

37234       getuid — get a real user ID

37235 **SYNOPSIS**

37236       #include &lt;unistd.h&gt;

37237       uid\_t getuid(void);

37238 **DESCRIPTION**

37239       The *getuid()* function shall return the real user ID of the calling process. The *getuid()* function +  
 37240       shall not modify *errno*.

37241 **RETURN VALUE**

37242       The *getuid()* function shall always be successful and no return value is reserved to indicate the  
 37243       error.

37244 **ERRORS**

37245       No errors are defined.

37246 **EXAMPLES**37247       **Setting the Effective User ID to the Real User ID**

37248       The following example sets the effective user ID of the calling process to the real user ID. |

37249       #include &lt;unistd.h&gt;

37250       ...

37251       seteuid(getuid()); +

37252 **APPLICATION USAGE**

37253       None.

37254 **RATIONALE**

37255       In a conforming environment, *getuid()* will always succeed. It is possible for implementations to |  
 37256       provide an extension where a process in a non-conforming environment will not be associated |  
 37257       with a user or group ID. It is recommended that such implementations return (**uid\_t**)–1 and set |  
 37258       *errno* to indicate such an environment; doing so does not violate this standard, since such an |  
 37259       environment is already an extension.

37260 **FUTURE DIRECTIONS**

37261       None.

37262 **SEE ALSO**37263       *getegid()*, *geteuid()*, *getgid()*, *setegid()*, *seteuid()*, *setgid()*, *setregid()*, *setreuid()*, *setuid()*

37264       XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

37265 **CHANGE HISTORY**

37266       First released in Issue 1. Derived from Issue 1 of the SVID.

37267 **Issue 6**

37268       In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

37269       The following new requirements on POSIX implementations derive from alignment with the  
 37270       Single UNIX Specification:

- 37271       • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
 37272       required for conforming implementations of previous POSIX specifications, it was not  
 37273       required for UNIX applications.

37274 **NAME**

37275 getutxent, getutxid, getutxline — get user accounting database entries

37276 **SYNOPSIS**

```
37277 XSI      #include <utmpx.h>
37278          struct utmpx *getutxent(void);
37279          struct utmpx *getutxid(const struct utmpx *id);
37280          struct utmpx *getutxline(const struct utmpx *line);
```

37281 **DESCRIPTION**37282 Refer to *endutxent()*.

37283 **NAME**

37284 getwc — get a wide character from a stream

37285 **SYNOPSIS**

37286 #include &lt;stdio.h&gt;

37287 #include &lt;wchar.h&gt;

37288 wint\_t getwc(FILE \*stream);

37289 **DESCRIPTION**

37290 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
37291 conflict between the requirements described here and the ISO C standard is unintentional. This  
37292 volume of POSIX.1-2008 defers to the ISO C standard.

37293 The *getwc()* function shall be equivalent to *fgetwc()*, except that if it is implemented as a macro it  
37294 may evaluate *stream* more than once, so the argument should never be an expression with side-  
37295 effects.

37296 **RETURN VALUE**37297 Refer to *fgetwc()*.37298 **ERRORS**37299 Refer to *fgetwc()*.37300 **EXAMPLES**

37301 None.

37302 **APPLICATION USAGE**

37303 Since it may be implemented as a macro, *getwc()* may treat incorrectly a *stream* argument with  
37304 side-effects. In particular, *getwc(\*f++)* does not necessarily work as expected. Therefore, use of  
37305 this function is not recommended; *fgetwc()* should be used instead.

37306 **RATIONALE**

37307 None.

37308 **FUTURE DIRECTIONS**

37309 None.

37310 **SEE ALSO**37311 [Section 2.5](#) (on page 495), *fgetwc()*37312 XBD [<stdio.h>](#), [<wchar.h>](#)37313 **CHANGE HISTORY**

37314 First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working  
37315 draft.

37316 **Issue 5**37317 The Optional Header (OH) marking is removed from [<stdio.h>](#).37318 **Issue 7**

37319 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0270 [14] is applied.

37320 **NAME**37321       getwchar — get a wide character from a *stdin* stream37322 **SYNOPSIS**

37323       #include &lt;wchar.h&gt;

37324       wint\_t getwchar(void);

37325 **DESCRIPTION**

37326 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
37327       conflict between the requirements described here and the ISO C standard is unintentional. This  
37328       volume of POSIX.1-2008 defers to the ISO C standard.

37329       The *getwchar()* function shall be equivalent to *getwc(stdin)*.37330 **RETURN VALUE**37331       Refer to *fgetwc()*.37332 **ERRORS**37333       Refer to *fgetwc()*.37334 **EXAMPLES**

37335       None.

37336 **APPLICATION USAGE**

37337       If the **wint\_t** value returned by *getwchar()* is stored into a variable of type **wchar\_t** and then  
37338       compared against the **wint\_t** macro WEOF, the result may be incorrect. Only the **wint\_t** type is  
37339       guaranteed to be able to represent any wide character and WEOF.

37340 **RATIONALE**

37341       None.

37342 **FUTURE DIRECTIONS**

37343       None.

37344 **SEE ALSO**37345       Section 2.5 (on page 495), *fgetwc()*, *getwc()*

37349       draft.

37350 **Issue 7**

37351       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0271 [14] is applied.

**NAME**

glob, globfree — generate pathnames matching a pattern

**SYNOPSIS**

```
#include <glob.h>

int glob(const char *restrict pattern, int flags,
         int (*errfunc)(const char *epath, int eerrno),
         glob_t *restrict pglob);
void globfree(glob_t *pglob);
```

**DESCRIPTION**

The `glob()` function is a pathname generator that shall implement the rules defined in XCU [Section 2.13](#) (on page 2372), with optional support for rule 3 in XCU [Section 2.13.3](#) (on page 2373).

The structure type `glob_t` is defined in `<glob.h>` and includes at least the following members:

| Member Type          | Member Name           | Description                                                  |
|----------------------|-----------------------|--------------------------------------------------------------|
| <code>size_t</code>  | <code>gl_pathc</code> | Count of paths matched by <i>pattern</i> .                   |
| <code>char **</code> | <code>gl_pathv</code> | Pointer to a list of matched pathnames.                      |
| <code>size_t</code>  | <code>gl_offs</code>  | Slots to reserve at the beginning of <code>gl_pathv</code> . |

The argument *pattern* is a pointer to a pathname pattern to be expanded. The `glob()` function shall match all accessible pathnames against this pattern and develop a list of all pathnames that match. In order to have access to a pathname, `glob()` requires search permission on every component of a path except the last, and read permission on each directory of any filename component of *pattern* that contains any of the following special characters: `'*'`, `'?'`, and `'['`.

The `glob()` function shall store the number of matched pathnames into `pglob->gl_pathc` and a pointer to a list of pointers to pathnames into `pglob->gl_pathv`. The pathnames shall be in sort order as defined by the current setting of the `LC_COLLATE` category; see XBD [Section 7.3.2](#) (on page 147). The first pointer after the last pathname shall be a null pointer. If the pattern does not match any pathnames, the returned number of matched paths is set to 0, and the contents of `pglob->gl_pathv` are implementation-defined.

It is the caller's responsibility to create the structure pointed to by *pglob*. The `glob()` function shall allocate other space as needed, including the memory pointed to by `gl_pathv`. The `globfree()` function shall free any space associated with *pglob* from a previous call to `glob()`.

The *flags* argument is used to control the behavior of `glob()`. The value of *flags* is a bitwise-inclusive OR of zero or more of the following constants, which are defined in `<glob.h>`:

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>GLOB_APPEND</code> | Append pathnames generated to the ones from a previous call to <code>glob()</code> .                                                                                                                                                                                                                                                                                                                            |
| <code>GLOB_DOOFFS</code> | Make use of <code>pglob-&gt;gl_offs</code> . If this flag is set, <code>pglob-&gt;gl_offs</code> is used to specify how many null pointers to add to the beginning of <code>pglob-&gt;gl_pathv</code> . In other words, <code>pglob-&gt;gl_pathv</code> shall point to <code>pglob-&gt;gl_offs</code> null pointers, followed by <code>pglob-&gt;gl_pathc</code> pathname pointers, followed by a null pointer. |
| <code>GLOB_ERR</code>    | Cause <code>glob()</code> to return when it encounters a directory that it cannot open or read. Ordinarily, <code>glob()</code> continues to find matches.                                                                                                                                                                                                                                                      |
| <code>GLOB_MARK</code>   | Each pathname that is a directory that matches <i>pattern</i> shall have a <code>&lt;slash&gt;</code> appended.                                                                                                                                                                                                                                                                                                 |

GLOB\_NOCHECK Supports rule 3 in XCU [Section 2.13.3](#) (on page 2373). If *pattern* does not match any pathname, then *glob()* shall return a list consisting of only *pattern*, and the number of matched pathnames is 1.

GLOB\_NOESCAPE Disable backslash escaping.

GLOB\_NOSORT Ordinarily, *glob()* sorts the matching pathnames according to the current setting of the *LC\_COLLATE* category; see XBD [Section 7.3.2](#) (on page 147). When this flag is used, the order of pathnames returned is unspecified.

The GLOB\_APPEND flag can be used to append a new set of pathnames to those found in a previous call to *glob()*. The following rules apply to applications when two or more calls to *glob()* are made with the same value of *pglob* and without intervening calls to *globfree()*:

1. The first such call shall not set GLOB\_APPEND. All subsequent calls shall set it.
2. All the calls shall set GLOB\_DOOFFS, or all shall not set it.
3. After the second call, *pglob->gl\_pathv* points to a list containing the following:
  - a. Zero or more null pointers, as specified by GLOB\_DOOFFS and *pglob->gl\_offs*.
  - b. Pointers to the pathnames that were in the *pglob->gl\_pathv* list before the call, in the same order as before.
  - c. Pointers to the new pathnames generated by the second call, in the specified order.
4. The count returned in *pglob->gl\_pathc* shall be the total number of pathnames from the two calls.
5. The application can change any of the fields after a call to *glob()*. If it does, the application shall reset them to the original value before a subsequent call, using the same *pglob* value, to *globfree()* or *glob()* with the GLOB\_APPEND flag.

If, during the search, a directory is encountered that cannot be opened or read and *errfunc* is not a null pointer, *glob()* calls *(\*errfunc())* with two arguments:

1. The *epath* argument is a pointer to the path that failed.
2. The *eerrno* argument is the value of *errno* from the failure, as set by *opendir()*, *readdir()*, or *stat()*. (Other values may be used to report other errors not explicitly documented for those functions.)

If *(\*errfunc())* is called and returns non-zero, or if the GLOB\_ERR flag is set in *flags*, *glob()* shall stop the scan and return GLOB\_ABORTED after setting *gl\_pathc* and *gl\_pathv* in *pglob* to reflect the paths already scanned. If GLOB\_ERR is not set and either *errfunc* is a null pointer or *(\*errfunc())* returns 0, the error shall be ignored.

The *glob()* function shall not fail because of large files.

## RETURN VALUE

Upon successful completion, *glob()* shall return 0. The argument *pglob->gl\_pathc* shall return the number of matched pathnames and the argument *pglob->gl\_pathv* shall contain a pointer to a null-terminated list of matched and sorted pathnames. However, if *pglob->gl\_pathc* is 0, the content of *pglob->gl\_pathv* is undefined.

The *globfree()* function shall not return a value.

If *glob()* terminates due to an error, it shall return one of the non-zero constants defined in **<glob.h>**. The arguments *pglob->gl\_pathc* and *pglob->gl\_pathv* are still set as defined above.

**ERRORS**

The *glob()* function shall fail and return the corresponding value if:

**GLOB\_ABORTED** The scan was stopped because **GLOB\_ERR** was set or *(\*errfunc())* returned non-zero.

**GLOB\_NOMATCH** The pattern does not match any existing pathname, and **GLOB\_NOCHECK** was not set in flags.

**GLOB\_NOSPACE** An attempt to allocate memory failed.

**EXAMPLES**

One use of the **GLOB\_DOOFFS** flag is by applications that build an argument list for use with *execv()*, *execve()*, or *execvp()*. Suppose, for example, that an application wants to do the equivalent of:

```
ls -l *.c
```

but for some reason:

```
system("ls -l *.c")
```

is not acceptable. The application could obtain approximately the same result using the sequence:

```
globbuf.gl_offs = 2;
glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
globbuf.gl_pathv[0] = "ls";
globbuf.gl_pathv[1] = "-l";
execvp("ls", &globbuf.gl_pathv[0]);
```

Using the same example:

```
ls -l *.c *.h
```

could be approximately simulated using **GLOB\_APPEND** as follows:

```
globbuf.gl_offs = 2;
glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
glob("*.h", GLOB_DOOFFS|GLOB_APPEND, NULL, &globbuf);
...
```

**APPLICATION USAGE**

This function is not provided for the purpose of enabling utilities to perform pathname expansion on their arguments, as this operation is performed by the shell, and utilities are explicitly not expected to redo this. Instead, it is provided for applications that need to do pathname expansion on strings obtained from other sources, such as a pattern typed by a user or read from a file.

If a utility needs to see if a pathname matches a given pattern, it can use *fnmatch()*.

Note that *gl\_pathc* and *gl\_pathv* have meaning even if *glob()* fails. This allows *glob()* to report partial results in the event of an error. However, if *gl\_pathc* is 0, *gl\_pathv* is unspecified even if *glob()* did not return an error.

The **GLOB\_NOCHECK** option could be used when an application wants to expand a pathname if wildcards are specified, but wants to treat the pattern as just a string otherwise. The *sh* utility might use this for option-arguments, for example.

The new pathnames generated by a subsequent call with **GLOB\_APPEND** are not sorted together with the previous pathnames. This mirrors the way that the shell handles pathname

expansion when multiple expansions are done on a command line.

Applications that need tilde and parameter expansion should use *wordexp()*.

#### RATIONALE

It was claimed that the GLOB\_DOOFFS flag is unnecessary because it could be simulated using:

```
new = (char **)malloc((n + pglob->gl_pathc + 1)
    * sizeof(char *));
(void) memcpy(new+n, pglob->gl_pathv,
    pglob->gl_pathc * sizeof(char *));
(void) memset(new, 0, n * sizeof(char *));
free(pglob->gl_pathv);
pglob->gl_pathv = new;
```

However, this assumes that the memory pointed to by *gl\_pathv* is a block that was separately created using *malloc()*. This is not necessarily the case. An application should make no assumptions about how the memory referenced by fields in *pglob* was allocated. It might have been obtained from *malloc()* in a large chunk and then carved up within *glob()*, or it might have been created using a different memory allocator. It is not the intent of the standard developers to specify or imply how the memory used by *glob()* is managed.

The GLOB\_APPEND flag would be used when an application wants to expand several different patterns into a single list.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

*exec*, *fdopendir()*, *fnmatch()*, *fstatat()*, *readdir()*, Section 2.6

XBD Section 7.3.2 (on page 147), **<glob.h>**

#### CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

##### Issue 5

Moved from POSIX2 C-language Binding to BASE.

##### Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *glob()* prototype for alignment with the ISO/IEC 9899:1999 standard.

## 37512 NAME

37513 gmtime, gmtime\_r — convert a time value to a broken-down UTC time

## 37514 SYNOPSIS

```
37515 #include <time.h>
37516 struct tm *gmtime(const time_t *timer);
37517 CX struct tm *gmtime_r(const time_t *restrict timer,
37518 struct tm *restrict result);
```

## 37519 DESCRIPTION

37520 CX For *gmtime()*: The functionality described on this reference page is aligned with the ISO C  
37521 standard. Any conflict between the requirements described here and the ISO C standard is  
37522 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

37523 The *gmtime()* function shall convert the time in seconds since the Epoch pointed to by *timer* into  
37524 a broken-down time, expressed as Coordinated Universal Time (UTC).

37525 CX The relationship between a time in seconds since the Epoch used as an argument to *gmtime()*  
37526 and the **tm** structure (defined in the **<time.h>** header) is that the result shall be as specified in  
37527 the expression given in the definition of seconds since the Epoch (see XBD [Section 4.16](#), on page  
37528 113), where the names in the structure and in the expression correspond.

37529 The same relationship shall apply for *gmtime\_r()*.

37530 The *gmtime()* function need not be thread-safe.

37531 The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static  
37532 objects: a broken-down time structure and an array of type **char**. Execution of any of the  
37533 functions may overwrite the information returned in either of these objects by any of the other  
37534 functions.

37535 The *gmtime\_r()* function shall convert the time in seconds since the Epoch pointed to by *timer*  
37536 into a broken-down time expressed as Coordinated Universal Time (UTC). The broken-down  
37537 time is stored in the structure referred to by *result*. The *gmtime\_r()* function shall also return the  
37538 address of the same structure.

## 37539 RETURN VALUE

37540 Upon successful completion, the *gmtime()* function shall return a pointer to a **struct tm**. If an  
37541 CX error is detected, *gmtime()* shall return a null pointer and set *errno* to indicate the error.

37542 Upon successful completion, *gmtime\_r()* shall return the address of the structure pointed to by  
37543 the argument *result*. If an error is detected, *gmtime\_r()* shall return a null pointer and set *errno* to  
37544 indicate the error.

## 37545 ERRORS

37546 CX The *gmtime()* and *gmtime\_r()* functions shall fail if:

37547 CX [EOVERFLOW] The result cannot be represented.

**EXAMPLES**

None.

**APPLICATION USAGE**

The *gmtime\_r()* function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

A note indicating that the *gmtime()* function need not be reentrant is added to the DESCRIPTION.

The *gmtime\_r()* function is included for alignment with the POSIX Threads Extension.

**Issue 6**

The *gmtime\_r()* function is marked as part of the Thread-Safe Functions option.

Extensions beyond the ISO C standard are marked.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *gmtime\_r()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/27 is applied, adding the [EOVERFLOW] error.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/48 is applied, updating the error handling for *gmtime\_r()*.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #156 is applied.

The *gmtime\_r()* function is moved from the Thread-Safe Functions option to the Base.

37580 **NAME**

37581 grantpt — grant access to the slave pseudo-terminal device

37582 **SYNOPSIS**

```
37583 XSI      #include <stdlib.h>
37584         int grantpt(int fildes);
```

37585 **DESCRIPTION**

37586 The *grantpt()* function shall change the mode and ownership of the slave pseudo-terminal  
37587 device associated with its master pseudo-terminal counterpart. The *fildes* argument is a file  
37588 descriptor that refers to a master pseudo-terminal device. The user ID of the slave shall be set to  
37589 the real UID of the calling process and the group ID shall be set to an unspecified group ID. The  
37590 permission mode of the slave pseudo-terminal shall be set to readable and writable by the  
37591 owner, and writable by the group.

37592 The behavior of the *grantpt()* function is unspecified if the application has installed a signal  
37593 handler to catch SIGCHLD signals.

37594 **RETURN VALUE**

37595 Upon successful completion, *grantpt()* shall return 0; otherwise, it shall return -1 and set *errno* to  
37596 indicate the error.

37597 **ERRORS**

37598 The *grantpt()* function may fail if:

|       |          |                                                                                    |   |
|-------|----------|------------------------------------------------------------------------------------|---|
| 37599 | [EACCES] | The corresponding slave pseudo-terminal device could not be accessed.              | + |
| 37600 | [EBADF]  | The <i>fildes</i> argument is not a valid open file descriptor.                    |   |
| 37601 | [EINVAL] | The <i>fildes</i> argument is not associated with a master pseudo-terminal device. | - |

37602 **EXAMPLES**

37603 None.

37604 **APPLICATION USAGE**

37605 None.

37606 **RATIONALE**

37607 See the RATIONALE section for *posix\_openpt()*.

37608 **FUTURE DIRECTIONS**

37609 None.

37610 **SEE ALSO**

37612 XBD *<stdlib.h>*

37613 **CHANGE HISTORY**

37614 First released in Issue 4, Version 2.

37615 **Issue 5**

37616 Moved from X/OPEN UNIX extension to BASE.

37617 The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

37618 **Issue 7**  
37619

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0272 [96] is applied.

**NAME**

hcreate, hdestroy, hsearch — manage hash search table

**SYNOPSIS**

```
XSI    #include <search.h>

int hcreate(size_t nel);
void hdestroy(void);
ENTRY *hsearch(ENTRY item, ACTION action);
```

**DESCRIPTION**

The *hcreate()*, *hdestroy()*, and *hsearch()* functions shall manage hash search tables.

The *hcreate()* function shall allocate sufficient space for the table, and the application shall ensure it is called before *hsearch()* is used. The *nel* argument is an estimate of the maximum number of entries that the table shall contain. This number may be adjusted upward by the algorithm in order to obtain certain mathematically favorable circumstances.

The *hdestroy()* function shall dispose of the search table, and may be followed by another call to *hcreate()*. After the call to *hdestroy()*, the data can no longer be considered accessible.

The *hsearch()* function is a hash-table search routine. It shall return a pointer into a hash table indicating the location at which an entry can be found. The *item* argument is a structure of type **ENTRY** (defined in the **<search.h>** header) containing two pointers: *item.key* points to the comparison key (a **char \***), and *item.data* (a **void \***) points to any other data to be associated with that key. The comparison function used by *hsearch()* is *strcmp()*. The *action* argument is a member of an enumeration type **ACTION** indicating the disposition of the entry if it cannot be found in the table. **ENTER** indicates that the item should be inserted in the table at an appropriate point. **FIND** indicates that no entry should be made. Unsuccessful resolution is indicated by the return of a null pointer.

These functions need not be thread-safe.

**RETURN VALUE**

The *hcreate()* function shall return 0 if it cannot allocate sufficient space for the table; otherwise, it shall return non-zero.

The *hdestroy()* function shall not return a value.

The *hsearch()* function shall return a null pointer if either the action is **FIND** and the item could not be found or the action is **ENTER** and the table is full.

**ERRORS**

The *hcreate()* and *hsearch()* functions may fail if:

[ENOMEM]      Insufficient storage space is available.

**EXAMPLES**

The following example reads in strings followed by two numbers and stores them in a hash table, discarding duplicates. It then reads in strings and finds the matching entry in the hash table and prints it out.

```
#include <stdio.h>
#include <search.h>
#include <string.h>

struct info {          /* This is the info stored in the table */
    int age, room;      /* other than the key. */
};
```

```

37664     #define NUM_EMPL      5000      /* # of elements in search table. */
37665     int main(void)
37666     {
37667         char string_space[NUM_EMPL*20]; /* Space to store strings. */
37668         struct info info_space[NUM_EMPL]; /* Space to store employee info. */
37669         char *str_ptr = string_space; /* Next space in string_space. */
37670         struct info *info_ptr = info_space;
37671                                     /* Next space in info_space. */
37672         ENTRY item;
37673         ENTRY *found_item; /* Name to look for in table. */
37674         char name_to_find[30];
37675
37676         int i = 0;
37677
37678         /* Create table; no error checking is performed. */
37679         (void) hcreate(NUM_EMPL);
37680         while (scanf("%s%d%d", str_ptr, &info_ptr->age,
37681                     &info_ptr->room) != EOF && i++ < NUM_EMPL) {
37682             /* Put information in structure, and structure in item. */
37683             item.key = str_ptr;
37684             item.data = info_ptr;
37685             str_ptr += strlen(str_ptr) + 1;
37686             info_ptr++;
37687
37688             /* Put item into table. */
37689             (void) hsearch(item, ENTER);
37690         }
37691
37692         /* Access table. */
37693         item.key = name_to_find;
37694         while (scanf("%s", item.key) != EOF) {
37695             if ((found_item = hsearch(item, FIND)) != NULL) {
37696                 /* If item is in the table. */
37697                 (void)printf("found %s, age = %d, room = %d\n",
37698                             found_item->key,
37699                             ((struct info *)found_item->data)->age,
37700                             ((struct info *)found_item->data)->room);
37701             } else
37702                 (void)printf("no such employee %s\n", name_to_find);
37703         }
37704         return 0;
37705     }

```

**APPLICATION USAGE**

The *hcreate()* and *hsearch()* functions may use *malloc()* to allocate space.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

37710 XBD &lt;search.h&gt;

37711 **CHANGE HISTORY**

37712 First released in Issue 1. Derived from Issue 1 of the SVID.

37713 **Issue 6**

37714 The normative text is updated to avoid use of the term “must” for application requirements.

37715 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

37716 **Issue 7**

37717 Austin Group Interpretation 1003.1-2001 #156 is applied.

**NAME**

htonl, htons, ntohl, ntohs — convert values between host and network byte order

**SYNOPSIS**

```
#include <arpa/inet.h>

uint32_t htonl(uint32_t hostlong);
uint16_t htons(uint16_t hostshort);
uint32_t ntohl(uint32_t netlong);
uint16_t ntohs(uint16_t netshort);
```

**DESCRIPTION**

These functions shall convert 16-bit and 32-bit quantities between network byte order and host byte order.

On some implementations, these functions are defined as macros.

The `uint32_t` and `uint16_t` types are defined in `<inttypes.h>`.

**RETURN VALUE**

The `htonl()` and `htons()` functions shall return the argument value converted from host to network byte order.

The `ntohl()` and `ntohs()` functions shall return the argument value converted from network to host byte order.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

These functions are most often used in conjunction with IPv4 addresses and ports as returned by `gethostent()` and `getservent()`.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*endhostent()*, *endservent()*

XBD `<arpa/inet.h>`, `<inttypes.h>`

**CHANGE HISTORY**

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

37752 **NAME**

37753 hypot, hypotf, hypotl — Euclidean distance function

37754 **SYNOPSIS**

```
37755 #include <math.h>
37756 double hypot(double x, double y);
37757 float hypotf(float x, float y);
37758 long double hypotl(long double x, long double y);
```

37759 **DESCRIPTION**

37760 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 37761 conflict between the requirements described here and the ISO C standard is unintentional. This  
 37762 volume of POSIX.1-2008 defers to the ISO C standard.

37763 These functions shall compute the value of the square root of  $x^2+y^2$  without undue overflow or  
 37764 underflow.

37765 An application wishing to check for error situations should set *errno* to zero and call  
 37766 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 37767 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 37768 zero, an error has occurred.

37769 **RETURN VALUE**

37770 Upon successful completion, these functions shall return the length of the hypotenuse of a right-  
 37771 angled triangle with sides of length *x* and *y*.

37772 If the correct value would cause overflow, a range error shall occur and *hypot()*, *hypotf()*, and  
 37773 *hypotl()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 37774 respectively.

37775 MX If *x* or *y* is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned (even if one of *x* or *y* is NaN).

37776 If *x* or *y* is NaN, and the other is not  $\pm\text{Inf}$ , a NaN shall be returned.

37777 MXX If both arguments are subnormal and the correct result is subnormal, a range error may occur  
 37778 and the correct result shall be returned.

37779 **ERRORS**

37780 These functions shall fail if:

37781 Range Error The result overflows.

37782 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 37783 then *errno* shall be set to [ERANGE]. If the integer expression  
 37784 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 37785 floating-point exception shall be raised.

37786 These functions may fail if:

37787 MX Range Error The result underflows.

37788 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 37789 then *errno* shall be set to [ERANGE]. If the integer expression  
 37790 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 37791 floating-point exception shall be raised.

**EXAMPLES**

See the EXAMPLES section in *atan2()*.

**APPLICATION USAGE**

*hypot(x,y)*, *hypot(y,x)*, and *hypot(x, -y)* are equivalent.

*hypot(x, ±0)* is equivalent to *fabs(x)*.

Underflow only happens when both *x* and *y* are subnormal and the (inexact) result is also subnormal.

These functions take precautions against overflow during intermediate steps of the computation.

On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* & MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*atan2()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *sqrt()*

XBD Section 4.20 (on page 117), <math.h>

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

**Issue 6**

The *hypot()* function is no longer marked as an extension.

The *hypotf()* and *hypotl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/49 is applied, updating the EXAMPLES section.

**Issue 7**

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0273 [68] is applied.

**NAME**

iconv — codeset conversion function

**SYNOPSIS**

```
#include <iconv.h>

size_t iconv(iconv_t cd, char **restrict inbuf,
             size_t *restrict inbytesleft, char **restrict outbuf,
             size_t *restrict outbytesleft);
```

**DESCRIPTION**

The *iconv()* function shall convert the sequence of characters from one codeset, in the array specified by *inbuf*, into a sequence of corresponding characters in another codeset, in the array specified by *outbuf*. The codesets are those specified in the *iconv\_open()* call that returned the conversion descriptor, *cd*. The *inbuf* argument points to a variable that points to the first character in the input buffer and *inbytesleft* indicates the number of bytes to the end of the buffer to be converted. The *outbuf* argument points to a variable that points to the first available byte in the output buffer and *outbytesleft* indicates the number of the available bytes to the end of the buffer.

For state-dependent encodings, the conversion descriptor *cd* is placed into its initial shift state by a call for which *inbuf* is a null pointer, or for which *inbuf* points to a null pointer. When *iconv()* is called in this way, and if *outbuf* is not a null pointer or a pointer to a null pointer, and *outbytesleft* points to a positive value, *iconv()* shall place, into the output buffer, the byte sequence to change the output buffer to its initial shift state. If the output buffer is not large enough to hold the entire reset sequence, *iconv()* shall fail and set *errno* to [E2BIG]. Subsequent calls with *inbuf* as other than a null pointer or a pointer to a null pointer cause the conversion to take place from the current state of the conversion descriptor.

If a sequence of input bytes does not form a valid character in the specified codeset, conversion shall stop after the previous successfully converted character. If the input buffer ends with an incomplete character or shift sequence, conversion shall stop after the previous successfully converted bytes. If the output buffer is not large enough to hold the entire converted input, conversion shall stop just prior to the input bytes that would cause the output buffer to overflow. The variable pointed to by *inbuf* shall be updated to point to the byte following the last byte successfully used in the conversion. The value pointed to by *inbytesleft* shall be decremented to reflect the number of bytes still not converted in the input buffer. The variable pointed to by *outbuf* shall be updated to point to the byte following the last byte of converted output data. The value pointed to by *outbytesleft* shall be decremented to reflect the number of bytes still available in the output buffer. For state-dependent encodings, the conversion descriptor shall be updated to reflect the shift state in effect at the end of the last successfully converted byte sequence.

If *iconv()* encounters a character in the input buffer that is valid, but for which an identical character does not exist in the target codeset, *iconv()* shall perform an implementation-defined conversion on this character.

**RETURN VALUE**

The *iconv()* function shall update the variables pointed to by the arguments to reflect the extent of the conversion and return the number of non-identical conversions performed. If the entire string in the input buffer is converted, the value pointed to by *inbytesleft* shall be 0. If the input conversion is stopped due to any conditions mentioned above, the value pointed to by *inbytesleft* shall be non-zero and *errno* shall be set to indicate the condition. If an error occurs, *iconv()* shall return (**size\_t**)–1 and set *errno* to indicate the error.

**ERRORS**

The *iconv()* function shall fail if:

[EILSEQ] Input conversion stopped due to an input byte that does not belong to the input codeset.

[E2BIG] Input conversion stopped due to lack of space in the output buffer.

[EINVAL] Input conversion stopped due to an incomplete character or shift sequence at the end of the input buffer.

The *iconv()* function may fail if:

[EBADF] The *cd* argument is not a valid open conversion descriptor.

**EXAMPLES**

None.

**APPLICATION USAGE**

The *inbuf* argument indirectly points to the memory area which contains the conversion input data. The *outbuf* argument indirectly points to the memory area which is to contain the result of the conversion. The objects indirectly pointed to by *inbuf* and *outbuf* are not restricted to containing data that is directly representable in the ISO C standard language **char** data type. The type of *inbuf* and *outbuf*, **char \*\***, does not imply that the objects pointed to are interpreted as null-terminated C strings or arrays of characters. Any interpretation of a byte sequence that represents a character in a given character set encoding scheme is done internally within the codeset converters. For example, the area pointed to indirectly by *inbuf* and/or *outbuf* can contain all zero octets that are not interpreted as string terminators but as coded character data according to the respective codeset encoding scheme. The type of the data (**char**, **short**, **long**, and so on) read or stored in the objects is not specified, but may be inferred for both the input and output data by the converters determined by the *fromcode* and *tocode* arguments of *iconv\_open()*.

Regardless of the data type inferred by the converter, the size of the remaining space in both input and output objects (the *intbytesleft* and *outbytesleft* arguments) is always measured in bytes.

For implementations that support the conversion of state-dependent encodings, the conversion descriptor must be able to accurately reflect the shift-state in effect at the end of the last successful conversion. It is not required that the conversion descriptor itself be updated, which would require it to be a pointer type. Thus, implementations are free to implement the descriptor as a handle (other than a pointer type) by which the conversion information can be accessed and updated.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

XBD <**iconv.h**>

**CHANGE HISTORY**

First released in Issue 4. Derived from the HP-UX Manual.

37914 **Issue 6**

37915 The SYNOPSIS has been corrected to align with the **<iconv.h>** reference page.

37916 The **restrict** keyword is added to the *iconv()* prototype for alignment with the  
37917 ISO/IEC 9899:1999 standard.

37918 **Issue 7**

37919 The *iconv()* function is moved from the XSI option to the Base.

37920 **NAME**

37921 iconv\_close — codeset conversion deallocation function

37922 **SYNOPSIS**

37923 #include &lt;iconv.h&gt;

37924 int iconv\_close(iconv\_t *cd*);37925 **DESCRIPTION**37926 The *iconv\_close()* function shall deallocate the conversion descriptor *cd* and all other associated  
37927 resources allocated by *iconv\_open()*.37928 If a file descriptor is used to implement the type **iconv\_t**, that file descriptor shall be closed.37929 **RETURN VALUE**37930 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
37931 indicate the error.37932 **ERRORS**37933 The *iconv\_close()* function may fail if:

37934 [EBADF] The conversion descriptor is invalid.

37935 **EXAMPLES**

37936 None.

37937 **APPLICATION USAGE**

37938 None.

37939 **RATIONALE**

37940 None.

37941 **FUTURE DIRECTIONS**

37942 None.

37943 **SEE ALSO**37944 *iconv()*, *iconv\_open()*

37945 XBD &lt;iconv.h&gt;

37946 **CHANGE HISTORY**

37947 First released in Issue 4. Derived from the HP-UX Manual.

37948 **Issue 7**37949 The *iconv\_close()* function is moved from the XSI option to the Base.

**NAME**

iconv\_open — codeset conversion allocation function

**SYNOPSIS**

```
#include <iconv.h>
```

```
iconv_t iconv_open(const char *tocode, const char *fromcode);
```

**DESCRIPTION**

The *iconv\_open()* function shall return a conversion descriptor that describes a conversion from the codeset specified by the string pointed to by the *fromcode* argument to the codeset specified by the string pointed to by the *tocode* argument. For state-dependent encodings, the conversion descriptor shall be in a codeset-dependent initial shift state, ready for immediate use with *iconv()*.

Settings of *fromcode* and *tocode* and their permitted combinations are implementation-defined.

A conversion descriptor shall remain valid until it is closed by *iconv\_close()* or an implicit close.

If a file descriptor is used to implement conversion descriptors, the FD\_CLOEXEC flag shall be set; see <fcntl.h>.

**RETURN VALUE**

Upon successful completion, *iconv\_open()* shall return a conversion descriptor for use on subsequent calls to *iconv()*. Otherwise, *iconv\_open()* shall return (**iconv\_t**)−1 and set *errno* to indicate the error.

**ERRORS**

The *iconv\_open()* function may fail if:

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] Too many files are currently open in the system.

[ENOMEM] Insufficient storage space is available.

[EINVAL] The conversion specified by *fromcode* and *tocode* is not supported by the implementation.

**EXAMPLES**

None.

**APPLICATION USAGE**

Some implementations of *iconv\_open()* use *malloc()* to allocate space for internal buffer areas. The *iconv\_open()* function may fail if there is insufficient storage space to accommodate these buffers.

Conforming applications must assume that conversion descriptors are not valid after a call to one of the *exec* functions.

Application developers should consult the system documentation to determine the supported codesets and their naming schemes.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

37990 **SEE ALSO**37991 *iconv()*, *iconv\_close()*

37993 **CHANGE HISTORY**

37994 First released in Issue 4. Derived from the HP-UX Manual.

37995 **Issue 7**

37996 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

37997 The *iconv\_open()* function is moved from the XSI option to the Base.

**37998 NAME**

37999       if\_freenameindex — free memory allocated by if\_nameindex

**38000 SYNOPSIS**

38001       #include <net/if.h>

38002       void if\_freenameindex(struct if\_nameindex \*ptr);

**38003 DESCRIPTION**

38004       The *if\_freenameindex()* function shall free the memory allocated by *if\_nameindex()*. The *ptr*  
 38005       argument shall be a pointer that was returned by *if\_nameindex()*. After *if\_freenameindex()* has  
 38006       been called, the application shall not use the array of which *ptr* is the address.

**38007 RETURN VALUE**

38008       None.

**38009 ERRORS**

38010       No errors are defined.

**38011 EXAMPLES**

38012       None.

**38013 APPLICATION USAGE**

38014       None.

**38015 RATIONALE**

38016       None.

**38017 FUTURE DIRECTIONS**

38018       None.

38021       XBD <net/if.h>

**38022 CHANGE HISTORY**

38023       First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

38024 **NAME**

38025 if\_indextoname — map a network interface index to its corresponding name

38026 **SYNOPSIS**

38027 #include &lt;net/if.h&gt;

38028 char \*if\_indextoname(unsigned ifindex, char \*ifname);

38029 **DESCRIPTION**38030 The *if\_indextoname()* function shall map an interface index to its corresponding name.38031 When this function is called, *ifname* shall point to a buffer of at least {IF\_NAMESIZE} bytes. The  
38032 function shall place in this buffer the name of the interface with index *ifindex*.38033 **RETURN VALUE**38034 If *ifindex* is an interface index, then the function shall return the value supplied in *ifname*, which  
38035 points to a buffer now containing the interface name. Otherwise, the function shall return a null  
38036 pointer and set *errno* to indicate the error.38037 **ERRORS**38038 The *if\_indextoname()* function shall fail if:

38039 [ENXIO] The interface does not exist.

38040 **EXAMPLES**

38041 None.

38042 **APPLICATION USAGE**

38043 None.

38044 **RATIONALE**

38045 None.

38046 **FUTURE DIRECTIONS**

38047 None.

38050 XBD &lt;net/if.h&gt;

38051 **CHANGE HISTORY**

38052 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

38053 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/28 is applied, changing {IFNAMSIZ} to  
38054 {IF\_NAMESIZ} in the DESCRIPTION.

38055 **NAME**

38056 if\_nameindex — return all network interface names and indexes

38057 **SYNOPSIS**

38058 #include <net/if.h>

38059 struct if\_nameindex \*if\_nameindex(void);

38060 **DESCRIPTION**

38061 The *if\_nameindex()* function shall return an array of *if\_nameindex* structures, one structure per  
38062 interface. The end of the array is indicated by a structure with an *if\_index* field of zero and an  
38063 *if\_name* field of NULL.

38064 Applications should call *if\_freenameindex()* to release the memory that may be dynamically  
38065 allocated by this function, after they have finished using it.

38066 **RETURN VALUE**

38067 An array of structures identifying local interfaces. A null pointer is returned upon an error, with  
38068 *errno* set to indicate the error.

38069 **ERRORS**

38070 The *if\_nameindex()* function may fail if:

38071 [ENOBUFS] Insufficient resources are available to complete the function.

38072 **EXAMPLES**

38073 None.

38074 **APPLICATION USAGE**

38075 None.

38076 **RATIONALE**

38077 None.

38078 **FUTURE DIRECTIONS**

38079 None.

38105 *getsockopt()*, *if\_freenameindex()*, *if\_indextoname()*, *if\_nameindex()*, *setsockopt()*

38106 XBD <net/if.h>

**38107 CHANGE HISTORY**

38108 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

38109 **NAME**

38110       ilogb, ilogbf, ilogbl — return an unbiased exponent

38111 **SYNOPSIS**

```
38112       #include <math.h>
38113       int ilogb(double x);
38114       int ilogbf(float x);
38115       int ilogbl(long double x);
```

38116 **DESCRIPTION**

38117 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 38118       conflict between the requirements described here and the ISO C standard is unintentional. This  
 38119       volume of POSIX.1-2008 defers to the ISO C standard.

38120       These functions shall return the exponent part of their argument  $x$ . Formally, the return value is  
 38121       the integral part of  $\log_r |x|$  as a signed integral value, for non-zero  $x$ , where  $r$  is the radix of the  
 38122       machine's floating-point arithmetic, which is the value of FLT\_RADIX defined in <float.h>.

38123       An application wishing to check for error situations should set *errno* to zero and call  
 38124       *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 38125       *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 38126       zero, an error has occurred.

38127 **RETURN VALUE**

38128       Upon successful completion, these functions shall return the exponent part of  $x$  as a signed  
 38129       integer value. They are equivalent to calling the corresponding *logb*() function and casting the  
 38130       returned value to type **int**.

38131 XSI       If  $x$  is 0, the value FP\_ILOGB0 shall be returned. On XSI-conformant systems, a domain error  
 38132       shall occur;

38133 CX       otherwise, a domain error may occur.

38134 XSI       If  $x$  is  $\pm\text{Inf}$ , the value {INT\_MAX} shall be returned. On XSI-conformant systems, a domain  
 38135       error shall occur;

38136 CX       otherwise, a domain error may occur.

38137 XSI       If  $x$  is a NaN, the value FP\_ILOGBNAN shall be returned. On XSI-conformant systems, a  
 38138       domain error shall occur;

38139 CX       otherwise, a domain error may occur.

38140 MX       If the correct value is greater than {INT\_MAX}, a domain error shall occur and an unspecified  
 38141 XSI       value shall be returned. On XSI-conformant systems, a domain error shall occur and  
 38142       {INT\_MAX} shall be returned.

38143 MX       If the correct value is less than {INT\_MIN}, a domain error shall occur and an unspecified value  
 38144 XSI       shall be returned. On XSI-conformant systems, a domain error shall occur and {INT\_MIN} shall  
 38145       be returned.

38146 **ERRORS**

38147       These functions shall fail if:

38148 XSI|MX   **Domain Error**   The correct value is not representable as an integer.

38149 XSI       The  $x$  argument is zero, NaN, or  $\pm\text{Inf}$ .

38150 XSI|MX   If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 38151       then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 38152       & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 38153       shall be raised.

38154 These functions may fail if:

38155 Domain Error The  $x$  argument is zero, NaN, or  $\pm\text{Inf}$ .

38156 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 38157 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 38158 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 38159 shall be raised.

#### 38160 EXAMPLES

38161 None.

#### 38162 APPLICATION USAGE

38163 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 38164 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

#### 38165 RATIONALE

38166 The errors come from taking the expected floating-point value and converting it to **int**, which is  
 38167 an invalid operation in IEEE Std 754-1985 (since overflow, infinity, and NaN are not  
 38168 representable in a type **int**), so should be a domain error.

38169 There are no known implementations that overflow. For overflow to happen, {INT\_MAX} must  
 38170 be less than  $\text{LDBL\_MAX\_EXP} \cdot \log_2(\text{FLT\_RADIX})$  or {INT\_MIN} must be greater than  
 38171  $\text{LDBL\_MIN\_EXP} \cdot \log_2(\text{FLT\_RADIX})$  if subnormals are not supported, or {INT\_MIN} must be  
 38172 greater than  $(\text{LDBL\_MIN\_EXP} - \text{LDBL\_MANT\_DIG}) \cdot \log_2(\text{FLT\_RADIX})$  if subnormals are  
 38173 supported.

#### 38174 FUTURE DIRECTIONS

38175 None.

#### 38179 CHANGE HISTORY

38180 First released in Issue 4, Version 2.

#### 38181 Issue 5

38182 Moved from X/OPEN UNIX extension to BASE.

#### 38183 Issue 6

38184 The *ilogb()* function is no longer marked as an extension.

38185 The *ilogbf()* and *ilogbl()* functions are added for alignment with the ISO/IEC 9899:1999  
 38186 standard.

38187 The RETURN VALUE section is revised for alignment with the ISO/IEC 9899:1999 standard.

38188 Functionality relating to the XSI option is marked.

#### 38189 Issue 7

38190 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #48 (SD5-XSH-ERN-71), #49, and #79  
 38191 (SD5-XSH-ERN-72) are applied.

38192 **NAME**

38193 imaxabs — return absolute value

38194 **SYNOPSIS**

38195 #include &lt;inttypes.h&gt;

38196 intmax\_t imaxabs(intmax\_t j);

38197 **DESCRIPTION**

38198 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
38199 conflict between the requirements described here and the ISO C standard is unintentional. This  
38200 volume of POSIX.1-2008 defers to the ISO C standard.

38201 The *imaxabs()* function shall compute the absolute value of an integer *j*. If the result cannot be  
38202 represented, the behavior is undefined.

38203 **RETURN VALUE**38204 The *imaxabs()* function shall return the absolute value.38205 **ERRORS**

38206 No errors are defined.

38207 **EXAMPLES**

38208 None.

38209 **APPLICATION USAGE**

38210 The absolute value of the most negative number cannot be represented in two's complement.

38211 **RATIONALE**

38212 None.

38213 **FUTURE DIRECTIONS**

38214 None.

38215 **SEE ALSO**38216 *imaxdiv()*

38217 XBD &lt;inttypes.h&gt;

38218 **CHANGE HISTORY**

38219 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

38220 **NAME**

38221 imaxdiv — return quotient and remainder

38222 **SYNOPSIS**

38223 #include &lt;inttypes.h&gt;

38224 imaxdiv\_t imaxdiv(intmax\_t numer, intmax\_t denom);

38225 **DESCRIPTION**

38226 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
38227 conflict between the requirements described here and the ISO C standard is unintentional. This  
38228 volume of POSIX.1-2008 defers to the ISO C standard.

38229 The *imaxdiv()* function shall compute *numer* / *denom* and *numer* % *denom* in a single operation.38230 **RETURN VALUE**

38231 The *imaxdiv()* function shall return a structure of type **imaxdiv\_t**, comprising both the quotient  
38232 and the remainder. The structure shall contain (in either order) the members *quot* (the quotient)  
38233 and *rem* (the remainder), each of which has type **intmax\_t**.

38234 If either part of the result cannot be represented, the behavior is undefined.

38235 **ERRORS**

38236 No errors are defined.

38237 **EXAMPLES**

38238 None.

38239 **APPLICATION USAGE**

38240 None.

38247 XBD &lt;inttypes.h&gt;

38248 **CHANGE HISTORY**

38249 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**NAME**

inet\_addr, inet\_ntoa — IPv4 address manipulation

**SYNOPSIS**

```
#include <arpa/inet.h>

in_addr_t inet_addr(const char *cp);
char *inet_ntoa(struct in_addr in);
```

**DESCRIPTION**

The *inet\_addr()* function shall convert the string pointed to by *cp*, in the standard IPv4 dotted decimal notation, to an integer value suitable for use as an Internet address.

The *inet\_ntoa()* function shall convert the Internet host address specified by *in* to a string in the Internet standard dot notation.

The *inet\_ntoa()* function need not be thread-safe.

All Internet addresses shall be returned in network order (bytes ordered from left to right).

Values specified using IPv4 dotted decimal notation take one of the following forms:

*a.b.c.d* When four parts are specified, each shall be interpreted as a byte of data and assigned, from left to right, to the four bytes of an Internet address.

*a.b.c* When a three-part address is specified, the last part shall be interpreted as a 16-bit quantity and placed in the rightmost two bytes of the network address. This makes the three-part address format convenient for specifying Class B network addresses as "128.net.host".

*a.b* When a two-part address is supplied, the last part shall be interpreted as a 24-bit quantity and placed in the rightmost three bytes of the network address. This makes the two-part address format convenient for specifying Class A network addresses as "net.host".

*a* When only one part is given, the value shall be stored directly in the network address without any byte rearrangement.

All numbers supplied as parts in IPv4 dotted decimal notation may be decimal, octal, or hexadecimal, as specified in the ISO C standard (that is, a leading 0x or 0X implies hexadecimal; otherwise, a leading '0' implies octal; otherwise, the number is interpreted as decimal).

**RETURN VALUE**

Upon successful completion, *inet\_addr()* shall return the Internet address. Otherwise, it shall return (*in\_addr\_t*)(-1).

The *inet\_ntoa()* function shall return a pointer to the network address in Internet standard dot notation.

**ERRORS**

No errors are defined.

**38286 EXAMPLES**

38287       None.

**38288 APPLICATION USAGE**

38289       The return value of *inet\_ntoa()* may point to static data that may be overwritten by subsequent  
38290       calls to *inet\_ntoa()*.

**38291 RATIONALE**

38292       None.

**38293 FUTURE DIRECTIONS**

38294       None.

38301       Austin Group Interpretation 1003.1-2001 #156 is applied.

## 38302 NAME

38303 inet\_ntop, inet\_pton — convert IPv4 and IPv6 addresses between binary and text form

## 38304 SYNOPSIS

```
38305 #include <arpa/inet.h>
38306
38306 const char *inet_ntop(int af, const void *restrict src,
38307                       char *restrict dst, socklen_t size);
38308
38308 int inet_pton(int af, const char *restrict src, void *restrict dst);
```

## 38309 DESCRIPTION

38310 The *inet\_ntop()* function shall convert a numeric address into a text string suitable for  
 38311 IP6 presentation. The *af* argument shall specify the family of the address. This can be AF\_INET or  
 38312 AF\_INET6. The *src* argument points to a buffer holding an IPv4 address if the *af* argument is  
 38313 IP6 AF\_INET, or an IPv6 address if the *af* argument is AF\_INET6; the address must be in network  
 38314 byte order. The *dst* argument points to a buffer where the function stores the resulting text string;  
 38315 it shall not be NULL. The *size* argument specifies the size of this buffer, which shall be large  
 38316 IP6 enough to hold the text string (INET\_ADDRSTRLEN characters for IPv4,  
 38317 INET6\_ADDRSTRLEN characters for IPv6).

38318 The *inet\_pton()* function shall convert an address in its standard text presentation form into its  
 38319 IP6 numeric binary form. The *af* argument shall specify the family of the address. The AF\_INET and  
 38320 AF\_INET6 address families shall be supported. The *src* argument points to the string being  
 38321 passed in. The *dst* argument points to a buffer into which the function stores the numeric  
 38322 IP6 address; this shall be large enough to hold the numeric address (32 bits for AF\_INET, 128 bits  
 38323 for AF\_INET6).

38324 If the *af* argument of *inet\_pton()* is AF\_INET, the *src* string shall be in the standard IPv4 dotted-  
 38325 decimal form:

38326 ddd.ddd.ddd.ddd

38327 where "ddd" is a one to three digit decimal number between 0 and 255 (see *inet\_addr()*). The  
 38328 *inet\_pton()* function does not accept other formats (such as the octal numbers, hexadecimal  
 38329 numbers, and fewer than four numbers that *inet\_addr()* accepts).

38330 IP6 If the *af* argument of *inet\_pton()* is AF\_INET6, the *src* string shall be in one of the following  
 38331 standard IPv6 text forms:

- 38332 1. The preferred form is "x:x:x:x:x:x:x:x", where the 'x's are the hexadecimal values  
 38333 of the eight 16-bit pieces of the address. Leading zeros in individual fields can be  
 38334 omitted, but there shall be one to four hexadecimal digits in every field.
- 38335 2. A string of contiguous zero fields in the preferred form can be shown as "::". The "::"  
 38336 can only appear once in an address. Unspecified addresses ("0:0:0:0:0:0:0:0") may  
 38337 be represented simply as "::".
- 38338 3. A third form that is sometimes more convenient when dealing with a mixed environment  
 38339 of IPv4 and IPv6 nodes is "x:x:x:x:x:x.d.d.d.d", where the 'x's are the  
 38340 hexadecimal values of the six high-order 16-bit pieces of the address, and the 'd's are the  
 38341 decimal values of the four low-order 8-bit pieces of the address (standard IPv4  
 38342 representation).

38343 **Note:** A more extensive description of the standard representations of IPv6 addresses can be found in  
 38344 RFC 2373.

**RETURN VALUE**

The *inet\_ntop()* function shall return a pointer to the buffer containing the text string if the conversion succeeds, and NULL otherwise, and set *errno* to indicate the error.

The *inet\_pton()* function shall return 1 if the conversion succeeds, with the address pointed to by *dst* in network byte order. It shall return 0 if the input is not a valid IPv4 dotted-decimal string or a valid IPv6 address string, or -1 with *errno* set to [EAFNOSUPPORT] if the *af* argument is unknown.

**ERRORS**

The *inet\_ntop()* and *inet\_pton()* functions shall fail if:

[EAFNOSUPPORT]

The *af* argument is invalid.

[ENOSPC]

The size of the *inet\_ntop()* result buffer is inadequate.

**EXAMPLES**

XBD <arpa/inet.h>

**CHANGE HISTORY**

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

IPv6 extensions are marked.

The **restrict** keyword is added to the *inet\_ntop()* and *inet\_pton()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/29 is applied, adding “the address must be in network byte order” to the end of the fourth sentence of the first paragraph in the DESCRIPTION.

**NAME**

initstate, random, setstate, srandom — pseudo-random number functions

**SYNOPSIS**

```
XSI #include <stdlib.h>

char *initstate(unsigned seed, char *state, size_t size);
long random(void);
char *setstate(char *state);
void srandom(unsigned seed);
```

**DESCRIPTION**

The *random()* function shall use a non-linear additive feedback random-number generator employing a default state array size of 31 **long** integers to return successive pseudo-random numbers in the range from 0 to  $2^{31}-1$ . The period of this random-number generator is approximately  $16 \times (2^{31}-1)$ . The size of the state array determines the period of the random-number generator. Increasing the state array size shall increase the period.

With 256 bytes of state information, the period of the random-number generator shall be greater than  $2^{69}$ .

Like *rand()*, *random()* shall produce by default a sequence of numbers that can be duplicated by calling *srandom()* with 1 as the seed.

The *srandom()* function shall initialize the current state array using the value of *seed*.

The *initstate()* and *setstate()* functions handle restarting and changing random-number generators. The *initstate()* function allows a state array, pointed to by the *state* argument, to be initialized for future use. The *size* argument, which specifies the size in bytes of the state array, shall be used by *initstate()* to decide what type of random-number generator to use; the larger the state array, the more random the numbers. Values for the amount of state information are 8, 32, 64, 128, and 256 bytes. Other values greater than 8 bytes are rounded down to the nearest one of these values. If *initstate()* is called with  $8 \leq \text{size} < 32$ , then *random()* shall use a simple linear congruential random number generator. The *seed* argument specifies a starting point for the random-number sequence and provides for restarting at the same point. The *initstate()* function shall return a pointer to the previous state information array.

If *initstate()* has not been called, then *random()* shall behave as though *initstate()* had been called with *seed*=1 and *size*=128.

Once a state has been initialized, *setstate()* allows switching between state arrays. The array defined by the *state* argument shall be used for further random-number generation until *initstate()* is called or *setstate()* is called again. The *setstate()* function shall return a pointer to the previous state array.

**RETURN VALUE**

If *initstate()* is called with *size* less than 8, it shall return NULL.

The *random()* function shall return the generated pseudo-random number.

The *srandom()* function shall not return a value.

Upon successful completion, *initstate()* and *setstate()* shall return a pointer to the previous state array; otherwise, a null pointer shall be returned.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

After initialization, a state array can be restarted at a different point in one of two ways:

1. The *initstate()* function can be used, with the desired seed, state array, and size of the array.
2. The *setstate()* function, with the desired state, can be used, followed by *srandom()* with the desired seed. The advantage of using both of these functions is that the size of the state array does not have to be saved once it is initialized.

Although some implementations of *random()* have written messages to standard error, such implementations do not conform to POSIX.1-2008.

Issue 5 restored the historical behavior of this function.

Threaded applications should use *erand48()*, *nrand48()*, or *jrand48()* instead of *random()* when an independent random number sequence in multiple threads is required.

These functions should be avoided whenever non-trivial requirements (including safety) have to be fulfilled.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

XBD <stdlib.h>

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

In the DESCRIPTION, the phrase “values smaller than 8” is replaced with “values greater than or equal to 8, or less than 32”, “size<8” is replaced with “8≤size <32”, and a new first paragraph is added to the RETURN VALUE section. A note is added to the APPLICATION USAGE indicating that these changes restore the historical behavior of the function.

**Issue 6**

In the DESCRIPTION, duplicate text “For values greater than or equal to 8...” is removed.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/30 is applied, removing *rand\_r()* from the list of suggested functions in the APPLICATION USAGE section.

**Issue 7**

The type of the first argument to *setstate()* is changed from **const char \*** to **char \***.

**NAME**

insque, remque — insert or remove an element in a queue

**SYNOPSIS**

```
XSI    #include <search.h>

void insque(void *element, void *pred);
void remque(void *element);
```

**DESCRIPTION**

The *insque()* and *remque()* functions shall manipulate queues built from doubly-linked lists. The queue can be either circular or linear. An application using *insque()* or *remque()* shall ensure it defines a structure in which the first two members of the structure are pointers to the same type of structure, and any further members are application-specific. The first member of the structure is a forward pointer to the next entry in the queue. The second member is a backward pointer to the previous entry in the queue. If the queue is linear, the queue is terminated with null pointers. The names of the structure and of the pointer members are not subject to any special restriction.

The *insque()* function shall insert the element pointed to by *element* into a queue immediately after the element pointed to by *pred*.

The *remque()* function shall remove the element pointed to by *element* from a queue.

If the queue is to be used as a linear list, invoking *insque(&element, NULL)*, where *element* is the initial element of the queue, shall initialize the forward and backward pointers of *element* to null pointers.

If the queue is to be used as a circular list, the application shall ensure it initializes the forward pointer and the backward pointer of the initial element of the queue to the element's own address.

**RETURN VALUE**

The *insque()* and *remque()* functions do not return a value.

**ERRORS**

No errors are defined.

**EXAMPLES****Creating a Linear Linked List**

The following example creates a linear linked list.

```
#include <search.h>
...
struct myque element1;
struct myque element2;

char *data1 = "DATA1";
char *data2 = "DATA2";
...
element1.data = data1;
element2.data = data2;

insque (&element1, NULL);
insque (&element2, &element1);
```

### Creating a Circular Linked List

The following example creates a circular linked list.

```
#include <search.h>
...
struct myque element1;
struct myque element2;

char *data1 = "DATA1";
char *data2 = "DATA2";
...
element1.data = data1;
element2.data = data2;

element1.fwd = &element1;
element1.bck = &element1;

insque (&element2, &element1);
```

### Removing an Element

The following example removes the element pointed to by *element1*.

```
#include <search.h>
...
struct myque element1;
...
remque (&element1);
```

## APPLICATION USAGE

The historical implementations of these functions described the arguments as being of type **struct qelem \*** rather than as being of type **void \*** as defined here. In those implementations, **struct qelem** was commonly defined in **<search.h>** as:

```
struct qelem {
    struct qelem *q_forw;
    struct qelem *q_back;
};
```

Applications using these functions, however, were never able to use this structure directly since it provided no room for the actual data contained in the elements. Most applications defined structures that contained the two pointers as the initial elements and also provided space for, or pointers to, the object's data. Applications that used these functions to update more than one type of table also had the problem of specifying two or more different structures with the same name, if they literally used **struct qelem** as specified.

As described here, the implementations were actually expecting a structure type where the first two members were forward and backward pointers to structures. With C compilers that didn't provide function prototypes, applications used structures as specified in the DESCRIPTION above and the compiler did what the application expected.

If this method had been carried forward with an ISO C standard compiler and the historical function prototype, most applications would have to be modified to cast pointers to the structures actually used to be pointers to **struct qelem** to avoid compilation warnings. By specifying **void \*** as the argument type, applications do not need to change (unless they specifically referenced **struct qelem** and depended on it being defined in **<search.h>**).

38551 **Issue 6**

38552 The normative text is updated to avoid use of the term “must” for application requirements.

38553 **NAME**38554        **ioctl** — control a STREAMS device (**STREAMS**)38555 **SYNOPSIS**

```
38556 OB XSR  #include <stropts.h>
38557         int ioctl(int fildes, int request, ... /* arg */);
```

38558 **DESCRIPTION**

38559        The *ioctl()* function shall perform a variety of control functions on STREAMS devices. For non-  
 38560        STREAMS devices, the functions performed by this call are unspecified. The *request* argument  
 38561        and an optional third argument (with varying type) shall be passed to and interpreted by the  
 38562        appropriate part of the STREAM associated with *fildes*.

38563        The *fildes* argument is an open file descriptor that refers to a device.

38564        The *request* argument selects the control function to be performed and shall depend on the  
 38565        STREAMS device being addressed.

38566        The *arg* argument represents additional information that is needed by this specific STREAMS  
 38567        device to perform the requested function. The type of *arg* depends upon the particular control  
 38568        request, but it shall be either an integer or a pointer to a device-specific data structure.

38569        The *ioctl()* commands applicable to STREAMS, their arguments, and error conditions that apply  
 38570        to each individual command are described below.

38571        The following *ioctl()* commands, with error values indicated, are applicable to all STREAMS  
 38572        files:

38573        **I\_PUSH**        Pushes the module whose name is pointed to by *arg* onto the top of the current  
 38574        STREAM, just below the STREAM head. It then calls the *open()* function of the  
 38575        newly-pushed module.

38576        The *ioctl()* function with the **I\_PUSH** command shall fail if:

38577        [EINVAL]        Invalid module name.

38578        [ENXIO]        Open function of new module failed.

38579        [ENXIO]        Hangup received on *fildes*.

38580        **I\_POP**        Removes the module just below the STREAM head of the STREAM pointed to  
 38581        by *fildes*. The *arg* argument should be 0 in an **I\_POP** request.

38582        The *ioctl()* function with the **I\_POP** command shall fail if:

38583        [EINVAL]        No module present in the STREAM.

38584        [ENXIO]        Hangup received on *fildes*.

38585        **I\_LOOK**        Retrieves the name of the module just below the STREAM head of the  
 38586        STREAM pointed to by *fildes*, and places it in a character string pointed to by  
 38587        *arg*. The buffer pointed to by *arg* should be at least FMNAMESZ+1 bytes long,  
 38588        where FMNAMESZ is defined in **<stropts.h>**.

38589        The *ioctl()* function with the **I\_LOOK** command shall fail if:

38590        [EINVAL]        No module present in the STREAM.

38591        **I\_FLUSH**       Flushes read and/or write queues, depending on the value of *arg*. Valid *arg*  
 38592        values are:

|       |                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| 38683 |            | RMSGN           Message-nondiscard mode.                                                             |
| 38684 |            | The bitwise-inclusive OR of RMSGD and RMSGN shall return [EINVAL]. The                               |
| 38685 |            | bitwise-inclusive OR of RNORM and either RMSGD or RMSGN shall result in                              |
| 38686 |            | the other flag overriding RNORM which is the default.                                                |
| 38687 |            | In addition, treatment of control messages by the STREAM head may be                                 |
| 38688 |            | changed by setting any of the following flags in <i>arg</i> :                                        |
| 38689 |            | RPROTNORM   Fail <i>read()</i> with [EBADMSG] if a message containing a                              |
| 38690 |            | control part is at the front of the STREAM head read queue.                                          |
| 38691 |            | RPROTDAT     Deliver the control part of a message as data when a process                            |
| 38692 |            | issues a <i>read()</i> .                                                                             |
| 38693 |            | RPROTDIS     Discard the control part of a message, delivering any data                              |
| 38694 |            | portion, when a process issues a <i>read()</i> .                                                     |
| 38695 |            | The <i>ioctl()</i> function with the I_SRDOPT command shall fail if:                                 |
| 38696 |            | [EINVAL]      The <i>arg</i> argument is not valid.                                                  |
| 38697 | I_GRDOPT   | Returns the current read mode setting, as described above, in an <b>int</b> pointed to               |
| 38698 |            | by the argument <i>arg</i> . Read modes are described in <i>read()</i> .                             |
| 38699 | I_NREAD    | Counts the number of data bytes in the data part of the first message on the                         |
| 38700 |            | STREAM head read queue and places this value in the <b>int</b> pointed to by <i>arg</i> .            |
| 38701 |            | The return value for the command shall be the number of messages on the                              |
| 38702 |            | STREAM head read queue. For example, if 0 is returned in <i>arg</i> , but the <i>ioctl()</i>         |
| 38703 |            | return value is greater than 0, this indicates that a zero-length message is next                    |
| 38704 |            | on the queue.                                                                                        |
| 38705 | I_FDINSERT | Creates a message from specified buffer(s), adds information about another                           |
| 38706 |            | STREAM, and sends the message downstream. The message contains a                                     |
| 38707 |            | control part and an optional data part. The data and control parts to be sent                        |
| 38708 |            | are distinguished by placement in separate buffers, as described below. The                          |
| 38709 |            | <i>arg</i> argument points to a <b>strfdinsert</b> structure.                                        |
| 38710 |            | The application shall ensure that the <i>len</i> member in the <b>ctlbuf</b> <b>strbuf</b> structure |
| 38711 |            | is set to the size of a <b>t_uscalar_t</b> plus the number of bytes of control                       |
| 38712 |            | information to be sent with the message. The <i>fildev</i> member specifies the file                 |
| 38713 |            | descriptor of the other STREAM, and the <i>offset</i> member, which must be                          |
| 38714 |            | suitably aligned for use as a <b>t_uscalar_t</b> , specifies the offset from the start of            |
| 38715 |            | the control buffer where I_FDINSERT shall store a <b>t_uscalar_t</b> whose                           |
| 38716 |            | interpretation is specific to the STREAM end. The application shall ensure that                      |
| 38717 |            | the <i>len</i> member in the <b>databuf</b> <b>strbuf</b> structure is set to the number of bytes of |
| 38718 |            | data information to be sent with the message, or to 0 if no data part is to be                       |
| 38719 |            | sent.                                                                                                |
| 38720 |            | The <i>flags</i> member specifies the type of message to be created. A normal                        |
| 38721 |            | message is created if <i>flags</i> is set to 0, and a high-priority message is created if            |

|       |                     |                                                                                        |
|-------|---------------------|----------------------------------------------------------------------------------------|
| 38722 |                     | <i>flags</i> is set to RS_HIPRI. For non-priority messages, I_FDINSERT shall block if  |
| 38723 |                     | the STREAM write queue is full due to internal flow control conditions. For            |
| 38724 |                     | priority messages, I_FDINSERT does not block on this condition. For non-               |
| 38725 |                     | priority messages, I_FDINSERT does not block when the write queue is full              |
| 38726 |                     | and O_NONBLOCK is set. Instead, it fails and sets <i>errno</i> to [EAGAIN].            |
| 38727 |                     | I_FDINSERT also blocks, unless prevented by lack of internal resources,                |
| 38728 |                     | waiting for the availability of message blocks in the STREAM, regardless of            |
| 38729 |                     | priority or whether O_NONBLOCK has been specified. No partial message is               |
| 38730 |                     | sent.                                                                                  |
| 38731 |                     | The <i>ioctl()</i> function with the I_FDINSERT command shall fail if:                 |
| 38732 | [EAGAIN]            | A non-priority message is specified, the O_NONBLOCK                                    |
| 38733 |                     | flag is set, and the STREAM write queue is full due to                                 |
| 38734 |                     | internal flow control conditions.                                                      |
| 38735 | [EAGAIN] or [ENOSR] |                                                                                        |
| 38736 |                     | Buffers cannot be allocated for the message that is to be                              |
| 38737 |                     | created.                                                                               |
| 38738 | [EINVAL]            | One of the following:                                                                  |
| 38739 |                     | — The <i>fildev</i> member of the <b>strfdinsert</b> structure is not a                |
| 38740 |                     | valid, open STREAM file descriptor.                                                    |
| 38741 |                     | — The size of a <b>t_uscalar_t</b> plus <i>offset</i> is greater than the              |
| 38742 |                     | <i>len</i> member for the buffer specified through <b>ctlbuf</b> .                     |
| 38743 |                     | — The <i>offset</i> member does not specify a properly-aligned                         |
| 38744 |                     | location in the data buffer.                                                           |
| 38745 |                     | — An undefined value is stored in <i>flags</i> .                                       |
| 38746 | [ENXIO]             | Hangup received on the STREAM identified by either the                                 |
| 38747 |                     | <i>fildev</i> argument or the <i>fildev</i> member of the <b>strfdinsert</b>           |
| 38748 |                     | structure.                                                                             |
| 38749 | [ERANGE]            | The <i>len</i> member for the buffer specified through <b>databuf</b>                  |
| 38750 |                     | does not fall within the range specified by the maximum                                |
| 38751 |                     | and minimum packet sizes of the topmost STREAM                                         |
| 38752 |                     | module; or the <i>len</i> member for the buffer specified through                      |
| 38753 |                     | <b>databuf</b> is larger than the maximum configured size of the                       |
| 38754 |                     | data part of a message; or the <i>len</i> member for the buffer                        |
| 38755 |                     | specified through <b>ctlbuf</b> is larger than the maximum                             |
| 38756 |                     | configured size of the control part of a message.                                      |
| 38757 | I_STR               | Constructs an internal STREAMS <i>ioctl()</i> message from the data pointed to by      |
| 38758 |                     | <i>arg</i> , and sends that message downstream.                                        |
| 38759 |                     | This mechanism is provided to send <i>ioctl()</i> requests to downstream modules       |
| 38760 |                     | and drivers. It allows information to be sent with <i>ioctl()</i> , and returns to the |
| 38761 |                     | process any information sent upstream by the downstream recipient. I_STR               |
| 38762 |                     | shall block until the system responds with either a positive or negative               |
| 38763 |                     | acknowledgement message, or until the request times out after some period of           |
| 38764 |                     | time. If the request times out, it shall fail with <i>errno</i> set to [ETIME].        |
| 38765 |                     | At most, one I_STR can be active on a STREAM. Further I_STR calls shall                |
| 38766 |                     | block until the active I_STR completes at the STREAM head. The default                 |

|       |          |                                                                                         |
|-------|----------|-----------------------------------------------------------------------------------------|
| 38767 |          | timeout interval for these requests is 15 seconds. The O_NONBLOCK flag has              |
| 38768 |          | no effect on this call.                                                                 |
| 38769 |          | To send requests downstream, the application shall ensure that <i>arg</i> points to a   |
| 38770 |          | <b>strioc</b> structure.                                                                |
| 38771 |          | The <i>ic_cmd</i> member is the internal <i>ioctl()</i> command intended for a          |
| 38772 |          | downstream module or driver and <i>ic_timeout</i> is the number of seconds              |
| 38773 |          | (−1=infinite, 0=use implementation-defined timeout interval, >0=as specified)           |
| 38774 |          | an I_STR request shall wait for acknowledgement before timing out. <i>ic_len</i> is     |
| 38775 |          | the number of bytes in the data argument, and <i>ic_dp</i> is a pointer to the data     |
| 38776 |          | argument. The <i>ic_len</i> member has two uses: on input, it contains the length of    |
| 38777 |          | the data argument passed in, and on return from the command, it contains the            |
| 38778 |          | number of bytes being returned to the process (the buffer pointed to by <i>ic_dp</i>    |
| 38779 |          | should be large enough to contain the maximum amount of data that any                   |
| 38780 |          | module or the driver in the STREAM can return).                                         |
| 38781 |          | The STREAM head shall convert the information pointed to by the <b>strioc</b>           |
| 38782 |          | structure to an internal <i>ioctl()</i> command message and send it downstream.         |
| 38783 |          | The <i>ioctl()</i> function with the I_STR command shall fail if:                       |
| 38784 |          | [EAGAIN] or [ENOSR]                                                                     |
| 38785 |          | Unable to allocate buffers for the <i>ioctl()</i> message.                              |
| 38786 |          | [EINVAL] The <i>ic_len</i> member is less than 0 or larger than the                     |
| 38787 |          | maximum configured size of the data part of a message, or                               |
| 38788 |          | <i>ic_timeout</i> is less than −1.                                                      |
| 38789 |          | [ENXIO] Hangup received on <i>fil</i> .                                                 |
| 38790 |          | [ETIME] A downstream <i>ioctl()</i> timed out before acknowledgement                    |
| 38791 |          | was received.                                                                           |
| 38792 |          | An I_STR can also fail while waiting for an acknowledgement if a message                |
| 38793 |          | indicating an error or a hangup is received at the STREAM head. In addition,            |
| 38794 |          | an error code can be returned in the positive or negative acknowledgement               |
| 38795 |          | message, in the event the <i>ioctl()</i> command sent downstream fails. For these       |
| 38796 |          | cases, I_STR shall fail with <i>errno</i> set to the value in the message.              |
| 38797 | I_SWROPT | Sets the write mode using the value of the argument <i>arg</i> . Valid bit settings for |
| 38798 |          | <i>arg</i> are:                                                                         |
| 38799 |          | SNDZERO Send a zero-length message downstream when a <i>write()</i> of 0                |
| 38800 |          | bytes occurs. To not send a zero-length message when a                                  |
| 38801 |          | <i>write()</i> of 0 bytes occurs, the application shall ensure that                     |
| 38802 |          | this bit is not set in <i>arg</i> (for example, <i>arg</i> would be set to 0).          |
| 38803 |          | The <i>ioctl()</i> function with the I_SWROPT command shall fail if:                    |
| 38804 |          | [EINVAL] <i>arg</i> is not the above value.                                             |
| 38805 | I_GWROPT | Returns the current write mode setting, as described above, in the <b>int</b> that is   |
| 38806 |          | pointed to by the argument <i>arg</i> .                                                 |
| 38807 | I_SENDFD | Creates a new reference to the open file description associated with the file           |
| 38808 |          | descriptor <i>arg</i> , and writes a message on the STREAMS-based pipe <i>fil</i>       |
| 38809 |          | containing this reference, together with the user ID and group ID of the calling        |
| 38810 |          | process.                                                                                |

|       |          |                                                                                                    |
|-------|----------|----------------------------------------------------------------------------------------------------|
| 38811 |          | The <i>ioctl()</i> function with the I_SENDFD command shall fail if:                               |
| 38812 |          | [EAGAIN] The sending STREAM is unable to allocate a message block                                  |
| 38813 |          | to contain the file pointer; or the read queue of the receiving                                    |
| 38814 |          | STREAM head is full and cannot accept the message sent by                                          |
| 38815 |          | I_SENDFD.                                                                                          |
| 38816 |          | [EBADF] The <i>arg</i> argument is not a valid, open file descriptor.                              |
| 38817 |          | [EINVAL] The <i>fildev</i> argument is not connected to a STREAM pipe.                             |
| 38818 |          | [ENXIO] Hangup received on <i>fildev</i> .                                                         |
| 38819 |          | The <i>ioctl()</i> function with the I_SENDFD command may fail if:                                 |
| 38820 |          | [EINVAL] The <i>arg</i> argument is equal to the <i>fildev</i> argument.                           |
| 38821 | I_RECVFD | Retrieves the reference to an open file description from a message written to a                    |
| 38822 |          | STREAMS-based pipe using the I_SENDFD command, and allocates a new file                            |
| 38823 |          | descriptor in the calling process that refers to this open file description. The                   |
| 38824 |          | <i>arg</i> argument is a pointer to a <b>strrecvfd</b> data structure as defined in                |
| 38825 |          | <b>&lt;stropts.h&gt;</b> .                                                                         |
| 38826 |          | The <i>fd</i> member is a file descriptor. The <i>uid</i> and <i>gid</i> members are the effective |
| 38827 |          | user ID and effective group ID, respectively, of the sending process.                              |
| 38828 |          | If O_NONBLOCK is not set, I_RECVFD shall block until a message is present                          |
| 38829 |          | at the STREAM head. If O_NONBLOCK is set, I_RECVFD shall fail with <i>errno</i>                    |
| 38830 |          | set to [EAGAIN] if no message is present at the STREAM head.                                       |
| 38831 |          | If the message at the STREAM head is a message sent by an I_SENDFD, a new                          |
| 38832 |          | file descriptor shall be allocated for the open file descriptor referenced in the                  |
| 38833 |          | message. The new file descriptor is placed in the <i>fd</i> member of the <b>strrecvfd</b>         |
| 38834 |          | structure pointed to by <i>arg</i> .                                                               |
| 38835 |          | The <i>ioctl()</i> function with the I_RECVFD command shall fail if:                               |
| 38836 |          | [EAGAIN] A message is not present at the STREAM head read queue                                    |
| 38837 |          | and the O_NONBLOCK flag is set.                                                                    |
| 38838 |          | [EBADMSG] The message at the STREAM head read queue is not a                                       |
| 38839 |          | message containing a passed file descriptor.                                                       |
| 38840 |          | [EMFILE] All file descriptors available to the process are currently                               |
| 38841 |          | open.                                                                                              |
| 38842 |          | [ENXIO] Hangup received on <i>fildev</i> .                                                         |
| 38843 | I_LIST   | Allows the process to list all the module names on the STREAM, up to and                           |
| 38844 |          | including the topmost driver name. If <i>arg</i> is a null pointer, the return value               |
| 38845 |          | shall be the number of modules, including the driver, that are on the STREAM                       |
| 38846 |          | pointed to by <i>fildev</i> . This lets the process allocate enough space for the module           |
| 38847 |          | names. Otherwise, it should point to a <b>str_list</b> structure.                                  |
| 38848 |          | The <i>sl_nmods</i> member indicates the number of entries the process has                         |
| 38849 |          | allocated in the array. Upon return, the <i>sl_modlist</i> member of the <b>str_list</b>           |
| 38850 |          | structure shall contain the list of module names, and the number of entries                        |
| 38851 |          | that have been filled into the <i>sl_modlist</i> array is found in the <i>sl_nmods</i> member      |
| 38852 |          | (the number includes the number of modules including the driver). The return                       |
| 38853 |          | value from <i>ioctl()</i> shall be 0. The entries are filled in starting at the top of the         |

|       |                    |                                                                                           |
|-------|--------------------|-------------------------------------------------------------------------------------------|
| 38854 |                    | STREAM and continuing downstream until either the end of the STREAM is                    |
| 38855 |                    | reached, or the number of requested modules ( <i>sl_nmods</i> ) is satisfied.             |
| 38856 |                    | The <i>ioctl()</i> function with the <i>I_LIST</i> command shall fail if:                 |
| 38857 |                    | [EINVAL]           The <i>sl_nmods</i> member is less than 1.                             |
| 38858 |                    | [EAGAIN] or [ENOSR]                                                                       |
| 38859 |                    | Unable to allocate buffers.                                                               |
| 38860 | <i>I_ATMARK</i>    | Allows the process to see if the message at the head of the STREAM head read              |
| 38861 |                    | queue is marked by some module downstream. The <i>arg</i> argument determines             |
| 38862 |                    | how the checking is done when there may be multiple marked messages on                    |
| 38863 |                    | the STREAM head read queue. It may take on the following values:                          |
| 38864 |                    | ANYMARK           Check if the message is marked.                                         |
| 38865 |                    | LASTMARK          Check if the message is the last one marked on the queue.               |
| 38866 |                    | The bitwise-inclusive OR of the flags ANYMARK and LASTMARK is                             |
| 38867 |                    | permitted.                                                                                |
| 38868 |                    | The return value shall be 1 if the mark condition is satisfied; otherwise, the            |
| 38869 |                    | value shall be 0.                                                                         |
| 38870 |                    | The <i>ioctl()</i> function with the <i>I_ATMARK</i> command shall fail if:               |
| 38871 |                    | [EINVAL]           Invalid <i>arg</i> value.                                              |
| 38872 | <i>I_CKBAND</i>    | Checks if the message of a given priority band exists on the STREAM head                  |
| 38873 |                    | read queue. This shall return 1 if a message of the given priority exists, 0 if no        |
| 38874 |                    | such message exists, or –1 on error. <i>arg</i> should be of type <b>int</b> .            |
| 38875 |                    | The <i>ioctl()</i> function with the <i>I_CKBAND</i> command shall fail if:               |
| 38876 |                    | [EINVAL]           Invalid <i>arg</i> value.                                              |
| 38877 | <i>I_GETBAND</i>   | Returns the priority band of the first message on the STREAM head read                    |
| 38878 |                    | queue in the integer referenced by <i>arg</i> .                                           |
| 38879 |                    | The <i>ioctl()</i> function with the <i>I_GETBAND</i> command shall fail if:              |
| 38880 |                    | [ENODATA]          No message on the STREAM head read queue.                              |
| 38881 | <i>I_CANPUT</i>    | Checks if a certain band is writable. <i>arg</i> is set to the priority band in question. |
| 38882 |                    | The return value shall be 0 if the band is flow-controlled, 1 if the band is              |
| 38883 |                    | writable, or –1 on error.                                                                 |
| 38884 |                    | The <i>ioctl()</i> function with the <i>I_CANPUT</i> command shall fail if:               |
| 38885 |                    | [EINVAL]           Invalid <i>arg</i> value.                                              |
| 38886 | <i>I_SETCLTIME</i> | This request allows the process to set the time the STREAM head shall delay               |
| 38887 |                    | when a STREAM is closing and there is data on the write queues. Before                    |
| 38888 |                    | closing each module or driver, if there is data on its write queue, the STREAM            |
| 38889 |                    | head shall delay for the specified amount of time to allow the data to drain. If,         |
| 38890 |                    | after the delay, data is still present, it shall be flushed. The <i>arg</i> argument is a |
| 38891 |                    | pointer to an integer specifying the number of milliseconds to delay, rounded             |
| 38892 |                    | up to the nearest valid value. If <i>I_SETCLTIME</i> is not performed on a STREAM,        |
| 38893 |                    | an implementation-defined default timeout interval is used.                               |

38894 The *ioctl()* function with the *I\_SETCLTIME* command shall fail if:

38895 [EINVAL] Invalid *arg* value.

38896 *I\_GETCLTIME* Returns the close time delay in the integer pointed to by *arg*.

### 38897 Multiplexed STREAMS Configurations

38898 The following commands are used for connecting and disconnecting multiplexed STREAMS  
38899 configurations. These commands use an implementation-defined default timeout interval.

38900 *I\_LINK* Connects two STREAMs, where *fildev* is the file descriptor of the STREAM  
38901 connected to the multiplexing driver, and *arg* is the file descriptor of the  
38902 STREAM connected to another driver. The STREAM designated by *arg* is  
38903 connected below the multiplexing driver. *I\_LINK* requires the multiplexing  
38904 driver to send an acknowledgement message to the STREAM head regarding  
38905 the connection. This call shall return a multiplexer ID number (an identifier  
38906 used to disconnect the multiplexer; see *I\_UNLINK*) on success, and *-1* on  
38907 failure.

38908 The *ioctl()* function with the *I\_LINK* command shall fail if:

38909 [ENXIO] Hangup received on *fildev*.

38910 [ETIME] Timeout before acknowledgement message was received at  
38911 STREAM head.

38912 [EAGAIN] or [ENOSR]

38913 Unable to allocate STREAMS storage to perform the  
38914 *I\_LINK*.

38915 [EBADF] The *arg* argument is not a valid, open file descriptor.

38916 [EINVAL] The *fildev* argument does not support multiplexing; or *arg* is  
38917 not a STREAM or is already connected downstream from a  
38918 multiplexer; or the specified *I\_LINK* operation would  
38919 connect the STREAM head in more than one place in the  
38920 multiplexed STREAM.

38921 An *I\_LINK* can also fail while waiting for the multiplexing driver to  
38922 acknowledge the request, if a message indicating an error or a hangup is  
38923 received at the STREAM head of *fildev*. In addition, an error code can be  
38924 returned in the positive or negative acknowledgement message. For these  
38925 cases, *I\_LINK* fails with *errno* set to the value in the message.

38926 *I\_UNLINK* Disconnects the two STREAMs specified by *fildev* and *arg*. *fildev* is the file  
38927 descriptor of the STREAM connected to the multiplexing driver. The *arg*  
38928 argument is the multiplexer ID number that was returned by the *I\_LINK*  
38929 *ioctl()* command when a STREAM was connected downstream from the  
38930 multiplexing driver. If *arg* is *MUXID\_ALL*, then all STREAMs that were  
38931 connected to *fildev* shall be disconnected. As in *I\_LINK*, this command requires  
38932 acknowledgement.

38933 The *ioctl()* function with the *I\_UNLINK* command shall fail if:

38934 [ENXIO] Hangup received on *fildev*.

|       |           |                     |                                                                                             |
|-------|-----------|---------------------|---------------------------------------------------------------------------------------------|
| 38935 |           | [ETIME]             | Timeout before acknowledgement message was received at                                      |
| 38936 |           |                     | STREAM head.                                                                                |
| 38937 |           | [EAGAIN] or [ENOSR] |                                                                                             |
| 38938 |           |                     | Unable to allocate buffers for the acknowledgement                                          |
| 38939 |           |                     | message.                                                                                    |
| 38940 |           | [EINVAL]            | Invalid multiplexer ID number.                                                              |
| 38941 |           |                     | An I_UNLINK can also fail while waiting for the multiplexing driver to                      |
| 38942 |           |                     | acknowledge the request if a message indicating an error or a hangup is                     |
| 38943 |           |                     | received at the STREAM head of <i>fildev</i> . In addition, an error code can be            |
| 38944 |           |                     | returned in the positive or negative acknowledgement message. For these                     |
| 38945 |           |                     | cases, I_UNLINK shall fail with <i>errno</i> set to the value in the message.               |
| 38946 | I_PLINK   |                     | Creates a <i>persistent connection</i> between two STREAMs, where <i>fildev</i> is the file |
| 38947 |           |                     | descriptor of the STREAM connected to the multiplexing driver, and <i>arg</i> is the        |
| 38948 |           |                     | file descriptor of the STREAM connected to another driver. This call shall                  |
| 38949 |           |                     | create a persistent connection which can exist even if the file descriptor <i>fildev</i>    |
| 38950 |           |                     | associated with the upper STREAM to the multiplexing driver is closed. The                  |
| 38951 |           |                     | STREAM designated by <i>arg</i> gets connected via a persistent connection below            |
| 38952 |           |                     | the multiplexing driver. I_PLINK requires the multiplexing driver to send an                |
| 38953 |           |                     | acknowledgement message to the STREAM head. This call shall return a                        |
| 38954 |           |                     | multiplexer ID number (an identifier that may be used to disconnect the                     |
| 38955 |           |                     | multiplexer; see I_PUNLINK) on success, and -1 on failure.                                  |
| 38956 |           |                     | The <i>ioctl()</i> function with the I_PLINK command shall fail if:                         |
| 38957 |           | [ENXIO]             | Hangup received on <i>fildev</i> .                                                          |
| 38958 |           | [ETIME]             | Timeout before acknowledgement message was received at                                      |
| 38959 |           |                     | STREAM head.                                                                                |
| 38960 |           | [EAGAIN] or [ENOSR] |                                                                                             |
| 38961 |           |                     | Unable to allocate STREAMS storage to perform the                                           |
| 38962 |           |                     | I_PLINK.                                                                                    |
| 38963 |           | [EBADF]             | The <i>arg</i> argument is not a valid, open file descriptor.                               |
| 38964 |           | [EINVAL]            | The <i>fildev</i> argument does not support multiplexing; or <i>arg</i> is                  |
| 38965 |           |                     | not a STREAM or is already connected downstream from a                                      |
| 38966 |           |                     | multiplexer; or the specified I_PLINK operation would                                       |
| 38967 |           |                     | connect the STREAM head in more than one place in the                                       |
| 38968 |           |                     | multiplexed STREAM.                                                                         |
| 38969 |           |                     | An I_PLINK can also fail while waiting for the multiplexing driver to                       |
| 38970 |           |                     | acknowledge the request, if a message indicating an error or a hangup is                    |
| 38971 |           |                     | received at the STREAM head of <i>fildev</i> . In addition, an error code can be            |
| 38972 |           |                     | returned in the positive or negative acknowledgement message. For these                     |
| 38973 |           |                     | cases, I_PLINK shall fail with <i>errno</i> set to the value in the message.                |
| 38974 | I_PUNLINK |                     | Disconnects the two STREAMs specified by <i>fildev</i> and <i>arg</i> from a persistent     |
| 38975 |           |                     | connection. The <i>fildev</i> argument is the file descriptor of the STREAM                 |
| 38976 |           |                     | connected to the multiplexing driver. The <i>arg</i> argument is the multiplexer ID         |
| 38977 |           |                     | number that was returned by the I_PLINK <i>ioctl()</i> command when a STREAM                |
| 38978 |           |                     | was connected downstream from the multiplexing driver. If <i>arg</i> is                     |
| 38979 |           |                     | MUXID_ALL, then all STREAMs which are persistent connections to <i>fildev</i>               |
| 38980 |           |                     | shall be disconnected. As in I_PLINK, this command requires the multiplexing                |

38981 driver to acknowledge the request.

38982 The *ioctl()* function with the *I\_PUNLINK* command shall fail if:

38983 [ENXIO] Hangup received on *fildev*.

38984 [ETIME] Timeout before acknowledgement message was received at

38985 STREAM head.

38986 [EAGAIN] or [ENOSR]

38987 Unable to allocate buffers for the acknowledgement

38988 message.

38989 [EINVAL] Invalid multiplexer ID number.

38990 An *I\_PUNLINK* can also fail while waiting for the multiplexing driver to

38991 acknowledge the request if a message indicating an error or a hangup is

38992 received at the STREAM head of *fildev*. In addition, an error code can be

38993 returned in the positive or negative acknowledgement message. For these

38994 cases, *I\_PUNLINK* shall fail with *errno* set to the value in the message.

#### 38995 RETURN VALUE

38996 Upon successful completion, *ioctl()* shall return a value other than *-1* that depends upon the

38997 STREAMS device control function. Otherwise, it shall return *-1* and set *errno* to indicate the

38998 error.

#### 38999 ERRORS

39000 Under the following general conditions, *ioctl()* shall fail if:

39001 [EBADF] The *fildev* argument is not a valid open file descriptor.

39002 [EINTR] A signal was caught during the *ioctl()* operation.

39003 [EINVAL] The STREAM or multiplexer referenced by *fildev* is linked (directly or

39004 indirectly) downstream from a multiplexer.

39005 If an underlying device driver detects an error, then *ioctl()* shall fail if:

39006 [EINVAL] The *request* or *arg* argument is not valid for this device.

39007 [EIO] Some physical I/O error has occurred.

39008 [ENOTTY] The file associated with the *fildev* argument is not a STREAMS device that

39009 accepts control functions.

39010 [ENXIO] The *request* and *arg* arguments are valid for this device driver, but the service

39011 requested cannot be performed on this particular sub-device.

39012 [ENODEV] The *fildev* argument refers to a valid STREAMS device, but the corresponding

39013 device driver does not support the *ioctl()* function.

39014 If a STREAM is connected downstream from a multiplexer, any *ioctl()* command except

39015 *I\_UNLINK* and *I\_PUNLINK* shall set *errno* to [EINVAL].

39016 **EXAMPLES**

39017 None.

39018 **APPLICATION USAGE**

39019 The implementation-defined timeout interval for STREAMS has historically been 15 seconds.

39020 **RATIONALE**

39021 None.

39022 **FUTURE DIRECTIONS**

39023 The *ioctl()* function may be removed in a future version.

39024 **SEE ALSO**

39025 Section 2.6 (on page 500), *close()*, *fcntl()*, *getmsg()*, *open()*, *pipe()*, *poll()*, *putmsg()*, *read()*,  
39026 *sigaction()*, *write()*

39027 XBD <stropts.h>

39028 **CHANGE HISTORY**

39029 First released in Issue 4, Version 2.

39030 **Issue 5**

39031 Moved from X/OPEN UNIX extension to BASE.

39032 **Issue 6**

39033 The Open Group Corrigendum U028/4 is applied, correcting text in the I\_FDINSERT [EINVAL]  
39034 case to refer to *ctlbuf*.

39035 This function is marked as part of the XSI STREAMS Option Group.

39036 The normative text is updated to avoid use of the term “must” for application requirements.

39037 **Issue 7**

39038 Austin Group Interpretation 1003.1-2001 #155 is applied, adding a “may fail” [EINVAL] error  
39039 condition for the I\_SENDFD command.

39040 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

39041 The *ioctl()* function is marked obsolescent.

39042 **NAME**

39043 isalnum, isalnum\_l — test for an alphanumeric character

39044 **SYNOPSIS**

39045 #include &lt;ctype.h&gt;

39046 int isalnum(int c);

39047 CX int isalnum\_l(int c, locale\_t locale);

39048 **DESCRIPTION**

39049 CX For *isalnum()*: The functionality described on this reference page is aligned with the ISO C  
 39050 standard. Any conflict between the requirements described here and the ISO C standard is  
 39051 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39052 CX The *isalnum()* and *isalnum\_l()* functions shall test whether *c* is a character of class **alpha** or  
 39053 CX **digit** in the current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7  
 39054 (on page 135).

39055 The *c* argument is an **int**, the value of which the application shall ensure is representable as an  
 39056 **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the  
 39057 behavior is undefined.

39058 CX The behavior is undefined if the *locale* argument to *isalnum\_l()* is the special locale object  
 39059 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

39060 **RETURN VALUE**

39061 CX The *isalnum()* and *isalnum\_l()* functions shall return non-zero if *c* is an alphanumeric character;  
 39062 otherwise, they shall return 0.

39063 **ERRORS**

39064 No errors are defined.

39065 **EXAMPLES**

39066 None.

39067 **APPLICATION USAGE**

39068 To ensure applications portability, especially across natural languages, only these functions and  
 39069 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 39070 classification.

39071 **RATIONALE**

39072 None.

39073 **FUTURE DIRECTIONS**

39074 None.

39075 **SEE ALSO**

39076 *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,  
 39077 *isxdigit()*, *setlocale()*, *uselocale()*

39078 XBD Chapter 7 (on page 135), &lt;ctype.h&gt;, &lt;stdio.h&gt;

39079 **CHANGE HISTORY**

39080 First released in Issue 1. Derived from Issue 1 of the SVID.

39081 **Issue 6**

39082 The normative text is updated to avoid use of the term “must” for application requirements.

39083 **Issue 7**

39084 The *isalnum\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
39085 API Set Part 4.

39086 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0274 [302], XSH/TC1-2008/0275 [283],  
39087 and XSH/TC1-2008/0276 [283] are applied.

39088 **NAME**

39089 isalpha, isalpha\_l — test for an alphabetic character

39090 **SYNOPSIS**

```
39091     #include <ctype.h>
39092     int isalpha(int c);
39093 CX    int isalpha_l(int c, locale_t locale);
```

39094 **DESCRIPTION**

39095 CX For *isalpha()*: The functionality described on this reference page is aligned with the ISO C  
 39096 standard. Any conflict between the requirements described here and the ISO C standard is  
 39097 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39098 CX The *isalpha()* and *isalpha\_l()* functions shall test whether *c* is a character of class **alpha** in the  
 39099 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
 39100 135).

39101 The *c* argument is an **int**, the value of which the application shall ensure is representable as an  
 39102 **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the  
 39103 behavior is undefined.

39104 CX The behavior is undefined if the *locale* argument to *isalpha\_l()* is the special locale object  
 39105 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

39106 **RETURN VALUE**

39107 CX The *isalpha()* and *isalpha\_l()* functions shall return non-zero if *c* is an alphabetic character;  
 39108 otherwise, they shall return 0.

39109 **ERRORS**

39110 No errors are defined.

39111 **EXAMPLES**

39112 None.

39113 **APPLICATION USAGE**

39114 To ensure applications portability, especially across natural languages, only these functions and  
 39115 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 39116 classification.

39117 **RATIONALE**

39118 None.

39119 **FUTURE DIRECTIONS**

39120 None.

39121 **SEE ALSO**

39126 First released in Issue 1. Derived from Issue 1 of the SVID.

39127 **Issue 6**

39128 The normative text is updated to avoid use of the term “must” for application requirements.

39129 **Issue 7**

39130 The *isalpha\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
39131 Set Part 4.

39132 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0277 [302], XSH/TC1-2008/0278 [283],  
39133 and XSH/TC1-2008/0279 [283] are applied.

39134 **NAME**

39135 isascii — test for a 7-bit US-ASCII character

39136 **SYNOPSIS**

```
39137 OB XSI #include <ctype.h>
39138 int isascii(int c);
```

39139 **DESCRIPTION**39140 The *isascii()* function shall test whether *c* is a 7-bit US-ASCII character code.39141 The *isascii()* function is defined on all integer values.39142 **RETURN VALUE**

39143 The *isascii()* function shall return non-zero if *c* is a 7-bit US-ASCII character code between 0 and  
 39144 octal 0177 inclusive; otherwise, it shall return 0.

39145 **ERRORS**

39146 No errors are defined.

39147 **EXAMPLES**

39148 None.

39149 **APPLICATION USAGE**39150 The *isascii()* function cannot be used portably in a localized application.39151 **RATIONALE**

39152 None.

39153 **FUTURE DIRECTIONS**39154 The *isascii()* function may be removed in a future version.39155 **SEE ALSO**39156 XBD [<ctype.h>](#)39157 **CHANGE HISTORY**

39158 First released in Issue 1. Derived from Issue 1 of the SVID.

39159 **Issue 7**39160 The *isascii()* function is marked obsolescent.

39161 **NAME**39162 isastream — test a file descriptor (**STREAMS**)39163 **SYNOPSIS**

```
39164 OB XSR #include <stropts.h>
39165 int isastream(int fildes);
```

39166 **DESCRIPTION**

39167 The *isastream()* function shall test whether *fildes*, an open file descriptor, is associated with a  
39168 STREAMS-based file.

39169 **RETURN VALUE**

39170 Upon successful completion, *isastream()* shall return 1 if *fildes* refers to a STREAMS-based file  
39171 and 0 if not. Otherwise, *isastream()* shall return -1 and set *errno* to indicate the error.

39172 **ERRORS**

39173 The *isastream()* function shall fail if:

39174 [EBADF] The *fildes* argument is not a valid open file descriptor.

39175 **EXAMPLES**

39176 None.

39177 **APPLICATION USAGE**

39178 None.

39179 **RATIONALE**

39180 None.

39181 **FUTURE DIRECTIONS**

39182 The *isastream()* function may be removed in a future version.

39187 **Issue 5**

39188 Moved from X/OPEN UNIX extension to BASE.

39189 **Issue 7**

39190 The *isastream()* function is marked obsolescent.

39191 **NAME**

39192 isatty — test for a terminal device

39193 **SYNOPSIS**

39194 #include &lt;unistd.h&gt;

39195 int isatty(int *fildes*);39196 **DESCRIPTION**39197 The *isatty()* function shall test whether *fildes*, an open file descriptor, is associated with a  
39198 terminal device.39199 **RETURN VALUE**39200 The *isatty()* function shall return 1 if *fildes* is associated with a terminal; otherwise, it shall return  
39201 0 and may set *errno* to indicate the error.39202 **ERRORS**39203 The *isatty()* function may fail if:39204 [EBADF] The *fildes* argument is not a valid open file descriptor.39205 [ENOTTY] The file associated with the *fildes* argument is not a terminal.39206 **EXAMPLES**

39207 None.

39208 **APPLICATION USAGE**39209 The *isatty()* function does not necessarily indicate that a human being is available for interaction  
39210 via *fildes*. It is quite possible that non-terminal devices are connected to the communications  
39211 line.39212 **RATIONALE**

39213 None.

39214 **FUTURE DIRECTIONS**

39215 None.

39216 **SEE ALSO**

39217 XBD &lt;unistd.h&gt;

39218 **CHANGE HISTORY**

39219 First released in Issue 1. Derived from Issue 1 of the SVID.

39220 **Issue 6**39221 The following new requirements on POSIX implementations derive from alignment with the  
39222 Single UNIX Specification:

- 39223 • The optional setting of *errno* to indicate an error is added.
- 39224 • The [EBADF] and [ENOTTY] optional error conditions are added.

39225 **Issue 7**

39226 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

39227 **NAME**

39228 isblank, isblank\_l — test for a blank character

39229 **SYNOPSIS**

39230 #include &lt;ctype.h&gt;

39231 int isblank(int c);

39232 CX int isblank\_l(int c, locale\_t locale);

39233 **DESCRIPTION**39234 CX For *isblank()*: The functionality described on this reference page is aligned with the ISO C  
39235 standard. Any conflict between the requirements described here and the ISO C standard is  
39236 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.39237 CX The *isblank()* and *isblank\_l()* functions shall test whether *c* is a character of class **blank** in the  
39238 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
39239 135).39240 The *c* argument is a type **int**, the value of which the application shall ensure is a character  
39241 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
39242 any other value, the behavior is undefined.39243 CX The behavior is undefined if the *locale* argument to *isblank\_l()* is the special locale object  
39244 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.39245 **RETURN VALUE**39246 CX The *isblank()* and *isblank\_l()* functions shall return non-zero if *c* is a <blank>; otherwise, they  
39247 shall return 0.39248 **ERRORS**

39249 No errors are defined.

39250 **EXAMPLES**

39251 None.

39252 **APPLICATION USAGE**39253 To ensure applications portability, especially across natural languages, only these functions and  
39254 the functions in the reference pages listed in the SEE ALSO section should be used for character  
39255 classification.39256 **RATIONALE**

39257 None.

39258 **FUTURE DIRECTIONS**

39259 None.

39260 **SEE ALSO**39261 *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,  
39262 *isxdigit()*, *setlocale()*, *uselocale()*

39263 XBD Chapter 7 (on page 135), &lt;ctype.h&gt;, &lt;locale.h&gt;

39264 **CHANGE HISTORY**

39265 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

39266 **Issue 7**39267 The *isblank\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
39268 Set Part 4.

39269  
39270

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0280 [302], XSH/TC1-2008/0281 [283], and XSH/TC1-2008/0282 [283] are applied.

39271 **NAME**

39272 isctrl, isctrl\_l — test for a control character

39273 **SYNOPSIS**

39274 #include &lt;ctype.h&gt;

39275 int isctrl(int c);

39276 CX int isctrl\_l(int c, locale\_t locale);

39277 **DESCRIPTION**39278 CX For *isctrl()*: The functionality described on this reference page is aligned with the ISO C  
39279 standard. Any conflict between the requirements described here and the ISO C standard is  
39280 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.39281 CX The *isctrl()* and *isctrl\_l()* functions shall test whether *c* is a character of class **cntrl** in the  
39282 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
39283 135).39284 The *c* argument is a type **int**, the value of which the application shall ensure is a character  
39285 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
39286 any other value, the behavior is undefined.39287 CX The behavior is undefined if the *locale* argument to *isctrl\_l()* is the special locale object  
39288 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.39289 **RETURN VALUE**39290 CX The *isctrl()* and *isctrl\_l()* functions shall return non-zero if *c* is a control character; otherwise,  
39291 they shall return 0.39292 **ERRORS**

39293 No errors are defined.

39294 **EXAMPLES**

39295 None.

39296 **APPLICATION USAGE**39297 To ensure applications portability, especially across natural languages, only these functions and  
39298 the functions in the reference pages listed in the SEE ALSO section should be used for character  
39299 classification.39300 **RATIONALE**

39301 None.

39302 **FUTURE DIRECTIONS**

39303 None.

39304 **SEE ALSO**39305 *isalnum()*, *isalpha()*, *isblank()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*,  
39306 *isupper()*, *isxdigit()*, *setlocale()*, *uselocale()*

39307 XBD Chapter 7 (on page 135), &lt;ctype.h&gt;, &lt;locale.h&gt;

39308 **CHANGE HISTORY**

39309 First released in Issue 1. Derived from Issue 1 of the SVID.

39310 **Issue 6**

39311 The normative text is updated to avoid use of the term “must” for application requirements.

39312 **Issue 7**

39313

39314

The *isctrl\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

39315

39316

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0283 [302], XSH/TC1-2008/0284 [283], and XSH/TC1-2008/0285 [283] are applied.

39317 **NAME**

39318       isdigit, isdigit\_l — test for a decimal digit

39319 **SYNOPSIS**

```
39320       #include <ctype.h>
39321       int isdigit(int c);
39322 CX     int isdigit_l(int c, locale_t locale);
```

39323 **DESCRIPTION**

39324 CX     For *isdigit()*: The functionality described on this reference page is aligned with the ISO C  
39325 standard. Any conflict between the requirements described here and the ISO C standard is  
39326 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39327 CX     The *isdigit()* and *isdigit\_l()* functions shall test whether *c* is a character of class **digit** in the  
39328 CX     current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
39329 135).

39330       The *c* argument is an **int**, the value of which the application shall ensure is a character  
39331 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
39332 any other value, the behavior is undefined.

39333 CX     The behavior is undefined if the *locale* argument to *isdigit\_l()* is the special locale object  
39334 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

39335 **RETURN VALUE**

39336 CX     The *isdigit()* and *isdigit\_l()* functions shall return non-zero if *c* is a decimal digit; otherwise,  
39337 they shall return 0.

39338 **ERRORS**

39339       No errors are defined.

39340 **EXAMPLES**

39341       None.

39342 **APPLICATION USAGE**

39343       To ensure applications portability, especially across natural languages, only these functions and  
39344 the functions in the reference pages listed in the SEE ALSO section should be used for character  
39345 classification.

39346 **RATIONALE**

39347       None.

39348 **FUTURE DIRECTIONS**

39349       None.

39350 **SEE ALSO**

39351       *isalnum()*, *isalpha()*, *isblank()*, *iscntrl()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*,

39355       First released in Issue 1. Derived from Issue 1 of the SVID.

39356 **Issue 6**

39357       The normative text is updated to avoid use of the term “must” for application requirements.

39358 **Issue 7**

39359

39360

The *isdigit\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

39361

39362

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0286 [302], XSH/TC1-2008/0287 [283], and XSH/TC1-2008/0288 [283] are applied.

39363 **NAME**

39364 isfinite — test for finite value

39365 **SYNOPSIS**

39366 #include &lt;math.h&gt;

39367 int isfinite(real-floating x);

39368 **DESCRIPTION**

39369 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
39370 conflict between the requirements described here and the ISO C standard is unintentional. This  
39371 volume of POSIX.1-2008 defers to the ISO C standard.

39372 The *isfinite()* macro shall determine whether its argument has a finite value (zero, subnormal, or  
39373 normal, and not infinite or NaN). First, an argument represented in a format wider than its  
39374 semantic type is converted to its semantic type. Then determination is based on the type of the  
39375 argument.

39376 **RETURN VALUE**39377 The *isfinite()* macro shall return a non-zero value if and only if its argument has a finite value.39378 **ERRORS**

39379 No errors are defined.

39380 **EXAMPLES**

39381 None.

39382 **APPLICATION USAGE**

39383 None.

39384 **RATIONALE**

39385 None.

39386 **FUTURE DIRECTIONS**

39387 None.

39388 **SEE ALSO**39389 *fpclassify()*, *isinf()*, *isnan()*, *isnormal()*, *signbit()*

39390 XBD &lt;math.h&gt;

39391 **CHANGE HISTORY**

39392 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

39393 **NAME**

39394 isgraph, isgraph\_l — test for a visible character

39395 **SYNOPSIS**

```
39396     #include <ctype.h>
39397     int isgraph(int c);
39398 CX   int isgraph_l(int c, locale_t locale);
```

39399 **DESCRIPTION**

39400 CX For *isgraph()*: The functionality described on this reference page is aligned with the ISO C  
 39401 standard. Any conflict between the requirements described here and the ISO C standard is  
 39402 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39403 CX The *isgraph()* and *isgraph\_l()* functions shall test whether *c* is a character of class **graph** in the  
 39404 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
 39405 135).

39406 The *c* argument is an **int**, the value of which the application shall ensure is a character  
 39407 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 39408 any other value, the behavior is undefined.

39409 CX The behavior is undefined if the *locale* argument to *isgraph\_l()* is the special locale object  
 39410 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

39411 **RETURN VALUE**

39412 CX The *isgraph()* and *isgraph\_l()* functions shall return non-zero if *c* is a character with a visible  
 39413 representation; otherwise, they shall return 0.

39414 **ERRORS**

39415 No errors are defined.

39416 **EXAMPLES**

39417 None.

39418 **APPLICATION USAGE**

39419 To ensure applications portability, especially across natural languages, only these functions and  
 39420 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 39421 classification.

39422 **RATIONALE**

39423 None.

39424 **FUTURE DIRECTIONS**

39425 None.

39426 **SEE ALSO**

39427 *isalnum()*, *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,

39429 XBD Chapter 7 (on page 135), *<ctype.h>*, *<locale.h>*39430 **CHANGE HISTORY**

39431 First released in Issue 1. Derived from Issue 1 of the SVID.

39432 **Issue 6**

39433 The normative text is updated to avoid use of the term “must” for application requirements.

39434 **Issue 7**

39435

39436

The *isgraph\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

39437

39438

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0289 [302], XSH/TC1-2008/0290 [283], and XSH/TC1-2008/0291 [283] are applied.

39439 **NAME**39440 `isgreater` — test if  $x$  greater than  $y$ 39441 **SYNOPSIS**39442 `#include <math.h>`39443 `int isgreater(real-floating  $x$ , real-floating  $y$ );`39444 **DESCRIPTION**

39445 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 39446 conflict between the requirements described here and the ISO C standard is unintentional. This  
 39447 volume of POSIX.1-2008 defers to the ISO C standard.

39448 The `isgreater()` macro shall determine whether its first argument is greater than its second  
 39449 argument. The value of `isgreater( $x$ ,  $y$ )` shall be equal to  $(x) > (y)$ ; however, unlike  $(x) > (y)$ ,  
 39450 `isgreater( $x$ ,  $y$ )` shall not raise the invalid floating-point exception when  $x$  and  $y$  are unordered.

39451 **RETURN VALUE**39452 Upon successful completion, the `isgreater()` macro shall return the value of  $(x) > (y)$ .39453 If  $x$  or  $y$  is NaN, 0 shall be returned.39454 **ERRORS**

39455 No errors are defined.

39456 **EXAMPLES**

39457 None.

39458 **APPLICATION USAGE**

39459 The relational and equality operators support the usual mathematical relationships between  
 39460 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
 39461 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
 39462 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
 39463 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
 39464 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
 39465 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
 39466 indicates that the argument shall be an expression of **real-floating** type.

39467 **RATIONALE**

39468 None.

39469 **FUTURE DIRECTIONS**

39470 None.

39471 **SEE ALSO**39472 `isgreaterequal()`, `isless()`, `islessequal()`, `islessgreater()`, `isunordered()`39473 XBD `<math.h>`39474 **CHANGE HISTORY**

39475 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

39476 **NAME**39477       isgreaterequal — test if *x* is greater than or equal to *y*39478 **SYNOPSIS**

39479       #include &lt;math.h&gt;

39480       int isgreaterequal(real-floating *x*, real-floating *y*);39481 **DESCRIPTION**

39482 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 39483 conflict between the requirements described here and the ISO C standard is unintentional. This  
 39484 volume of POSIX.1-2008 defers to the ISO C standard.

39485       The *isgreaterequal()* macro shall determine whether its first argument is greater than or equal to  
 39486 its second argument. The value of *isgreaterequal(x, y)* shall be equal to  $(x) \geq (y)$ ; however, unlike  
 39487  $(x) \geq (y)$ , *isgreaterequal(x, y)* shall not raise the invalid floating-point exception when *x* and *y* are  
 39488 unordered.

39489 **RETURN VALUE**39490       Upon successful completion, the *isgreaterequal()* macro shall return the value of  $(x) \geq (y)$ .39491       If *x* or *y* is NaN, 0 shall be returned.39492 **ERRORS**

39493       No errors are defined.

39494 **EXAMPLES**

39495       None.

39496 **APPLICATION USAGE**

39497       The relational and equality operators support the usual mathematical relationships between  
 39498 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
 39499 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
 39500 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
 39501 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
 39502 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
 39503 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
 39504 indicates that the argument shall be an expression of **real-floating** type.

39578 **CHANGE HISTORY**

39579 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

39580 **NAME**39581 islessequal — test if *x* is less than or equal to *y*39582 **SYNOPSIS**

39583 #include &lt;math.h&gt;

39584 int islessequal(real-floating *x*, real-floating *y*);39585 **DESCRIPTION**

39586 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
39587 conflict between the requirements described here and the ISO C standard is unintentional. This  
39588 volume of POSIX.1-2008 defers to the ISO C standard.

39589 The *islessequal()* macro shall determine whether its first argument is less than or equal to its  
39590 second argument. The value of *islessequal(x, y)* shall be equal to  $(x) \leq (y)$ ; however, unlike  
39591  $(x) \leq (y)$ , *islessequal(x, y)* shall not raise the invalid floating-point exception when *x* and *y* are  
39592 unordered.

39593 **RETURN VALUE**39594 Upon successful completion, the *islessequal()* macro shall return the value of  $(x) \leq (y)$ .39595 If *x* or *y* is NaN, 0 shall be returned.39596 **ERRORS**

39597 No errors are defined.

39598 **EXAMPLES**

39599 None.

39600 **APPLICATION USAGE**

39601 The relational and equality operators support the usual mathematical relationships between  
39602 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
39603 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
39604 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
39605 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
39606 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
39607 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
39608 indicates that the argument shall be an expression of **real-floating** type.

39609 **RATIONALE**

39610 None.

39611 **FUTURE DIRECTIONS**

39612 None.

39613 **SEE ALSO**39614 *isgreater(), isgreaterequal(), isless(), islessgreater(), isunordered()*

39615 XBD &lt;math.h&gt;

39616 **CHANGE HISTORY**

39617 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

## NAME

islessgreater — test if *x* is less than or greater than *y*

## SYNOPSIS

```
#include <math.h>
```

```
int islessgreater(real-floating x, real-floating y);
```

## DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *islessgreater()* macro shall determine whether its first argument is less than or greater than its second argument. The *islessgreater(x, y)* macro is similar to  $(x) < (y) \parallel (x) > (y)$ ; however, *islessgreater(x, y)* shall not raise the invalid floating-point exception when *x* and *y* are unordered (nor shall it evaluate *x* and *y* twice).

## RETURN VALUE

Upon successful completion, the *islessgreater()* macro shall return the value of  $(x) < (y) \parallel (x) > (y)$ .

If *x* or *y* is NaN, 0 shall be returned.

## ERRORS

No errors are defined.

## EXAMPLES

None.

## APPLICATION USAGE

The relational and equality operators support the usual mathematical relationships between numeric values. For any ordered pair of numeric values, exactly one of the relationships (less, greater, and equal) is true. Relational operators may raise the invalid floating-point exception when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the unordered relationship is true. This macro is a quiet (non-floating-point exception raising) version of a relational operator. It facilitates writing efficient code that accounts for NaNs without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating** indicates that the argument shall be an expression of **real-floating** type.

## RATIONALE

## CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

39657 **NAME**

39658 islower, islower\_l — test for a lowercase letter

39659 **SYNOPSIS**

```
39660     #include <ctype.h>
39661     int islower(int c);
39662 CX    int islower_l(int c, locale_t locale);
```

39663 **DESCRIPTION**

39664 CX For *islower()*: The functionality described on this reference page is aligned with the ISO C  
 39665 standard. Any conflict between the requirements described here and the ISO C standard is  
 39666 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39667 CX The *islower()* and *islower\_l()* functions shall test whether *c* is a character of class **lower** in the  
 39668 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
 39669 135).

39670 The *c* argument is an **int**, the value of which the application shall ensure is a character  
 39671 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 39672 any other value, the behavior is undefined.

39673 CX The behavior is undefined if the *locale* argument to *islower\_l()* is the special locale object  
 39674 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

39675 **RETURN VALUE**

39676 CX The *islower()* and *islower\_l()* functions shall return non-zero if *c* is a lowercase letter; otherwise,  
 39677 they shall return 0.

39678 **ERRORS**

39679 No errors are defined.

39680 **EXAMPLES**39681 **Testing for a Lowercase Letter**

39682 Two examples follow, the first using *islower()*, the second using multiple concurrent locales and  
 39683 *islower\_l()*.

39684 The examples test whether the value is a lowercase letter, based on the current locale, then use it  
 39685 as part of a key value.

```
39686     /* Example 1 -- using islower() */
39687     #include <ctype.h>
39688     #include <stdlib.h>
39689     #include <locale.h>
39690     ...
39691     char *keystr;
39692     int elementlen, len;
39693     unsigned char c;
39694     ...
39695     setlocale(LC_ALL, "");
39696     ...
39697     len = 0;
39698     while (len < elementlen) {
39699         c = (unsigned char) (rand() % 256);
39700     ...
```

```

39701         if (islower(c))
39702             keystr[len++] = c;
39703     }
39704     ...
39705     /* Example 2 -- using islower_l() */
39706     #include <ctype.h>
39707     #include <stdlib.h>
39708     #include <locale.h>
39709     ...
39710     char *keystr;
39711     int elementlen, len;
39712     unsigned char c;
39713     ...
39714     locale_t loc = newlocale (LC_ALL_MASK, "", (locale_t) 0);
39715     ...
39716     len = 0;
39717     while (len < elementlen) {
39718         c = (unsigned char) (rand() % 256);
39719         ...
39720         if (islower_l(c, loc))
39721             keystr[len++] = c;
39722     }
39723     ...

```

#### APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

#### RATIONALE

None.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

*isalnum()*, *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *isgraph()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*, *isxdigit()*, *setlocale()*, *uselocale()*

XBD Chapter 7 (on page 135), **<ctype.h>**, **<locale.h>**

#### CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

##### Issue 6

The normative text is updated to avoid use of the term “must” for application requirements and an example is added.

##### Issue 7

The *islower\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0292 [302], XSH/TC1-2008/0293 [283], XSH/TC1-2008/0294 [283], XSH/TC1-2008/0295 [302], and XSH/TC1-2008/0296 [304] are applied.

**NAME**

isnan — test for a NaN

**SYNOPSIS**

```
#include <math.h>
```

```
int isnan(real-floating x);
```

**DESCRIPTION**

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *isnan()* macro shall determine whether its argument value is a NaN. First, an argument represented in a format wider than its semantic type is converted to its semantic type. Then determination is based on the type of the argument.

**RETURN VALUE**

The *isnan()* macro shall return a non-zero value if and only if its argument has a NaN value.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*fpclassify()*, *isfinite()*, *isinf()*, *isnormal()*, *signbit()*

XBD **<math.h>**

**CHANGE HISTORY**

First released in Issue 3.

**Issue 5**

The DESCRIPTION is updated to indicate the return value when NaN is not supported. This text was previously published in the APPLICATION USAGE section.

**Issue 6**

Re-written for alignment with the ISO/IEC 9899:1999 standard.

39781 **NAME**

39782       isnormal — test for a normal value

39783 **SYNOPSIS**

39784       #include &lt;math.h&gt;

39785       int isnormal(real-floating x);

39786 **DESCRIPTION**

39787 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 39788 conflict between the requirements described here and the ISO C standard is unintentional. This  
 39789 volume of POSIX.1-2008 defers to the ISO C standard.

39790       The *isnormal()* macro shall determine whether its argument value is normal (neither zero,  
 39791 subnormal, infinite, nor NaN). First, an argument represented in a format wider than its  
 39792 semantic type is converted to its semantic type. Then determination is based on the type of the  
 39793 argument.

39794 **RETURN VALUE**

39795       The *isnormal()* macro shall return a non-zero value if and only if its argument has a normal  
 39796 value.

39797 **ERRORS**

39798       No errors are defined.

39799 **EXAMPLES**

39800       None.

39801 **APPLICATION USAGE**

39802       None.

39803 **RATIONALE**

39804       None.

39805 **FUTURE DIRECTIONS**

39806       None.

39810 **CHANGE HISTORY**

39811       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

39812 **NAME**

39813 isprint, isprint\_l — test for a printable character

39814 **SYNOPSIS**

```
39815 #include <ctype.h>
39816 int isprint(int c);
39817 CX int isprint_l(int c, locale_t locale);
```

39818 **DESCRIPTION**

39819 CX For *isprint()*: The functionality described on this reference page is aligned with the ISO C  
39820 standard. Any conflict between the requirements described here and the ISO C standard is  
39821 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39822 CX The *isprint()* and *isprint\_l()* functions shall test whether *c* is a character of class **print** in the  
39823 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
39824 135).

39825 The *c* argument is an **int**, the value of which the application shall ensure is a character  
39826 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
39827 any other value, the behavior is undefined.

39828 CX The behavior is undefined if the *locale* argument to *isprint\_l()* is the special locale object  
39829 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

39830 **RETURN VALUE**

39831 CX The *isprint()* and *isprint\_l()* functions shall return non-zero if *c* is a printable character;  
39832 otherwise, they shall return 0.

39833 **ERRORS**

39834 No errors are defined.

39835 **EXAMPLES**

39836 None.

39837 **APPLICATION USAGE**

39838 To ensure applications portability, especially across natural languages, only these functions and  
39839 the functions in the reference pages listed in the SEE ALSO section should be used for character  
39840 classification.

39841 **RATIONALE**

39842 None.

## 39950 NAME

39951 isunordered — test if arguments are unordered

## 39952 SYNOPSIS

39953 #include <math.h>

39954 int isunordered(real-floating x, real-floating y);

## 39955 DESCRIPTION

39956 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 39957 conflict between the requirements described here and the ISO C standard is unintentional. This  
 39958 volume of POSIX.1-2008 defers to the ISO C standard.

39959 The *isunordered()* macro shall determine whether its arguments are unordered.

## 39960 RETURN VALUE

39961 Upon successful completion, the *isunordered()* macro shall return 1 if its arguments are  
 39962 unordered, and 0 otherwise.

39963 If *x* or *y* is NaN, 1 shall be returned.

## 39964 ERRORS

39965 No errors are defined.

## 39966 EXAMPLES

39967 None.

## 39968 APPLICATION USAGE

39969 The relational and equality operators support the usual mathematical relationships between  
 39970 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
 39971 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
 39972 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
 39973 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
 39974 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
 39975 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
 39976 indicates that the argument shall be an expression of **real-floating** type.

## 39977 RATIONALE

39978 None.

## 39979 FUTURE DIRECTIONS

39980 None.

## 39981 SEE ALSO

39982 *isgreater()*, *isgreaterequal()*, *isless()*, *islessequal()*, *islessgreater()*

39983 XBD <math.h>

## 39984 CHANGE HISTORY

39985 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

39986 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/50 is applied, correcting the RETURN  
 39987 VALUE section when *x* or *y* is NaN.

39988 **NAME**

39989 isupper, isupper\_l — test for an uppercase letter

39990 **SYNOPSIS**

```
39991     #include <ctype.h>
39992     int isupper(int c);
39993 CX    int isupper_l(int c, locale_t locale);
```

39994 **DESCRIPTION**

39995 CX For *isupper()*: The functionality described on this reference page is aligned with the ISO C  
 39996 standard. Any conflict between the requirements described here and the ISO C standard is  
 39997 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39998 CX The *isupper()* and *isupper\_l()* functions shall test whether *c* is a character of class **upper** in the  
 39999 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
 40000 135).

40001 The *c* argument is an **int**, the value of which the application shall ensure is a character  
 40002 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 40003 any other value, the behavior is undefined.

40004 CX The behavior is undefined if the *locale* argument to *isupper\_l()* is the special locale object  
 40005 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

40006 **RETURN VALUE**

40007 CX The *isupper()* and *isupper\_l()* functions shall return non-zero if *c* is an uppercase letter;  
 40008 otherwise, they shall return 0.

40009 **ERRORS**

40010 No errors are defined.

40011 **EXAMPLES**

40012 None.

40013 **APPLICATION USAGE**

40014 To ensure applications portability, especially across natural languages, only these functions and  
 40015 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 40016 classification.

40017 **RATIONALE**

40018 None.

40019 **FUTURE DIRECTIONS**

40020 None.

40021 **SEE ALSO**

40024 XBD Chapter 7 (on page 135), *<ctype.h>*, *<locale.h>*40025 **CHANGE HISTORY**

40026 First released in Issue 1. Derived from Issue 1 of the SVID.

40027 **Issue 6**

40028 The normative text is updated to avoid use of the term “must” for application requirements.

40029 **Issue 7**

40030 The *isupper\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
40031 Set Part 4.

40032 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0306 [302], XSH/TC1-2008/0307 [283],  
40033 and XSH/TC1-2008/0308 [283] are applied.

40034 **NAME**

40035       iswalnum, iswalnum\_l — test for an alphanumeric wide-character code

40036 **SYNOPSIS**

40037       #include &lt;wctype.h&gt;

40038       int iswalnum(wint\_t wc);

40039 CX     int iswalnum\_l(wint\_t wc, locale\_t locale);

40040 **DESCRIPTION**40041 CX     For *iswalnum()*: The functionality described on this reference page is aligned with the ISO C  
40042 standard. Any conflict between the requirements described here and the ISO C standard is  
40043 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.40044 CX     The *iswalnum()* and *iswalnum\_l()* functions shall test whether *wc* is a wide-character code  
40045 CX     representing a character of class **alpha** or **digit** in the current locale, or in the locale represented  
40046 by *locale*, respectively; see XBD Chapter 7 (on page 135).40047       The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
40048 code corresponding to a valid character in the locale used by the function, or equal to the value  
40049 of the macro WEOF. If the argument has any other value, the behavior is undefined.40050 CX     The behavior is undefined if the *locale* argument to *iswalnum\_l()* is the special locale object  
40051 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.40052 **RETURN VALUE**40053 CX     The *iswalnum()* and *iswalnum\_l()* functions shall return non-zero if *wc* is an alphanumeric  
40054 wide-character code; otherwise, they shall return 0.40055 **ERRORS**

40056       No errors are defined.

40057 **EXAMPLES**

40058       None.

40059 **APPLICATION USAGE**40060       To ensure applications portability, especially across natural languages, only these functions and  
40061 the functions in the reference pages listed in the SEE ALSO section should be used for character  
40062 classification.40063 **RATIONALE**

40064       None.

40065 **FUTURE DIRECTIONS**

40066       None.

40067 **SEE ALSO**40068       *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,  
40069 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

40070       XBD Chapter 7 (on page 135), &lt;locale.h&gt;, &lt;stdio.h&gt;, &lt;wctype.h&gt;

40071 **CHANGE HISTORY**

40072       First released as a World-wide Portability Interface in Issue 4.

40073 **Issue 5**40074       The following change has been made in this version for alignment with  
40075 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40076 • The SYNOPSIS has been changed to indicate that this function and associated data types  
40077 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

40078 **Issue 6**

40079 The normative text is updated to avoid use of the term “must” for application requirements.

40080 **Issue 7**

40081 The `iswalnum_l()` function is added from The Open Group Technical Standard, 2006, Extended  
40082 API Set Part 4.

40083 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0309 [302], XSH/TC1-2008/0310 [283],  
40084 and XSH/TC1-2008/0311 [283] are applied.

40085 **NAME**

40086 iswalpha, iswalpha\_l — test for an alphabetic wide-character code

40087 **SYNOPSIS**

40088 #include &lt;wctype.h&gt;

40089 int iswalpha(wint\_t wc);

40090 CX int iswalpha\_l(wint\_t wc, locale\_t locale);

40091 **DESCRIPTION**

40092 CX For *iswalpha()*: The functionality described on this reference page is aligned with the ISO C  
 40093 standard. Any conflict between the requirements described here and the ISO C standard is  
 40094 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40095 CX The *iswalpha()* and *iswalpha\_l()* functions shall test whether *wc* is a wide-character code  
 40096 CX representing a character of class **alpha** in the current locale, or in the locale represented by *locale*,  
 40097 respectively; see XBD Chapter 7 (on page 135).

40098 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 40099 code corresponding to a valid character in the locale used by the function, or equal to the value  
 40100 of the macro WEOF. If the argument has any other value, the behavior is undefined.

40101 CX The behavior is undefined if the *locale* argument to *iswalpha\_l()* is the special locale object  
 40102 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

40103 **RETURN VALUE**

40104 CX The *iswalpha()* and *iswalpha\_l()* functions shall return non-zero if *wc* is an alphabetic wide-  
 40105 character code; otherwise, they shall return 0.

40106 **ERRORS**

40107 No errors are defined.

40108 **EXAMPLES**

40109 None.

40110 **APPLICATION USAGE**

40111 To ensure applications portability, especially across natural languages, only these functions and  
 40112 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 40113 classification.

40114 **RATIONALE**

40115 None.

40116 **FUTURE DIRECTIONS**

40117 None.

40118 **SEE ALSO**

40119 *iswalnum()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,  
 40120 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

40121 XBD Chapter 7 (on page 135), &lt;locale.h&gt;, &lt;wctype.h&gt;

40122 **CHANGE HISTORY**

40123 First released in Issue 4.

40124 **Issue 5**

40125 The following change has been made in this version for alignment with  
 40126 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40127                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
40128                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.
- 40129 **Issue 6**
- 40130                   The normative text is updated to avoid use of the term “must” for application requirements.
- 40131 **Issue 7**
- 40132                   The *iswalpha\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
40133                   API Set Part 4.
- 40134                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0312 [302], XSH/TC1-2008/0313 [283],  
40135                   and XSH/TC1-2008/0314 [283] are applied.

40136 **NAME**

40137 iswblank, iswblank\_l — test for a blank wide-character code

40138 **SYNOPSIS**

40139 #include &lt;wctype.h&gt;

40140 int iswblank(wint\_t wc);

40141 CX int iswblank\_l(wint\_t wc, locale\_t locale);

40142 **DESCRIPTION**

40143 CX For *iswblank()*: The functionality described on this reference page is aligned with the ISO C  
 40144 standard. Any conflict between the requirements described here and the ISO C standard is  
 40145 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40146 CX The *iswblank()* and *iswblank\_l()* functions shall test whether *wc* is a wide-character code  
 40147 CX representing a character of class **blank** in the current locale, or in the locale represented by  
 40148 *locale*, respectively; see XBD Chapter 7 (on page 135).

40149 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 40150 code corresponding to a valid character in the locale used by the function, or equal to the value  
 40151 of the macro WEOF. If the argument has any other value, the behavior is undefined.

40152 CX The behavior is undefined if the *locale* argument to *iswblank\_l()* is the special locale object  
 40153 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

40154 **RETURN VALUE**

40155 CX The *iswblank()* and *iswblank\_l()* functions shall return non-zero if *wc* is a blank wide-character  
 40156 code; otherwise, they shall return 0.

40157 **ERRORS**

40158 No errors are defined.

40159 **EXAMPLES**

40160 None.

40161 **APPLICATION USAGE**

40162 To ensure applications portability, especially across natural languages, only these functions and  
 40163 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 40164 classification.

40165 **RATIONALE**

40166 None.

40167 **FUTURE DIRECTIONS**

40168 None.

40169 **SEE ALSO**

40170 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*,

40172 XBD Chapter 7 (on page 135), &lt;locale.h&gt;, &lt;wctype.h&gt;

40173 **CHANGE HISTORY**

40174 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

40175 **Issue 7**

40176 The *iswblank\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
 40177 API Set Part 4.

40178  
40179

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0315 [302], XSH/TC1-2008/0316 [283], and XSH/TC1-2008/0317 [283] are applied.

40180 **NAME**

40181 iswcntrl, iswcntrl\_l — test for a control wide-character code

40182 **SYNOPSIS**

40183 #include &lt;wctype.h&gt;

40184 int iswcntrl(wint\_t wc);

40185 CX int iswcntrl\_l(wint\_t wc, locale\_t locale);

40186 **DESCRIPTION**

40187 CX For *iswcntrl()*: The functionality described on this reference page is aligned with the ISO C  
 40188 standard. Any conflict between the requirements described here and the ISO C standard is  
 40189 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40190 CX The *iswcntrl()* and *iswcntrl\_l()* functions shall test whether *wc* is a wide-character code  
 40191 CX representing a character of class **cntrl** in the current locale, or in the locale represented by *locale*,  
 40192 respectively; see XBD Chapter 7 (on page 135).

40193 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 40194 code corresponding to a valid character in the locale used by the function, or equal to the value  
 40195 of the macro WEOF. If the argument has any other value, the behavior is undefined.

40196 CX The behavior is undefined if the *locale* argument to *iswcntrl\_l()* is the special locale object  
 40197 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

40198 **RETURN VALUE**

40199 CX The *iswcntrl()* and *iswcntrl\_l()* functions shall return non-zero if *wc* is a control wide-character  
 40200 code; otherwise, they shall return 0.

40201 **ERRORS**

40202 No errors are defined.

40203 **EXAMPLES**

40204 None.

40205 **APPLICATION USAGE**

40206 To ensure applications portability, especially across natural languages, only these functions and  
 40207 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 40208 classification.

40209 **RATIONALE**

40210 None.

40211 **FUTURE DIRECTIONS**

40212 None.

40213 **SEE ALSO**

40214 *iswalnum()*, *iswalpha()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,  
 40215 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

40216 XBD Chapter 7 (on page 135), &lt;locale.h&gt;, &lt;wctype.h&gt;

40217 **CHANGE HISTORY**

40218 First released in Issue 4.

40219 **Issue 5**

40220 The following change has been made in this version for alignment with  
 40221 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40222                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
40223                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.
- 40224 **Issue 6**
- 40225                   The normative text is updated to avoid use of the term “must” for application requirements.
- 40226 **Issue 7**
- 40227                   The `iswcntrl_l()` function is added from The Open Group Technical Standard, 2006, Extended  
40228                   API Set Part 4.
- 40229                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0318 [302], XSH/TC1-2008/0319 [283],  
40230                   and XSH/TC1-2008/0320 [283] are applied.

**NAME**

iswctype, iswctype\_l — test character for a specified class

**SYNOPSIS**

```
#include <wctype.h>

int iswctype(wint_t wc, wctype_t charclass);
int iswctype_l(wint_t wc, wctype_t charclass,
               locale_t locale);
```

**DESCRIPTION**

For *iswctype()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *iswctype()* and *iswctype\_l()* functions shall determine whether the wide-character code *wc* has the character class *charclass*, returning true or false. The *iswctype()* and *iswctype\_l()* functions are defined on WEOF and wide-character codes corresponding to the valid character encodings in the current locale, or in the locale represented by *locale*, respectively. If the *wc* argument is not in the domain of the function, the result is undefined. If the value of *charclass* is invalid (that is, not obtained by a call to *wctype()* or *charclass* is invalidated by a subsequent call to *setlocale()* that has affected category *LC\_CTYPE*) the result is unspecified.

The behavior is undefined if the *locale* argument to *iswctype\_l()* is the special locale object *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.

**RETURN VALUE**

The *iswctype()* and *iswctype\_l()* functions shall return non-zero (true) if and only if *wc* has the property described by *charclass*. If *charclass* is (**wctype\_t**)0, these functions shall return 0.

**ERRORS**

No errors are defined.

**EXAMPLES****Testing for a Valid Character**

```
#include <wctype.h>
...
int yes_or_no;
wint_t wc;
wctype_t valid_class;
...
if ((valid_class=wctype("vowel")) == (wctype_t)0)
    /* Invalid character class. */
yes_or_no=iswctype(wc,valid_class);
```

**APPLICATION USAGE**

The twelve strings "alnum", "alpha", "blank", "cntrl", "digit", "graph", "lower", "print", "punct", "space", "upper", and "xdigit" are reserved for the standard character classes. In the table below, the functions in the left column are equivalent to the functions in the right column.

|                                         |                                                          |
|-----------------------------------------|----------------------------------------------------------|
| iswalnum( <i>wc</i> )                   | iswctype( <i>wc</i> , wctype("alnum"))                   |
| iswalnum_l( <i>wc</i> , <i>locale</i> ) | iswctype_l( <i>wc</i> , wctype("alnum"), <i>locale</i> ) |
| iswalpha( <i>wc</i> )                   | iswctype( <i>wc</i> , wctype("alpha"))                   |
| iswalpha_l( <i>wc</i> , <i>locale</i> ) | iswctype_l( <i>wc</i> , wctype("alpha"), <i>locale</i> ) |

```

40276      iswblank(wc)           iswctype(wc, wctype("blank"))
40277      iswblank_l(wc, locale) iswctype_l(wc, wctype("blank"), locale)
40278      iswcntrl(wc)           iswctype(wc, wctype("cntrl"))

XBD **<locale.h>**, **<wctype.h>****CHANGE HISTORY**

First released as World-wide Portability Interfaces in Issue 4.

**Issue 5**

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

**Issue 6**The behavior of *charclass* = (**wctype\_t**)0 is now described.

An example is added.

A new function, *iswblank()*, is added to the list in the APPLICATION USAGE.**Issue 7**

The *iswctype\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0321 [283] and XSH/TC1-2008/0322 [283] are applied.

40320 **NAME**

40321 iswdigit, iswdigit\_l — test for a decimal digit wide-character code

40322 **SYNOPSIS**

40323 #include &lt;wctype.h&gt;

40324 int iswdigit(wint\_t wc);

40325 CX int iswdigit\_l(wint\_t wc, locale\_t locale);

40326 **DESCRIPTION**

40327 CX For *iswdigit()*: The functionality described on this reference page is aligned with the ISO C  
 40328 standard. Any conflict between the requirements described here and the ISO C standard is  
 40329 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40330 CX The *iswdigit()* and *iswdigit\_l()* functions shall test whether *wc* is a wide-character code  
 40331 CX representing a character of class **digit** in the current locale, or in the locale represented by *locale*,  
 40332 respectively; see XBD Chapter 7 (on page 135).

40333 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 40334 code corresponding to a valid character in the locale used by the function, or equal to the value  
 40335 of the macro WEOF. If the argument has any other value, the behavior is undefined.

40336 CX The behavior is undefined if the *locale* argument to *iswdigit\_l()* is the special locale object  
 40337 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

40338 **RETURN VALUE**

40339 CX The *iswdigit()* and *iswdigit\_l()* functions shall return non-zero if *wc* is a decimal digit wide-  
 40340 character code; otherwise, they shall return 0.

40341 **ERRORS**

40342 No errors are defined.

40343 **EXAMPLES**

40344 None.

40345 **APPLICATION USAGE**

40346 To ensure applications portability, especially across natural languages, only these functions and  
 40347 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 40348 classification.

40349 **RATIONALE**

40350 None.

40351 **FUTURE DIRECTIONS**

40352 None.

40357 **CHANGE HISTORY**

40358 First released in Issue 4.

40359 **Issue 5**

40360 The following change has been made in this version for alignment with  
 40361 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40362 • The SYNOPSIS has been changed to indicate that this function and associated data types  
40363 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

40364 **Issue 6**

40365 The normative text is updated to avoid use of the term “must” for application requirements.

40366 **Issue 7**

40367 The `iswdigit_l()` function is added from The Open Group Technical Standard, 2006, Extended  
40368 API Set Part 4.

40369 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0323 [302], XSH/TC1-2008/0324 [283],  
40370 and XSH/TC1-2008/0325 [283] are applied.

40371 **NAME**

40372 iswgraph, iswgraph\_l — test for a visible wide-character code

40373 **SYNOPSIS**

40374 #include &lt;wctype.h&gt;

40375 int iswgraph(wint\_t wc);

40376 CX int iswgraph\_l(wint\_t wc, locale\_t locale);

40377 **DESCRIPTION**

40378 CX For *iswgraph()*: The functionality described on this reference page is aligned with the ISO C  
 40379 standard. Any conflict between the requirements described here and the ISO C standard is  
 40380 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40381 CX The *iswgraph()* and *iswgraph\_l()* functions shall test whether *wc* is a wide-character code  
 40382 CX representing a character of class **graph** in the current locale, or in the locale represented by  
 40383 *locale*, respectively; see XBD Chapter 7 (on page 135).

40384 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 40385 code corresponding to a valid character in the locale used by the function, or equal to the value  
 40386 of the macro WEOF. If the argument has any other value, the behavior is undefined.

40387 CX The behavior is undefined if the *locale* argument to *iswgraph\_l()* is the special locale object  
 40388 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

40389 **RETURN VALUE**

40390 CX The *iswgraph()* and *iswgraph\_l()* functions shall return non-zero if *wc* is a wide-character code  
 40391 with a visible representation; otherwise, they shall return 0.

40392 **ERRORS**

40393 No errors are defined.

40394 **EXAMPLES**

40395 None.

40396 **APPLICATION USAGE**

40397 To ensure applications portability, especially across natural languages, only these functions and  
 40398 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 40399 classification.

40400 **RATIONALE**

40401 None.

40402 **FUTURE DIRECTIONS**

40403 None.

40404 **SEE ALSO**

40405 *iswalnum()*, *iswalphabeta()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswlower()*, *iswprint()*, *iswpunct()*,  
 40406 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

40407 XBD Chapter 7 (on page 135), &lt;locale.h&gt;, &lt;wctype.h&gt;

40408 **CHANGE HISTORY**

40409 First released in Issue 4.

40410 **Issue 5**

40411 The following change has been made in this version for alignment with  
 40412 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40413 • The SYNOPSIS has been changed to indicate that this function and associated data types  
40414 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

40415 **Issue 6**

40416 The normative text is updated to avoid use of the term “must” for application requirements.

40417 **Issue 7**

40418 The `iswgraph_l()` function is added from The Open Group Technical Standard, 2006, Extended  
40419 API Set Part 4.

40420 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0326 [302], XSH/TC1-2008/0327 [283],  
40421 and XSH/TC1-2008/0328 [283] are applied.

40422 **NAME**

40423 iswlower, iswlower\_l — test for a lowercase letter wide-character code

40424 **SYNOPSIS**

40425 #include &lt;wctype.h&gt;

40426 int iswlower(wint\_t wc);

40427 CX int iswlower\_l(wint\_t wc, locale\_t locale);

40428 **DESCRIPTION**

40429 CX For *iswlower()*: The functionality described on this reference page is aligned with the ISO C  
 40430 standard. Any conflict between the requirements described here and the ISO C standard is  
 40431 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40432 CX The *iswlower()* and *iswlower\_l()* functions shall test whether *wc* is a wide-character code  
 40433 CX representing a character of class **lower** in the current locale, or in the locale represented by  
 40434 *locale*, respectively; see XBD Chapter 7 (on page 135).

40435 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 40436 code corresponding to a valid character in the locale used by the function, or equal to the value  
 40437 of the macro WEOF. If the argument has any other value, the behavior is undefined.

40438 CX The behavior is undefined if the *locale* argument to *iswlower\_l()* is the special locale object  
 40439 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

40440 **RETURN VALUE**

40441 CX The *iswlower()* and *iswlower\_l()* functions shall return non-zero if *wc* is a lowercase letter wide-  
 40442 character code; otherwise, they shall return 0.

40443 **ERRORS**

40444 No errors are defined.

40445 **EXAMPLES**

40446 None.

40447 **APPLICATION USAGE**

40448 To ensure applications portability, especially across natural languages, only these functions and  
 40449 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 40450 classification.

40451 **RATIONALE**

40452 None.

40453 **FUTURE DIRECTIONS**

40454 None.

40455 **SEE ALSO**

40456 *iswalnum()*, *iswalphabet()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswprint()*, *iswpunct()*,  
 40457 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()* (on page 2196) 1

40458 XBD Chapter 7 (on page 135), &lt;locale.h&gt;, &lt;wctype.h&gt;

40459 **CHANGE HISTORY**

40460 First released in Issue 4.

40461 **Issue 5**

40462 The following change has been made in this version for alignment with  
 40463 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40464
- 40465
- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

40466 **Issue 6**

40467 The normative text is updated to avoid use of the term “must” for application requirements.

40468 **Issue 7**

40469 The `iswlower_l()` function is added from The Open Group Technical Standard, 2006, Extended  
40470 API Set Part 4.

40471 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0329 [302], XSH/TC1-2008/0330 [283],  
40472 and XSH/TC1-2008/0331 [283] are applied.

40473 **NAME**

40474 iswprint, iswprint\_l — test for a printable wide-character code

40475 **SYNOPSIS**

40476 #include &lt;wctype.h&gt;

40477 int iswprint(wint\_t wc);

40478 CX int iswprint\_l(wint\_t wc, locale\_t locale);

40479 **DESCRIPTION**

40480 CX For *iswprint()*: The functionality described on this reference page is aligned with the ISO C  
 40481 standard. Any conflict between the requirements described here and the ISO C standard is  
 40482 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40483 CX The *iswprint()* and *iswprint\_l()* functions shall test whether *wc* is a wide-character code  
 40484 CX representing a character of class **print** in the current locale, or in the locale represented by *locale*,  
 40485 respectively; see XBD Chapter 7 (on page 135).

40486 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 40487 code corresponding to a valid character in the locale used by the function, or equal to the value  
 40488 of the macro WEOF. If the argument has any other value, the behavior is undefined.

40489 CX The behavior is undefined if the *locale* argument to *iswprint\_l()* is the special locale object  
 40490 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

40491 **RETURN VALUE**

40492 CX The *iswprint()* and *iswprint\_l()* functions shall return non-zero if *wc* is a printable wide-  
 40493 character code; otherwise, they shall return 0.

40494 **ERRORS**

40495 No errors are defined.

40496 **EXAMPLES**

40497 None.

40498 **APPLICATION USAGE**

40499 To ensure applications portability, especially across natural languages, only these functions and  
 40500 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 40501 classification.

40502 **RATIONALE**

40503 None.

40504 **FUTURE DIRECTIONS**

40505 None.

40507 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswpunct()*,  
 40508 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

40509 XBD Chapter 7 (on page 135), &lt;locale.h&gt;, &lt;wctype.h&gt;

40510 **CHANGE HISTORY**

40511 First released in Issue 4.

40512 **Issue 5**

40513 The following change has been made in this version for alignment with  
 40514 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40515 • The SYNOPSIS has been changed to indicate that this function and associated data types  
40516 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

40517 **Issue 6**

40518 The normative text is updated to avoid use of the term “must” for application requirements.

40519 **Issue 7**

40520 The `iswprint_l()` function is added from The Open Group Technical Standard, 2006, Extended  
40521 API Set Part 4.

40522 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0332 [302], XSH/TC1-2008/0333 [283],  
40523 and XSH/TC1-2008/0334 [283] are applied.

40524 **NAME**

40525 iswpunct, iswpunct\_l — test for a punctuation wide-character code

40526 **SYNOPSIS**

40527 #include &lt;wctype.h&gt;

40528 int iswpunct(wint\_t wc);

40529 CX int iswpunct\_l(wint\_t wc, locale\_t locale);

40530 **DESCRIPTION**

40531 CX For *iswpunct()*: The functionality described on this reference page is aligned with the ISO C  
 40532 standard. Any conflict between the requirements described here and the ISO C standard is  
 40533 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40534 CX The *iswpunct()* and *iswpunct\_l()* functions shall test whether *wc* is a wide-character code  
 40535 CX representing a character of class **punct** in the current locale, or in the locale represented by  
 40536 *locale*, respectively; see XBD Chapter 7 (on page 135).

40537 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 40538 code corresponding to a valid character in the locale used by the function, or equal to the value  
 40539 of the macro WEOF. If the argument has any other value, the behavior is undefined.

40540 CX The behavior is undefined if the *locale* argument to *iswpunct\_l()* is the special locale object  
 40541 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

40542 **RETURN VALUE**

40543 CX The *iswpunct()* and *iswpunct\_l()* functions shall return non-zero if *wc* is a punctuation wide-  
 40544 character code; otherwise, they shall return 0.

40545 **ERRORS**

40546 No errors are defined.

40547 **EXAMPLES**

40548 None.

40549 **APPLICATION USAGE**

40550 To ensure applications portability, especially across natural languages, only these functions and  
 40551 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 40552 classification.

40553 **RATIONALE**

40554 None.

40555 **FUTURE DIRECTIONS**

40556 None.

40557 **SEE ALSO**

40560 XBD Chapter 7 (on page 135), &lt;locale.h&gt;, &lt;wctype.h&gt;

40561 **CHANGE HISTORY**

40562 First released in Issue 4.

40563 **Issue 5**

40564 The following change has been made in this version for alignment with  
 40565 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40566 • The SYNOPSIS has been changed to indicate that this function and associated data types  
40567 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

40568 **Issue 6**

40569 The normative text is updated to avoid use of the term “must” for application requirements.

40570 **Issue 7**

40571 The `iswpunct_l()` function is added from The Open Group Technical Standard, 2006, Extended  
40572 API Set Part 4.

40573 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0335 [302], XSH/TC1-2008/0336 [283],  
40574 and XSH/TC1-2008/0337 [283] are applied.

40575 **NAME**

40576 iswspace, iswspace\_l — test for a white-space wide-character code

40577 **SYNOPSIS**

40578 #include &lt;wctype.h&gt;

40579 int iswspace(wint\_t wc);

40580 CX int iswspace\_l(wint\_t wc, locale\_t locale);

40581 **DESCRIPTION**

40582 CX For *iswspace()*: The functionality described on this reference page is aligned with the ISO C  
 40583 standard. Any conflict between the requirements described here and the ISO C standard is  
 40584 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40585 CX The *iswspace()* and *iswspace\_l()* functions shall test whether *wc* is a wide-character code  
 40586 CX representing a character of class **space** in the current locale, or in the locale represented by *locale*,  
 40587 respectively; see XBD Chapter 7 (on page 135).

40588 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 40589 code corresponding to a valid character in the locale used by the function, or equal to the value  
 40590 of the macro WEOF. If the argument has any other value, the behavior is undefined.

40591 CX The behavior is undefined if the *locale* argument to *iswspace\_l()* is the special locale object  
 40592 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

40593 **RETURN VALUE**

40594 CX The *iswspace()* and *iswspace\_l()* functions shall return non-zero if *wc* is a white-space wide-  
 40595 character code; otherwise, they shall return 0.

40596 **ERRORS**

40597 No errors are defined.

40598 **EXAMPLES**

40599 None.

40600 **APPLICATION USAGE**

40601 To ensure applications portability, especially across natural languages, only these functions and  
 40602 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 40603 classification.

40604 **RATIONALE**

40605 None.

40606 **FUTURE DIRECTIONS**

40607 None.

40608 **SEE ALSO**

40609 *iswalnum()*, *iswalphabeta()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*,

40611 XBD Chapter 7 (on page 135), &lt;locale.h&gt;, &lt;wctype.h&gt;

40612 **CHANGE HISTORY**

40613 First released in Issue 4.

40614 **Issue 5**

40615 The following change has been made in this version for alignment with  
 40616 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40617                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
40618                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

40619 **Issue 6**

40620                   The normative text is updated to avoid use of the term “must” for application requirements.

40621 **Issue 7**

40622                   The `iswspace_l()` function is added from The Open Group Technical Standard, 2006, Extended  
40623                   API Set Part 4.

40624                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0338 [302], XSH/TC1-2008/0339 [283],  
40625                   and XSH/TC1-2008/0340 [283] are applied.

40626 **NAME**

40627 iswupper, iswupper\_l — test for an uppercase letter wide-character code

40628 **SYNOPSIS**

40629 #include &lt;wctype.h&gt;

40630 int iswupper(wint\_t wc);

40631 CX int iswupper\_l(wint\_t wc, locale\_t locale);

40632 **DESCRIPTION**

40633 CX For *iswupper()*: The functionality described on this reference page is aligned with the ISO C  
 40634 standard. Any conflict between the requirements described here and the ISO C standard is  
 40635 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40636 CX The *iswupper()* and *iswupper\_l()* functions shall test whether *wc* is a wide-character code  
 40637 CX representing a character of class **upper** in the current locale, or in the locale represented by  
 40638 *locale*, respectively; see XBD Chapter 7 (on page 135).

40639 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 40640 code corresponding to a valid character in the locale used by the function, or equal to the value  
 40641 of the macro WEOF. If the argument has any other value, the behavior is undefined.

40642 CX The behavior is undefined if the *locale* argument to *iswupper\_l()* is the special locale object  
 40643 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

40644 **RETURN VALUE**

40645 CX The *iswupper()* and *iswupper\_l()* functions shall return non-zero if *wc* is an uppercase letter  
 40646 wide-character code; otherwise, they shall return 0.

40647 **ERRORS**

40648 No errors are defined.

40649 **EXAMPLES**

40650 None.

40651 **APPLICATION USAGE**

40652 To ensure applications portability, especially across natural languages, only these functions and  
 40653 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 40654 classification.

40655 **RATIONALE**

40656 None.

40657 **FUTURE DIRECTIONS**

40658 None.

40662 XBD Chapter 7 (on page 135), &lt;locale.h&gt;, &lt;wctype.h&gt;

40663 **CHANGE HISTORY**

40664 First released in Issue 4.

40665 **Issue 5**

40666 The following change has been made in this version for alignment with  
 40667 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40668                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
40669                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

40670 **Issue 6**

40671                   The normative text is updated to avoid use of the term “must” for application requirements.

40672 **Issue 7**

40673                   The *iswupper\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
40674                   API Set Part 4.

40675                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0341 [302], XSH/TC1-2008/0342 [283],  
40676                   and XSH/TC1-2008/0343 [283] are applied.

40677 **NAME**

40678 iswxdigit, iswxdigit\_l — test for a hexadecimal digit wide-character code

40679 **SYNOPSIS**

40680 #include &lt;wctype.h&gt;

40681 int iswxdigit(wint\_t wc);

40682 CX int iswxdigit\_l(wint\_t wc, locale\_t locale);

40683 **DESCRIPTION**

40684 CX For *iswxdigit()*: The functionality described on this reference page is aligned with the ISO C  
 40685 standard. Any conflict between the requirements described here and the ISO C standard is  
 40686 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40687 CX The *iswxdigit()* and *iswxdigit\_l()* functions shall test whether *wc* is a wide-character code  
 40688 CX representing a character of class **xdigit** in the current locale, or in the locale represented by  
 40689 *locale*, respectively; see XBD Chapter 7 (on page 135).

40690 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
 40691 code corresponding to a valid character in the locale used by the function, or equal to the value  
 40692 of the macro WEOF. If the argument has any other value, the behavior is undefined.

40693 CX The behavior is undefined if the *locale* argument to *iswxdigit\_l()* is the special locale object  
 40694 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

40695 **RETURN VALUE**

40696 CX The *iswxdigit()* and *iswxdigit\_l()* functions shall return non-zero if *wc* is a hexadecimal digit  
 40697 wide-character code; otherwise, they shall return 0.

40698 **ERRORS**

40699 No errors are defined.

40700 **EXAMPLES**

40701 None.

40702 **APPLICATION USAGE**

40703 To ensure applications portability, especially across natural languages, only these functions and  
 40704 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 40705 classification.

40706 **RATIONALE**

40707 None.

40708 **FUTURE DIRECTIONS**

40709 None.

40710 **SEE ALSO**

40711 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*,

40714 **CHANGE HISTORY**

40715 First released in Issue 4.

40716 **Issue 5**

40717 The following change has been made in this version for alignment with  
 40718 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 40719                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
40720                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.
- 40721 **Issue 6**
- 40722                   The normative text is updated to avoid use of the term “must” for application requirements.
- 40723 **Issue 7**
- 40724                   The `iswxdigit_l()` function is added from The Open Group Technical Standard, 2006, Extended  
40725                   API Set Part 4.
- 40726                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0344 [302], XSH/TC1-2008/0345 [283],  
40727                   and XSH/TC1-2008/0346 [283] are applied.

40728 **NAME**

40729 isxdigit, isxdigit\_l — test for a hexadecimal digit

40730 **SYNOPSIS**

```
40731     #include <ctype.h>
40732     int isxdigit(int c);
40733 CX    int isxdigit_l(int c, locale_t locale);
```

40734 **DESCRIPTION**

40735 CX For *isxdigit()*: The functionality described on this reference page is aligned with the ISO C  
 40736 standard. Any conflict between the requirements described here and the ISO C standard is  
 40737 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

40738 CX The *isxdigit()* and *isxdigit\_l()* functions shall test whether *c* is a character of class **xdigit** in the  
 40739 CX current locale, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page  
 40740 135).

40741 The *c* argument is an **int**, the value of which the application shall ensure is a character  
 40742 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 40743 any other value, the behavior is undefined.

40744 CX The behavior is undefined if the *locale* argument to *isxdigit\_l()* is the special locale object  
 40745 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

40746 **RETURN VALUE**

40747 CX The *isxdigit()* and *isxdigit\_l()* functions shall return non-zero if *c* is a hexadecimal digit;  
 40748 otherwise, they shall return 0.

40749 **ERRORS**

40750 No errors are defined.

40751 **EXAMPLES**

40752 None.

40753 **APPLICATION USAGE**

40754 To ensure applications portability, especially across natural languages, only these functions and  
 40755 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 40756 classification.

40757 **RATIONALE**

40758 None.

40759 **FUTURE DIRECTIONS**

40760 None.

40761 **SEE ALSO**

40762 *isalnum()*, *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*,  
 40763 *isupper()*

40764 XBD Chapter 7 (on page 135), **<ctype.h>**40765 **CHANGE HISTORY**

40766 First released in Issue 1. Derived from Issue 1 of the SVID.

40767 **Issue 6**

40768 The normative text is updated to avoid use of the term “must” for application requirements.

40769 **Issue 7**40770  
40771

The *isxdigit\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

40772  
40773

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0347 [302], XSH/TC1-2008/0348 [283], and XSH/TC1-2008/0349 [283] are applied.

40774 **NAME**

40775       j0, j1, jn — Bessel functions of the first kind

40776 **SYNOPSIS**

```

40777 XSI      #include <math.h>
40778          double j0(double x);
40779          double j1(double x);
40780          double jn(int n, double x);

```

40781 **DESCRIPTION**

40782       The *j0()*, *j1()*, and *jn()* functions shall compute Bessel functions of *x* of the first kind of orders 0,  
 40783       1, and *n*, respectively.

40784       An application wishing to check for error situations should set *errno* to zero and call  
 40785       *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 40786       *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 40787       zero, an error has occurred.

40788 **RETURN VALUE**

40789       Upon successful completion, these functions shall return the relevant Bessel value of *x* of the  
 40790       first kind.

40791       If the *x* argument is too large in magnitude, or the correct result would cause underflow, 0 shall  
 40792       be returned and a range error may occur.

40793 MXX       If *x* is NaN, a NaN shall be returned.

40794 **ERRORS**

40795       These functions may fail if:

40796       Range Error       The value of *x* was too large in magnitude, or an underflow occurred.

40797       If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 40798       then *errno* shall be set to [ERANGE]. If the integer expression  
 40799       (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 40800       floating-point exception shall be raised.

40801       No other errors shall occur.

40802 **EXAMPLES**

40803       None.

40804 **APPLICATION USAGE**

40805       On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 40806       MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

40807 **RATIONALE**

40808       None.

40809 **FUTURE DIRECTIONS**

40810       None.

40811 **SEE ALSO**

40812       *feclearexcept()*, *fetestexcept()*, *isnan()*, *y0()*

40813       XBD Section 4.20 (on page 117), *<math.h>*

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

**Issue 6**

The may fail [EDOM] error is removed for the case for NaN.

The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling with the ISO/IEC 9899:1999 standard.

**Issue 7**

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0350 [68] is applied.

40825 **NAME**

40826       jrand48 — generate a uniformly distributed pseudo-random long signed integer

40827 **SYNOPSIS**

```
40828 XSI      #include <stdlib.h>
40829          long jrand48(unsigned short xsubi[3]);
```

40830 **DESCRIPTION**40831       Refer to *drand48()*.

**NAME**

kill — send a signal to a process or a group of processes

**SYNOPSIS**

```
CX      #include <signal.h>
int kill(pid_t pid, int sig);
```

**DESCRIPTION**

The `kill()` function shall send a signal to a process or a group of processes specified by `pid`. The signal to be sent is specified by `sig` and is either one from the list given in `<signal.h>` or 0. If `sig` is 0 (the null signal), error checking is performed but no signal is actually sent. The null signal can be used to check the validity of `pid`.

For a process to have permission to send a signal to a process designated by `pid`, unless the sending process has appropriate privileges, the real or effective user ID of the sending process shall match the real or saved set-user-ID of the receiving process.

If `pid` is greater than 0, `sig` shall be sent to the process whose process ID is equal to `pid`.

If `pid` is 0, `sig` shall be sent to all processes (excluding an unspecified set of system processes) whose process group ID is equal to the process group ID of the sender, and for which the process has permission to send a signal.

If `pid` is -1, `sig` shall be sent to all processes (excluding an unspecified set of system processes) for which the process has permission to send that signal.

If `pid` is negative, but not -1, `sig` shall be sent to all processes (excluding an unspecified set of system processes) whose process group ID is equal to the absolute value of `pid`, and for which the process has permission to send a signal.

If the value of `pid` causes `sig` to be generated for the sending process, and if `sig` is not blocked for the calling thread and if no other thread has `sig` unblocked or is waiting in a `sigwait()` function for `sig`, either `sig` or at least one pending unblocked signal shall be delivered to the sending thread before `kill()` returns.

The user ID tests described above shall not be applied when sending SIGCONT to a process that is a member of the same session as the sending process.

An implementation that provides extended security controls may impose further implementation-defined restrictions on the sending of signals, including the null signal. In particular, the system may deny the existence of some or all of the processes specified by `pid`.

The `kill()` function is successful if the process has permission to send `sig` to any of the processes specified by `pid`. If `kill()` fails, no signal shall be sent.

**RETURN VALUE**

Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and `errno` set to indicate the error.

**ERRORS**

The `kill()` function shall fail if:

- |          |                                                                                        |
|----------|----------------------------------------------------------------------------------------|
| [EINVAL] | The value of the <code>sig</code> argument is an invalid or unsupported signal number. |
| [EPERM]  | The process does not have permission to send the signal to any receiving process.      |

40873 [ESRCH] No process or process group can be found corresponding to that specified by  
 40874 *pid*.

#### 40875 EXAMPLES

40876 None.

#### 40877 APPLICATION USAGE

40878 None.

#### 40879 RATIONALE

40880 The semantics for permission checking for *kill()* differed between System V and most other  
 40881 implementations, such as Version 7 or 4.3 BSD. The semantics chosen for this volume of  
 40882 POSIX.1-2008 agree with System V. Specifically, a set-user-ID process cannot protect itself  
 40883 against signals (or at least not against SIGKILL) unless it changes its real user ID. This choice  
 40884 allows the user who starts an application to send it signals even if it changes its effective user ID.  
 40885 The other semantics give more power to an application that wants to protect itself from the user  
 40886 who ran it.

40887 Some implementations provide semantic extensions to the *kill()* function when the absolute  
 40888 value of *pid* is greater than some maximum, or otherwise special, value. Negative values are a  
 40889 flag to *kill()*. Since most implementations return [ESRCH] in this case, this behavior is not  
 40890 included in this volume of POSIX.1-2008, although a conforming implementation could provide  
 40891 such an extension.

40892 The unspecified processes to which a signal cannot be sent may include the scheduler or *init*.

40893 There was initially strong sentiment to specify that, if *pid* specifies that a signal be sent to the  
 40894 calling process and that signal is not blocked, that signal would be delivered before *kill()*  
 40895 returns. This would permit a process to call *kill()* and be guaranteed that the call never return.  
 40896 However, historical implementations that provide only the *signal()* function make only the  
 40897 weaker guarantee in this volume of POSIX.1-2008, because they only deliver one signal each  
 40898 time a process enters the kernel. Modifications to such implementations to support the  
 40899 *sigaction()* function generally require entry to the kernel following return from a signal-catching  
 40900 function, in order to restore the signal mask. Such modifications have the effect of satisfying the  
 40901 stronger requirement, at least when *sigaction()* is used, but not necessarily when *signal()* is used.  
 40902 The standard developers considered making the stronger requirement except when *signal()* is  
 40903 used, but felt this would be unnecessarily complex. Implementors are encouraged to meet the  
 40904 stronger requirement whenever possible. In practice, the weaker requirement is the same, except  
 40905 in the rare case when two signals arrive during a very short window. This reasoning also applies  
 40906 to a similar requirement for *sigprocmask()*.

40907 In 4.2 BSD, the SIGCONT signal can be sent to any descendant process regardless of user-ID  
 40908 security checks. This allows a job control shell to continue a job even if processes in the job have  
 40909 altered their user IDs (as in the *su* command). In keeping with the addition of the concept of  
 40910 sessions, similar functionality is provided by allowing the SIGCONT signal to be sent to any  
 40911 process in the same session regardless of user ID security checks. This is less restrictive than BSD  
 40912 in the sense that ancestor processes (in the same session) can now be the recipient. It is more  
 40913 restrictive than BSD in the sense that descendant processes that form new sessions are now  
 40914 subject to the user ID checks. A similar relaxation of security is not necessary for the other job  
 40915 control signals since those signals are typically sent by the terminal driver in recognition of  
 40916 special characters being typed; the terminal driver bypasses all security checks.

40917 In secure implementations, a process may be restricted from sending a signal to a process having  
 40918 a different security label. In order to prevent the existence or nonexistence of a process from  
 40919 being used as a covert channel, such processes should appear nonexistent to the sender; that is,  
 40920 [ESRCH] should be returned, rather than [EPERM], if *pid* refers only to such processes.

Historical implementations varied on the result of a `kill()` with `pid` indicating a zombie process. Some indicated success on such a call (subject to permission checking), while others gave an error of [ESRCH]. Since the definition of process lifetime in this volume of POSIX.1-2008 covers zombie processes, the [ESRCH] error as described is inappropriate in this case and implementations that give this error do not conform. This means that an application cannot have a parent process check for termination of a particular child by sending it the null signal with `kill()`, but must instead use `waitpid()` or `waitid()`.

There is some belief that the name `kill()` is misleading, since the function is not always intended to cause process termination. However, the name is common to all historical implementations, and any change would be in conflict with the goal of minimal changes to existing application code.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

`getpid()`, `raise()`, `setsid()`, `sigaction()`, `sigqueue()`, `wait()`

XBD `<signal.h>`, `<sys/types.h>`

#### CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

##### Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

##### Issue 6

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the second paragraph is reworded to indicate that the saved set-user-ID of the calling process is checked in place of its effective user ID. This is a FIPS requirement.
- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The behavior when `pid` is `-1` is now specified. It was previously explicitly unspecified in the POSIX.1-1988 standard.

The normative text is updated to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/51 is applied, correcting the RATIONALE section.

40956 **NAME**

40957 killpg — send a signal to a process group

40958 **SYNOPSIS**

```
40959 XSI      #include <signal.h>
40960         int killpg(pid_t pgrp, int sig);
```

40961 **DESCRIPTION**40962 The *killpg()* function shall send the signal specified by *sig* to the process group specified by *pgrp*.

40963 If *pgrp* is greater than 1, *killpg(pgrp, sig)* shall be equivalent to *kill(-pgrp, sig)*. If *pgrp* is less than or  
 40964 equal to 1, the behavior of *killpg()* is undefined.

40965 **RETURN VALUE**40966 Refer to *kill()*.40967 **ERRORS**40968 Refer to *kill()*.40969 **EXAMPLES**40970 **Sending a Signal to All Other Members of a Process Group**

40971 The following example shows how the calling process could send a signal to all other members  
 40972 of its process group. To prevent itself from receiving the signal it first makes itself immune to the  
 40973 signal by ignoring it.

```
40974 #include <signal.h>
40975 #include <unistd.h>
40976 ...
40977     if (signal(SIGUSR1, SIG_IGN) == SIG_ERR)
40978         /* Handle error */;
40979     if (killpg(getpgrp(), SIGUSR1) == -1)
40980         /* Handle error */;
```

40981 **APPLICATION USAGE**

40982 None.

40983 **RATIONALE**

40984 None.

40985 **FUTURE DIRECTIONS**

40986 None.

40987 **SEE ALSO**40988 *getpgid()*, *getpid()*, *kill()*, *raise()*40989 XBD *<signal.h>*40990 **CHANGE HISTORY**

40991 First released in Issue 4, Version 2.

40993 Moved from X/OPEN UNIX extension to BASE.

40994 **Issue 6**

40995 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/52 is applied, adding the example to the  
40996 EXAMPLES section.

40997 **NAME**

40998 l64a — convert a 32-bit integer to a radix-64 ASCII string

40999 **SYNOPSIS**

```
41000 XSI      #include <stdlib.h>  
41001      char *l64a(long value);
```

41002 **DESCRIPTION**41003 Refer to *a64l()*.

41004 **NAME**

41005 labs, llabs — return a long integer absolute value

41006 **SYNOPSIS**

41007 #include &lt;stdlib.h&gt;

41008 long labs(long i);

41009 long long llabs(long long i);

41010 **DESCRIPTION**

41011 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
41012 conflict between the requirements described here and the ISO C standard is unintentional. This  
41013 volume of POSIX.1-2008 defers to the ISO C standard.

41014 The *labs()* function shall compute the absolute value of the **long** integer operand *i*. The *llabs()*  
41015 function shall compute the absolute value of the **long long** integer operand *i*. If the result  
41016 cannot be represented, the behavior is undefined.

41017 **RETURN VALUE**41018 The *labs()* function shall return the absolute value of the **long** integer operand.41019 The *llabs()* function shall return the absolute value of the **long long** integer operand.41020 **ERRORS**

41021 No errors are defined.

41022 **EXAMPLES**

41023 None.

41024 **APPLICATION USAGE**

41025 None.

41026 **RATIONALE**

41027 None.

41029 None.

41030 **SEE ALSO**41031 *abs()*

41032 XBD &lt;stdlib.h&gt;

41033 **CHANGE HISTORY**

41034 First released in Issue 4. Derived from the ISO C standard.

41035 **Issue 6**41036 The *llabs()* function is added for alignment with the ISO/IEC 9899:1999 standard.41037 **Issue 7**

41038 SD5-XSH-ERN-152 is applied, correcting the RETURN VALUE section.

41039 **NAME**

41040 lchown — change the owner and group of a symbolic link

41041 **SYNOPSIS**

41042 #include &lt;unistd.h&gt;

41043 int lchown(const char \*path, uid\_t owner, gid\_t group);

41044 **DESCRIPTION**

41045 The *lchown()* function shall be equivalent to *chown()*, except in the case where the named file is a  
 41046 symbolic link. In this case, *lchown()* shall change the ownership of the symbolic link file itself,  
 41047 while *chown()* changes the ownership of the file or directory to which the symbolic link refers.

41048 **RETURN VALUE**

41049 Upon successful completion, *lchown()* shall return 0. Otherwise, it shall return –1 and set *errno* to  
 41050 indicate an error.

41051 **ERRORS**41052 The *lchown()* function shall fail if:

- |       |                |                                                                                                                                                                                                                                                                                                                                                                                                       |

| 41073 | [ENAMETOOLONG] |                                                                                                                                                                                                                                                                                                                                                                                                       |
| 41074 |                | The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.                                                                                                                                                                                                                                         |
| 41075 |                |                                                                                                                                                                                                                                                                                                                                                                                                       |
| 41076 |                |                                                                                                                                                                                                                                                                                                                                                                                                       |

41077 **EXAMPLES**41078 **Changing the Current Owner of a File**

41079 The following example shows how to change the ownership of the symbolic link named  
41080 **/modules/pass1** to the user ID associated with “jones” and the group ID associated with “cnd”.

41081 The numeric value for the user ID is obtained by using the *getpwnam()* function. The numeric  
41082 value for the group ID is obtained by using the *getgrnam()* function.

```
41083 #include <sys/types.h>
41084 #include <unistd.h>
41085 #include <pwd.h>
41086 #include <grp.h>

41087 struct passwd *pwd;
41088 struct group *grp;
41089 char          *path = "/modules/pass1";
41090 ...
41091 pwd = getpwnam("jones");
41092 grp = getgrnam("cnd");
41093 lchown(path, pwd->pw_uid, grp->gr_gid);
```

41094 **APPLICATION USAGE**

41095 On implementations which support symbolic links as directory entries rather than files, *lchown()*  
41096 may fail.

41097 **RATIONALE**

41098 None.

41099 **FUTURE DIRECTIONS**

41100 None.

41101 **SEE ALSO**

41102 *chown()*, *symlink()*

41103 XBD **<unistd.h>**

41104 **CHANGE HISTORY**

41105 First released in Issue 4, Version 2.

41106 **Issue 5**

41107 Moved from X/OPEN UNIX extension to BASE.

41108 **Issue 6**

41109 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
41110 [ELOOP] error condition is added.

41111 The Open Group Base Resolution bwg2001-013 is applied, adding wording to the  
41112 APPLICATION USAGE.

41113 **Issue 7**

41114 Austin Group Interpretation 1003.1-2001 #143 is applied.

41115 The *lchown()* function is moved from the XSI option to the Base.

41116 The [EOPNOTSUPP] error is removed.

41117 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
41118 pathname exists but is not a directory or a symbolic link to a directory.

41119

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0351 [324] is applied.

**41120 NAME**

41121 lcong48 — seed a uniformly distributed pseudo-random signed long integer generator

**41122 SYNOPSIS**

```
41123 XSI #include <stdlib.h>  
41124 void lcong48(unsigned short param[7]);
```

**41125 DESCRIPTION**

41126 Refer to *drand48()*.

41127 **NAME**

41128 ldexp, ldexpf, ldexpl — load exponent of a floating-point number

41129 **SYNOPSIS**

```
41130 #include <math.h>
41131 double ldexp(double x, int exp);
41132 float ldexpf(float x, int exp);
41133 long double ldexpl(long double x, int exp);
```

41134 **DESCRIPTION**

41135 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 41136 conflict between the requirements described here and the ISO C standard is unintentional. This  
 41137 volume of POSIX.1-2008 defers to the ISO C standard.

41138 These functions shall compute the quantity  $x * 2^{exp}$ .

41139 An application wishing to check for error situations should set *errno* to zero and call  
 41140 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 41141 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 41142 zero, an error has occurred.

41143 **RETURN VALUE**

41144 Upon successful completion, these functions shall return *x* multiplied by 2, raised to the power  
 41145 *exp*.

41146 If these functions would cause overflow, a range error shall occur and *ldexp*(), *ldexpf*(), and  
 41147 *ldexpl*() shall return  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$  (according to the sign of  
 41148 *x*), respectively.

41149 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 41150 MXX and *ldexp*(), *ldexpf*(), and *ldexpl*() shall return 0.0, or (if IEC 60559 Floating-Point is not  
 41151 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
 41152 FLT\_MIN, and LDBL\_MIN, respectively.

41153 MX If *x* is NaN, a NaN shall be returned.

41154 If *x* is  $\pm 0$  or  $\pm\text{Inf}$ , *x* shall be returned.

41155 If *exp* is 0, *x* shall be returned.

41156 MXX If the correct value would cause underflow, and is representable, a range error may occur and  
 41157 the correct value shall be returned.

41158 **ERRORS**

41159 These functions shall fail if:

41160 Range Error The result overflows.

41161 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41162 then *errno* shall be set to [ERANGE]. If the integer expression  
 41163 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 41164 floating-point exception shall be raised.

41165 These functions may fail if:

41166 Range Error The result underflows.

41167 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41168 then *errno* shall be set to [ERANGE]. If the integer expression  
 41169 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow

41170 floating-point exception shall be raised.

41171 **EXAMPLES**

41172 None.

41173 **APPLICATION USAGE**

41174 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
41175 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

41176 **RATIONALE**

41177 None.

41178 **FUTURE DIRECTIONS**

41179 None.

41180 **SEE ALSO**

41181 *feclearexcept()*, *fetestexcept()*, *frexp()*, *isnan()*

41182 XBD Section 4.20 (on page 117), **<math.h>**

41183 **CHANGE HISTORY**

41184 First released in Issue 1. Derived from Issue 1 of the SVID.

41185 **Issue 5**

41186 The DESCRIPTION is updated to indicate how an application should check for an error. This  
41187 text was previously published in the APPLICATION USAGE section.

41188 **Issue 6**

41189 The *ldexpf()* and *ldexpl()* functions are added for alignment with the ISO/IEC 9899:1999  
41190 standard.

41191 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
41192 revised to align with the ISO/IEC 9899:1999 standard.

41193 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
41194 marked.

41195 **Issue 7**

41196 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0352 [68] and XSH/TC1-2008/0353  
41197 [68] are applied.

41198 **NAME**

41199       ldiv, lldiv — compute quotient and remainder of a long division

41200 **SYNOPSIS**

41201       #include &lt;stdlib.h&gt;

41202       ldiv\_t ldiv(long *numer*, long *denom*);41203       lldiv\_t lldiv(long long *numer*, long long *denom*);41204 **DESCRIPTION**

41205 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 41206 conflict between the requirements described here and the ISO C standard is unintentional. This  
 41207 volume of POSIX.1-2008 defers to the ISO C standard.

41208       These functions shall compute the quotient and remainder of the division of the numerator  
 41209 *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the **long**  
 41210 integer (for the *ldiv*() function) or **long long** integer (for the *lldiv*() function) of lesser magnitude  
 41211 that is the nearest to the algebraic quotient. If the result cannot be represented, the behavior is  
 41212 undefined; otherwise, *quot* \* *denom* + *rem* shall equal *numer*.

41213 **RETURN VALUE**

41214       The *ldiv*() function shall return a structure of type **ldiv\_t**, comprising both the quotient and the  
 41215 remainder. The structure shall include the following members, in any order:

```
41216       long   quot;       /* Quotient */
41217       long   rem;       /* Remainder */
```

41218       The *lldiv*() function shall return a structure of type **lldiv\_t**, comprising both the quotient and the  
 41219 remainder. The structure shall include the following members, in any order:

```
41220       long long   quot;       /* Quotient */
41221       long long   rem;       /* Remainder */
```

41222 **ERRORS**

41223       No errors are defined.

41224 **EXAMPLES**

41225       None.

41226 **APPLICATION USAGE**

41227       None.

41228 **RATIONALE**

41229       None.

41230 **FUTURE DIRECTIONS**

41231       None.

41232 **SEE ALSO**41233       

*div*()

41234       XBD &lt;stdlib.h&gt;

41235 **CHANGE HISTORY**

41236       First released in Issue 4. Derived from the ISO C standard.

41237 **Issue 6**41238       The *lldiv*() function is added for alignment with the ISO/IEC 9899:1999 standard.

41239 **NAME**

41240 lfind — find entry in a linear search table

41241 **SYNOPSIS**

```
41242 XSI #include <search.h>
41243 void *lfind(const void *key, const void *base, size_t *nelp,
41244            size_t width, int (*compar)(const void *, const void *));
```

41245 **DESCRIPTION**41246 Refer to *lsearch()*.

41247 **NAME**

41248 lgamma, lgammaf, lgammal, signgam — log gamma function

41249 **SYNOPSIS**

```
41250 #include <math.h>
41251 double lgamma(double x);
41252 float lgammaf(float x);
41253 long double lgammal(long double x);
41254 XSI extern int signgam;
```

41255 **DESCRIPTION**

41256 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 41257 conflict between the requirements described here and the ISO C standard is unintentional. This  
 41258 volume of POSIX.1-2008 defers to the ISO C standard.

41259 These functions shall compute  $\log_e |\Gamma(x)|$  where  $\Gamma(x)$  is defined as  $\int_0^{\infty} e^{-t} t^{x-1} dt$ . The argument  $x$   
 41260 need not be a non-positive integer ( $\Gamma(x)$  is defined over the reals, except the non-positive  
 41261 integers).

41262 XSI If  $x$  is NaN,  $-\text{Inf}$ , or a negative integer, the value of *signgam* is unspecified.

41263 CX These functions need not be thread-safe.

41264 An application wishing to check for error situations should set *errno* to zero and call  
 41265 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 41266 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 41267 zero, an error has occurred.

41268 **RETURN VALUE**

41269 Upon successful completion, these functions shall return the logarithmic gamma of  $x$ .

41270 If  $x$  is a non-positive integer, a pole error shall occur and *lgamma*(), *lgammaf*(), and *lgammal*()  
 41271 shall return +HUGE\_VAL, +HUGE\_VALF, and +HUGE\_VALL, respectively.

41272 If the correct value would cause overflow, a range error shall occur and *lgamma*(), *lgammaf*(),  
 41273 and *lgammal*() shall return  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$  (having the same  
 41274 sign as the correct value), respectively.

41275 MX If  $x$  is NaN, a NaN shall be returned.

41276 If  $x$  is 1 or 2, +0 shall be returned.

41277 If  $x$  is  $\pm\text{Inf}$ , +Inf shall be returned.

41278 **ERRORS**

41279 These functions shall fail if:

41280 Pole Error The  $x$  argument is a negative integer or zero.

41281 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41282 then *errno* shall be set to [ERANGE]. If the integer expression  
 41283 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 41284 floating-point exception shall be raised.

41285 Range Error The result overflows.

41286 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41287 then *errno* shall be set to [ERANGE]. If the integer expression

41288 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, then the overflow  
41289 floating-point exception shall be raised.

#### 41290 EXAMPLES

41291 None.

#### 41292 APPLICATION USAGE

41293 On error, the expressions (math\_errhandling & MATH\_ERRNO) and (math\_errhandling &  
41294 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

#### 41295 RATIONALE

41296 None.

#### 41297 FUTURE DIRECTIONS

41298 None.

#### 41299 SEE ALSO

41300 [exp\(\)](#), [feclearexcept\(\)](#), [fetestexcept\(\)](#), [isnan\(\)](#)

41301 XBD [Section 4.20](#) (on page 117), [<math.h>](#)

#### 41302 CHANGE HISTORY

41303 First released in Issue 3.

#### 41304 Issue 5

41305 The DESCRIPTION is updated to indicate how an application should check for an error. This  
41306 text was previously published in the APPLICATION USAGE section.

41307 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

#### 41308 Issue 6

41309 The [lgamma\(\)](#) function is no longer marked as an extension.

41310 The [lgammaf\(\)](#) and [lgammal\(\)](#) functions are added for alignment with the ISO/IEC 9899:1999  
41311 standard.

41312 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
41313 revised to align with the ISO/IEC 9899:1999 standard.

41314 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
41315 marked.

41316 Functionality relating to the XSI option is marked.

#### 41317 Issue 7

41318 Austin Group Interpretation 1003.1-2001 #156 is applied.

41319 The DESCRIPTION is clarified regarding the value of *signgam* when *x* is Nan, -Inf, or a negative  
41320 integer.

41321 **NAME**

41322 link, linkat — link one file to another file |

41323 **SYNOPSIS**

41324 #include &lt;unistd.h&gt;

41325 int link(const char \*path1, const char \*path2);

41326 OH #include &lt;fcntl.h&gt; +

41327 +

```
41328 int linkat(int fd1, const char *path1, int fd2,
41329           const char *path2, int flag);
```

41330 **DESCRIPTION**41331 The *link()* function shall create a new link (directory entry) for the existing file, *path1*.

41332 The *path1* argument points to a pathname naming an existing file. The *path2* argument points to  
 41333 a pathname naming the new directory entry to be created. The *link()* function shall atomically  
 41334 create a new link for the existing file and the link count of the file shall be incremented by one.

41335 If *path1* names a directory, *link()* shall fail unless the process has appropriate privileges and the  
 41336 implementation supports using *link()* on directories.

41337 If *path1* names a symbolic link, it is implementation-defined whether *link()* follows the symbolic  
 41338 link, or creates a new link to the symbolic link itself.

41339 Upon successful completion, *link()* shall mark for update the last file status change timestamp of  
 41340 the file. Also, the last data modification and last file status change timestamps of the directory  
 41341 that contains the new entry shall be marked for update.

41342 If *link()* fails, no link shall be created and the link count of the file shall remain unchanged.

41343 The implementation may require that the calling process has permission to access the existing  
 41344 file.

41345 The *linkat()* function shall be equivalent to the *link()* function except that symbolic links shall be  
 41346 handled as specified by the value of *flag* (see below) and except in the case where either *path1* or  
 41347 *path2* or both are relative paths. In this case a relative path *path1* is interpreted relative to the  
 41348 directory associated with the file descriptor *fd1* instead of the current working directory and  
 41349 similarly for *path2* and the file descriptor *fd2*. If the access mode of the open file description |  
 41350 associated with the file descriptor is not O\_SEARCH, the function shall check whether directory |  
 41351 searches are permitted using the current permissions of the directory underlying the file |  
 41352 descriptor. If the access mode is O\_SEARCH, the function shall not perform the check.

41353 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 41354 in <fcntl.h>:

41355 AT\_SYMLINK\_FOLLOW

41356 If *path1* names a symbolic link, a new link for the target of the symbolic link is created.

41357 If *linkat()* is passed the special value AT\_FDCWD in the *fd1* or *fd2* parameter, the current  
 41358 working directory shall be used for the respective *path* argument. If both *fd1* and *fd2* have value  
 41359 AT\_FDCWD, the behavior shall be identical to a call to *link()*, except that symbolic links shall be  
 41360 handled as specified by the value of *flag*.

41361 If the AT\_SYMLINK\_FOLLOW flag is clear in the *flag* argument and the *path1* argument names a  
 41362 symbolic link, a new link is created for the symbolic link *path1* and not its target.

41363 **RETURN VALUE**

41364       Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
41365       return -1 and set *errno* to indicate the error.

41366 **ERRORS**

41367       These functions shall fail if:

- |                                                                      |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 41395<br>41396<br>41397                                              | [EPERM]               | The file named by <i>path1</i> is a directory and either the calling process does not have appropriate privileges or the implementation prohibits using <i>link()</i> on directories.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 41398                                                                | [EROFS]               | The requested link requires writing in a directory on a read-only file system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 41399<br>41400                                                       | [EXDEV]               | The link named by <i>path2</i> and the file named by <i>path1</i> are on different file systems and the implementation does not support links between file systems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 41401                                                                | OB XSR [EXDEV]        | <i>path1</i> refers to a named STREAM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

41402       The *linkat()* function shall fail if:

- |                         |          |                                                                                                                                                                                                                                            |
|-------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 41403<br>41404<br>41405 | [EACCES] | The access mode of the open file description associated with <i>fd1</i> or <i>fd2</i> is not +<br>O_SEARCH and the permissions of the directory underlying <i>fd1</i> or <i>fd2</i> , +<br>respectively, do not permit directory searches. |
|-------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

41406 [EBADF] The *path1* or *path2* argument does not specify an absolute path and the *fd1* or  
 41407 *fd2* argument, respectively, is neither AT\_FDCWD nor a valid file descriptor  
 41408 open for reading or searching.

41409 [ENOTDIR] The *path1* or *path2* argument is not an absolute path and *fd1* or *fd2*,  
 41410 respectively, is a file descriptor associated with a non-directory file.

41411 These functions may fail if:

41412 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 41413 resolution of the *path1* or *path2* argument.

41414 [ENAMETOOLONG]  
 41415 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 41416 symbolic link produced an intermediate result with a length that exceeds  
 41417 {PATH\_MAX}.

41418 The *linkat()* function may fail if:

41419 [EINVAL] The value of the *flag* argument is not valid.

## 41420 EXAMPLES

### 41421 Creating a Link to a File

41422 The following example shows how to create a link to a file named **/home/cnd/mod1** by creating  
 41423 a new directory entry named **/modules/pass1**.

```
41424 #include <unistd.h>
41425 char *path1 = "/home/cnd/mod1";
41426 char *path2 = "/modules/pass1";
41427 int status;
41428 ...
41429 status = link (path1, path2);
```

### 41430 Creating a Link to a File Within a Program

41431 In the following program example, the *link()* function links the **/etc/passwd** file (defined as  
 41432 **PASSWDFILE**) to a file named **/etc/opasswd** (defined as **SAVEFILE**), which is used to save the  
 41433 current password file. Then, after removing the current password file (defined as  
 41434 **PASSWDFILE**), the new password file is saved as the current password file using the *link()*  
 41435 function again.

```
41436 #include <unistd.h>
41437 #define LOCKFILE "/etc/ptmp"
41438 #define PASSWDFILE "/etc/passwd"
41439 #define SAVEFILE "/etc/opasswd"
41440 ...
41441 /* Save current password file */
41442 link (PASSWDFILE, SAVEFILE);
41443
41444 /* Remove current password file. */
41445 unlink (PASSWDFILE);
41446
41447 /* Save new password file as current password file. */
41448 link (LOCKFILE, PASSWDFILE);
```

**APPLICATION USAGE**

Some implementations do allow links between file systems.

If *path1* refers to a symbolic link, application developers should use *linkat()* with appropriate flags to select whether or not the symbolic link should be resolved.

**RATIONALE**

Linking to a directory is restricted to the superuser in most historical implementations because this capability may produce loops in the file hierarchy or otherwise corrupt the file system. This volume of POSIX.1-2008 continues that philosophy by prohibiting *link()* and *unlink()* from doing this. Other functions could do it if the implementor designed such an extension.

Some historical implementations allow linking of files on different file systems. Wording was added to explicitly allow this optional behavior.

The exception for cross-file system links is intended to apply only to links that are programmatically indistinguishable from “hard” links.

The purpose of the *linkat()* function is to link files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *link()*, resulting in unspecified behavior. By opening a file descriptor for the directory of both the existing file and the target location and using the *linkat()* function it can be guaranteed that the both filenames are in the desired directories.

The AT\_SYMLINK\_FOLLOW flag allows for implementing both common behaviors of the *link()* function. The POSIX specification requires that if *path1* is a symbolic link, a new link for the target of the symbolic link is created. Many systems by default or as an alternative provide a mechanism to avoid the implicit symbolic link lookup and create a new link for the symbolic link itself.

Earlier versions of this standard specified only the *link()* function, and required it to behave like *linkat()* with the AT\_SYMLINK\_FOLLOW flag. However, historical practice from SVR4 and Linux kernels had *link()* behaving like *linkat()* with no flags, and many systems that attempted to provide a conforming *link()* function did so in a way that was rarely used, and when it was used did not conform to the standard (e.g., by not being atomic, or by dereferencing the symbolic link incorrectly). Since applications could not rely on *link()* following links in practice, the *linkat()* function was added taking a flag to specify the desired behavior for the application.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- An explanation is added of the action when *path2* refers to a symbolic link.
- The [ELOOP] optional error condition is added.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #143 is applied.

SD5-XSH-ERN-93 is applied, adding RATIONALE.

The *linkat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to XSI STREAMS is marked obsolescent.

Changes are made related to support for finegrained timestamps.

The [EOPNOTSUPP] error is removed.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0354 [326], XSH/TC1-2008/0355 [461], XSH/TC1-2008/0356 [326], XSH/TC1-2008/0357 [324], XSH/TC1-2008/0358 [147,429], XSH/TC1-2008/0359 [277], XSH/TC1-2008/0360 [278], and XSH/TC1-2008/0361 [278] are applied.

**NAME**

lio\_listio — list directed I/O

**SYNOPSIS**

```
#include <aio.h>
```

```
int lio_listio(int mode, struct aiocb *restrict const list[restrict],  
              int nent, struct sigevent *restrict sig);
```

**DESCRIPTION**

The *lio\_listio()* function shall initiate a list of I/O requests with a single function call.

The *mode* argument takes one of the values LIO\_WAIT or LIO\_NOWAIT declared in **<aio.h>** and determines whether the function returns when the I/O operations have been completed, or as soon as the operations have been queued. If the *mode* argument is LIO\_WAIT, the function shall wait until all I/O is complete and the *sig* argument shall be ignored.

If the *mode* argument is LIO\_NOWAIT, the function shall return immediately, and asynchronous notification shall occur, according to the *sig* argument, when all the I/O operations complete. If *sig* is NULL, then no asynchronous notification shall occur. If *sig* is not NULL, asynchronous notification occurs as specified in [Section 2.4.1](#) (on page 488) when all the requests in *list* have completed.

The I/O requests enumerated by *list* are submitted in an unspecified order.

The *list* argument is an array of pointers to **aiocb** structures. The array contains *nent* elements. The array may contain NULL elements, which shall be ignored.

If the buffer pointed to by *list* or the **aiocb** structures pointed to by the elements of the array *list* become illegal addresses before all asynchronous I/O completed and, if necessary, the notification is sent, then the behavior is undefined. If the buffers pointed to by the *aio\_buf* member of the **aiocb** structure pointed to by the elements of the array *list* become illegal addresses prior to the asynchronous I/O associated with that **aiocb** structure being completed, the behavior is undefined.

The *aio\_lio\_opcode* field of each **aiocb** structure specifies the operation to be performed. The supported operations are LIO\_READ, LIO\_WRITE, and LIO\_NOP; these symbols are defined in **<aio.h>**. The LIO\_NOP operation causes the list entry to be ignored. If the *aio\_lio\_opcode* element is equal to LIO\_READ, then an I/O operation is submitted as if by a call to *aio\_read()* with the *aio\_cbp* equal to the address of the **aiocb** structure. If the *aio\_lio\_opcode* element is equal to LIO\_WRITE, then an I/O operation is submitted as if by a call to *aio\_write()* with the *aio\_cbp* equal to the address of the **aiocb** structure.

The *aio\_fildes* member specifies the file descriptor on which the operation is to be performed.

The *aio\_buf* member specifies the address of the buffer to or from which the data is transferred.

The *aio\_nbytes* member specifies the number of bytes of data to be transferred.

The members of the **aiocb** structure further describe the I/O operation to be performed, in a manner identical to that of the corresponding **aiocb** structure when used by the *aio\_read()* and *aio\_write()* functions.

The *nent* argument specifies how many elements are members of the list; that is, the length of the array.

The behavior of this function is altered according to the definitions of synchronized I/O data integrity completion and synchronized I/O file integrity completion if synchronized I/O is enabled on the file associated with *aio\_fildes*.

For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with *aio*cbp->*aio\_fildes*.

If *sig*->*sigev\_notify* is SIGEV\_THREAD and *sig*->*sigev\_notify\_attributes* is a non-null pointer and the block pointed to by this pointer becomes an illegal address prior to all asynchronous I/O being completed, then the behavior is undefined.

## RETURN VALUE

If the *mode* argument has the value LIO\_NOWAIT, the *lio\_listio()* function shall return the value zero if the I/O operations are successfully queued; otherwise, the function shall return the value -1 and set *errno* to indicate the error.

If the *mode* argument has the value LIO\_WAIT, the *lio\_listio()* function shall return the value zero when all the indicated I/O has completed successfully. Otherwise, *lio\_listio()* shall return a value of -1 and set *errno* to indicate the error.

In either case, the return value only indicates the success or failure of the *lio\_listio()* call itself, not the status of the individual I/O requests. In some cases one or more of the I/O requests contained in the list may fail. Failure of an individual request does not prevent completion of any other individual request. To determine the outcome of each I/O request, the application shall examine the error status associated with each **aio**cb control block. The error statuses so returned are identical to those returned as the result of an *aio\_read()* or *aio\_write()* function.

## ERRORS

The *lio\_listio()* function shall fail if:

[EAGAIN] The resources necessary to queue all the I/O requests were not available. The application may check the error status for each **aio**cb to determine the individual request(s) that failed.

[EAGAIN] The number of entries indicated by *nent* would cause the system-wide limit {AIO\_MAX} to be exceeded.

[EINVAL] The *mode* argument is not a proper value, or the value of *nent* was greater than {AIO\_LISTIO\_MAX}.

[EINTR] A signal was delivered while waiting for all I/O requests to complete during an LIO\_WAIT operation. Note that, since each I/O operation invoked by *lio\_listio()* may possibly provoke a signal when it completes, this error return may be caused by the completion of one (or more) of the very I/O operations being awaited. Outstanding I/O requests are not canceled, and the application shall examine each list element to determine whether the request was initiated, canceled, or completed.

[EIO] One or more of the individual I/O operations failed. The application may check the error status for each **aio**cb structure to determine the individual request(s) that failed.

In addition to the errors returned by the *lio\_listio()* function, if the *lio\_listio()* function succeeds or fails with errors of [EAGAIN], [EINTR], or [EIO], then some of the I/O specified by the list may have been initiated. If the *lio\_listio()* function fails with an error code other than [EAGAIN], [EINTR], or [EIO], no operations from the list shall have been initiated. The I/O operation indicated by each list element can encounter errors specific to the individual read or write function being performed. In this event, the error status for each **aio**cb control block contains the associated error code. The error codes that can be set are the same as would be set by a *read()* or *write()* function, with the following additional error codes possible:

41593 [EAGAIN] The requested I/O operation was not queued due to resource limitations.

41594 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit  
41595 *aio\_cancel()* request.

41596 [EFBIG] The *aiocbp->aio\_lio\_opcode* is LIO\_WRITE, the file is a regular file,  
41597 *aiocbp->aio\_nbytes* is greater than 0, and the *aiocbp->aio\_offset* is greater than or  
41598 equal to the offset maximum in the open file description associated with  
41599 *aiocbp->aio\_fildes*.

41600 [EINPROGRESS] The requested I/O is in progress.

41601 [EOVERFLOW] The *aiocbp->aio\_lio\_opcode* is LIO\_READ, the file is a regular file,  
41602 *aiocbp->aio\_nbytes* is greater than 0, and the *aiocbp->aio\_offset* is before the  
41603 end-of-file and is greater than or equal to the offset maximum in the open file  
41604 description associated with *aiocbp->aio\_fildes*.

**EXAMPLES**

41605 None.

**APPLICATION USAGE**

41608 None.

**RATIONALE**

41610 Although it may appear that there are inconsistencies in the specified circumstances for error  
41611 codes, the [EIO] error condition applies when any circumstance relating to an individual  
41612 operation makes that operation fail. This might be due to a badly formulated request (for  
41613 example, the *aio\_lio\_opcode* field is invalid, and *aio\_error()* returns [EINVAL]) or might arise from  
41614 application behavior (for example, the file descriptor is closed before the operation is initiated,  
41615 and *aio\_error()* returns [EBADF]).

41616 The limitation on the set of error codes returned when operations from the list shall have been  
41617 initiated enables applications to know when operations have been started and whether  
41618 *aio\_error()* is valid for a specific operation.

**FUTURE DIRECTIONS**

41619 None.

**SEE ALSO**

41622 *aio\_read()*, *aio\_write()*, *aio\_error()*, *aio\_return()*, *aio\_cancel()*, *close()*, *exec*, *exit()*, *fork()*, *lseek()*,  
41623 *read()*

41624 XBD <*aio.h*>

**CHANGE HISTORY**

41625 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

41627 Large File Summit extensions are added.

**Issue 6**

41629 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
41630 implementation does not support the Asynchronous Input and Output option.

41631 The *lio\_listio()* function is marked as part of the Asynchronous Input and Output option.

41632 The following new requirements on POSIX implementations derive from alignment with the  
41633 Single UNIX Specification:

41634 • In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs  
41635 past the offset maximum established in the open file description associated with  
41636 *aiocbp*→*aio\_fildes*. This change is to support large files.

41637 • The [EBIG] and [EOVERFLOW] error conditions are defined. This change is to support  
41638 large files.

41639 The normative text is updated to avoid use of the term “must” for application requirements.

41640 The **restrict** keyword is added to the *lio\_listio()* prototype for alignment with the  
41641 ISO/IEC 9899:1999 standard.

#### 41642 Issue 6

41643 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/53 is applied, adding new text for  
41644 symmetry with the *aio\_read()* and *aio\_write()* functions to the DESCRIPTION.

41645 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/54 is applied, adding text to the  
41646 DESCRIPTION making it explicit that the user is required to keep the structure pointed to by  
41647 *sig*→*sigev\_notify\_attributes* valid until the last asynchronous operation finished and the  
41648 notification has been sent.

#### 41649 Issue 7

41650 The *lio\_listio()* function is moved from the Asynchronous Input and Output option to the Base.

41651 **NAME**

41652 listen — listen for socket connections and limit the queue of incoming connections

41653 **SYNOPSIS**

41654 #include &lt;sys/socket.h&gt;

41655 int listen(int *socket*, int *backlog*);41656 **DESCRIPTION**41657 The *listen()* function shall mark a connection-mode socket, specified by the *socket* argument, as  
41658 accepting connections.41659 The *backlog* argument provides a hint to the implementation which the implementation shall use  
41660 to limit the number of outstanding connections in the socket's listen queue. Implementations  
41661 may impose a limit on *backlog* and silently reduce the specified value. Normally, a larger *backlog*  
41662 argument value shall result in a larger or equal length of the listen queue. Implementations shall  
41663 support values of *backlog* up to SOMAXCONN, defined in <sys/socket.h>.41664 The implementation may include incomplete connections in its listen queue. The limits on the  
41665 number of incomplete connections and completed connections queued may be different.41666 The implementation may have an upper limit on the length of the listen queue—either global or  
41667 per accepting socket. If *backlog* exceeds this limit, the length of the listen queue is set to the limit.41668 If *listen()* is called with a *backlog* argument value that is less than 0, the function behaves as if it  
41669 had been called with a *backlog* argument value of 0.41670 A *backlog* argument of 0 may allow the socket to accept connections, in which case the length of  
41671 the listen queue may be set to an implementation-defined minimum value.41672 The socket in use may require the process to have appropriate privileges to use the *listen()*  
41673 function.41674 **RETURN VALUE**41675 Upon successful completions, *listen()* shall return 0; otherwise, -1 shall be returned and *errno* set  
41676 to indicate the error.41677 **ERRORS**41678 The *listen()* function shall fail if:41679 [EBADF] The *socket* argument is not a valid file descriptor.

41680 [EDESTADDRREQ]

41681 The socket is not bound to a local address, and the protocol does not support  
41682 listening on an unbound socket.41683 [EINVAL] The *socket* is already connected.41684 [ENOTSOCK] The *socket* argument does not refer to a socket.41685 [EOPNOTSUPP] The socket protocol does not support *listen()*.41686 The *listen()* function may fail if:

41687 [EACCES] The calling process does not have appropriate privileges.

41688 [EINVAL] The *socket* has been shut down.

41689 [ENOBUFS] Insufficient resources are available in the system to complete the call.

41700 XBD &lt;sys/socket.h&gt;

41701 **CHANGE HISTORY**

41702 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

41703 The DESCRIPTION is updated to describe the relationship of SOMAXCONN and the *backlog*  
41704 argument.

41705 **NAME**

41706       llabs — return a long integer absolute value

41707 **SYNOPSIS**

41708       #include &lt;stdlib.h&gt;

41709       long long llabs(long long i);

41710 **DESCRIPTION**41711       Refer to *labs()*.

41712 **NAME**

41713       lldiv — compute quotient and remainder of a long division

41714 **SYNOPSIS**

41715       #include &lt;stdlib.h&gt;

41716       lldiv\_t lldiv(long long *numer*, long long *denom*);41717 **DESCRIPTION**41718       Refer to *ldiv()*.

**NAME**

llrint, llrintf, llrintl — round to the nearest integer value using current rounding direction

**SYNOPSIS**

```
#include <math.h>

long long llrint(double x);
long long llrintf(float x);
long long llrintl(long double x);
```

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

These functions shall round their argument to the nearest integer value, rounding according to the current rounding direction.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-zero, an error has occurred.

**RETURN VALUE**

Upon successful completion, these functions shall return the rounded integer value.

MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

MX If the correct value is positive and too large to represent as a **long long**, an unspecified value shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall occur; otherwise, a domain error may occur.

MX If the correct value is negative and too large to represent as a **long long**, an unspecified value shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall occur; otherwise, a domain error may occur.

**ERRORS**

These functions shall fail if:

MX **Domain Error** The *x* argument is NaN or  $\pm$ Inf, or the correct value is not representable as an integer.

If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

**Domain Error** The correct value is not representable as an integer.

If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

41761 **EXAMPLES**

41762       None.

41763 **APPLICATION USAGE**

41764       On error, the expressions *(math\_errhandling & MATH\_ERRNO)* and *(math\_errhandling &*  
41765       *MATH\_ERREXCEPT)* are independent of each other, but at least one of them must be non-zero.

41766 **RATIONALE**

41767       These functions provide floating-to-integer conversions. They round according to the current  
41768       rounding direction. If the rounded value is outside the range of the return type, the numeric  
41769       result is unspecified and the invalid floating-point exception is raised. When they raise no other  
41770       floating-point exception and the result differs from the argument, they raise the inexact floating-  
41771       point exception.

41772 **FUTURE DIRECTIONS**

41773       None.

41774 **SEE ALSO**41775       *feclearexcept()*, *fetestexcept()*, *lrint()*41776       XBD Section 4.20 (on page 117), *<math.h>*41777 **CHANGE HISTORY**

41778       First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

41779 **Issue 7**

41780       ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #53 is applied.

41781 **NAME**

41782 llround, llroundf, llroundl — round to nearest integer value

41783 **SYNOPSIS**

41784 #include <math.h>  
41785 long long llround(double x);  
41786 long long llroundf(float x);  
41787 long long llroundl(long double x);

41788 **DESCRIPTION**

41789 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
41790 conflict between the requirements described here and the ISO C standard is unintentional. This  
41791 volume of POSIX.1-2008 defers to the ISO C standard.

41792 These functions shall round their argument to the nearest integer value, rounding halfway cases  
41793 away from zero, regardless of the current rounding direction.

41794 An application wishing to check for error situations should set *errno* to zero and call  
41795 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
41796 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
41797 zero, an error has occurred.

41798 **RETURN VALUE**

41799 Upon successful completion, these functions shall return the rounded integer value.

41800 MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

41801 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

41802 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

41803 If the correct value is positive and too large to represent as a **long long**, an unspecified value  
41804 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error  
41805 CX shall occur; otherwise, a domain error may occur.

41806 If the correct value is negative and too large to represent as a **long long**, an unspecified value  
41807 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error  
41808 CX shall occur; otherwise, a domain error may occur.

41809 **ERRORS**

41810 These functions shall fail if:

41811 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
41812 integer.

41813 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
41814 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
41815 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
41816 shall be raised.

41817 These functions may fail if:

41818 **Domain Error** The correct value is not representable as an integer.

41819 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
41820 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
41821 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
41822 shall be raised.

**41823 EXAMPLES**

41824       None.

**41825 APPLICATION USAGE**

41826       On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
41827       MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**41828 RATIONALE**

41829       These functions differ from the *llrint()* functions in that the default rounding direction for the  
41830       *llround()* functions round halfway cases away from zero and need not raise the inexact floating-  
41831       point exception for non-integer arguments that round to within the range of the return type.

**41832 FUTURE DIRECTIONS**

41833       None.

**41834 SEE ALSO**

**41837 CHANGE HISTORY**

41838       First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

**41839 Issue 7**

41840       ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #54 (SD5-XSH-ERN-75) is applied.

41841 **NAME**

41842 localeconv — return locale-specific information

41843 **SYNOPSIS**

41844 #include &lt;locale.h&gt;

41845 struct lconv \*localeconv(void);

41846 **DESCRIPTION**

41847 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
41848 conflict between the requirements described here and the ISO C standard is unintentional. This  
41849 volume of POSIX.1-2008 defers to the ISO C standard.

41850 The *localeconv()* function shall set the components of an object with the type **struct lconv** with  
41851 the values appropriate for the formatting of numeric quantities (monetary and otherwise)  
41852 according to the rules of the current locale.

41853 The members of the structure with type **char \*** are pointers to strings, any of which (except  
41854 **decimal\_point**) can point to " ", to indicate that the value is not available in the current locale or  
41855 is of zero length. The members with type **char** are non-negative numbers, any of which can be  
41856 {CHAR\_MAX} to indicate that the value is not available in the current locale.

41857 The members include the following:

41858 **char \*decimal\_point**

41859 The radix character used to format non-monetary quantities.

41860 **char \*thousands\_sep**

41861 The character used to separate groups of digits before the decimal-point character in  
41862 formatted non-monetary quantities.

41863 **char \*grouping**

41864 A string whose elements taken as one-byte integer values indicate the size of each group of  
41865 digits in formatted non-monetary quantities.

41866 **char \*int\_curr\_symbol**

41867 The international currency symbol applicable to the current locale. The first three characters  
41868 contain the alphabetic international currency symbol in accordance with those specified in  
41869 the ISO 4217:2001 standard. The fourth character (immediately preceding the null byte) is  
41870 the character used to separate the international currency symbol from the monetary  
41871 quantity.

41872 **char \*currency\_symbol**

41873 The local currency symbol applicable to the current locale.

41874 **char \*mon\_decimal\_point**

41875 The radix character used to format monetary quantities.

41876 **char \*mon\_thousands\_sep**

41877 The separator for groups of digits before the decimal-point in formatted monetary  
41878 quantities.

41879 **char \*mon\_grouping**

41880 A string whose elements taken as one-byte integer values indicate the size of each group of  
41881 digits in formatted monetary quantities.

41882 **char \*positive\_sign**

41883 The string used to indicate a non-negative valued formatted monetary quantity.

41884 **char \*negative\_sign**  
41885 The string used to indicate a negative valued formatted monetary quantity.

41886 **char int\_frac\_digits**  
41887 The number of fractional digits (those after the decimal-point) to be displayed in an  
41888 internationally formatted monetary quantity.

41889 **char frac\_digits**  
41890 The number of fractional digits (those after the decimal-point) to be displayed in a  
41891 formatted monetary quantity.

41892 **char p\_cs\_precedes**  
41893 Set to 1 if the **currency\_symbol** precedes the value for a non-negative formatted monetary  
41894 quantity. Set to 0 if the symbol succeeds the value.

41895 **char p\_sep\_by\_space**  
41896 Set to a value indicating the separation of the **currency\_symbol**, the sign string, and the  
41897 value for a non-negative formatted monetary quantity.

41898 **char n\_cs\_precedes**  
41899 Set to 1 if the **currency\_symbol** precedes the value for a negative formatted monetary  
41900 quantity. Set to 0 if the symbol succeeds the value.

41901 **char n\_sep\_by\_space**  
41902 Set to a value indicating the separation of the **currency\_symbol**, the sign string, and the  
41903 value for a negative formatted monetary quantity.

41904 **char p\_sign\_posn**  
41905 Set to a value indicating the positioning of the **positive\_sign** for a non-negative formatted  
41906 monetary quantity.

41907 **char n\_sign\_posn**  
41908 Set to a value indicating the positioning of the **negative\_sign** for a negative formatted  
41909 monetary quantity.

41910 **char int\_p\_cs\_precedes**  
41911 Set to 1 or 0 if the **int\_curr\_symbol** respectively precedes or succeeds the value for a non-  
41912 negative internationally formatted monetary quantity.

41913 **char int\_n\_cs\_precedes**  
41914 Set to 1 or 0 if the **int\_curr\_symbol** respectively precedes or succeeds the value for a  
41915 negative internationally formatted monetary quantity.

41916 **char int\_p\_sep\_by\_space**  
41917 Set to a value indicating the separation of the **int\_curr\_symbol**, the sign string, and the  
41918 value for a non-negative internationally formatted monetary quantity.

41919 **char int\_n\_sep\_by\_space**  
41920 Set to a value indicating the separation of the **int\_curr\_symbol**, the sign string, and the  
41921 value for a negative internationally formatted monetary quantity.

41922 **char int\_p\_sign\_posn**  
41923 Set to a value indicating the positioning of the **positive\_sign** for a non-negative  
41924 internationally formatted monetary quantity.

41925 **char int\_n\_sign\_posn**  
41926 Set to a value indicating the positioning of the **negative\_sign** for a negative internationally  
41927 formatted monetary quantity.

- 41928 The elements of **grouping** and **mon\_grouping** are interpreted according to the following:
- 41929 {CHAR\_MAX} No further grouping is to be performed.
- 41930 0 The previous element is to be repeatedly used for the remainder of the digits.
- 41931 *other* The integer value is the number of digits that comprise the current group. The
- 41932 next element is examined to determine the size of the next group of digits
- 41933 before the current group.
- 41934 The values of **p\_sep\_by\_space**, **n\_sep\_by\_space**, **int\_p\_sep\_by\_space**, and **int\_n\_sep\_by\_space**
- 41935 are interpreted according to the following:
- 41936 0 No space separates the currency symbol and value.
- 41937 1 If the currency symbol and sign string are adjacent, a space separates them from the value;
- 41938 otherwise, a space separates the currency symbol from the value.
- 41939 2 If the currency symbol and sign string are adjacent, a space separates them; otherwise, a
- 41940 space separates the sign string from the value.
- 41941 For **int\_p\_sep\_by\_space** and **int\_n\_sep\_by\_space**, the fourth character of **int\_curr\_symbol** is
- 41942 used instead of a space.
- 41943 The values of **p\_sign\_posn**, **n\_sign\_posn**, **int\_p\_sign\_posn**, and **int\_n\_sign\_posn** are
- 41944 interpreted according to the following:
- 41945 0 Parentheses surround the quantity and **currency\_symbol** or **int\_curr\_symbol**.
- 41946 1 The sign string precedes the quantity and **currency\_symbol** or **int\_curr\_symbol**.
- 41947 2 The sign string succeeds the quantity and **currency\_symbol** or **int\_curr\_symbol**.
- 41948 3 The sign string immediately precedes the **currency\_symbol** or **int\_curr\_symbol**.
- 41949 4 The sign string immediately succeeds the **currency\_symbol** or **int\_curr\_symbol**.
- 41950 The implementation shall behave as if no function in this volume of POSIX.1-2008 calls
- 41951 *localeconv*( ).
- 41952 CX The *localeconv*( ) function need not be thread-safe.
- 41953 **RETURN VALUE**
- 41954 The *localeconv*( ) function shall return a pointer to the filled-in object. The application shall not
- 41955 CX modify the structure to which the return value points, nor any storage areas pointed to by
- 41956 pointers within the structure. The returned pointer, and pointers within the structure, might be
- 41957 CX invalidated or the structure or the storage areas might be overwritten by a subsequent call to
- 41958 CX *localeconv*( ). In addition, the returned pointer, and pointers within the structure, might be
- 41959 CX invalidated or the structure or the storage areas might be overwritten by subsequent calls to
- 41960 CX *setlocale*( ) with the categories LC\_ALL, LC\_MONETARY, or LC\_NUMERIC, or by calls to
- 41961 *uselocale*( ) which change the categories LC\_MONETARY or LC\_NUMERIC. The returned
- 41962 pointer, pointers within the structure, the structure, and the storage areas might also be
- 41963 invalidated if the calling thread is terminated.
- 41964 **ERRORS**
- 41965 No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

The following table illustrates the rules which may be used by four countries to format monetary quantities.

| Country     | Positive Format | Negative Format | International Format |
|-------------|-----------------|-----------------|----------------------|
| Italy       | €1.230          | −€1.230         | EUR.1.230            |
| Netherlands | € 1.234,56      | € −1.234,56     | EUR 1.234,56         |
| Norway      | kr1.234,56      | kr1.234,56−     | NOK 1.234,56         |
| Switzerland | SFrs.1,234.56   | SFrs.1,234.56C  | CHF 1,234.56         |

For these four countries, the respective values for the monetary members of the structure returned by *localeconv()* are:

|                           | Italy   | Netherlands | Norway | Switzerland |
|---------------------------|---------|-------------|--------|-------------|
| <b>int_curr_symbol</b>    | "EUR. " | "EUR "      | "NOK " | "CHF "      |
| <b>currency_symbol</b>    | "€. "   | "€ "        | "kr "  | "SFrs. "    |
| <b>mon_decimal_point</b>  | " "     | " , "       | " , "  | " . "       |
| <b>mon_thousands_sep</b>  | " . "   | " . "       | " . "  | " , "       |
| <b>mon_grouping</b>       | "\3 "   | "\3 "       | "\3 "  | "\3 "       |
| <b>positive_sign</b>      | " "     | " "         | " "    | " "         |
| <b>negative_sign</b>      | " − "   | " − "       | " − "  | "C "        |
| <b>int_frac_digits</b>    | 0       | 2           | 2      | 2           |
| <b>frac_digits</b>        | 0       | 2           | 2      | 2           |
| <b>p_cs_precedes</b>      | 1       | 1           | 1      | 1           |

42008 **CHANGE HISTORY**

42009 First released in Issue 4. Derived from the ANSI C standard.

42010 **Issue 6**

42011 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

42012 The RETURN VALUE section is rewritten to avoid use of the term “must”.

42013 This reference page is updated for alignment with the ISO/IEC 9899: 1999 standard.

42014 ISO/IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.

42015 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/31 is applied, removing references to  
42016 **int\_curr\_symbol** and updating the descriptions of **p\_sep\_by\_space** and **n\_sep\_by\_space**. These  
42017 changes are for alignment with the ISO C standard.42018 **Issue 7**

42019 Austin Group Interpretation 1003.1-2001 #156 is applied.

42020 The definitions of **int\_curr\_symbol** and **currency\_symbol** are updated.

42021 The examples in the APPLICATION USAGE section are updated.

42022 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0362 [75] is applied.

42023 **NAME**42024 `localtime`, `localtime_r` — convert a time value to a broken-down local time42025 **SYNOPSIS**

```
42026 #include <time.h>
42027 struct tm *localtime(const time_t *timer);
42028 CX struct tm *localtime_r(const time_t *restrict timer,
42029 struct tm *restrict result);
```

42030 **DESCRIPTION**

42031 CX For `localtime()`: The functionality described on this reference page is aligned with the ISO C  
 42032 standard. Any conflict between the requirements described here and the ISO C standard is  
 42033 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

42034 The `localtime()` function shall convert the time in seconds since the Epoch pointed to by `timer`  
 42035 into a broken-down time, expressed as a local time. The function corrects for the timezone and  
 42036 CX any seasonal time adjustments. Local timezone information is used as though `localtime()` calls  
 42037 `tzset()`.

42038 The relationship between a time in seconds since the Epoch used as an argument to `localtime()`  
 42039 and the `tm` structure (defined in the `<time.h>` header) is that the result shall be as specified in  
 42040 the expression given in the definition of seconds since the Epoch (see XBD Section 4.16, on page  
 42041 113) corrected for timezone and any seasonal time adjustments, where the names in the structure  
 42042 and in the expression correspond.

42043 The same relationship shall apply for `localtime_r()`.

42044 The `localtime()` function need not be thread-safe.

42045 The `asctime()`, `ctime()`, `gmtime()`, and `localtime()` functions shall return values in one of two static  
 42046 objects: a broken-down time structure and an array of type `char`. Execution of any of the  
 42047 functions may overwrite the information returned in either of these objects by any of the other  
 42048 functions.

42049 The `localtime_r()` function shall convert the time in seconds since the Epoch pointed to by `timer`  
 42050 into a broken-down time stored in the structure to which `result` points. The `localtime_r()` function  
 42051 shall also return a pointer to that same structure.

42052 Unlike `localtime()`, the `localtime_r()` function is not required to set `tzname`. If `localtime_r()` sets +  
 42053 `tzname`, it shall also set `daylight` and `timezone`. If `localtime_r()` does not set `tzname`, it shall not set  
 42054 `daylight` and shall not set `timezone`.

42055 **RETURN VALUE**

42056 Upon successful completion, the `localtime()` function shall return a pointer to the broken-down  
 42057 CX time structure. If an error is detected, `localtime()` shall return a null pointer and set `errno` to  
 42058 indicate the error.

42059 Upon successful completion, `localtime_r()` shall return a pointer to the structure pointed to by the  
 42060 argument `result`. If an error is detected, `localtime_r()` shall return a null pointer and set `errno` to  
 42061 indicate the error.

42062 **ERRORS**

42063 CX The `localtime()` and `localtime_r()` functions shall fail if:

42064 CX [EOVERFLOW] The result cannot be represented.

42065 **EXAMPLES**42066 **Getting the Local Date and Time**

42067 The following example uses the *time()* function to calculate the time elapsed, in seconds, since  
42068 January 1, 1970 0:00 UTC (the Epoch), *localtime()* to convert that value to a broken-down time,  
42069 and *asctime()* to convert the broken-down time values into a printable string.

```
42070 #include <stdio.h>
42071 #include <time.h>
42072 int main(void)
42073 {
42074     time_t result;
42075     result = time(NULL);
42076     printf("%s%ju secs since the Epoch\n",
42077           asctime(localtime(&result)),
42078           (uintmax_t)result);
42079     return(0);
42080 }
```

42081 This example writes the current time to *stdout* in a form like this:

```
42082 Wed Jun 26 10:32:15 1996
42083 835810335 secs since the Epoch
```

42084 **Getting the Modification Time for a File**

42085 The following example prints the last data modification timestamp in the local timezone for a  
42086 given file.

```
42087 #include <stdio.h>
42088 #include <time.h>
42089 #include <sys/stat.h>
42090 int
42091 print_file_time(const char *pathname)
42092 {
42093     struct stat statbuf;
42094     struct tm *tm;
42095     char timestr[BUFSIZ];
42096     if(stat(pathname, &statbuf) == -1)
42097         return -1;
42098     if((tm = localtime(&statbuf.st_mtime)) == NULL)
42099         return -1;
42100     if(strftime(timestr, sizeof(timestr), "%Y-%m-%d %H:%M:%S", tm) == 0)
42101         return -1;
42102     printf("%s: %s.%09ld\n", pathname, timestr, statbuf.st_mtim.tv_nsec);
42103     return 0;
42104 }
```

**Timing an Event**

The following example gets the current time, converts it to a string using *localtime()* and *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to an event being timed.

```
#include <time.h>
#include <stdio.h>
...
time_t now;
int minutes_to_event;
...
time(&now);
printf("The time is ");
fputs(asctime(localtime(&now)), stdout);
printf("There are still %d minutes to the event.\n",
       minutes_to_event);
...
```

**APPLICATION USAGE**

The *localtime\_r()* function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*asctime()*, *clock()*, *ctime()*, *difftime()*, *getdate()*, *gmtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*, *tzset()*, *utime()*

XBD Section 4.16 (on page 113), *<time.h>*

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

A note indicating that the *localtime()* function need not be reentrant is added to the DESCRIPTION.

The *localtime\_r()* function is included for alignment with the POSIX Threads Extension.

**Issue 6**

The *localtime\_r()* function is marked as part of the Thread-Safe Functions option.

Extensions beyond the ISO C standard are marked.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *localtime\_r()* prototype for alignment with the ISO/IEC 9899:1999 standard.

Examples are added.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/32 is applied, adding the [EOVERFLOW] error.

- 42148 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/55 is applied, updating the error handling  
42149 for *localtime\_r()*.
- 42150 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/56 is applied, adding a requirement that if  
42151 *localtime\_r()* does not set the *tzname* variable, it shall not set the *daylight* or *timezone* variables. On  
42152 systems supporting XSI, the *daylight*, *timezone*, and *tzname* variables should all be set to provide  
42153 information for the same timezone. This updates the description of *localtime\_r()* to mention  
42154 *daylight* and *timezone* as well as *tzname*. The SEE ALSO section is updated.
- 42155 **Issue 7**
- 42156 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 42157 The *localtime\_r()* function is moved from the Thread-Safe Functions option to the Base.
- 42158 Changes are made to the EXAMPLES section related to support for finegrained timestamps.
- 42159 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0363 [291] is applied.

**NAME**

lockf — record locking on files

**SYNOPSIS**

```

#include <unistd.h>

int lockf(int fildes, int function, off_t size);

```

**DESCRIPTION**

The *lockf()* function shall lock sections of a file with advisory-mode locks. Calls to *lockf()* from threads in other processes which attempt to lock the locked file section shall either return an error value or block until the section becomes unlocked. All the locks for a process are removed when the process terminates. Record locking with *lockf()* shall be supported for regular files and may be supported for other files.

The *fildes* argument is an open file descriptor. To establish a lock with this function, the file descriptor shall be opened with write-only permission (O\_WRONLY) or with read/write permission (O\_RDWR).

The *function* argument is a control value which specifies the action to be taken. The permissible values for *function* are defined in **<unistd.h>** as follows:

| Function | Description                                  |
|----------|----------------------------------------------|
| F_ULOCK  | Unlock locked sections.                      |
| F_LOCK   | Lock a section for exclusive use.            |
| F_TLOCK  | Test and lock a section for exclusive use.   |
| F_TEST   | Test a section for locks by other processes. |

F\_TEST shall detect if a lock by another process is present on the specified section.

F\_LOCK and F\_TLOCK shall both lock a section of a file if the section is available.

F\_ULOCK shall remove locks from a section of the file.

The *size* argument is the number of contiguous bytes to be locked or unlocked. The section to be locked or unlocked starts at the current offset in the file and extends forward for a positive size or backward for a negative size (the preceding bytes up to but not including the current offset). If *size* is 0, the section from the current offset through the largest possible file offset shall be locked (that is, from the current offset through the present or any future end-of-file). An area need not be allocated to the file to be locked because locks may exist past the end-of-file.

The sections locked with F\_LOCK or F\_TLOCK may, in whole or in part, contain or be contained by a previously locked section for the same process. When this occurs, or if adjacent locked sections would occur, the sections shall be combined into a single locked section. If the request would cause the number of locks to exceed a system-imposed limit, the request shall fail.

F\_LOCK and F\_TLOCK requests differ only by the action taken if the section is not available. F\_LOCK shall block the calling thread until the section is available. F\_TLOCK shall cause the function to fail if the section is already locked by another process.

File locks shall be released on first close by the locking process of any file descriptor for the file.

F\_ULOCK requests may release (wholly or in part) one or more locked sections controlled by the process. Locked sections shall be unlocked starting at the current file offset through *size* bytes or to the end-of-file if *size* is (off\_t)0. When all of a locked section is not released (that is, when the beginning or end of the area to be unlocked falls within a locked section), the remaining portions of that section shall remain locked by the process. Releasing the center portion of a locked section shall cause the remaining locked beginning and end portions to become two separate

locked sections. If the request would cause the number of locks in the system to exceed a system-imposed limit, the request shall fail.

A potential for deadlock occurs if the threads of a process controlling a locked section are blocked by accessing a locked section of another process. If the system detects that deadlock would occur, *lockf()* shall fail with an [EDEADLK] error.

The interaction between *fcntl()* and *lockf()* locks is unspecified.

Blocking on a section shall be interrupted by any signal.

An F\_ULOCK request in which *size* is non-zero and the offset of the last byte of the requested section is the maximum value for an object of type **off\_t**, when the process has an existing lock in which *size* is 0 and which includes the last byte of the requested section, shall be treated as a request to unlock from the start of the requested section with a size equal to 0. Otherwise, an F\_ULOCK request shall attempt to unlock only the requested section.

Attempting to lock a section of a file that is associated with a buffered stream produces unspecified results.

#### RETURN VALUE

Upon successful completion, *lockf()* shall return 0. Otherwise, it shall return -1, set *errno* to indicate an error, and existing locks shall not be changed.

#### ERRORS

The *lockf()* function shall fail if:

[EBADF]            The *fildes* argument is not a valid open file descriptor; or *function* is F\_LOCK or F\_TLOCK and *fildes* is not a valid file descriptor open for writing.

[EACCES] or [EAGAIN]            The *function* argument is F\_TLOCK or F\_TEST and the section is already locked by another process.

[EDEADLK]            The *function* argument is F\_LOCK and a deadlock is detected.

[EINTR]            A signal was caught during execution of the function.

[EINVAL]            The *function* argument is not one of F\_LOCK, F\_TLOCK, F\_TEST, or F\_ULOCK; or *size* plus the current file offset is less than 0.

[EOVERFLOW]            The offset of the first, or if *size* is not 0 then the last, byte in the requested section cannot be represented correctly in an object of type **off\_t**.

The *lockf()* function may fail if:

[EAGAIN]            The *function* argument is F\_LOCK or F\_TLOCK and the file is mapped with *mmap()*.

[EDEADLK] or [ENOLCK]            The *function* argument is F\_LOCK, F\_TLOCK, or F\_ULOCK, and the request would cause the number of locks to exceed a system-imposed limit.

[EOPNOTSUPP] or [EINVAL]            The implementation does not support the locking of files of the type indicated by the *fildes* argument.

42243 **EXAMPLES**42244 **Locking a Portion of a File**

42245 In the following example, a file named `/home/cnd/mod1` is being modified. Other processes that  
 42246 use locking are prevented from changing it during this process. Only the first 10 000 bytes are  
 42247 locked, and the lock call fails if another process has any part of this area locked already.

```
42248 #include <fcntl.h>
42249 #include <unistd.h>

42250 int fildes;
42251 int status;
42252 ...
42253 fildes = open("/home/cnd/mod1", O_RDWR);
42254 status = lockf(fildes, F_TLOCK, (off_t)10000);
```

42255 **APPLICATION USAGE**

42256 Record-locking should not be used in combination with the *fopen()*, *fread()*, *fwrite()*, and other  
 42257 *stdio* functions. Instead, the more primitive, non-buffered functions (such as *open()*) should be  
 42258 used. Unexpected results may occur in processes that do buffering in the user address space. The  
 42259 process may later read/write data which is/was locked. The *stdio* functions are the most  
 42260 common source of unexpected buffering.

42261 The *alarm()* function may be used to provide a timeout facility in applications requiring it.

42262 **RATIONALE**

42263 None.

42264 **FUTURE DIRECTIONS**

42265 None.

42266 **SEE ALSO**

42267 *alarm()*, *chmod()*, *close()*, *creat()*, *fcntl()*, *fopen()*, *mmap()*, *open()*, *read()*, *write()*

42268 XBD **<unistd.h>**

42269 **CHANGE HISTORY**

42270 First released in Issue 4, Version 2.

42271 **Issue 5**

42272 Moved from X/OPEN UNIX extension to BASE.

42273 Large File Summit extensions are added. In particular, the description of [EINVAL] is clarified  
 42274 and moved from optional to mandatory status.

42275 A note is added to the DESCRIPTION indicating the effects of attempting to lock a section of a  
 42276 file that is associated with a buffered stream.

42277 **Issue 6**

42278 The normative text is updated to avoid use of the term “must” for application requirements.

42279 **Issue 7**

42280 Austin Group Interpretation 1003.1-2001 #054 is applied, updating the DESCRIPTION.

42281 **NAME**

42282 log, logf, logl — natural logarithm function

42283 **SYNOPSIS**

```
42284 #include <math.h>
42285 double log(double x);
42286 float logf(float x);
42287 long double logl(long double x);
```

42288 **DESCRIPTION**

42289 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 42290 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42291 volume of POSIX.1-2008 defers to the ISO C standard.

42292 These functions shall compute the natural logarithm of their argument  $x$ ,  $\log_e(x)$ .

42293 An application wishing to check for error situations should set *errno* to zero and call  
 42294 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 42295 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 42296 zero, an error has occurred.

42297 **RETURN VALUE**

42298 Upon successful completion, these functions shall return the natural logarithm of  $x$ .

42299 If  $x$  is  $\pm 0$ , a pole error shall occur and *log()*, *logf()*, and *logl()* shall return  $-\text{HUGE\_VAL}$ ,  
 42300  $-\text{HUGE\_VALF}$ , and  $-\text{HUGE\_VALL}$ , respectively.

42301 MX For finite values of  $x$  that are less than 0, or if  $x$  is  $-\text{Inf}$ , a domain error shall occur, and either a  
 42302 NaN (if supported), or an implementation-defined value shall be returned.

42303 MX If  $x$  is NaN, a NaN shall be returned.

42304 If  $x$  is 1, +0 shall be returned.

42305 If  $x$  is  $+\text{Inf}$ ,  $x$  shall be returned.

42306 **ERRORS**

42307 These functions shall fail if:

|       |    |              |                                                                                               |
|-------|----|--------------|-----------------------------------------------------------------------------------------------|
| 42308 | MX | Domain Error | The finite value of $x$ is negative, or $x$ is $-\text{Inf}$ .                                |
| 42309 |    |              | If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,                |
| 42310 |    |              | then <i>errno</i> shall be set to [EDOM]. If the integer expression ( <i>math_errhandling</i> |
| 42311 |    |              | & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception                      |
| 42312 |    |              | shall be raised.                                                                              |

|       |  |            |                           |
|-------|--|------------|---------------------------|
| 42313 |  | Pole Error | The value of $x$ is zero. |
|-------|--|------------|---------------------------|

|       |  |  |                                                                                  |
|-------|--|--|----------------------------------------------------------------------------------|
| 42314 |  |  | If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,   |
| 42315 |  |  | then <i>errno</i> shall be set to [ERANGE]. If the integer expression            |
| 42316 |  |  | ( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the divide-by-zero |
| 42317 |  |  | floating-point exception shall be raised.                                        |

42318 **EXAMPLES**

42319 None.

42320 **APPLICATION USAGE**

42321 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 42322 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

42323 **RATIONALE**

42324 None.

42325 **FUTURE DIRECTIONS**

42326 None.

42327 **SEE ALSO**42328 *exp()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *log10()*, *log1p()*

42329 XBD Section 4.20 (on page 117), &lt;math.h&gt;

42330 **CHANGE HISTORY**

42331 First released in Issue 1. Derived from Issue 1 of the SVID.

42332 **Issue 5**

42333 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 42334 text was previously published in the APPLICATION USAGE section.

42335 **Issue 6**

42336 The normative text is updated to avoid use of the term “must” for application requirements.

42337 The *logf()* and *logl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

42338 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 42339 revised to align with the ISO/IEC 9899:1999 standard.

42340 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 42341 marked.

42342 **NAME**

42343 log10, log10f, log10l — base 10 logarithm function

42344 **SYNOPSIS**

```
42345 #include <math.h>
42346 double log10(double x);
42347 float log10f(float x);
42348 long double log10l(long double x);
```

42349 **DESCRIPTION**

42350 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 42351 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42352 volume of POSIX.1-2008 defers to the ISO C standard.

42353 These functions shall compute the base 10 logarithm of their argument  $x$ ,  $\log_{10}(x)$ .

42354 An application wishing to check for error situations should set *errno* to zero and call  
 42355 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 42356 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 42357 zero, an error has occurred.

42358 **RETURN VALUE**

42359 Upon successful completion, these functions shall return the base 10 logarithm of  $x$ .

42360 If  $x$  is  $\pm 0$ , a pole error shall occur and *log10()*, *log10f()*, and *log10l()* shall return  $-\text{HUGE\_VAL}$ ,  
 42361  $-\text{HUGE\_VALF}$ , and  $-\text{HUGE\_VALL}$ , respectively.

42362 MX For finite values of  $x$  that are less than 0, or if  $x$  is  $-\text{Inf}$ , a domain error shall occur, and either a  
 42363 NaN (if supported), or an implementation-defined value shall be returned.

42364 MX If  $x$  is NaN, a NaN shall be returned.

42365 If  $x$  is 1, +0 shall be returned.

42366 If  $x$  is  $+\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

42367 **ERRORS**

42368 These functions shall fail if:

42369 MX Domain Error The finite value of  $x$  is negative, or  $x$  is  $-\text{Inf}$ .

42370 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 42371 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 42372 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 42373 shall be raised.

42374 Pole Error The value of  $x$  is zero.

42375 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 42376 then *errno* shall be set to [ERANGE]. If the integer expression  
 42377 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 42378 floating-point exception shall be raised.

42379 **EXAMPLES**

42380 None.

42381 **APPLICATION USAGE**

42382 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 42383 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

42384 **RATIONALE**

42385 None.

42386 **FUTURE DIRECTIONS**

42387 None.

42388 **SEE ALSO**42389 *feclearexcept()*, *fetestexcept()*, *isnan()*, *log()*, *pow()*42390 XBD Section 4.20 (on page 117), **<math.h>**42391 **CHANGE HISTORY**

42392 First released in Issue 1. Derived from Issue 1 of the SVID.

42393 **Issue 5**

42394 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 42395 text was previously published in the APPLICATION USAGE section.

42396 **Issue 6**

42397 The normative text is updated to avoid use of the term “must” for application requirements.

42398 The *log10f()* and *log10l()* functions are added for alignment with the ISO/IEC 9899:1999  
 42399 standard.

42400 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 42401 revised to align with the ISO/IEC 9899:1999 standard.

42402 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 42403 marked.

42404 **NAME**

42405 log1p, log1pf, log1pl — compute a natural logarithm

42406 **SYNOPSIS**

```
42407 #include <math.h>
42408 double log1p(double x);
42409 float log1pf(float x);
42410 long double log1pl(long double x);
```

42411 **DESCRIPTION**

42412 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 42413 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42414 volume of POSIX.1-2008 defers to the ISO C standard.

42415 These functions shall compute  $\log_e(1.0 + x)$ .

42416 An application wishing to check for error situations should set *errno* to zero and call  
 42417 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 42418 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 42419 zero, an error has occurred.

42420 **RETURN VALUE**42421 Upon successful completion, these functions shall return the natural logarithm of  $1.0 + x$ .

42422 If  $x$  is  $-1$ , a pole error shall occur and *log1p()*, *log1pf()*, and *log1pl()* shall return  $-\text{HUGE\_VAL}$ ,  
 42423  $-\text{HUGE\_VALF}$ , and  $-\text{HUGE\_VALL}$ , respectively.

42424 MX For finite values of  $x$  that are less than  $-1$ , or if  $x$  is  $-\text{Inf}$ , a domain error shall occur, and either a  
 42425 NaN (if supported), or an implementation-defined value shall be returned.

42426 MX If  $x$  is NaN, a NaN shall be returned.42427 If  $x$  is  $\pm 0$ , or  $+\text{Inf}$ ,  $x$  shall be returned.42428 If  $x$  is subnormal, a range error may occur42429 MXX and  $x$  should be returned.

42430 MX If  $x$  is not returned, *log1p()*, *log1pf()*, and *log1pl()* shall return an implementation-defined value  
 42431 no greater in magnitude than DBL\_MIN, FLT\_MIN, and LDBL\_MIN, respectively.

42432 **ERRORS**

42433 These functions shall fail if:

42434 MX Domain Error The finite value of  $x$  is less than  $-1$ , or  $x$  is  $-\text{Inf}$ .

42435 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 42436 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 42437 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 42438 shall be raised.

42439 Pole Error The value of  $x$  is  $-1$ .

42440 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 42441 then *errno* shall be set to [ERANGE]. If the integer expression  
 42442 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 42443 floating-point exception shall be raised.

42444 These functions may fail if:

42445 MX **Range Error** The value of  $x$  is subnormal.

42446 If the integer expression  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  is non-zero,  
 42447 then *errno* shall be set to [ERANGE]. If the integer expression  
 42448  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$  is non-zero, then the underflow  
 42449 floating-point exception shall be raised.

#### 42450 EXAMPLES

42451 None.

#### 42452 APPLICATION USAGE

42453 On error, the expressions  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  and  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$  are independent of each other, but at least one of them must be non-zero.

#### 42455 RATIONALE

42456 None.

#### 42457 FUTURE DIRECTIONS

42458 None.

#### 42462 CHANGE HISTORY

42463 First released in Issue 4, Version 2.

#### 42464 Issue 5

42465 Moved from X/OPEN UNIX extension to BASE.

#### 42466 Issue 6

42467 The normative text is updated to avoid use of the term “must” for application requirements.

42468 The *log1p()* function is no longer marked as an extension.

42469 The *log1pf()* and *log1pl()* functions are added for alignment with the ISO/IEC 9899:1999  
 42470 standard.

42471 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 42472 revised to align with the ISO/IEC 9899:1999 standard.

42473 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 42474 marked.

#### 42475 Issue 7

42476 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0364 [68] is applied.

42477 **NAME**

42478 log2, log2f, log2l — compute base 2 logarithm functions

42479 **SYNOPSIS**

```
42480 #include <math.h>
42481 double log2(double x);
42482 float log2f(float x);
42483 long double log2l(long double x);
```

42484 **DESCRIPTION**

42485 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 42486 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42487 volume of POSIX.1-2008 defers to the ISO C standard.

42488 These functions shall compute the base 2 logarithm of their argument  $x$ ,  $\log_2(x)$ .

42489 An application wishing to check for error situations should set *errno* to zero and call  
 42490 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 42491 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 42492 zero, an error has occurred.

42493 **RETURN VALUE**

42494 Upon successful completion, these functions shall return the base 2 logarithm of  $x$ .

42495 If  $x$  is  $\pm 0$ , a pole error shall occur and *log2()*, *log2f()*, and *log2l()* shall return  $-\text{HUGE\_VAL}$ ,  
 42496  $-\text{HUGE\_VALF}$ , and  $-\text{HUGE\_VALL}$ , respectively.

42497 MX For finite values of  $x$  that are less than 0, or if  $x$  is  $-\text{Inf}$ , a domain error shall occur, and either a  
 42498 NaN (if supported), or an implementation-defined value shall be returned.

42499 MX If  $x$  is NaN, a NaN shall be returned.

42500 If  $x$  is 1, +0 shall be returned.

42501 If  $x$  is  $+\text{Inf}$ ,  $x$  shall be returned.

42502 **ERRORS**

42503 These functions shall fail if:

42504 MX Domain Error The finite value of  $x$  is less than zero, or  $x$  is  $-\text{Inf}$ .

42505 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 42506 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 42507 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 42508 shall be raised.

42509 Pole Error The value of  $x$  is zero.

42510 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 42511 then *errno* shall be set to [ERANGE]. If the integer expression  
 42512 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 42513 floating-point exception shall be raised.

42514 **EXAMPLES**

42515       None.

42516 **APPLICATION USAGE**

42517       On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
42518       MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

42519 **RATIONALE**

42520       None.

42521 **FUTURE DIRECTIONS**

42522       None.

42523 **SEE ALSO**42524       *feclearexcept()*, *fetestexcept()*, *log()*42525       XBD Section 4.20 (on page 117), **<math.h>**42526 **CHANGE HISTORY**

42527       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

42528 **NAME**

42529 logb, logbf, logbl — radix-independent exponent

42530 **SYNOPSIS**

```
42531 #include <math.h>
42532 double logb(double x);
42533 float logbf(float x);
42534 long double logbl(long double x);
```

42535 **DESCRIPTION**

42536 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 42537 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42538 volume of POSIX.1-2008 defers to the ISO C standard.

42539 These functions shall compute the exponent of  $x$ , which is the integral part of  $\log_r |x|$ , as a  
 42540 signed floating-point value, for non-zero  $x$ , where  $r$  is the radix of the machine's floating-point  
 42541 arithmetic, which is the value of FLT\_RADIX defined in the **<float.h>** header.

42542 If  $x$  is subnormal it is treated as though it were normalized; thus for finite positive  $x$ :

42543  $1 \leq x * \text{FLT\_RADIX}^{-\log_b(x)} < \text{FLT\_RADIX}$

42544 An application wishing to check for error situations should set *errno* to zero and call  
 42545 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 42546 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 42547 zero, an error has occurred.

42548 **RETURN VALUE**

42549 Upon successful completion, these functions shall return the exponent of  $x$ .

42550 If  $x$  is  $\pm 0$ , *logb()*, *logbf()*, and *logbl()* shall return  $-\text{HUGE\_VAL}$ ,  $-\text{HUGE\_VALF}$ , and  
 42551  $-\text{HUGE\_VALL}$ , respectively.

42552 MX On systems that support the IEC 60559 Floating-Point option, a pole error shall occur;

42553 CX otherwise, a pole error may occur.

42554 MX If  $x$  is NaN, a NaN shall be returned.

42555 MX If  $x$  is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

42556 **ERRORS**

42557 These functions shall fail if:

42558 MX **Pole Error** The value of  $x$  is  $\pm 0$ .

42559 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 42560 then *errno* shall be set to [ERANGE]. If the integer expression  
 42561 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 42562 floating-point exception shall be raised.

42563 These functions may fail if:

42564 **Pole Error** The value of  $x$  is 0.

42565 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 42566 then *errno* shall be set to [ERANGE]. If the integer expression  
 42567 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 42568 floating-point exception shall be raised.

42569 **EXAMPLES**

42570 None.

42571 **APPLICATION USAGE**

42572 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 42573 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

42574 **RATIONALE**

42575 None.

42576 **FUTURE DIRECTIONS**

42577 None.

42578 **SEE ALSO**42579 *feclearexcept()*, *fetestexcept()*, *ilogb()*, *scalbln()*42580 XBD Section 4.20 (on page 117), **<float.h>**, **<math.h>**42581 **CHANGE HISTORY**

42582 First released in Issue 4, Version 2.

42583 **Issue 5**

42584 Moved from X/OPEN UNIX extension to BASE.

42585 **Issue 6**42586 The *logb()* function is no longer marked as an extension.42587 The *logbf()* and *logbl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

42588 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 42589 revised to align with the ISO/IEC 9899:1999 standard.

42590 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 42591 marked.

42592 **Issue 7**

42593 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #50 (SD5-XSH-ERN-76) is applied.

42594 **NAME**

42595       logf, logl — natural logarithm function

42596 **SYNOPSIS**

42597       #include &lt;math.h&gt;

42598       float logf(float x);

42599       long double logl(long double x);

42600 **DESCRIPTION**42601       Refer to *log()*.

42602 **NAME**

42603 longjmp — non-local goto

42604 **SYNOPSIS**

42605 #include &lt;setjmp.h&gt;

42606 void longjmp(jmp\_buf env, int val);

42607 **DESCRIPTION**

42608 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 42609 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42610 volume of POSIX.1-2008 defers to the ISO C standard.

42611 The *longjmp()* function shall restore the environment saved by the most recent invocation of  
 42612 *setjmp()* in the same process, with the corresponding **jmp\_buf** argument. If the most recent  
 42613 invocation of *setjmp()* with the corresponding **jmp\_buf** occurred in another thread, or if there is  
 42614 no such invocation, or if the function containing the invocation of *setjmp()* has terminated  
 42615 execution in the interim, or if the invocation of *setjmp()* was within the scope of an identifier  
 42616 with variably modified type and execution has left that scope in the interim, the behavior is  
 42617 CX undefined. It is unspecified whether *longjmp()* restores the signal mask, leaves the signal mask  
 42618 unchanged, or restores it to its value at the time *setjmp()* was called.

42619 All accessible objects have values, and all other components of the abstract machine have state  
 42620 (for example, floating-point status flags and open files), as of the time *longjmp()* was called,  
 42621 except that the values of objects of automatic storage duration are unspecified if they meet all  
 42622 the following conditions:

- 42623 • They are local to the function containing the corresponding *setjmp()* invocation.
- 42624 • They do not have volatile-qualified type.
- 42625 • They are changed between the *setjmp()* invocation and *longjmp()* call.

42626 CX Although *longjmp()* is an async-signal-safe function, if it is invoked from a signal handler which  
 42627 interrupted a non-async-signal-safe function or equivalent (such as the processing equivalent to  
 42628 *exit()* performed after a return from the initial call to *main()*), the behavior of any subsequent  
 42629 call to a non-async-signal-safe function or equivalent is undefined.

42630 The effect of a call to *longjmp()* where initialization of the **jmp\_buf** structure was not performed  
 42631 in the calling thread is undefined.

42632 **RETURN VALUE**

42633 After *longjmp()* is completed, program execution continues as if the corresponding invocation of  
 42634 *setjmp()* had just returned the value specified by *val*. The *longjmp()* function shall not cause  
 42635 *setjmp()* to return 0; if *val* is 0, *setjmp()* shall return 1.

42636 **ERRORS**

42637 No errors are defined.

42638 **EXAMPLES**

42639 None.

42640 **APPLICATION USAGE**

42641 Applications whose behavior depends on the value of the signal mask should not use *longjmp()*  
 42642 and *setjmp()*, since their effect on the signal mask is unspecified, but should instead use the  
 42643 *siglongjmp()* and *sigsetjmp()* functions (which can save and restore the signal mask under  
 42644 application control).

42645 It is recommended that applications do not call *longjmp()* or *siglongjmp()* from signal handlers. +  
 42646 To avoid undefined behavior when calling these functions from a signal handler, the application +

|       |                                                                                                                    |   |
|-------|--------------------------------------------------------------------------------------------------------------------|---|
| 42647 | needs to ensure one of the following two things:                                                                   | + |
| 42648 | 1. After the call to <i>longjmp()</i> or <i>siglongjmp()</i> the process only calls async-signal-safe              | + |
| 42649 | functions and does not return from the initial call to <i>main()</i> .                                             | + |
| 42650 | 2. Any signal whose handler calls <i>longjmp()</i> or <i>siglongjmp()</i> is blocked during <i>every</i> call to a | + |
| 42651 | non-async-signal-safe function, and no such calls are made after returning from the initial                        | + |
| 42652 | call to <i>main()</i> .                                                                                            | + |
| 42653 | <b>RATIONALE</b>                                                                                                   |   |
| 42654 | None.                                                                                                              |   |
| 42655 | <b>FUTURE DIRECTIONS</b>                                                                                           |   |
| 42656 | None.                                                                                                              |   |
| 42657 | <b>SEE ALSO</b>                                                                                                    |   |
| 42658 | <i>setjmp()</i> , <i>sigaction()</i> , <i>siglongjmp()</i> , <i>sigsetjmp()</i>                                    |   |
| 42659 | XBD <setjmp.h>                                                                                                     |   |
| 42660 | <b>CHANGE HISTORY</b>                                                                                              |   |
| 42661 | First released in Issue 1. Derived from Issue 1 of the SVID.                                                       |   |
| 42662 | <b>Issue 5</b>                                                                                                     |   |
| 42663 | The DESCRIPTION is updated for alignment with the POSIX Threads Extension.                                         |   |
| 42664 | <b>Issue 6</b>                                                                                                     |   |
| 42665 | Extensions beyond the ISO C standard are marked.                                                                   |   |
| 42666 | The following new requirements on POSIX implementations derive from alignment with the                             |   |
| 42667 | Single UNIX Specification:                                                                                         |   |
| 42668 | • The DESCRIPTION now explicitly makes <i>longjmp()</i> 's effect on the signal mask                               |   |
| 42669 | unspecified.                                                                                                       |   |
| 42670 | The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.                                      |   |
| 42671 | <b>Issue 7</b>                                                                                                     |   |
| 42672 | POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0365 [394] is applied.                                         |   |

42673 **NAME**

42674 lrand48 — generate uniformly distributed pseudo-random non-negative long integers

42675 **SYNOPSIS**

```
42676 XSI      #include <stdlib.h>  
42677          long lrand48(void);
```

42678 **DESCRIPTION**42679 Refer to *drand48()*.

42680 **NAME**

42681 lrint, lrintf, lrintl — round to nearest integer value using current rounding direction

42682 **SYNOPSIS**

```
42683 #include <math.h>
42684 long lrint(double x);
42685 long lrintf(float x);
42686 long lrintl(long double x);
```

42687 **DESCRIPTION**

42688 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 42689 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42690 volume of POSIX.1-2008 defers to the ISO C standard.

42691 These functions shall round their argument to the nearest integer value, rounding according to  
 42692 the current rounding direction.

42693 An application wishing to check for error situations should set *errno* to zero and call  
 42694 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 42695 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 42696 zero, an error has occurred.

42697 **RETURN VALUE**

42698 Upon successful completion, these functions shall return the rounded integer value.

42699 MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.

42700 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

42701 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

42702 If the correct value is positive and too large to represent as a **long**, an unspecified value shall be  
 42703 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall  
 42704 CX occur; otherwise, a domain error may occur.

42705 If the correct value is negative and too large to represent as a **long**, an unspecified value shall be  
 42706 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall  
 42707 CX occur; otherwise, a domain error may occur.

42708 **ERRORS**

42709 These functions shall fail if:

42710 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
 42711 integer.

42712 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 42713 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 42714 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 42715 shall be raised.

42716 These functions may fail if:

42717 **Domain Error** The correct value is not representable as an integer.

42718 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 42719 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 42720 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 42721 shall be raised.

**42722 EXAMPLES**

42723 None.

**42724 APPLICATION USAGE**

42725 On error, the expressions *(math\_errhandling & MATH\_ERRNO)* and *(math\_errhandling &*  
42726 *MATH\_ERREXCEPT)* are independent of each other, but at least one of them must be non-zero.

**42727 RATIONALE**

42728 These functions provide floating-to-integer conversions. They round according to the current  
42729 rounding direction. If the rounded value is outside the range of the return type, the numeric  
42730 result is unspecified and the invalid floating-point exception is raised. When they raise no other  
42731 floating-point exception and the result differs from the argument, they raise the inexact floating-  
42732 point exception.

**42733 FUTURE DIRECTIONS**

42734 None.

**42735 SEE ALSO**

42736 *feclearexcept()*, *fetestexcept()*, *llrint()*

42737 XBD Section 4.20 (on page 117), *<math.h>*

**42738 CHANGE HISTORY**

42739 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

**42740 Issue 7**

42741 ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #53 (SD5-XSH-ERN-77) is applied.

42742 **NAME**

42743 lround, lroundf, lroundl — round to nearest integer value

42744 **SYNOPSIS**

```
42745 #include <math.h>
42746 long lround(double x);
42747 long lroundf(float x);
42748 long lroundl(long double x);
```

42749 **DESCRIPTION**

42750 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 42751 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42752 volume of POSIX.1-2008 defers to the ISO C standard.

42753 These functions shall round their argument to the nearest integer value, rounding halfway cases  
 42754 away from zero, regardless of the current rounding direction.

42755 An application wishing to check for error situations should set *errno* to zero and call  
 42756 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 42757 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 42758 zero, an error has occurred.

42759 **RETURN VALUE**

42760 Upon successful completion, these functions shall return the rounded integer value.

42761 MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.

42762 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

42763 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

42764 If the correct value is positive and too large to represent as a **long**, an unspecified value shall be  
 42765 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain shall occur;  
 42766 CX otherwise, a domain error may occur.

42767 If the correct value is negative and too large to represent as a **long**, an unspecified value shall be  
 42768 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain shall occur;  
 42769 CX otherwise, a domain error may occur.

42770 **ERRORS**

42771 These functions shall fail if:

42772 MX **Domain Error** The *x* argument is NaN or  $\pm\text{Inf}$ , or the correct value is not representable as an  
 42773 integer.

42774 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 42775 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 42776 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 42777 shall be raised.

42778 These functions may fail if:

42779 **Domain Error** The correct value is not representable as an integer.

42780 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 42781 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 42782 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 42783 shall be raised.

42784 **EXAMPLES**

42785 None.

42786 **APPLICATION USAGE**

42787 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 42788 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

42789 **RATIONALE**

42790 These functions differ from the *lrint()* functions in the default rounding direction, with the  
 42791 *lround()* functions rounding halfway cases away from zero and needing not to raise the inexact  
 42792 floating-point exception for non-integer arguments that round to within the range of the return  
 42793 type.

42794 **FUTURE DIRECTIONS**

42795 None.

42796 **SEE ALSO**42797 *feclearexcept()*, *fetestexcept()*, *llround()*

42798 XBD Section 4.20 (on page 117), &lt;math.h&gt;

42799 **CHANGE HISTORY**

42800 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

42801 **Issue 7**

42802 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #54 (SD5-XSH-ERN-78) is applied.

42803 **NAME**

42804 lsearch, lfind — linear search and update

42805 **SYNOPSIS**

```

42806 XSI #include <search.h>
42807 void *lsearch(const void *key, void *base, size_t *nel, size_t width,
42808             int (*compar)(const void *, const void *));
42809 void *lfind(const void *key, const void *base, size_t *nel,
42810            size_t width, int (*compar)(const void *, const void *));

```

42811 **DESCRIPTION**

42812 The *lsearch()* function shall linearly search the table and return a pointer into the table for the  
 42813 matching entry. If the entry does not occur, it shall be added at the end of the table. The *key*  
 42814 argument points to the entry to be sought in the table. The *base* argument points to the first  
 42815 element in the table. The *width* argument is the size of an element in bytes. The *nel* argument  
 42816 points to an integer containing the current number of elements in the table. The integer to which  
 42817 *nel* points shall be incremented if the entry is added to the table. The *compar* argument points to  
 42818 a comparison function which the application shall supply (for example, *strcmp()*). It is called  
 42819 with two arguments that point to the elements being compared. The application shall ensure  
 42820 that the function returns 0 if the elements are equal, and non-zero otherwise.

42821 The *lfind()* function shall be equivalent to *lsearch()*, except that if the entry is not found, it is not  
 42822 added to the table. Instead, a null pointer is returned.

42823 **RETURN VALUE**

42824 If the searched for entry is found, both *lsearch()* and *lfind()* shall return a pointer to it.  
 42825 Otherwise, *lfind()* shall return a null pointer and *lsearch()* shall return a pointer to the newly  
 42826 added element.

42827 Both functions shall return a null pointer in case of error.

42828 **ERRORS**

42829 No errors are defined.

42830 **EXAMPLES**42831 **Storing Strings in a Table**

42832 This fragment reads in less than or equal to TABSIZE strings of length less than or equal to  
 42833 ELSIZE and stores them in a table, eliminating duplicates.

```

42834 #include <stdio.h>
42835 #include <string.h>
42836 #include <search.h>
42837 #define TABSIZE 50
42838 #define ELSIZE 120
42839 ...
42840     char line[ELSIZE], tab[TABSIZE][ELSIZE];
42841     size_t nel = 0;
42842     ...
42843     while (fgets(line, ELSIZE, stdin) != NULL && nel < TABSIZE)
42844         (void) lsearch(line, tab, &nel,
42845                       ELSIZE, (int (*)(const void *, const void *)) strcmp);
42846     ...

```

**Finding a Matching Entry**

The following example finds any line that reads "This is a test.".

```
#include <search.h>
#include <string.h>
...
char line[ELSIZE], tab[TABSIZE][ELSIZE];
size_t nel = 0;
char *findline;
void *entry;

findline = "This is a test.\n";

entry = lfind(findline, tab, &nel, ELSIZE, (
    int (*)(const void *, const void *)) strcmp);
```

**APPLICATION USAGE**

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

Undefined results can occur if there is not enough room in the table to add a new item.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*hcreate(), tdelete()*

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

The normative text is updated to avoid use of the term “must” for application requirements.

42874 **NAME**

42875 lseek — move the read/write file offset

42876 **SYNOPSIS**

42877 #include &lt;unistd.h&gt;

42878 off\_t lseek(int *fildev*, off\_t *offset*, int *whence*);42879 **DESCRIPTION**42880 The *lseek()* function shall set the file offset for the open file description associated with the file  
42881 descriptor *fildev*, as follows:

- 42882 • If *whence* is SEEK\_SET, the file offset shall be set to *offset* bytes.
- 42883 • If *whence* is SEEK\_CUR, the file offset shall be set to its current location plus *offset*.
- 42884 • If *whence* is SEEK\_END, the file offset shall be set to the size of the file plus *offset*.

42885 The symbolic constants SEEK\_SET, SEEK\_CUR, and SEEK\_END are defined in &lt;unistd.h&gt;.

42886 The behavior of *lseek()* on devices which are incapable of seeking is implementation-defined.  
42887 The value of the file offset associated with such a device is undefined.42888 The *lseek()* function shall allow the file offset to be set beyond the end of the existing data in the  
42889 file. If data is later written at this point, subsequent reads of data in the gap shall return bytes  
42890 with the value 0 until data is actually written into the gap.42891 The *lseek()* function shall not, by itself, extend the size of a file.42892 SHM If *fildev* refers to a shared memory object, the result of the *lseek()* function is unspecified.42893 TYM If *fildev* refers to a typed memory object, the result of the *lseek()* function is unspecified.42894 **RETURN VALUE**42895 Upon successful completion, the resulting offset, as measured in bytes from the beginning of the  
42896 file, shall be returned. Otherwise, -1 shall be returned, *errno* shall be set to indicate the error, and  
42897 the file offset shall remain unchanged.42898 **ERRORS**42899 The *lseek()* function shall fail if:

- |       |             |                                                                                                                                                        |
|-------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 42900 | [EBADF]     | The <i>fildev</i> argument is not an open file descriptor.                                                                                             |
| 42901 | [EINVAL]    | The <i>whence</i> argument is not a proper value, or the resulting file offset would be negative for a regular file, block special file, or directory. |
| 42902 |             |                                                                                                                                                        |
| 42903 | [EOVERFLOW] | The resulting file offset would be a value which cannot be represented correctly in an object of type <b>off_t</b> .                                   |
| 42904 |             |                                                                                                                                                        |
| 42905 | [ESPIPE]    | The <i>fildev</i> argument is associated with a pipe, FIFO, or socket.                                                                                 |

42906 **EXAMPLES**

42907 None.

42908 **APPLICATION USAGE**

42909 None.

42910 **RATIONALE**42911 The ISO C standard includes the functions *fgetpos()* and *fsetpos()*, which work on very large files  
42912 by use of a special positioning type.42913 Although *lseek()* may position the file offset beyond the end of the file, this function does not  
42914 itself extend the size of the file. While the only function in POSIX.1-2008 that may directly extend

the size of the file is *write()*, *truncate()*, and *ftruncate()*, several functions originally derived from the ISO C standard, such as *fwrite()*, *fprintf()*, and so on, may do so (by causing calls on *write()*).

An invalid file offset that would cause [EINVAL] to be returned may be both implementation-defined and device-dependent (for example, memory may have few invalid values). A negative file offset may be valid for some devices in some implementations.

The POSIX.1-1990 standard did not specifically prohibit *lseek()* from returning a negative offset. Therefore, an application was required to clear *errno* prior to the call and check *errno* upon return to determine whether a return value of (**off\_t**)-1 is a negative offset or an indication of an error condition. The standard developers did not wish to require this action on the part of a conforming application, and chose to require that *errno* be set to [EINVAL] when the resulting file offset would be negative for a regular file, block special file, or directory.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

*open()*

XBD [`<sys/types.h>`](#), [`<unistd.h>`](#)

#### CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

##### Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

##### Issue 6

In the SYNOPSIS, the optional include of the [`<sys/types.h>`](#) header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include [`<sys/types.h>`](#) has been removed. Although [`<sys/types.h>`](#) was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EOVERFLOW] error condition is added. This change is to support large files.

An additional [ESPIPE] error condition is added for sockets.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *lseek()* results are unspecified for typed memory objects.

##### Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0366 [421] is applied.

42949 **NAME**

42950       lstat — get file status

42951 **SYNOPSIS**

42952       #include &lt;sys/stat.h&gt;

42953       int lstat(const char \*restrict *path*, struct stat \*restrict *buf*);42954 **DESCRIPTION**42955       Refer to *fstatat()*.

42956 **NAME**

42957        malloc — a memory allocator

42958 **SYNOPSIS**

42959        #include &lt;stdlib.h&gt;

42960        void \*malloc(size\_t size);

42961 **DESCRIPTION**

42962 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
 42963            conflict between the requirements described here and the ISO C standard is unintentional. This  
 42964            volume of POSIX.1-2008 defers to the ISO C standard.

42965        The *malloc()* function shall allocate unused space for an object whose size in bytes is specified by  
 42966        *size* and whose value is unspecified.

42967        The order and contiguity of storage allocated by successive calls to *malloc()* is unspecified. The  
 42968        pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to  
 42969        a pointer to any type of object and then used to access such an object in the space allocated (until  
 42970        the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object  
 42971        disjoint from any other object. The pointer returned points to the start (lowest byte address) of  
 42972        the allocated space. If the space cannot be allocated, a null pointer shall be returned. If the size of  
 42973        the space requested is 0, the behavior is implementation-defined: either a null pointer shall be  
 42974        returned, or the behavior shall be as if the size were some non-zero value, except that the  
 42975        behavior is undefined if the returned pointer is used to access an object.

42976 **RETURN VALUE**

42977        Upon successful completion with *size* not equal to 0, *malloc()* shall return a pointer to the  
 42978        allocated space. If *size* is 0, either:

- 42979 CX        • A null pointer shall be returned and *errno* may be set to an implementation-defined value,  
 42980            or  
 42981            • A pointer to the allocated space shall be returned. The application shall ensure that the  
 42982            pointer is not used to access an object.

42983 CX        Otherwise, it shall return a null pointer and set *errno* to indicate the error.

42984 **ERRORS**42985        The *malloc()* function shall fail if:

42986 CX        [ENOMEM]        Insufficient storage space is available.

42987 **EXAMPLES**

42988        None.

42989 **APPLICATION USAGE**

42990        None.

42991 **RATIONALE**

42992        None.

42993 **FUTURE DIRECTIONS**

42994        None.

42995 **SEE ALSO**42996        *calloc()*, *free()*, *getrlimit()*, *posix\_memalign()*, *realloc()*

42997        XBD &lt;stdlib.h&gt;

42998 **CHANGE HISTORY**

42999 First released in Issue 1. Derived from Issue 1 of the SVID.

43000 **Issue 6**

43001 Extensions beyond the ISO C standard are marked.

43002 The following new requirements on POSIX implementations derive from alignment with the  
43003 Single UNIX Specification:

- 43004
- In the RETURN VALUE section, the requirement to set *errno* to indicate an error is added.
  - The [ENOMEM] error condition is added.
- 43005

43006 **NAME**

43007       mblen — get number of bytes in a character

43008 **SYNOPSIS**

43009       #include &lt;stdlib.h&gt;

43010       int mblen(const char \*s, size\_t n);

43011 **DESCRIPTION**

43012 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 43013 conflict between the requirements described here and the ISO C standard is unintentional. This  
 43014 volume of POSIX.1-2008 defers to the ISO C standard.

43015       If *s* is not a null pointer, *mblen()* shall determine the number of bytes constituting the character  
 43016 pointed to by *s*. Except that the shift state of *mbtowc()* is not affected, it shall be equivalent to:

43017       mbtowc((wchar\_t \*)0, s, n);

43018       The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
 43019 *mblen()*.

43020       The behavior of this function is affected by the *LC\_CTYPE* category of the current locale. For a  
 43021 state-dependent encoding, this function shall be placed into its initial state by a call for which its  
 43022 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null  
 43023 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a  
 43024 null pointer shall cause this function to return a non-zero value if encodings have state  
 43025 dependency, and 0 otherwise. If the implementation employs special bytes to change the shift  
 43026 state, these bytes shall not produce separate wide-character codes, but shall be grouped with an  
 43027 adjacent character. Changing the *LC\_CTYPE* category causes the shift state of this function to be  
 43028 unspecified.

43029 CX       The *mblen()* function need not be thread-safe.

43030 **RETURN VALUE**

43031       If *s* is a null pointer, *mblen()* shall return a non-zero or 0 value, if character encodings,  
 43032 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mblen()* shall  
 43033 either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the  
 43034 character (if the next *n* or fewer bytes form a valid character), or return -1 (if they do not form a  
 43035 CX       valid character) and may set *errno* to indicate the error. In no case shall the value returned be  
 43036 greater than *n* or the value of the {MB\_CUR\_MAX} macro.

43037 **ERRORS**43038       The *mblen()* function may fail if:

43039 CX       [EILSEQ]       An invalid character sequence is detected. In the POSIX locale an [EILSEQ]  
 43040 error cannot occur since all byte values are valid characters.

43041 **EXAMPLES**

43042       None.

43043 **APPLICATION USAGE**

43044       None.

43045 **RATIONALE**

43046       None.

43047 **FUTURE DIRECTIONS**

43048 None.

43049 **SEE ALSO**43050 *mbtowc()*, *mbstowcs()*, *wctomb()*, *wcstombs()*43051 XBD **<stdlib.h>**43052 **CHANGE HISTORY**

43053 First released in Issue 4. Aligned with the ISO C standard.

43054 **Issue 7**

43055 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0367 [109] is applied.

43056 **NAME**43057 `mbrlen` — get number of bytes in a character (restartable)43058 **SYNOPSIS**43059 `#include <wchar.h>`

43060 `size_t mbrlen(const char *restrict s, size_t n,`  
 43061 `mbstate_t *restrict ps);`

43062 **DESCRIPTION**

43063 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 43064 conflict between the requirements described here and the ISO C standard is unintentional. This  
 43065 volume of POSIX.1-2008 defers to the ISO C standard.

43066 If *s* is not a null pointer, `mbrlen()` shall determine the number of bytes constituting the character  
 43067 pointed to by *s*. It shall be equivalent to:

43068 `mbstate_t internal;`  
 43069 `mbrtowc(NULL, s, n, ps != NULL ? ps : &internal);`

43070 If *ps* is a null pointer, the `mbrlen()` function shall use its own internal **mbstate\_t** object, which is  
 43071 initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t** object  
 43072 pointed to by *ps* shall be used to completely describe the current conversion state of the  
 43073 associated character sequence. The implementation shall behave as if no function defined in this  
 43074 volume of POSIX.1-2008 calls `mbrlen()`.

43075 The behavior of this function is affected by the `LC_CTYPE` category of the current locale.

43076 CX The `mbrlen()` function need not be thread-safe if called with a NULL *ps* argument.

43077 The `mbrlen()` function shall not change the setting of `errno` if successful.

43078 **RETURN VALUE**

43079 The `mbrlen()` function shall return the first of the following that applies:

43080 0 If the next *n* or fewer bytes complete the character that corresponds to the null  
 43081 wide character.

43082 *positive* If the next *n* or fewer bytes complete a valid character; the value returned shall  
 43083 be the number of bytes that complete the character.

43084 **(size\_t)–2** If the next *n* bytes contribute to an incomplete but potentially valid character,  
 43085 and all *n* bytes have been processed. When *n* has at least the value of the  
 43086 {MB\_CUR\_MAX} macro, this case can only occur if *s* points at a sequence of  
 43087 redundant shift sequences (for implementations with state-dependent  
 43088 encodings).

43089 **(size\_t)–1** If an encoding error occurs, in which case the next *n* or fewer bytes do not  
 43090 contribute to a complete and valid character. In this case, [EILSEQ] shall be  
 43091 stored in `errno` and the conversion state is undefined.

43092 **ERRORS**

43093 The `mbrlen()` function shall fail if:

43094 CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ] +  
 43095 error cannot occur since all byte values are valid characters.

43096 The `mbrlen()` function may fail if:

43097 [EINVAL] *ps* points to an object that contains an invalid conversion state.

43098 **EXAMPLES**

43099 None.

43100 **APPLICATION USAGE**

43101 None.

43102 **RATIONALE**

43103 None.

43104 **FUTURE DIRECTIONS**

43105 None.

43109 **CHANGE HISTORY**

43110 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
43111 (E).

43112 **Issue 6**

43113 The *mbrlen()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

43114 **Issue 7**

43115 Austin Group Interpretation 1003.1-2001 #170 is applied.

43116 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0368 [109,105] is applied.

**NAME**

`mbrtowc` — convert a character to a wide-character code (restartable)

**SYNOPSIS**

```
#include <wchar.h>
```

```
size_t mbrtowc(wchar_t *restrict pwc, const char *restrict s,
               size_t n, mbstate_t *restrict ps);
```

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

If *s* is a null pointer, the `mbrtowc()` function shall be equivalent to the call:

```
mbrtowc(NULL, "", 1, ps)
```

In this case, the values of the arguments *pwc* and *n* are ignored.

If *s* is not a null pointer, the `mbrtowc()` function shall inspect at most *n* bytes beginning at the byte pointed to by *s* to determine the number of bytes needed to complete the next character (including any shift sequences). If the function determines that the next character is completed, it shall determine the value of the corresponding wide character and then, if *pwc* is not a null pointer, shall store that value in the object pointed to by *pwc*. If the corresponding wide character is the null wide character, the resulting state described shall be the initial conversion state.

If *ps* is a null pointer, the `mbrtowc()` function shall use its own internal `mbstate_t` object, which shall be initialized at program start-up to the initial conversion state. Otherwise, the `mbstate_t` object pointed to by *ps* shall be used to completely describe the current conversion state of the associated character sequence. The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls `mbrtowc()`.

The behavior of this function is affected by the `LC_CTYPE` category of the current locale.

The `mbrtowc()` function need not be thread-safe if called with a NULL *ps* argument.

The `mbrtowc()` function shall not change the setting of *errno* if successful.

**RETURN VALUE**

The `mbrtowc()` function shall return the first of the following that applies:

0 If the next *n* or fewer bytes complete the character that corresponds to the null wide character (which is the value stored).

between 1 and *n* inclusive

If the next *n* or fewer bytes complete a valid character (which is the value stored); the value returned shall be the number of bytes that complete the character.

(`size_t`)−2

If the next *n* bytes contribute to an incomplete but potentially valid character, and all *n* bytes have been processed (no value is stored). When *n* has at least the value of the `{MB_CUR_MAX}` macro, this case can only occur if *s* points at a sequence of redundant shift sequences (for implementations with state-dependent encodings).

(`size_t`)−1

If an encoding error occurs, in which case the next *n* or fewer bytes do not contribute to a complete and valid character (no value is stored). In this case, `[EILSEQ]` shall be stored in *errno* and the conversion state is undefined.

43161 **ERRORS**43162 The *mbrtowc*() function shall fail if:

43163 CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ] +  
43164 error cannot occur since all byte values are valid characters.

43165 The *mbrtowc*() function may fail if:

43166 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

43167 **EXAMPLES**

43168 None.

43169 **APPLICATION USAGE**

43170 None.

43171 **RATIONALE**

43172 None.

43173 **FUTURE DIRECTIONS**

43174 None.

43175 **SEE ALSO**43176 *mbsinit()*, *mbsrtowcs()*

43177 XBD &lt;wchar.h&gt;

43178 **CHANGE HISTORY**

43179 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
43180 (E).

43181 **Issue 6**43182 The *mbrtowc*() prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

43183 The following new requirements on POSIX implementations derive from alignment with the  
43184 Single UNIX Specification:

- 43185 • The [EINVAL] error condition is added.

43186 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

43187 **Issue 7**

43188 Austin Group Interpretation 1003.1-2001 #170 is applied.

43189 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0369 [109,105] is applied.

43190 **NAME**

43191       mbsinit — determine conversion object status

43192 **SYNOPSIS**

43193       #include &lt;wchar.h&gt;

43194       int mbsinit(const mbstate\_t \*ps);

43195 **DESCRIPTION**

43196 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 43197 conflict between the requirements described here and the ISO C standard is unintentional. This  
 43198 volume of POSIX.1-2008 defers to the ISO C standard.

43199       If *ps* is not a null pointer, the *mbsinit()* function shall determine whether the object pointed to by  
 43200 *ps* describes an initial conversion state.

43201 **RETURN VALUE**

43202       The *mbsinit()* function shall return non-zero if *ps* is a null pointer, or if the pointed-to object  
 43203 describes an initial conversion state; otherwise, it shall return zero.

43204       If an **mbstate\_t** object is altered by any of the functions described as “restartable”, and is then  
 43205 used with a different character sequence, or in the other conversion direction, or with a different  
 43206 *LC\_CTYPE* category setting than on earlier function calls, the behavior is undefined.

43207 **ERRORS**

43208       No errors are defined.

43209 **EXAMPLES**

43210       None.

43211 **APPLICATION USAGE**

43212       The **mbstate\_t** object is used to describe the current conversion state from a particular character  
 43213 sequence to a wide-character sequence (or *vice versa*) under the rules of a particular setting of the  
 43214 *LC\_CTYPE* category of the current locale.

43215       The initial conversion state corresponds, for a conversion in either direction, to the beginning of  
 43216 a new character sequence in the initial shift state. A zero valued **mbstate\_t** object is at least one  
 43217 way to describe an initial conversion state. A zero valued **mbstate\_t** object can be used to initiate  
 43218 conversion involving any character sequence, in any *LC\_CTYPE* category setting.

43219 **RATIONALE**

43220       None.

43221 **FUTURE DIRECTIONS**

43222       None.

43223 **SEE ALSO**43224       *mbrlen()*, *mbrtowc()*, *mbstowcs()*, *wcrtomb()*, *wcsrtombs()*

43225       XBD &lt;wchar.h&gt;

43226 **CHANGE HISTORY**

43227       First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 43228 (E).

## 43229 NAME

43230 mbsnrtowcs, mbsrtowcs — convert a character string to a wide-character string (restartable)

## 43231 SYNOPSIS

43232 #include &lt;wchar.h&gt;

```
43233 CX size_t mbsnrtowcs(wchar_t *restrict dst, const char **restrict src,
43234 size_t nmc, size_t len, mbstate_t *restrict ps);
43235 size_t mbsrtowcs(wchar_t *restrict dst, const char **restrict src,
43236 size_t len, mbstate_t *restrict ps);
```

## 43237 DESCRIPTION

43238 CX For *mbsrtowcs()*: The functionality described on this reference page is aligned with the ISO C  
 43239 standard. Any conflict between the requirements described here and the ISO C standard is  
 43240 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

43241 The *mbsrtowcs()* function shall convert a sequence of characters, beginning in the conversion  
 43242 state described by the object pointed to by *ps*, from the array indirectly pointed to by *src* into a  
 43243 sequence of corresponding wide characters. If *dst* is not a null pointer, the converted characters  
 43244 shall be stored into the array pointed to by *dst*. Conversion continues up to and including a  
 43245 terminating null character, which shall also be stored. Conversion shall stop early in either of the  
 43246 following cases:

- 43247 • A sequence of bytes is encountered that does not form a valid character.
- 43248 • *len* codes have been stored into the array pointed to by *dst* (and *dst* is not a null pointer).

43249 Each conversion shall take place as if by a call to the *mbrtowc()* function.

43250 If *dst* is not a null pointer, the pointer object pointed to by *src* shall be assigned either a null  
 43251 pointer (if conversion stopped due to reaching a terminating null character) or the address just  
 43252 past the last character converted (if any). If conversion stopped due to reaching a terminating  
 43253 null character, and if *dst* is not a null pointer, the resulting state described shall be the initial  
 43254 conversion state.

43255 If *ps* is a null pointer, the *mbsrtowcs()* function shall use its own internal **mbstate\_t** object, which  
 43256 is initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t** object  
 43257 pointed to by *ps* shall be used to completely describe the current conversion state of the  
 43258 associated character sequence.

43259 CX The *mbsnrtowcs()* function shall be equivalent to the *mbsrtowcs()* function, except that the  
 43260 conversion of characters indirectly pointed to by *src* is limited to at most *nmc* bytes (the size of  
 43261 the input buffer), and under conditions where *mbsrtowcs()* would assign the address just past  
 43262 the last character converted (if any) to the pointer object pointed to by *src*, *mbsnrtowcs()* shall  
 43263 instead assign the address just past the last byte processed (if any) to that pointer object. If the  
 43264 input buffer ends with an incomplete character, it is unspecified whether conversion stops at the  
 43265 end of the previous character (if any), or at the end of the input buffer. In the latter case, a  
 43266 subsequent call to *mbsnrtowcs()* with an input buffer that starts with the remainder of the  
 43267 incomplete character shall correctly complete the conversion of that character.

43268 The behavior of these functions shall be affected by the *LC\_CTYPE* category of the current locale.

43269 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
 43270 these functions.

43271 CX The *mbsnrtowcs()* and *mbsrtowcs()* functions need not be thread-safe if called with a NULL *ps*  
 43272 argument.

43273 The *mbsrtowcs()* function shall not change the setting of *errno* if successful.

43274 **RETURN VALUE**

43275 If the input conversion encounters a sequence of bytes that do not form a valid character, an  
 43276 encoding error occurs. In this case, these functions shall store the value of the macro [EILSEQ] in  
 43277 *errno* and shall return (**size\_t**)−1; the conversion state is undefined. Otherwise, these functions  
 43278 shall return the number of characters successfully converted, not including the terminating null  
 43279 (if any).

43280 **ERRORS**

43281 These functions shall fail if:

43282 CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ] +  
 43283 error cannot occur since all byte values are valid characters.

43284 These functions may fail if:

43285 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

43286 **EXAMPLES**

43287 None.

43288 **APPLICATION USAGE**

43289 None.

43290 **RATIONALE**

43291 None.

43292 **FUTURE DIRECTIONS**

43293 A future version may require that when the input buffer ends with an incomplete character, |  
 43294 conversion stops at the end of the input buffer.

43295 **SEE ALSO**

43296 *iconv()*, *mbrtowc()*, *mbsinit()*

43297 XBD <wchar.h>

43298 **CHANGE HISTORY**

43299 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 43300 (E).

43301 **Issue 6**

43302 The *mbsrtowcs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

43303 The [EINVAL] error condition is marked CX.

43304 **Issue 7**

43305 Austin Group Interpretation 1003.1-2001 #170 is applied.

43306 The *mbsnrtowcs()* function is added from The Open Group Technical Standard, 2006, Extended  
 43307 API Set Part 1.

43308 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0370 [109,105] is applied.

43309 **NAME**

43310 mbstowcs — convert a character string to a wide-character string

43311 **SYNOPSIS**

43312 #include &lt;stdlib.h&gt;

43313 size\_t mbstowcs(wchar\_t \*restrict pwcs, const char \*restrict s,  
43314 size\_t n);43315 **DESCRIPTION**43316 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
43317 conflict between the requirements described here and the ISO C standard is unintentional. This  
43318 volume of POSIX.1-2008 defers to the ISO C standard.43319 The *mbstowcs()* function shall convert a sequence of characters that begins in the initial shift  
43320 state from the array pointed to by *s* into a sequence of corresponding wide-character codes and  
43321 shall store not more than *n* wide-character codes into the array pointed to by *pwcs*. No  
43322 characters that follow a null byte (which is converted into a wide-character code with value 0)  
43323 shall be examined or converted. Each character shall be converted as if by a call to *mbtowc()*,  
43324 except that the shift state of *mbtowc()* is not affected.43325 No more than *n* elements shall be modified in the array pointed to by *pwcs*. If copying takes  
43326 place between objects that overlap, the behavior is undefined.43327 XSI The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.  
43328 If *pwcs* is a null pointer, *mbstowcs()* shall return the length required to convert the entire array  
43329 regardless of the value of *n*, but no values are stored.43330 **RETURN VALUE**43331 CX If an invalid character is encountered, *mbstowcs()* shall return (size\_t)-1 and shall set *errno* to  
43332 indicate the error.43333 XSI Otherwise, *mbstowcs()* shall return the number of the array elements modified (or required if  
43334 *pwcs* is null), not including a terminating 0 code, if any. The array shall not be zero-terminated if  
43335 the value returned is *n*.43336 **ERRORS**43337 The *mbstowcs()* function shall fail if:43338 CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ]  
43339 error cannot occur since all byte values are valid characters.43340 **EXAMPLES**

43341 None.

43342 **APPLICATION USAGE**

43343 None.

43350 XBD &lt;stdlib.h&gt;

43351 **CHANGE HISTORY**

43352 First released in Issue 4. Aligned with the ISO C standard.

43353 **Issue 6**43354 The *mbstowcs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

43355 Extensions beyond the ISO C standard are marked.

43356 **Issue 7**

43357 Austin Group Interpretation 1003.1-2001 #170 is applied.

43358 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0371 [195] is applied.

43359 **NAME**

43360 mbtowc — convert a character to a wide-character code

43361 **SYNOPSIS**

43362 #include &lt;stdlib.h&gt;

43363 int mbtowc(wchar\_t \*restrict *pwc*, const char \*restrict *s*, size\_t *n*);43364 **DESCRIPTION**

43365 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 43366 conflict between the requirements described here and the ISO C standard is unintentional. This  
 43367 volume of POSIX.1-2008 defers to the ISO C standard.

43368 If *s* is not a null pointer, *mbtowc*() shall determine the number of bytes that constitute the  
 43369 character pointed to by *s*. It shall then determine the wide-character code for the value of type  
 43370 **wchar\_t** that corresponds to that character. (The value of the wide-character code corresponding  
 43371 to the null byte is 0.) If the character is valid and *pwc* is not a null pointer, *mbtowc*() shall store  
 43372 the wide-character code in the object pointed to by *pwc*.

43373 The behavior of this function is affected by the *LC\_CTYPE* category of the current locale. For a  
 43374 state-dependent encoding, this function is placed into its initial state by a call for which its  
 43375 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null  
 43376 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a  
 43377 null pointer shall cause this function to return a non-zero value if encodings have state  
 43378 dependency, and 0 otherwise. If the implementation employs special bytes to change the shift  
 43379 state, these bytes shall not produce separate wide-character codes, but shall be grouped with an  
 43380 adjacent character. Changing the *LC\_CTYPE* category causes the shift state of this function to be  
 43381 unspecified. At most *n* bytes of the array pointed to by *s* shall be examined.

43382 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
 43383 *mbtowc*()).

43384 CX The *mbtowc*() function need not be thread-safe.

43385 **RETURN VALUE**

43386 If *s* is a null pointer, *mbtowc*() shall return a non-zero or 0 value, if character encodings,  
 43387 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mbtowc*()  
 43388 shall either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the  
 43389 CX converted character (if the next *n* or fewer bytes form a valid character), or return -1 and shall  
 43390 set *errno* to indicate the error (if they do not form a valid character).

43391 In no case shall the value returned be greater than *n* or the value of the {MB\_CUR\_MAX} macro.

43392 **ERRORS**

43393 The *mbtowc*() function shall fail if:

43394 CX [EILSEQ] An invalid character sequence is detected. In the POSIX locale an [EILSEQ]  
 43395 error cannot occur since all byte values are valid characters.

43396 **EXAMPLES**

43397 None.

43398 **APPLICATION USAGE**

43399 None.

43400 **RATIONALE**

43406 XBD &lt;stdlib.h&gt;

43407 **CHANGE HISTORY**

43408 First released in Issue 4. Aligned with the ISO C standard.

43409 **Issue 6**43410 The *mbtowc()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

43411 Extensions beyond the ISO C standard are marked.

43412 **Issue 7**

43413 Austin Group Interpretation 1003.1-2001 #170 is applied.

43414 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0372 [109] and XSH/TC1-2008/0373  
43415 [195] are applied.

43416 **NAME**

43417 memccpy — copy bytes in memory

43418 **SYNOPSIS**

```
43419 XSI      #include <string.h>
43420          void *memccpy(void *restrict s1, const void *restrict s2,
43421                        int c, size_t n);
```

43422 **DESCRIPTION**

43423 The *memccpy()* function shall copy bytes from memory area *s2* into *s1*, stopping after the first  
43424 occurrence of byte *c* (converted to an **unsigned char**) is copied, or after *n* bytes are copied,  
43425 whichever comes first. If copying takes place between objects that overlap, the behavior is  
43426 undefined.

43427 **RETURN VALUE**

43428 The *memccpy()* function shall return a pointer to the byte after the copy of *c* in *s1*, or a null  
43429 pointer if *c* was not found in the first *n* bytes of *s2*.

43430 **ERRORS**

43431 No errors are defined.

43432 **EXAMPLES**

43433 None.

43434 **APPLICATION USAGE**43435 The *memccpy()* function does not check for the overflow of the receiving memory area.43436 **RATIONALE**

43437 None.

43438 **FUTURE DIRECTIONS**

43439 None.

43440 **SEE ALSO**43441 XBD [<string.h>](#)43442 **CHANGE HISTORY**

43443 First released in Issue 1. Derived from Issue 1 of the SVID.

43444 **Issue 6**

43445 The **restrict** keyword is added to the *memccpy()* prototype for alignment with the  
43446 ISO/IEC 9899:1999 standard.

43447 **NAME**

43448 memchr — find byte in memory

43449 **SYNOPSIS**

43450 #include &lt;string.h&gt;

43451 void \*memchr(const void \*s, int c, size\_t n);

43452 **DESCRIPTION**

43453 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 43454 conflict between the requirements described here and the ISO C standard is unintentional. This  
 43455 volume of POSIX.1-2008 defers to the ISO C standard.

43456 The *memchr()* function shall locate the first occurrence of *c* (converted to an **unsigned char**) in  
 43457 the initial *n* bytes (each interpreted as **unsigned char**) pointed to by *s*.

43458 Implementations shall behave as if they read the memory byte by byte from the beginning of the  
 43459 bytes pointed to by *s* and stop at the first occurrence of *c* (if it is found in the initial *n* bytes).

43460 **RETURN VALUE**

43461 The *memchr()* function shall return a pointer to the located byte, or a null pointer if the byte is  
 43462 not found.

43463 **ERRORS**

43464 No errors are defined.

43465 **EXAMPLES**

43466 None.

43467 **APPLICATION USAGE**

43468 None.

43469 **RATIONALE**

43470 None.

## 43479 NAME

43480 memcmp — compare bytes in memory

## 43481 SYNOPSIS

43482 #include <string.h>

43483 int memcmp(const void \*s1, const void \*s2, size\_t n);

## 43484 DESCRIPTION

43485 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
43486 conflict between the requirements described here and the ISO C standard is unintentional. This  
43487 volume of POSIX.1-2008 defers to the ISO C standard.

43488 The *memcmp()* function shall compare the first *n* bytes (each interpreted as **unsigned char**) of the  
43489 object pointed to by *s1* to the first *n* bytes of the object pointed to by *s2*.

43490 The sign of a non-zero return value shall be determined by the sign of the difference between the  
43491 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the objects  
43492 being compared.

## 43493 RETURN VALUE

43494 The *memcmp()* function shall return an integer greater than, equal to, or less than 0, if the object  
43495 pointed to by *s1* is greater than, equal to, or less than the object pointed to by *s2*, respectively.

## 43496 ERRORS

43497 No errors are defined.

## 43498 EXAMPLES

43499 None.

## 43500 APPLICATION USAGE

43501 None.

## 43502 RATIONALE

## 43508 CHANGE HISTORY

43509 First released in Issue 1. Derived from Issue 1 of the SVID.

43510 **NAME**

43511       memcpy — copy bytes in memory

43512 **SYNOPSIS**

43513       #include &lt;string.h&gt;

43514       void \*memcpy(void \*restrict s1, const void \*restrict s2, size\_t n);

43515 **DESCRIPTION**

43516 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 43517 conflict between the requirements described here and the ISO C standard is unintentional. This  
 43518 volume of POSIX.1-2008 defers to the ISO C standard.

43519       The *memcpy()* function shall copy *n* bytes from the object pointed to by *s2* into the object pointed  
 43520 to by *s1*. If copying takes place between objects that overlap, the behavior is undefined.

43521 **RETURN VALUE**43522       The *memcpy()* function shall return *s1*; no return value is reserved to indicate an error.43523 **ERRORS**

43524       No errors are defined.

43525 **EXAMPLES**

43526       None.

43527 **APPLICATION USAGE**43528       The *memcpy()* function does not check for the overflow of the receiving memory area.43529 **RATIONALE**

43530       None.

43531 **FUTURE DIRECTIONS**

43532       None.

43533 **SEE ALSO**

43534       XBD &lt;string.h&gt;

43535 **CHANGE HISTORY**

43536       First released in Issue 1. Derived from Issue 1 of the SVID.

43537 **Issue 6**43538       The *memcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

43539 **NAME**

43540 memmove — copy bytes in memory with overlapping areas

43541 **SYNOPSIS**

43542 #include &lt;string.h&gt;

43543 void \*memmove(void \*s1, const void \*s2, size\_t n);

43544 **DESCRIPTION**

43545 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
43546 conflict between the requirements described here and the ISO C standard is unintentional. This  
43547 volume of POSIX.1-2008 defers to the ISO C standard.

43548 The *memmove()* function shall copy *n* bytes from the object pointed to by *s2* into the object  
43549 pointed to by *s1*. Copying takes place as if the *n* bytes from the object pointed to by *s2* are first  
43550 copied into a temporary array of *n* bytes that does not overlap the objects pointed to by *s1* and  
43551 *s2*, and then the *n* bytes from the temporary array are copied into the object pointed to by *s1*.

43552 **RETURN VALUE**43553 The *memmove()* function shall return *s1*; no return value is reserved to indicate an error.43554 **ERRORS**

43555 No errors are defined.

43556 **EXAMPLES**

43557 None.

43558 **APPLICATION USAGE**

43559 None.

43560 **RATIONALE**

43561 None.

43562 **FUTURE DIRECTIONS**

43563 None.

43564 **SEE ALSO**

43565 XBD &lt;string.h&gt;

43566 **CHANGE HISTORY**

43567 First released in Issue 4. Derived from the ANSI C standard.

43568 **NAME**

43569       memset — set bytes in memory

43570 **SYNOPSIS**

43571       #include &lt;string.h&gt;

43572       void \*memset(void \*s, int c, size\_t n);

43573 **DESCRIPTION**

43574 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 43575       conflict between the requirements described here and the ISO C standard is unintentional. This  
 43576       volume of POSIX.1-2008 defers to the ISO C standard.

43577       The `memset()` function shall copy `c` (converted to an **unsigned char**) into each of the first `n` bytes  
 43578       of the object pointed to by `s`.

43579 **RETURN VALUE**43580       The `memset()` function shall return `s`; no return value is reserved to indicate an error.43581 **ERRORS**

43582       No errors are defined.

43583 **EXAMPLES**

43584       None.

43585 **APPLICATION USAGE**

43586       None.

43587 **RATIONALE**

43588       None.

43589 **FUTURE DIRECTIONS**

43590       None.

43591 **SEE ALSO**

43592       XBD &lt;string.h&gt;

43593 **CHANGE HISTORY**

43594       First released in Issue 1. Derived from Issue 1 of the SVID.

43595 **NAME**

43596       mkdir, mkdirat — make a directory |

43597 **SYNOPSIS**

43598       #include &lt;sys/stat.h&gt;

43599       int mkdir(const char \*path, mode\_t mode);

43600 OH      #include &lt;fcntl.h&gt; +

43601 +

43602       int mkdirat(int fd, const char \*path, mode\_t mode);

43603 **DESCRIPTION**

43604       The *mkdir()* function shall create a new directory with name *path*. The file permission bits of the  
 43605       new directory shall be initialized from *mode*. These file permission bits of the *mode* argument  
 43606       shall be modified by the process' file creation mask.

43607       When bits in *mode* other than the file permission bits are set, the meaning of these additional bits  
 43608       is implementation-defined.

43609       The directory's user ID shall be set to the process' effective user ID. The directory's group ID  
 43610       shall be set to the group ID of the parent directory or to the effective group ID of the process.  
 43611       Implementations shall provide a way to initialize the directory's group ID to the group ID of the  
 43612       parent directory. Implementations may, but need not, provide an implementation-defined way  
 43613       to initialize the directory's group ID to the effective group ID of the calling process.

43614       The newly created directory shall be an empty directory.

43615       If *path* names a symbolic link, *mkdir()* shall fail and set *errno* to [EEXIST].

43616       Upon successful completion, *mkdir()* shall mark for update the last data access, last data  
 43617       modification, and last file status change timestamps of the directory. Also, the last data  
 43618       modification and last file status change timestamps of the directory that contains the new entry  
 43619       shall be marked for update.

43620       The *mkdirat()* function shall be equivalent to the *mkdir()* function except in the case where *path*  
 43621       specifies a relative path. In this case the newly created directory is created relative to the  
 43622       directory associated with the file descriptor *fd* instead of the current working directory. If the  
 43623       access mode of the open file description associated with the file descriptor is not O\_SEARCH, |  
 43624       the function shall check whether directory searches are permitted using the current permissions |  
 43625       of the directory underlying the file descriptor. If the access mode is O\_SEARCH, the function |  
 43626       shall not perform the check.

43627       If *mkdirat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 43628       directory shall be used and the behavior shall be identical to a call to *mkdir()*.

43629 **RETURN VALUE**

43630       Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 43631       return -1 and set *errno* to indicate the error. If -1 is returned, no directory shall be created.

43632 **ERRORS**

43633       These functions shall fail if:

43634       [EACCES]       Search permission is denied on a component of the path prefix, or write  
 43635       permission is denied on the parent directory of the directory to be created.

43636       [EEXIST]       The named file exists.

|       |                                                            |                                                                                                |
|-------|------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| 43637 | [ELOOP]                                                    | A loop exists in symbolic links encountered during resolution of the <i>path</i>               |
| 43638 |                                                            | argument.                                                                                      |
| 43639 | [EMLINK]                                                   | The link count of the parent directory would exceed {LINK_MAX}.                                |
| 43640 | [ENAMETOOLONG]                                             |                                                                                                |
| 43641 |                                                            | The length of a component of a pathname is longer than {NAME_MAX}.                             |
| 43642 | [ENOENT]                                                   | A component of the path prefix specified by <i>path</i> does not name an existing              |
| 43643 |                                                            | directory or <i>path</i> is an empty string.                                                   |
| 43644 | [ENOSPC]                                                   | The file system does not contain enough space to hold the contents of the new                  |
| 43645 |                                                            | directory or to extend the parent directory of the new directory.                              |
| 43646 | [ENOTDIR]                                                  | A component of the path prefix names an existing file that is neither a                        |
| 43647 |                                                            | directory nor a symbolic link to a directory.                                                  |
| 43648 | [EROFS]                                                    | The parent directory resides on a read-only file system.                                       |
| 43649 | In addition, the <i>mkdirat</i> () function shall fail if: |                                                                                                |
| 43650 | [EACCES]                                                   | The access mode of the open file description associated with <i>fd</i> is not +                |
| 43651 |                                                            | O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit +             |
| 43652 |                                                            | directory searches.                                                                            |
| 43653 | [EBADF]                                                    | The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is       |
| 43654 |                                                            | neither AT_FDCWD nor a valid file descriptor open for reading or searching.                    |
| 43655 | [ENOTDIR]                                                  | The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated |
| 43656 |                                                            | with a non-directory file.                                                                     |
| 43657 | These functions may fail if:                               |                                                                                                |
| 43658 | [ELOOP]                                                    | More than {SYMLOOP_MAX} symbolic links were encountered during                                 |
| 43659 |                                                            | resolution of the <i>path</i> argument.                                                        |
| 43660 | [ENAMETOOLONG]                                             |                                                                                                |
| 43661 |                                                            | The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a                       |
| 43662 |                                                            | symbolic link produced an intermediate result with a length that exceeds                       |
| 43663 |                                                            | {PATH_MAX}.                                                                                    |

## 43664 EXAMPLES

### 43665 Creating a Directory

43666 The following example shows how to create a directory named **/home/cnd/mod1**, with  
 43667 read/write/search permissions for owner and group, and with read/search permissions for  
 43668 others.

```

43669 #include <sys/types.h>
43670 #include <sys/stat.h>

43671 int status;
43672 ...
43673 status = mkdir("/home/cnd/mod1", S_IRWXU | S_IRWXG | S_IROTH | S_IXOTH);

```

## 43674 APPLICATION USAGE

43675 None.

**RATIONALE**

The *mkdir()* function originated in 4.2 BSD and was added to System V in Release 3.0.

4.3 BSD detects [ENAMETOOLONG].

The POSIX.1-1990 standard required that the group ID of a newly created directory be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown()* to set the group ID after the directory is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *mkdirat()* function is to create a directory in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to the call to *mkdir()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *mkdirat()* function it can be guaranteed that the newly created directory is located relative to the desired directory.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*chmod()*, *mkdtemp()*, *mknod()*, *umask()*

XBD [\*<fcntl.h>\*](#), [\*<sys/stat.h>\*](#), [\*<sys/types.h>\*](#)

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 6**

In the SYNOPSIS, the optional include of the [\*<sys/types.h>\*](#) header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include [\*<sys/types.h>\*](#) has been removed. Although [\*<sys/types.h>\*](#) was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *mkdirat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0375 [461], XSH/TC1-2008/0376 [324], XSH/TC1-2008/0377 [277], XSH/TC1-2008/0378 [278], and XSH/TC1-2008/0379 [278] are applied.

43718 **NAME**

43719 mkdtemp, mkstemp — create a unique directory or file

43720 **SYNOPSIS**

```
43721 CX      #include <stdlib.h>
43722          char *mkdtemp(char *template);
43723          int mkstemp(char *template);
```

43724 **DESCRIPTION**

43725 The *mkdtemp()* function shall create a directory with a unique name derived from *template*. The  
 43726 application shall ensure that the string provided in *template* is a pathname ending with at least  
 43727 six trailing 'X' characters. The *mkdtemp()* function shall modify the contents of *template* by  
 43728 replacing six or more 'X' characters at the end of the pathname with the same number of  
 43729 characters from the portable filename character set. The characters shall be chosen such that the  
 43730 resulting pathname does not duplicate the name of an existing file at the time of the call to  
 43731 *mkdtemp()*. The *mkdtemp()* function shall use the resulting pathname to create the new directory  
 43732 as if by a call to:

```
43733 mkdir(pathname, S_IRWXU)
```

43734 The *mkstemp()* function shall create a regular file with a unique name derived from *template* and  
 43735 return a file descriptor for the file open for reading and writing. The application shall ensure that  
 43736 the string provided in *template* is a pathname ending with at least six trailing 'X' characters. The  
 43737 *mkstemp()* function shall modify the contents of *template* by replacing six or more 'X' characters  
 43738 at the end of the pathname with the same number of characters from the portable filename  
 43739 character set. The characters shall be chosen such that the resulting pathname does not duplicate  
 43740 the name of an existing file at the time of the call to *mkstemp()*. The *mkstemp()* function shall use  
 43741 the resulting pathname to create the file, and obtain a file descriptor for it, as if by a call to:

```
43742 open(pathname, O_RDWR|O_CREAT|O_EXCL, S_IRUSR|S_IWUSR)
```

43743 By behaving as if the O\_EXCL flag for *open()* is set, the function prevents any possible race  
 43744 condition between testing whether the file exists and opening it for use.

43745 **RETURN VALUE**

43746 Upon successful completion, the *mkdtemp()* function shall return the value of *template*.  
 43747 Otherwise, it shall return a null pointer and shall set *errno* to indicate the error.

43748 Upon successful completion, the *mkstemp()* function shall return an open file descriptor.  
 43749 Otherwise, it shall return -1 and shall set *errno* to indicate the error.

43750 **ERRORS**

43751 The *mkdtemp()* function shall fail if:

- |       |                |                                                                                                                                                      |
|-------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 43752 | [EACCES]       | Search permission is denied on a component of the path prefix, or write permission is denied on the parent directory of the directory to be created. |
| 43753 |                |                                                                                                                                                      |
| 43754 | [EINVAL]       | The string pointed to by <i>template</i> does not end in "XXXXXX".                                                                                   |
| 43755 | [ELOOP]        | A loop exists in symbolic links encountered during resolution of the path of the directory to be created.                                            |
| 43756 |                |                                                                                                                                                      |
| 43757 | [EMLINK]       | The link count of the parent directory would exceed {LINK_MAX}.                                                                                      |
| 43758 | [ENAMETOOLONG] |                                                                                                                                                      |
| 43759 |                | The length of a component of a pathname is longer than {NAME_MAX}.                                                                                   |

|       |                |                                                                                       |
|-------|----------------|---------------------------------------------------------------------------------------|
| 43760 | [ENOENT]       | A component of the path prefix specified by the <i>template</i> argument does not     |
| 43761 |                | name an existing directory.                                                           |
| 43762 | [ENOSPC]       | The file system does not contain enough space to hold the contents of the new         |
| 43763 |                | directory or to extend the parent directory of the new directory.                     |
| 43764 | [ENOTDIR]      | A component of the path prefix names an existing file that is neither a               |
| 43765 |                | directory nor a symbolic link to a directory.                                         |
| 43766 | [EROFS]        | The parent directory resides on a read-only file system.                              |
| 43767 |                | The <i>mkdtemp()</i> function may fail if:                                            |
| 43768 | [ELOOP]        | More than {SYMLOOP_MAX} symbolic links were encountered during                        |
| 43769 |                | resolution of the path of the directory to be created.                                |
| 43770 | [ENAMETOOLONG] |                                                                                       |
| 43771 |                | The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a              |
| 43772 |                | symbolic link produced an intermediate result with a length that exceeds              |
| 43773 |                | {PATH_MAX}.                                                                           |
| 43774 |                | The error conditions for the <i>mkstemp()</i> function are defined in <i>open()</i> . |

## 43775 EXAMPLES

### 43776 Generating a Pathname

43777 The following example creates a file with a 10-character name beginning with the characters  
 43778 "file" and opens the file for reading and writing. The value returned as the value of *fd* is a file  
 43779 descriptor that identifies the file.

```
43780 #include <stdlib.h>
43781 ...
43782 char template[] = "/tmp/fileXXXXXX";
43783 int fd;
43784 fd = mkstemp(template);
```

## 43785 APPLICATION USAGE

43786 It is possible to run out of letters.

43787 Portable applications should pass exactly six trailing 'X's in the template and no more; |  
 43788 implementations may treat any additional trailing 'X's as either a fixed or replaceable part of |  
 43789 the template. To be sure of only passing six, a fixed string of at least one non-'X' character |  
 43790 should precede the six 'X's. |

43791 Since 'X' is in the portable filename character set, some of the replacement characters can be |  
 43792 'X's, leaving part (or even all) of the template effectively unchanged. |

## 43793 RATIONALE

43800 **CHANGE HISTORY**

43801 First released in Issue 4, Version 2.

43802 **Issue 5**

43803 Moved from X/OPEN UNIX extension to BASE.

43804 **Issue 7**

43805 Austin Group Interpretation 1003.1-2001 #143 is applied.

43806 SD5-XSH-ERN-168 is applied, clarifying file permissions upon creation.

43807 The *mkstemp()* function is moved from the XSI option to the Base.43808 The *mkdtemp()* function is added from The Open Group Technical Standard, 2006, Extended API  
43809 Set Part 1.43810 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0380 [291], XSH/TC1-2008/0381 [324],  
43811 and XSH/TC1-2008/0382 [291] are applied.

43812 **NAME**

43813 mkfifo, mkfifoat — make a FIFO special file |

43814 **SYNOPSIS**

43815 #include &lt;sys/stat.h&gt;

43816 int mkfifo(const char \*path, mode\_t mode);

43817 OH #include &lt;fcntl.h&gt; +

43818 +

43819 int mkfifoat(int fd, const char \*path, mode\_t mode);

43820 **DESCRIPTION**

43821 The *mkfifo()* function shall create a new FIFO special file named by the pathname pointed to by  
 43822 *path*. The file permission bits of the new FIFO shall be initialized from *mode*. The file permission  
 43823 bits of the *mode* argument shall be modified by the process' file creation mask.

43824 When bits in *mode* other than the file permission bits are set, the effect is implementation-  
 43825 defined.

43826 If *path* names a symbolic link, *mkfifo()* shall fail and set *errno* to [EEXIST].

43827 The FIFO's user ID shall be set to the process' effective user ID. The FIFO's group ID shall be set  
 43828 to the group ID of the parent directory or to the effective group ID of the process.  
 43829 Implementations shall provide a way to initialize the FIFO's group ID to the group ID of the  
 43830 parent directory. Implementations may, but need not, provide an implementation-defined way  
 43831 to initialize the FIFO's group ID to the effective group ID of the calling process.

43832 Upon successful completion, *mkfifo()* shall mark for update the last data access, last data  
 43833 modification, and last file status change timestamps of the file. Also, the last data modification  
 43834 and last file status change timestamps of the directory that contains the new entry shall be  
 43835 marked for update.

43836 The *mkfifoat()* function shall be equivalent to the *mkfifo()* function except in the case where *path*  
 43837 specifies a relative path. In this case the newly created FIFO is created relative to the directory  
 43838 associated with the file descriptor *fd* instead of the current working directory. If the access mode |  
 43839 of the open file description associated with the file descriptor is not O\_SEARCH, the function |  
 43840 shall check whether directory searches are permitted using the current permissions of the |  
 43841 directory underlying the file descriptor. If the access mode is O\_SEARCH, the function shall not |  
 43842 perform the check.

43843 If *mkfifoat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 43844 directory shall be used and the behavior shall be identical to a call to *mkfifo()*.

43845 **RETURN VALUE**

43846 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 43847 return -1 and set *errno* to indicate the error. If -1 is returned, no FIFO shall be created.

43848 **ERRORS**

43849 These functions shall fail if:

43850 [EACCES] A component of the path prefix denies search permission, or write permission  
 43851 is denied on the parent directory of the FIFO to be created.

43852 [EEXIST] The named file already exists.

43853 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 43854 argument.

43855 [ENAMETOOLONG]  
 43856 The length of a component of a pathname is longer than {NAME\_MAX}.

43857 [ENOENT] A component of the path prefix of *path* does not name an existing file or *path* is  
 43858 an empty string.

43859 [ENOENT] or [ENOTDIR]  
 43860 The *path* argument contains at least one non-`<slash>` character and ends with  
 43861 one or more trailing `<slash>` characters. If *path* without the trailing `<slash>`  
 43862 characters would name an existing file, an [ENOENT] error shall not occur.

43863 [ENOSPC] The directory that would contain the new file cannot be extended or the file  
 43864 system is out of file-allocation resources.

43865 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
 43866 directory nor a symbolic link to a directory.

43867 [EROFS] The named file resides on a read-only file system.

43868 The *mkfifoat()* function shall fail if:

43869 [EACCES] The access mode of the open file description associated with *fd* is not  
 43870 O\_SEARCH and the permissions of the directory underlying *fd* do not permit  
 43871 directory searches.

43872 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
 43873 neither AT\_FDCWD nor a valid file descriptor open for reading or searching.

43874 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated  
 43875 with a non-directory file.

43876 These functions may fail if:

43877 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 43878 resolution of the *path* argument.

43879 [ENAMETOOLONG]  
 43880 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 43881 symbolic link produced an intermediate result with a length that exceeds  
 43882 {PATH\_MAX}.

## 43883 EXAMPLES

### 43884 Creating a FIFO File

43885 The following example shows how to create a FIFO file named `/home/cnd/mod_done`, with  
 43886 read/write permissions for owner, and with read permissions for group and others.

```
43887 #include <sys/types.h>
43888 #include <sys/stat.h>
43889
43889 int status;
43890 ...
43891 status = mkfifo("/home/cnd/mod_done", S_IWUSR | S_IRUSR |
43892               S_IRGRP | S_IROTH);
```

**APPLICATION USAGE**

None.

**RATIONALE**

The syntax of this function is intended to maintain compatibility with historical implementations of *mknod()*. The latter function was included in the 1984 /usr/group standard but only for use in creating FIFO special files. The *mknod()* function was originally excluded from the POSIX.1-1988 standard as implementation-defined and replaced by *mkdir()* and *mkfifo()*. The *mknod()* function is now included for alignment with the Single UNIX Specification.

The POSIX.1-1990 standard required that the group ID of a newly created FIFO be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown()* to set the group ID after the FIFO is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *mkfifoat()* function is to create a FIFO special file in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *mkfifo()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *mkfifoat()* function it can be guaranteed that the newly created FIFO is located relative to the desired directory.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*chmod()*, *mknod()*, *umask()*

XBD [<fcntl.h>](#), [<sys/stat.h>](#), [<sys/types.h>](#)

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 6**

In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *mkfifoat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

43937 Changes are made related to support for finegrained timestamps.  
43938 Changes are made to allow a directory to be opened for searching.  
43939 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0383 [461], XSH/TC1-2008/0384  
43940 [146,435], XSH/TC1-2008/0385 [324], XSH/TC1-2008/0386 [278], and XSH/TC1-2008/0387  
43941 [278] are applied.

43942 **NAME**

43943 mknod, mknodat — make directory, special file, or regular file

43944 **SYNOPSIS**43945 XSI `#include <sys/stat.h>`43946 `int mknod(const char *path, mode_t mode, dev_t dev);`43947 OH XSI `#include <fcntl.h>`

43948

43949 XSI `int mknodat(int fd, const char *path, mode_t mode, dev_t dev);`+  
+43950 **DESCRIPTION**43951 The *mknod()* function shall create a new file named by the pathname to which the argument *path*  
43952 points.43953 The file type for *path* is OR'ed into the *mode* argument, and the application shall select one of the  
43954 following symbolic constants:

| Name    | Description                      |
|---------|----------------------------------|
| S_IFIFO | FIFO-special                     |
| S_IFCHR | Character-special (non-portable) |
| S_IFDIR | Directory (non-portable)         |
| S_IFBLK | Block-special (non-portable)     |
| S_IFREG | Regular (non-portable)           |

43961 The only portable use of *mknod()* is to create a FIFO-special file. If *mode* is not S\_IFIFO or *dev* is  
43962 not 0, the behavior of *mknod()* is unspecified.43963 The permissions for the new file are OR'ed into the *mode* argument, and may be selected from  
43964 any combination of the following symbolic constants:

| Name    | Description                                 |
|---------|---------------------------------------------|
| S_ISUID | Set user ID on execution.                   |
| S_ISGID | Set group ID on execution.                  |
| S_IRWXU | Read, write, or execute (search) by owner.  |
| S_IRUSR | Read by owner.                              |
| S_IWUSR | Write by owner.                             |
| S_IXUSR | Execute (search) by owner.                  |
| S_IRWXG | Read, write, or execute (search) by group.  |
| S_IRGRP | Read by group.                              |
| S_IWGRP | Write by group.                             |
| S_IXGRP | Execute (search) by group.                  |
| S_IRWXO | Read, write, or execute (search) by others. |
| S_IROTH | Read by others.                             |
| S_IWOTH | Write by others.                            |
| S_IXOTH | Execute (search) by others.                 |
| S_ISVTX | On directories, restricted deletion flag.   |

43981 The user ID of the file shall be initialized to the effective user ID of the process. The group ID of  
 43982 the file shall be initialized to either the effective group ID of the process or the group ID of the  
 43983 parent directory. Implementations shall provide a way to initialize the file's group ID to the  
 43984 group ID of the parent directory. Implementations may, but need not, provide an

implementation-defined way to initialize the file's group ID to the effective group ID of the calling process. The owner, group, and other permission bits of *mode* shall be modified by the file mode creation mask of the process. The *mknod()* function shall clear each bit whose corresponding bit in the file mode creation mask of the process is set.

If *path* names a symbolic link, *mknod()* shall fail and set *errno* to [EEXIST].

Upon successful completion, *mknod()* shall mark for update the last data access, last data modification, and last file status change timestamps of the file. Also, the last data modification and last file status change timestamps of the directory that contains the new entry shall be marked for update.

Only a process with appropriate privileges may invoke *mknod()* for file types other than FIFO-special.

The *mknodat()* function shall be equivalent to the *mknod()* function except in the case where *path* specifies a relative path. In this case the newly created directory, special file, or regular file is located relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the access mode of the open file description associated with the file descriptor is not O\_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the access mode is O\_SEARCH, the function shall not perform the check.

If *mknodat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working directory shall be used and the behavior shall be identical to a call to *mknod()*.

#### RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return -1 and set *errno* to indicate the error. If -1 is returned, the new file shall not be created.

#### ERRORS

These functions shall fail if:

[EACCES] A component of the path prefix denies search permission, or write permission is denied on the parent directory.

[EEXIST] The named file exists.

[EINVAL] An invalid argument exists.

[EIO] An I/O error occurred while accessing the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]

The length of a component of a pathname is longer than {NAME\_MAX}.

[ENOENT] A component of the path prefix of *path* does not name an existing file or *path* is an empty string.

[ENOENT] or [ENOTDIR]

The *path* argument contains at least one non-*<slash>* character and ends with one or more trailing *<slash>* characters. If *path* without the trailing *<slash>* characters would name an existing file, an [ENOENT] error shall not occur.

[ENOSPC] The directory that would contain the new file cannot be extended or the file system is out of file allocation resources.

|       |                                              |                                                                                                |
|-------|----------------------------------------------|------------------------------------------------------------------------------------------------|
| 44027 | [ENOTDIR]                                    | A component of the path prefix names an existing file that is neither a                        |
| 44028 |                                              | directory nor a symbolic link to a directory.                                                  |
| 44029 | [EPERM]                                      | The invoking process does not have appropriate privileges and the file type is                 |
| 44030 |                                              | not FIFO-special.                                                                              |
| 44031 | [EROFS]                                      | The directory in which the file is to be created is located on a read-only file                |
| 44032 |                                              | system.                                                                                        |
| 44033 | The <i>mknodat()</i> function shall fail if: |                                                                                                |
| 44034 | [EACCES]                                     | The access mode of the open file description associated with <i>fd</i> is not                  |
| 44035 |                                              | O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit               |

| 44037 | [EBADF]                                      | The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is       |
| 44038 |                                              | neither AT_FDCWD nor a valid file descriptor open for reading or searching.                    |
| 44039 | [ENOTDIR]                                    | The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated |
| 44040 |                                              | with a non-directory file.                                                                     |
| 44041 | These functions may fail if:                 |                                                                                                |
| 44042 | [ELOOP]                                      | More than {SYMLOOP_MAX} symbolic links were encountered during                                 |
| 44043 |                                              | resolution of the <i>path</i> argument.                                                        |
| 44044 | [ENAMETOOLONG]                               |                                                                                                |
| 44045 |                                              | The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a                       |
| 44046 |                                              | symbolic link produced an intermediate result with a length that exceeds                       |
| 44047 |                                              | {PATH_MAX}.                                                                                    |

## 44048 EXAMPLES

### 44049 Creating a FIFO Special File

44050 The following example shows how to create a FIFO special file named */home/cnd/mod\_done*,  
 44051 with read/write permissions for owner, and with read permissions for group and others.

```

44052 #include <sys/types.h>
44053 #include <sys/stat.h>
44054 dev_t dev;
44055 int status;
44056 ...
44057 status = mknod("/home/cnd/mod_done", S_IFIFO | S_IWUSR |
44058               S_IRUSR | S_IRGRP | S_IROTH, dev);

```

## 44059 APPLICATION USAGE

44060 The *mkfifo()* function is preferred over this function for making FIFO special files.

## 44061 RATIONALE

44062 The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group  
 44063 ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required  
 44064 that implementations provide a way to have the group ID be set to the group ID of the  
 44065 containing directory, but did not prohibit implementations also supporting a way to set the  
 44066 group ID to the effective group ID of the creating process. Conforming applications should not  
 44067 assume which group ID will be used. If it matters, an application can use *chown()* to set the  
 44068 group ID after the file is created, or determine under what conditions the implementation will  
 44069 set the desired group ID.

44070 The purpose of the *mknodat()* function is to create directories, special files, or regular files in  
44071 directories other than the current working directory without exposure to race conditions. Any  
44072 part of the path of a file could be changed in parallel to a call to *mknod()*, resulting in unspecified  
44073 behavior. By opening a file descriptor for the target directory and using the *mknodat()* function it  
44074 can be guaranteed that the newly created directory, special file, or regular file is located relative  
44075 to the desired directory.

#### 44076 FUTURE DIRECTIONS

44077 None.

#### 44081 CHANGE HISTORY

44082 First released in Issue 4, Version 2.

##### 44083 Issue 5

44084 Moved from X/OPEN UNIX extension to BASE.

##### 44085 Issue 6

44086 The normative text is updated to avoid use of the term “must” for application requirements.

44087 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
44088 [ELOOP] error condition is added.

##### 44089 Issue 7

44090 Austin Group Interpretation 1003.1-2001 #143 is applied.

44091 The *mknodat()* function is added from The Open Group Technical Standard, 2006, Extended API  
44092 Set Part 2.

44093 Changes are made related to support for finegrained timestamps.

44094 Changes are made to allow a directory to be opened for searching.

44095 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0388 [324], XSH/TC1-2008/0389 [461],  
44096 XSH/TC1-2008/0390 [146,435], XSH/TC1-2008/0391 [278], and XSH/TC1-2008/0392 [278] are  
44097 applied.

44098 **NAME**

44099 mkstemp — create a unique file |

44100 **SYNOPSIS**

```
44101 CX      #include <stdlib.h>  
44102      int mkstemp(char *template);
```

44103 **DESCRIPTION**44104 Refer to *mkdtemp()*.

44105 **NAME**

44106 mktime — convert broken-down time into time since the Epoch

44107 **SYNOPSIS**

44108 #include &lt;time.h&gt;

44109 time\_t mktime(struct tm \*timeptr);

44110 **DESCRIPTION**

44111 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 44112 conflict between the requirements described here and the ISO C standard is unintentional. This  
 44113 volume of POSIX.1-2008 defers to the ISO C standard.

44114 The *mktime()* function shall convert the broken-down time, expressed as local time, in the  
 44115 structure pointed to by *timeptr*, into a time since the Epoch value with the same encoding as that  
 44116 of the values returned by *time()*. The original values of the *tm\_wday* and *tm\_yday* components of  
 44117 the structure shall be ignored, and the original values of the other components shall not be  
 44118 restricted to the ranges described in <time.h>.

44119 CX A positive or 0 value for *tm\_isdst* shall cause *mktime()* to presume initially that Daylight Savings  
 44120 Time, respectively, is or is not in effect for the specified time. A negative value for *tm\_isdst* shall  
 44121 cause *mktime()* to attempt to determine whether Daylight Savings Time is in effect for the  
 44122 specified time.

44123 Local timezone information shall be set as though *mktime()* called *tzset()*.

44124 The relationship between the **tm** structure (defined in the <time.h> header) and the time in  
 44125 seconds since the Epoch is that the result shall be as specified in the expression given in the  
 44126 definition of seconds since the Epoch (see XBD Section 4.16, on page 113) corrected for timezone  
 44127 and any seasonal time adjustments, where the names other than *tm\_yday* in the structure and in  
 44128 the expression correspond, and the *tm\_yday* value used in the expression is the day of the year  
 44129 from 0 to 365 inclusive, calculated from the other **tm** structure members specified in <time.h>  
 44130 (excluding *tm\_wday*).

44131 Upon successful completion, the values of the *tm\_wday* and *tm\_yday* components of the structure  
 44132 shall be set appropriately, and the other components shall be set to represent the specified time  
 44133 since the Epoch, but with their values forced to the ranges indicated in the <time.h> entry; the  
 44134 final value of *tm\_mday* shall not be set until *tm\_mon* and *tm\_year* are determined.

44135 **RETURN VALUE**

44136 The *mktime()* function shall return the specified time since the Epoch encoded as a value of type  
 44137 **time\_t**. If the time since the Epoch cannot be represented, the function shall return the value  
 44138 CX (**time\_t**)-1 and set *errno* to indicate the error.

44139 **ERRORS**44140 The *mktime()* function shall fail if:

44141 CX [EOVERFLOW] The result cannot be represented.

**EXAMPLES**

What day of the week is July 4, 2001?

```
#include <stdio.h>
#include <time.h>

struct tm time_str;
char daybuf[20];

int main(void)
{
    time_str.tm_year = 2001 - 1900;
    time_str.tm_mon = 7 - 1;
    time_str.tm_mday = 4;
    time_str.tm_hour = 0;
    time_str.tm_min = 0;
    time_str.tm_sec = 1;
    time_str.tm_isdst = -1;
    if (mktime(&time_str) == -1)
        (void)puts("-unknown-");
    else {
        (void)strftime(daybuf, sizeof(daybuf), "%A", &time_str);
        (void)puts(daybuf);
    }
    return 0;
}

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ANSI C standard.

**Issue 6**

Extensions beyond the ISO C standard are marked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/58 is applied, updating the RETURN VALUE and ERRORS sections to add the optional [EOVERFLOW] error as a CX extension.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/59 is applied, adding the *tzset()* function to the SEE ALSO section.

44184 **Issue 7**  
44185

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0393 [104] is applied.

**NAME**

mlock, munlock — lock or unlock a range of process address space (**REALTIME**)

**SYNOPSIS**

```
#include <sys/mman.h>

int mlock(const void *addr, size_t len);
int munlock(const void *addr, size_t len);
```

**DESCRIPTION**

The *mlock()* function shall cause those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes to be memory-resident until unlocked or until the process exits or *execs* another process image. The implementation may require that *addr* be a multiple of {PAGESIZE}.

The *munlock()* function shall unlock those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes, regardless of how many times *mlock()* has been called by the process for any of the pages in the specified range. The implementation may require that *addr* be a multiple of {PAGESIZE}.

If any of the pages in the range specified to a call to *munlock()* are also mapped into the address spaces of other processes, any locks established on those pages by another process are unaffected by the call of this process to *munlock()*. If any of the pages in the range specified by a call to *munlock()* are also mapped into other portions of the address space of the calling process outside the range specified, any locks established on those pages via the other mappings are also unaffected by this call.

Upon successful return from *mlock()*, pages in the specified range shall be locked and memory-resident. Upon successful return from *munlock()*, pages in the specified range shall be unlocked with respect to the address space of the process. Memory residency of unlocked pages is unspecified.

Appropriate privileges are required to lock process memory with *mlock()*.

**RETURN VALUE**

Upon successful completion, the *mlock()* and *munlock()* functions shall return a value of zero. Otherwise, no change is made to any locks in the address space of the process, and the function shall return a value of -1 and set *errno* to indicate the error.

**ERRORS**

The *mlock()* and *munlock()* functions shall fail if:

[ENOMEM] Some or all of the address range specified by the *addr* and *len* arguments does not correspond to valid mapped pages in the address space of the process.

The *mlock()* function shall fail if:

[EAGAIN] Some or all of the memory identified by the operation could not be locked when the call was made.

The *mlock()* and *munlock()* functions may fail if:

[EINVAL] The *addr* argument is not a multiple of {PAGESIZE}.

The *mlock()* function may fail if:

[ENOMEM] Locking the pages mapped by the specified range would exceed an implementation-defined limit on the amount of memory that the process may lock.

44229 [EPERM] The calling process does not have appropriate privileges to perform the  
44230 requested operation.

**44242 CHANGE HISTORY**

44243 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**44244 Issue 6**

44245 The *mlock()* and *munlock()* functions are marked as part of the Range Memory Locking option.

44246 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
44247 implementation does not support the Range Memory Locking option.

**NAME**

mlockall, munlockall — lock/unlock the address space of a process (**REALTIME**)

**SYNOPSIS**

```
ML    #include <sys/mman.h>

      int mlockall(int flags);
      int munlockall(void);
```

**DESCRIPTION**

The *mlockall()* function shall cause all of the pages mapped by the address space of a process to be memory-resident until unlocked or until the process exits or *execs* another process image. The *flags* argument determines whether the pages to be locked are those currently mapped by the address space of the process, those that are mapped in the future, or both. The *flags* argument is constructed from the bitwise-inclusive OR of one or more of the following symbolic constants, defined in *<sys/mman.h>*:

**MCL\_CURRENT** Lock all of the pages currently mapped into the address space of the process.

**MCL\_FUTURE** Lock all of the pages that become mapped into the address space of the process in the future, when those mappings are established.

If **MCL\_FUTURE** is specified, and the automatic locking of future mappings eventually causes the amount of locked memory to exceed the amount of available physical memory or any other implementation-defined limit, the behavior is implementation-defined. The manner in which the implementation informs the application of these situations is also implementation-defined.

The *munlockall()* function shall unlock all currently mapped pages of the address space of the process. Any pages that become mapped into the address space of the process after a call to *munlockall()* shall not be locked, unless there is an intervening call to *mlockall()* specifying **MCL\_FUTURE** or a subsequent call to *mlockall()* specifying **MCL\_CURRENT**. If pages mapped into the address space of the process are also mapped into the address spaces of other processes and are locked by those processes, the locks established by the other processes shall be unaffected by a call by this process to *munlockall()*.

Upon successful return from the *mlockall()* function that specifies **MCL\_CURRENT**, all currently mapped pages of the address space of the process shall be memory-resident and locked. Upon return from the *munlockall()* function, all currently mapped pages of the address space of the process shall be unlocked with respect to the address space of the process. The memory residency of unlocked pages is unspecified.

Appropriate privileges are required to lock process memory with *mlockall()*.

**RETURN VALUE**

Upon successful completion, the *mlockall()* function shall return a value of zero. Otherwise, no additional memory shall be locked, and the function shall return a value of *-1* and set *errno* to indicate the error. The effect of failure of *mlockall()* on previously existing locks in the address space is unspecified.

If it is supported by the implementation, the *munlockall()* function shall always return a value of zero. Otherwise, the function shall return a value of *-1* and set *errno* to indicate the error.

**ERRORS**

The *mlockall()* function shall fail if:

**[EAGAIN]** Some or all of the memory identified by the operation could not be locked when the call was made.

44292 [EINVAL] The *flags* argument is zero, or includes unimplemented flags.  
44293 The *mlockall()* function may fail if:  
44294 [ENOMEM] Locking all of the pages currently mapped into the address space of the  
44295 process would exceed an implementation-defined limit on the amount of  
44296 memory that the process may lock.  
44297 [EPERM] The calling process does not have appropriate privileges to perform the  
44298 requested operation.

#### 44310 CHANGE HISTORY

44311 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

#### 44312 Issue 6

44313 The *mlockall()* and *munlockall()* functions are marked as part of the Process Memory Locking  
44314 option.

44315 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
44316 implementation does not support the Process Memory Locking option.

44317 **NAME**

44318 mmap — map pages of memory

44319 **SYNOPSIS**

44320 #include &lt;sys/mman.h&gt;

```
44321 void *mmap(void *addr, size_t len, int prot, int flags,
44322           int fildes, off_t off);
```

44323 **DESCRIPTION**

44324 The *mmap()* function shall establish a mapping between an address space of a process and a  
 44325 memory object.

44326 The *mmap()* function shall be supported for the following memory objects:

- 44327 • Regular files
- 44328 SHM • Shared memory objects
- 44329 TYM • Typed memory objects

44330 Support for any other type of file is unspecified.

44331 The format of the call is as follows:

```
44332 pa=mmap(addr, len, prot, flags, fildes, off);
```

44333 The *mmap()* function shall establish a mapping between the address space of the process at an  
 44334 address *pa* for *len* bytes to the memory object represented by the file descriptor *fildes* at offset *off*  
 44335 for *len* bytes. The value of *pa* is an implementation-defined function of the parameter *addr* and  
 44336 the values of *flags*, further described below. A successful *mmap()* call shall return *pa* as its result.  
 44337 The address range starting at *pa* and continuing for *len* bytes shall be legitimate for the possible  
 44338 (not necessarily current) address space of the process. The range of bytes starting at *off* and  
 44339 continuing for *len* bytes shall be legitimate for the possible (not necessarily current) offsets in the  
 44340 memory object represented by *fildes*.

44341 TYM If *fildes* represents a typed memory object opened with either the  
 44342 POSIX\_TYPED\_MEM\_ALLOCATE flag or the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG  
 44343 flag, the memory object to be mapped shall be that portion of the typed memory object allocated  
 44344 by the implementation as specified below. In this case, if *off* is non-zero, the behavior of *mmap()*  
 44345 is undefined. If *fildes* refers to a valid typed memory object that is not accessible from the calling  
 44346 process, *mmap()* shall fail.

44347 The mapping established by *mmap()* shall replace any previous mappings for those whole pages  
 44348 containing any part of the address space of the process starting at *pa* and continuing for *len*  
 44349 bytes.

44350 If the size of the mapped file changes after the call to *mmap()* as a result of some other operation  
 44351 on the mapped file, the effect of references to portions of the mapped region that correspond to  
 44352 added or removed portions of the file is unspecified.

44353 If *len* is zero, *mmap()* shall fail and no mapping shall be established.

44354 The parameter *prot* determines whether read, write, execute, or some combination of accesses  
 44355 are permitted to the data being mapped. The *prot* shall be either PROT\_NONE or the bitwise-  
 44356 inclusive OR of one or more of the other flags in the following table, defined in the  
 44357 <sys/mman.h> header.

| Symbolic Constant | Description              |
|-------------------|--------------------------|
| PROT_READ         | Data can be read.        |
| PROT_WRITE        | Data can be written.     |
| PROT_EXEC         | Data can be executed.    |
| PROT_NONE         | Data cannot be accessed. |

If an implementation cannot support the combination of access types specified by *prot*, the call to *mmap()* shall fail.

An implementation may permit accesses other than those specified by *prot*; however, the implementation shall not permit a write to succeed where PROT\_WRITE has not been set and shall not permit any access where PROT\_NONE alone has been set. The implementation shall support at least the following values of *prot*: PROT\_NONE, PROT\_READ, PROT\_WRITE, and the bitwise-inclusive OR of PROT\_READ and PROT\_WRITE. The file descriptor *fildes* shall have been opened with read permission, regardless of the protection options specified. If PROT\_WRITE is specified, the application shall ensure that it has opened the file descriptor *fildes* with write permission unless MAP\_PRIVATE is specified in the *flags* parameter as described below.

The parameter *flags* provides other information about the handling of the mapped data. The value of *flags* is the bitwise-inclusive OR of these options, defined in <sys/mman.h>:

| Symbolic Constant | Description                    |
|-------------------|--------------------------------|
| MAP_SHARED        | Changes are shared.            |
| MAP_PRIVATE       | Changes are private.           |
| MAP_FIXED         | Interpret <i>addr</i> exactly. |

It is implementation-defined whether MAP\_FIXED shall be supported. MAP\_FIXED shall be supported on XSI-conformant systems.

MAP\_SHARED and MAP\_PRIVATE describe the disposition of write references to the memory object. If MAP\_SHARED is specified, write references shall change the underlying object. If MAP\_PRIVATE is specified, modifications to the mapped data by the calling process shall be visible only to the calling process and shall not change the underlying object. It is unspecified whether modifications to the underlying object done after the MAP\_PRIVATE mapping is established are visible through the MAP\_PRIVATE mapping. Either MAP\_SHARED or MAP\_PRIVATE can be specified, but not both. The mapping type is retained across *fork()*.

The state of synchronization objects such as mutexes, semaphores, barriers, and conditional variables placed in shared memory mapped with MAP\_SHARED becomes undefined when the last region in any process containing the synchronization object is unmapped.

When *fildes* represents a typed memory object opened with either the POSIX\_TYPED\_MEM\_ALLOCATE flag or the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag, *mmap()* shall, if there are enough resources available, map *len* bytes allocated from the corresponding typed memory object which were not previously allocated to any process in any processor that may access that typed memory object. If there are not enough resources available, the function shall fail. If *fildes* represents a typed memory object opened with the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag, these allocated bytes shall be contiguous within the typed memory object. If *fildes* represents a typed memory object opened with the POSIX\_TYPED\_MEM\_ALLOCATE flag, these allocated bytes may be composed of non-contiguous fragments within the typed memory object. If *fildes* represents a typed memory object opened with neither the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag nor the POSIX\_TYPED\_MEM\_ALLOCATE flag, *len* bytes starting at offset *off* within the typed memory object are mapped, exactly as when mapping a file or shared memory object. In this case, if two

processes map an area of typed memory using the same *off* and *len* values and using file descriptors that refer to the same memory pool (either from the same port or from a different port), both processes shall map the same region of storage.

When MAP\_FIXED is set in the *flags* argument, the implementation is informed that the value of *pa* shall be *addr*, exactly. If MAP\_FIXED is set, *mmap()* may return MAP\_FAILED and set *errno* to [EINVAL]. If a MAP\_FIXED request is successful, then any previous mappings **or memory locks** for those whole pages containing any part of the address range [*pa*,*pa+len*) shall be removed, as if by an appropriate call to *munmap()*, before the new mapping is established.

When MAP\_FIXED is not set, the implementation uses *addr* in an implementation-defined manner to arrive at *pa*. The *pa* so chosen shall be an area of the address space that the implementation deems suitable for a mapping of *len* bytes to the file. All implementations interpret an *addr* value of 0 as granting the implementation complete freedom in selecting *pa*, subject to constraints described below. A non-zero value of *addr* is taken to be a suggestion of a process address near which the mapping should be placed. When the implementation selects a value for *pa*, it never places a mapping at address 0, nor does it replace any extant mapping.

If MAP\_FIXED is specified and *addr* is non-zero, it shall have the same remainder as the *off* parameter, modulo the page size as returned by *sysconf()* when passed \_SC\_PAGESIZE or \_SC\_PAGE\_SIZE. The implementation may require that *off* is a multiple of the page size. If MAP\_FIXED is specified, the implementation may require that *addr* is a multiple of the page size. The system performs mapping operations over whole pages. Thus, while the parameter *len* need not meet a size or alignment constraint, the system shall include, in any mapping operation, any partial page specified by the address range starting at *pa* and continuing for *len* bytes.

The system shall always zero-fill any partial page at the end of an object. Further, the system shall never write out any modified portions of the last page of an object which are beyond its end. References within the address range starting at *pa* and continuing for *len* bytes to whole pages following the end of an object shall result in delivery of a SIGBUS signal.

An implementation may generate SIGBUS signals when a reference would cause an error in the mapped object, such as out-of-space condition.

The *mmap()* function shall add an extra reference to the file associated with the file descriptor *fd* which is not removed by a subsequent *close()* on that file descriptor. This reference shall be removed when there are no more mappings to the file.

The last data access timestamp of the mapped file may be marked for update at any time between the *mmap()* call and the corresponding *munmap()* call. The initial read or write reference to a mapped region shall cause the file's last data access timestamp to be marked for update if it has not already been marked for update.

The last data modification and last file status change timestamps of a file that is mapped with MAP\_SHARED and PROT\_WRITE shall be marked for update at some point in the interval between a write reference to the mapped region and the next call to *msync()* with MS\_ASYNC or MS\_SYNC for that portion of the file by any process. If there is no such call and if the underlying file is modified as a result of a write reference, then these timestamps shall be marked for update at some time after the write reference.

There may be implementation-defined limits on the number of memory regions that can be mapped (per process or per system).

If such a limit is imposed, whether the number of memory regions that can be mapped by a process is decreased by the use of *shmat()* is implementation-defined.

44451 If *mmap()* fails for reasons other than [EBADF], [EINVAL], or [ENOTSUP], some of the  
 44452 mappings in the address range starting at *addr* and continuing for *len* bytes may have been  
 44453 unmapped.

#### 44454 RETURN VALUE

44455 Upon successful completion, the *mmap()* function shall return the address at which the mapping  
 44456 was placed (*pa*); otherwise, it shall return a value of MAP\_FAILED and set *errno* to indicate the  
 44457 error. The symbol MAP\_FAILED is defined in the <sys/mman.h> header. No successful return  
 44458 from *mmap()* shall return the value MAP\_FAILED.

#### 44459 ERRORS

44460 The *mmap()* function shall fail if:

- |           |             |                                                                                                                                                                                                                                                                            |

| 44489     | [EOVERFLOW] | The file is a regular file and the value of <i>off</i> plus <i>len</i> exceeds the offset<br>44490 maximum established in the open file description associated with <i>fildev</i> .                                                                                        |

44491 The *mmap()* function may fail if:

44492 [EINVAL] The *addr* argument (if MAP\_FIXED was specified) or *off* is not a multiple of the  
 44493 page size as returned by *sysconf()*, or is considered invalid by the  
 44494 implementation.

#### 44495 EXAMPLES

44496 None.

#### 44497 APPLICATION USAGE

44498 Use of *mmap()* may reduce the amount of memory available to other memory allocation  
 44499 functions.

44500 Use of MAP\_FIXED may result in unspecified behavior in further use of *malloc()* and *shmat()*.  
 44501 The use of MAP\_FIXED is discouraged, as it may prevent an implementation from making the  
 44502 most effective use of resources. Most implementations require that *off* and *addr* are multiples of  
 44503 the page size as returned by *sysconf()*.

44504 The application must ensure correct synchronization when using *mmap()* in conjunction with  
 44505 any other file access method, such as *read()* and *write()*, standard input/output, and *shmat()*.

44506 The *mmap()* function allows access to resources via address space manipulations, instead of  
 44507 *read()/write()*. Once a file is mapped, all a process has to do to access it is use the data at the  
 44508 address to which the file was mapped. So, using pseudo-code to illustrate the way in which an  
 44509 existing program might be changed to use *mmap()*, the following:

```
44510 fildes = open(...)
44511 lseek(fildes, some_offset)
44512 read(fildes, buf, len)
44513 /* Use data in buf. */
```

44514 becomes:

```
44515 fildes = open(...)
44516 address = mmap(0, len, PROT_READ, MAP_PRIVATE, fildes, some_offset)
44517 /* Use data at address. */
```

#### 44518 RATIONALE

44519 After considering several other alternatives, it was decided to adopt the *mmap()* definition  
 44520 found in SVR4 for mapping memory objects into process address spaces. The SVR4 definition is  
 44521 minimal, in that it describes only what has been built, and what appears to be necessary for a  
 44522 general and portable mapping facility.

44523 Note that while *mmap()* was first designed for mapping files, it is actually a general-purpose  
 44524 mapping facility. It can be used to map any appropriate object, such as memory, files, devices,  
 44525 and so on, into the address space of a process.

44526 When a mapping is established, it is possible that the implementation may need to map more  
 44527 than is requested into the address space of the process because of hardware requirements. An  
 44528 application, however, cannot count on this behavior. Implementations that do not use a paged  
 44529 architecture may simply allocate a common memory region and return the address of it; such  
 44530 implementations probably do not allocate any more than is necessary. References past the end of  
 44531 the requested area are unspecified.

44532 If an application requests a mapping that overlaps existing mappings in the process, it might be  
 44533 desirable that an implementation detect this and inform the application. However, if the  
 44534 program specifies a fixed address mapping (which requires some implementation knowledge to  
 44535 determine a suitable address, if the function is supported at all), then the program is presumed

to be successfully managing its own address space and should be trusted when it asks to map over existing data structures. Furthermore, it is also desirable to make as few system calls as possible, and it might be considered onerous to require an *munmap()* before an *mmap()* to the same address range. This volume of POSIX.1-2008 specifies that the new mapping replaces any existing mappings (implying an automatic *munmap()* on the address range), following existing practice in this regard. The standard developers also considered whether there should be a way for new mappings to overlay existing mappings, but found no existing practice for this.

It is not expected that all hardware implementations are able to support all combinations of permissions at all addresses. Implementations are required to disallow write access to mappings without write permission and to disallow access to mappings without any access permission. Other than these restrictions, implementations may allow access types other than those requested by the application. For example, if the application requests only *PROT\_WRITE*, the implementation may also allow read access. A call to *mmap()* fails if the implementation cannot support allowing all the access requested by the application. For example, some implementations cannot support a request for both write access and execute access simultaneously. All implementations must support requests for no access, read access, write access, and both read and write access. Strictly conforming code must only rely on the required checks. These restrictions allow for portability across a wide range of hardware.

The *MAP\_FIXED* address treatment is likely to fail for non-page-aligned values and for certain architecture-dependent address ranges. Conforming implementations cannot count on being able to choose address values for *MAP\_FIXED* without utilizing non-portable, implementation-defined knowledge. Nonetheless, *MAP\_FIXED* is provided as a standard interface conforming to existing practice for utilizing such knowledge when it is available.

Similarly, in order to allow implementations that do not support virtual addresses, support for directly specifying any mapping addresses via *MAP\_FIXED* is not required and thus a conforming application may not count on it.

The *MAP\_PRIVATE* function can be implemented efficiently when memory protection hardware is available. When such hardware is not available, implementations can implement such “mappings” by simply making a real copy of the relevant data into process private memory, though this tends to behave similarly to *read()*.

The function has been defined to allow for many different models of using shared memory. However, all uses are not equally portable across all machine architectures. In particular, the *mmap()* function allows the system as well as the application to specify the address at which to map a specific region of a memory object. The most portable way to use the function is always to let the system choose the address, specifying *NULL* as the value for the argument *addr* and not to specify *MAP\_FIXED*.

If it is intended that a particular region of a memory object be mapped at the same address in a group of processes (on machines where this is even possible), then *MAP\_FIXED* can be used to pass in the desired mapping address. The system can still be used to choose the desired address if the first such mapping is made without specifying *MAP\_FIXED*, and then the resulting mapping address can be passed to subsequent processes for them to pass in via *MAP\_FIXED*. The availability of a specific address range cannot be guaranteed, in general.

The *mmap()* function can be used to map a region of memory that is larger than the current size of the object. Memory access within the mapping but beyond the current end of the underlying objects may result in *SIGBUS* signals being sent to the process. The reason for this is that the size of the object can be manipulated by other processes and can change at any moment. The implementation should tell the application that a memory reference is outside the object where this can be detected; otherwise, written data may be lost and read data may not reflect actual

data in the object.

Note that references beyond the end of the object do not extend the object as the new end cannot be determined precisely by most virtual memory hardware. Instead, the size can be directly manipulated by *ftruncate()*.

Process memory locking does apply to shared memory regions, and the `MCL_FUTURE` argument to *mlockall()* can be relied upon to cause new shared memory regions to be automatically locked.

Existing implementations of *mmap()* return the value `-1` when unsuccessful. Since the casting of this value to type `void *` cannot be guaranteed by the ISO C standard to be distinct from a successful value, this volume of POSIX.1-2008 defines the symbol `MAP_FAILED`, which a conforming implementation does not return as the result of a successful call.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 4, Version 2.

### Issue 5

Moved from X/OPEN UNIX extension to BASE.

Aligned with *mmap()* in the POSIX Realtime Extension as follows:

- The DESCRIPTION is extensively reworded.
- The `[EAGAIN]` and `[ENOTSUP]` mandatory error conditions are added.
- New cases of `[ENOMEM]` and `[ENXIO]` are added as mandatory error conditions.
- The value returned on failure is the value of the constant `MAP_FAILED`; this was previously defined as `-1`.

Large File Summit extensions are added.

### Issue 6

The *mmap()* function is marked as part of the Memory Mapped Files option.

The Open Group Corrigendum U028/6 is applied, changing `(void *)-1` to `MAP_FAILED`.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to describe the use of `MAP_FIXED`.
- The DESCRIPTION is updated to describe the addition of an extra reference to the file associated with the file descriptor passed to *mmap()*.
- The DESCRIPTION is updated to state that there may be implementation-defined limits on the number of memory regions that can be mapped.
- The DESCRIPTION is updated to describe constraints on the alignment and size of the *off* argument.

- The [EINVAL] and [EMFILE] error conditions are added.

- The [EOVERFLOW] error condition is added. This change is to support large files.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The DESCRIPTION is updated to describe the cases when MAP\_PRIVATE and MAP\_FIXED need not be supported.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- Semantics for typed memory objects are added to the DESCRIPTION.
- New [ENOMEM] and [ENXIO] errors are added to the ERRORS section.
- The *posix\_typed\_mem\_open()* function is added to the SEE ALSO section.

The normative text is updated to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/60 is applied, updating the DESCRIPTION and ERRORS sections to add the [EINVAL] error when *len* is zero.

#### Issue 7

Austin Group Interpretations 1003.1-2001 #078 and #079 are applied, clarifying page alignment requirements and adding a note about the state of synchronization objects becoming undefined when a shared region is unmapped.

Functionality relating to the Memory Protection and Memory Mapped Files options is moved to the Base.

Changes are made related to support for finegrained timestamps.

44645 **NAME**

44646 modf, modff, modfl — decompose a floating-point number

44647 **SYNOPSIS**

44648 #include &lt;math.h&gt;

44649 double modf(double *x*, double \**iptr*);44650 float modff(float *value*, float \**iptr*);44651 long double modfl(long double *value*, long double \**iptr*);44652 **DESCRIPTION**

44653 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 44654 conflict between the requirements described here and the ISO C standard is unintentional. This  
 44655 volume of POSIX.1-2008 defers to the ISO C standard.

44656 These functions shall break the argument *x* into integral and fractional parts, each of which has  
 44657 the same sign as the argument. It stores the integral part as a **double** (for the *modf*() function), a  
 44658 **float** (for the *modff*() function), or a **long double** (for the *modfl*() function), in the object pointed  
 44659 to by *iptr*.

44660 **RETURN VALUE**44661 Upon successful completion, these functions shall return the signed fractional part of *x*.44662 MX If *x* is NaN, a NaN shall be returned, and \**iptr* shall be set to a NaN.44663 If *x* is  $\pm\text{Inf}$ ,  $\pm 0$  shall be returned, and \**iptr* shall be set to  $\pm\text{Inf}$ .44664 **ERRORS**

44665 No errors are defined.

44666 **EXAMPLES**

44667 None.

44668 **APPLICATION USAGE**44669 The *modf*() function computes the function result and \**iptr* such that:44670 *a* = modf(*x*, *iptr*) ;44671 *x* == *a*+\**iptr* ;

44672 allowing for the usual floating-point inaccuracies.

44673 **RATIONALE**

44674 None.

44675 **FUTURE DIRECTIONS**

44676 None.

44677 **SEE ALSO**44678 *frexp()*, *isnan()*, *ldexp()*

44679 XBD &lt;math.h&gt;

44680 **CHANGE HISTORY**

44681 First released in Issue 1. Derived from Issue 1 of the SVID.

44682 **Issue 5**

44683 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 44684 text was previously published in the APPLICATION USAGE section.

44685 **Issue 6**

44686 The *modff()* and *modfl()* functions are added for alignment with the ISO/IEC 9899:1999  
44687 standard.

44688 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
44689 revised to align with the ISO/IEC 9899:1999 standard.

44690 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
44691 marked.

44692 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/35 is applied, correcting the code example  
44693 in the APPLICATION USAGE section.

**NAME**

mprotect — set protection of memory mapping

**SYNOPSIS**

```
#include <sys/mman.h>
```

```
int mprotect(void *addr, size_t len, int prot);
```

**DESCRIPTION**

The *mprotect()* function shall change the access protections to be that specified by *prot* for those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes. The parameter *prot* determines whether read, write, execute, or some combination of accesses are permitted to the data being mapped. The *prot* argument should be either *PROT\_NONE* or the bitwise-inclusive OR of one or more of *PROT\_READ*, *PROT\_WRITE*, and *PROT\_EXEC*.

If an implementation cannot support the combination of access types specified by *prot*, the call to *mprotect()* shall fail.

An implementation may permit accesses other than those specified by *prot*; however, no implementation shall permit a write to succeed where *PROT\_WRITE* has not been set or shall permit any access where *PROT\_NONE* alone has been set. Implementations shall support at least the following values of *prot*: *PROT\_NONE*, *PROT\_READ*, *PROT\_WRITE*, and the bitwise-inclusive OR of *PROT\_READ* and *PROT\_WRITE*. If *PROT\_WRITE* is specified, the application shall ensure that it has opened the mapped objects in the specified address range with write permission, unless *MAP\_PRIVATE* was specified in the original mapping, regardless of whether the file descriptors used to map the objects have since been closed.

The implementation may require that *addr* be a multiple of the page size as returned by *sysconf()*.

The behavior of this function is unspecified if the mapping was not established by a call to *mmap()*.

When *mprotect()* fails for reasons other than *[EINVAL]*, the protections on some of the pages in the range [*addr*,*addr*+*len*) may have been changed.

**RETURN VALUE**

Upon successful completion, *mprotect()* shall return 0; otherwise, it shall return *-1* and set *errno* to indicate the error.

**ERRORS**

The *mprotect()* function shall fail if:

**[EACCES]** The *prot* argument specifies a protection that violates the access permission the process has to the underlying memory object.

**[EAGAIN]** The *prot* argument specifies *PROT\_WRITE* over a *MAP\_PRIVATE* mapping and there are insufficient memory resources to reserve for locking the private page.

**[ENOMEM]** Addresses in the range [*addr*,*addr*+*len*) are invalid for the address space of a process, or specify one or more pages which are not mapped.

**[ENOMEM]** The *prot* argument specifies *PROT\_WRITE* on a *MAP\_PRIVATE* mapping, and it would require more space than the system is able to supply for locking the private pages, if required.

44737 [ENOTSUP] The implementation does not support the combination of accesses requested  
44738 in the *prot* argument.

44739 The *mprotect()* function may fail if:

44740 [EINVAL] The *addr* argument is not a multiple of the page size as returned by *sysconf()*.

#### 44741 EXAMPLES

44742 None.

#### 44743 APPLICATION USAGE

44744 Most implementations require that *addr* is a multiple of the page size as returned by *sysconf()*.

#### 44745 RATIONALE

44746 None.

#### 44747 FUTURE DIRECTIONS

44748 None.

#### 44749 SEE ALSO

44751 XBD <sys/mman.h>

#### 44752 CHANGE HISTORY

44753 First released in Issue 4, Version 2.

#### 44754 Issue 5

44755 Moved from X/OPEN UNIX extension to BASE.

44756 Aligned with *mprotect()* in the POSIX Realtime Extension as follows:

- 44757 • The DESCRIPTION is largely reworded.
- 44758 • [ENOTSUP] and a second form of [ENOMEM] are added as mandatory error conditions.
- 44759 • [EAGAIN] is moved from the optional to the mandatory error conditions.

#### 44760 Issue 6

44761 The *mprotect()* function is marked as part of the Memory Protection option.

44762 The following new requirements on POSIX implementations derive from alignment with the  
44763 Single UNIX Specification:

- 44764 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple  
44765 of the page size as returned by *sysconf()*.
- 44766 • The [EINVAL] error condition is added.

44767 The normative text is updated to avoid use of the term “must” for application requirements.

#### 44768 Issue 7

44769 SD5-XSH-ERN-22 is applied, deleting erroneous APPLICATION USAGE.

44770 Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment  
44771 requirements.

44772 The *mprotect()* function is moved from the Memory Protection option to the Base.

44773 **NAME**44774 mq\_close — close a message queue (**REALTIME**)44775 **SYNOPSIS**

```
44776 MSG #include <mqueue.h>
44777 int mq_close(mqd_t mqdes);
```

44778 **DESCRIPTION**

44779 The *mq\_close()* function shall remove the association between the message queue descriptor,  
 44780 *mqdes*, and its message queue. The results of using this message queue descriptor after successful  
 44781 return from this *mq\_close()*, and until the return of this message queue descriptor from a  
 44782 subsequent *mq\_open()*, are undefined.

44783 If the process has successfully attached a notification request to the message queue via this  
 44784 *mqdes*, this attachment shall be removed, and the message queue is available for another process  
 44785 to attach for notification.

44786 **RETURN VALUE**

44787 Upon successful completion, the *mq\_close()* function shall return a value of zero; otherwise, the  
 44788 function shall return a value of -1 and set *errno* to indicate the error.

44789 **ERRORS**

44790 The *mq\_close()* function shall fail if:

44791 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

44792 **EXAMPLES**

44793 None.

44794 **APPLICATION USAGE**

44795 None.

44796 **RATIONALE**

44797 None.

44798 **FUTURE DIRECTIONS**

44799 None.

44802 XBD [<mqueue.h>](#)

44803 **CHANGE HISTORY**

44804 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

44805 **Issue 6**

44806 The *mq\_close()* function is marked as part of the Message Passing option.

44807 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 44808 implementation does not support the Message Passing option.

44809 **NAME**44810 mq\_getattr — get message queue attributes (**REALTIME**)44811 **SYNOPSIS**

```
44812 MSG #include <mqueue.h>
44813 int mq_getattr(mqd_t mqdes, struct mq_attr *mqstat);
```

44814 **DESCRIPTION**

44815 The *mq\_getattr()* function shall obtain status information and attributes of the message queue  
44816 and the open message queue description associated with the message queue descriptor.

44817 The *mqdes* argument specifies a message queue descriptor.

44818 The results shall be returned in the **mq\_attr** structure referenced by the *mqstat* argument.

44819 Upon return, the following members shall have the values associated with the open message  
44820 queue description as set when the message queue was opened and as modified by subsequent  
44821 *mq\_setattr()* calls: *mq\_flags*.

44822 The following attributes of the message queue shall be returned as set at message queue  
44823 creation: *mq\_maxmsg*, *mq\_msgsize*.

44824 Upon return, the following members within the **mq\_attr** structure referenced by the *mqstat*  
44825 argument shall be set to the current state of the message queue:

44826 *mq\_curmsgs* The number of messages currently on the queue.

44827 **RETURN VALUE**

44828 Upon successful completion, the *mq\_getattr()* function shall return zero. Otherwise, the function  
44829 shall return  $-1$  and set *errno* to indicate the error.

44830 **ERRORS**

44831 The *mq\_getattr()* function may fail if:

44832 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

44833 **EXAMPLES**

44834 See *mq\_notify()*.

44847 The *mq\_getattr()* function is marked as part of the Message Passing option.

44848 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
44849 implementation does not support the Message Passing option.

44850 The *mq\_timedsend()* function is added to the SEE ALSO section for alignment with IEEE Std  
44851 1003.1d-1999.

44852 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/61 is applied, updating the ERRORS  
44853 section to change the [EBADF] error from mandatory to optional.

44854 **NAME**44855 mq\_notify — notify process that a message is available (**REALTIME**)44856 **SYNOPSIS**

```
44857 MSG    #include <mqueue.h>
44858        int mq_notify(mqd_t mqdes, const struct sigevent *notification);
```

44859 **DESCRIPTION**

44860 If the argument *notification* is not NULL, this function shall register the calling process to be  
44861 notified of message arrival at an empty message queue associated with the specified message  
44862 queue descriptor, *mqdes*. The notification specified by the *notification* argument shall be sent to  
44863 the process when the message queue transitions from empty to non-empty. At any time, only  
44864 one process may be registered for notification by a message queue. If the calling process or any  
44865 other process has already registered for notification of message arrival at the specified message  
44866 queue, subsequent attempts to register for that message queue shall fail.

44867 If *notification* is NULL and the process is currently registered for notification by the specified  
44868 message queue, the existing registration shall be removed.

44869 When the notification is sent to the registered process, its registration shall be removed. The  
44870 message queue shall then be available for registration.

44871 If a process has registered for notification of message arrival at a message queue and some  
44872 thread is blocked in *mq\_receive()* or *mq\_timedreceive()* waiting to receive a message when a  
44873 message arrives at the queue, the arriving message shall satisfy the appropriate *mq\_receive()* or  
44874 *mq\_timedreceive()*, respectively. The resulting behavior is as if the message queue remains empty,  
44875 and no notification shall be sent.

44876 **RETURN VALUE**

44877 Upon successful completion, the *mq\_notify()* function shall return a value of zero; otherwise, the  
44878 function shall return a value of -1 and set *errno* to indicate the error.

44879 **ERRORS**

44880 The *mq\_notify()* function shall fail if:

44881 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

44882 [EBUSY] A process is already registered for notification by the message queue.

44883 The *mq\_notify()* function may fail if:

44884 [EINVAL] The *notification* argument is NULL and the process is currently not registered.

44885 **EXAMPLES**

44886 The following program registers a notification request for the message queue named in its  
44887 command-line argument. Notification is performed by creating a thread. The thread executes a  
44888 function which reads one message from the queue and then terminates the process.

```
44889 #include <pthread.h>
44890 #include <mqueue.h>
44891 #include <assert.h>
44892 #include <stdio.h>
44893 #include <stdlib.h>
44894 #include <unistd.h>

44895 static void                                /* Thread start function */
44896 tfunc(union sigval sv)
44897 {
```

```
44898     struct mq_attr attr;
44899     ssize_t nr;
44900     void *buf;
44901     mqd_t mqdes = *((mqd_t *) sv.sival_ptr);
44902     /* Determine maximum msg size; allocate buffer to receive msg */
44903     if (mq_getattr(mqdes, &attr) == -1) {
44904         perror("mq_getattr");
44905         exit(EXIT_FAILURE);
44906     }
44907     buf = malloc(attr.mq_msgsize);
44908     if (buf == NULL) {
44909         perror("malloc");
44910         exit(EXIT_FAILURE);
44911     }
44912     nr = mq_receive(mqdes, buf, attr.mq_msgsize, NULL);
44913     if (nr == -1) {
44914         perror("mq_receive");
44915         exit(EXIT_FAILURE);
44916     }
44917     printf("Read %ld bytes from message queue\n", (long) nr);
44918     free(buf);
44919     exit(EXIT_SUCCESS);          /* Terminate the process */
44920 }
44921 int
44922 main(int argc, char *argv[])
44923 {
44924     mqd_t mqdes;
44925     struct sigevent not;
44926     assert(argc == 2);
44927     mqdes = mq_open(argv[1], O_RDONLY);
44928     if (mqdes == (mqd_t) -1) {
44929         perror("mq_open");
44930         exit(EXIT_FAILURE);
44931     }
44932     not.sigev_notify = SIGEV_THREAD;
44933     not.sigev_notify_function = tfunc;
44934     not.sigev_notify_attributes = NULL;
44935     not.sigev_value.sival_ptr = &mqdes;    /* Arg. to thread func. */
44936     if (mq_notify(mqdes, &not) == -1) {
44937         perror("mq_notify");
44938         exit(EXIT_FAILURE);
44939     }
44940     pause();    /* Process will be terminated by thread function */
44941 }
```

44950 XBD &lt;mqqueue.h&gt;

44951 **CHANGE HISTORY**

44952 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

44953 **Issue 6**44954 The *mq\_notify()* function is marked as part of the Message Passing option.44955 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
44956 implementation does not support the Message Passing option.44957 The *mq\_timedsend()* function is added to the SEE ALSO section for alignment with IEEE Std  
44958 1003.1d-1999.44959 **Issue 7**44960 SD5-XSH-ERN-38 is applied, adding the *mq\_timedreceive()* function to the DESCRIPTION.

44961 Austin Group Interpretation 1003.1-2001 #032 is applied, adding the [EINVAL] error.

44962 An example is added.

44963 **NAME**44964 `mq_open` — open a message queue (**REALTIME**)44965 **SYNOPSIS**

```
44966 MSG      #include <mqueue.h>
44967      mqd_t mq_open(const char *name, int oflag, ...);
```

44968 **DESCRIPTION**

44969 The `mq_open()` function shall establish the connection between a process and a message queue  
 44970 with a message queue descriptor. It shall create an open message queue description that refers to  
 44971 the message queue, and a message queue descriptor that refers to that open message queue  
 44972 description. The message queue descriptor is used by other functions to refer to that message  
 44973 queue. The *name* argument points to a string naming a message queue. It is unspecified whether  
 44974 the name appears in the file system and is visible to other functions that take pathnames as  
 44975 arguments. The *name* argument conforms to the construction rules for a pathname, except that  
 44976 the interpretation of <slash> characters other than the leading <slash> character in *name* is  
 44977 implementation-defined, and that the length limits for the *name* argument are implementation-  
 44978 defined and need not be the same as the pathname limits {PATH\_MAX} and {NAME\_MAX}. If  
 44979 *name* begins with the <slash> character, then processes calling `mq_open()` with the same value of  
 44980 *name* shall refer to the same message queue object, as long as that name has not been removed. If  
 44981 *name* does not begin with the <slash> character, the effect is implementation-defined. If the *name*  
 44982 argument is not the name of an existing message queue and creation is not requested, `mq_open()`  
 44983 shall fail and return an error.

44984 A message queue descriptor may be implemented using a file descriptor, in which case  
 44985 applications can open up to at least {OPEN\_MAX} file and message queues.

44986 The *oflag* argument requests the desired receive and/or send access to the message queue. The  
 44987 requested access permission to receive messages or send messages shall be granted if the calling  
 44988 process would be granted read or write access, respectively, to an equivalently protected file.

44989 The value of *oflag* is the bitwise-inclusive OR of values from the following list. Applications  
 44990 shall specify exactly one of the first three values (access modes) below in the value of *oflag*:

44991 **O\_RDONLY**      Open the message queue for receiving messages. The process can use the  
 44992                    returned message queue descriptor with `mq_receive()`, but not `mq_send()`. A  
 44993                    message queue may be open multiple times in the same or different processes  
 44994                    for receiving messages.

44995 **O\_WRONLY**      Open the queue for sending messages. The process can use the returned  
 44996                    message queue descriptor with `mq_send()` but not `mq_receive()`. A message  
 44997                    queue may be open multiple times in the same or different processes for  
 44998                    sending messages.

44999 **O\_RDWR**        Open the queue for both receiving and sending messages. The process can use  
 45000                    any of the functions allowed for **O\_RDONLY** and **O\_WRONLY**. A message  
 45001                    queue may be open multiple times in the same or different processes for  
 45002                    sending messages.

45003 Any combination of the remaining flags may be specified in the value of *oflag*:

45004 **O\_CREAT**        Create a message queue. It requires two additional arguments: *mode*, which  
 45005                    shall be of type **mode\_t**, and *attr*, which shall be a pointer to an **mq\_attr**  
 45006                    structure. If the pathname *name* has already been used to create a message  
 45007                    queue that still exists, then this flag shall have no effect, except as noted under  
 45008                    **O\_EXCL**. Otherwise, a message queue shall be created without any messages

|       |                                                                                              |                                                                                                   |
|-------|----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| 45009 |                                                                                              | in it. The user ID of the message queue shall be set to the effective user ID of                  |
| 45010 |                                                                                              | the process. The group ID of the message queue shall be set to the effective                      |
| 45011 |                                                                                              | group ID of the process; however, if the <i>name</i> argument is visible in the file              |
| 45012 |                                                                                              | system, the group ID may be set to the group ID of the containing directory.                      |
| 45013 |                                                                                              | When bits in <i>mode</i> other than the file permission bits are specified, the effect is         |
| 45014 |                                                                                              | unspecified. If <i>attr</i> is NULL, the message queue shall be created with                      |
| 45015 |                                                                                              | implementation-defined default message queue attributes. If <i>attr</i> is non-NULL               |
| 45016 |                                                                                              | and the calling process has appropriate privileges on <i>name</i> , the message queue             |
| 45017 |                                                                                              | <i>mq_maxmsg</i> and <i>mq_msgsize</i> attributes shall be set to the values of the               |
| 45018 |                                                                                              | corresponding members in the <b>mq_attr</b> structure referred to by <i>attr</i> . The            |
| 45019 |                                                                                              | values of the <i>mq_flags</i> and <i>mq_curmsgs</i> members of the <b>mq_attr</b> structure shall |
| 45020 |                                                                                              | be ignored. If <i>attr</i> is non-NULL, but the calling process does not have                     |
| 45021 |                                                                                              | appropriate privileges on <i>name</i> , the <i>mq_open()</i> function shall fail and return an    |
| 45022 |                                                                                              | error without creating the message queue.                                                         |
| 45023 | O_EXCL                                                                                       | If O_EXCL and O_CREAT are set, <i>mq_open()</i> shall fail if the message queue                   |
| 45024 |                                                                                              | <i>name</i> exists. The check for the existence of the message queue and the creation             |
| 45025 |                                                                                              | of the message queue if it does not exist shall be atomic with respect to other                   |
| 45026 |                                                                                              | threads executing <i>mq_open()</i> naming the same <i>name</i> with O_EXCL and                    |
| 45027 |                                                                                              | O_CREAT set. If O_EXCL is set and O_CREAT is not set, the result is                               |
| 45028 |                                                                                              | undefined.                                                                                        |
| 45029 | O_NONBLOCK                                                                                   | Determines whether an <i>mq_send()</i> or <i>mq_receive()</i> waits for resources or              |
| 45030 |                                                                                              | messages that are not currently available, or fails with <i>errno</i> set to [EAGAIN];            |
| 45031 |                                                                                              | see <i>mq_send()</i> and <i>mq_receive()</i> for details.                                         |
| 45032 | The <i>mq_open()</i> function does not add or remove messages from the queue.                |                                                                                                   |
| 45033 | <b>RETURN VALUE</b>                                                                          |                                                                                                   |
| 45034 | Upon successful completion, the function shall return a message queue descriptor; otherwise, |                                                                                                   |
| 45035 | the function shall return ( <b>mqd_t</b> )−1 and set <i>errno</i> to indicate the error.     |                                                                                                   |
| 45036 | <b>ERRORS</b>                                                                                |                                                                                                   |
| 45037 | The <i>mq_open()</i> function shall fail if:                                                 |                                                                                                   |
| 45038 | [EACCES]                                                                                     | The message queue exists and the permissions specified by <i>oflag</i> are denied, or             |
| 45039 |                                                                                              | the message queue does not exist and permission to create the message queue                       |
| 45040 |                                                                                              | is denied.                                                                                        |
| 45041 | [EEXIST]                                                                                     | O_CREAT and O_EXCL are set and the named message queue already exists.                            |
| 45042 | [EINTR]                                                                                      | The <i>mq_open()</i> function was interrupted by a signal.                                        |
| 45043 | [EINVAL]                                                                                     | The <i>mq_open()</i> function is not supported for the given name.                                |
| 45044 | [EINVAL]                                                                                     | O_CREAT was specified in <i>oflag</i> , the value of <i>attr</i> is not NULL, and either          |
| 45045 |                                                                                              | <i>mq_maxmsg</i> or <i>mq_msgsize</i> was less than or equal to zero.                             |
| 45046 | [EMFILE]                                                                                     | Too many message queue descriptors or file descriptors are currently in use by                    |
| 45047 |                                                                                              | this process.                                                                                     |
| 45048 | [ENFILE]                                                                                     | Too many message queues are currently open in the system.                                         |
| 45049 | [ENOENT]                                                                                     | O_CREAT is not set and the named message queue does not exist.                                    |
| 45050 | [ENOSPC]                                                                                     | There is insufficient space for the creation of the new message queue.                            |

45051 If any of the following conditions occur, the *mq\_open()* function may return (**mqd\_t**)–1 and set  
 45052 *errno* to the corresponding value.

45053 [ENAMETOOLONG]

45054 The length of the *name* argument exceeds {\_POSIX\_PATH\_MAX} on systems  
 45055 XSI that do not support the XSI option or exceeds {\_XOPEN\_PATH\_MAX} on XSI  
 45056 systems, or has a pathname component that is longer than  
 45057 XSI {\_POSIX\_NAME\_MAX} on systems that do not support the XSI option or  
 45058 longer than {\_XOPEN\_NAME\_MAX} on XSI systems.

#### 45059 EXAMPLES

45060 None.

#### 45061 APPLICATION USAGE

45062 None.

#### 45063 RATIONALE

45064 None.

#### 45065 FUTURE DIRECTIONS

45066 A future version might require the *mq\_open()* and *mq\_unlink()* functions to have semantics  
 45067 similar to normal file system operations.

#### 45068 SEE ALSO

45069 *mq\_close()*, *mq\_getattr()*, *mq\_receive()*, *mq\_send()*, *mq\_setattr()*, *mq\_unlink()*, *msgctl()*, *msgget()*,

45071 XBD <mqqueue.h>

#### 45072 CHANGE HISTORY

45073 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

#### 45074 Issue 6

45075 The *mq\_open()* function is marked as part of the Message Passing option.

45076 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 45077 implementation does not support the Message Passing option.

45078 The *mq\_timedreceive()* and *mq\_timedsend()* functions are added to the SEE ALSO section for  
 45079 alignment with IEEE Std 1003.1d-1999.

45080 The DESCRIPTION of O\_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.

45081 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/62 is applied, updating the description of  
 45082 the permission bits in the DESCRIPTION. The change is made for consistency with the  
 45083 *shm\_open()* and *sem\_open()* functions.

#### 45084 Issue 7

45085 Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and  
 45086 changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error.

45087 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

45088 SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the  
 45089 user ID and group ID of the message queue.

45090 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0394 [259] is applied.

## NAME

mq\_receive, mq\_timedreceive — receive a message from a message queue (REALTIME)

## SYNOPSIS

```
#include <mqueue.h>

ssize_t mq_receive(mqd_t mqdes, char *msg_ptr, size_t msg_len,
    unsigned *msg_prio);

#include <mqueue.h>
#include <time.h>

ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
    size_t msg_len, unsigned *restrict msg_prio,
    const struct timespec *restrict abstime);
```

## DESCRIPTION

The *mq\_receive()* function shall receive the oldest of the highest priority message(s) from the message queue specified by *mqdes*. If the size of the buffer in bytes, specified by the *msg\_len* argument, is less than the *mq\_msgsize* attribute of the message queue, the function shall fail and return an error. Otherwise, the selected message shall be removed from the queue and copied to the buffer pointed to by the *msg\_ptr* argument.

If the value of *msg\_len* is greater than {SSIZE\_MAX}, the result is implementation-defined.

If the argument *msg\_prio* is not NULL, the priority of the selected message shall be stored in the location referenced by *msg\_prio*.

If the specified message queue is empty and O\_NONBLOCK is not set in the message queue description associated with *mqdes*, *mq\_receive()* shall block until a message is enqueued on the message queue or until *mq\_receive()* is interrupted by a signal. If more than one thread is waiting to receive a message when a message arrives at an empty queue and the Priority Scheduling option is supported, then the thread of highest priority that has been waiting the longest shall be selected to receive the message. Otherwise, it is unspecified which waiting thread receives the message. If the specified message queue is empty and O\_NONBLOCK is set in the message queue description associated with *mqdes*, no message shall be removed from the queue, and *mq\_receive()* shall return an error.

The *mq\_timedreceive()* function shall receive the oldest of the highest priority messages from the message queue specified by *mqdes* as described for the *mq\_receive()* function. However, if O\_NONBLOCK was not specified when the message queue was opened via the *mq\_open()* function, and no message exists on the queue to satisfy the receive, the wait for such a message shall be terminated when the specified timeout expires. If O\_NONBLOCK is set, this function is equivalent to *mq\_receive()*.

The timeout expires when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall be the resolution of the clock on which it is based. The *timespec* argument is defined in the **<time.h>** header.

Under no circumstance shall the operation fail with a timeout if a message can be removed from the message queue immediately. The validity of the *abstime* parameter need not be checked if a message can be removed from the message queue immediately.

**RETURN VALUE**

Upon successful completion, the *mq\_receive()* and *mq\_timedreceive()* functions shall return the length of the selected message in bytes and the message shall be removed from the queue. Otherwise, no message shall be removed from the queue, the functions shall return a value of -1, and set *errno* to indicate the error.

**ERRORS**

These functions shall fail if:

- [EAGAIN] O\_NONBLOCK was set in the message description associated with *mqdes*, and the specified message queue is empty.
- [EBADF] The *mqdes* argument is not a valid message queue descriptor open for reading.
- [EMSGSIZE] The specified message buffer size, *msg\_len*, is less than the message size attribute of the message queue.
- [EINTR] The *mq\_receive()* or *mq\_timedreceive()* operation was interrupted by a signal.
- [EINVAL] The process or thread would have blocked, and the *abstime* parameter specified a nanoseconds field value less than zero or greater than or equal to 1 000 million.
- [ETIMEDOUT] The O\_NONBLOCK flag was not set when the message queue was opened, but no message arrived on the queue before the specified timeout expired.

These functions may fail if:

- [EBADMSG] The implementation has detected a data corruption problem with the message.

XBD <mqqueue.h>, <time.h>

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

The *mq\_receive()* function is marked as part of the Message Passing option.

The Open Group Corrigendum U021/4 is applied. The DESCRIPTION is changed to refer to *msg\_len* rather than *maxsize*.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In this function it is possible for the return value to exceed the range of the type **ssize\_t** (since **size\_t** has a larger range of positive values than **ssize\_t**). A sentence restricting the size of the **size\_t** object is added to the description to resolve this conflict.

The *mq\_timedreceive()* function is added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *mq\_timedreceive()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE PASC Interpretation 1003.1 #109 is applied, correcting the return type for *mq\_timedreceive()* from **int** to **ssize\_t**.

#### Issue 7

The *mq\_timedreceive()* function is moved from the Timeouts option to the Base.

Functionality relating to the Timers option is moved to the Base.

45189 **NAME**45190 `mq_send`, `mq_timedsend` — send a message to a message queue (**REALTIME**)45191 **SYNOPSIS**

```
45192 MSG    #include <mqueue.h>
45193
45193     int mq_send(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
45194               unsigned msg_prio);
45195
45195     #include <mqueue.h>
45196     #include <time.h>
45197
45197     int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
45198                   unsigned msg_prio, const struct timespec *abstime);
```

45199 **DESCRIPTION**

45200 The `mq_send()` function shall add the message pointed to by the argument `msg_ptr` to the  
45201 message queue specified by `mqdes`. The `msg_len` argument specifies the length of the message, in  
45202 bytes, pointed to by `msg_ptr`. The value of `msg_len` shall be less than or equal to the `mq_msgsize`  
45203 attribute of the message queue, or `mq_send()` shall fail.

45204 If the specified message queue is not full, `mq_send()` shall behave as if the message is inserted  
45205 into the message queue at the position indicated by the `msg_prio` argument. A message with a  
45206 larger numeric value of `msg_prio` shall be inserted before messages with lower values of  
45207 `msg_prio`. A message shall be inserted after other messages in the queue, if any, with equal  
45208 `msg_prio`. The value of `msg_prio` shall be less than {MQ\_PRIO\_MAX}.

45209 If the specified message queue is full and O\_NONBLOCK is not set in the message queue  
45210 description associated with `mqdes`, `mq_send()` shall block until space becomes available to  
45211 enqueue the message, or until `mq_send()` is interrupted by a signal. If more than one thread is  
45212 waiting to send when space becomes available in the message queue and the Priority Scheduling  
45213 option is supported, then the thread of the highest priority that has been waiting the longest  
45214 shall be unblocked to send its message. Otherwise, it is unspecified which waiting thread is  
45215 unblocked. If the specified message queue is full and O\_NONBLOCK is set in the message  
45216 queue description associated with `mqdes`, the message shall not be queued and `mq_send()` shall  
45217 return an error.

45218 The `mq_timedsend()` function shall add a message to the message queue specified by `mqdes` in the  
45219 manner defined for the `mq_send()` function. However, if the specified message queue is full and  
45220 O\_NONBLOCK is not set in the message queue description associated with `mqdes`, the wait for  
45221 sufficient room in the queue shall be terminated when the specified timeout expires. If  
45222 O\_NONBLOCK is set in the message queue description, this function shall be equivalent to  
45223 `mq_send()`.

45224 The timeout shall expire when the absolute time specified by `abstime` passes, as measured by the  
45225 clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
45226 `abstime`), or if the absolute time specified by `abstime` has already been passed at the time of the  
45227 call.

45228 The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall  
45229 be the resolution of the clock on which it is based. The `timespec` argument is defined in the  
45230 **<time.h>** header.

45231 Under no circumstance shall the operation fail with a timeout if there is sufficient room in the  
45232 queue to add the message immediately. The validity of the `abstime` parameter need not be  
45233 checked when there is sufficient room in the queue.

**RETURN VALUE**

Upon successful completion, the `mq_send()` and `mq_timedsend()` functions shall return a value of zero. Otherwise, no message shall be enqueued, the functions shall return `-1`, and `errno` shall be set to indicate the error.

**ERRORS**

The `mq_send()` and `mq_timedsend()` functions shall fail if:

[EAGAIN] The `O_NONBLOCK` flag is set in the message queue description associated with `mqdes`, and the specified message queue is full.

[EBADF] The `mqdes` argument is not a valid message queue descriptor open for writing.

[EINTR] A signal interrupted the call to `mq_send()` or `mq_timedsend()`.

[EINVAL] The value of `msg_prio` was outside the valid range.

[EINVAL] The process or thread would have blocked, and the `abstime` parameter specified a nanoseconds field value less than zero or greater than or equal to 1 000 million.

[EMSGSIZE] The specified message length, `msg_len`, exceeds the message size attribute of the message queue.

[ETIMEDOUT] The `O_NONBLOCK` flag was not set when the message queue was opened, but the timeout expired before the message could be added to the queue.

**EXAMPLES**

None.

**APPLICATION USAGE**

The value of the symbol `{MQ_PRIO_MAX}` limits the number of priority levels supported by the application. Message priorities range from 0 to `{MQ_PRIO_MAX}-1`.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**Issue 6**

The `mq_send()` function is marked as part of the Message Passing option.

The `[ENOSYS]` error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The `mq_timedsend()` function is added for alignment with IEEE Std 1003.1d-1999.

**Issue 7**

The `mq_timedsend()` function is moved from the Timeouts option to the Base.

Functionality relating to the Timers option is moved to the Base.

45274 **NAME**45275 mq\_setattr — set message queue attributes (**REALTIME**)45276 **SYNOPSIS**

```
45277 MSG    #include <mqueue.h>
45278
45278     int mq_setattr(mqd_t mqdes, const struct mq_attr *restrict mqstat,
45279                   struct mq_attr *restrict omqstat);
```

45280 **DESCRIPTION**

45281 The *mq\_setattr()* function shall set attributes associated with the open message queue  
 45282 description referenced by the message queue descriptor specified by *mqdes*.

45283 The message queue attributes corresponding to the following members defined in the **mq\_attr**  
 45284 structure shall be set to the specified values upon successful completion of *mq\_setattr()*:

45285 *mq\_flags*           The value of this member is the bitwise-logical OR of zero or more of  
 45286 O\_NONBLOCK and any implementation-defined flags.

45287 The values of the *mq\_maxmsg*, *mq\_msgsize*, and *mq\_curmsgs* members of the **mq\_attr** structure  
 45288 shall be ignored by *mq\_setattr()*.

45289 If *omqstat* is non-NULL, the *mq\_setattr()* function shall store, in the location referenced by  
 45290 *omqstat*, the previous message queue attributes and the current queue status. These values shall  
 45291 be the same as would be returned by a call to *mq\_getattr()* at that point.

45292 **RETURN VALUE**

45293 Upon successful completion, the function shall return a value of zero and the attributes of the  
 45294 message queue shall have been changed as specified.

45295 Otherwise, the message queue attributes shall be unchanged, and the function shall return a  
 45296 value of -1 and set *errno* to indicate the error.

45297 **ERRORS**

45298 The *mq\_setattr()* function shall fail if:

45299 [EBADF]           The *mqdes* argument is not a valid message queue descriptor.

```
45334 MSG    #include <mqueue.h>
45335        #include <time.h>
45336        int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
45337                        unsigned msg_prio, const struct timespec *abstime);
```

45338 **DESCRIPTION**45339 Refer to *mq\_send()*.

45340 **NAME**45341 `mq_unlink` — remove a message queue (**REALTIME**)45342 **SYNOPSIS**

```
45343 MSG    #include <mqueue.h>
45344        int mq_unlink(const char *name);
```

45345 **DESCRIPTION**

45346 The `mq_unlink()` function shall remove the message queue named by the string `name`. If one or  
45347 more processes have the message queue open when `mq_unlink()` is called, destruction of the  
45348 message queue shall be postponed until all references to the message queue have been closed.  
45349 However, the `mq_unlink()` call need not block until all references have been closed; it may return  
45350 immediately.

45351 After a successful call to `mq_unlink()`, reuse of the name shall subsequently cause `mq_open()` to  
45352 behave as if no message queue of this name exists (that is, `mq_open()` will fail if `O_CREAT` is not  
45353 set, or will create a new message queue if `O_CREAT` is set).

45354 **RETURN VALUE**

45355 Upon successful completion, the function shall return a value of zero. Otherwise, the named  
45356 message queue shall be unchanged by this function call, and the function shall return a value of  
45357 `-1` and set `errno` to indicate the error.

45358 **ERRORS**45359 The `mq_unlink()` function shall fail if:

45360 [EACCES] Permission is denied to unlink the named message queue.

45361 [EINTR] The call to `mq_unlink()` blocked waiting for all references to the named +  
45362 message queue to be closed and a signal interrupted the call.

45363 [ENOENT] The named message queue does not exist.

45364 The `mq_unlink()` function may fail if:

45365 [ENAMETOOLONG]

45366 The length of the `name` argument exceeds `{_POSIX_PATH_MAX}` on systems  
45367 XSI that do not support the XSI option or exceeds `{_XOPEN_PATH_MAX}` on XSI  
45368 systems, or has a pathname component that is longer than  
45369 XSI `{_POSIX_NAME_MAX}` on systems that do not support the XSI option or  
45370 longer than `{_XOPEN_NAME_MAX}` on XSI systems. A call to `mq_unlink()`  
45371 with a `name` argument that contains the same message queue name as was  
45372 previously used in a successful `mq_open()` call shall not give an  
45373 [ENAMETOOLONG] error.

45374 **EXAMPLES**

45375 None.

45376 **APPLICATION USAGE**

45377 None.

45378 **RATIONALE**

45379 None.

**FUTURE DIRECTIONS**

A future version might require the *mq\_open()* and *mq\_unlink()* functions to have semantics similar to normal file system operations.

**SEE ALSO**

*mq\_close()*, *mq\_open()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*

XBD <mqqueue.h>

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

The *mq\_unlink()* function is marked as part of the Message Passing option.

The Open Group Corrigendum U021/5 is applied, clarifying that upon unsuccessful completion, the named message queue is unchanged by this function.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error .

Austin Group Interpretation 1003.1-2001 #141 is applied.

45398 **NAME**

45399       rand48 — generate uniformly distributed pseudo-random signed long integers

45400 **SYNOPSIS**

```
45401 XSI      #include <stdlib.h>
45402          long rand48(void);
```

45403 **DESCRIPTION**45404       Refer to *rand48()*.

45405 **NAME**

45406 msgctl — XSI message control operations

45407 **SYNOPSIS**

```
45408 XSI    #include <sys/msg.h>
45409    int msgctl(int msqid, int cmd, struct msqid_ds *buf);
```

45410 **DESCRIPTION**

45411 The *msgctl()* function operates on XSI message queues (see XBD [Section 3.226](#), on page 69). It is  
 45412 unspecified whether this function interoperates with the realtime interprocess communication  
 45413 facilities defined in [Section 2.8](#) (on page 503).

45414 The *msgctl()* function shall provide message control operations as specified by *cmd*. The  
 45415 following values for *cmd*, and the message control operations they specify, are:

45416 **IPC\_STAT** Place the current value of each member of the **msqid\_ds** data structure  
 45417 associated with *msqid* into the structure pointed to by *buf*. The contents of this  
 45418 structure are defined in **<sys/msg.h>**.

45419 **IPC\_SET** Set the value of the following members of the **msqid\_ds** data structure  
 45420 associated with *msqid* to the corresponding value found in the structure  
 45421 pointed to by *buf*:

```
45422 msg_perm.uid
45423 msg_perm.gid
45424 msg_perm.mode
45425 msg_qbytes
```

45426 Also, the *msg\_ctime* timestamp shall be set to the current time, as described in  
 45427 [Section 2.7.1](#) (on page 502).

45428 IPC\_SET can only be executed by a process with appropriate privileges or that  
 45429 has an effective user ID equal to the value of **msg\_perm.cuid** or  
 45430 **msg\_perm.uid** in the **msqid\_ds** data structure associated with *msqid*. Only a  
 45431 process with appropriate privileges can raise the value of **msg\_qbytes**.

45432 **IPC\_RMID** Remove the message queue identifier specified by *msqid* from the system and  
 45433 destroy the message queue and **msqid\_ds** data structure associated with it.  
 45434 IPC\_RMID can only be executed by a process with appropriate privileges or  
 45435 one that has an effective user ID equal to the value of **msg\_perm.cuid** or  
 45436 **msg\_perm.uid** in the **msqid\_ds** data structure associated with *msqid*.

45437 **RETURN VALUE**

45438 Upon successful completion, *msgctl()* shall return 0; otherwise, it shall return -1 and set *errno* to  
 45439 indicate the error.

45440 **ERRORS**

45441 The *msgctl()* function shall fail if:

45442 [EACCES] The argument *cmd* is IPC\_STAT and the calling process does not have read  
 45443 permission; see [Section 2.7](#) (on page 501).

45444 [EINVAL] The value of *msqid* is not a valid message queue identifier; or the value of *cmd*  
 45445 is not a valid command.

45446 [EPERM] The argument *cmd* is IPC\_RMID or IPC\_SET and the effective user ID of the  
 45447 calling process is not equal to that of a process with appropriate privileges and  
 45448 it is not equal to the value of **msg\_perm.cuid** or **msg\_perm.uid** in the data

45449 structure associated with *msqid*.

45450 [EPERM] The argument *cmd* is IPC\_SET, an attempt is being made to increase to the  
45451 value of **msg\_qbytes**, and the effective user ID of the calling process does not  
45452 have appropriate privileges.

#### 45453 EXAMPLES

45454 None.

#### 45455 APPLICATION USAGE

45456 The POSIX Realtime Extension defines alternative interfaces for interprocess communication  
45457 (IPC). Application developers who need to use IPC should design their applications so that  
45458 modules using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to  
45459 use the alternative interfaces.

#### 45460 RATIONALE

45461 None.

#### 45468 CHANGE HISTORY

45469 First released in Issue 2. Derived from Issue 2 of the SVID.

#### 45470 Issue 5

45471 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
45472 DIRECTIONS to a new APPLICATION USAGE section.

#### 45473 Issue 7

45474 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0395 [345] is applied.

**NAME**

msgget — get the XSI message queue identifier

**SYNOPSIS**

```
XSI    #include <sys/msg.h>
      int msgget(key_t key, int msgflg);
```

**DESCRIPTION**

The `msgget()` function operates on XSI message queues (see XBD [Section 3.226](#), on page 69). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in [Section 2.8](#) (on page 503).

The `msgget()` function shall return the message queue identifier associated with the argument `key`.

A message queue identifier, associated message queue, and data structure (see `<sys/msg.h>`), shall be created for the argument `key` if one of the following is true:

- The argument `key` is equal to `IPC_PRIVATE`.
- The argument `key` does not already have a message queue identifier associated with it, and (`msgflg & IPC_CREAT`) is non-zero.

Upon creation, the data structure associated with the new message queue identifier shall be initialized as follows:

- `msg_perm.cuid`, `msg_perm.uid`, `msg_perm.cgid`, and `msg_perm.gid` shall be set to the effective user ID and effective group ID, respectively, of the calling process.
- The low-order 9 bits of `msg_perm.mode` shall be set to the low-order 9 bits of `msgflg`.
- `msg_qnum`, `msg_lspid`, `msg_lrpid`, `msg_stime`, and `msg_rtime` shall be set to 0.
- `msg_ctime` shall be set to the current time, as described in [Section 2.7.1](#) (on page 502).
- `msg_qbytes` shall be set to the system limit.

**RETURN VALUE**

Upon successful completion, `msgget()` shall return a non-negative integer, namely a message queue identifier. Otherwise, it shall return `-1` and set `errno` to indicate the error.

**ERRORS**

The `msgget()` function shall fail if:

- |          |                                                                                                                                                                                                                                 |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [EACCES] | A message queue identifier exists for the argument <code>key</code> , but operation permission as specified by the low-order 9 bits of <code>msgflg</code> would not be granted; see <a href="#">Section 2.7</a> (on page 501). |
| [EEXIST] | A message queue identifier exists for the argument <code>key</code> but <code>((msgflg &amp; IPC_CREAT) &amp;&amp; (msgflg &amp; IPC_EXCL))</code> is non-zero.                                                                 |
| [ENOENT] | A message queue identifier does not exist for the argument <code>key</code> and <code>(msgflg &amp; IPC_CREAT)</code> is 0.                                                                                                     |
| [ENOSPC] | A message queue identifier is to be created but the system-imposed limit on the maximum number of allowed message queue identifiers system-wide would be exceeded.                                                              |

45514 **EXAMPLES**

45515 None.

45516 **APPLICATION USAGE**

45517 The POSIX Realtime Extension defines alternative interfaces for interprocess communication  
 45518 (IPC). Application developers who need to use IPC should design their applications so that  
 45519 modules using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to  
 45520 use the alternative interfaces.

45521 **RATIONALE**

45522 None.

45530 First released in Issue 2. Derived from Issue 2 of the SVID.

45531 **Issue 5**

45532 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
 45533 DIRECTIONS to a new APPLICATION USAGE section.

45534 **Issue 7**

45535 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0396 [345] and XSH/TC1-2008/0397  
 45536 [344] are applied.

**NAME**

msgrcv — XSI message receive operation

**SYNOPSIS**

```
XSI    #include <sys/msg.h>

      ssize_t msgrcv(int msqid, void *msgp, size_t msgsz, long msgtyp,
      int msgflg);
```

**DESCRIPTION**

The *msgrcv()* function operates on XSI message queues (see XBD [Section 3.226](#), on page 69). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in [Section 2.8](#) (on page 503).

The *msgrcv()* function shall read a message from the queue associated with the message queue identifier specified by *msqid* and place it in the user-defined buffer pointed to by *msgp*.

The application shall ensure that the argument *msgp* points to a user-defined buffer that contains first a field of type **long** specifying the type of the message, and then a data portion that holds the data bytes of the message. The structure below is an example of what this user-defined buffer might look like:

```
struct mymsg {
    long    mtype;    /* Message type. */
    char    mtext[1]; /* Message text. */
}
```

The structure member *mtype* is the received message's type as specified by the sending process.

The structure member *mtext* is the text of the message.

The argument *msgsz* specifies the size in bytes of *mtext*. The received message shall be truncated to *msgsz* bytes if it is larger than *msgsz* and (*msgflg* & MSG\_NOERROR) is non-zero. The truncated part of the message shall be lost and no indication of the truncation shall be given to the calling process.

If the value of *msgsz* is greater than {SSIZE\_MAX}, the result is implementation-defined.

The argument *msgtyp* specifies the type of message requested as follows:

- If *msgtyp* is 0, the first message on the queue shall be received.
- If *msgtyp* is greater than 0, the first message of type *msgtyp* shall be received.
- If *msgtyp* is less than 0, the first message of the lowest type that is less than or equal to the absolute value of *msgtyp* shall be received.

The argument *msgflg* specifies the action to be taken if a message of the desired type is not on the queue. These are as follows:

- If (*msgflg* & IPC\_NOWAIT) is non-zero, the calling thread shall return immediately with a return value of -1 and *errno* set to [ENOMSG].
- If (*msgflg* & IPC\_NOWAIT) is 0, the calling thread shall suspend execution until one of the following occurs:
  - A message of the desired type is placed on the queue.
  - The message queue identifier *msqid* is removed from the system; when this occurs, *errno* shall be set to [EIDRM] and -1 shall be returned.

45578 — The calling thread receives a signal that is to be caught; in this case a message is not  
 45579 received and the calling thread resumes execution in the manner prescribed in  
 45580 *sigaction()*.

45581 Upon successful completion, the following actions are taken with respect to the data structure  
 45582 associated with *msqid*:

- 45583 • **msg\_qnum** shall be decremented by 1.
- 45584 • **msg\_lrpid** shall be set to the process ID of the calling process.
- 45585 • **msg\_rtime** shall be set to the current time, as described in [Section 2.7.1](#) (on page 502).

#### 45586 RETURN VALUE

45587 Upon successful completion, *msgrcv()* shall return a value equal to the number of bytes actually  
 45588 placed into the buffer *mtext*. Otherwise, no message shall be received, *msgrcv()* shall return `-1`,  
 45589 and *errno* shall be set to indicate the error.

#### 45590 ERRORS

45591 The *msgrcv()* function shall fail if:

- |       |          |                                                                                                         |
|-------|----------|---------------------------------------------------------------------------------------------------------|
| 45592 | [E2BIG]  | The value of <i>mtext</i> is greater than <i>msgsz</i> and ( <i>msgflg</i> & MSG_NOERROR) is 0.         |
| 45593 | [EACCES] | Operation permission is denied to the calling process; see <a href="#">Section 2.7</a> (on page 501).   |
| 45594 |          |                                                                                                         |
| 45595 | [EIDRM]  | The message queue identifier <i>msqid</i> is removed from the system.                                   |
| 45596 | [EINTR]  | The <i>msgrcv()</i> function was interrupted by a signal.                                               |
| 45597 | [EINVAL] | <i>msqid</i> is not a valid message queue identifier.                                                   |
| 45598 | [ENOMSG] | The queue does not contain a message of the desired type and ( <i>msgflg</i> & IPC_NOWAIT) is non-zero. |
| 45599 |          |                                                                                                         |

#### 45600 EXAMPLES

##### 45601 Receiving a Message

45602 The following example receives the first message on the queue (based on the value of the *msgtyp*  
 45603 argument, 0). The queue is identified by the *msqid* argument (assuming that the value has  
 45604 previously been set). This call specifies that an error should be reported if no message is  
 45605 available, but not if the message is too large. The message size is calculated directly using the  
 45606 *sizeof* operator.

```

45607 #include <sys/msg.h>
45608 ...
45609 int result;
45610 int msqid;
45611 struct message {
45612     long type;
45613     char text[20];
45614 } msg;
45615 long msgtyp = 0;
45616 ...
45617 result = msgrcv(msqid, (void *) &msg, sizeof(msg.text),
45618                 msgtyp, MSG_NOERROR | IPC_NOWAIT);
  
```

**APPLICATION USAGE**

The POSIX Realtime Extension defines alternative interfaces for interprocess communication (IPC). Application developers who need to use IPC should design their applications so that modules using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the alternative interfaces.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 2. Derived from Issue 2 of the SVID.

**Issue 5**

The type of the return value is changed from **int** to **ssize\_t**, and a warning is added to the DESCRIPTION about values of *msgsz* larger than {SSIZE\_MAX}.

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to the APPLICATION USAGE section.

**Issue 6**

The normative text is updated to avoid use of the term “must” for application requirements.

**Issue 7**

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0398 [345] and XSH/TC1-2008/0399 [421] are applied.

**NAME**

msgsnd — XSI message send operation

**SYNOPSIS**

```
XSI    #include <sys/msg.h>
int msgsnd(int msqid, const void *msgp, size_t msgsz, int msgflg);
```

**DESCRIPTION**

The `msgsnd()` function operates on XSI message queues (see XBD [Section 3.226](#), on page 69). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in [Section 2.8](#) (on page 503).

The `msgsnd()` function shall send a message to the queue associated with the message queue identifier specified by `msqid`.

The application shall ensure that the argument `msgp` points to a user-defined buffer that contains first a field of type **long** specifying the type of the message, and then a data portion that holds the data bytes of the message. The structure below is an example of what this user-defined buffer might look like:

```
struct mymsg {
    long    mtype;        /* Message type. */
    char    mtext[1];     /* Message text. */
}
```

The structure member `mtype` is a non-zero positive type **long** that can be used by the receiving process for message selection.

The structure member `mtext` is any text of length `msgsz` bytes. The argument `msgsz` can range from 0 to a system-imposed maximum.

The argument `msgflg` specifies the action to be taken if one or more of the following is true:

- The number of bytes already on the queue is equal to **msg\_qbytes**; see `<sys/msg.h>`.
- The total number of messages on all queues system-wide is equal to the system-imposed limit.

These actions are as follows:

- If `(msgflg & IPC_NOWAIT)` is non-zero, the message shall not be sent and the calling thread shall return immediately.
- If `(msgflg & IPC_NOWAIT)` is 0, the calling thread shall suspend execution until one of the following occurs:
  - The condition responsible for the suspension no longer exists, in which case the message is sent.
  - The message queue identifier `msqid` is removed from the system; when this occurs, `errno` shall be set to [EIDRM] and `-1` shall be returned.
  - The calling thread receives a signal that is to be caught; in this case the message is not sent and the calling thread resumes execution in the manner prescribed in [sigaction\(\)](#).

Upon successful completion, the following actions are taken with respect to the data structure associated with *msqid*; see `<sys/msg.h>`:

- **msg\_qnum** shall be incremented by 1.
- **msg\_lspid** shall be set to the process ID of the calling process.
- **msg\_stime** shall be set to the current time, as described in [Section 2.7.1](#) (on page 502).

#### RETURN VALUE

Upon successful completion, *msgsnd()* shall return 0; otherwise, no message shall be sent, *msgsnd()* shall return -1, and *errno* shall be set to indicate the error.

#### ERRORS

The *msgsnd()* function shall fail if:

- |          |                                                                                                                                                                                       |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [EACCES] | Operation permission is denied to the calling process; see <a href="#">Section 2.7</a> (on page 501).                                                                                 |
| [EAGAIN] | The message cannot be sent for one of the reasons cited above and ( <i>msgflg</i> & <i>IPC_NOWAIT</i> ) is non-zero.                                                                  |
| [EIDRM]  | The message queue identifier <i>msqid</i> is removed from the system.                                                                                                                 |
| [EINTR]  | The <i>msgsnd()</i> function was interrupted by a signal.                                                                                                                             |
| [EINVAL] | The value of <i>msqid</i> is not a valid message queue identifier, or the value of <i>mtyp</i> is less than 1; or the value of <i>msgsz</i> is greater than the system-imposed limit. |

#### EXAMPLES

##### Sending a Message

The following example sends a message to the queue identified by the *msqid* argument (assuming that value has previously been set). This call specifies that an error should be reported if no message is available. The message size is calculated directly using the *sizeof* operator.

```
#include <sys/msg.h>
...
int result;
int msqid;
struct message {
    long type;
    char text[20];
} msg;

msg.type = 1;
strcpy(msg.text, "This is message 1");
...
result = msgsnd(msqid, (void *) &msg, sizeof(msg.text), IPC_NOWAIT);
```

#### APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication (IPC). Application developers who need to use IPC should design their applications so that modules using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the alternative interfaces.

45725 **RATIONALE**

45726 None.

45727 **FUTURE DIRECTIONS**

45735 First released in Issue 2. Derived from Issue 2 of the SVID.

45736 **Issue 5**

45737 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
45738 DIRECTIONS to a new APPLICATION USAGE section.

45739 **Issue 6**

45740 The normative text is updated to avoid use of the term “must” for application requirements.

45741 **Issue 7**

45742 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0400 [345] and XSH/TC1-2008/0401  
45743 [359] are applied.

**NAME**

msync — synchronize memory with physical storage

**SYNOPSIS**

```
#include <sys/mman.h>

int msync(void *addr, size_t len, int flags);
```

**DESCRIPTION**

The *msync()* function shall write all modified data to permanent storage locations, if any, in those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes. If no such storage exists, *msync()* need not have any effect. If requested, the *msync()* function shall then invalidate cached copies of data.

The implementation may require that *addr* be a multiple of the page size as returned by *sysconf()*.

For mappings to files, the *msync()* function shall ensure that all write operations are completed as defined for synchronized I/O data integrity completion. It is unspecified whether the implementation also writes out other file attributes. When the *msync()* function is called on MAP\_PRIVATE mappings, any modified data shall not be written to the underlying object and shall not cause such data to be made visible to other processes. It is unspecified whether data in MAP\_PRIVATE mappings has any permanent storage locations. The effect of *msync()* on a shared memory object or a typed memory object is unspecified. The behavior of this function is unspecified if the mapping was not established by a call to *mmap()*.

The *flags* argument is constructed from the bitwise-inclusive OR of one or more of the following flags defined in the `<sys/mman.h>` header:

| Symbolic Constant | Description                  |
|-------------------|------------------------------|
| MS_ASYNC          | Perform asynchronous writes. |
| MS_SYNC           | Perform synchronous writes.  |
| MS_INVALIDATE     | Invalidate cached data.      |

When MS\_ASYNC is specified, *msync()* shall return immediately once all the write operations are initiated or queued for servicing; when MS\_SYNC is specified, *msync()* shall not return until all write operations are completed as defined for synchronized I/O data integrity completion. Either MS\_ASYNC or MS\_SYNC shall be specified, but not both.

When MS\_INVALIDATE is specified, *msync()* shall invalidate all cached copies of mapped data that are inconsistent with the permanent storage locations such that subsequent references shall obtain data that was consistent with the permanent storage locations sometime between the call to *msync()* and the first subsequent memory reference to the data.

If *msync()* causes any write to a file, the file's last data modification and last file status change timestamps shall be marked for update.

**RETURN VALUE**

Upon successful completion, *msync()* shall return 0; otherwise, it shall return -1 and set *errno* to indicate the error.

**ERRORS**

The *msync()* function shall fail if:

[EBUSY] Some or all of the addresses in the range starting at *addr* and continuing for *len* bytes are locked, and MS\_INVALIDATE is specified.

45787 [EINVAL] The value of *flags* is invalid.

45788 [ENOMEM] The addresses in the range starting at *addr* and continuing for *len* bytes are

45789 outside the range allowed for the address space of a process or specify one or

45790 more pages that are not mapped.

45791 The *msync()* function may fail if:

45792 [EINVAL] The value of *addr* is not a multiple of the page size as returned by *sysconf()*.

#### 45793 EXAMPLES

45794 None.

#### 45795 APPLICATION USAGE

45796 The *msync()* function is only supported if the Synchronized Input and Output option is

45797 supported, and thus need not be available on all implementations.

45798 The *msync()* function should be used by programs that require a memory object to be in a

45799 known state; for example, in building transaction facilities.

45800 Normal system activity can cause pages to be written to disk. Therefore, there are no guarantees

45801 that *msync()* is the only control over when pages are or are not written to disk.

#### 45802 RATIONALE

45803 The *msync()* function writes out data in a mapped region to the permanent storage for the

45804 underlying object. The call to *msync()* ensures data integrity of the file.

45805 After the data is written out, any cached data may be invalidated if the MS\_INVALIDATE flag

45806 was specified. This is useful on systems that do not support read/write consistency.

#### 45807 FUTURE DIRECTIONS

45808 None.

#### 45809 SEE ALSO

45810 *mmap()*, *sysconf()*

45811 XBD <sys/mman.h>

#### 45812 CHANGE HISTORY

45813 First released in Issue 4, Version 2.

#### 45814 Issue 5

45815 Moved from X/OPEN UNIX extension to BASE.

45816 Aligned with *msync()* in the POSIX Realtime Extension as follows:

- 45817 • The DESCRIPTION is extensively reworded.
- 45818 • [EBUSY] and a new form of [EINVAL] are added as mandatory error conditions.

#### 45819 Issue 6

45820 The *msync()* function is marked as part of the Memory Mapped Files and Synchronized Input

45821 and Output options.

45822 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 45823 • The [EBUSY] mandatory error condition is added.

45824 The following new requirements on POSIX implementations derive from alignment with the

45825 Single UNIX Specification:

- 45826                   • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple  
45827                   of the page size.
- 45828                   • The second [EINVAL] error condition is made mandatory.
- 45829                   The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding reference to  
45830                   typed memory objects.
- 45831   **Issue 7**
- 45832                   Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment  
45833                   requirements.
- 45834                   SD5-XSH-ERN-110 is applied.
- 45835                   The *msync()* function is marked as part of the Synchronized Input and Output option or XSI  
45836                   option as the Memory Mapped Files is moved to the Base.
- 45837                   Changes are made related to support for finegrained timestamps.

45838 **NAME**

45839       munlock — unlock a range of process address space

45840 **SYNOPSIS**

```
45841 MLR       #include <sys/mman.h>  
45842       int munlock(const void *addr, size_t len);
```

45843 **DESCRIPTION**45844       Refer to *mlock()*.

45845 **NAME**

45846       munlockall — unlock the address space of a process

45847 **SYNOPSIS**

```
45848 ML      #include <sys/mman.h>
45849      int munlockall(void);
```

45850 **DESCRIPTION**45851       Refer to *mlockall()*.

45852 **NAME**45853 `munmap` — unmap pages of memory45854 **SYNOPSIS**45855 `#include <sys/mman.h>`45856 `int munmap(void *addr, size_t len);`45857 **DESCRIPTION**

45858 The `munmap()` function shall remove any mappings for those entire pages containing any part of  
 45859 the address space of the process starting at `addr` and continuing for `len` bytes. Further references  
 45860 to these pages shall result in the generation of a SIGSEGV signal to the process. If there are no  
 45861 mappings in the specified address range, then `munmap()` has no effect.

45862 The implementation may require that `addr` be a multiple of the page size as returned by  
 45863 `sysconf()`.

45864 If a mapping to be removed was private, any modifications made in this address range shall be  
 45865 discarded.

45866 ML|MLR Any memory locks (see `mlock()` and `mlockall()`) associated with this address range shall be  
 45867 removed, as if by an appropriate call to `munlock()`.

45868 TYM If a mapping removed from a typed memory object causes the corresponding address range of  
 45869 the memory pool to be inaccessible by any process in the system except through allocatable  
 45870 mappings (that is, mappings of typed memory objects opened with the  
 45871 POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flag), then that range of the memory pool shall  
 45872 become deallocated and may become available to satisfy future typed memory allocation  
 45873 requests.

45874 A mapping removed from a typed memory object opened with the  
 45875 POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flag shall not affect in any way the availability of  
 45876 that typed memory for allocation.

45877 The behavior of this function is unspecified if the mapping was not established by a call to  
 45878 `mmap()`.

45879 **RETURN VALUE**

45880 Upon successful completion, `munmap()` shall return 0; otherwise, it shall return -1 and set `errno`  
 45881 to indicate the error.

45882 **ERRORS**

45883 The `munmap()` function shall fail if:

45884 [EINVAL] Addresses in the range `[addr,addr+len)` are outside the valid range for the  
 45885 address space of a process.

45886 [EINVAL] The `len` argument is 0.

45887 The `munmap()` function may fail if:

45888 [EINVAL] The `addr` argument is not a multiple of the page size as returned by `sysconf()`.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

The *munmap()* function corresponds to SVR4, just as the *mmap()* function does.

It is possible that an application has applied process memory locking to a region that contains shared memory. If this has occurred, the *munmap()* call ignores those locks and, if necessary, causes those locks to be removed.

Most implementations require that *addr* is a multiple of the page size as returned by *sysconf()*.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*mlock()*, *mlockall()*, *mmap()*, *posix\_typed\_mem\_open()*, *sysconf()*

XBD <sys/mman.h>

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

Aligned with *munmap()* in the POSIX Realtime Extension as follows:

- The DESCRIPTION is extensively reworded.
- The SIGBUS error is no longer permitted to be generated.

**Issue 6**

The *munmap()* function is marked as part of the Memory Mapped Files and Shared Memory Objects option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of the page size.
- The [EINVAL] error conditions are added.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- Semantics for typed memory objects are added to the DESCRIPTION.
- The *posix\_typed\_mem\_open()* function is added to the SEE ALSO section.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).

**Issue 7**

Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment requirements.

The *munmap()* function is moved from the Memory Mapped Files option to the Base.

45928 **NAME**

45929 nan, nanf, nanl — return quiet NaN

45930 **SYNOPSIS**

```
45931 #include <math.h>
45932 double nan(const char *tagp);
45933 float nanf(const char *tagp);
45934 long double nanl(const char *tagp);
```

45935 **DESCRIPTION**

45936 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 45937 conflict between the requirements described here and the ISO C standard is unintentional. This  
 45938 volume of POSIX.1-2008 defers to the ISO C standard.

45939 The function call *nan("n-char-sequence")* shall be equivalent to:

```
45940 strtod("NAN(n-char-sequence)", (char **) NULL);
```

45941 The function call *nan("")* shall be equivalent to:

```
45942 strtod("NAN()", (char **) NULL)
```

45943 If *tagp* does not point to an *n-char* sequence or an empty string, the function call shall be  
 45944 equivalent to:

```
45945 strtod("NAN", (char **) NULL)
```

45946 Function calls to *nanf()* and *nanl()* are equivalent to the corresponding function calls to *strtof()*  
 45947 and *strtold()*.

45948 **RETURN VALUE**

45949 These functions shall return a quiet NaN, if available, with content indicated through *tagp*.

45950 If the implementation does not support quiet NaNs, these functions shall return zero.

45951 **ERRORS**

45952 No errors are defined.

45953 **EXAMPLES**

45954 None.

45955 **APPLICATION USAGE**

45956 None.

45957 **RATIONALE**

45958 None.

45959 **FUTURE DIRECTIONS**

45960 None.

45964 **CHANGE HISTORY**

45965 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**NAME**

nanosleep — high resolution sleep

**SYNOPSIS**

```
#include <time.h>

int nanosleep(const struct timespec *rqtp, struct timespec *rmtp);
```

**DESCRIPTION**

The *nanosleep()* function shall cause the current thread to be suspended from execution until either the time interval specified by the *rqtp* argument has elapsed or a signal is delivered to the calling thread, and its action is to invoke a signal-catching function or to terminate the process. The suspension time may be longer than requested because the argument value is rounded up to an integer multiple of the sleep resolution or because of the scheduling of other activity by the system. But, except for the case of being interrupted by a signal, the suspension time shall not be less than the time specified by *rqtp*, as measured by the system clock `CLOCK_REALTIME`.

The use of the *nanosleep()* function has no effect on the action or blockage of any signal.

**RETURN VALUE**

If the *nanosleep()* function returns because the requested time has elapsed, its return value shall be zero.

If the *nanosleep()* function returns because it has been interrupted by a signal, it shall return a value of `-1` and set *errno* to indicate the interruption. If the *rmtp* argument is non-NULL, the **timespec** structure referenced by it is updated to contain the amount of time remaining in the interval (the requested time minus the time actually slept). The *rqtp* and *rmtp* arguments can point to the same object. If the *rmtp* argument is NULL, the remaining time is not returned.

If *nanosleep()* fails, it shall return a value of `-1` and set *errno* to indicate the error.

**ERRORS**

The *nanosleep()* function shall fail if:

[EINTR] The *nanosleep()* function was interrupted by a signal.

[EINVAL] The *rqtp* argument specified a nanosecond value less than zero or greater than or equal to 1 000 million.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

It is common to suspend execution of a thread for an interval in order to poll the status of a non-interrupting function. A large number of actual needs can be met with a simple extension to *sleep()* that provides finer resolution.

In the POSIX.1-1990 standard and SVR4, it is possible to implement such a routine, but the frequency of wakeup is limited by the resolution of the *alarm()* and *sleep()* functions. In 4.3 BSD, it is possible to write such a routine using no static storage and reserving no system facilities. Although it is possible to write a function with similar functionality to *sleep()* using the remainder of the *timer\_\**() functions, such a function requires the use of signals and the reservation of some signal number. This volume of POSIX.1-2008 requires that *nanosleep()* be non-intrusive of the signals function.

The *nanosleep()* function shall return a value of 0 on success and `-1` on failure or if interrupted.

46010 This latter case is different from *sleep()*. This was done because the remaining time is returned  
46011 via an argument structure pointer, *rmtpt*, instead of as the return value.

#### 46012 FUTURE DIRECTIONS

46013 None.

#### 46014 SEE ALSO

46015 *clock\_nanosleep()*, *sleep()*

46016 XBD <time.h>

#### 46017 CHANGE HISTORY

46018 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

#### 46019 Issue 6

46020 The *nanosleep()* function is marked as part of the Timers option.

46021 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
46022 implementation does not support the Timers option.

46023 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/37 is applied, updating the SEE ALSO  
46024 section to include the *clock\_nanosleep()* function.

46025 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/63 is applied, correcting text in the  
46026 RATIONALE section.

#### 46027 Issue 7

46028 SD5-XBD-ERN-33 is applied.

46029 The *nanosleep()* function is moved from the Timers option to the Base.

46030 **NAME**

46031 nearbyint, nearbyintf, nearbyintl — floating-point rounding functions

46032 **SYNOPSIS**

```
46033 #include <math.h>
46034 double nearbyint(double x);
46035 float nearbyintf(float x);
46036 long double nearbyintl(long double x);
```

46037 **DESCRIPTION**

46038 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
46039 conflict between the requirements described here and the ISO C standard is unintentional. This  
46040 volume of POSIX.1-2008 defers to the ISO C standard.

46041 These functions shall round their argument to an integer value in floating-point format, using  
46042 the current rounding direction and without raising the inexact floating-point exception.

46043 **RETURN VALUE**

46044 MX Upon successful completion, these functions shall return the rounded integer value. The result  
46045 shall have the same sign as  $x$ .

46046 MX If  $x$  is NaN, a NaN shall be returned.

46047 If  $x$  is  $\pm 0$ ,  $\pm 0$  shall be returned.

46048 If  $x$  is  $\pm \text{Inf}$ ,  $x$  shall be returned.

46049 **ERRORS**

46050 No errors are defined.

46051 **EXAMPLES**

46052 None.

46053 **APPLICATION USAGE**

46054 The integral value returned by these functions need not be expressible as an `intmax_t`. The  
46055 return value should be tested before assigning it to an integer type to avoid the undefined  
46056 results of an integer overflow.

46057 **RATIONALE**

46058 None.

46059 **FUTURE DIRECTIONS**

46060 None.

46061 **SEE ALSO**

**NAME**

newlocale — create or modify a locale object

**SYNOPSIS**

```
CX      #include <locale.h>

      locale_t newlocale(int category_mask, const char *locale,
      locale_t base);
```

**DESCRIPTION**

The *newlocale()* function shall create a new locale object or modify an existing one. If the *base* argument is **(locale\_t)0**, a new locale object shall be created. It is unspecified whether the locale object pointed to by *base* shall be modified, or freed and a new locale object created.

The *category\_mask* argument specifies the locale categories to be set or modified. Values for *category\_mask* shall be constructed by a bitwise-inclusive OR of the symbolic constants *LC\_CTYPE\_MASK*, *LC\_NUMERIC\_MASK*, *LC\_TIME\_MASK*, *LC\_COLLATE\_MASK*, *LC\_MONETARY\_MASK*, and *LC\_MESSAGES\_MASK*, or any of the implementation-defined mask values defined in **<locale.h>**.

For each category with the corresponding bit set in *category\_mask* the data from the locale named by *locale* shall be used. In the case of modifying an existing locale object, the data from the locale named by *locale* shall replace the existing data within the locale object. If a completely new locale object is created, the data for all sections not requested by *category\_mask* shall be taken from the default locale.

The following preset values of *locale* are defined for all settings of *category\_mask*:

|         |                                                                                                                                                                                                                                                           |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| "POSIX" | Specifies the minimal environment for C-language translation called the POSIX locale.                                                                                                                                                                     |
| "C"     | Equivalent to "POSIX".                                                                                                                                                                                                                                    |
| " "     | Specifies an implementation-defined native environment. This corresponds to the value of the associated environment variables, <i>LC_*</i> and <i>LANG</i> ; see XBD <a href="#">Chapter 7</a> (on page 135) and <a href="#">Chapter 8</a> (on page 173). |

If the *base* argument is not **(locale\_t)0** and the *newlocale()* function call succeeds, the contents of *base* are unspecified. Applications shall ensure that they stop using *base* as a locale object before calling *newlocale()*. If the function call fails and the *base* argument is not **(locale\_t)0**, the contents of *base* shall remain valid and unchanged.

The behavior is undefined if the *base* argument is the special locale object *LC\_GLOBAL\_LOCALE*, or is not a valid locale object handle and is not **(locale\_t)0**.

**RETURN VALUE**

Upon successful completion, the *newlocale()* function shall return a handle which the caller may use on subsequent calls to *duplocale()*, *freelocale()*, and other functions taking a **locale\_t** argument.

Upon failure, the *newlocale()* function shall return **(locale\_t)0** and set *errno* to indicate the error.

**ERRORS**

The *newlocale()* function shall fail if:

|          |                                                                                           |
|----------|-------------------------------------------------------------------------------------------|
| [ENOMEM] | There is not enough memory available to create the locale object or load the locale data. |
|----------|-------------------------------------------------------------------------------------------|

46110 [EINVAL] The *category\_mask* contains a bit that does not correspond to a valid category.  
46111 [ENOENT] For any of the categories in *category\_mask*, the locale data is not available.  
46112 The *newlocale()* function may fail if:  
46113 [EINVAL] The *locale* argument is not a valid string pointer.

## 46114 EXAMPLES

### 46115 Constructing a Locale Object from Different Locales

46116 The following example shows the construction of a locale where the *LC\_CTYPE* category data  
46117 comes from a locale *loc1* and the *LC\_TIME* category data from a locale *loc2*:

```
46118 #include <locale.h>
46119 ...
46120 locale_t loc, new_loc;
46121 /* Get the "loc1" data. */
46122 loc = newlocale (LC_CTYPE_MASK, "loc1", (locale_t)0);
46123 if (loc == (locale_t) 0)
46124     abort ();
46125 /* Get the "loc2" data. */
46126 new_loc = newlocale (LC_TIME_MASK, "loc2", loc);
46127 if (new_loc != (locale_t) 0)
46128     /* We don't abort if this fails. In this case this
46129        simply used to unchanged locale object. */
46130     loc = new_loc;
46131 ...
```

### 46132 Freeing up a Locale Object

46133 The following example shows a code fragment to free a locale object created by *newlocale()*:

```
46134 #include <locale.h>
46135 ...
46136 /* Every locale object allocated with newlocale() should be
46137    * freed using freelocale():
46138    */
46139 locale_t loc;
46140 /* Get the locale. */
46141 loc = newlocale (LC_CTYPE_MASK | LC_TIME_MASK, "locname", (locale_t)0);
46142 /* ... Use the locale object ... */
46143 ...
46144 /* Free the locale object resources. */
46145 freelocale (loc);
```

**APPLICATION USAGE**

Handles for locale objects created by the *newlocale()* function should either be released by a corresponding call to *freelocale()*, or be used as a base locale to another *newlocale()* call.

The special locale object LC\_GLOBAL\_LOCALE must not be passed for the *base* argument, even when returned by the *uselocale()* function.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*duplocale()*, *freelocale()*, *uselocale()*

**CHANGE HISTORY**

First released in Issue 7.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0403 [227], XSH/TC1-2008/0404 [283], XSH/TC1-2008/0405 [295], and XSH/TC1-2008/0406 [227] are applied.

**NAME**

nextafter, nextafterf, nextafterl, nexttoward, nexttowardf, nexttowardl — next representable floating-point number

**SYNOPSIS**

```
#include <math.h>

double nextafter(double x, double y);
float nextafterf(float x, float y);
long double nextafterl(long double x, long double y);
double nexttoward(double x, long double y);
float nexttowardf(float x, long double y);
long double nexttowardl(long double x, long double y);
```

**DESCRIPTION**

**CX** The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *nextafter()*, *nextafterf()*, and *nextafterl()* functions shall compute the next representable floating-point value following *x* in the direction of *y*. Thus, if *y* is less than *x*, *nextafter()* shall return the largest representable floating-point number less than *x*. The *nextafter()*, *nextafterf()*, and *nextafterl()* functions shall return *y* if *x* equals *y*.

The *nexttoward()*, *nexttowardf()*, and *nexttowardl()* functions shall be equivalent to the corresponding *nextafter()* functions, except that the second parameter shall have type **long double** and the functions shall return *y* converted to the type of the function if *x* equals *y*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-zero, an error has occurred.

**RETURN VALUE**

Upon successful completion, these functions shall return the next representable floating-point value following *x* in the direction of *y*.

If *x*=*y*, *y* (of the type *x*) shall be returned.

If *x* is finite and the correct function value would overflow, a range error shall occur and  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$  (with the same sign as *x*) shall be returned as appropriate for the return type of the function.

**MX** If *x* or *y* is NaN, a NaN shall be returned.

**MX** If *x*!=*y* and the correct function value is subnormal, zero, or underflows, a range error shall occur, and

**MX** the correct function value (if representable) or

**MX** 0.0 shall be returned.

**ERRORS**

These functions shall fail if:

**Range Error** The correct value overflows.

If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

46207 MX **Range Error** The correct value is subnormal or underflows.  
 46208 If the integer expression *(math\_errhandling & MATH\_ERRNO)* is non-zero,  
 46209 then *errno* shall be set to [ERANGE]. If the integer expression  
 46210 *(math\_errhandling & MATH\_ERREXCEPT)* is non-zero, then the underflow  
 46211 floating-point exception shall be raised.

**EXAMPLES**

46212  
 46213 None.

**APPLICATION USAGE**

46215 On error, the expressions *(math\_errhandling & MATH\_ERRNO)* and *(math\_errhandling &*  
 46216 *MATH\_ERREXCEPT)* are independent of each other, but at least one of them must be non-zero.

46217 When **<tgmath.h>** is included, note that the return type of *nextafter()* depends on the generic  
 46218 typing deduced from both arguments, while the return type of *nexttoward()* depends only on the  
 46219 generic typing of the first argument.

**RATIONALE**

46220  
 46221 None.

**FUTURE DIRECTIONS**

46222  
 46223 None.

**SEE ALSO**

46226 XBD Section 4.20 (on page 117), **<math.h>**, **<tgmath.h>**

**CHANGE HISTORY**

46228 First released in Issue 4, Version 2.

**Issue 5**

46229  
 46230 Moved from X/OPEN UNIX extension to BASE.

**Issue 6**

46231 The *nextafter()* function is no longer marked as an extension.

46233 The *nextafterf()*, *nextafterl()*, *nexttoward()*, *nexttowardf()*, and *nexttowardl()* functions are added  
 46234 for alignment with the ISO/IEC 9899:1999 standard.

46235 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 46236 revised to align with the ISO/IEC 9899:1999 standard.

46237 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 46238 marked.

**Issue 7**

46240 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0407 [68] and XSH/TC1-2008/0408  
 46241 [357] are applied.

## 46242 NAME

46243 nftw — walk a file tree

## 46244 SYNOPSIS

```
46245 XSI      #include <ftw.h>
46246
46246      int nftw(const char *path, int (*fn)(const char *,
46247          const struct stat *, int, struct FTW *), int fd_limit, int flags);
```

## 46248 DESCRIPTION

46249 The *nftw()* function shall recursively descend the directory hierarchy rooted in *path*. The *nftw()*  
 46250 function has a similar effect to *ftw()* except that it takes an additional argument *flags*, which is a  
 46251 bitwise-inclusive OR of zero or more of the following flags:

46252 FTW\_CHDIR If set, *nftw()* shall change the current working directory to each directory as it  
 46253 reports files in that directory. If clear, *nftw()* shall not change the current  
 46254 working directory.

46255 FTW\_DEPTH If set, *nftw()* shall report all files in a directory before reporting the directory  
 46256 itself. If clear, *nftw()* shall report any directory before reporting the files in that  
 46257 directory.

46258 FTW\_MOUNT If set, *nftw()* shall only report files in the same file system as *path*. If clear,  
 46259 *nftw()* shall report all files encountered during the walk.

46260 FTW\_PHYS If set, *nftw()* shall perform a physical walk and shall not follow symbolic links.

46261 If FTW\_PHYS is clear and FTW\_DEPTH is set, *nftw()* shall follow links instead of reporting  
 46262 them, but shall not report any directory that would be a descendant of itself. If FTW\_PHYS is  
 46263 clear and FTW\_DEPTH is clear, *nftw()* shall follow links instead of reporting them, but shall not  
 46264 report the contents of any directory that would be a descendant of itself.

46265 At each file it encounters, *nftw()* shall call the user-supplied function *fn* with four arguments:

- 46266 • The first argument is the pathname of the object.
- 46267 • The second argument is a pointer to the **stat** buffer containing information on the object,  
 46268 filled in as if *fstatat()*, *stat()*, or *lstat()* had been called to retrieve the information.
- 46269 • The third argument is an integer giving additional information. Its value is one of the  
 46270 following:

46271 FTW\_D The object is a directory.

46272 FTW\_DNR The object is a directory that cannot be read. The *fn* function shall not be  
 46273 called for any of its descendants.

46274 FTW\_DP The object is a directory and subdirectories have been visited. (This condition  
 46275 shall only occur if the FTW\_DEPTH flag is included in *flags*.)

46276 FTW\_F The object is a non-directory file.

46277 FTW\_NS The *stat()* function failed on the object because of lack of appropriate  
 46278 permission. The **stat** buffer passed to *fn* is undefined. Failure of *stat()* for any  
 46279 other reason is considered an error and *nftw()* shall return  $-1$ .

46280 FTW\_SL The object is a symbolic link. (This condition shall only occur if the  
 46281 FTW\_PHYS flag is included in *flags*.)

46282 FTW\_SLN The object is a symbolic link that does not name an existing file. (This  
46283 condition shall only occur if the FTW\_PHYS flag is not included in *flags*.)

- 46284 • The fourth argument is a pointer to an **FTW** structure. The value of **base** is the offset of the  
46285 object's filename in the pathname passed as the first argument to *fn*. The value of **level**  
46286 indicates depth relative to the root of the walk, where the root level is 0.

46287 The results are unspecified if the application-supplied *fn* function does not preserve the current  
46288 working directory.

46289 The argument *fd\_limit* sets the maximum number of file descriptors that shall be used by *nftw()*  
46290 while traversing the file tree. At most one file descriptor shall be used for each directory level.

46291 The *nftw()* function need not be thread-safe.

## 46292 RETURN VALUE

46293 The *nftw()* function shall continue until the first of the following conditions occurs:

- 46294 • An invocation of *fn* shall return a non-zero value, in which case *nftw()* shall return that  
46295 value.
- 46296 • The *nftw()* function detects an error other than [EACCES] (see FTW\_DNR and FTW\_NS  
46297 above), in which case *nftw()* shall return -1 and set *errno* to indicate the error.
- 46298 • The tree is exhausted, in which case *nftw()* shall return 0.

## 46299 ERRORS

46300 The *nftw()* function shall fail if:

- 46301 [EACCES] Search permission is denied for any component of *path* or read permission is  
46302 denied for *path*, or *fn* returns -1 and does not reset *errno*.
- 46303 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
46304 argument.
- 46305 [ENAMETOOLONG]  
46306 The length of a component of a pathname is longer than {NAME\_MAX}.
- 46307 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- 46308 [ENOTDIR] A component of *path* names an existing file that is neither a directory nor a  
46309 symbolic link to a directory.
- 46310 [EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current  
46311 programming environment for one or more files found in the file hierarchy.

46312 The *nftw()* function may fail if:

- 46313 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
46314 resolution of the *path* argument.
- 46315 [EMFILE] All file descriptors available to the process are currently open.
- 46316 [ENAMETOOLONG]  
46317 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
46318 symbolic link produced an intermediate result with a length that exceeds  
46319 {PATH\_MAX}.
- 46320 [ENFILE] Too many files are currently open in the system.

46321 In addition, *errno* may be set if the function pointed to by *fn* causes *errno* to be set.

**EXAMPLES**

The following program traverses the directory tree under the path named in its first command-line argument, or under the current directory if no argument is supplied. It displays various information about each file. The second command-line argument can be used to specify characters that control the value assigned to the *flags* argument when calling *nftw()*.

```
#include <ftw.h>
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <stdint.h>

static int
display_info(const char *fpath, const struct stat *sb,
             int tflag, struct FTW *ftwbuf)
{
    printf("%-3s %2d %7jd    %-40s %d %s\n",
           (tflag == FTW_D) ? "d" : (tflag == FTW_DNR) ? "dnr" :
           (tflag == FTW_DP) ? "dp" : (tflag == FTW_F) ?
           (S_ISBLK(sb->st_mode) ? "f b" :
            S_ISCHR(sb->st_mode) ? "f c" :
            S_ISFIFO(sb->st_mode) ? "f p" :
            S_ISREG(sb->st_mode) ? "f r" :
            S_ISSOCK(sb->st_mode) ? "f s" : "f ?") :
           (tflag == FTW_NS) ? "ns" : (tflag == FTW_SL) ? "sl" :
           (tflag == FTW_SLN) ? "sln" : "?",
           ftwbuf->level, (intmax_t) sb->st_size,
           fpath, ftwbuf->base, fpath + ftwbuf->base);
    return 0;          /* To tell nftw() to continue */
}

int
main(int argc, char *argv[])
{
    int flags = 0;

    if (argc > 2 && strchr(argv[2], 'd') != NULL)
        flags |= FTW_DEPTH;
    if (argc > 2 && strchr(argv[2], 'p') != NULL)
        flags |= FTW_PHYS;

    if (nftw((argc < 2) ? "." : argv[1], display_info, 20, flags) == -1)
    {
        perror("nftw");
        exit(EXIT_FAILURE);
    }

    exit(EXIT_SUCCESS);
}
```

**APPLICATION USAGE**

The *nftw()* function may allocate dynamic storage during its operation. If *nftw()* is forcibly terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *fn* or an interrupt routine, *nftw()* does not have a chance to free that storage, so it remains permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has

46370 occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next  
 46371 invocation.

#### 46372 RATIONALE

46373 None.

#### 46374 FUTURE DIRECTIONS

46375 None.

#### 46376 SEE ALSO

46377 *fdopendir()*, *fstatat()*, *readdir()*

46378 XBD <ftw.h>

#### 46379 CHANGE HISTORY

46380 First released in Issue 4, Version 2.

#### 46381 Issue 5

46382 Moved from X/OPEN UNIX extension to BASE.

46383 In the DESCRIPTION, the definition of the *depth* argument is clarified.

#### 46384 Issue 6

46385 The Open Group Base Resolution bwg97-003 is applied.

46386 The ERRORS section is updated as follows:

- 46387 • The wording of the mandatory [ELOOP] error condition is updated.
- 46388 • A second optional [ELOOP] error condition is added.
- 46389 • The [Eoverflow] mandatory error condition is added.

46390 Text is added to the DESCRIPTION to say that the *nftw()* function need not be reentrant and that  
 46391 the results are unspecified if the application-supplied *fn* function does not preserve the current  
 46392 working directory.

46393 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/64 is applied, changing the argument  
 46394 *depth* to *fd\_limit* throughout and changing “to a maximum of 5 levels deep” to “using a  
 46395 maximum of 5 file descriptors” in the EXAMPLES section.

#### 46396 Issue 7

46397 Austin Group Interpretations 1003.1-2001 #143 and #156 are applied.

46398 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

46399 SD5-XBD-ERN-61 is applied.

46400 APPLICATION USAGE is added and the EXAMPLES section is replaced with a new example.

46401 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0409 [403], XSH/TC1-2008/0410 [324],  
 46402 and XSH/TC1-2008/0411 [403] are applied.

46403 **NAME**

46404 **nice** — change the nice value of a process

46405 **SYNOPSIS**

46406 XSI `#include <unistd.h>`  
46407 `int nice(int incr);`

46408 **DESCRIPTION**

46409 The *nice()* function shall add the value of *incr* to the nice value of the calling process. A nice  
46410 value of a process is a non-negative number for which a more positive value shall result in less  
46411 favorable scheduling.

46412 A maximum nice value of 2\*[NZERO]–1 and a minimum nice value of 0 shall be imposed by the  
46413 system. Requests for values above or below these limits shall result in the nice value being set to  
46414 the corresponding limit. Only a process with appropriate privileges can lower the nice value.

46415 PS|TPS Calling the *nice()* function has no effect on the priority of processes or threads with policy  
46416 SCHED\_FIFO or SCHED\_RR. The effect on processes or threads with other scheduling policies  
46417 is implementation-defined.

46418 The nice value set with *nice()* shall be applied to the process. If the process is multi-threaded, the  
46419 nice value shall affect all system scope threads in the process.

46420 As –1 is a permissible return value in a successful situation, an application wishing to check for  
46421 error situations should set *errno* to 0, then call *nice()*, and if it returns –1, check to see whether  
46422 *errno* is non-zero.

46423 **RETURN VALUE**

46424 Upon successful completion, *nice()* shall return the new nice value –[NZERO]. Otherwise, –1  
46425 shall be returned, the nice value of the process shall not be changed, and *errno* shall be set to  
46426 indicate the error.

46427 **ERRORS**

46428 The *nice()* function shall fail if:

46429 [EPERM] The *incr* argument is negative and the calling process does not have  
46430 appropriate privileges.

46431 **EXAMPLES**

46432 **Changing the Nice Value**

46433 The following example adds the value of the *incr* argument, –20, to the nice value of the calling  
46434 process.

46435 `#include <unistd.h>`  
46436 `...`  
46437 `int incr = -20;`  
46438 `int ret;`  
46439 `ret = nice(incr);`

46440 **APPLICATION USAGE**

46450 First released in Issue 1. Derived from Issue 1 of the SVID.

46451 **Issue 5**46452 A statement is added to the description indicating the effects of this function on the different  
46453 scheduling policies and multi-threaded processes.

## NAME

nl\_langinfo, nl\_langinfo\_l — language information

## SYNOPSIS

```
#include <langinfo.h>

char *nl_langinfo(nl_item item);
char *nl_langinfo_l(nl_item item, locale_t locale);
```

## DESCRIPTION

The *nl\_langinfo()* and *nl\_langinfo\_l()* functions shall return a pointer to a string containing information relevant to the particular language or cultural area defined in the current locale, or in the locale represented by *locale*, respectively (see <langinfo.h>). The manifest constant names and values of *item* are defined in <langinfo.h>. For example:

```
nl_langinfo(ABDAY_1)
```

would return a pointer to the string "Dom" if the identified language was Portuguese, and "Sun" if the identified language was English.

```
nl_langinfo_l(ABDAY_1, loc)
```

would return a pointer to the string "Dom" if the identified language of the locale represented by *loc* was Portuguese, and "Sun" if the identified language of the locale represented by *loc* was English.

The *nl\_langinfo()* function need not be thread-safe.

The behavior is undefined if the *locale* argument to *nl\_langinfo\_l()* is the special locale object LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

## RETURN VALUE

In a locale where *langinfo* data is not defined, these functions shall return a pointer to the corresponding string in the POSIX locale. In all locales, these functions shall return a pointer to an empty string if *item* contains an invalid setting.

The application shall not modify the string returned. The pointer returned by *nl\_langinfo()* might be invalidated or the string content might be overwritten by a subsequent call to *nl\_langinfo()* in any thread or to *nl\_langinfo\_l()* in the same thread or the initial thread, by subsequent calls to *setlocale()* with a category corresponding to the category of *item* (see <langinfo.h>) or the category LC\_ALL, or by subsequent calls to *uselocale()* which change the category corresponding to the category of *item*. The pointer returned by *nl\_langinfo\_l()* might be invalidated or the string content might be overwritten by a subsequent call to *nl\_langinfo\_l()* in the same thread or to *nl\_langinfo()* in any thread, or by subsequent calls to *freelocale()* or *newlocale()* which free or modify the locale object that was passed to *nl\_langinfo\_l()*. The returned pointer and the string content might also be invalidated if the calling thread is terminated.

## ERRORS

No errors are defined.

46492 **EXAMPLES**46493 **Getting Date and Time Formatting Information**

46494 The following example returns a pointer to a string containing date and time formatting  
 46495 information, as defined in the *LC\_TIME* category of the current locale.

```
46496 #include <time.h>
46497 #include <langinfo.h>
46498 ...
46499 strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);
46500 ...
```

46501 **APPLICATION USAGE**

46502 The array pointed to by the return value should not be modified by the program, but may be  
 46503 modified by further calls to these functions.

46504 **RATIONALE**

46505 The possible interactions between internal data used by *nl\_langinfo()* and *nl\_langinfo\_l()* are  
 46506 complicated by the fact that *nl\_langinfo\_l()* must be thread-safe but *nl\_langinfo()* need not be.  
 46507 The various implementation choices are:

- 46508 1. *nl\_langinfo\_l()* and *nl\_langinfo()* use separate buffers, or at least one of them does not use  
 46509 an internal string buffer. In this case there are no interactions.
- 46510 2. *nl\_langinfo\_l()* and *nl\_langinfo()* share an internal per-thread buffer. There can be  
 46511 interactions, but only in the same thread.
- 46512 3. *nl\_langinfo\_l()* uses an internal per-thread buffer, and *nl\_langinfo()* uses (in all threads)  
 46513 the same buffer that *nl\_langinfo\_l()* uses in the initial thread. There can be interactions,  
 46514 but only when *nl\_langinfo\_l()* is called in the initial thread.

46515 **FUTURE DIRECTIONS**

46516 None.

46520 **CHANGE HISTORY**

46521 First released in Issue 2.

46522 **Issue 5**

46523 The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

46524 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

46525 **Issue 7**

46526 Austin Group Interpretation 1003.1-2001 #156 is applied.

46527 The *nl\_langinfo()* function is moved from the XSI option to the Base.

46528 The *nl\_langinfo\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
 46529 API Set Part 4.

46530 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0412 [302], XSH/TC1-2008/0413 [75],  
 46531 XSH/TC1-2008/0414 [283], XSH/TC1-2008/0415 [75,402], XSH/TC1-2008/0416 [283], and  
 46532 XSH/TC1-2008/0417 [402] are applied.

46544       uint32\_t ntohl(uint32\_t *netlong*);46545       uint16\_t ntohs(uint16\_t *netshort*);46546 **DESCRIPTION**46547       Refer to *htonl()*.

## 46548 NAME

46549 open, openat — open file |

## 46550 SYNOPSIS

46551 OH `#include <sys/stat.h>`46552 `#include <fcntl.h>`46553 `int open(const char *path, int oflag, ...);`46554 `int openat(int fd, const char *path, int oflag, ...);`

## 46555 DESCRIPTION

46556 The `open()` function shall establish the connection between a file and a file descriptor. It shall  
 46557 create an open file description that refers to a file and a file descriptor that refers to that open file  
 46558 description. The file descriptor is used by other I/O functions to refer to that file. The *path*  
 46559 argument points to a pathname naming the file.

46560 The `open()` function shall return a file descriptor for the named file, allocated as described in |  
 46561 [Section 2.14](#) (on page 549). The open file description is new, and therefore the file descriptor |  
 46562 shall not share it with any other process in the system. The FD\_CLOEXEC file descriptor flag  
 46563 associated with the new file descriptor shall be cleared unless the O\_CLOEXEC flag is set in  
 46564 *oflag*.

46565 The file offset used to mark the current position within the file shall be set to the beginning of  
 46566 the file.

46567 The file status flags and file access modes of the open file description shall be set according to  
 46568 the value of *oflag*.

46569 Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 46570 in `<fcntl.h>`. Applications shall specify exactly one of the first five values (file access modes)  
 46571 below in the value of *oflag*:

46572 O\_EXEC Open for execute only (non-directory files). The result is unspecified if  
 46573 this flag is applied to a directory.

46574 O\_RDONLY Open for reading only.

46575 O\_RDWR Open for reading and writing. The result is undefined if this flag is  
 46576 applied to a FIFO.

46577 O\_SEARCH Open directory for search only. The result is unspecified if this flag is  
 46578 applied to a non-directory file.

46579 O\_WRONLY Open for writing only.

46580 Any combination of the following may be used:

46581 O\_APPEND If set, the file offset shall be set to the end of the file prior to each write.

46582 O\_CLOEXEC If set, the FD\_CLOEXEC flag for the new file descriptor shall be set.

46583 O\_CREAT If the file exists, this flag has no effect except as noted under O\_EXCL |  
 46584 below. Otherwise, if O\_DIRECTORY is not set the file shall be created as a |  
 46585 regular file; the user ID of the file shall be set to the effective user ID of the |  
 46586 process; the group ID of the file shall be set to the group ID of the file's |  
 46587 parent directory or to the effective group ID of the process; and the access |  
 46588 permission bits (see `<sys/stat.h>`) of the file mode shall be set to the value |  
 46589 of the argument following the *oflag* argument taken as type `mode_t`  
 46590 modified as follows: a bitwise AND is performed on the file-mode bits  
 46591 and the corresponding bits in the complement of the process' file mode

|       |     |             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------|-----|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 46592 |     |             | creation mask. Thus, all bits in the file mode whose corresponding bit in the file mode creation mask is set are cleared. When bits other than the file permission bits are set, the effect is unspecified. The argument following the <i>oflag</i> argument does not affect whether the file is open for reading, writing, or for both. Implementations shall provide a way to initialize the file's group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the file's group ID to the effective group ID of the calling process. |
| 46593 |     |             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 46594 |     |             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 46595 |     |             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 46596 |     |             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 46597 |     |             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 46598 |     |             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 46601 |     | O_DIRECTORY | If <i>path</i> resolves to a non-directory file, fail and set <i>errno</i> to [ENOTDIR].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 46602 | SIO | O_DSYNC     | Write I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 46603 |     |             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 46604 |     | O_EXCL      | If O_CREAT and O_EXCL are set, <i>open()</i> shall fail if the file exists. The check for the existence of the file and the creation of the file if it does not exist shall be atomic with respect to other threads executing <i>open()</i> naming the same filename in the same directory with O_EXCL and O_CREAT set. If O_EXCL and O_CREAT are set, and <i>path</i> names a symbolic link, <i>open()</i> shall fail and set <i>errno</i> to [EEXIST], regardless of the contents of the symbolic link. If O_EXCL is set and O_CREAT is not set, the result is undefined.                                          |

| 46651 |           | O_TTY_INIT | If <i>path</i> identifies a terminal device other than a pseudo-terminal, the device is not already open in any process, and either O_TTY_INIT is set in <i>oflag</i> or O_TTY_INIT has the value zero, <i>open()</i> shall set any non-standard <b>termios</b> structure terminal parameters to a state that provides conforming behavior; see XBD Section 11.2 (on page 205). It is unspecified whether O_TTY_INIT has any effect if the device is already open in any process. If <i>path</i> identifies the slave side of a pseudo-terminal that is not already open in any process, <i>open()</i> shall set any non-standard <b>termios</b> structure terminal parameters to a state that provides conforming behavior, regardless of whether O_TTY_INIT is set. If <i>path</i> does not identify a terminal device, O_TTY_INIT shall be ignored. |

| 46670 | SIO       |            | If both the O_SYNC and O_DSYNC flags are set, the effect is as if only the O_SYNC flag was set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 46671 | OB XSR    |            | If <i>path</i> refers to a STREAMS file, <i>oflag</i> may be constructed from O_NONBLOCK OR'ed with either O_RDONLY, O_WRONLY, or O_RDWR. Other flag values are not applicable to STREAMS devices and shall have no effect on them. The value O_NONBLOCK affects the operation of STREAMS drivers and certain functions applied to file descriptors associated with STREAMS files. For STREAMS drivers, the implementation of O_NONBLOCK is device-specific.                                                                                                                                                                                                                                                                                                                                                                                           |

| 46675 |           |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 46676 |           |            | The application shall ensure that it specifies the O_TTY_INIT flag on the first open of a terminal device since system boot or since the device was closed by the process that last had it open. The application need not specify the O_TTY_INIT flag when opening pseudo-terminals. If <i>path</i> names the master side of a pseudo-terminal device, then it is unspecified whether <i>open()</i> locks the slave side so that it cannot be opened. Conforming applications shall call <i>unlockpt()</i> before opening the slave side.                                                                                                                                                                                                                                                                                                              |

| 46680 |           |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 46681 |           |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

46682 The largest value that can be represented correctly in an object of type **off\_t** shall be established  
 46683 as the offset maximum in the open file description.

46684 The *openat()* function shall be equivalent to the *open()* function except in the case where *path*  
 46685 specifies a relative path. In this case the file to be opened is determined relative to the directory  
 46686 associated with the file descriptor *fd* instead of the current working directory. If the access mode  
 46687 of the open file description associated with the file descriptor is not O\_SEARCH, the function  
 46688 shall check whether directory searches are permitted using the current permissions of the  
 46689 directory underlying the file descriptor. If the access mode is O\_SEARCH, the function shall not  
 46690 perform the check.

46691 The *oflag* parameter and the optional fourth parameter correspond exactly to the parameters of  
 46692 *open()*.

46693 If *openat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 46694 directory shall be used and the behavior shall be identical to a call to *open()*.

#### 46695 RETURN VALUE

46696 Upon successful completion, these functions shall open the file and return a non-negative  
 46697 integer representing the file descriptor. Otherwise, these functions shall return -1 and set *errno*  
 46698 to indicate the error. If -1 is returned, no files shall be created or modified.

#### 46699 ERRORS

46700 These functions shall fail if:

46701 [EACCES] Search permission is denied on a component of the path prefix, or the file  
 46702 exists and the permissions specified by *oflag* are denied, or the file does not  
 46703 exist and write permission is denied for the parent directory of the file to be  
 46704 created, or O\_TRUNC is specified and write permission is denied.

46705 [EEXIST] O\_CREAT and O\_EXCL are set, and the named file exists.

46706 [EINTR] A signal was caught during *open()*.

46707 SIO [EINVAL] The implementation does not support synchronized I/O for this file.

46708 OB XSR [EIO] The *path* argument names a STREAMS file and a hangup or error occurred  
 46709 during the *open()*.

46710 [EISDIR] The named file is a directory and *oflag* includes O\_WRONLY or O\_RDWR, or  
 46711 includes O\_CREAT without O\_DIRECTORY.

46712 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 46713 argument, or O\_NOFOLLOW was specified and the *path* argument names a  
 46714 symbolic link.

46715 [EMFILE] All file descriptors available to the process are currently open.

46716 [ENAMETOOLONG]  
 46717 The length of a component of a pathname is longer than {NAME\_MAX}.

46718 [ENFILE] The maximum allowable number of files is currently open in the system.

46719 [ENOENT] O\_CREAT is not set and a component of *path* does not name an existing file, or  
 46720 O\_CREAT is set and a component of the path prefix of *path* does not name an  
 46721 existing file, or *path* points to an empty string.

46722 [ENOENT] or [ENOTDIR]  
 46723 O\_CREAT is set, and the *path* argument contains at least one non-*<slash>*  
 46724 character and ends with one or more trailing *<slash>* characters. If *path*

| 46765 | OB XSR | [ENOMEM]       | The <i>path</i> argument names a STREAMS file and the system is unable to allocate             |
| 46766 |        |                | resources.                                                                                     |

46767 [EOPNOTSUPP] The *path* argument names a socket. +

46768 [ETXTBSY] The file is a pure procedure (shared text) file that is being executed and *oflag* is

46769 O\_WRONLY or O\_RDWR.

## 46770 EXAMPLES

### 46771 Opening a File for Writing by the Owner

46772 The following example opens the file **/tmp/file**, either by creating it (if it does not already exist),

46773 or by truncating its length to 0 (if it does exist). In the former case, if the call creates a new file,

46774 the access permission bits in the file mode of the file are set to permit reading and writing by the

46775 owner, and to permit reading only by group members and others.

46776 If the call to *open()* is successful, the file is opened for writing.

```
46777 #include <fcntl.h>
46778 ...
46779 int fd;
46780 mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
46781 char *pathname = "/tmp/file";
46782 ...
46783 fd = open(pathname, O_WRONLY | O_CREAT | O_TRUNC, mode);
46784 ...
```

### 46785 Opening a File Using an Existence Check

46786 The following example uses the *open()* function to try to create the **LOCKFILE** file and open it

46787 for writing. Since the *open()* function specifies the O\_EXCL flag, the call fails if the file already

46788 exists. In that case, the program assumes that someone else is updating the password file and

46789 exits.

```
46790 #include <fcntl.h>
46791 #include <stdio.h>
46792 #include <stdlib.h>
46793 #define LOCKFILE "/etc/ptmp"
46794 ...
46795 int pfd; /* Integer for file descriptor returned by open() call. */
46796 ...
46797 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
46798     S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
46799 {
46800     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
46801     exit(1);
46802 }
46803 ...
```

## Opening a File for Writing

The following example opens a file for writing, creating the file if it does not already exist. If the file does exist, the system truncates the file to zero bytes.

```
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>

#define LOCKFILE "/etc/ptmp"
...
int pfd;
char pathname[PATH_MAX+1];
...
if ((pfd = open(pathname, O_WRONLY | O_CREAT | O_TRUNC,
    S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
{
    perror("Cannot open output file\n"); exit(1);
}
...
```

## APPLICATION USAGE

POSIX.1-2008 does not require that terminal parameters be automatically set to any state on first open, nor that they be reset after the last close. It is possible for a non-conforming application to leave a terminal device in a state where the next process to use that device finds it in a non-conforming state, but has no way of determining this. To ensure that the device is set to a conforming initial state, applications which perform a first open of a terminal (other than a pseudo-terminal) should do so using the `O_TTY_INIT` flag to set the parameters associated with the terminal to a conforming state.

Except as specified in this volume of POSIX.1-2008, the flags allowed in *oflag* are not mutually-exclusive and any number of them may be used simultaneously. Not all combinations of flags make sense. For example, using `O_SEARCH | O_CREAT` will successfully open a pre-existing directory for searching, but if there is no existing file by that name, then it is unspecified whether a regular file will be created. Likewise, if a non-directory file descriptor is successfully returned, it is unspecified whether that descriptor will have execute permissions as if by `O_EXEC` (note that it is unspecified whether `O_EXEC` and `O_SEARCH` have the same value).

## RATIONALE

Some implementations permit opening FIFOs with `O_RDWR`. Since FIFOs could be implemented in other ways, and since two file descriptors can be used to the same effect, this possibility is left as undefined.

See [\*getgroups\(\)\*](#) about the group of a newly created file.

The use of `open()` to create a regular file is preferable to the use of `creat()`, because the latter is redundant and included only for historical reasons.

The use of the `O_TRUNC` flag on FIFOs and directories (pipes cannot be `open()`-ed) must be permissible without unexpected side-effects (for example, `creat()` on a FIFO must not remove data). Since terminal special files might have type-ahead data stored in the buffer, `O_TRUNC` should not affect their content, particularly if a program that normally opens a regular file should open the current controlling terminal instead. Other file types, particularly implementation-defined ones, are left implementation-defined.

POSIX.1-2008 permits `[EACCES]` to be returned for conditions other than those explicitly listed.

The `O_NOCTTY` flag was added to allow applications to avoid unintentionally acquiring a controlling terminal as a side-effect of opening a terminal file. This volume of POSIX.1-2008 does not specify how a controlling terminal is acquired, but it allows an implementation to provide this on `open()` if the `O_NOCTTY` flag is not set and other conditions specified in XBD Chapter 11 (on page 199) are met.

In historical implementations the value of `O_RDONLY` is zero. Because of that, it is not possible to detect the presence of `O_RDONLY` and another option. Future implementations should encode `O_RDONLY` and `O_WRONLY` as bit flags so that:

```
O_RDONLY | O_WRONLY == O_RDWR
```

`O_EXEC` and `O_SEARCH` are specified as two of the five file access modes. Since `O_EXEC` does not apply to directories, and `O_SEARCH` only applies to directories, their values need not be distinct. Since `O_RDONLY` has historically had the value zero, implementations are not able to distinguish between `O_SEARCH` and `O_SEARCH | O_RDONLY`, and similarly for `O_EXEC`.

In general, the `open()` function follows the symbolic link if *path* names a symbolic link. However, the `open()` function, when called with `O_CREAT` and `O_EXCL`, is required to fail with `[EEXIST]` if *path* names an existing symbolic link, even if the symbolic link refers to a nonexistent file. This behavior is required so that privileged applications can create a new file in a known location without the possibility that a symbolic link might cause the file to be created in a different location.

For example, a privileged application that must create a file with a predictable name in a user-writable directory, such as the user's home directory, could be compromised if the user creates a symbolic link with that name that refers to a nonexistent file in a system directory. If the user can influence the contents of a file, the user could compromise the system by creating a new system configuration or spool file that would then be interpreted by the system. The test for a symbolic link which refers to a nonexistent file must be atomic with the creation of a new file.

In addition, the `open()` function refuses to open non-directories if the `O_DIRECTORY` flag is set. This avoids race conditions whereby a user might compromise the system by substituting a hard link to a sensitive file (e.g., a device or a FIFO) while a privileged application is running, where opening a file even for read access might have undesirable side-effects.

In addition, the `open()` function does not follow symbolic links if the `O_NOFOLLOW` flag is set. This avoids race conditions whereby a user might compromise the system by substituting a symbolic link to a sensitive file (e.g., a device) while a privileged application is running, where opening a file even for read access might have undesirable side-effects.

The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use `chown()` to set the group ID after the file is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the `openat()` function is to enable opening files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to `open()`, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the `openat()` function it can be guaranteed that the opened file is located relative to the desired directory. Some implementations use the `openat()` function for other purposes as well. In some cases, if the *oflag* parameter has the

O\_XATTR bit set, the returned file descriptor provides access to extended attributes. This functionality is not standardized here.

#### FUTURE DIRECTIONS

XBD Chapter 11 (on page 199), *<fcntl.h>*, *<sys/stat.h>*, *<sys/types.h>*

#### CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

##### Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

##### Issue 6

In the SYNOPSIS, the optional include of the *<sys/types.h>* header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include *<sys/types.h>* has been removed. Although *<sys/types.h>* was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the DESCRIPTION, O\_CREAT is amended to state that the group ID of the file is set to the group ID of the file's parent directory or to the effective group ID of the process. This is a FIPS requirement.
- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.
- The [ENXIO] mandatory error condition is added.
- The [EINVAL], [ENAMETOOLONG], and [ETXTBSY] optional error conditions are added.

The DESCRIPTION and ERRORS sections are updated so that items related to the optional XSI STREAMS Option Group are marked.

The following changes were made to align with the IEEE P1003.1a draft standard:

- An explanation is added of the effect of the O\_CREAT and O\_EXCL flags when the path refers to a symbolic link.
- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term “must” for application requirements.

The DESCRIPTION of O\_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.

46935 **Issue 7**

- 46936 Austin Group Interpretations 1003.1-2001 #113 and #143 are applied.
- 46937 Austin Group Interpretation 1003.1-2001 #144 is applied, adding the O\_TTY\_INIT flag.
- 46938 Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the
- 46939 FD\_CLOEXEC flag atomically at *open()*, and adding the F\_DUPFD\_CLOEXEC flag.
- 46940 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.
- 46941 This page is revised and the *openat()* function is added from The Open Group Technical
- 46942 Standard, 2006, Extended API Set Part 2.
- 46943 Functionality relating to the XSI STREAMS option is marked obsolescent.
- 46944 Changes are made related to support for finegrained timestamps.
- 46945 Changes are made to allow a directory to be opened for searching.
- 46946 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0418 [292], XSH/TC1-2008/0419 [141],
- 46947 XSH/TC1-2008/0420 [461], XSH/TC1-2008/0421 [390], XSH/TC1-2008/0422 [146],
- 46948 XSH/TC1-2008/0423 [324], XSH/TC1-2008/0424 [292], XSH/TC1-2008/0425 [278],
- 46949 XSH/TC1-2008/0426 [278], XSH/TC1-2008/0427 [291], and XSH/TC1-2008/0428 [307] are
- 46950 applied.

46951 **NAME**

46952 open\_memstream, open\_wmemstream — open a dynamic memory buffer stream

46953 **SYNOPSIS**

```

46954 CX    #include <stdio.h>
46955
46955     FILE *open_memstream(char **bufp, size_t *sizep);
46956
46956     #include <wchar.h>
46957
46957     FILE *open_wmemstream(wchar_t **bufp, size_t *sizep);

```

46958 **DESCRIPTION**

46959 The *open\_memstream()* and *open\_wmemstream()* functions shall create an I/O stream associated  
 46960 with a dynamically allocated memory buffer. The stream shall be opened for writing and shall  
 46961 be seekable.

46962 The stream associated with a call to *open\_memstream()* shall be byte-oriented.

46963 The stream associated with a call to *open\_wmemstream()* shall be wide-oriented.

46964 The stream shall maintain a current position in the allocated buffer and a current buffer length.  
 46965 The position shall be initially set to zero (the start of the buffer). Each write to the stream shall  
 46966 start at the current position and move this position by the number of successfully written bytes  
 46967 for *open\_memstream()* or the number of successfully written wide characters for  
 46968 *open\_wmemstream()*. The length shall be initially set to zero. If a write moves the position to a  
 46969 value larger than the current length, the current length shall be set to this position. In this case a  
 46970 null character for *open\_memstream()* or a null wide character for *open\_wmemstream()* shall be  
 46971 appended to the current buffer. For both functions the terminating null is not included in the  
 46972 calculation of the buffer length.

46973 After a successful *fflush()* or *fclose()*, the pointer referenced by *bufp* shall contain the address of  
 46974 the buffer, and the variable pointed to by *sizep* shall contain the smaller of the current buffer  
 46975 length and the number of bytes for *open\_memstream()*, or the number of wide characters for  
 46976 *open\_wmemstream()*, between the beginning of the buffer and the current file position indicator.

46977 After a successful *fflush()* the pointer referenced by *bufp* and the variable referenced by *sizep*  
 46978 remain valid only until the next write operation on the stream or a call to *fclose()*.

46979 After a successful *fclose()*, the pointer referenced by *bufp* can be passed to *free()*. +

46980 **RETURN VALUE**

46981 Upon successful completion, these functions shall return a pointer to the object controlling the  
 46982 stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

46983 **ERRORS**

46984 These functions shall fail if: +

46985 [EMFILE] {STREAM\_MAX} streams are currently open in the calling process. +

46986 These functions may fail if:

46987 [EINVAL] *bufp* or *sizep* are NULL.

46988 [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

46989 [ENOMEM] Memory for the stream or the buffer could not be allocated.

**EXAMPLES**

```
#include <stdio.h>
#include <stdlib.h>

int
main (void)
{
    FILE *stream;
    char *buf;
    size_t len;
    off_t eob;

    stream = open_memstream (&buf, &len);
    if (stream == NULL)
        /* handle error */ ;
    fprintf (stream, "hello my world");
    fflush (stream);
    printf ("buf=%s, len=%zu\n", buf, len);
    eob = ftello(stream);
    fseeko (stream, 0, SEEK_SET);
    fprintf (stream, "good-bye");
    fseeko (stream, eob, SEEK_SET);
    fclose (stream);
    printf ("buf=%s, len=%zu\n", buf, len);
    free (buf);
    return 0;
}
```

This program produces the following output:

```
buf=hello my world, len=14
buf=good-bye world, len=14
```

**APPLICATION USAGE**

The buffer created by these functions should be freed by the application after closing the stream, by means of a call to *free()*.

**RATIONALE**

These functions are similar to *fmemopen()* except that the memory is always allocated dynamically by the function, and the stream is opened only for output.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*fclose()*, *fdopen()*, *fflush()*, *fmemopen()*, *fopen()*, *free()*, *freopen()*

**CHANGE HISTORY**

First released in Issue 7.

47031 **NAME**

47032       openat — open file relative to directory file descriptor

47033 **SYNOPSIS**

47034       #include &lt;fcntl.h&gt;

47035       int openat(int *fd*, const char \**path*, int *oflag*, ...);47036 **DESCRIPTION**47037       Refer to *open()*.

47038 **NAME**

47039        opendir — open directory associated with file descriptor

47040 **SYNOPSIS**

47041        #include &lt;dirent.h&gt;

47042        DIR \*opendir(const char \*dirname);

47043 **DESCRIPTION**47044        Refer to *fdopendir()*.

47045 **NAME**

47046       openlog — open a connection to the logging facility

47047 **SYNOPSIS**

47048 XSI       #include &lt;syslog.h&gt;

47049       void openlog(const char \*ident, int logopt, int facility);

47050 **DESCRIPTION**47051       Refer to *closelog()*.

47052 **NAME**

47053       optarg, opterr, optind, optopt — options parsing variables

47054 **SYNOPSIS**

47055       #include &lt;unistd.h&gt;

47056       extern char \*optarg;

47057       extern int opterr, optind, optopt;

47058 **DESCRIPTION**47059       Refer to *getopt()*.

47060 **NAME**

47061 pathconf — get configurable pathname variables

47062 **SYNOPSIS**

47063 #include &lt;unistd.h&gt;

47064 long pathconf(const char \*path, int name);

47065 **DESCRIPTION**47066 Refer to *fpathconf()*.

47067 **NAME**

47068 pause — suspend the thread until a signal is received

47069 **SYNOPSIS**

47070 #include &lt;unistd.h&gt;

47071 int pause(void);

47072 **DESCRIPTION**47073 The *pause()* function shall suspend the calling thread until delivery of a signal whose action is  
47074 either to execute a signal-catching function or to terminate the process.47075 If the action is to terminate the process, *pause()* shall not return.47076 If the action is to execute a signal-catching function, *pause()* shall return after the signal-catching  
47077 function returns.47078 **RETURN VALUE**47079 Since *pause()* suspends thread execution indefinitely unless interrupted by a signal, there is no  
47080 successful completion return value. A value of -1 shall be returned and *errno* set to indicate the  
47081 error.47082 **ERRORS**47083 The *pause()* function shall fail if:47084 [EINTR] A signal is caught by the calling process and control is returned from the  
47085 signal-catching function.47086 **EXAMPLES**

47087 None.

47088 **APPLICATION USAGE**47089 Many common uses of *pause()* have timing windows. The scenario involves checking a  
47090 condition related to a signal and, if the signal has not occurred, calling *pause()*. When the signal  
47091 occurs between the check and the call to *pause()*, the process often blocks indefinitely. The  
47092 *sigprocmask()* and *sigsuspend()* functions can be used to avoid this type of problem.47093 **RATIONALE**

47094 None.

47095 **FUTURE DIRECTIONS**

47096 None.

47097 **SEE ALSO**47098 *sigsuspend()*

47099 XBD &lt;unistd.h&gt;

47100 **CHANGE HISTORY**

47101 First released in Issue 1. Derived from Issue 1 of the SVID.

47102 **Issue 5**

47103 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

47104 **Issue 6**

47105 The APPLICATION USAGE section is added.

**NAME**

pclose — close a pipe stream to or from a process

**SYNOPSIS**

```
#include <stdio.h>

int pclose(FILE *stream);
```

**DESCRIPTION**

The *pclose()* function shall close a stream that was opened by *popen()*, wait for the command to terminate, and return the termination status of the process that was running the command language interpreter. However, if a call caused the termination status to be unavailable to *pclose()*, then *pclose()* shall return  $-1$  with *errno* set to [ECHILD] to report this situation. This can happen if the application calls one of the following functions:

- *wait()*
- *waitpid()* with a *pid* argument less than or equal to 0 or equal to the process ID of the command line interpreter
- Any other function not defined in this volume of POSIX.1-2008 that could do one of the above

In any case, *pclose()* shall not return before the child process created by *popen()* has terminated.

If the command language interpreter cannot be executed, the child termination status returned by *pclose()* shall be as if the command language interpreter terminated using *exit(127)* or *\_exit(127)*.

The *pclose()* function shall not affect the termination status of any child of the calling process other than the one created by *popen()* for the associated stream.

If the argument *stream* to *pclose()* is not a pointer to a stream created by *popen()*, the result of *pclose()* is undefined.

If a thread is canceled during execution of *pclose()*, the behavior is undefined.

+

**RETURN VALUE**

Upon successful return, *pclose()* shall return the termination status of the command language interpreter. Otherwise, *pclose()* shall return  $-1$  and set *errno* to indicate the error.

**ERRORS**

The *pclose()* function shall fail if:

[ECHILD] The status of the child process could not be obtained, as described above.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

There is a requirement that *pclose()* not return before the child process terminates. This is intended to disallow implementations that return [EINTR] if a signal is received while waiting. If *pclose()* returned before the child terminated, there would be no way for the application to discover which child used to be associated with the stream, and it could not do the cleanup itself.

If the stream pointed to by *stream* was not created by *popen()*, historical implementations of

*pclose()* return `-1` without setting *errno*. To avoid requiring *pclose()* to set *errno* in this case, POSIX.1-2008 makes the behavior unspecified. An application should not use *pclose()* to close any stream that was not created by *popen()*.

Some historical implementations of *pclose()* either block or ignore the signals `SIGINT`, `SIGQUIT`, and `SIGHUP` while waiting for the child process to terminate. Since this behavior is not described for the *pclose()* function in POSIX.1-2008, such implementations are not conforming. Also, some historical implementations return `[EINTR]` if a signal is received, even though the child process has not terminated. Such implementations are also considered non-conforming.

Consider, for example, an application that uses:

```
popen("command", "r")
```

to start *command*, which is part of the same application. The parent writes a prompt to its standard output (presumably the terminal) and then reads from the *popen()*ed stream. The child reads the response from the user, does some transformation on the response (pathname expansion, perhaps) and writes the result to its standard output. The parent process reads the result from the pipe, does something with it, and prints another prompt. The cycle repeats. Assuming that both processes do appropriate buffer flushing, this would be expected to work.

To conform to POSIX.1-2008, *pclose()* must use *waitpid()*, or some similar function, instead of *wait()*.

The code sample below illustrates how the *pclose()* function might be implemented on a system conforming to POSIX.1-2008.

```
int pclose(FILE *stream)
{
    int stat;
    pid_t pid;

    pid = <pid for process created for stream by popen(>
    (void) fclose(stream);
    while (waitpid(pid, &stat, 0) == -1) {
        if (errno != EINTR){
            stat = -1;
            break;
        }
    }
    return(stat);
}
```

## FUTURE DIRECTIONS

None.

## SEE ALSO

XBD `<stdio.h>`

## CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

47189 **NAME**

47190 perror — write error messages to standard error

47191 **SYNOPSIS**

47192 #include &lt;stdio.h&gt;

47193 void perror(const char \*s);

47194 **DESCRIPTION**

47195 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 47196 conflict between the requirements described here and the ISO C standard is unintentional. This  
 47197 volume of POSIX.1-2008 defers to the ISO C standard.

47198 The *perror()* function shall map the error number accessed through the symbol *errno* to a  
 47199 language-dependent error message, which shall be written to the standard error stream as  
 47200 follows:

- 47201 • First (if *s* is not a null pointer and the character pointed to by *s* is not the null byte), the  
 47202 string pointed to by *s* followed by a <colon> and a <space>.
- 47203 • Then an error message string followed by a <newline>.

47204 The contents of the error message strings shall be the same as those returned by *strerror()* with  
 47205 argument *errno*.

47206 CX The *perror()* function shall mark for update the last data modification and last file status change  
 47207 timestamps of the file associated with the standard error stream at some time between its  
 47208 successful completion and *exit()*, *abort()*, or the completion of *fflush()* or *fclose()* on *stderr*.

47209 The *perror()* function shall not change the orientation of the standard error stream.

47210 On error, *perror()* shall set the error indicator for the stream to which *stderr* points, and shall set  
 47211 *errno* to indicate the error.

47212 Since no value is returned, an application wishing to check for error situations should call  
 47213 *clearerr(stderr)* before calling *perror()*, then if *ferror(stderr)* returns non-zero, the value of *errno*  
 47214 indicates which error occurred.

47215 **RETURN VALUE**47216 The *perror()* function shall not return a value.47217 **ERRORS**47218 CX Refer to *fputc()*.47219 **EXAMPLES**47220 **Printing an Error Message for a Function**

47221 The following example replaces *bufptr* with a buffer that is the necessary size. If an error occurs,  
 47222 the *perror()* function prints a message and the program exits.

```

47223 #include <stdio.h>
47224 #include <stdlib.h>
47225 ...
47226 char *bufptr;
47227 size_t szbuf;
47228 ...
47229 if ((bufptr = malloc(szbuf)) == NULL) {
47230     perror("malloc"); exit(2);
47231 }
```

47232 . . .

#### 47233 APPLICATION USAGE

47234 Application writers may prefer to use alternative interfaces instead of *perror()*, such as  
47235 *strerror\_r()* in combination with *fprintf()*.

#### 47236 RATIONALE

47237 None.

#### 47238 FUTURE DIRECTIONS

47239 None.

#### 47240 SEE ALSO

#### 47243 CHANGE HISTORY

47244 First released in Issue 1. Derived from Issue 1 of the SVID.

##### 47245 Issue 5

47246 A paragraph is added to the DESCRIPTION indicating that *perror()* does not change the  
47247 orientation of the standard error stream.

##### 47248 Issue 6

47249 Extensions beyond the ISO C standard are marked.

##### 47250 Issue 7

47251 SD5-XSH-ERN-95 is applied.

47252 Changes are made related to support for finegrained timestamps.

47253 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0429 [389,401], XSH/TC1-2008/0430  
47254 [389], and XSH/TC1-2008/0431 [389,401] are applied.

**NAME**

pipe — create an interprocess channel

**SYNOPSIS**

```
#include <unistd.h>

int pipe(int fildes[2]);
```

**DESCRIPTION**

The *pipe()* function shall create a pipe and place two file descriptors, one each into the arguments *fildes*[0] and *fildes*[1], that refer to the open file descriptions for the read and write ends of the pipe. The file descriptors shall be allocated as described in [Section 2.14](#) (on page 549). The O\_NONBLOCK and FD\_CLOEXEC flags shall be clear on both file descriptors. (The *fcntl()* function can be used to set both these flags.)

Data can be written to the file descriptor *fildes*[1] and read from the file descriptor *fildes*[0]. A read on the file descriptor *fildes*[0] shall access data written to the file descriptor *fildes*[1] on a first-in-first-out basis. It is unspecified whether *fildes*[0] is also open for writing and whether *fildes*[1] is also open for reading.

A process has the pipe open for reading (correspondingly writing) if it has a file descriptor open that refers to the read end, *fildes*[0] (write end, *fildes*[1]).

The pipe's user ID shall be set to the effective user ID of the calling process.

The pipe's group ID shall be set to the effective group ID of the calling process.

Upon successful completion, *pipe()* shall mark for update the last data access, last data modification, and last file status change timestamps of the pipe.

**RETURN VALUE**

Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to indicate the error, no file descriptors shall be allocated and the contents of *fildes* shall be left unmodified.

**ERRORS**

The *pipe()* function shall fail if:

- |          |                                                                                            |
|----------|--------------------------------------------------------------------------------------------|
| [EMFILE] | All, or all but one, of the file descriptors available to the process are currently open.  |
| [ENFILE] | The number of simultaneously open files in the system would exceed a system-imposed limit. |

**EXAMPLES****Using a Pipe to Pass Data Between a Parent Process and a Child Process**

The following example demonstrates the use of a pipe to transfer data between a parent process and a child process. Error handling is excluded, but otherwise this code demonstrates good practice when using pipes: after the *fork()* the two processes close the unused ends of the pipe before they commence transferring data.

```
#include <stdlib.h>
#include <unistd.h>
...

int fildes[2];
const int BSIZE = 100;
char buf[BSIZE];
```

```

47298     ssize_t nbytes;
47299     int status;

47300     status = pipe(fildes);
47301     if (status == -1 ) {
47302         /* an error occurred */
47303         ...
47304     }

47305     switch (fork()) {
47306     case -1: /* Handle error */
47307         break;

47308     case 0: /* Child - reads from pipe */
47309         close(fildes[1]); /* Write end is unused */
47310         nbytes = read(fildes[0], buf, BSIZE); /* Get data from pipe */
47311         /* At this point, a further read would see end-of-file ... */
47312         close(fildes[0]); /* Finished with pipe */
47313         exit(EXIT_SUCCESS);

47314     default: /* Parent - writes to pipe */
47315         close(fildes[0]); /* Read end is unused */
47316         write(fildes[1], "Hello world\n", 12); /* Write data on pipe */
47317         close(fildes[1]); /* Child will see EOF */
47318         exit(EXIT_SUCCESS);
47319     }

```

**APPLICATION USAGE**

None.

**RATIONALE**

The wording carefully avoids using the verb “to open” in order to avoid any implication of use of *open()*; see also *write()*.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to indicate that certain dispositions of *fildes[0]* and *fildes[1]* are unspecified.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/65 is applied, adding the example to the EXAMPLES section.

47339 **Issue 7**

47340 SD5-XSH-ERN-156 is applied, updating the DESCRIPTION to state the setting of the pipe's user  
47341 ID and group ID.

47342 Changes are made related to support for finegrained timestamps.

47343 **NAME**

47344 poll — input/output multiplexing

47345 **SYNOPSIS**

47346 #include &lt;poll.h&gt;

47347 int poll(struct pollfd *fds*[], nfds\_t *nfds*, int *timeout*);47348 **DESCRIPTION**

47349 The *poll()* function provides applications with a mechanism for multiplexing input/output over  
 47350 a set of file descriptors. For each member of the array pointed to by *fds*, *poll()* shall examine the  
 47351 given file descriptor for the event(s) specified in *events*. The number of **pollfd** structures in the  
 47352 *fds* array is specified by *nfds*. The *poll()* function shall identify those file descriptors on which an  
 47353 application can read or write data, or on which certain events have occurred.

47354 The *fds* argument specifies the file descriptors to be examined and the events of interest for each  
 47355 file descriptor. It is a pointer to an array with one member for each open file descriptor of  
 47356 interest. The array's members are **pollfd** structures within which *fd* specifies an open file  
 47357 descriptor and *events* and *revents* are bitmasks constructed by OR'ing a combination of the  
 47358 following event flags:

47359 **POLLIN** Data other than high-priority data may be read without blocking.

47360 OB XSR For STREAMS, this flag is set in *revents* even if the message is of zero length.  
 47361 This flag shall be equivalent to **POLLRDNORM** | **POLLRDBAND**.

47362 **POLLRDNORM** Normal data may be read without blocking.

47363 OB XSR For STREAMS, data on priority band 0 may be read without blocking. This  
 47364 flag is set in *revents* even if the message is of zero length.

47365 **POLLRDBAND** Priority data may be read without blocking.

47366 OB XSR For STREAMS, data on priority bands greater than 0 may be read without  
 47367 blocking. This flag is set in *revents* even if the message is of zero length.

47368 **POLLPRI** High-priority data may be read without blocking.

47369 OB XSR For STREAMS, this flag is set in *revents* even if the message is of zero length.

47370 **POLLOUT** Normal data may be written without blocking.

47371 OB XSR For STREAMS, data on priority band 0 may be written without blocking.

47372 **POLLWRNORM** Equivalent to **POLLOUT**.

47373 **POLLWRBAND** Priority data may be written.

47374 OB XSR For STREAMS, data on priority bands greater than 0 may be written without  
 47375 blocking. If any priority band has been written to on this STREAM, this event  
 47376 only examines bands that have been written to at least once.

47377 **POLLERR** An error has occurred on the device or stream. This flag is only valid in the  
 47378 *revents* bitmask; it shall be ignored in the *events* member.

47379 **POLLHUP** A device has been disconnected, or a pipe or FIFO has been closed by the last  
 47380 process that had it open for writing. Once set, the hangup state of a FIFO shall  
 47381 persist until some process opens the FIFO for writing or until all read-only file  
 47382 descriptors for the FIFO are closed. This event and **POLLOUT** are mutually-  
 47383 exclusive; a stream can never be writable if a hangup has occurred. However,  
 47384 this event and **POLLIN**, **POLLRDNORM**, **POLLRDBAND**, or **POLLPRI** are  
 47385 not mutually-exclusive. This flag is only valid in the *revents* bitmask; it shall be

|       |                     |                                                                                                                                       |
|-------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| 47386 |                     | ignored in the <i>events</i> member.                                                                                                  |
| 47387 | POLLNVAL            | The specified <i>fd</i> value is invalid. This flag is only valid in the <i>revents</i> member;                                       |
| 47388 |                     | it shall ignored in the <i>events</i> member.                                                                                         |
| 47389 |                     | The significance and semantics of normal, priority, and high-priority data are file and device-                                       |
| 47390 |                     | specific.                                                                                                                             |
| 47391 |                     | If the value of <i>fd</i> is less than 0, <i>events</i> shall be ignored, and <i>revents</i> shall be set to 0 in that entry on       |
| 47392 |                     | return from <i>poll()</i> .                                                                                                           |
| 47393 |                     | In each <b>pollfd</b> structure, <i>poll()</i> shall clear the <i>revents</i> member, except that where the application               |
| 47394 |                     | requested a report on a condition by setting one of the bits of <i>events</i> listed above, <i>poll()</i> shall set                   |
| 47395 |                     | the corresponding bit in <i>revents</i> if the requested condition is true. In addition, <i>poll()</i> shall set the                  |
| 47396 |                     | POLLHUP, POLLERR, and POLLNVAL flag in <i>revents</i> if the condition is true, even if the                                           |
| 47397 |                     | application did not set the corresponding bit in <i>events</i> .                                                                      |
| 47398 |                     | If none of the defined events have occurred on any selected file descriptor, <i>poll()</i> shall wait at                              |
| 47399 |                     | least <i>timeout</i> milliseconds for an event to occur on any of the selected file descriptors. If the value                         |
| 47400 |                     | of <i>timeout</i> is 0, <i>poll()</i> shall return immediately. If the value of <i>timeout</i> is -1, <i>poll()</i> shall block until |
| 47401 |                     | a requested event occurs or until the call is interrupted.                                                                            |
| 47402 |                     | Implementations may place limitations on the granularity of timeout intervals. If the requested                                       |
| 47403 |                     | timeout interval requires a finer granularity than the implementation supports, the actual                                            |
| 47404 |                     | timeout interval shall be rounded up to the next supported value.                                                                     |
| 47405 |                     | The <i>poll()</i> function shall not be affected by the O_NONBLOCK flag.                                                              |
| 47406 |                     | The <i>poll()</i> function shall support regular files, terminal and pseudo-terminal devices, FIFOs,                                  |
| 47407 | OB XSR              | pipes, sockets and <b>STREAMS-based files</b> . The behavior of <i>poll()</i> on elements of <i>fds</i> that refer to                 |
| 47408 |                     | other types of file is unspecified.                                                                                                   |
| 47409 |                     | Regular files shall always poll TRUE for reading and writing.                                                                         |
| 47410 |                     | A file descriptor for a socket that is listening for connections shall indicate that it is ready for                                  |
| 47411 |                     | reading, once connections are available. A file descriptor for a socket that is connecting                                            |
| 47412 |                     | asynchronously shall indicate that it is ready for writing, once a connection has been established.                                   |
| 47413 |                     | Provided the application does not perform any action that results in unspecified or undefined +                                       |
| 47414 |                     | behavior, the value of the <i>fd</i> and <i>events</i> members of each element of <i>fds</i> shall not be modified by +               |
| 47415 |                     | <i>poll()</i> .                                                                                                                       |
| 47416 | <b>RETURN VALUE</b> |                                                                                                                                       |
| 47417 |                     | Upon successful completion, <i>poll()</i> shall return a non-negative value. A positive value indicates                               |
| 47418 |                     | the total number of <b>pollfd</b> structures that have selected events (that is, those for which the                                  |
| 47419 |                     | <i>revents</i> member is non-zero). A value of 0 indicates that the call timed out and no file descriptors                            |
| 47420 |                     | have been selected. Upon failure, <i>poll()</i> shall return -1 and set <i>errno</i> to indicate the error.                           |
| 47421 | <b>ERRORS</b>       |                                                                                                                                       |
| 47422 |                     | The <i>poll()</i> function shall fail if:                                                                                             |
| 47423 | [EAGAIN]            | The allocation of internal data structures failed but a subsequent request may                                                        |
| 47424 |                     | succeed.                                                                                                                              |
| 47425 | [EINTR]             | A signal was caught during <i>poll()</i> .                                                                                            |
| 47426 | OB XSR [EINVAL]     | The <i>nfds</i> argument is greater than {OPEN_MAX}, or one of the <i>fd</i> members                                                  |
| 47427 |                     | refers to a <b>STREAM</b> or multiplexer that is linked (directly or indirectly)                                                      |
| 47428 |                     | <b>downstream from a multiplexer.</b>                                                                                                 |

## EXAMPLES

## Checking for Events on a Stream

The following example opens a pair of STREAMS devices and then waits for either one to become writable. This example proceeds as follows:

1. Sets the *timeout* parameter to 500 milliseconds.
2. Opens the STREAMS devices */dev/dev0* and */dev/dev1*, and then polls them, specifying POLLOUT and POLLWRBAND as the events of interest.

The STREAMS device names */dev/dev0* and */dev/dev1* are only examples of how STREAMS devices can be named; STREAMS naming conventions may vary among systems conforming to the POSIX.1-2008.

3. Uses the *ret* variable to determine whether an event has occurred on either of the two STREAMS. The *poll()* function is given 500 milliseconds to wait for an event to occur (if it has not occurred prior to the *poll()* call).
4. Checks the returned value of *ret*. If a positive value is returned, one of the following can be done:
  - a. Priority data can be written to the open STREAM on priority bands greater than 0, because the POLLWRBAND event occurred on the open STREAM (*fds[0]* or *fds[1]*).
  - b. Data can be written to the open STREAM on priority-band 0, because the POLLOUT event occurred on the open STREAM (*fds[0]* or *fds[1]*).
5. If the returned value is not a positive value, permission to write data to the open STREAM (on any priority band) is denied.
6. If the POLLHUP event occurs on the open STREAM (*fds[0]* or *fds[1]*), the device on the open STREAM has disconnected.

```
#include <stropts.h>
#include <poll.h>
...
struct pollfd fds[2];
int timeout_msecs = 500;
int ret;
int i;

/* Open STREAMS device. */
fds[0].fd = open("/dev/dev0", ...);
fds[1].fd = open("/dev/dev1", ...);
fds[0].events = POLLOUT | POLLWRBAND;
fds[1].events = POLLOUT | POLLWRBAND;

ret = poll(fds, 2, timeout_msecs);

if (ret > 0) {
    /* An event on one of the fds has occurred. */
    for (i=0; i<2; i++) {
        if (fds[i].revents & POLLWRBAND) {
            /* Priority data may be written on device number i. */
            ...
        }
    }
}
```

```
47472         if (fds[i].revents & POLLOUT) {
47473             /* Data may be written on device number i. */
47474             ...
47475         }
47476         if (fds[i].revents & POLLHUP) {
47477             /* A hangup has occurred on device number i. */
47478             ...
47479         }
47480     }
47481 }
```

#### 47482 APPLICATION USAGE

47483 None.

#### 47484 RATIONALE

47485 The POLLHUP event does not occur for FIFOs just because the FIFO is not open for writing. It  
47486 only occurs when the FIFO is closed by the last writer and persists until some process opens the  
47487 FIFO for writing or until all read-only file descriptors for the FIFO are closed.

#### 47488 FUTURE DIRECTIONS

47489 None.

#### 47490 SEE ALSO

47491 [Section 2.6](#) (on page 500), [getmsg\(\)](#), [pselect\(\)](#), [putmsg\(\)](#), [read\(\)](#), [write\(\)](#)

#### 47493 CHANGE HISTORY

47494 First released in Issue 4, Version 2.

##### 47495 Issue 5

47496 Moved from X/OPEN UNIX extension to BASE.

47497 The description of POLLWRBAND is updated.

##### 47498 Issue 6

47499 Text referring to sockets is added to the DESCRIPTION.

47500 Functionality relating to the XSI STREAMS Option Group is marked.

47501 The Open Group Corrigendum U055/3 is applied, updating the DESCRIPTION of  
47502 POLLWRBAND.

47503 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/66 is applied, correcting the spacing in  
47504 the EXAMPLES section.

##### 47505 Issue 7

47506 Austin Group Interpretation 1003.1-2001 #209 is applied, clarifying the POLLHUP event.

47507 The *poll()* function is moved from the XSI option to the Base.

47508 Functionality relating to the XSI STREAMS option is marked obsolescent.

**NAME**

popen — initiate pipe streams to or from a process

**SYNOPSIS**

```
#include <stdio.h>
```

```
FILE *popen(const char *command, const char *mode);
```

**DESCRIPTION**

The *popen()* function shall execute the command specified by the string *command*. It shall create a pipe between the calling program and the executed command, and shall return a pointer to a stream that can be used to either read from or write to the pipe.

The environment of the executed command shall be as if a child process were created within the *popen()* call using the *fork()* function, and the child invoked the *sh* utility using the call:

```
execl(shell_path, "sh", "-c", command, (char *)0);
```

where *shell\_path* is an unspecified pathname for the *sh* utility.

The *popen()* function shall ensure that any streams from previous *popen()* calls that remain open in the parent process are closed in the new child process.

The *mode* argument to *popen()* is a string that specifies I/O mode:

1. If *mode* is *r*, when the child process is started, its file descriptor *STDOUT\_FILENO* shall be the writable end of the pipe, and the file descriptor *fileno(stream)* in the calling process, where *stream* is the stream pointer returned by *popen()*, shall be the readable end of the pipe.
2. If *mode* is *w*, when the child process is started its file descriptor *STDIN\_FILENO* shall be the readable end of the pipe, and the file descriptor *fileno(stream)* in the calling process, where *stream* is the stream pointer returned by *popen()*, shall be the writable end of the pipe.
3. If *mode* is any other value, the result is unspecified.

After *popen()*, both the parent and the child process shall be capable of executing independently before either terminates.

Pipe streams are byte-oriented.

**RETURN VALUE**

Upon successful completion, *popen()* shall return a pointer to an open stream that can be used to read or write to the pipe. Otherwise, it shall return a null pointer and may set *errno* to indicate the error.

**ERRORS**

The *popen()* function shall fail if:

[EMFILE] {STREAM\_MAX} streams are currently open in the calling process.

The *popen()* function may fail if:

[EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

[EINVAL] The *mode* argument is invalid.

The *popen()* function may also set *errno* values as described by *fork()* or *pipe()*.

## EXAMPLES

## Using popen() to Obtain a List of Files from the ls Utility

The following example demonstrates the use of *popen()* and *pclose()* to execute the command *ls* in order to obtain a list of files in the current directory:

```
#include <stdio.h>
...

FILE *fp;
int status;
char path[PATH_MAX];

fp = popen("ls *", "r");
if (fp == NULL)
    /* Handle error */;

while (fgets(path, PATH_MAX, fp) != NULL)
    printf("%s", path);

status = pclose(fp);
if (status == -1) {
    /* Error reported by pclose() */
    ...
} else {
    /* Use macros described under wait() to inspect 'status' in order
       to determine success/failure of command executed by popen() */
    ...
}
```

## APPLICATION USAGE

Since open files are shared, a mode *r* command can be used as an input filter and a mode *w* command as an output filter.

Buffered reading before opening an input filter may leave the standard input of that filter mispositioned. Similar problems with an output filter may be prevented by careful buffer flushing; for example, with *fflush()*.

A stream opened by *popen()* should be closed by *pclose()*.

The behavior of *popen()* is specified for values of *mode* of *r* and *w*. Other modes such as *rb* and *wb* might be supported by specific implementations, but these would not be portable features. Note that historical implementations of *popen()* only check to see if the first character of *mode* is *r*. Thus, a *mode* of *robert the robot* would be treated as *mode r*, and a *mode* of *anything else* would be treated as *mode w*.

If the application calls *waitpid()* or *waitid()* with a *pid* argument greater than 0, and it still has a stream that was called with *popen()* open, it must ensure that *pid* does not refer to the process started by *popen()*.

To determine whether or not the environment specified in the Shell and Utilities volume of POSIX.1-2008 is present, use the function call:

```
sysconf(_SC_2_VERSION)
```

(See *sysconf()*).

**RATIONALE**

The *popen()* function should not be used by programs that have set user (or group) ID privileges. The *fork()* and *exec* family of functions (except *execlp()* and *execvp()*), should be used instead. This prevents any unforeseen manipulation of the environment of the user that could cause execution of commands not anticipated by the calling program.

If the original and *popen()*ed processes both intend to read or write or read and write a common file, and either will be using FILE-type C functions (*fread()*, *fwrite()*, and so on), the rules for sharing file handles must be observed (see [Section 2.5.1](#), on page 497).

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

A statement is added to the DESCRIPTION indicating that pipe streams are byte-oriented.

**Issue 6**

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The optional [EMFILE] error condition is added.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/67 is applied, adding the example to the EXAMPLES section.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #029 is applied, clarifying the values for *mode* in the DESCRIPTION.

SD5-XSH-ERN-149 is applied, changing the {STREAM\_MAX} [EMFILE] error condition from a “may fail” to a “shall fail”.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0432 [14] is applied.

**NAME**

posix\_fadvise — file advisory information (**ADVANCED REALTIME**)

**SYNOPSIS**

```
#include <fcntl.h>

int posix_fadvise(int fd, off_t offset, off_t len, int advice);
```

**DESCRIPTION**

The *posix\_fadvise()* function shall advise the implementation on the expected behavior of the application with respect to the data in the file associated with the open file descriptor, *fd*, starting at *offset* and continuing for *len* bytes. The specified range need not currently exist in the file. If *len* is zero, all data following *offset* is specified. The implementation may use this information to optimize handling of the specified data. The *posix\_fadvise()* function shall have no effect on the semantics of other operations on the specified data, although it may affect the performance of other operations.

The advice to be applied to the data is specified by the *advice* parameter and may be one of the following values:

**POSIX\_FADV\_NORMAL**

Specifies that the application has no advice to give on its behavior with respect to the specified data. It is the default characteristic if no advice is given for an open file.

**POSIX\_FADV\_SEQUENTIAL**

Specifies that the application expects to access the specified data sequentially from lower offsets to higher offsets.

**POSIX\_FADV\_RANDOM**

Specifies that the application expects to access the specified data in a random order.

**POSIX\_FADV\_WILLNEED**

Specifies that the application expects to access the specified data in the near future.

**POSIX\_FADV\_DONTNEED**

Specifies that the application expects that it will not access the specified data in the near future.

**POSIX\_FADV\_NOREUSE**

Specifies that the application expects to access the specified data once and then not reuse it thereafter.

These values are defined in **<fcntl.h>**.

**RETURN VALUE**

Upon successful completion, *posix\_fadvise()* shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The *posix\_fadvise()* function shall fail if:

- |          |                                                                                      |
|----------|--------------------------------------------------------------------------------------|
| [EBADF]  | The <i>fd</i> argument is not a valid file descriptor.                               |
| [EINVAL] | The value of <i>advice</i> is invalid, or the value of <i>len</i> is less than zero. |
| [ESPIPE] | The <i>fd</i> argument is associated with a pipe or FIFO.                            |

47660 **EXAMPLES**

47661 None.

47662 **APPLICATION USAGE**

47663 The *posix\_fadvise()* function is part of the Advisory Information option and need not be  
47664 provided on all implementations.

47665 **RATIONALE**

47666 None.

47680 Austin Group Interpretation 1003.1-2001 #024 is applied, changing the definition of the  
47681 [EINVAL] error.

## NAME

posix\_fallocate — file space control (ADVANCED REALTIME)

## SYNOPSIS

```
#include <fcntl.h>

int posix_fallocate(int fd, off_t offset, off_t len);
```

## DESCRIPTION

The *posix\_fallocate()* function shall ensure that any required storage for regular file data starting at *offset* and continuing for *len* bytes is allocated on the file system storage media. If *posix\_fallocate()* returns successfully, subsequent writes to the specified file data shall not fail due to the lack of free space on the file system storage media.

If the *offset+len* is beyond the current file size, then *posix\_fallocate()* shall adjust the file size to *offset+len*. Otherwise, the file size shall not be changed.

It is implementation-defined whether a previous *posix\_fadvise()* call influences allocation strategy.

Space allocated via *posix\_fallocate()* shall be freed by a successful call to *creat()* or *open()* that truncates the size of the file. Space allocated via *posix\_fallocate()* may be freed by a successful call to *ftruncate()* that reduces the file size to a size smaller than *offset+len*.

## RETURN VALUE

Upon successful completion, *posix\_fallocate()* shall return zero; otherwise, an error number shall be returned to indicate the error.

## ERRORS

The *posix\_fallocate()* function shall fail if:

- [EBADF] The *fd* argument is not a valid file descriptor.
  - [EBADF] The *fd* argument references a file that was opened without write permission.
  - [EFBIG] The value of *offset+len* is greater than the maximum file size.
  - [EINTR] A signal was caught during execution.
  - [EINVAL] The *len* argument is less than zero, or the *offset* argument is less than zero, or the underlying file system does not support this operation.
  - [EIO] An I/O error occurred while reading from or writing to a file system.
  - [ENODEV] The *fd* argument does not refer to a regular file.
  - [ENOSPC] There is insufficient free space remaining on the file system storage media.
  - [ESPIPE] The *fd* argument is associated with a pipe or FIFO.
- The *posix\_fallocate()* function may fail if:
- [EINVAL] The *len* argument is zero.

47716 **EXAMPLES**

47717 None.

47718 **APPLICATION USAGE**

47719 The *posix\_fallocate()* function is part of the Advisory Information option and need not be  
47720 provided on all implementations.

47737 definition of the [EINVAL] error.

## NAME

posix\_madvise — memory advisory information and alignment control (**ADVANCED REALTIME**)

## SYNOPSIS

```
#include <sys/mman.h>

int posix_madvise(void *addr, size_t len, int advice);
```

## DESCRIPTION

The *posix\_madvise()* function shall advise the implementation on the expected behavior of the application with respect to the data in the memory starting at address *addr*, and continuing for *len* bytes. The implementation may use this information to optimize handling of the specified data. The *posix\_madvise()* function shall have no effect on the semantics of access to memory in the specified range, although it may affect the performance of access.

The implementation may require that *addr* be a multiple of the page size, which is the value returned by *sysconf()* when the name value *\_SC\_PAGESIZE* is used.

The advice to be applied to the memory range is specified by the *advice* parameter and may be one of the following values:

### POSIX\_MADV\_NORMAL

Specifies that the application has no advice to give on its behavior with respect to the specified range. It is the default characteristic if no advice is given for a range of memory.

### POSIX\_MADV\_SEQUENTIAL

Specifies that the application expects to access the specified range sequentially from lower addresses to higher addresses.

### POSIX\_MADV\_RANDOM

Specifies that the application expects to access the specified range in a random order.

### POSIX\_MADV\_WILLNEED

Specifies that the application expects to access the specified range in the near future.

### POSIX\_MADV\_DONTNEED

Specifies that the application expects that it will not access the specified range in the near future.

These values are defined in the **<sys/mman.h>** header.

## RETURN VALUE

Upon successful completion, *posix\_madvise()* shall return zero; otherwise, an error number shall be returned to indicate the error.

## ERRORS

The *posix\_madvise()* function shall fail if:

[EINVAL] The value of *advice* is invalid.

[ENOMEM] Addresses in the range starting at *addr* and continuing for *len* bytes are partly or completely outside the range allowed for the address space of the calling process.

47777 The *posix\_madvise()* function may fail if:

47778 [EINVAL] The value of *addr* is not a multiple of the value returned by *sysconf()* when the  
47779 name value *\_SC\_PAGESIZE* is used.

47780 [EINVAL] The value of *len* is zero.

#### 47793 CHANGE HISTORY

47794 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

47795 IEEE PASC Interpretation 1003.1 #102 is applied.

**NAME**

posix\_mem\_offset — find offset and length of a mapped typed memory block (**ADVANCED REALTIME**)

**SYNOPSIS**

```
#include <sys/mman.h>
```

```
int posix_mem_offset(const void *restrict addr, size_t len,
    off_t *restrict off, size_t *restrict contig_len,
    int *restrict fildes);
```

**DESCRIPTION**

The *posix\_mem\_offset()* function shall return in the variable pointed to by *off* a value that identifies the offset (or location), within a memory object, of the memory block currently mapped at *addr*. The function shall return in the variable pointed to by *fildes*, the descriptor used (via *mmap()*) to establish the mapping which contains *addr*. If that descriptor was closed since the mapping was established, the returned value of *fildes* shall be  $-1$ . The *len* argument specifies the length of the block of the memory object the user wishes the offset for; upon return, the value pointed to by *contig\_len* shall equal either *len*, or the length of the largest contiguous block of the memory object that is currently mapped to the calling process starting at *addr*, whichever is smaller.

If the memory object mapped at *addr* is a typed memory object, then if the *off* and *contig\_len* values obtained by calling *posix\_mem\_offset()* are used in a call to *mmap()* with a file descriptor that refers to the same memory pool as *fildes* (either through the same port or through a different port), and that was opened with neither the `POSIX_TYPED_MEM_ALLOCATE` nor the `POSIX_TYPED_MEM_ALLOCATE_CONTIG` flag, the typed memory area that is mapped shall be exactly the same area that was mapped at *addr* in the address space of the process that called *posix\_mem\_offset()*.

If the memory object specified by *fildes* is not a typed memory object, then the behavior of this function is implementation-defined.

**RETURN VALUE**

Upon successful completion, the *posix\_mem\_offset()* function shall return zero; otherwise, the corresponding error status value shall be returned.

**ERRORS**

The *posix\_mem\_offset()* function shall fail if:

[EACCES] The process has not mapped a memory object supported by this function at the given address *addr*.

This function shall not return an error code of [EINTR].

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

47842 **CHANGE HISTORY**

47843 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

47844 **NAME**

47845       posix\_memalign — aligned memory allocation (**ADVANCED REALTIME**)

47846 **SYNOPSIS**

47847 ADV       #include <stdlib.h>  
47848       int posix\_memalign(void \*\*memptr, size\_t alignment, size\_t size);

47849 **DESCRIPTION**

47850       The *posix\_memalign()* function shall allocate *size* bytes aligned on a boundary specified by  
47851       *alignment*, and shall return a pointer to the allocated memory in *memptr*. The value of *alignment*  
47852       shall be a power of two multiple of *sizeof(void \*)*.

47853       Upon successful completion, the value pointed to by *memptr* shall be a multiple of *alignment*.

47854       If the size of the space requested is 0, the behavior is implementation-defined: either a null  
47855       pointer shall be returned in *memptr*, or the behavior shall be as if the size were some non-zero  
47856       value, except that the behavior is undefined if the the value returned in *memptr* is used to access  
47857       an object.

47858 CX       The *free()* function shall deallocate memory that has previously been allocated by  
47859       *posix\_memalign()*.

47860 **RETURN VALUE**

47861       Upon successful completion, *posix\_memalign()* shall return zero; otherwise, an error number  
47862       shall be returned to indicate the error and the contents of *memptr* shall either be left unmodified  
47863       or be set to a null pointer.

47864       If *size* is 0, either:

- 47865       • *posix\_memalign()* shall not attempt to allocate any space, in which case either an  
47866       implementation-defined error number shall be returned, or zero shall be returned with a  
47867       null pointer returned in *memptr*, or
- 47868       • *posix\_memalign()* shall attempt to allocate some space and, if the allocation succeeds, zero  
47869       shall be returned and a pointer to the allocated space shall be returned in *memptr*. The  
47870       application shall ensure that the pointer is not used to access an object.

47871 **ERRORS**

47872       The *posix\_memalign()* function shall fail if:

47873       [EINVAL]       The value of the alignment parameter is not a power of two multiple of  
47874       *sizeof(void \*)*.

47875       [ENOMEM]       There is insufficient memory available with the requested alignment.

47876 **EXAMPLES**

47877       The following example shows how applications can obtain consistent behavior on error by  
47878       setting *\*memptr* to be a null pointer before calling *posix\_memalign()*.

```
47879 void *ptr = NULL;
47880 ...
47881 //do some work, which might goto error
47882 if (posix_memalign(&ptr, align, size))
47883     goto error;
47884
47885 //do some more work, which might goto error
47886 ...
47887 error:
```

```
47887         free(ptr);
47888         //more cleanup;
```

#### 47889 APPLICATION USAGE

47890 The *posix\_memalign()* function is part of the Advisory Information option and need not be  
47891 provided on all implementations.

47903 Austin Group Interpretation 1003.1-2001 #058 is applied, clarifying the value of the *alignment*  
47904 argument in the DESCRIPTION.

47905 Austin Group Interpretation 1003.1-2001 #152 is applied, clarifying the behavior when the size of  
47906 the space requested is 0.

## NAME

`posix_openpt` — open a pseudo-terminal device

## SYNOPSIS

```
XSI      #include <stdlib.h>
         #include <fcntl.h>

         int posix_openpt(int oflag);
```

## DESCRIPTION

The `posix_openpt()` function shall establish a connection between a master device for a pseudo-terminal and a file descriptor. The file descriptor shall be allocated as described in [Section 2.14](#) (on page 549) and can be used by other I/O functions that refer to that pseudo-terminal.

The file status flags and file access modes of the open file description shall be set according to the value of *oflag*.

Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in `<fcntl.h>`:

|        |                               |
|--------|-------------------------------|
| O_RDWR | Open for reading and writing. |
|--------|-------------------------------|

|          |                                                                                                                      |
|----------|----------------------------------------------------------------------------------------------------------------------|
| O_NOCTTY | If set <i>posix_openpt()</i> shall not cause the terminal device to become the controlling terminal for the process. |
|----------|----------------------------------------------------------------------------------------------------------------------|

The behavior of other values for the *oflag* argument is unspecified.

## RETURN VALUE

Upon successful completion, the `posix_openpt()` function shall open a file descriptor for a master pseudo-terminal device and return a non-negative integer representing the file descriptor. Otherwise, `-1` shall be returned and `errno` set to indicate the error.

## ERRORS

The *posix\_openpt()* function shall fail if:

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] The maximum allowable number of files is currently open in the system.

The `posix_openpt()` function may fail if:

[EINVAL] The value of *oflag* is not valid.

[EAGAIN] Out of pseudo-terminal resources.

|    |     |         |                           |
|----|-----|---------|---------------------------|
| OB | XSR | [ENOSR] | Out of STREAMS resources. |
|----|-----|---------|---------------------------|

## EXAMPLES

## Opening a Pseudo-Terminal and Returning the Name of the Slave Device and a File Descriptor

```
#include <fcntl.h>
#include <stdio.h>

int masterfd, slavefd;
char *slavedevice;

masterfd = posix_openpt(O_RDWR|O_NOCTTY);

if (masterfd == -1
    || grantpt (masterfd) == -1
```

```
47947         || unlockpt (masterfd) == -1
47948         || (slavedevice = ptsname (masterfd)) == NULL)
47949         return -1;

47950     printf("slave device is: %s\n", slavedevice);

47951     slavefd = open(slavedevice, O_RDWR|O_NOCTTY);
47952     if (slavefd < 0)
47953         return -1;
```

#### 47954 APPLICATION USAGE

47955 This function is a method for portably obtaining a file descriptor of a master terminal device for  
47956 a pseudo-terminal. The *grantpt()* and *ptsname()* functions can be used to manipulate mode and  
47957 ownership permissions, and to obtain the name of the slave device, respectively.

#### 47958 RATIONALE

47959 The standard developers considered the matter of adding a special device for cloning master  
47960 pseudo-terminals: the */dev/ptmx* device. However, consensus could not be reached, and it was  
47961 felt that adding a new function would permit other implementations. The *posix\_openpt()*  
47962 function is designed to complement the *grantpt()*, *ptsname()*, and *unlockpt()* functions.

47963 On implementations supporting the */dev/ptmx* clone device, opening the master device of a  
47964 pseudo-terminal is simply:

```
47965     mfdp = open("/dev/ptmx", oflag );
47966     if (mfdp < 0)
47967         return -1;
```

#### 47968 FUTURE DIRECTIONS

47969 None.

#### 47970 SEE ALSO

47971 [Section 2.14](#) (on page 549), *grantpt()*, *open()*, *ptsname()*, *unlockpt()*

#### 47973 CHANGE HISTORY

47974 First released in Issue 6.

#### 47975 Issue 7

47976 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

47977 SD5-XSH-ERN-51 is applied, correcting an error in the EXAMPLES section.

## NAME

`posix_spawn`, `posix_spawnnp` — spawn a process (**ADVANCED REALTIME**)

## SYNOPSIS

```
SPN    #include <spawn.h>
```

```
int posix_spawn(pid_t *restrict pid, const char *restrict path,
    const posix_spawn_file_actions_t *file_actions,
    const posix_spawnattr_t *restrict attrp,
    char *const argv[restrict], char *const envp[restrict]);
int posix_spawnp(pid_t *restrict pid, const char *restrict file,
    const posix_spawn_file_actions_t *file_actions,
    const posix_spawnattr_t *restrict attrp,
    char *const argv[restrict], char *const envp[restrict]);
```

## DESCRIPTION

The *posix\_spawn()* and *posix\_spawnnp()* functions shall create a new process (child process) from the specified process image. The new process image shall be constructed from a regular executable file called the new process image file.

When a C program is executed as the result of this call, it shall be entered as a C-language function call as follows:

```
int main(int argc, char *argv[]);
```

where *argc* is the argument count and *argv* is an array of character pointers to the arguments themselves. In addition, the following variable:

```
extern char **environ;
```

shall be initialized as a pointer to an array of character pointers to the environment strings.

The argument *argv* is an array of character pointers to null-terminated strings. The last member of this array shall be a null pointer and is not counted in *argc*. These strings constitute the argument list available to the new process image. The value in *argv*[0] should point to a filename string that is associated with the process image being started by the *posix\_spawn()* or *posix\_spawnnp()* function.

The argument *envp* is an array of character pointers to null-terminated strings. These strings constitute the environment for the new process image. The environment array is terminated by a null pointer.

The number of bytes available for the combined argument and environment lists of the child process is {ARG\_MAX}. The implementation shall specify in the system documentation (see XBD [Chapter 2](#), on page 15) whether any list overhead, such as length words, null terminators, pointers, or alignment bytes, is included in this total.

The *path* argument to *posix\_spawn()* is a pathname that identifies the new process image file to execute.

The *file* parameter to *posix\_spawnnp()* shall be used to construct a pathname that identifies the new process image file. If the *file* parameter contains a <slash> character, the *file* parameter shall be used as the pathname for the new process image file. Otherwise, the path prefix for this file shall be obtained by a search of the directories passed as the environment variable *PATH* (see XBD Chapter 8, on page 173). If this environment variable is not defined, the results of the search are implementation-defined.

If *file\_actions* is a null pointer, then file descriptors open in the calling process shall remain open

in the child process, except for those whose close-on-exec flag FD\_CLOEXEC is set (see *fcntl()*). For those file descriptors that remain open, the child process shall not inherit any file locks, but all remaining attributes of the corresponding open file descriptions (see *fcntl()*), shall remain unchanged.

If *file\_actions* is not NULL, then the file descriptors open in the child process shall be those open in the calling process as modified by the spawn file actions object pointed to by *file\_actions* and the FD\_CLOEXEC flag of each remaining open file descriptor after the spawn file actions have been processed. The effective order of processing the spawn file actions shall be:

1. The set of open file descriptors for the child process shall initially be the same set as is open for the calling process. The child process shall not inherit any file locks, but all remaining attributes of the corresponding open file descriptions (see *fcntl()*), shall remain unchanged.
2. The signal mask, signal default actions, and the effective user and group IDs for the child process shall be changed as specified in the attributes object referenced by *attrp*.
3. The file actions specified by the spawn file actions object shall be performed in the order in which they were added to the spawn file actions object.
4. Any file descriptor that has its FD\_CLOEXEC flag set (see *fcntl()*) shall be closed.

If file descriptor 0, 1, or 2 would otherwise be closed in the new process image created by *posix\_spawn()* or *posix\_spawnnp()*, implementations may open an unspecified file for the file descriptor in the new process image. If a standard utility or a conforming application is executed with file descriptor 0 not open for reading or with file descriptor 1 or 2 not open for writing, the environment in which the utility or application is executed shall be deemed non-conforming, and consequently the utility or application might not behave as described in this standard.

The **posix\_spawnattr\_t** spawn attributes object type is defined in **<spawn.h>**. It shall contain at least the attributes defined below.

If the POSIX\_SPAWN\_SETPGROUP flag is set in the *spawn-flags* attribute of the object referenced by *attrp*, and the *spawn-pgroup* attribute of the same object is non-zero, then the child's process group shall be as specified in the *spawn-pgroup* attribute of the object referenced by *attrp*.

As a special case, if the POSIX\_SPAWN\_SETPGROUP flag is set in the *spawn-flags* attribute of the object referenced by *attrp*, and the *spawn-pgroup* attribute of the same object is set to zero, then the child shall be in a new process group with a process group ID equal to its process ID.

If the POSIX\_SPAWN\_SETPGROUP flag is not set in the *spawn-flags* attribute of the object referenced by *attrp*, the new child process shall inherit the parent's process group.

PS If the POSIX\_SPAWN\_SETSCHEDPARAM flag is set in the *spawn-flags* attribute of the object referenced by *attrp*, but POSIX\_SPAWN\_SETSCHEDULER is not set, the new process image shall initially have the scheduling policy of the calling process with the scheduling parameters specified in the *spawn-schedparam* attribute of the object referenced by *attrp*.

If the POSIX\_SPAWN\_SETSCHEDULER flag is set in the *spawn-flags* attribute of the object referenced by *attrp* (regardless of the setting of the POSIX\_SPAWN\_SETSCHEDPARAM flag), the new process image shall initially have the scheduling policy specified in the *spawn-schedpolicy* attribute of the object referenced by *attrp* and the scheduling parameters specified in the *spawn-schedparam* attribute of the same object.

The POSIX\_SPAWN\_RESETPID flag in the *spawn-flags* attribute of the object referenced by *attrp* governs the effective user ID of the child process. If this flag is not set, the child process shall inherit the effective user ID of the parent process. If this flag is set, the effective user ID of the

[EINVAL] The value specified by *file\_actions* or *attrp* is invalid.

If this error occurs after the calling process successfully returns from the *posix\_spawn()* or *posix\_spawnnp()* function, the child process may exit with exit status 127.

If *posix\_spawn()* or *posix\_spawnnp()* fail for any of the reasons that would cause *fork()* or one of the *exec* family of functions to fail, an error value shall be returned as described by *fork()* and *exec*, respectively (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If POSIX\_SPAWN\_SETPGROUP is set in the *spawn\_flags* attribute of the object referenced by *attrp*, and *posix\_spawn()* or *posix\_spawnnp()* fails while changing the child's process group, an error value shall be returned as described by *setpgid()* (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

PS If POSIX\_SPAWN\_SETSCHEDPARAM is set and POSIX\_SPAWN\_SETSCHEDULER is not set in the *spawn\_flags* attribute of the object referenced by *attrp*, then if *posix\_spawn()* or *posix\_spawnnp()* fails for any of the reasons that would cause *sched\_setparam()* to fail, an error value shall be returned as described by *sched\_setparam()* (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If POSIX\_SPAWN\_SETSCHEDULER is set in the *spawn\_flags* attribute of the object referenced by *attrp*, and if *posix\_spawn()* or *posix\_spawnnp()* fails for any of the reasons that would cause *sched\_setscheduler()* to fail, an error value shall be returned as described by *sched\_setscheduler()* (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If the *file\_actions* argument is not NULL, and specifies any *close*, *dup2*, or *open* actions to be performed, and if *posix\_spawn()* or *posix\_spawnnp()* fails for any of the reasons that would cause *close()*, *dup2()*, or *open()* to fail, an error value shall be returned as described by *close()*, *dup2()*, and *open()*, respectively (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127). An open file action may, by itself, result in any of the errors described by *close()* or *dup2()*, in addition to those described by *open()*.

## EXAMPLES

None.

## APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

See also the APPLICATION USAGE section for *exec*.

## RATIONALE

The *posix\_spawn()* function and its close relation *posix\_spawnnp()* have been introduced to overcome the following perceived difficulties with *fork()*: the *fork()* function is difficult or impossible to implement without swapping or dynamic address translation.

- Swapping is generally too slow for a realtime environment.
- Dynamic address translation is not available everywhere that POSIX might be useful.
- Processes are too useful to simply option out of POSIX whenever it must run without address translation or other MMU services.

Thus, POSIX needs process creation and file execution primitives that can be efficiently implemented without address translation or other MMU services.

The *posix\_spawn()* function is implementable as a library routine, but both *posix\_spawn()* and *posix\_spawnnp()* are designed as kernel operations. Also, although they may be an efficient

replacement for many *fork()/exec* pairs, their goal is to provide useful process creation primitives for systems that have difficulty with *fork()*, not to provide drop-in replacements for *fork()/exec*.

This view of the role of *posix\_spawn()* and *posix\_spawnnp()* influenced the design of their API. It does not attempt to provide the full functionality of *fork()/exec* in which arbitrary user-specified operations of any sort are permitted between the creation of the child process and the execution of the new process image; any attempt to reach that level would need to provide a programming language as parameters. Instead, *posix\_spawn()* and *posix\_spawnnp()* are process creation primitives like the *Start\_Process* and *Start\_Process\_Search* Ada language bindings package *POSIX\_Process\_Primitives* and also like those in many operating systems that are not UNIX systems, but with some POSIX-specific additions.

To achieve its coverage goals, *posix\_spawn()* and *posix\_spawnnp()* have control of six types of inheritance: file descriptors, process group ID, user and group ID, signal mask, scheduling, and whether each signal ignored in the parent will remain ignored in the child, or be reset to its default action in the child.

Control of file descriptors is required to allow an independently written child process image to access data streams opened by and even generated or read by the parent process without being specifically coded to know which parent files and file descriptors are to be used. Control of the process group ID is required to control how the job control of the child process relates to that of the parent.

Control of the signal mask and signal defaulting is sufficient to support the implementation of *system()*. Although support for *system()* is not explicitly one of the goals for *posix\_spawn()* and *posix\_spawnnp()*, it is covered under the “at least 50%” coverage goal.

The intention is that the normal file descriptor inheritance across *fork()*, the subsequent effect of the specified spawn file actions, and the normal file descriptor inheritance across one of the *exec* family of functions should fully specify open file inheritance. The implementation need make no decisions regarding the set of open file descriptors when the child process image begins execution, those decisions having already been made by the caller and expressed as the set of open file descriptors and their *FD\_CLOEXEC* flags at the time of the call and the spawn file actions object specified in the call. We have been assured that in cases where the POSIX *Start\_Process* Ada primitives have been implemented in a library, this method of controlling file descriptor inheritance may be implemented very easily.

We can identify several problems with *posix\_spawn()* and *posix\_spawnnp()*, but there does not appear to be a solution that introduces fewer problems. Environment modification for child process attributes not specifiable via the *attrp* or *file\_actions* arguments must be done in the parent process, and since the parent generally wants to save its context, it is more costly than similar functionality with *fork()/exec*. It is also complicated to modify the environment of a multi-threaded process temporarily, since all threads must agree when it is safe for the environment to be changed. However, this cost is only borne by those invocations of *posix\_spawn()* and *posix\_spawnnp()* that use the additional functionality. Since extensive modifications are not the usual case, and are particularly unlikely in time-critical code, keeping much of the environment control out of *posix\_spawn()* and *posix\_spawnnp()* is appropriate design.

The *posix\_spawn()* and *posix\_spawnnp()* functions do not have all the power of *fork()/exec*. This is to be expected. The *fork()* function is a wonderfully powerful operation. We do not expect to duplicate its functionality in a simple, fast function with no special hardware requirements. It is worth noting that *posix\_spawn()* and *posix\_spawnnp()* are very similar to the process creation operations on many operating systems that are not UNIX systems.

## Requirements

The requirements for *posix\_spawn()* and *posix\_spawnnp()* are:

- They must be implementable without an MMU or unusual hardware.
- They must be compatible with existing POSIX standards.

Additional goals are:

- They should be efficiently implementable.
- They should be able to replace at least 50% of typical executions of *fork()*.
- A system with *posix\_spawn()* and *posix\_spawnnp()* and without *fork()* should be useful, at least for realtime applications.
- A system with *fork()* and the *exec* family should be able to implement *posix\_spawn()* and *posix\_spawnnp()* as library routines.

## Two-Syntax

POSIX *exec* has several calling sequences with approximately the same functionality. These appear to be required for compatibility with existing practice. Since the existing practice for the *posix\_spawn\*()* functions is otherwise substantially unlike POSIX, we feel that simplicity outweighs compatibility. There are, therefore, only two names for the *posix\_spawn\*()* functions.

The parameter list does not differ between *posix\_spawn()* and *posix\_spawnnp()*; *posix\_spawnnp()* interprets the second parameter more elaborately than *posix\_spawn()*.

## Compatibility with POSIX.5 (Ada)

The *Start\_Process* and *Start\_Process\_Search* procedures from the *POSIX\_Process\_Primitives* package from the Ada language binding to POSIX.1 encapsulate *fork()* and *exec* functionality in a manner similar to that of *posix\_spawn()* and *posix\_spawnnp()*. Originally, in keeping with our simplicity goal, the standard developers had limited the capabilities of *posix\_spawn()* and *posix\_spawnnp()* to a subset of the capabilities of *Start\_Process* and *Start\_Process\_Search*; certain non-default capabilities were not supported. However, based on suggestions by the ballot group to improve file descriptor mapping or drop it, and on the advice of an Ada Language Bindings working group member, the standard developers decided that *posix\_spawn()* and *posix\_spawnnp()* should be sufficiently powerful to implement *Start\_Process* and *Start\_Process\_Search*. The rationale is that if the Ada language binding to such a primitive had already been approved as an IEEE standard, there can be little justification for not approving the functionally-equivalent parts of a C binding. The only three capabilities provided by *posix\_spawn()* and *posix\_spawnnp()* that are not provided by *Start\_Process* and *Start\_Process\_Search* are optionally specifying the child's process group ID, the set of signals to be reset to default signal handling in the child process, and the child's scheduling policy and parameters.

For the Ada language binding for *Start\_Process* to be implemented with *posix\_spawn()*, that binding would need to explicitly pass an empty signal mask and the parent's environment to *posix\_spawn()* whenever the caller of *Start\_Process* allowed these arguments to default, since *posix\_spawn()* does not provide such defaults. The ability of *Start\_Process* to mask user-specified signals during its execution is functionally unique to the Ada language binding and must be dealt with in the binding separately from the call to *posix\_spawn()*.

identify this class of error, nor does it provide any detailed information on the nature of the failure. Note that a kernel implementation of *posix\_spawn()* or *posix\_spawnnp()* is permitted (and encouraged) to return any possible error as the function value, thus providing more detailed failure information to the parent process.

Thus, no special macros are available to isolate asynchronous *posix\_spawn()* or *posix\_spawnnp()* errors. Instead, errors detected by the *posix\_spawn()* or *posix\_spawnnp()* operations in the context of the child process before the new process image executes are reported by setting the child's exit status to 127. The calling process may use the WIFEXITED and WEXITSTATUS macros on the *stat\_val* stored by the *wait()* or *waitpid()* functions to detect spawn failures to the extent that other status values with which the child process image may exit (before the parent can conclusively determine that the child process image has begun execution) are distinct from exit status 127.

#### CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #103 is applied, noting that the signal default actions are changed as well as the signal mask in step 2.

IEEE PASC Interpretation 1003.1 #132 is applied.

#### Issue 7

Functionality relating to the Threads option is moved to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0433 [291], XSH/TC1-2008/0434 [173], and XSH/TC1-2008/0435 [173] are applied.

## NAME

posix\_spawn\_file\_actions\_addclose, posix\_spawn\_file\_actions\_addopen — add close or open action to spawn file actions object (**ADVANCED REALTIME**)

## SYNOPSIS

```
#include <spawn.h>

int posix_spawn_file_actions_addclose(posix_spawn_file_actions_t
    *file_actions, int fildes);
int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t
    *restrict file_actions, int fildes,
    const char *restrict path, int oflag, mode_t mode);
```

## DESCRIPTION

These functions shall add or delete a close or open action to a spawn file actions object.

A spawn file actions object is of type **posix\_spawn\_file\_actions\_t** (defined in **<spawn.h>**) and is used to specify a series of actions to be performed by a *posix\_spawn()* or *posix\_spawnnp()* operation in order to arrive at the set of open file descriptors for the child process given the set of open file descriptors of the parent. POSIX.1-2008 does not define comparison or assignment operators for the type **posix\_spawn\_file\_actions\_t**.

A spawn file actions object, when passed to *posix\_spawn()* or *posix\_spawnnp()*, shall specify how the set of open file descriptors in the calling process is transformed into a set of potentially open file descriptors for the spawned process. This transformation shall be as if the specified sequence of actions was performed exactly once, in the context of the spawned process (prior to execution of the new process image), in the order in which the actions were added to the object; additionally, when the new process image is executed, any file descriptor (from this new set) which has its FD\_CLOEXEC flag set shall be closed (see *posix\_spawn()*).

The *posix\_spawn\_file\_actions\_addclose()* function shall add a *close* action to the object referenced by *file\_actions* that shall cause the file descriptor *fildes* to be closed (as if *close(fildes)* had been called) when a new process is spawned using this file actions object.

The *posix\_spawn\_file\_actions\_addopen()* function shall add an *open* action to the object referenced by *file\_actions* that shall cause the file named by *path* to be opened (as if *open(path, oflag, mode)* had been called, and the returned file descriptor, if not *fildes*, had been changed to *fildes*) when a new process is spawned using this file actions object. If *fildes* was already an open file descriptor, it shall be closed before the new file is opened.

The string described by *path* shall be copied by the *posix\_spawn\_file\_actions\_addopen()* function.

## RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

## ERRORS

The *posix\_spawn\_file\_actions\_addopen()* function shall fail if:

[EBADF]        The value specified by *fildes* is negative or greater than or equal to {OPEN\_MAX}.

The *posix\_spawn\_file\_actions\_addclose()* function shall fail if:

[EBADF]        The value specified by *fildes* is negative.

48361 These functions may fail if:

48362 [EINVAL] The value specified by *file\_actions* is invalid.

48363 [ENOMEM] Insufficient memory exists to add to the spawn file actions object.

48364 It shall not be considered an error for the *fildev* argument passed to these functions to specify a  
 48365 file descriptor for which the specified operation could not be performed at the time of the call.  
 48366 Any such error will be detected when the associated file actions object is later used during a  
 48367 *posix\_spawn()* or *posix\_spawnnp()* operation.

#### 48368 EXAMPLES

48369 None.

#### 48370 APPLICATION USAGE

48371 These functions are part of the Spawn option and need not be provided on all implementations.

48372 Implementations may use file descriptors that must be inherited into child processes for the  
 48373 child process to remain conforming, such as for message catalog or tracing purposes. Therefore,  
 48374 an application that calls *posix\_spawn\_file\_actions\_addclose()* with an arbitrary integer risks non-  
 48375 conforming behavior, and this function can only portably be used to close file descriptor values  
 48376 that the application has obtained through explicit actions, or for the three file descriptors  
 48377 corresponding to the standard file streams. In order to avoid a race condition of leaking an  
 48378 unintended file descriptor into a child process, an application should consider opening all file  
 48379 descriptors with the FD\_CLOEXEC bit set unless the file descriptor is intended to be inherited  
 48380 across *exec*.

#### 48381 RATIONALE

48382 A spawn file actions object may be initialized to contain an ordered sequence of *close()*, *dup2()*,  
 48383 and *open()* operations to be used by *posix\_spawn()* or *posix\_spawnnp()* to arrive at the set of open  
 48384 file descriptors inherited by the spawned process from the set of open file descriptors in the  
 48385 parent at the time of the *posix\_spawn()* or *posix\_spawnnp()* call. It had been suggested that the  
 48386 *close()* and *dup2()* operations alone are sufficient to rearrange file descriptors, and that files  
 48387 which need to be opened for use by the spawned process can be handled either by having the  
 48388 calling process open them before the *posix\_spawn()* or *posix\_spawnnp()* call (and close them after),  
 48389 or by passing pathnames to the spawned process (in *argv*) so that it may open them itself. The  
 48390 standard developers recommend that applications use one of these two methods when practical,  
 48391 since detailed error status on a failed open operation is always available to the application this  
 48392 way. However, the standard developers feel that allowing a spawn file actions object to specify  
 48393 open operations is still appropriate because:

- 48394 1. It is consistent with equivalent POSIX.5 (Ada) functionality.
- 48395 2. It supports the I/O redirection paradigm commonly employed by POSIX programs  
 48396 designed to be invoked from a shell. When such a program is the child process, it may not  
 48397 be designed to open files on its own.
- 48398 3. It allows file opens that might otherwise fail or violate file ownership/access rights if  
 48399 executed by the parent process.

48400 Regarding 2. above, note that the spawn open file action provides to *posix\_spawn()* and  
 48401 *posix\_spawnnp()* the same capability that the shell redirection operators provide to *system()*, only  
 48402 without the intervening execution of a shell; for example:

```
48403 system ("myprog <file1 3<file2");
```

48404 Regarding 3. above, note that if the calling process needs to open one or more files for access by  
 48405 the spawned process, but has insufficient spare file descriptors, then the open action is necessary

to allow the *open()* to occur in the context of the child process after other file descriptors have been closed (that must remain open in the parent).

Additionally, if a parent is executed from a file having a “set-user-id” mode bit set and the POSIX\_SPAWN\_RESETPID flag is set in the spawn attributes, a file created within the parent process will (possibly incorrectly) have the parent’s effective user ID as its owner, whereas a file created via an *open()* action during *posix\_spawn()* or *posix\_spawnnp()* will have the parent’s real ID as its owner; and an open by the parent process may successfully open a file to which the real user should not have access or fail to open a file to which the real user should have access.

### File Descriptor Mapping

The standard developers had originally proposed using an array which specified the mapping of child file descriptors back to those of the parent. It was pointed out by the ballot group that it is not possible to reshuffle file descriptors arbitrarily in a library implementation of *posix\_spawn()* or *posix\_spawnnp()* without provision for one or more spare file descriptor entries (which simply may not be available). Such an array requires that an implementation develop a complex strategy to achieve the desired mapping without inadvertently closing the wrong file descriptor at the wrong time.

It was noted by a member of the Ada Language Bindings working group that the approved Ada Language *Start\_Process* family of POSIX process primitives use a caller-specified set of file actions to alter the normal *fork()/exec* semantics for inheritance of file descriptors in a very flexible way, yet no such problems exist because the burden of determining how to achieve the final file descriptor mapping is completely on the application. Furthermore, although the file actions interface appears frightening at first glance, it is actually quite simple to implement in either a library or the kernel.

The *posix\_spawn\_file\_actions\_addclose()* function is not required to check whether the file descriptor is less than {OPEN\_MAX} because on some implementations {OPEN\_MAX} reflects the RLIMIT\_NOFILE soft limit and therefore calling *setrlimit()* to reduce this limit can result in an {OPEN\_MAX} value less than or equal to an already open file descriptor. Applications need to be able to close such file descriptors on spawn. On implementations where {OPEN\_MAX} does not change, it is recommended that *posix\_spawn\_file\_actions\_addclose()* should return [EBADF] if *fd* is greater than or equal to {OPEN\_MAX}.

### FUTURE DIRECTIONS

None.

### CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #105 is applied, adding a note to the DESCRIPTION that the string pointed to by *path* is copied by the *posix\_spawn\_file\_actions\_addopen()* function.

### Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0436 [418], XSH/TC1-2008/0437 [149], XSH/TC1-2008/0438 [291], and XSH/TC1-2008/0439 [418] are applied.

**NAME**

posix\_spawn\_file\_actions\_adddup2 — add dup2 action to spawn file actions object  
(ADVANCED REALTIME)

**SYNOPSIS**

```
#include <spawn.h>

int posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t
    *file_actions, int fildes, int newfildes);
```

**DESCRIPTION**

The *posix\_spawn\_file\_actions\_adddup2()* function shall add a *dup2()* action to the object referenced by *file\_actions* that shall cause the file descriptor *fildes* to be duplicated as *newfildes* (as if *dup2(fildes, newfildes)* had been called) when a new process is spawned using this file actions object.

A spawn file actions object is as defined in *posix\_spawn\_file\_actions\_addclose()*.

**RETURN VALUE**

Upon successful completion, the *posix\_spawn\_file\_actions\_adddup2()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The *posix\_spawn\_file\_actions\_adddup2()* function shall fail if:

[EBADF] The value specified by *fildes* or *newfildes* is negative or greater than or equal to {OPEN\_MAX}.

[ENOMEM] Insufficient memory exists to add to the spawn file actions object.

The *posix\_spawn\_file\_actions\_adddup2()* function may fail if:

[EINVAL] The value specified by *file\_actions* is invalid.

It shall not be considered an error for the *fildes* argument passed to the *posix\_spawn\_file\_actions\_adddup2()* function to specify a file descriptor for which the specified operation could not be performed at the time of the call. Any such error will be detected when the associated file actions object is later used during a *posix\_spawn()* or *posix\_spawnnp()* operation.

**EXAMPLES**

None.

**APPLICATION USAGE**

The *posix\_spawn\_file\_actions\_adddup2()* function is part of the Spawn option and need not be provided on all implementations.

Implementations may use file descriptors that must be inherited into child processes for the child process to remain conforming, such as for message catalog or tracing purposes. Therefore, an application that calls *posix\_spawn\_file\_actions\_adddup2()* with an arbitrary integer for *newfildes* risks non-conforming behavior, and this function can only portably be used to overwrite file descriptor values that the application has obtained through explicit actions, or for the three file descriptors corresponding to the standard file streams. In order to avoid a race condition of leaking an unintended file descriptor into a child process, an application should consider opening all file descriptors with the FD\_CLOEXEC bit set unless the file descriptor is intended to be inherited across *exec*.

48499 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

48500 IEEE PASC Interpretation 1003.1 #104 is applied, noting that the [EBADF] error can apply to the  
48501 *newfildes* argument in addition to *fildes*.48502 **Issue 7**

48503 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0440 [149] is applied.

48504 **NAME**

48505       posix\_spawn\_file\_actions\_addopen — add open action to spawn file actions object  
48506       (ADVANCED REALTIME)

48507 **SYNOPSIS**

```
48508 SPN   #include <spawn.h>  
48509       int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t  
48510       *restrict file_actions, int fildes,  
48511       const char *restrict path, int oflag, mode_t mode);
```

48512 **DESCRIPTION**

48513       Refer to *posix\_spawn\_file\_actions\_addclose()*.

## NAME

posix\_spawn\_file\_actions\_destroy, posix\_spawn\_file\_actions\_init — destroy and initialize spawn file actions object (ADVANCED REALTIME)

## SYNOPSIS

```
SPN    #include <spawn.h>

int posix_spawn_file_actions_destroy(posix_spawn_file_actions_t
    *file_actions);
int posix_spawn_file_actions_init(posix_spawn_file_actions_t
    *file_actions);
```

## DESCRIPTION

The *posix\_spawn\_file\_actions\_destroy()* function shall destroy the object referenced by *file\_actions*; the object becomes, in effect, uninitialized. An implementation may cause *posix\_spawn\_file\_actions\_destroy()* to set the object referenced by *file\_actions* to an invalid value. A destroyed spawn file actions object can be reinitialized using *posix\_spawn\_file\_actions\_init()*; the results of otherwise referencing the object after it has been destroyed are undefined.

The *posix\_spawn\_file\_actions\_init()* function shall initialize the object referenced by *file\_actions* to contain no file actions for *posix\_spawn()* or *posix\_spawnnp()* to perform.

A spawn file actions object is as defined in *posix\_spawn\_file\_actions\_addclose()*.

The effect of initializing an already initialized spawn file actions object is undefined.

## RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

## ERRORS

The *posix\_spawn\_file\_actions\_init()* function shall fail if:

[ENOMEM]      Insufficient memory exists to initialize the spawn file actions object.

The *posix\_spawn\_file\_actions\_destroy()* function may fail if:

[EINVAL]      The value specified by *file\_actions* is invalid.

## EXAMPLES

None.

## APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

## RATIONALE

Refer to the RATIONALE section in *posix\_spawn\_file\_actions\_addclose()*.

## FUTURE DIRECTIONS

None.

## SEE ALSO

XBD <spawn.h>

**CHANGE HISTORY**

- 48552 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.
- 48553
- 48554 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

## NAME

posix\_spawnattr\_destroy, posix\_spawnattr\_init — destroy and initialize spawn attributes object (ADVANCED REALTIME)

## SYNOPSIS

```
#include <spawn.h>

int posix_spawnattr_destroy(posix_spawnattr_t *attr);
int posix_spawnattr_init(posix_spawnattr_t *attr);
```

## DESCRIPTION

The *posix\_spawnattr\_destroy()* function shall destroy a spawn attributes object. A destroyed *attr* attributes object can be reinitialized using *posix\_spawnattr\_init()*; the results of otherwise referencing the object after it has been destroyed are undefined. An implementation may cause *posix\_spawnattr\_destroy()* to set the object referenced by *attr* to an invalid value.

The *posix\_spawnattr\_init()* function shall initialize a spawn attributes object *attr* with the default value for all of the individual attributes used by the implementation. Results are undefined if *posix\_spawnattr\_init()* is called specifying an already initialized *attr* attributes object.

A spawn attributes object is of type **posix\_spawnattr\_t** (defined in **<spawn.h>**) and is used to specify the inheritance of process attributes across a spawn operation. POSIX.1-2008 does not define comparison or assignment operators for the type **posix\_spawnattr\_t**.

Each implementation shall document the individual attributes it uses and their default values unless these values are defined by POSIX.1-2008. Attributes not defined by POSIX.1-2008, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

The resulting spawn attributes object (possibly modified by setting individual attribute values), is used to modify the behavior of *posix\_spawn()* or *posix\_spawnnp()*. After a spawn attributes object has been used to spawn a process by a call to a *posix\_spawn()* or *posix\_spawnnp()*, any function affecting the attributes object (including destruction) shall not affect any process that has been spawned in this way.

## RETURN VALUE

Upon successful completion, *posix\_spawnattr\_destroy()* and *posix\_spawnattr\_init()* shall return zero; otherwise, an error number shall be returned to indicate the error.

## ERRORS

The *posix\_spawnattr\_init()* function shall fail if:

[ENOMEM]      Insufficient memory exists to initialize the spawn attributes object.

The *posix\_spawnattr\_destroy()* function may fail if:

[EINVAL]      The value specified by *attr* is invalid.

## EXAMPLES

None.

## APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

## RATIONALE

The original spawn interface proposed in POSIX.1-2008 defined the attributes that specify the inheritance of process attributes across a spawn operation as a structure. In order to be able to separate optional individual attributes under their appropriate options (that is, the *spawn-schedparam* and *spawn-schedpolicy* attributes depending upon the Process Scheduling option), and

also for extensibility and consistency with the newer POSIX interfaces, the attributes interface has been changed to an opaque data type. This interface now consists of the type **posix\_spawnattr\_t**, representing a spawn attributes object, together with associated functions to initialize or destroy the attributes object, and to set or get each individual attribute. Although the new object-oriented interface is more verbose than the original structure, it is simple to use, more extensible, and easy to implement.

**FUTURE DIRECTIONS**

None.

*posix\_spawnattr\_getpgroup()*, *posix\_spawnattr\_getschedparam()*, *posix\_spawnattr\_getschedpolicy()*,  
*posix\_spawnattr\_getsigmask()*

XBD <spawn.h>

**CHANGE HISTORY**

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #106 is applied, noting that the effect of initializing an already initialized spawn attributes option is undefined.

**NAME**

posix\_spawnattr\_getflags, posix\_spawnattr\_setflags — get and set the spawn-flags attribute of a spawn attributes object (**ADVANCED REALTIME**)

**SYNOPSIS**

```
#include <spawn.h>

int posix_spawnattr_getflags(const posix_spawnattr_t *restrict attr,
    short *restrict flags);
int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

**DESCRIPTION**

The *posix\_spawnattr\_getflags()* function shall obtain the value of the *spawn-flags* attribute from the attributes object referenced by *attr*.

The *posix\_spawnattr\_setflags()* function shall set the *spawn-flags* attribute in an initialized attributes object referenced by *attr*.

The *spawn-flags* attribute is used to indicate which process attributes are to be changed in the new process image when invoking *posix\_spawn()* or *posix\_spawnnp()*. It is the bitwise-inclusive OR of zero or more of the following flags:

```
POSIX_SPAWN_RESETIDS
POSIX_SPAWN_SETPGROUP
POSIX_SPAWN_SETSIGDEF
POSIX_SPAWN_SETSIGMASK
POSIX_SPAWN_SETSCHEDPARAM
POSIX_SPAWN_SETSCHEDULER
```

These flags are defined in **<spawn.h>**. The default value of this attribute shall be as if no flags were set.

**RETURN VALUE**

Upon successful completion, *posix\_spawnattr\_getflags()* shall return zero and store the value of the *spawn-flags* attribute of *attr* into the object referenced by the *flags* parameter; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, *posix\_spawnattr\_setflags()* shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

These functions may fail if:

[EINVAL] The value specified by *attr* is invalid.

The *posix\_spawnattr\_setflags()* function may fail if:

[EINVAL] The value of the attribute being set is not valid.

**48651 EXAMPLES**

48652       None.

**48653 APPLICATION USAGE**

48654       These functions are part of the Spawn option and need not be provided on all implementations.

**48655 RATIONALE**

48656       None.

**48664 CHANGE HISTORY**

48665       First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

**NAME**

posix\_spawnattr\_getpgroup, posix\_spawnattr\_setpgroup — get and set the spawn-pgroup attribute of a spawn attributes object (**ADVANCED REALTIME**)

**SYNOPSIS**

```
#include <spawn.h>

int posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict attr,
    pid_t *restrict pgroup);
int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);
```

**DESCRIPTION**

The *posix\_spawnattr\_getpgroup()* function shall obtain the value of the *spawn-pgroup* attribute from the attributes object referenced by *attr*.

The *posix\_spawnattr\_setpgroup()* function shall set the *spawn-pgroup* attribute in an initialized attributes object referenced by *attr*.

The *spawn-pgroup* attribute represents the process group to be joined by the new process image in a spawn operation (if `POSIX_SPAWN_SETPGROUP` is set in the *spawn-flags* attribute). The default value of this attribute shall be zero.

**RETURN VALUE**

Upon successful completion, *posix\_spawnattr\_getpgroup()* shall return zero and store the value of the *spawn-pgroup* attribute of *attr* into the object referenced by the *pgroup* parameter; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, *posix\_spawnattr\_setpgroup()* shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

These functions may fail if:

[EINVAL] The value specified by *attr* is invalid.

The *posix\_spawnattr\_setpgroup()* function may fail if:

[EINVAL] The value of the attribute being set is not valid.

**EXAMPLES**

None.

**APPLICATION USAGE**

These functions are part of the Spawn option and need not be provided on all implementations.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

48708 **NAME**

48709 posix\_spawnattr\_getschedparam, posix\_spawnattr\_setschedparam — get and set the spawn-  
 48710 schedparam attribute of a spawn attributes object (**ADVANCED REALTIME**)

48711 **SYNOPSIS**

```
48712 SPN PS #include <spawn.h>
48713         #include <sched.h>

48714         int posix_spawnattr_getschedparam(const posix_spawnattr_t
48715             *restrict attr, struct sched_param *restrict schedparam);
48716         int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,
48717             const struct sched_param *restrict schedparam);
```

48718 **DESCRIPTION**

48719 The *posix\_spawnattr\_getschedparam()* function shall obtain the value of the *spawn-schedparam*  
 48720 attribute from the attributes object referenced by *attr*.

48721 The *posix\_spawnattr\_setschedparam()* function shall set the *spawn-schedparam* attribute in an  
 48722 initialized attributes object referenced by *attr*.

48723 The *spawn-schedparam* attribute represents the scheduling parameters to be assigned to the new  
 48724 process image in a spawn operation (if POSIX\_SPAWN\_SETSCHEDULER or  
 48725 POSIX\_SPAWN\_SETSCHEDPARAM is set in the *spawn-flags* attribute). The default value of this  
 48726 attribute is unspecified.

48727 **RETURN VALUE**

48728 Upon successful completion, *posix\_spawnattr\_getschedparam()* shall return zero and store the  
 48729 value of the *spawn-schedparam* attribute of *attr* into the object referenced by the *schedparam*  
 48730 parameter; otherwise, an error number shall be returned to indicate the error.

48731 Upon successful completion, *posix\_spawnattr\_setschedparam()* shall return zero; otherwise, an  
 48732 error number shall be returned to indicate the error.

48733 **ERRORS**

48734 These functions may fail if:

48735 [EINVAL] The value specified by *attr* is invalid.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

48799 **NAME**

48800 `posix_spawnattr_getsigdefault`, `posix_spawnattr_setsigdefault` — get and set the `spawn-sigdefault`  
 48801 attribute of a spawn attributes object (**ADVANCED REALTIME**)

48802 **SYNOPSIS**

```
48803 SPN    #include <signal.h>
48804        #include <spawn.h>

48805        int posix_spawnattr_getsigdefault(const posix_spawnattr_t
48806            *restrict attr, sigset_t *restrict sigdefault);
48807        int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,
48808            const sigset_t *restrict sigdefault);
```

48809 **DESCRIPTION**

48810 The `posix_spawnattr_getsigdefault()` function shall obtain the value of the `spawn-sigdefault`  
 48811 attribute from the attributes object referenced by `attr`.

48812 The `posix_spawnattr_setsigdefault()` function shall set the `spawn-sigdefault` attribute in an  
 48813 initialized attributes object referenced by `attr`.

48814 The `spawn-sigdefault` attribute represents the set of signals to be forced to default signal handling  
 48815 in the new process image (if `POSIX_SPAWN_SETSIGDEF` is set in the `spawn-flags` attribute) by a  
 48816 spawn operation. The default value of this attribute shall be an empty signal set.

48817 **RETURN VALUE**

48818 Upon successful completion, `posix_spawnattr_getsigdefault()` shall return zero and store the value  
 48819 of the `spawn-sigdefault` attribute of `attr` into the object referenced by the `sigdefault` parameter;  
 48820 otherwise, an error number shall be returned to indicate the error.

48821 Upon successful completion, `posix_spawnattr_setsigdefault()` shall return zero; otherwise, an error  
 48822 number shall be returned to indicate the error.

48823 **ERRORS**

48824 These functions may fail if:

48825 [EINVAL] The value specified by `attr` is invalid.

48842 **NAME**

48843 posix\_spawnattr\_getsigmask, posix\_spawnattr\_setsigmask — get and set the spawn-sigmask  
 48844 attribute of a spawn attributes object (**ADVANCED REALTIME**)

48845 **SYNOPSIS**

```
48846 SPN      #include <signal.h>
48847           #include <spawn.h>

48848           int posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict attr,
48849           sigset_t *restrict sigmask);
48850           int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,
48851           const sigset_t *restrict sigmask);
```

48852 **DESCRIPTION**

48853 The *posix\_spawnattr\_getsigmask()* function shall obtain the value of the *spawn-sigmask* attribute  
 48854 from the attributes object referenced by *attr*.

48855 The *posix\_spawnattr\_setsigmask()* function shall set the *spawn-sigmask* attribute in an initialized  
 48856 attributes object referenced by *attr*.

48857 The *spawn-sigmask* attribute represents the signal mask in effect in the new process image of a  
 48858 spawn operation (if `POSIX_SPAWN_SETSIGMASK` is set in the *spawn-flags* attribute). The  
 48859 default value of this attribute is unspecified.

48860 **RETURN VALUE**

48861 Upon successful completion, *posix\_spawnattr\_getsigmask()* shall return zero and store the value  
 48862 of the *spawn-sigmask* attribute of *attr* into the object referenced by the *sigmask* parameter;  
 48863 otherwise, an error number shall be returned to indicate the error.

48864 Upon successful completion, *posix\_spawnattr\_setsigmask()* shall return zero; otherwise, an error  
 48865 number shall be returned to indicate the error.

48866 **ERRORS**

48867 These functions may fail if:

48868 [EINVAL] The value specified by *attr* is invalid.

48869 The *posix\_spawnattr\_setsigmask()* function may fail if:

48870 [EINVAL] The value of the attribute being set is not valid.

48871 **EXAMPLES**

48872 None.

48873 **APPLICATION USAGE**

48874 These functions are part of the Spawn option and need not be provided on all implementations.

48875 **RATIONALE**

48876 None.

48877 **FUTURE DIRECTIONS**

48878 None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

48886 **NAME**48887       posix\_spawnattr\_init — initialize the spawn attributes object (**ADVANCED REALTIME**)48888 **SYNOPSIS**

48889 SPN       #include &lt;spawn.h&gt;

48890       int posix\_spawnattr\_init(posix\_spawnattr\_t \*attr);

48891 **DESCRIPTION**48892       Refer to *posix\_spawnattr\_destroy()*.

48893 **NAME**

48894       posix\_spawnattr\_setflags — set the spawn-flags attribute of a spawn attributes object  
48895       (ADVANCED REALTIME)

48896 **SYNOPSIS**

```
48897 SPN       #include <spawn.h>  
48898       int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

48899 **DESCRIPTION**

48900       Refer to *posix\_spawnattr\_getflags()*.

48901 **NAME**

48902       posix\_spawnattr\_setpgroup — set the spawn-pgroup attribute of a spawn attributes object  
48903       (ADVANCED REALTIME)

48904 **SYNOPSIS**

48905 SPN       #include <spawn.h>  
48906       int posix\_spawnattr\_setpgroup(posix\_spawnattr\_t \*attr, pid\_t pgroup);

48907 **DESCRIPTION**

48908       Refer to *posix\_spawnattr\_getpgroup()*.

48909 **NAME**

48910        posix\_spawnattr\_setschedparam — set the spawn-schedparam attribute of a spawn attributes  
48911        object (**ADVANCED REALTIME**)

48912 **SYNOPSIS**

```
48913 SPN PS  #include <sched.h>  
48914          #include <spawn.h>  
  
48915          int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,  
48916          const struct sched_param *restrict schedparam);
```

48917 **DESCRIPTION**

48918        Refer to *posix\_spawnattr\_getschedparam()*.

48919 **NAME**

48920 posix\_spawnattr\_setschedpolicy — set the spawn-schedpolicy attribute of a spawn attributes  
48921 object (**ADVANCED REALTIME**)

48922 **SYNOPSIS**

```
48923 SPN PS #include <sched.h>  
48924 #include <spawn.h>  
  
48925 int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,  
48926     int schedpolicy);
```

48927 **DESCRIPTION**

48928 Refer to *posix\_spawnattr\_getschedpolicy()*.

48929 **NAME**

48930 posix\_spawnattr\_setsigdefault — set the spawn-sigdefault attribute of a spawn attributes object  
48931 (**ADVANCED REALTIME**)

48932 **SYNOPSIS**

```
48933 SPN      #include <signal.h>  
48934          #include <spawn.h>  
  
48935          int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,  
48936          const sigset_t *restrict sigdefault);
```

48937 **DESCRIPTION**

48938 Refer to *posix\_spawnattr\_getsigdefault()*.

48939 **NAME**

48940        `posix_spawnattr_setsigmask` — set the spawn-sigmask attribute of a spawn attributes object  
48941        (**ADVANCED REALTIME**)

48942 **SYNOPSIS**

```
48943 SPN      #include <signal.h>  
48944           #include <spawn.h>  
  
48945           int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,  
48946           const sigset_t *restrict sigmask);
```

48947 **DESCRIPTION**

48948        Refer to *[posix\\_spawnattr\\_getsigmask\(\)](#)*.

48949 **NAME**48950 posix\_spawn — spawn a process (**ADVANCED REALTIME**)48951 **SYNOPSIS**48952 SPN `#include <spawn.h>`

```
48953 int posix_spawn(pid_t *restrict pid, const char *restrict file,  
48954     const posix_spawn_file_actions_t *file_actions,  
48955     const posix_spawnattr_t *restrict attrp,  
48956     char *const argv[restrict], char *const envp[restrict]);
```

48957 **DESCRIPTION**48958 Refer to *posix\_spawn()*.

48959 **NAME**

48960        posix\_trace\_attr\_destroy, posix\_trace\_attr\_init — destroy and initialize the trace stream  
 48961        attributes object (**TRACING**)

48962 **SYNOPSIS**

```
48963 OB TRC #include <trace.h>
48964         int posix_trace_attr_destroy(trace_attr_t *attr);
48965         int posix_trace_attr_init(trace_attr_t *attr);
```

48966 **DESCRIPTION**

48967        The *posix\_trace\_attr\_destroy()* function shall destroy an initialized trace attributes object. A  
 48968        destroyed *attr* attributes object can be reinitialized using *posix\_trace\_attr\_init()*; the results of  
 48969        otherwise referencing the object after it has been destroyed are undefined.

48970        The *posix\_trace\_attr\_init()* function shall initialize a trace attributes object *attr* with the default  
 48971        value for all of the individual attributes used by a given implementation. The read-only  
 48972        *generation-version* and *clock-resolution* attributes of the newly initialized trace attributes object  
 48973        shall be set to their appropriate values (see [Section 2.11.1.2](#), on page 542).

48974        Results are undefined if *posix\_trace\_attr\_init()* is called specifying an already initialized *attr*  
 48975        attributes object.

48976        Implementations may add extensions to the trace attributes object structure as permitted in XBD  
 48977        [Chapter 2](#) (on page 15).

48978        The resulting attributes object (possibly modified by setting individual attributes values), when  
 48979        used by *posix\_trace\_create()*, defines the attributes of the trace stream created. A single attributes  
 48980        object can be used in multiple calls to *posix\_trace\_create()*. After one or more trace streams have  
 48981        been created using an attributes object, any function affecting that attributes object, including  
 48982        destruction, shall not affect any trace stream previously created. An initialized attributes object  
 48983        also serves to receive the attributes of an existing trace stream or trace log when calling the  
 48984        *posix\_trace\_get\_attr()* function.

48985 **RETURN VALUE**

48986        Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 48987        return the corresponding error number.

48988 **ERRORS**

48989        The *posix\_trace\_attr\_destroy()* function may fail if:

48990        [EINVAL]        The value of *attr* is invalid.

48991        The *posix\_trace\_attr\_init()* function shall fail if:

48992        [ENOMEM]        Insufficient memory exists to initialize the trace attributes object.

48993 **EXAMPLES**

48994        None.

48995 **APPLICATION USAGE**

48996        None.

48997 **RATIONALE**

48998        None.

**48999 FUTURE DIRECTIONS**

49000 The *posix\_trace\_attr\_destroy()* and *posix\_trace\_attr\_init()* functions may be removed in a future  
49001 version.

**49002 SEE ALSO**

49003 *posix\_trace\_create()*, *posix\_trace\_get\_attr()*, *uname()*

49004 XBD <trace.h>

**49005 CHANGE HISTORY**

49006 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

49007 IEEE PASC Interpretation 1003.1 #123 is applied.

**49008 Issue 7**

49009 The *posix\_trace\_attr\_destroy()* and *posix\_trace\_attr\_init()* functions are marked obsolescent.

**NAME**

posix\_trace\_attr\_getclockres, posix\_trace\_attr\_getcreatetime, posix\_trace\_attr\_getgenversion, posix\_trace\_attr\_getname, posix\_trace\_attr\_setname — retrieve and set information about a trace stream (**TRACING**)

**SYNOPSIS**

```
OB TRC #include <time.h>
#include <trace.h>

int posix_trace_attr_getclockres(const trace_attr_t *attr,
    struct timespec *resolution);
int posix_trace_attr_getcreatetime(const trace_attr_t *attr,
    struct timespec *createtime);

#include <trace.h>

int posix_trace_attr_getgenversion(const trace_attr_t *attr,
    char *genversion);
int posix_trace_attr_getname(const trace_attr_t *attr,
    char *tracename);
int posix_trace_attr_setname(trace_attr_t *attr,
    const char *tracename);
```

**DESCRIPTION**

The *posix\_trace\_attr\_getclockres()* function shall copy the clock resolution of the clock used to generate timestamps from the *clock-resolution* attribute of the attributes object pointed to by the *attr* argument into the structure pointed to by the *resolution* argument.

The *posix\_trace\_attr\_getcreatetime()* function shall copy the trace stream creation time from the *creation-time* attribute of the attributes object pointed to by the *attr* argument into the structure pointed to by the *createtime* argument. The *creation-time* attribute shall represent the time of creation of the trace stream.

The *posix\_trace\_attr\_getgenversion()* function shall copy the string containing version information from the *generation-version* attribute of the attributes object pointed to by the *attr* argument into the string pointed to by the *genversion* argument. The *genversion* argument shall be the address of a character array which can store at least {TRACE\_NAME\_MAX} characters.

The *posix\_trace\_attr\_getname()* function shall copy the string containing the trace name from the *trace-name* attribute of the attributes object pointed to by the *attr* argument into the string pointed to by the *tracename* argument. The *tracename* argument shall be the address of a character array which can store at least {TRACE\_NAME\_MAX} characters.

The *posix\_trace\_attr\_setname()* function shall set the name in the *trace-name* attribute of the attributes object pointed to by the *attr* argument, using the trace name string supplied by the *tracename* argument. If the supplied string contains more than {TRACE\_NAME\_MAX} characters, the name copied into the *trace-name* attribute may be truncated to one less than the length of {TRACE\_NAME\_MAX} characters. The default value is a null string.

**RETURN VALUE**

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

If successful, the *posix\_trace\_attr\_getclockres()* function stores the *clock-resolution* attribute value in the object pointed to by *resolution*. Otherwise, the content of this object is unspecified.

If successful, the *posix\_trace\_attr\_getcreatetime()* function stores the trace stream creation time in

49055 the object pointed to by *createtime*. Otherwise, the content of this object is unspecified.

49056 If successful, the *posix\_trace\_attr\_getgenversion()* function stores the trace version information in

49057 the string pointed to by *genversion*. Otherwise, the content of this string is unspecified.

49058 If successful, the *posix\_trace\_attr\_getname()* function stores the trace name in the string pointed

49059 to by *tracename*. Otherwise, the content of this string is unspecified.

#### 49060 ERRORS

49061 The *posix\_trace\_attr\_getclockres()*, *posix\_trace\_attr\_getcreatetime()*, *posix\_trace\_attr\_getgenversion()*,

49062 and *posix\_trace\_attr\_getname()* functions may fail if:

49063 [EINVAL] The value specified by one of the arguments is invalid.

#### 49064 EXAMPLES

49065 None.

#### 49066 APPLICATION USAGE

49067 None.

#### 49068 RATIONALE

49069 None.

#### 49070 FUTURE DIRECTIONS

49071 The *posix\_trace\_attr\_getclockres()*, *posix\_trace\_attr\_getcreatetime()*, *posix\_trace\_attr\_getgenversion()*,

49072 *posix\_trace\_attr\_getname()*, and *posix\_trace\_attr\_setname()* functions may be removed in a future

49073 version.

#### 49074 SEE ALSO

49076 XBD [\*\*<time.h>\*\*](#), [\*\*<trace.h>\*\*](#)

#### 49077 CHANGE HISTORY

49078 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

#### 49079 Issue 7

49080 The *posix\_trace\_attr\_getclockres()*, *posix\_trace\_attr\_getcreatetime()*, *posix\_trace\_attr\_getgenversion()*,

49081 *posix\_trace\_attr\_getname()*, and *posix\_trace\_attr\_setname()* functions are marked obsolescent.

## 49082 NAME

49083 posix\_trace\_attr\_getinherited, posix\_trace\_attr\_getlogfullpolicy,  
 49084 posix\_trace\_attr\_getstreamfullpolicy, posix\_trace\_attr\_setinherited,  
 49085 posix\_trace\_attr\_setlogfullpolicy, posix\_trace\_attr\_setstreamfullpolicy — retrieve and set the  
 49086 behavior of a trace stream (TRACING)

## 49087 SYNOPSIS

```
49088 OB TRC #include <trace.h>
49089 TRI int posix_trace_attr_getinherited(const trace_attr_t *restrict attr,
49090 int *restrict inheritancepolicy);
49091 TRL int posix_trace_attr_getlogfullpolicy(const trace_attr_t *restrict attr,
49092 int *restrict logpolicy);
49093 int posix_trace_attr_getstreamfullpolicy(const trace_attr_t *restrict
49094 attr, int *restrict streampolicy);
49095 TRI int posix_trace_attr_setinherited(trace_attr_t *attr,
49096 int inheritancepolicy);
49097 TRL int posix_trace_attr_setlogfullpolicy(trace_attr_t *attr,
49098 int logpolicy);
49099 int posix_trace_attr_setstreamfullpolicy(trace_attr_t *attr,
49100 int streampolicy);
```

## 49101 DESCRIPTION

49102 TRI The *posix\_trace\_attr\_getinherited()* and *posix\_trace\_attr\_setinherited()* functions, respectively, shall  
 49103 get and set the inheritance policy stored in the *inheritance* attribute for traced processes across the  
 49104 *fork()* and *spawn()* operations. The *inheritance* attribute of the attributes object pointed to by the  
 49105 *attr* argument shall be set to one of the following values defined by manifest constants in the  
 49106 **<trace.h>** header:

## 49107 POSIX\_TRACE\_CLOSE\_FOR\_CHILD

49108 After a *fork()* or *spawn()* operation, the child shall not be traced, and tracing of the parent  
 49109 shall continue.

## 49110 POSIX\_TRACE\_INHERITED

49111 After a *fork()* or *spawn()* operation, if the parent is being traced, its child shall be  
 49112 concurrently traced using the same trace stream.

49113 The default value for the *inheritance* attribute is **POSIX\_TRACE\_CLOSE\_FOR\_CHILD**.

49114 TRL The *posix\_trace\_attr\_getlogfullpolicy()* and *posix\_trace\_attr\_setlogfullpolicy()* functions,  
 49115 respectively, shall get and set the trace log full policy stored in the *log-full-policy* attribute of the  
 49116 attributes object pointed to by the *attr* argument.

49117 The *log-full-policy* attribute shall be set to one of the following values defined by manifest  
 49118 constants in the **<trace.h>** header:

## 49119 POSIX\_TRACE\_LOOP

49120 The trace log shall loop until the associated trace stream is stopped. This policy means that  
 49121 when the trace log gets full, the file system shall reuse the resources allocated to the oldest  
 49122 trace events that were recorded. In this way, the trace log will always contain the most  
 49123 recent trace events flushed.

## 49124 POSIX\_TRACE\_UNTIL\_FULL

49125 The trace stream shall be flushed to the trace log until the trace log is full. This condition can  
 49126 be deduced from the *posix\_log\_full\_status* member status (see the **posix\_trace\_status\_info**  
 49127 structure defined in **<trace.h>**). The last recorded trace event shall be the  
 49128 **POSIX\_TRACE\_STOP** trace event.

**POSIX\_TRACE\_APPEND**

The associated trace stream shall be flushed to the trace log without log size limitation. If the application specifies **POSIX\_TRACE\_APPEND**, the implementation shall ignore the *log-max-size* attribute.

The default value for the *log-full-policy* attribute is **POSIX\_TRACE\_LOOP**.

The *posix\_trace\_attr\_getstreamfullpolicy()* and *posix\_trace\_attr\_setstreamfullpolicy()* functions, respectively, shall get and set the trace stream full policy stored in the *stream-full-policy* attribute of the attributes object pointed to by the *attr* argument.

The *stream-full-policy* attribute shall be set to one of the following values defined by manifest constants in the **<trace.h>** header:

**POSIX\_TRACE\_LOOP**

The trace stream shall loop until explicitly stopped by the *posix\_trace\_stop()* function. This policy means that when the trace stream is full, the trace system shall reuse the resources allocated to the oldest trace events recorded. In this way, the trace stream will always contain the most recent trace events recorded.

**POSIX\_TRACE\_UNTIL\_FULL**

The trace stream will run until the trace stream resources are exhausted. Then the trace stream will stop. This condition can be deduced from *posix\_stream\_status* and *posix\_stream\_full\_status* (see the **posix\_trace\_status\_info** structure defined in **<trace.h>**). When this trace stream is read, a **POSIX\_TRACE\_STOP** trace event shall be reported after reporting the last recorded trace event. The trace system shall reuse the resources allocated to any trace events already reported—see the *posix\_trace\_getnext\_event()*, *posix\_trace\_trygetnext\_event()*, and *posix\_trace\_timedgetnext\_event()* functions—or already flushed for an active trace stream with log if the Trace Log option is supported; see the *posix\_trace\_flush()* function. The trace system shall restart the trace stream when it is empty and may restart it sooner. A **POSIX\_TRACE\_START** trace event shall be reported before reporting the next recorded trace event.

**POSIX\_TRACE\_FLUSH**

If the Trace Log option is supported, this policy is identical to the **POSIX\_TRACE\_UNTIL\_FULL** trace stream full policy except that the trace stream shall be flushed regularly as if *posix\_trace\_flush()* had been explicitly called. Defining this policy for an active trace stream without log shall be invalid.

The default value for the *stream-full-policy* attribute shall be **POSIX\_TRACE\_LOOP** for an active trace stream without log.

If the Trace Log option is supported, the default value for the *stream-full-policy* attribute shall be **POSIX\_TRACE\_FLUSH** for an active trace stream with log.

**RETURN VALUE**

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

If successful, the *posix\_trace\_attr\_getinherited()* function shall store the *inheritance* attribute value in the object pointed to by *inheritancepolicy*. Otherwise, the content of this object is undefined.

If successful, the *posix\_trace\_attr\_getlogfullpolicy()* function shall store the *log-full-policy* attribute value in the object pointed to by *logpolicy*. Otherwise, the content of this object is undefined.

If successful, the *posix\_trace\_attr\_getstreamfullpolicy()* function shall store the *stream-full-policy* attribute value in the object pointed to by *streampolicy*. Otherwise, the content of this object is undefined.

49175 **ERRORS**

49176 These functions may fail if:

49177 [EINVAL] The value specified by at least one of the arguments is invalid.

49178 **EXAMPLES**

49179 None.

49180 **APPLICATION USAGE**

49181 None.

49182 **RATIONALE**

49183 None.

49184 **FUTURE DIRECTIONS**

49185 The following functions:

49186 *posix\_trace\_attr\_getinherited()*  
 49187 *posix\_trace\_attr\_getlogfullpolicy()*  
 49188 *posix\_trace\_attr\_getstreamfullpolicy()*  
 49189 *posix\_trace\_attr\_setinherited()*  
 49190 *posix\_trace\_attr\_setlogfullpolicy()*  
 49191 *posix\_trace\_attr\_setstreamfullpolicy()*

49192 may be removed in a future version.

49193 **SEE ALSO**

49194 *fork()*, *posix\_trace\_attr\_destroy()*, *posix\_trace\_create()*, *posix\_trace\_get\_attr()*,  
 49195 *posix\_trace\_getnext\_event()*, *posix\_trace\_start()*

49196 XBD &lt;trace.h&gt;

49197 **CHANGE HISTORY**

49198 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

49199 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/39 is applied, adding the TRL and TRC  
 49200 margin codes to the *posix\_trace\_attr\_setlogfullpolicy()* function.

49201 **Issue 7**

49202 SD5-XSH-ERN-116 is applied, adding the missing **restrict** keyword to the  
 49203 *posix\_trace\_attr\_getstreamfullpolicy()* function declaration.

49204 These functions are marked obsolescent.

**NAME**

posix\_trace\_attr\_getlogsize, posix\_trace\_attr\_getmaxdatasize,  
 posix\_trace\_attr\_getmaxsystemeventsize, posix\_trace\_attr\_getmaxusereventsize,  
 posix\_trace\_attr\_getstreamsize, posix\_trace\_attr\_setlogsize, posix\_trace\_attr\_setmaxdatasize,  
 posix\_trace\_attr\_setstreamsize — retrieve and set trace stream size attributes (TRACING)

**SYNOPSIS**

```
OB TRC  #include <sys/types.h>
        #include <trace.h>

TRL     int posix_trace_attr_getlogsize(const trace_attr_t *restrict attr,
        size_t *restrict logsize);

        int posix_trace_attr_getmaxdatasize(const trace_attr_t *restrict attr,
        size_t *restrict maxdatasize);

        int posix_trace_attr_getmaxsystemeventsize(
        const trace_attr_t *restrict attr,
        size_t *restrict eventsize);

        int posix_trace_attr_getmaxusereventsize(
        const trace_attr_t *restrict attr,
        size_t data_len, size_t *restrict eventsize);

        int posix_trace_attr_getstreamsize(const trace_attr_t *restrict attr,
        size_t *restrict streamsize);

TRL     int posix_trace_attr_setlogsize(trace_attr_t *attr,
        size_t logsize);

        int posix_trace_attr_setmaxdatasize(trace_attr_t *attr,
        size_t maxdatasize);

        int posix_trace_attr_setstreamsize(trace_attr_t *attr,
        size_t streamsize);
```

**DESCRIPTION**

The *posix\_trace\_attr\_getlogsize()* function shall copy the log size, in bytes, from the *log-max-size* attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by the *logsize* argument. This log size is the maximum total of bytes that shall be allocated for system and user trace events in the trace log. The default value for the *log-max-size* attribute is implementation-defined.

The *posix\_trace\_attr\_setlogsize()* function shall set the maximum allowed size, in bytes, in the *log-max-size* attribute of the attributes object pointed to by the *attr* argument, using the size value supplied by the *logsize* argument.

The trace log size shall be used if the *log-full-policy* attribute is set to *POSIX\_TRACE\_LOOP* or *POSIX\_TRACE\_UNTIL\_FULL*. If the *log-full-policy* attribute is set to *POSIX\_TRACE\_APPEND*, the implementation shall ignore the *log-max-size* attribute.

The *posix\_trace\_attr\_getmaxdatasize()* function shall copy the maximum user trace event data size, in bytes, from the *max-data-size* attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by the *maxdatasize* argument. The default value for the *max-data-size* attribute is implementation-defined.

The *posix\_trace\_attr\_getmaxsystemeventsize()* function shall calculate the maximum memory size, in bytes, required to store a single system trace event. This value is calculated for the trace stream attributes object pointed to by the *attr* argument and is returned in the variable pointed to by the *eventsize* argument.

The values returned as the maximum memory sizes of the user and system trace events shall be such that if the sum of the maximum memory sizes of a set of the trace events that may be

recorded in a trace stream is less than or equal to the *stream-min-size* attribute of that trace stream, the system provides the necessary resources for recording all those trace events, without loss.

The *posix\_trace\_attr\_getmaxusereventsize()* function shall calculate the maximum memory size, in bytes, required to store a single user trace event generated by a call to *posix\_trace\_event()* with a *data\_len* parameter equal to the *data\_len* value specified in this call. This value is calculated for the trace stream attributes object pointed to by the *attr* argument and is returned in the variable pointed to by the *eventsize* argument.

The *posix\_trace\_attr\_getstreamsize()* function shall copy the stream size, in bytes, from the *stream-min-size* attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by the *streamsize* argument.

This stream size is the current total memory size reserved for system and user trace events in the trace stream. The default value for the *stream-min-size* attribute is implementation-defined. The stream size refers to memory used to store trace event records. Other stream data (for example, trace attribute values) shall not be included in this size.

The *posix\_trace\_attr\_setmaxdatasize()* function shall set the maximum allowed size, in bytes, in the *max-data-size* attribute of the attributes object pointed to by the *attr* argument, using the size value supplied by the *maxdatasize* argument. This maximum size is the maximum allowed size for the user data argument which may be passed to *posix\_trace\_event()*. The implementation shall be allowed to truncate data passed to *trace\_user\_event* which is longer than *maxdatasize*.

The *posix\_trace\_attr\_setstreamsize()* function shall set the minimum allowed size, in bytes, in the *stream-min-size* attribute of the attributes object pointed to by the *attr* argument, using the size value supplied by the *streamsize* argument.

#### RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

TRL The *posix\_trace\_attr\_getlogsize()* function stores the maximum trace log allowed size in the object pointed to by *logsize*, if successful.

The *posix\_trace\_attr\_getmaxdatasize()* function stores the maximum trace event record memory size in the object pointed to by *maxdatasize*, if successful.

The *posix\_trace\_attr\_getmaxsystemeventsize()* function stores the maximum memory size to store a single system trace event in the object pointed to by *eventsize*, if successful.

The *posix\_trace\_attr\_getmaxusereventsize()* function stores the maximum memory size to store a single user trace event in the object pointed to by *eventsize*, if successful.

The *posix\_trace\_attr\_getstreamsize()* function stores the maximum trace stream allowed size in the object pointed to by *streamsize*, if successful.

#### ERRORS

These functions may fail if:

[EINVAL] The value specified by one of the arguments is invalid.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

The following functions:

*posix\_trace\_attr\_getlogsize()**posix\_trace\_attr\_getmaxdatasize()**posix\_trace\_attr\_getmaxsystemeventsize()**posix\_trace\_attr\_getmaxusereventsize()**posix\_trace\_attr\_getstreamsize()**posix\_trace\_attr\_setlogsize()**posix\_trace\_attr\_setmaxdatasize()**posix\_trace\_attr\_setstreamsize()*

may be removed in a future version.

49394         int posix_trace_attr_setstreamsize(trace_attr_t *attr,
49395         size_t streamsize);
```

49396 **DESCRIPTION**49397 Refer to *posix\_trace\_attr\_getlogsize()*.

49398 **NAME**

49399       posix\_trace\_clear — clear trace stream and trace log (TRACING)

49400 **SYNOPSIS**

```
49401 OB TRC  #include <sys/types.h>
49402          #include <trace.h>
49403          int posix_trace_clear(trace_id_t trid);
```

49404 **DESCRIPTION**

49405       The *posix\_trace\_clear()* function shall reinitialize the trace stream identified by the argument *trid*  
49406       as if it were returning from the *posix\_trace\_create()* function, except that the same allocated  
49407       resources shall be reused, the mapping of trace event type identifiers to trace event names shall  
49408       be unchanged, and the trace stream status shall remain unchanged (that is, if it was running, it  
49409       remains running and if it was suspended, it remains suspended).

49410       All trace events in the trace stream recorded before the call to *posix\_trace\_clear()* shall be lost. The  
49411       *posix\_stream\_full\_status* status shall be set to POSIX\_TRACE\_NOT\_FULL. There is no guarantee  
49412       that all trace events that occurred during the *posix\_trace\_clear()* call are recorded; the behavior  
49413       with respect to trace points that may occur during this call is unspecified.

49414 OB TRL    If the Trace Log option is supported and the trace stream has been created with a log, the  
49415       *posix\_trace\_clear()* function shall reinitialize the trace stream with the same behavior as if the  
49416       trace stream was created without the log, plus it shall reinitialize the trace log associated with  
49417       the trace stream identified by the argument *trid* as if it were returning from the  
49418       *posix\_trace\_create\_withlog()* function, except that the same allocated resources, for the trace log,  
49419       may be reused and the associated trace stream status remains unchanged. The first trace event  
49420       recorded in the trace log after the call to *posix\_trace\_clear()* shall be the same as the first trace  
49421       event recorded in the active trace stream after the call to *posix\_trace\_clear()*. The  
49422       *posix\_log\_full\_status* status shall be set to POSIX\_TRACE\_NOT\_FULL. There is no guarantee that  
49423       all trace events that occurred during the *posix\_trace\_clear()* call are recorded in the trace log; the  
49424       behavior with respect to trace points that may occur during this call is unspecified. If the log full  
49425       policy is POSIX\_TRACE\_APPEND, the effect of a call to this function is unspecified for the trace  
49426       log associated with the trace stream identified by the *trid* argument.

49427 **RETURN VALUE**

49428       Upon successful completion, the *posix\_trace\_clear()* function shall return a value of zero.  
49429       Otherwise, it shall return the corresponding error number.

49430 **ERRORS**

49431       The *posix\_trace\_clear()* function shall fail if:

49432       [EINVAL]       The value of the *trid* argument does not correspond to an active trace stream.

49433 **EXAMPLES**

49434       None.

49435 **APPLICATION USAGE**

49436       None.

49437 **RATIONALE**

49438       None.

49439 **FUTURE DIRECTIONS**

49440       The *posix\_trace\_clear()* function may be removed in a future version.

49441 **SEE ALSO**

49443 XBD *<sys/types.h>*, *<trace.h>*

49444 **CHANGE HISTORY**

49445 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

49446 IEEE PASC Interpretation 1003.1 #123 is applied.

49447 **Issue 7**

49448 The *posix\_trace\_clear()* function is marked obsolescent.

**NAME**

posix\_trace\_close, posix\_trace\_open, posix\_trace\_rewind — trace log management (**TRACING**)

**SYNOPSIS**

```
#include <trace.h>
```

```
int posix_trace_close(trace_id_t trid);
int posix_trace_open(int file_desc, trace_id_t *trid);
int posix_trace_rewind(trace_id_t trid);
```

**DESCRIPTION**

The *posix\_trace\_close()* function shall deallocate the trace log identifier indicated by *trid*, and all of its associated resources. If there is no valid trace log pointed to by the *trid*, this function shall fail.

The *posix\_trace\_open()* function shall allocate the necessary resources and establish the connection between a trace log identified by the *file\_desc* argument and a trace stream identifier identified by the object pointed to by the *trid* argument. The *file\_desc* argument should be a valid open file descriptor that corresponds to a trace log. The *file\_desc* argument shall be open for reading. The current trace event timestamp, which specifies the timestamp of the trace event that will be read by the next call to *posix\_trace\_getnext\_event()*, shall be set to the timestamp of the oldest trace event recorded in the trace log identified by *trid*.

The *posix\_trace\_open()* function shall return a trace stream identifier in the variable pointed to by the *trid* argument, that may only be used by the following functions:

|                                               |                                    |
|-----------------------------------------------|------------------------------------|
| <i>posix_trace_close()</i>                    | <i>posix_trace_get_attr()</i>      |
| <i>posix_trace_eventid_equal()</i>            | <i>posix_trace_get_status()</i>    |
| <i>posix_trace_eventid_get_name()</i>         | <i>posix_trace_getnext_event()</i> |
| <i>posix_trace_eventtypelist_getnext_id()</i> | <i>posix_trace_rewind()</i>        |
| <i>posix_trace_eventtypelist_rewind()</i>     |                                    |

In particular, notice that the operations normally used by a trace controller process, such as *posix\_trace\_start()*, *posix\_trace\_stop()*, or *posix\_trace\_shutdown()*, cannot be invoked using the trace stream identifier returned by the *posix\_trace\_open()* function.

The *posix\_trace\_rewind()* function shall reset the current trace event timestamp, which specifies the timestamp of the trace event that will be read by the next call to *posix\_trace\_getnext\_event()*, to the timestamp of the oldest trace event recorded in the trace log identified by *trid*.

**RETURN VALUE**

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

If successful, the *posix\_trace\_open()* function stores the trace stream identifier value in the object pointed to by *trid*.

**ERRORS**

The *posix\_trace\_open()* function shall fail if:

|          |                                                                                     |
|----------|-------------------------------------------------------------------------------------|
| [EINTR]  | The operation was interrupted by a signal and thus no trace log was opened.         |
| [EINVAL] | The object pointed to by <i>file_desc</i> does not correspond to a valid trace log. |

49489           The *posix\_trace\_close()* and *posix\_trace\_rewind()* functions may fail if:  
49490           [EINVAL]           The object pointed to by *trid* does not correspond to a valid trace log.

49491 **EXAMPLES**  
49492           None.

49493 **APPLICATION USAGE**  
49494           None.

49495 **RATIONALE**  
49496           None.

49497 **FUTURE DIRECTIONS**  
49498           The *posix\_trace\_close()*, *posix\_trace\_open()*, and *posix\_trace\_rewind()* functions may be removed in  
49499           a future version.

49500 **SEE ALSO**

49506 **Issue 7**  
49507           The *posix\_trace\_close()*, *posix\_trace\_open()*, and *posix\_trace\_rewind()* functions are marked  
49508           obsolescent.

49509 **NAME**

49510 `posix_trace_create`, `posix_trace_create_withlog`, `posix_trace_flush`, `posix_trace_shutdown` —  
 49511 trace stream initialization, flush, and shutdown from a process (**TRACING**)

49512 **SYNOPSIS**

```

49513 OB TRC #include <sys/types.h>
49514         #include <trace.h>

49515         int posix_trace_create(pid_t pid,
49516                               const trace_attr_t *restrict attr,
49517                               trace_id_t *restrict trid);
49518 TRL     int posix_trace_create_withlog(pid_t pid,
49519   const trace_attr_t *restrict attr, int file_desc,
49520   trace_id_t *restrict trid);
49521         int posix_trace_flush(trace_id_t trid);
49522 OB TRC  int posix_trace_shutdown(trace_id_t trid);

```

49523 **DESCRIPTION**

49524 The `posix_trace_create()` function shall create an active trace stream. It allocates all the resources  
 49525 needed by the trace stream being created for tracing the process specified by *pid* in accordance  
 49526 with the *attr* argument. The *attr* argument represents the initial attributes of the trace stream and  
 49527 shall have been initialized by the function `posix_trace_attr_init()` prior to the `posix_trace_create()`  
 49528 call. If the argument *attr* is NULL, the default attributes shall be used. The *attr* attributes object  
 49529 shall be manipulated through a set of functions described in the `posix_trace_attr` family of  
 49530 functions. If the attributes of the object pointed to by *attr* are modified later, the attributes of the  
 49531 trace stream shall not be affected. The *creation-time* attribute of the newly created trace stream  
 49532 shall be set to the value of the system clock, if the Timers option is not supported, or to the value  
 49533 of the CLOCK\_REALTIME clock, if the Timers option is supported.

49534 The *pid* argument represents the target process to be traced. If the process executing this function  
 49535 does not have appropriate privileges to trace the process identified by *pid*, an error shall be  
 49536 returned. If the *pid* argument is zero, the calling process shall be traced.

49537 The `posix_trace_create()` function shall store the trace stream identifier of the new trace stream in  
 49538 the object pointed to by the *trid* argument. This trace stream identifier shall be used in  
 49539 subsequent calls to control tracing. The *trid* argument may only be used by the following  
 49540 functions:

|       |                                                     |                                               |
|-------|-----------------------------------------------------|-----------------------------------------------|
| 49541 | <code>posix_trace_clear()</code>                    | <code>posix_trace_getnext_event()</code>      |
| 49542 | <code>posix_trace_eventid_equal()</code>            | <code>posix_trace_shutdown()</code>           |
| 49543 | <code>posix_trace_eventid_get_name()</code>         | <code>posix_trace_start()</code>              |
| 49544 | <code>posix_trace_eventtypelist_getnext_id()</code> | <code>posix_trace_stop()</code>               |
| 49545 | <code>posix_trace_eventtypelist_rewind()</code>     | <code>posix_trace_timedgetnext_event()</code> |
| 49546 | <code>posix_trace_get_attr()</code>                 | <code>posix_trace_trid_eventid_open()</code>  |
| 49547 | <code>posix_trace_get_status()</code>               | <code>posix_trace_trygetnext_event()</code>   |

49548 TEF If the Trace Event Filter option is supported, the following additional functions may use the *trid*  
 49549 argument:

```

49550 posix_trace_get_filter()   posix_trace_set_filter()

```

49551 In particular, notice that the operations normally used by a trace analyzer process, such as  
 49552 `posix_trace_rewind()` or `posix_trace_close()`, cannot be invoked using the trace stream identifier  
 49553 returned by the `posix_trace_create()` function.

49554 TEF A trace stream shall be created in a suspended state. If the Trace Event Filter option is  
49555 supported, its trace event type filter shall be empty.

49556 The *posix\_trace\_create()* function may be called multiple times from the same or different  
49557 processes, with the system-wide limit indicated by the runtime invariant value  
49558 {TRACE\_SYS\_MAX}, which has the minimum value {\_POSIX\_TRACE\_SYS\_MAX}.

49559 The trace stream identifier returned by the *posix\_trace\_create()* function in the argument pointed  
49560 to by *trid* is valid only in the process that made the function call. If it is used from another  
49561 process, that is a child process, in functions defined in POSIX.1-2008, these functions shall return  
49562 with the error [EINVAL].

49563 TRL The *posix\_trace\_create\_withlog()* function shall be equivalent to *posix\_trace\_create()*, except that it  
49564 associates a trace log with this stream. The *file\_desc* argument shall be the file descriptor  
49565 designating the trace log destination. The function shall fail if this file descriptor refers to a file  
49566 with a file type that is not compatible with the log policy associated with the trace log. The list of  
49567 the appropriate file types that are compatible with each log policy is implementation-defined.

49568 The *posix\_trace\_create\_withlog()* function shall return in the parameter pointed to by *trid* the trace  
49569 stream identifier, which uniquely identifies the newly created trace stream, and shall be used in  
49570 subsequent calls to control tracing. The *trid* argument may only be used by the following  
49571 functions:

|                                                     |                                         |
|-----------------------------------------------------|-----------------------------------------|
| 49572 <i>posix_trace_clear()</i>                    | <i>posix_trace_get_status()</i>         |
| 49573 <i>posix_trace_eventid_equal()</i>            | <i>posix_trace_getnext_event()</i>      |
| 49574 <i>posix_trace_eventid_get_name()</i>         | <i>posix_trace_shutdown()</i>           |
| 49575 <i>posix_trace_eventtypelist_getnext_id()</i> | <i>posix_trace_start()</i>              |
| 49576 <i>posix_trace_eventtypelist_rewind()</i>     | <i>posix_trace_stop()</i>               |
| 49577 <i>posix_trace_flush()</i>                    | <i>posix_trace_timedgetnext_event()</i> |
| 49578 <i>posix_trace_get_attr()</i>                 | <i>posix_trace_trid_eventid_open()</i>  |

49579 TEF TRL If the Trace Event Filter option is supported, the following additional functions may use the *trid*  
49580 argument:

49581 *posix\_trace\_get\_filter()*    *posix\_trace\_set\_filter()*

49582 TRL In particular, notice that the operations normally used by a trace analyzer process, such as  
49583 *posix\_trace\_rewind()* or *posix\_trace\_close()*, cannot be invoked using the trace stream identifier  
49584 returned by the *posix\_trace\_create\_withlog()* function.

49585 The *posix\_trace\_flush()* function shall initiate a flush operation which copies the contents of the  
49586 trace stream identified by the argument *trid* into the trace log associated with the trace stream at  
49587 the creation time. If no trace log has been associated with the trace stream pointed to by *trid*, this  
49588 function shall return an error. The termination of the flush operation can be polled by the  
49589 *posix\_trace\_get\_status()* function. During the flush operation, it shall be possible to trace new  
49590 trace events up to the point when the trace stream becomes full. After flushing is completed, the  
49591 space used by the flushed trace events shall be available for tracing new trace events.

49592 If flushing the trace stream causes the resulting trace log to become full, the trace log full policy  
49593 shall be applied. If the trace *log-full-policy* attribute is set, the following occurs:

49594 POSIX\_TRACE\_UNTIL\_FULL

49595 The trace events that have not yet been flushed shall be discarded.

49596 POSIX\_TRACE\_LOOP  
 49597 The trace events that have not yet been flushed shall be written to the beginning of the trace  
 49598 log, overwriting previous trace events stored there.

49599 POSIX\_TRACE\_APPEND  
 49600 The trace events that have not yet been flushed shall be appended to the trace log.

49601 The *posix\_trace\_shutdown()* function shall stop the tracing of trace events in the trace stream  
 49602 identified by *trid*, as if *posix\_trace\_stop()* had been invoked. The *posix\_trace\_shutdown()* function  
 49603 shall free all the resources associated with the trace stream.

49604 The *posix\_trace\_shutdown()* function shall not return until all the resources associated with the  
 49605 trace stream have been freed. When the *posix\_trace\_shutdown()* function returns, the *trid*  
 49606 argument becomes an invalid trace stream identifier. A call to this function shall unconditionally  
 49607 deallocate the resources regardless of whether all trace events have been retrieved by the  
 49608 analyzer process. Any thread blocked on one of the *trace\_getnext\_event()* functions (which  
 49609 specified this *trid*) before this call is unblocked with the error [EINVAL].

49610 If the process exits, invokes a member of the *exec* family of functions, or is terminated, the trace  
 49611 streams that the process had created and that have not yet been shut down, shall be  
 49612 automatically shut down as if an explicit call were made to the *posix\_trace\_shutdown()* function.

49613 TRL For an active trace stream with log, when the *posix\_trace\_shutdown()* function is called, all trace  
 49614 events that have not yet been flushed to the trace log shall be flushed, as in the  
 49615 *posix\_trace\_flush()* function, and the trace log shall be closed.

49616 When a trace log is closed, all the information that may be retrieved later from the trace log  
 49617 through the trace interface shall have been written to the trace log. This information includes the  
 49618 trace attributes, the list of trace event types (with the mapping between trace event names and  
 49619 trace event type identifiers), and the trace status.

49620 In addition, unspecified information shall be written to the trace log to allow detection of a valid  
 49621 trace log during the *posix\_trace\_open()* operation.

49622 The *posix\_trace\_shutdown()* function shall not return until all trace events have been flushed.

## 49623 RETURN VALUE

49624 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 49625 return the corresponding error number.

49626 TRL The *posix\_trace\_create()* and *posix\_trace\_create\_withlog()* functions store the trace stream  
 49627 identifier value in the object pointed to by *trid*, if successful.

## 49628 ERRORS

49629 TRL The *posix\_trace\_create()* and *posix\_trace\_create\_withlog()* functions shall fail if:

49630 [EAGAIN] No more trace streams can be started now. {TRACE\_SYS\_MAX} has been  
 49631 exceeded.

49632 [EINTR] The operation was interrupted by a signal. No trace stream was created.

49633 [EINVAL] One or more of the trace parameters specified by the *attr* parameter is invalid.

49634 [ENOMEM] The implementation does not currently have sufficient memory to create the  
 49635 trace stream with the specified parameters.

49636 [EPERM] The caller does not have appropriate privileges to trace the process specified  
 49637 by *pid*.

49638 [ESRCH] The *pid* argument does not refer to an existing process.

49639 TRL The *posix\_trace\_create\_withlog()* function shall fail if:

49640 [EBADF] The *file\_desc* argument is not a valid file descriptor open for writing.

49641 [EINVAL] The *file\_desc* argument refers to a file with a file type that does not support the

49642 log policy associated with the trace log.

49643 [ENOSPC] No space left on device. The device corresponding to the argument *file\_desc*

49644 does not contain the space required to create this trace log.

49645 TRL The *posix\_trace\_flush()* and *posix\_trace\_shutdown()* functions shall fail if:

49646 [EINVAL] The value of the *trid* argument does not correspond to an active trace stream

49647 with log.

49648 [EFBIG] The trace log file has attempted to exceed an implementation-defined

49649 maximum file size.

49650 [ENOSPC] No space left on device.

#### 49665 CHANGE HISTORY

49666 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

#### 49667 Issue 7

49668 These functions are marked obsolescent.

49669 SD5-XSH-ERN-154 is applied, updating the DESCRIPTION to remove the

49670 *posix\_trace\_trygetnext\_event()* function from the list of functions that use the *trid* argument.

49671 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0441 [358] is applied.

**NAME**

posix\_trace\_event, posix\_trace\_eventid\_open — trace functions for instrumenting application code (**TRACING**)

**SYNOPSIS**

```
OB TRC #include <sys/types.h>
#include <trace.h>

void posix_trace_event(trace_event_id_t event_id,
    const void *restrict data_ptr, size_t data_len);
int posix_trace_eventid_open(const char *restrict event_name,
    trace_event_id_t *restrict event_id);
```

**DESCRIPTION**

The *posix\_trace\_event()* function shall record the *event\_id* and the user data pointed to by *data\_ptr* in the trace stream into which the calling process is being traced and in which *event\_id* is not filtered out. If the total size of the user trace event data represented by *data\_len* is not greater than the declared maximum size for user trace event data, then the *truncation-status* attribute of the trace event recorded is POSIX\_TRACE\_NOT\_TRUNCATED. Otherwise, the user trace event data is truncated to this declared maximum size and the *truncation-status* attribute of the trace event recorded is POSIX\_TRACE\_TRUNCATED\_RECORD.

If there is no trace stream created for the process or if the created trace stream is not running, or if the trace event specified by *event\_id* is filtered out in the trace stream, the *posix\_trace\_event()* function shall have no effect.

The *posix\_trace\_eventid\_open()* function shall associate a user trace event name with a trace event type identifier for the calling process. The trace event name is the string pointed to by the argument *event\_name*. It shall have a maximum of {TRACE\_EVENT\_NAME\_MAX} characters (which has the minimum value {POSIX\_TRACE\_EVENT\_NAME\_MAX}). The number of user trace event type identifiers that can be defined for any given process is limited by the maximum value {TRACE\_USER\_EVENT\_MAX}, which has the minimum value {POSIX\_TRACE\_USER\_EVENT\_MAX}.

If the Trace Inherit option is not supported, the *posix\_trace\_eventid\_open()* function shall associate the user trace event name pointed to by the *event\_name* argument with a trace event type identifier that is unique for the traced process, and is returned in the variable pointed to by the *event\_id* argument. If the user trace event name has already been mapped for the traced process, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE\_USER\_EVENT\_MAX} has been reached, the pre-defined POSIX\_TRACE\_UNNAMED\_USEREVENT (see Table 2-7, on page 546) user trace event shall be returned.

**TRI**

If the Trace Inherit option is supported, the *posix\_trace\_eventid\_open()* function shall associate the user trace event name pointed to by the *event\_name* argument with a trace event type identifier that is unique for all the processes being traced in this same trace stream, and is returned in the variable pointed to by the *event\_id* argument. If the user trace event name has already been mapped for the traced processes, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE\_USER\_EVENT\_MAX} has been reached, the pre-defined POSIX\_TRACE\_UNNAMED\_USEREVENT (Table 2-7, on page 546) user trace event shall be returned.

**Note:** The above procedure, together with the fact that multiple processes can only be traced into the same trace stream by inheritance, ensure that all the processes that are traced into a trace stream have the same mapping of trace event names to trace event type identifiers.

49720 If there is no trace stream created, the *posix\_trace\_eventid\_open()* function shall store this  
 49721 information for future trace streams created for this process.

#### 49722 RETURN VALUE

49723 No return value is defined for the *posix\_trace\_event()* function.

49724 Upon successful completion, the *posix\_trace\_eventid\_open()* function shall return a value of zero.  
 49725 Otherwise, it shall return the corresponding error number. The *posix\_trace\_eventid\_open()*  
 49726 function stores the trace event type identifier value in the object pointed to by *event\_id*, if  
 49727 successful.

#### 49728 ERRORS

49729 The *posix\_trace\_eventid\_open()* function shall fail if:

49730 [ENAMETOOLONG]

49731 The size of the name pointed to by the *event\_name* argument was longer than  
 49732 the implementation-defined value {TRACE\_EVENT\_NAME\_MAX}.

#### 49733 EXAMPLES

49734 None.

#### 49735 APPLICATION USAGE

49736 None.

#### 49737 RATIONALE

49738 None.

#### 49739 FUTURE DIRECTIONS

49740 The *posix\_trace\_event()* and *posix\_trace\_eventid\_open()* functions may be removed in a future  
 49741 version.

#### 49742 SEE ALSO

#### 49745 CHANGE HISTORY

49746 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

49747 IEEE PASC Interpretation 1003.1 #123 is applied.

49748 IEEE PASC Interpretation 1003.1 #127 is applied, correcting some editorial errors in the names of  
 49749 the *posix\_trace\_eventid\_open()* function and the *event\_id* argument.

#### 49750 Issue 7

49751 The *posix\_trace\_event()* and *posix\_trace\_eventid\_open()* functions are marked obsolescent.

**NAME**

posix\_trace\_eventid\_equal, posix\_trace\_eventid\_get\_name, posix\_trace\_trid\_eventid\_open — manipulate the trace event type identifier (TRACING)

**SYNOPSIS**

```
#include <trace.h>

int posix_trace_eventid_equal(trace_id_t trid, trace_event_id_t event1,
    trace_event_id_t event2);
int posix_trace_eventid_get_name(trace_id_t trid,
    trace_event_id_t event, char *event_name);
int posix_trace_trid_eventid_open(trace_id_t trid,
    const char *restrict event_name,
    trace_event_id_t *restrict event);
```

**DESCRIPTION**

The *posix\_trace\_eventid\_equal()* function shall compare the trace event type identifiers *event1* and *event2* from the same trace stream or the same trace log identified by the *trid* argument. If the trace event type identifiers *event1* and *event2* are from different trace streams, the return value shall be unspecified.

The *posix\_trace\_eventid\_get\_name()* function shall return, in the argument pointed to by *event\_name*, the trace event name associated with the trace event type identifier identified by the argument *event*, for the trace stream or for the trace log identified by the *trid* argument. The name of the trace event shall have a maximum of {TRACE\_EVENT\_NAME\_MAX} characters (which has the minimum value {\_POSIX\_TRACE\_EVENT\_NAME\_MAX}). Successive calls to this function with the same trace event type identifier and the same trace stream identifier shall return the same event name.

The *posix\_trace\_trid\_eventid\_open()* function shall associate a user trace event name with a trace event type identifier for a given trace stream. The trace stream is identified by the *trid* argument, and it shall be an active trace stream. The trace event name is the string pointed to by the argument *event\_name*. It shall have a maximum of {TRACE\_EVENT\_NAME\_MAX} characters (which has the minimum value {\_POSIX\_TRACE\_EVENT\_NAME\_MAX}). The number of user trace event type identifiers that can be defined for any given process is limited by the maximum value {TRACE\_USER\_EVENT\_MAX}, which has the minimum value {\_POSIX\_TRACE\_USER\_EVENT\_MAX}.

If the Trace Inherit option is not supported, the *posix\_trace\_trid\_eventid\_open()* function shall associate the user trace event name pointed to by the *event\_name* argument with a trace event type identifier that is unique for the process being traced in the trace stream identified by the *trid* argument, and is returned in the variable pointed to by the *event* argument. If the user trace event name has already been mapped for the traced process, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE\_USER\_EVENT\_MAX} has been reached, the pre-defined POSIX\_TRACE\_UNNAMED\_USEREVENT (see Table 2-7, on page 546) user trace event shall be returned.

If the Trace Inherit option is supported, the *posix\_trace\_trid\_eventid\_open()* function shall associate the user trace event name pointed to by the *event\_name* argument with a trace event type identifier that is unique for all the processes being traced in the trace stream identified by the *trid* argument, and is returned in the variable pointed to by the *event* argument. If the user trace event name has already been mapped for the traced processes, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE\_USER\_EVENT\_MAX} has been reached, the pre-defined

49800 POSIX\_TRACE\_UNNAMED\_USEREVENT (see Table 2-7, on page 546) user trace event shall be  
49801 returned.

## 49802 RETURN VALUE

49803 TEF Upon successful completion, the `posix_trace_eventid_get_name()` and  
49804 `posix_trace_trid_eventid_open()` functions shall return a value of zero. Otherwise, they shall return  
49805 the corresponding error number.

49806 The `posix_trace_eventid_equal()` function shall return a non-zero value if *event1* and *event2* are  
49807 equal; otherwise, a value of zero shall be returned. No errors are defined. If either *event1* or  
49808 *event2* are not valid trace event type identifiers for the trace stream specified by *trid* or if the *trid*  
49809 is invalid, the behavior shall be unspecified.

49810 The `posix_trace_eventid_get_name()` function stores the trace event name value in the object  
49811 pointed to by *event\_name*, if successful.

49812 TEF The `posix_trace_trid_eventid_open()` function stores the trace event type identifier value in the  
49813 object pointed to by *event*, if successful.

## 49814 ERRORS

49815 TEF The `posix_trace_eventid_get_name()` and `posix_trace_trid_eventid_open()` functions shall fail if:

49816 [EINVAL] The *trid* argument was not a valid trace stream identifier.

49817 TEF The `posix_trace_trid_eventid_open()` function shall fail if:

49818 TEF [ENAMETOOLONG]

49819 The size of the name pointed to by the *event\_name* argument was longer than  
49820 the implementation-defined value {TRACE\_EVENT\_NAME\_MAX}.

49821 The `posix_trace_eventid_get_name()` function shall fail if:

49822 [EINVAL] The trace event type identifier *event* was not associated with any name.

## 49823 EXAMPLES

49824 None.

## 49825 APPLICATION USAGE

49826 None.

## 49827 RATIONALE

49828 None.

## 49829 FUTURE DIRECTIONS

49830 The `posix_trace_eventid_equal()`, `posix_trace_eventid_get_name()`, and  
49831 `posix_trace_trid_eventid_open()` functions may be removed in a future version.

## 49832 SEE ALSO

49837 IEEE PASC Interpretations 1003.1 #123 and #129 are applied.

## 49838 Issue 7

49839 These functions are marked obsolescent.

49840 **NAME**49841       posix\_trace\_eventid\_open — trace functions for instrumenting application code (**TRACING**)49842 **SYNOPSIS**

```
49843 OB TRC #include <sys/types.h>
49844         #include <trace.h>
49845         int posix_trace_eventid_open(const char *restrict event_name,
49846                                     trace_event_id_t *restrict event_id);
```

49847 **DESCRIPTION**49848       Refer to *posix\_trace\_event()*.

## NAME

posix\_trace\_eventset\_add, posix\_trace\_eventset\_del, posix\_trace\_eventset\_empty,  
 posix\_trace\_eventset\_fill, posix\_trace\_eventset\_ismember — manipulate trace event type sets  
 (TRACING)

## SYNOPSIS

```
#include <trace.h>

int posix_trace_eventset_add(trace_event_id_t event_id,
    trace_event_set_t *set);
int posix_trace_eventset_del(trace_event_id_t event_id,
    trace_event_set_t *set);
int posix_trace_eventset_empty(trace_event_set_t *set);
int posix_trace_eventset_fill(trace_event_set_t *set, int what);
int posix_trace_eventset_ismember(trace_event_id_t event_id,
    const trace_event_set_t *restrict set, int *restrict ismember);
```

## DESCRIPTION

These primitives manipulate sets of trace event types. They operate on data objects addressable by the application, not on the current trace event filter of any trace stream.

The *posix\_trace\_eventset\_add()* and *posix\_trace\_eventset\_del()* functions, respectively, shall add or delete the individual trace event type specified by the value of the argument *event\_id* to or from the trace event type set pointed to by the argument *set*. Adding a trace event type already in the set or deleting a trace event type not in the set shall not be considered an error.

The *posix\_trace\_eventset\_empty()* function shall initialize the trace event type set pointed to by the *set* argument such that all trace event types defined, both system and user, shall be excluded from the set.

The *posix\_trace\_eventset\_fill()* function shall initialize the trace event type set pointed to by the argument *set*, such that the set of trace event types defined by the argument *what* shall be included in the set. The value of the argument *what* shall consist of one of the following values, as defined in the **<trace.h>** header:

## POSIX\_TRACE\_WOPID\_EVENTS

All the process-independent implementation-defined system trace event types are included in the set.

## POSIX\_TRACE\_SYSTEM\_EVENTS

All the implementation-defined system trace event types are included in the set, as are those defined in POSIX.1-2008.

## POSIX\_TRACE\_ALL\_EVENTS

All trace event types defined, both system and user, are included in the set.

Applications shall call either *posix\_trace\_eventset\_empty()* or *posix\_trace\_eventset\_fill()* at least once for each object of type **trace\_event\_set\_t** prior to any other use of that object. If such an object is not initialized in this way, but is nonetheless supplied as an argument to any of the *posix\_trace\_eventset\_add()*, *posix\_trace\_eventset\_del()*, or *posix\_trace\_eventset\_ismember()* functions, the results are undefined.

The *posix\_trace\_eventset\_ismember()* function shall test whether the trace event type specified by the value of the argument *event\_id* is a member of the set pointed to by the argument *set*. The value returned in the object pointed to by *ismember* argument is zero if the trace event type identifier is not a member of the set and a value different from zero if it is a member of the set.

**49894 RETURN VALUE**

49895       Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
49896       return the corresponding error number.

**49897 ERRORS**

49898       These functions may fail if:

49899       [EINVAL]       The value of one of the arguments is invalid.

**49900 EXAMPLES**

49901       None.

**49902 APPLICATION USAGE**

49903       None.

**49904 RATIONALE**

49905       None.

**49906 FUTURE DIRECTIONS**

49907       The `posix_trace_eventset_add()`, `posix_trace_eventset_del()`, `posix_trace_eventset_empty()`,  
49908       `posix_trace_eventset_fill()`, and `posix_trace_eventset_ismember()` functions may be removed in a  
49909       future version.

**49910 SEE ALSO**

**49913 CHANGE HISTORY**

49914       First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

**49915 Issue 7**

49916       The `posix_trace_eventset_add()`, `posix_trace_eventset_del()`, `posix_trace_eventset_empty()`,  
49917       `posix_trace_eventset_fill()`, and `posix_trace_eventset_ismember()` functions are marked obsolescent.

49918 **NAME**

49919        posix\_trace\_eventtypelist\_getnext\_id, posix\_trace\_eventtypelist\_rewind — iterate over a  
 49920        mapping of trace event types (**TRACING**)

49921 **SYNOPSIS**

```
49922 OB TRC #include <trace.h>
49923
49924 int posix_trace_eventtypelist_getnext_id(trace_id_t trid,
49925     trace_event_id_t *restrict event, int *restrict unavailable);
49926 int posix_trace_eventtypelist_rewind(trace_id_t trid);
```

49926 **DESCRIPTION**

49927        The first time *posix\_trace\_eventtypelist\_getnext\_id()* is called, the function shall return in the  
 49928        variable pointed to by *event* the first trace event type identifier of the list of trace events of the  
 49929        trace stream identified by the *trid* argument. Successive calls to  
 49930        *posix\_trace\_eventtypelist\_getnext\_id()* return in the variable pointed to by *event* the next trace  
 49931        event type identifier in that same list. Each time a trace event type identifier is successfully  
 49932        written into the variable pointed to by the *event* argument, the variable pointed to by the  
 49933        *unavailable* argument shall be set to zero. When no more trace event type identifiers are available,  
 49934        and so none is returned, the variable pointed to by the *unavailable* argument shall be set to a  
 49935        value different from zero.

49936        The *posix\_trace\_eventtypelist\_rewind()* function shall reset the next trace event type identifier to  
 49937        be read to the first trace event type identifier from the list of trace events used in the trace stream  
 49938        identified by *trid*.

49939 **RETURN VALUE**

49940        Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 49941        return the corresponding error number.

49942        The *posix\_trace\_eventtypelist\_getnext\_id()* function stores the trace event type identifier value in  
 49943        the object pointed to by *event*, if successful.

49944 **ERRORS**

49945        These functions shall fail if:

49946        [EINVAL]        The *trid* argument was not a valid trace stream identifier.

49947 **EXAMPLES**

49948        None.

49949 **APPLICATION USAGE**

49950        None.

49951 **RATIONALE**

49952        None.

49953 **FUTURE DIRECTIONS**

49954        The *posix\_trace\_eventtypelist\_getnext\_id()* and *posix\_trace\_eventtypelist\_rewind()* functions may be  
 49955        removed in a future version.

49956 **SEE ALSO**

49962 The *posix\_trace\_eventtypelist\_getnext\_id()* and *posix\_trace\_eventtypelist\_rewind()* functions are  
49963 marked obsolescent.  
49964

49965 **NAME**49966       posix\_trace\_flush — trace stream flush from a process (**TRACING**)49967 **SYNOPSIS**

```
49968 OB TRC  #include <sys/types.h>
49969          #include <trace.h>
49970 TRL      int posix_trace_flush(trace_id_t trid);
```

49971 **DESCRIPTION**49972       Refer to *posix\_trace\_create()*.

49973 **NAME**

49974        `posix_trace_get_attr`, `posix_trace_get_status` — retrieve the trace attributes or trace status  
 49975        (**TRACING**)

49976 **SYNOPSIS**

```
49977 OB TRC #include <trace.h>
49978
49978     int posix_trace_get_attr(trace_id_t trid, trace_attr_t *attr);
49979     int posix_trace_get_status(trace_id_t trid,
49980                               struct posix_trace_status_info *statusinfo);
```

49981 **DESCRIPTION**

49982        The `posix_trace_get_attr()` function shall copy the attributes of the active trace stream identified  
 49983        TRL by `trid` into the object pointed to by the `attr` argument. If the Trace Log option is supported, `trid`  
 49984        may represent a pre-recorded trace log.

49985        The `posix_trace_get_status()` function shall return, in the structure pointed to by the `statusinfo`  
 49986        argument, the current trace status for the trace stream identified by the `trid` argument. These  
 49987        status values returned in the structure pointed to by `statusinfo` shall have been appropriately  
 49988        TRL read to ensure that the returned values are consistent. If the Trace Log option is supported and  
 49989        the `trid` argument refers to a pre-recorded trace stream, the status shall be the status of the  
 49990        completed trace stream.

49991        Each time the `posix_trace_get_status()` function is used, the overrun status of the trace stream  
 49992        TRL shall be reset to `POSIX_TRACE_NO_OVERRUN` immediately after the call completes. If the  
 49993        Trace Log option is supported, the `posix_trace_get_status()` function shall behave the same as  
 49994        when the option is not supported except for the following differences:

- 49995        • If the `trid` argument refers to a trace stream with log, each time the `posix_trace_get_status()`  
 49996        function is used, the log overrun status of the trace stream shall be reset to  
 49997        `POSIX_TRACE_NO_OVERRUN` and the `flush_error` status shall be reset to zero  
 49998        immediately after the call completes.
- 49999        • If the `trid` argument refers to a pre-recorded trace stream, the status returned shall be the  
 50000        status of the completed trace stream and the status values of the trace stream shall not be  
 50001        reset.

50002 **RETURN VALUE**

50003        Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 50004        return the corresponding error number.

50005        The `posix_trace_get_attr()` function stores the trace attributes in the object pointed to by `attr`, if  
 50006        successful.

50007        The `posix_trace_get_status()` function stores the trace status in the object pointed to by `statusinfo`,  
 50008        if successful.

50009 **ERRORS**

50010        These functions shall fail if:

- 50011        [EINVAL]        The trace stream argument `trid` does not correspond to a valid active trace  
 50012        stream or a valid trace log.

50013 **EXAMPLES**

50014       None.

50015 **APPLICATION USAGE**

50016       None.

50017 **RATIONALE**

50018       None.

50019 **FUTURE DIRECTIONS**50020       The *posix\_trace\_get\_attr()* and *posix\_trace\_get\_status()* functions may be removed in a future  
50021       version.50022 **SEE ALSO**50023       *posix\_trace\_attr\_destroy()*, *posix\_trace\_close()*, *posix\_trace\_create()*

50024       XBD &lt;trace.h&gt;

50025 **CHANGE HISTORY**

50026       First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

50027       IEEE PASC Interpretation 1003.1 #123 is applied.

50028 **Issue 7**50029       The *posix\_trace\_get\_attr()* and *posix\_trace\_get\_status()* functions are marked obsolescent.

50030 **NAME**

50031        `posix_trace_get_filter`, `posix_trace_set_filter` — retrieve and set the filter of an initialized trace  
 50032        stream (**TRACING**)

50033 **SYNOPSIS**

```
50034 OB TRC  #include <trace.h>

50035 TEF      int posix_trace_get_filter(trace_id_t trid, trace_event_set_t *set);
50036          int posix_trace_set_filter(trace_id_t trid,
50037          const trace_event_set_t *set, int how);
```

50038 **DESCRIPTION**

50039        The `posix_trace_get_filter()` function shall retrieve, into the argument pointed to by `set`, the actual  
 50040        trace event filter from the trace stream specified by `trid`.

50041        The `posix_trace_set_filter()` function shall change the set of filtered trace event types after a trace  
 50042        stream identified by the `trid` argument is created. This function may be called prior to starting  
 50043        the trace stream, or while the trace stream is active. By default, if no call is made to  
 50044        `posix_trace_set_filter()`, all trace events shall be recorded (that is, none of the trace event types are  
 50045        filtered out).

50046        If this function is called while the trace is in progress, a special system trace event,  
 50047        `POSIX_TRACE_FILTER`, shall be recorded in the trace indicating both the old and the new sets  
 50048        of filtered trace event types (see [Table 2-4](#) (on page 544) and [Table 2-6](#), on page 545).

50049        If the `posix_trace_set_filter()` function is interrupted by a signal, an error shall be returned and the  
 50050        filter shall not be changed. In this case, the state of the trace stream shall not be changed.

50051        The value of the argument `how` indicates the manner in which the set is to be changed and shall  
 50052        have one of the following values, as defined in the `<trace.h>` header:

50053 **POSIX\_TRACE\_SET\_EVENTSET**

50054        The resulting set of trace event types to be filtered shall be the trace event type set pointed  
 50055        to by the argument `set`.

50056 **POSIX\_TRACE\_ADD\_EVENTSET**

50057        The resulting set of trace event types to be filtered shall be the union of the current set and  
 50058        the trace event type set pointed to by the argument `set`.

50059 **POSIX\_TRACE\_SUB\_EVENTSET**

50060        The resulting set of trace event types to be filtered shall be all trace event types in the  
 50061        current set that are not in the set pointed to by the argument `set`; that is, remove each  
 50062        element of the specified set from the current filter.

50063 **RETURN VALUE**

50064        Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 50065        return the corresponding error number.

50066        The `posix_trace_get_filter()` function stores the set of filtered trace event types in `set`, if successful.

50067 **ERRORS**

50068        These functions shall fail if:

50069        [EINVAL]        The value of the `trid` argument does not correspond to an active trace stream  
 50070        or the value of the argument pointed to by `set` is invalid.

50071        [EINTR]        The operation was interrupted by a signal.

50072 **EXAMPLES**

50073 None.

50074 **APPLICATION USAGE**

50075 None.

50076 **RATIONALE**

50077 None.

50078 **FUTURE DIRECTIONS**

50079 The *posix\_trace\_get\_filter()* and *posix\_trace\_set\_filter()* functions may be removed in a future  
50080 version.

50081 **SEE ALSO**50082 [Table 2-4](#) (on page 544), [Table 2-6](#) (on page 545), [posix\\_trace\\_eventset\\_add\(\)](#)50083 XBD [<trace.h>](#)50084 **CHANGE HISTORY**

50085 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

50086 IEEE PASC Interpretation 1003.1 #123 is applied.

50087 **Issue 7**50088 The *posix\_trace\_get\_filter()* and *posix\_trace\_set\_filter()* functions are marked obsolescent.

50089 **NAME**

50090       posix\_trace\_get\_status — retrieve the trace status (TRACING)

50091 **SYNOPSIS**

50092 OB TRC   #include &lt;trace.h&gt;

```
50093       int posix_trace_get_status(trace_id_t trid,  
50094           struct posix_trace_status_info *statusinfo);
```

50095 **DESCRIPTION**50096       Refer to *posix\_trace\_get\_attr()*.

## 50097 NAME

50098 `posix_trace_getnext_event`, `posix_trace_timedgetnext_event`, `posix_trace_trygetnext_event` —  
 50099 retrieve a trace event (**TRACING**)

## 50100 SYNOPSIS

```
50101 OB TRC #include <sys/types.h>
50102         #include <trace.h>

50103         int posix_trace_getnext_event(trace_id_t trid,
50104             struct posix_trace_event_info *restrict event,
50105             void *restrict data, size_t num_bytes,
50106             size_t *restrict data_len, int *restrict unavailable);
50107         int posix_trace_timedgetnext_event(trace_id_t trid,
50108             struct posix_trace_event_info *restrict event,
50109             void *restrict data, size_t num_bytes,
50110             size_t *restrict data_len, int *restrict unavailable,
50111             const struct timespec *restrict abstime);
50112         int posix_trace_trygetnext_event(trace_id_t trid,
50113             struct posix_trace_event_info *restrict event,
50114             void *restrict data, size_t num_bytes,
50115             size_t *restrict data_len, int *restrict unavailable);
```

## 50116 DESCRIPTION

50117 The `posix_trace_getnext_event()` function shall report a recorded trace event either from an active  
 50118 TRL trace stream without log or a pre-recorded trace stream identified by the *trid* argument. The  
 50119 `posix_trace_trygetnext_event()` function shall report a recorded trace event from an active trace  
 50120 stream without log identified by the *trid* argument.

50121 The trace event information associated with the recorded trace event shall be copied by the  
 50122 function into the structure pointed to by the argument *event* and the data associated with the  
 50123 trace event shall be copied into the buffer pointed to by the *data* argument.

50124 The `posix_trace_getnext_event()` function shall block if the *trid* argument identifies an active trace  
 50125 stream and there is currently no trace event ready to be retrieved. When returning, if a recorded  
 50126 trace event was reported, the variable pointed to by the *unavailable* argument shall be set to zero.  
 50127 Otherwise, the variable pointed to by the *unavailable* argument shall be set to a value different  
 50128 from zero.

50129 The `posix_trace_timedgetnext_event()` function shall attempt to get another trace event from an  
 50130 active trace stream without log, as in the `posix_trace_getnext_event()` function. However, if no  
 50131 trace event is available from the trace stream, the implied wait shall be terminated when the  
 50132 timeout specified by the argument *abstime* expires, and the function shall return the error  
 50133 [ETIMEDOUT].

50134 The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the  
 50135 clock upon which timeouts are based (that is, when the value of that clock equals or exceeds  
 50136 *abstime*), or if the absolute time specified by *abstime* has already passed at the time of the call.

50137 The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall  
 50138 be the resolution of the clock on which it is based. The **timespec** data type is defined in the  
 50139 **<time.h>** header.

50140 Under no circumstance shall the function fail with a timeout if a trace event is immediately  
 50141 available from the trace stream. The validity of the *abstime* argument need not be checked if a  
 50142 trace event is immediately available from the trace stream.

50143 The behavior of this function for a pre-recorded trace stream is unspecified.

50144 TRL The *posix\_trace\_trygetnext\_event()* function shall not block. This function shall return an error if  
50145 the *trid* argument identifies a pre-recorded trace stream. If a recorded trace event was reported,  
50146 the variable pointed to by the *unavailable* argument shall be set to zero. Otherwise, if no trace  
50147 event was reported, the variable pointed to by the *unavailable* argument shall be set to a value  
50148 different from zero.

50149 The argument *num\_bytes* shall be the size of the buffer pointed to by the *data* argument. The  
50150 argument *data\_len* reports to the application the length in bytes of the data record just  
50151 transferred. If *num\_bytes* is greater than or equal to the size of the data associated with the trace  
50152 event pointed to by the *event* argument, all the recorded data shall be transferred. In this case,  
50153 the *truncation-status* member of the trace event structure shall be either  
50154 POSIX\_TRACE\_NOT\_TRUNCATED, if the trace event data was recorded without truncation  
50155 while tracing, or POSIX\_TRACE\_TRUNCATED\_RECORD, if the trace event data was truncated  
50156 when it was recorded. If the *num\_bytes* argument is less than the length of recorded trace event  
50157 data, the data transferred shall be truncated to a length of *num\_bytes*, the value stored in the  
50158 variable pointed to by *data\_len* shall be equal to *num\_bytes*, and the *truncation-status* member of  
50159 the *event* structure argument shall be set to POSIX\_TRACE\_TRUNCATED\_READ (see the  
50160 *posix\_trace\_event\_info* structure defined in <trace.h>).

50161 The report of a trace event shall be sequential starting from the oldest recorded trace event. Trace  
50162 events shall be reported in the order in which they were generated, up to an implementation-  
50163 defined time resolution that causes the ordering of trace events occurring very close to each  
50164 other to be unknown. Once reported, a trace event cannot be reported again from an active trace  
50165 stream. Once a trace event is reported from an active trace stream without log, the trace stream  
50166 shall make the resources associated with that trace event available to record future generated  
50167 trace events.

#### 50168 RETURN VALUE

50169 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
50170 return the corresponding error number.

50171 If successful, these functions store:

- 50172 • The recorded trace event in the object pointed to by *event*
- 50173 • The trace event information associated with the recorded trace event in the object pointed  
50174 to by *data*
- 50175 • The length of this trace event information in the object pointed to by *data\_len*
- 50176 • The value of zero in the object pointed to by *unavailable*

#### 50177 ERRORS

50178 These functions shall fail if:

50179 [EINVAL] The trace stream identifier argument *trid* is invalid.

50180 The *posix\_trace\_getnext\_event()* and *posix\_trace\_timedgetnext\_event()* functions shall fail if:

50181 [EINTR] The operation was interrupted by a signal, and so the call had no effect.

50182 The *posix\_trace\_trygetnext\_event()* function shall fail if:

50183 [EINVAL] The trace stream identifier argument *trid* does not correspond to an active  
50184 trace stream.

50185 The *posix\_trace\_timedgetnext\_event()* function shall fail if:  
50186 [EINVAL] There is no trace event immediately available from the trace stream, and the  
50187 *timeout* argument is invalid.  
50188 [ETIMEDOUT] No trace event was available from the trace stream before the specified  
50189 timeout *timeout* expired.

50190 **EXAMPLES**

50191 None.

50192 **APPLICATION USAGE**

50193 None.

50194 **RATIONALE**

50195 None.

50196 **FUTURE DIRECTIONS**

50197 These functions may be removed in a future version.

50198 **SEE ALSO**

50200 XBD <sys/types.h>, <trace.h>

50201 **CHANGE HISTORY**

50202 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

50203 IEEE PASC Interpretation 1003.1 #123 is applied.

50204 **Issue 7**

50205 The *posix\_trace\_getnext\_event()*, *posix\_trace\_timedgetnext\_event()*, and  
50206 *posix\_trace\_trygetnext\_event()* functions are marked obsolescent.

50207 Functionality relating to the Timers option is moved to the Base.

50208 **NAME**

50209       posix\_trace\_open, posix\_trace\_rewind — trace log management (TRACING)

50210 **SYNOPSIS**

50211 OB TRC   #include &lt;trace.h&gt;

50212 TRL       int posix\_trace\_open(int *file\_desc*, trace\_id\_t \*trid);

50213       int posix\_trace\_rewind(trace\_id\_t trid);

50214 **DESCRIPTION**50215       Refer to *posix\_trace\_close()*.

50216 **NAME**50217       posix\_trace\_set\_filter — set filter of an initialized trace stream (**TRACING**)50218 **SYNOPSIS**

50219 OB TRC   #include &lt;trace.h&gt;

50220 TEF       int posix\_trace\_set\_filter(trace\_id\_t trid,  
50221       const trace\_event\_set\_t \*set, int how);50222 **DESCRIPTION**50223       Refer to *posix\_trace\_get\_filter()*.

50224 **NAME**

50225       posix\_trace\_shutdown — trace stream shutdown from a process (TRACING)

50226 **SYNOPSIS**

```
50227 OB TRC #include <sys/types.h>  
50228         #include <trace.h>  
50229         int posix_trace_shutdown(trace_id_t trid);
```

50230 **DESCRIPTION**50231       Refer to *posix\_trace\_create()*.

50232 **NAME**

50233       posix\_trace\_start, posix\_trace\_stop — trace start and stop (TRACING)

50234 **SYNOPSIS**

```
50235 OB TRC  #include <trace.h>
50236         int posix_trace_start(trace_id_t trid);
50237         int posix_trace_stop (trace_id_t trid);
```

50238 **DESCRIPTION**

50239       The *posix\_trace\_start()* and *posix\_trace\_stop()* functions, respectively, shall start and stop the trace  
50240       stream identified by the argument *trid*.

50241       The effect of calling the *posix\_trace\_start()* function shall be recorded in the trace stream as the  
50242       POSIX\_TRACE\_START system trace event and the status of the trace stream shall become  
50243       POSIX\_TRACE\_RUNNING. If the trace stream is in progress when this function is called, the  
50244       POSIX\_TRACE\_START system trace event shall not be recorded and the trace stream shall  
50245       continue to run. If the trace stream is full, the POSIX\_TRACE\_START system trace event shall  
50246       not be recorded and the status of the trace stream shall not be changed.

50247       The effect of calling the *posix\_trace\_stop()* function shall be recorded in the trace stream as the  
50248       POSIX\_TRACE\_STOP system trace event and the status of the trace stream shall become  
50249       POSIX\_TRACE\_SUSPENDED. If the trace stream is suspended when this function is called, the  
50250       POSIX\_TRACE\_STOP system trace event shall not be recorded and the trace stream shall remain  
50251       suspended. If the trace stream is full, the POSIX\_TRACE\_STOP system trace event shall not be  
50252       recorded and the status of the trace stream shall not be changed.

50253 **RETURN VALUE**

50254       Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
50255       return the corresponding error number.

50256 **ERRORS**

50257       These functions shall fail if:

50258       [EINVAL]       The value of the argument *trid* does not correspond to an active trace stream  
50259       and thus no trace stream was started or stopped.

50260       [EINTR]       The operation was interrupted by a signal and thus the trace stream was not  
50261       necessarily started or stopped.

50262 **EXAMPLES**

50263       None.

50264 **APPLICATION USAGE**

50265       None.

50266 **RATIONALE**

50267       None.

50268 **FUTURE DIRECTIONS**

50269       The *posix\_trace\_start()* and *posix\_trace\_stop()* functions may be removed in a future version.

50270 **SEE ALSO**

50271       *posix\_trace\_create()*

50275 IEEE PASC Interpretation 1003.1 #123 is applied.

50276 **Issue 7**

50277 The *posix\_trace\_start()* and *posix\_trace\_stop()* functions are marked obsolescent.

50278 **NAME**50279       posix\_trace\_timedgetnext\_event — retrieve a trace event (**TRACING**)50280 **SYNOPSIS**

```
50281 OB TRC #include <sys/types.h>
50282         #include <trace.h>

50283         int posix_trace_timedgetnext_event(trace_id_t trid,
50284         struct posix_trace_event_info *restrict event,
50285         void *restrict data, size_t num_bytes,
50286         size_t *restrict data_len, int *restrict unavailable,
50287         const struct timespec *restrict abstime);
```

50288 **DESCRIPTION**50289       Refer to *posix\_trace\_getnext\_event()*.

50290 **NAME**50291       posix\_trace\_trid\_eventid\_open — open a trace event type identifier (**TRACING**)50292 **SYNOPSIS**

```
50293 OB TRC  #include <trace.h>
50294 TEF      int posix_trace_trid_eventid_open(trace_id_t trid,
50295      const char *restrict event_name,
50296      trace_event_id_t *restrict event);
```

50297 **DESCRIPTION**50298       Refer to *posix\_trace\_eventid\_equal()*.

50299 **NAME**50300        posix\_trace\_trygetnext\_event — retrieve a trace event (**TRACING**)50301 **SYNOPSIS**

```
50302 OB TRC #include <sys/types.h>
50303         #include <trace.h>
50304
50304         int posix_trace_trygetnext_event(trace_id_t trid,
50305         struct posix_trace_event_info *restrict event,
50306         void *restrict data, size_t num_bytes,
50307         size_t *restrict data_len, int *restrict unavailable);
```

50308 **DESCRIPTION**50309        Refer to *posix\_trace\_getnext\_event()*.

**50310 NAME**

50311 `posix_typed_mem_get_info` — query typed memory information (**ADVANCED REALTIME**)

**50312 SYNOPSIS**

```
50313 TYM      #include <sys/mman.h>
50314
50314      int posix_typed_mem_get_info(int fildes,
50315                                  struct posix_typed_mem_info *info);
```

**50316 DESCRIPTION**

50317 The `posix_typed_mem_get_info()` function shall return, in the `posix_tmi_length` field of the  
 50318 **posix\_typed\_mem\_info** structure pointed to by *info*, the maximum length which may be  
 50319 successfully allocated by the typed memory object designated by *fildes*. This maximum length  
 50320 shall take into account the flag `POSIX_TYPED_MEM_ALLOCATE` or  
 50321 `POSIX_TYPED_MEM_ALLOCATE_CONTIG` specified when the typed memory object  
 50322 represented by *fildes* was opened. The maximum length is dynamic; therefore, the value  
 50323 returned is valid only while the current mapping of the corresponding typed memory pool  
 50324 remains unchanged.

50325 If *fildes* represents a typed memory object opened with neither the  
 50326 `POSIX_TYPED_MEM_ALLOCATE` flag nor the `POSIX_TYPED_MEM_ALLOCATE_CONTIG`  
 50327 flag specified, the returned value of *info*->`posix_tmi_length` is unspecified.

50328 The `posix_typed_mem_get_info()` function may return additional implementation-defined  
 50329 information in other fields of the **posix\_typed\_mem\_info** structure pointed to by *info*.

50330 If the memory object specified by *fildes* is not a typed memory object, then the behavior of this  
 50331 function is undefined.

**50332 RETURN VALUE**

50333 Upon successful completion, the `posix_typed_mem_get_info()` function shall return zero;  
 50334 otherwise, the corresponding error status value shall be returned.

**50335 ERRORS**

50336 The `posix_typed_mem_get_info()` function shall fail if:

|       |          |                                                                                  |
|-------|----------|----------------------------------------------------------------------------------|
| 50337 | [EBADF]  | The <i>fildes</i> argument is not a valid open file descriptor.                  |
| 50338 | [ENODEV] | The <i>fildes</i> argument is not connected to a memory object supported by this |
| 50339 |          | function.                                                                        |

50340 This function shall not return an error code of [EINTR].

**50341 EXAMPLES**

50342 None.

**50343 APPLICATION USAGE**

50344 None.

**50345 RATIONALE**

50346 An application that needs to allocate a block of typed memory with length dependent upon the  
 50347 amount of memory currently available must either query the typed memory object to obtain the  
 50348 amount available, or repeatedly invoke `mmap()` attempting to guess an appropriate length.  
 50349 While the latter method is existing practice with `malloc()`, it is awkward and imprecise. The  
 50350 `posix_typed_mem_get_info()` function allows an application to immediately determine available  
 50351 memory. This is particularly important for typed memory objects that may in some cases be  
 50352 scarce resources. Note that when a typed memory pool is a shared resource, some form of  
 50353 mutual-exclusion or synchronization may be required while typed memory is being queried and

50354 allocated to prevent race conditions.

50355 The existing *fstat()* function is not suitable for this purpose. We realize that implementations  
50356 may wish to provide other attributes of typed memory objects (for example, alignment  
50357 requirements, page size, and so on). The *fstat()* function returns a structure which is not  
50358 extensible and, furthermore, contains substantial information that is inappropriate for typed  
50359 memory objects.

50360 **FUTURE DIRECTIONS**

50361 None.

50362 **SEE ALSO**

50363 *fstat()*, *mmap()*, *posix\_typed\_mem\_open()*

50364 XBD <sys/mman.h>

50365 **CHANGE HISTORY**

50366 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

**NAME**

posix\_typed\_mem\_open — open a typed memory object (**ADVANCED REALTIME**)

**SYNOPSIS**

```
#include <sys/mman.h>

int posix_typed_mem_open(const char *name, int oflag, int tflag);
```

**DESCRIPTION**

The `posix_typed_mem_open()` function shall establish a connection between the typed memory object specified by the string pointed to by *name* and a file descriptor. It shall create an open file description that refers to the typed memory object and a file descriptor that refers to that open file description. The file descriptor shall be allocated as described in [Section 2.14](#) (on page 549) and can be used by other functions to refer to that typed memory object. It is unspecified whether the name appears in the file system and is visible to other functions that take pathnames as arguments. The *name* argument conforms to the construction rules for a pathname, except that the interpretation of <slash> characters other than the leading <slash> character in *name* is implementation-defined, and that the length limits for the *name* argument are implementation-defined and need not be the same as the pathname limits {PATH\_MAX} and {NAME\_MAX}. If *name* begins with the <slash> character, then processes calling `posix_typed_mem_open()` with the same value of *name* shall refer to the same typed memory object. If *name* does not begin with the <slash> character, the effect is implementation-defined.

Each typed memory object supported in a system shall be identified by a name which specifies not only its associated typed memory pool, but also the path or port by which it is accessed. That is, the same typed memory pool accessed via several different ports shall have several different corresponding names. The binding between names and typed memory objects is established in an implementation-defined manner. Unlike shared memory objects, there is no way within POSIX.1-2008 for a program to create a typed memory object.

The value of *tflag* shall determine how the typed memory object behaves when subsequently mapped by calls to `mmap()`. At most, one of the following flags defined in `<sys/mman.h>` may be specified:

POSIX\_TYPED\_MEM\_ALLOCATE

Allocate on `mmap()`.

POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG

Allocate contiguously on `mmap()`.

POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE

Map on `mmap()`, without affecting allocatability.

If *tflag* has the flag POSIX\_TYPED\_MEM\_ALLOCATE specified, any subsequent call to `mmap()` using the returned file descriptor shall result in allocation and mapping of typed memory from the specified typed memory pool. The allocated memory may be a contiguous previously unallocated area of the typed memory pool or several non-contiguous previously unallocated areas (mapped to a contiguous portion of the process address space). If *tflag* has the flag POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG specified, any subsequent call to `mmap()` using the returned file descriptor shall result in allocation and mapping of a single contiguous previously unallocated area of the typed memory pool (also mapped to a contiguous portion of the process address space). If *tflag* has none of the flags POSIX\_TYPED\_MEM\_ALLOCATE or POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG specified, any subsequent call to `mmap()` using the returned file descriptor shall map an application-chosen area from the specified typed memory pool such that this mapped area becomes unavailable for allocation until unmapped by all processes. If *tflag* has the flag POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE specified, any

subsequent call to *mmap()* using the returned file descriptor shall map an application-chosen area from the specified typed memory pool without an effect on the availability of that area for allocation; that is, mapping such an object leaves each byte of the mapped area unallocated if it was unallocated prior to the mapping or allocated if it was allocated prior to the mapping. Appropriate privileges to specify the `POSIX_TYPED_MEM_MAP_ALLOCATABLE` flag are implementation-defined.

If successful, *posix\_typed\_mem\_open()* shall return a file descriptor for the typed memory object. The open file description is new, and therefore the file descriptor shall not share it with any other processes. It is unspecified whether the file offset is set. The `FD_CLOEXEC` file descriptor flag associated with the new file descriptor shall be cleared.

The behavior of *msync()*, *ftruncate()*, and all file operations other than *mmap()*, *posix\_mem\_offset()*, *posix\_typed\_mem\_get\_info()*, *fstat()*, *dup()*, *dup2()*, and *close()*, is unspecified when passed a file descriptor connected to a typed memory object by this function.

The file status flags of the open file description shall be set according to the value of *oflag*. Applications shall specify exactly one of the three access mode values described below and defined in the `<fcntl.h>` header, as the value of *oflag*.

- `O_RDONLY`      Open for read access only.
- `O_WRONLY`      Open for write access only.
- `O_RDWR`        Open for read or write access.

#### RETURN VALUE

Upon successful completion, the *posix\_typed\_mem\_open()* function shall return a non-negative integer representing the file descriptor. Otherwise, it shall return `-1` and set *errno* to indicate the error.

#### ERRORS

The *posix\_typed\_mem\_open()* function shall fail if:

- `[EACCES]`      The typed memory object exists and the permissions specified by *oflag* are denied.
- `[EINTR]`        The *posix\_typed\_mem\_open()* operation was interrupted by a signal.
- `[EINVAL]`        The flags specified in *tflag* are invalid (more than one of `POSIX_TYPED_MEM_ALLOCATE`, `POSIX_TYPED_MEM_ALLOCATE_CONTIG`, or `POSIX_TYPED_MEM_MAP_ALLOCATABLE` is specified).
- `[EMFILE]`        All file descriptors available to the process are currently open.
- `[ENFILE]`        Too many file descriptors are currently open in the system.
- `[ENOENT]`        The named typed memory object does not exist.
- `[EPERM]`        The caller lacks appropriate privileges to specify the `POSIX_TYPED_MEM_MAP_ALLOCATABLE` flag in the *tflag* argument.

The *posix\_typed\_mem\_open()* function may fail if:

- `[ENAMETOOLONG]`      The length of the *name* argument exceeds `{_POSIX_PATH_MAX}` on systems that do not support the XSI option or exceeds `{_XOPEN_PATH_MAX}` on XSI systems, or has a pathname component that is longer than

50456 XSI { \_POSIX\_NAME\_MAX } on systems that do not support the XSI option or  
50457 longer than { \_XOPEN\_NAME\_MAX } on XSI systems.

#### 50470 CHANGE HISTORY

50471 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

#### 50472 Issue 7

50473 Austin Group Interpretation 1003.1-2001 #143 is applied.

50474 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0442 [119,428] is applied.

50475 **NAME**

50476 pow, powf, powl — power function

50477 **SYNOPSIS**

```
50478 #include <math.h>
50479 double pow(double x, double y);
50480 float powf(float x, float y);
50481 long double powl(long double x, long double y);
```

50482 **DESCRIPTION**

50483 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 50484 conflict between the requirements described here and the ISO C standard is unintentional. This  
 50485 volume of POSIX.1-2008 defers to the ISO C standard.

50486 These functions shall compute the value of  $x$  raised to the power  $y$ ,  $x^y$ . If  $x$  is negative, the  
 50487 application shall ensure that  $y$  is an integer value.

50488 An application wishing to check for error situations should set *errno* to zero and call  
 50489 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 50490 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 50491 zero, an error has occurred.

50492 **RETURN VALUE**

50493 Upon successful completion, these functions shall return the value of  $x$  raised to the power  $y$ .

50494 MX For finite values of  $x < 0$ , and finite non-integer values of  $y$ , a domain error shall occur and  
 50495 either a NaN (if representable), or an implementation-defined value shall be returned.

50496 If the correct value would cause overflow, a range error shall occur and *pow()*, *powf()*, and  
 50497 *powl()* shall return  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$ , respectively, with the  
 50498 same sign as the correct value of the function.

50499 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 50500 MXX and *pow()*, *powf()*, and *powl()* shall return 0.0, or (if IEC 60559 Floating-Point is not supported)  
 50501 an implementation-defined value no greater in magnitude than DBL\_MIN, FLT\_MIN, and  
 50502 LDBL\_MIN, respectively.

50503 CX For  $y < 0$ , if  $x$  is zero, a pole error may occur and *pow()*, *powf()*, and *powl()* shall return  
 50504 MX  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$ , respectively. On systems that support the  
 50505 IEC 60559 Floating-Point option, if  $x$  is  $\pm 0$ , a pole error shall occur and *pow()*, *powf()*, and *powl()*  
 50506 shall return  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$ , respectively if  $y$  is an odd integer,  
 50507 or  $\text{HUGE\_VAL}$ ,  $\text{HUGE\_VALF}$ , and  $\text{HUGE\_VALL}$ , respectively if  $y$  is not an odd integer.

50508 MX If  $x$  or  $y$  is a NaN, a NaN shall be returned (unless specified elsewhere in this description).

50509 For any value of  $y$  (including NaN), if  $x$  is +1, 1.0 shall be returned.

50510 For any value of  $x$  (including NaN), if  $y$  is  $\pm 0$ , 1.0 shall be returned.

50511 For any odd integer value of  $y > 0$ , if  $x$  is  $\pm 0$ ,  $\pm 0$  shall be returned.

50512 For  $y > 0$  and not an odd integer, if  $x$  is  $\pm 0$ , +0 shall be returned.

50513 If  $x$  is -1, and  $y$  is  $\pm\text{Inf}$ , 1.0 shall be returned.

50514 For  $|x| < 1$ , if  $y$  is  $-\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

50515 For  $|x| > 1$ , if  $y$  is  $-\text{Inf}$ , +0 shall be returned.

50516 For  $|x| < 1$ , if  $y$  is  $+\text{Inf}$ , +0 shall be returned.

50517 For  $|x| > 1$ , if  $y$  is  $+\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

50518 For  $y$  an odd integer  $< 0$ , if  $x$  is  $-\text{Inf}$ ,  $-\text{Inf}$  shall be returned.

50519 For  $y < 0$  and not an odd integer, if  $x$  is  $-\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

50520 For  $y$  an odd integer  $> 0$ , if  $x$  is  $-\text{Inf}$ ,  $-\text{Inf}$  shall be returned.

50521 For  $y > 0$  and not an odd integer, if  $x$  is  $-\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

50522 For  $y < 0$ , if  $x$  is  $+\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

50523 For  $y > 0$ , if  $x$  is  $+\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

50524 MXX If the correct value would cause underflow, and is representable, a range error may occur and  
50525 the correct value shall be returned.

**ERRORS**

50526 These functions shall fail if:

50527 Domain Error The value of  $x$  is negative and  $y$  is a finite non-integer.

50528 If the integer expression  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  is non-zero,  
50529 then *errno* shall be set to [EDOM]. If the integer expression  $(\text{math\_errhandling}$   
50530  $\ \& \ \text{MATH\_ERREXCEPT})$  is non-zero, then the invalid floating-point exception  
50531 shall be raised.  
50532

50533 MX Pole Error The value of  $x$  is zero and  $y$  is negative.

50534 If the integer expression  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  is non-zero,  
50535 then *errno* shall be set to [ERANGE]. If the integer expression  
50536  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$  is non-zero, then the divide-by-zero  
50537 floating-point exception shall be raised.

50538 Range Error The result overflows.

50539 If the integer expression  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  is non-zero,  
50540 then *errno* shall be set to [ERANGE]. If the integer expression  
50541  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$  is non-zero, then the overflow  
50542 floating-point exception shall be raised.

50543 These functions may fail if:

50544 Pole Error The value of  $x$  is zero and  $y$  is negative.

50545 If the integer expression  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  is non-zero,  
50546 then *errno* shall be set to [ERANGE]. If the integer expression  
50547  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$  is non-zero, then the divide-by-zero  
50548 floating-point exception shall be raised.

50549 Range Error The result underflows.

50550 If the integer expression  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  is non-zero,  
50551 then *errno* shall be set to [ERANGE]. If the integer expression  
50552  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$  is non-zero, then the underflow  
50553 floating-point exception shall be raised.

**EXAMPLES**

None.

**APPLICATION USAGE**

On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* & MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

**Issue 6**

The normative text is updated to avoid use of the term “must” for application requirements.

The *powf()* and *powl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/42 is applied, correcting the third paragraph in the RETURN VALUE section.

**Issue 7**

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #51 (SD5-XSH-ERN-81) is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0443 [68], XSH/TC1-2008/0444 [148], and XSH/TC1-2008/0445 [68] are applied.

**NAME**

pselect, select — synchronous I/O multiplexing

**SYNOPSIS**

```
#include <sys/select.h>

int pselect(int nfds, fd_set *restrict readfds,
            fd_set *restrict writefds, fd_set *restrict errorfds,
            const struct timespec *restrict timeout,
            const sigset_t *restrict sigmask);
int select(int nfds, fd_set *restrict readfds,
           fd_set *restrict writefds, fd_set *restrict errorfds,
           struct timeval *restrict timeout);
void FD_CLR(int fd, fd_set *fdset);
int FD_ISSET(int fd, fd_set *fdset);
void FD_SET(int fd, fd_set *fdset);
void FD_ZERO(fd_set *fdset);
```

**DESCRIPTION**

The *pselect()* function shall examine the file descriptor sets whose addresses are passed in the *readfds*, *writefds*, and *errorfds* parameters to see whether some of their descriptors are ready for reading, are ready for writing, or have an exceptional condition pending, respectively.

The *select()* function shall be equivalent to the *pselect()* function, except as follows:

- For the *select()* function, the timeout period is given in seconds and microseconds in an argument of type **struct timeval**, whereas for the *pselect()* function the timeout period is given in seconds and nanoseconds in an argument of type **struct timespec**.
- The *select()* function has no *sigmask* argument; it shall behave as *pselect()* does when *sigmask* is a null pointer.
- Upon successful completion, the *select()* function may modify the object pointed to by the *timeout* argument.

The *pselect()* and *select()* functions shall support regular files, terminal and pseudo-terminal devices, **STREAMS-based files**, FIFOs, pipes, and sockets. The behavior of *pselect()* and *select()* on file descriptors that refer to other types of file is unspecified.

The *nfds* argument specifies the range of descriptors to be tested. The first *nfds* descriptors shall be checked in each set; that is, the descriptors from zero through *nfds*–1 in the descriptor sets shall be examined.

If the *readfds* argument is not a null pointer, it points to an object of type **fd\_set** that on input specifies the file descriptors to be checked for being ready to read, and on output indicates which file descriptors are ready to read.

If the *writefds* argument is not a null pointer, it points to an object of type **fd\_set** that on input specifies the file descriptors to be checked for being ready to write, and on output indicates which file descriptors are ready to write.

If the *errorfds* argument is not a null pointer, it points to an object of type **fd\_set** that on input specifies the file descriptors to be checked for error conditions pending, and on output indicates which file descriptors have error conditions pending.

Upon successful completion, the *pselect()* or *select()* function shall modify the objects pointed to by the *readfds*, *writefds*, and *errorfds* arguments to indicate which file descriptors are ready for reading, ready for writing, or have an error condition pending, respectively, and shall return the total number of ready descriptors in all the output sets. For each file descriptor less than *nfds*, the

corresponding bit shall be set upon successful completion if it was set on input and the associated condition is true for that file descriptor.

If none of the selected descriptors are ready for the requested operation, the *pselect()* or *select()* function shall block until at least one of the requested operations becomes ready, until the *timeout* occurs, or until interrupted by a signal. The *timeout* parameter controls how long the *pselect()* or *select()* function shall take before timing out. If the *timeout* parameter is not a null pointer, it specifies a maximum interval to wait for the selection to complete. If the specified time interval expires without any requested operation becoming ready, the function shall return. If the *timeout* parameter is a null pointer, then the call to *pselect()* or *select()* shall block indefinitely until at least one descriptor meets the specified criteria. To effect a poll, the *timeout* parameter should not be a null pointer, and should point to a zero-valued **timespec** structure.

The use of a timeout does not affect any pending timers set up by *alarm()* or *setitimer()*.

Implementations may place limitations on the maximum timeout interval supported. All implementations shall support a maximum timeout interval of at least 31 days. If the *timeout* argument specifies a timeout interval greater than the implementation-defined maximum value, the maximum value shall be used as the actual timeout value. Implementations may also place limitations on the granularity of timeout intervals. If the requested timeout interval requires a finer granularity than the implementation supports, the actual timeout interval shall be rounded up to the next supported value.

If *sigmask* is not a null pointer, then the *pselect()* function shall replace the signal mask of the caller by the set of signals pointed to by *sigmask* before examining the descriptors, and shall restore the signal mask of the calling thread before returning.

A descriptor shall be considered ready for reading when a call to an input function with **O\_NONBLOCK** clear would not block, whether or not the function would transfer data successfully. (The function might return data, an end-of-file indication, or an error other than one indicating that it is blocked, and in each of these cases the descriptor shall be considered ready for reading.)

A descriptor shall be considered ready for writing when a call to an output function with **O\_NONBLOCK** clear would not block, whether or not the function would transfer data successfully.

If a socket has a pending error, it shall be considered to have an exceptional condition pending. Otherwise, what constitutes an exceptional condition is file type-specific. For a file descriptor for use with a socket, it is protocol-specific except as noted below. For other file types it is implementation-defined. If the operation is meaningless for a particular file type, *pselect()* or *select()* shall indicate that the descriptor is ready for read or write operations, and shall indicate that the descriptor has no exceptional condition pending.

If a descriptor refers to a socket, the implied input function is the *recvmsg()* function with parameters requesting normal and ancillary data, such that the presence of either type shall cause the socket to be marked as readable. The presence of out-of-band data shall be checked if the socket option **SO\_OOBINLINE** has been enabled, as out-of-band data is enqueued with normal data. If the socket is currently listening, then it shall be marked as readable if an incoming connection request has been received, and a call to the *accept()* function shall complete without blocking.

If a descriptor refers to a socket, the implied output function is the *sendmsg()* function supplying an amount of normal data equal to the current value of the **SO\_SNDLOWAT** option for the socket. If a non-blocking call to the *connect()* function has been made for a socket, and the connection attempt has either succeeded or failed leaving a pending error, the socket shall be

marked as writable.

A socket shall be considered to have an exceptional condition pending if a receive operation with `O_NONBLOCK` clear for the open file description and with the `MSG_OOB` flag set would return out-of-band data without blocking. (It is protocol-specific whether the `MSG_OOB` flag would be used to read out-of-band data.) A socket shall also be considered to have an exceptional condition pending if an out-of-band data mark is present in the receive queue. Other circumstances under which a socket may be considered to have an exceptional condition pending are protocol-specific and implementation-defined.

If the `readfds`, `writefds`, and `errorfds` arguments are all null pointers and the `timeout` argument is not a null pointer, the `pselect()` or `select()` function shall block for the time specified, or until interrupted by a signal. If the `readfds`, `writefds`, and `errorfds` arguments are all null pointers and the `timeout` argument is a null pointer, the `pselect()` or `select()` function shall block until interrupted by a signal.

File descriptors associated with regular files shall always select true for ready to read, ready to write, and error conditions.

On failure, the objects pointed to by the `readfds`, `writefds`, and `errorfds` arguments shall not be modified. If the timeout interval expires without the specified condition being true for any of the specified file descriptors, the objects pointed to by the `readfds`, `writefds`, and `errorfds` arguments shall have all bits set to 0.

File descriptor masks of type `fd_set` can be initialized and tested with `FD_CLR()`, `FD_ISSET()`, `FD_SET()`, and `FD_ZERO()`. It is unspecified whether each of these is a macro or a function. If a macro definition is suppressed in order to access an actual function, or a program defines an external identifier with any of these names, the behavior is undefined.

`FD_CLR(fd, fdsetp)` shall remove the file descriptor *fd* from the set pointed to by *fdsetp*. If *fd* is not a member of this set, there shall be no effect on the set, nor will an error be returned.

`FD_ISSET(fd, fdsetp)` shall evaluate to non-zero if the file descriptor *fd* is a member of the set pointed to by *fdsetp*, and shall evaluate to zero otherwise.

`FD_SET(fd, fdsetp)` shall add the file descriptor *fd* to the set pointed to by *fdsetp*. If the file descriptor *fd* is already in this set, there shall be no effect on the set, nor will an error be returned.

`FD_ZERO(fdsetp)` shall initialize the descriptor set pointed to by *fdsetp* to the null set. No error is returned if the set is not empty at the time `FD_ZERO()` is invoked.

The behavior of these macros is undefined if the *fd* argument is less than 0 or greater than or equal to `FD_SETSIZE`, or if *fd* is not a valid file descriptor, or if any of the arguments are expressions with side-effects.

If a thread gets canceled during a `pselect()` call, the signal mask in effect when executing the registered cleanup functions is either the original signal mask or the signal mask installed as part of the `pselect()` call.

## RETURN VALUE

Upon successful completion, the `pselect()` and `select()` functions shall return the total number of bits set in the bit masks. Otherwise, `-1` shall be returned, and `errno` shall be set to indicate the error.

`FD_CLR()`, `FD_SET()`, and `FD_ZERO()` do not return a value. `FD_ISSET()` shall return a non-zero value if the bit for the file descriptor *fd* is set in the file descriptor set pointed to by *fdset*, and 0 otherwise.

**ERRORS**

Under the following conditions, *pselect()* and *select()* shall fail and set *errno* to:

[EBADF] One or more of the file descriptor sets specified a file descriptor that is not a valid open file descriptor.

[EINTR] The function was interrupted while blocked waiting for any of the selected descriptors to become ready and before the timeout interval expired.

If SA\_RESTART has been set for the interrupting signal, it is implementation-defined whether the function restarts or returns with [EINTR].

[EINVAL] An invalid timeout interval was specified.

[EINVAL] The *nfds* argument is less than 0 or greater than FD\_SETSIZE.

[EINVAL] One of the specified file descriptors refers to a STREAM or multiplexer that is linked (directly or indirectly) downstream from a multiplexer.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

In earlier versions of the Single UNIX Specification, the *select()* function was defined in the **<sys/time.h>** header. This is now changed to **<sys/select.h>**. The rationale for this change was as follows: the introduction of the *pselect()* function included the **<sys/select.h>** header and the **<sys/select.h>** header defines all the related definitions for the *pselect()* and *select()* functions. Backwards-compatibility to existing XSI implementations is handled by allowing **<sys/time.h>** to include **<sys/select.h>**.

Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers can install an additional cancellation handler which resets the signal mask to the expected value.

```
void cleanup(void *arg)
{
    sigset_t *ss = (sigset_t *) arg;
    pthread_sigmask(SIG_SETMASK, ss, NULL);
}

int call_pselect(int nfds, fd_set *readfds, fd_set *writefds,
    fd_set errorfds, const struct timespec *timeout,
    const sigset_t *sigmask)
{
    sigset_t oldmask;
    int result;
    pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
    pthread_cleanup_push(cleanup, &oldmask);
    result = pselect(nfds, readfds, writefds, errorfds, timeout, sigmask);
    pthread_cleanup_pop(0);
    return result;
}
```

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

XBD **<sys/select.h>**, **<sys/time.h>**

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

In the ERRORS section, the text has been changed to indicate that [EINVAL] is returned when *nfds* is less than 0 or greater than FD\_SETSIZE. It previously stated less than 0, or greater than or equal to FD\_SETSIZE.

Text about *timeout* is moved from the APPLICATION USAGE section to the DESCRIPTION.

**Issue 6**

The Open Group Corrigendum U026/6 is applied, changing the occurrences of *readfs* and *writefs* in the *select()* DESCRIPTION to be *readfds* and *writefds*.

Text referring to sockets is added to the DESCRIPTION.

The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- These functions are now mandatory.

The *pselect()* function is added for alignment with IEEE Std 1003.1g-2000 and additional detail related to sockets semantics is added to the DESCRIPTION.

The *select()* function now requires inclusion of **<sys/select.h>**.

The **restrict** keyword is added to the *select()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/70 is applied, updating the DESCRIPTION to reference the signal mask in terms of the calling thread rather than the process.

**Issue 7**

SD5-XSH-ERN-122 is applied, adding text to the DESCRIPTION for when a thread is canceled during a call to *pselect()*, and adding example code to the RATIONALE.

Functionality relating to the XSI STREAMS option is marked obsolescent.

Functionality relating to the Threads option is moved to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0446 [372] is applied.

**NAME**

psiginfo, psignal — write signal information to standard error

**SYNOPSIS**

```
CX      #include <signal.h>

void psiginfo(const siginfo_t *pinfo, const char *message);
void psignal(int signum, const char *message);
```

**DESCRIPTION**

The *psiginfo()* and *psignal()* functions shall write a language-dependent message associated with a signal number to the standard error stream as follows:

- First, if *message* is not a null pointer and is not the empty string, the string pointed to by the *message* argument shall be written, followed by a <colon> and a <space>.
- Then the signal description string associated with *signum* or with the signal indicated by *pinfo* shall be written, followed by a <newline>.

For *psiginfo()*, the application shall ensure that the argument *pinfo* references a valid **siginfo\_t** structure. For *psignal()*, if *signum* is not a valid signal number, the behavior is implementation-defined.

The *psiginfo()* and *psignal()* functions shall not change the orientation of the standard error stream.

The *psiginfo()* and *psignal()* functions shall mark for update the last data modification and last file status change timestamps of the file associated with the standard error stream at some time between their successful completion and *exit()*, *abort()*, or the completion of *fflush()* or *fclose()* on *stderr*.

The *psiginfo()* and *psignal()* functions shall not change the setting of *errno* if successful.

On error, the *psiginfo()* and *psignal()* functions shall set the error indicator for the stream to which *stderr* points, and shall set *errno* to indicate the error.

Since no value is returned, an application wishing to check for error situations should set *errno* to 0, then call *psiginfo()* or *psignal()*, then check *errno*.

**RETURN VALUE**

These functions shall not return a value.

**ERRORS**

Refer to *fputc()*.

**EXAMPLES**

None.

**APPLICATION USAGE**

As an alternative to setting *errno* to zero before the call and checking if it is non-zero afterwards, applications can use *ferror()* to detect whether *psiginfo()* or *psignal()* encountered an error.

An application wishing to use this method to check for error situations should call *clearerr(stderr)* before calling *psiginfo()* or *psignal()*, then if *ferror(stderr)* returns non-zero, the value of *errno* indicates which error occurred.

50853 **RATIONALE**

50854 System V historically has *psignal()* and *psiginfo()* in **<siginfo.h>**. However, the **<siginfo.h>**  
50855 header is not specified in the Base Definitions volume of POSIX.1-2008, and the type **siginfo\_t** is  
50856 defined in **<signal.h>**.

50857 **FUTURE DIRECTIONS**

50858 None.

50859 **SEE ALSO**

50860 *fputc()*, *perror()*, *strsignal()*

50862 **CHANGE HISTORY**

50863 First released in Issue 7.

50864 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0447 [399,428], XSH/TC1-2008/0448  
50865 [399], and XSH/TC1-2008/0449 [399,401] are applied.

## NAME

pthread\_atfork — register fork handlers

## SYNOPSIS

```
#include <pthread.h>

int pthread_atfork(void (*prepare)(void), void (*parent)(void),
void (*child)(void));
```

## DESCRIPTION

The *pthread\_atfork()* function shall declare fork handlers to be called before and after *fork()*, in the context of the thread that called *fork()*. The *prepare* fork handler shall be called before *fork()* processing commences. The *parent* fork handler shall be called after *fork()* processing completes in the parent process. The *child* fork handler shall be called after *fork()* processing completes in the child process. If no handling is desired at one or more of these three points, the corresponding fork handler address(es) may be set to NULL.

If a *fork()* call in a multi-threaded process leads to a *child* fork handler calling any function that is not async-signal-safe, the behavior is undefined. +

The order of calls to *pthread\_atfork()* is significant. The *parent* and *child* fork handlers shall be called in the order in which they were established by calls to *pthread\_atfork()*. The *prepare* fork handlers shall be called in the opposite order.

## RETURN VALUE

Upon successful completion, *pthread\_atfork()* shall return a value of zero; otherwise, an error number shall be returned to indicate the error.

## ERRORS

The *pthread\_atfork()* function shall fail if:

[ENOMEM]      Insufficient table space exists to record the fork handler addresses.

The *pthread\_atfork()* function shall not return an error code of [EINTR].

## EXAMPLES

None.

## APPLICATION USAGE

The original usage pattern envisaged for *pthread\_atfork()* was for the *prepare* fork handler to lock mutexes and other locks, and for the *parent* and *child* handlers to unlock them. However, since all of the relevant unlocking functions, except *sem\_post()*, are not async-signal-safe, this usage results in undefined behavior in the child process unless the only such unlocking function it calls is *sem\_post()*.

## RATIONALE

There are at least two serious problems with the semantics of *fork()* in a multi-threaded program. One problem has to do with state (for example, memory) covered by mutexes. Consider the case where one thread has a mutex locked and the state covered by that mutex is inconsistent while another thread calls *fork()*. In the child, the mutex is in the locked state (locked by a nonexistent thread and thus can never be unlocked). Having the child simply reinitialize the mutex is unsatisfactory since this approach does not resolve the question about how to correct or otherwise deal with the inconsistent state in the child.

It is suggested that programs that use *fork()* call an *exec* function very soon afterwards in the child process, thus resetting all states. In the meantime, only a short list of async-signal-safe library routines are promised to be available.

Unfortunately, this solution does not address the needs of multi-threaded libraries. Application

programs may not be aware that a multi-threaded library is in use, and they feel free to call any number of library routines between the *fork()* and *exec* calls, just as they always have. Indeed, they may be extant single-threaded programs and cannot, therefore, be expected to obey new restrictions imposed by the threads library.

On the other hand, the multi-threaded library needs a way to protect its internal state during *fork()* in case it is re-entered later in the child process. The problem arises especially in multi-threaded I/O libraries, which are almost sure to be invoked between the *fork()* and *exec* calls to effect I/O redirection. The solution may require locking mutex variables during *fork()*, or it may entail simply resetting the state in the child after the *fork()* processing completes.

The *pthread\_atfork()* function was intended to provide multi-threaded libraries with a means to protect themselves from innocent application programs that call *fork()*, and to provide multi-threaded application programs with a standard mechanism for protecting themselves from *fork()* calls in a library routine or the application itself.

The expected usage was that the prepare handler would acquire all mutex locks and the other two fork handlers would release them.

For example, an application could have supplied a prepare routine that acquires the necessary mutexes the library maintains and supplied child and parent routines that release those mutexes, thus ensuring that the child would have got a consistent snapshot of the state of the library (and that no mutexes would have been left stranded). This is good in theory, but in reality not practical. Each and every mutex and lock in the process must be located and locked. Every component of a program including third-party components must participate and they must agree who is responsible for which mutex or lock. This is especially problematic for mutexes and locks in dynamically allocated memory. All mutexes and locks internal to the implementation must be locked, too. This possibly delays the thread calling *fork()* for a long time or even indefinitely since uses of these synchronization objects may not be under control of the application. A final problem to mention here is the problem of locking streams. At least the streams under control of the system (like *stdin*, *stdout*, *stderr*) must be protected by locking the stream with *flockfile()*. But the application itself could have done that, possibly in the same thread calling *fork()*. In this case, the process will deadlock.

Alternatively, some libraries might have been able to supply just a *child* routine that reinitializes the mutexes in the library and all associated states to some known value (for example, what it was when the image was originally executed). This approach is not possible, though, because implementations are allowed to fail *\*\_init()* and *\*\_destroy()* calls for mutexes and locks if the mutex or lock is still locked. In this case, the *child* routine is not able to reinitialize the mutexes and locks.

When *fork()* is called, only the calling thread is duplicated in the child process. Synchronization variables remain in the same state in the child as they were in the parent at the time *fork()* was called. Thus, for example, mutex locks may be held by threads that no longer exist in the child process, and any associated states may be inconsistent. The intention was that the parent process could have avoided this by explicit code that acquires and releases locks critical to the child via *pthread\_atfork()*. In addition, any critical threads would have needed to be recreated and reinitialized to the proper state in the child (also via *pthread\_atfork()*).

A higher-level package may acquire locks on its own data structures before invoking lower-level packages. Under this scenario, the order specified for fork handler calls allows a simple rule of initialization for avoiding package deadlock: a package initializes all packages on which it depends before it calls the *pthread\_atfork()* function for itself.

As explained, there is no suitable solution for functionality which requires non-atomic operations to be protected through mutexes and locks. This is why the POSIX.1 standard since

50959 the 1996 release requires that the child process after *fork()* in a multi-threaded process only calls  
50960 async-signal-safe interfaces.

50961 **FUTURE DIRECTIONS**

50962 The *pthread\_atfork()* function may be formally deprecated (for example, by shading it OB) in a  
50963 future version of this standard.

50967 **CHANGE HISTORY**

50968 First released in Issue 5. Derived from the POSIX Threads Extension.

50969 IEEE PASC Interpretation 1003.1c #4 is applied.

50970 **Issue 6**

50971 The *pthread\_atfork()* function is marked as part of the Threads option.

50972 The **<pthread.h>** header is added to the SYNOPSIS.

50973 **Issue 7**

50974 The *pthread\_atfork()* function is moved from the Threads option to the Base.

50975 SD5-XSH-ERN-145 is applied, updating the RATIONALE.

**NAME**

pthread\_attr\_destroy, pthread\_attr\_init — destroy and initialize the thread attributes object

**SYNOPSIS**

```
#include <pthread.h>

int pthread_attr_destroy(pthread_attr_t *attr);
int pthread_attr_init(pthread_attr_t *attr);
```

**DESCRIPTION**

The *pthread\_attr\_destroy()* function shall destroy a thread attributes object. An implementation may cause *pthread\_attr\_destroy()* to set *attr* to an implementation-defined invalid value. A destroyed *attr* attributes object can be reinitialized using *pthread\_attr\_init()*; the results of otherwise referencing the object after it has been destroyed are undefined.

The *pthread\_attr\_init()* function shall initialize a thread attributes object *attr* with the default value for all of the individual attributes used by a given implementation.

The resulting attributes object (possibly modified by setting individual attribute values) when used by *pthread\_create()* defines the attributes of the thread created. A single attributes object can be used in multiple simultaneous calls to *pthread\_create()*. Results are undefined if *pthread\_attr\_init()* is called specifying an already initialized *attr* attributes object.

The behavior is undefined if the value specified by the *attr* argument to *pthread\_attr\_destroy()* does not refer to an initialized thread attributes object.

**RETURN VALUE**

Upon successful completion, *pthread\_attr\_destroy()* and *pthread\_attr\_init()* shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The *pthread\_attr\_init()* function shall fail if:

[ENOMEM]        Insufficient memory exists to initialize the thread attributes object.

These functions shall not return an error code of [EINTR].

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to support probable future standardization in these areas without requiring that the function itself be changed.

Attributes objects provide clean isolation of the configurable aspects of threads. For example, “stack size” is an important attribute of a thread, but it cannot be expressed portably. When porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects can help by allowing the changes to be isolated in a single place, rather than being spread across every instance of thread creation.

Attributes objects can be used to set up “classes” of threads with similar attributes; for example, “threads with large stacks and high priority” or “threads with minimal stacks”. These classes can be defined in a single place and then referenced wherever threads need to be created. Changes to “class” decisions become straightforward, and detailed analysis of each *pthread\_create()* call is not required.

The attributes objects are defined as opaque types as an aid to extensibility. If these objects had been specified as structures, adding new attributes would force recompilation of all multi-threaded programs when the attributes objects are extended; this might not be possible if different program components were supplied by different vendors.

Additionally, opaque attributes objects present opportunities for improving performance. Argument validity can be checked once when attributes are set, rather than each time a thread is created. Implementations often need to cache kernel objects that are expensive to create. Opaque attributes objects provide an efficient mechanism to detect when cached objects become invalid due to attribute changes.

Since assignment is not necessarily defined on a given opaque type, implementation-defined default values cannot be defined in a portable way. The solution to this problem is to allow attributes objects to be initialized dynamically by attributes object initialization functions, so that default values can be supplied automatically by the implementation.

The following proposal was provided as a suggested alternative to the supplied attributes:

1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to the initialization routines (*pthread\_create()*, *pthread\_mutex\_init()*, *pthread\_cond\_init()*). The parameter containing the flags should be an opaque type for extensibility. If no flags are set in the parameter, then the objects are created with default characteristics. An implementation may specify implementation-defined flag values and associated behavior.
2. If further specialization of mutexes and condition variables is necessary, implementations may specify additional procedures that operate on the **pthread\_mutex\_t** and **pthread\_cond\_t** objects (instead of on attributes objects).

The difficulties with this solution are:

1. A bitmask is not opaque if bits have to be set into bitvector attributes objects using explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an **int**, application programmers need to know the location of each bit. If bits are set or read by encapsulation (that is, *get* and *set* functions), then the bitmask is merely an implementation of attributes objects as currently defined and should not be exposed to the programmer.
2. Many attributes are not Boolean or very small integral values. For example, scheduling policy may be placed in 3-bit or 4-bit, but priority requires 5-bit or more, thereby taking up at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this, the bitmask can only reasonably control whether particular attributes are set or not, and it cannot serve as the repository of the value itself. The value needs to be specified as a function parameter (which is non-extensible), or by setting a structure field (which is non-opaque), or by *get* and *set* functions (making the bitmask a redundant addition to the attributes objects).

Stack size is defined as an optional attribute because the very notion of a stack is inherently machine-dependent. Some implementations may not be able to change the size of the stack, for example, and others may not need to because stack pages may be discontinuous and can be allocated and released on demand.

The attribute mechanism has been designed in large measure for extensibility. Future extensions to the attribute mechanism or to any attributes object defined in this volume of POSIX.1-2008 has to be done with care so as not to affect binary-compatibility.

Attributes objects, even if allocated by means of dynamic allocation functions such as *malloc()*,

may have their size fixed at compile time. This means, for example, a *pthread\_create()* in an implementation with extensions to **pthread\_attr\_t** cannot look beyond the area that the binary application assumes is valid. This suggests that implementations should maintain a size field in the attributes object, as well as possibly version information, if extensions in different directions (possibly by different vendors) are to be accommodated.

If an implementation detects that the value specified by the *attr* argument to *pthread\_attr\_destroy()* does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *attr* argument to *pthread\_attr\_init()* refers to an already initialized thread attributes object, it is recommended that the function should fail and report an [EBUSY] error.

#### **FUTURE DIRECTIONS**

None.

#### **SEE ALSO**

*pthread\_attr\_getstacksize()*, *pthread\_attr\_getdetachstate()*, *pthread\_create()*

XBD <pthread.h>

#### **CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### **Issue 6**

The *pthread\_attr\_destroy()* and *pthread\_attr\_init()* functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1 #107 is applied, noting that the effect of initializing an already initialized thread attributes object is undefined.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/71 is applied, updating the ERRORS section to add the optional [EINVAL] error for the *pthread\_attr\_destroy()* function, and the optional [EBUSY] error for the *pthread\_attr\_init()* function.

#### **Issue 7**

The *pthread\_attr\_destroy()* and *pthread\_attr\_init()* functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

The [EBUSY] error for an already initialized thread attributes object is removed; this condition results in undefined behavior.

51099 **NAME**

51100 pthread\_attr\_getdetachstate, pthread\_attr\_setdetachstate — get and set the detachstate attribute

51101 **SYNOPSIS**

```
51102 #include <pthread.h>
51103 int pthread_attr_getdetachstate(const pthread_attr_t *attr,
51104 int *detachstate);
51105 int pthread_attr_setdetachstate(pthread_attr_t *attr, int detachstate);
```

51106 **DESCRIPTION**

51107 The *detachstate* attribute controls whether the thread is created in a detached state. If the thread  
51108 is created detached, then use of the ID of the newly created thread by the *pthread\_detach()* or  
51109 *pthread\_join()* function is an error.

51110 The *pthread\_attr\_getdetachstate()* and *pthread\_attr\_setdetachstate()* functions, respectively, shall get  
51111 and set the *detachstate* attribute in the *attr* object.

51112 For *pthread\_attr\_getdetachstate()*, *detachstate* shall be set to either  
51113 PTHREAD\_CREATE\_DETACHED or PTHREAD\_CREATE\_JOINABLE.

51114 For *pthread\_attr\_setdetachstate()*, the application shall set *detachstate* to either  
51115 PTHREAD\_CREATE\_DETACHED or PTHREAD\_CREATE\_JOINABLE.

51116 A value of PTHREAD\_CREATE\_DETACHED shall cause all threads created with *attr* to be in  
51117 the detached state, whereas using a value of PTHREAD\_CREATE\_JOINABLE shall cause all  
51118 threads created with *attr* to be in the joinable state. The default value of the *detachstate* attribute  
51119 shall be PTHREAD\_CREATE\_JOINABLE.

51120 The behavior is undefined if the value specified by the *attr* argument to  
51121 *pthread\_attr\_getdetachstate()* or *pthread\_attr\_setdetachstate()* does not refer to an initialized thread  
51122 attributes object.

51123 **RETURN VALUE**

51124 Upon successful completion, *pthread\_attr\_getdetachstate()* and *pthread\_attr\_setdetachstate()* shall  
51125 return a value of 0; otherwise, an error number shall be returned to indicate the error.

51126 The *pthread\_attr\_getdetachstate()* function stores the value of the *detachstate* attribute in *detachstate*  
51127 if successful.

51128 **ERRORS**

51129 The *pthread\_attr\_setdetachstate()* function shall fail if:

51130 [EINVAL] The value of *detachstate* was not valid

51131 These functions shall not return an error code of [EINTR].

51132 **EXAMPLES**

51133 **Retrieving the detachstate Attribute**

51134 This example shows how to obtain the *detachstate* attribute of a thread attribute object.

```
51135 #include <pthread.h>
51136 pthread_attr_t thread_attr;
51137 int detachstate;
51138 int rc;
51139 /* code initializing thread_attr */
51140 ...
```

```

51141     rc = pthread_attr_getdetachstate (&thread_attr, &detachstate);
51142     if (rc!=0) {
51143         /* handle error */
51144         ...
51145     }
51146     else {
51147         /* legal values for detachstate are:
51148          * PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE
51149          */
51150         ...
51151     }

```

**APPLICATION USAGE**

None.

**RATIONALE**

If an implementation detects that the value specified by the *attr* argument to *pthread\_attr\_getdetachstate()* or *pthread\_attr\_setdetachstate()* does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*pthread\_attr\_destroy()*, *pthread\_attr\_getstacksize()*, *pthread\_create()*

XBD <pthread.h>

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

The *pthread\_attr\_setdetachstate()* and *pthread\_attr\_getdetachstate()* functions are marked as part of the Threads option.

The normative text is updated to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/72 is applied, adding the example to the EXAMPLES section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/73 is applied, updating the ERRORS section to include the optional [EINVAL] error.

**Issue 7**

The *pthread\_attr\_setdetachstate()* and *pthread\_attr\_getdetachstate()* functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

51178 **NAME**

51179 pthread\_attr\_getguardsize, pthread\_attr\_setguardsize — get and set the thread guardsize  
 51180 attribute

51181 **SYNOPSIS**

```
51182 #include <pthread.h>

51183 int pthread_attr_getguardsize(const pthread_attr_t *restrict attr,
51184                               size_t *restrict guardsize);
51185 int pthread_attr_setguardsize(pthread_attr_t *attr,
51186                               size_t guardsize);
```

51187 **DESCRIPTION**

51188 The *pthread\_attr\_getguardsize()* function shall get the *guardsize* attribute in the *attr* object. This  
 51189 attribute shall be returned in the *guardsize* parameter.

51190 The *pthread\_attr\_setguardsize()* function shall set the *guardsize* attribute in the *attr* object. The new  
 51191 value of this attribute shall be obtained from the *guardsize* parameter. If *guardsize* is zero, a guard  
 51192 area shall not be provided for threads created with *attr*. If *guardsize* is greater than zero, a guard  
 51193 area of at least size *guardsize* bytes shall be provided for each thread created with *attr*.

51194 The *guardsize* attribute controls the size of the guard area for the created thread's stack. The  
 51195 *guardsize* attribute provides protection against overflow of the stack pointer. If a thread's stack is  
 51196 created with guard protection, the implementation allocates extra memory at the overflow end  
 51197 of the stack as a buffer against stack overflow of the stack pointer. If an application overflows  
 51198 into this buffer an error shall result (possibly in a SIGSEGV signal being delivered to the thread).

51199 A conforming implementation may round up the value contained in *guardsize* to a multiple of  
 51200 the configurable system variable {PAGESIZE} (see <sys/mman.h>). If an implementation  
 51201 rounds up the value of *guardsize* to a multiple of {PAGESIZE}, a call to *pthread\_attr\_getguardsize()*  
 51202 specifying *attr* shall store in the *guardsize* parameter the guard size specified by the previous  
 51203 *pthread\_attr\_setguardsize()* function call.

51204 The default value of the *guardsize* attribute is implementation-defined.

51205 If the *stackaddr* attribute has been set (that is, the caller is allocating and managing its own thread  
 51206 stacks), the *guardsize* attribute shall be ignored and no protection shall be provided by the  
 51207 implementation. It is the responsibility of the application to manage stack overflow along with  
 51208 stack allocation and management in this case.

51209 The behavior is undefined if the value specified by the *attr* argument to  
 51210 *pthread\_attr\_getguardsize()* or *pthread\_attr\_setguardsize()* does not refer to an initialized thread  
 51211 attributes object.

51212 **RETURN VALUE**

51213 If successful, the *pthread\_attr\_getguardsize()* and *pthread\_attr\_setguardsize()* functions shall return  
 51214 zero; otherwise, an error number shall be returned to indicate the error.

51215 **ERRORS**

51216 These functions shall fail if:

51217 [EINVAL] The parameter *guardsize* is invalid.

51218 These functions shall not return an error code of [EINTR].

51219 **EXAMPLES**51220 **Retrieving the guardsize Attribute**

51221 This example shows how to obtain the *guardsize* attribute of a thread attribute object.

```
51222 #include <pthread.h>
51223 pthread_attr_t thread_attr;
51224 size_t guardsize;
51225 int rc;
51226
51227 /* code initializing thread_attr */
51228 ...
51229 rc = pthread_attr_getguardsize (&thread_attr, &guardsize);
51230 if (rc != 0) {
51231     /* handle error */
51232     ...
51233 }
51234 else {
51235     if (guardsize > 0) {
51236         /* a guard area of at least guardsize bytes is provided */
51237         ...
51238     }
51239     else {
51240         /* no guard area provided */
51241         ...
51242     }
51243 }
```

51243 **APPLICATION USAGE**

51244 None.

51245 **RATIONALE**

51246 The *guardsize* attribute is provided to the application for two reasons:

- 51247 1. Overflow protection can potentially result in wasted system resources. An application  
51248 that creates a large number of threads, and which knows its threads never overflow their  
51249 stack, can save system resources by turning off guard areas.
- 51250 2. When threads allocate large data structures on the stack, large guard areas may be needed  
51251 to detect stack overflow.

51252 The default size of the guard area is left implementation-defined since on systems supporting  
51253 very large page sizes, the overhead might be substantial if at least one guard page is required by  
51254 default.

51255 If an implementation detects that the value specified by the *attr* argument to  
51256 *pthread\_attr\_getguardsize()* or *pthread\_attr\_setguardsize()* does not refer to an initialized thread  
51257 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

51258 **FUTURE DIRECTIONS**

51259 None.

51260 **SEE ALSO**51261 XBD [<pthread.h>](#), [<sys/mman.h>](#)51262 **CHANGE HISTORY**

51263 First released in Issue 5.

51264 **Issue 6**51265 In the ERRORS section, a third [EINVAL] error condition is removed as it is covered by the  
51266 second error condition.51267 The **restrict** keyword is added to the *pthread\_attr\_getguardsize()* prototype for alignment with the  
51268 ISO/IEC 9899:1999 standard.51269 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/74 is applied, updating the ERRORS  
51270 section to remove the [EINVAL] error ("The attribute *attr* is invalid."), and replacing it with the  
51271 optional [EINVAL] error.51272 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/76 is applied, adding the example to the  
51273 EXAMPLES section.51274 **Issue 7**51275 SD5-XSH-ERN-111 is applied, removing the reference to the *stack* attribute in the DESCRIPTION.51276 SD5-XSH-ERN-175 is applied, updating the DESCRIPTION to note that the default size of the  
51277 guard area is implementation-defined.51278 The *pthread\_attr\_getguardsize()* and *pthread\_attr\_setguardsize()* functions are moved from the XSI  
51279 option to the Base.51280 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
51281 results in undefined behavior.

**51282 NAME**

51283 pthread\_attr\_getinheritsched, pthread\_attr\_setinheritsched — get and set the inheritsched  
 51284 attribute (**REALTIME THREADS**)

**51285 SYNOPSIS**

```
51286 TPS #include <pthread.h>
51287
51287 int pthread_attr_getinheritsched(const pthread_attr_t *restrict attr,
51288 int *restrict inheritsched);
51289 int pthread_attr_setinheritsched(pthread_attr_t *attr,
51290 int inheritsched);
```

**51291 DESCRIPTION**

51292 The *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions, respectively, shall  
 51293 get and set the *inheritsched* attribute in the *attr* argument.

51294 When the attributes objects are used by *pthread\_create()*, the *inheritsched* attribute determines  
 51295 how the other scheduling attributes of the created thread shall be set.

51296 The supported values of *inheritsched* shall be:

**51297 PTHREAD\_INHERIT\_SCHED**

51298 Specifies that the thread scheduling attributes shall be inherited from the creating thread,  
 51299 and the scheduling attributes in this *attr* argument shall be ignored.

**51300 PTHREAD\_EXPLICIT\_SCHED**

51301 Specifies that the thread scheduling attributes shall be set to the corresponding values from  
 51302 this attributes object.

51303 The symbols *PTHREAD\_INHERIT\_SCHED* and *PTHREAD\_EXPLICIT\_SCHED* are defined in  
 51304 the **<pthread.h>** header.

51305 The following thread scheduling attributes defined by POSIX.1-2008 are affected by the  
 51306 *inheritsched* attribute: scheduling policy (*schedpolicy*), scheduling parameters (*schedparam*), and  
 51307 scheduling contention scope (*contentionscope*).

51308 The behavior is undefined if the value specified by the *attr* argument to  
 51309 *pthread\_attr\_getinheritsched()* or *pthread\_attr\_setinheritsched()* does not refer to an initialized  
 51310 thread attributes object.

**51311 RETURN VALUE**

51312 If successful, the *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions shall  
 51313 return zero; otherwise, an error number shall be returned to indicate the error.

**51314 ERRORS**

51315 The *pthread\_attr\_setinheritsched()* function shall fail if:

51316 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

51317 The *pthread\_attr\_setinheritsched()* function may fail if:

51318 [EINVAL] The value of *inheritsched* is not valid.

51319 These functions shall not return an error code of [EINTR].

## EXAMPLES

None.

## APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using *pthread\_create()*. Using these routines does not affect the current running thread.

See [Section 2.9.4](#) (on page 515) for further details on thread scheduling attributes and their default settings.

## RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread\_attr\_getinheritsched()* or *pthread\_attr\_setinheritsched()* does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

## FUTURE DIRECTIONS

None.

## SEE ALSO

*pthread\_attr\_getschedparam()*, *pthread\_create()*

XBD [<pthread.h>](#), [<sched.h>](#)

## CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Marked as part of the Realtime Threads Feature Group.

### Issue 6

The *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions are marked as part of the Threads and Thread Execution Scheduling options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Execution Scheduling option.

The **restrict** keyword is added to the *pthread\_attr\_getinheritsched()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/75 is applied, clarifying the values of *inheritsched* in the DESCRIPTION and adding two optional [EINVAL] errors to the ERRORS section for checking when *attr* refers to an uninitialized thread attribute object.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/77 is applied, adding a reference to [Section 2.9.4](#) (on page 515) in the APPLICATION USAGE section.

### Issue 7

The *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions are marked only as part of the Thread Execution Scheduling option as the Threads option is now part of the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0450 [314] is applied.

**51359 NAME**

51360 pthread\_attr\_getschedparam, pthread\_attr\_setschedparam — get and set the schedparam  
51361 attribute

**51362 SYNOPSIS**

```
51363 #include <pthread.h>

51364 int pthread_attr_getschedparam(const pthread_attr_t *restrict attr,
51365                               struct sched_param *restrict param);
51366 int pthread_attr_setschedparam(pthread_attr_t *restrict attr,
51367                               const struct sched_param *restrict param);
```

**51368 DESCRIPTION**

51369 The *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions, respectively, shall  
51370 get and set the scheduling parameter attributes in the *attr* argument. The contents of the *param*  
51371 structure are defined in the **<sched.h>** header. For the SCHED\_FIFO and SCHED\_RR policies,  
51372 the only required member of *param* is *sched\_priority*.

51373 TSP For the SCHED\_SPORADIC policy, the required members of the *param* structure are  
51374 *sched\_priority*, *sched\_ss\_low\_priority*, *sched\_ss\_repl\_period*, *sched\_ss\_init\_budget*, and  
51375 *sched\_ss\_max\_repl*. The specified *sched\_ss\_repl\_period* must be greater than or equal to the  
51376 specified *sched\_ss\_init\_budget* for the function to succeed; if it is not, then the function shall fail.  
51377 The value of *sched\_ss\_max\_repl* shall be within the inclusive range [1, {SS\_REPL\_MAX}] for the  
51378 function to succeed; if not, the function shall fail. It is unspecified whether the  
51379 *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values are stored as provided by this function or are  
51380 rounded to align with the resolution of the clock being used.

51381 The behavior is undefined if the value specified by the *attr* argument to  
51382 *pthread\_attr\_getschedparam()* or *pthread\_attr\_setschedparam()* does not refer to an initialized thread  
51383 attributes object.

**51384 RETURN VALUE**

51385 If successful, the *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions shall  
51386 return zero; otherwise, an error number shall be returned to indicate the error.

**51387 ERRORS**

51388 The *pthread\_attr\_setschedparam()* function shall fail if:

51389 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

51390 The *pthread\_attr\_setschedparam()* function may fail if:

51391 [EINVAL] The value of *param* is not valid.

51392 These functions shall not return an error code of [EINTR].

**51393 EXAMPLES**

51394 None.

**51395 APPLICATION USAGE**

51396 After these attributes have been set, a thread can be created with the specified attributes using  
51397 *pthread\_create()*. Using these routines does not affect the current running thread.

**51398 RATIONALE**

51399 If an implementation detects that the value specified by the *attr* argument to  
51400 *pthread\_attr\_getschedparam()* or *pthread\_attr\_setschedparam()* does not refer to an initialized thread  
51401 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

51402 **FUTURE DIRECTIONS**

51403 None.

51404 **SEE ALSO**51405 *pthread\_attr\_destroy()*, *pthread\_attr\_getscope()*, *pthread\_attr\_getinheritsched()*,  
51406 *pthread\_attr\_getschedpolicy()*, *pthread\_create()*

51407 XBD &lt;pthread.h&gt;, &lt;sched.h&gt;

51408 **CHANGE HISTORY**

51409 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

51410 **Issue 6**51411 The *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions are marked as part  
51412 of the Threads option.

51413 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

51414 The **restrict** keyword is added to the *pthread\_attr\_getschedparam()* and  
51415 *pthread\_attr\_setschedparam()* prototypes for alignment with the ISO/IEC 9899:1999 standard.51416 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/78 is applied, updating the ERRORS  
51417 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute  
51418 object.51419 **Issue 7**51420 The *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions are moved from the  
51421 Threads option to the Base.51422 Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements  
51423 for the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values.51424 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
51425 results in undefined behavior.

51426 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0451 [314] is applied.

51427 **NAME**

51428 pthread\_attr\_getschedpolicy, pthread\_attr\_setschedpolicy — get and set the schedpolicy  
 51429 attribute (**REALTIME THREADS**)

51430 **SYNOPSIS**

```
51431 TPS    #include <pthread.h>
51432
51432    int pthread_attr_getschedpolicy(const pthread_attr_t *restrict attr,
51433                                   int *restrict policy);
51434    int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);
```

51435 **DESCRIPTION**

51436 The *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions, respectively, shall  
 51437 get and set the *schedpolicy* attribute in the *attr* argument.

51438 The supported values of *policy* shall include SCHED\_FIFO, SCHED\_RR, and SCHED\_OTHER,  
 51439 which are defined in the **<sched.h>** header. When threads executing with the scheduling policy  
 51440 TSP SCHED\_FIFO, SCHED\_RR, or SCHED\_SPORADIC are waiting on a mutex, they shall acquire  
 51441 the mutex in priority order when the mutex is unlocked.

51442 The behavior is undefined if the value specified by the *attr* argument to  
 51443 *pthread\_attr\_getschedpolicy()* or *pthread\_attr\_setschedpolicy()* does not refer to an initialized thread  
 51444 attributes object.

51445 **RETURN VALUE**

51446 If successful, the *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions shall  
 51447 return zero; otherwise, an error number shall be returned to indicate the error.

51448 **ERRORS**

51449 The *pthread\_attr\_setschedpolicy()* function shall fail if:

51450 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

51451 The *pthread\_attr\_setschedpolicy()* function may fail if:

51452 [EINVAL] The value of *policy* is not valid.

51453 These functions shall not return an error code of [EINTR].

51454 **EXAMPLES**

51455 None.

51456 **APPLICATION USAGE**

51457 After these attributes have been set, a thread can be created with the specified attributes using  
 51458 *pthread\_create()*. Using these routines does not affect the current running thread.

51459 See [Section 2.9.4](#) (on page 515) for further details on thread scheduling attributes and their  
 51460 default settings.

51461 **RATIONALE**

51462 If an implementation detects that the value specified by the *attr* argument to  
 51463 *pthread\_attr\_getschedpolicy()* or *pthread\_attr\_setschedpolicy()* does not refer to an initialized thread  
 51464 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

51465 **FUTURE DIRECTIONS**

51466 None.

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Marked as part of the Realtime Threads Feature Group.

**Issue 6**

The *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions are marked as part of the Threads and Thread Execution Scheduling options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Execution Scheduling option.

The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread\_attr\_getschedpolicy()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/79 is applied, adding a reference to [Section 2.9.4](#) (on page 515) in the APPLICATION USAGE section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/80 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

**Issue 7**

The *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions are marked only as part of the Thread Execution Scheduling option as the Threads option is now part of the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0452 [314] is applied.

**51493 NAME**

51494 pthread\_attr\_getscope, pthread\_attr\_setscope — get and set the contentionscope attribute  
 51495 (REALTIME THREADS)

**51496 SYNOPSIS**

```
51497 TPS #include <pthread.h>
51498
51498 int pthread_attr_getscope(const pthread_attr_t *restrict attr,
51499 int *restrict contentionscope);
51500
51500 int pthread_attr_setscope(pthread_attr_t *attr, int contentionscope);
```

**51501 DESCRIPTION**

51502 The *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions, respectively, shall get and set  
 51503 the *contentionscope* attribute in the *attr* object.

51504 The *contentionscope* attribute may have the values PTHREAD\_SCOPE\_SYSTEM, signifying  
 51505 system scheduling contention scope, or PTHREAD\_SCOPE\_PROCESS, signifying process  
 51506 scheduling contention scope. The symbols PTHREAD\_SCOPE\_SYSTEM and  
 51507 PTHREAD\_SCOPE\_PROCESS are defined in the **<pthread.h>** header.

51508 The behavior is undefined if the value specified by the *attr* argument to *pthread\_attr\_getscope()* or  
 51509 *pthread\_attr\_setscope()* does not refer to an initialized thread attributes object.

**51510 RETURN VALUE**

51511 If successful, the *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions shall return zero;  
 51512 otherwise, an error number shall be returned to indicate the error.

**51513 ERRORS**

51514 The *pthread\_attr\_setscope()* function shall fail if:

51515 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

51516 The *pthread\_attr\_setscope()* function may fail if:

51517 [EINVAL] The value of *contentionscope* is not valid.

51518 These functions shall not return an error code of [EINTR].

**51519 EXAMPLES**

51520 None.

**51521 APPLICATION USAGE**

51522 After these attributes have been set, a thread can be created with the specified attributes using  
 51523 *pthread\_create()*. Using these routines does not affect the current running thread.

51524 See [Section 2.9.4](#) (on page 515) for further details on thread scheduling attributes and their  
 51525 default settings.

**51526 RATIONALE**

51527 If an implementation detects that the value specified by the *attr* argument to  
 51528 *pthread\_attr\_getscope()* or *pthread\_attr\_setscope()* does not refer to an initialized thread attributes  
 51529 object, it is recommended that the function should fail and report an [EINVAL] error.

**51530 FUTURE DIRECTIONS**

51531 None.

**SEE ALSO**

*pthread\_attr\_destroy()*, *pthread\_attr\_getinheritsched()*, *pthread\_attr\_getschedpolicy()*,  
*pthread\_attr\_getschedparam()*, *pthread\_create()*

XBD **<pthread.h>**, **<sched.h>**

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Marked as part of the Realtime Threads Feature Group.

**Issue 6**

The *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions are marked as part of the Threads and Thread Execution Scheduling options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Execution Scheduling option.

The **restrict** keyword is added to the *pthread\_attr\_getscope()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/81 is applied, adding a reference to [Section 2.9.4](#) (on page 515) in the APPLICATION USAGE section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/82 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

**Issue 7**

The *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions are marked only as part of the Thread Execution Scheduling option as the Threads option is now part of the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0453 [314] is applied.

**NAME**

pthread\_attr\_getstack, pthread\_attr\_setstack — get and set stack attributes

**SYNOPSIS**

```
TSA TSS #include <pthread.h>
```

```
int pthread_attr_getstack(const pthread_attr_t *restrict attr,
    void **restrict stackaddr, size_t *restrict stacksize);
int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,
    size_t stacksize);
```

**DESCRIPTION**

The *pthread\_attr\_getstack()* and *pthread\_attr\_setstack()* functions, respectively, shall get and set the thread creation stack attributes *stackaddr* and *stacksize* in the *attr* object.

The stack attributes specify the area of storage to be used for the created thread's stack. The base (lowest addressable byte) of the storage shall be *stackaddr*, and the size of the storage shall be *stacksize* bytes. The *stacksize* shall be at least {PTHREAD\_STACK\_MIN}. The *pthread\_attr\_setstack()* function may fail with [EINVAL] if *stackaddr* does not meet implementation-defined alignment requirements. All pages within the stack described by *stackaddr* and *stacksize* shall be both readable and writable by the thread.

If the *pthread\_attr\_getstack()* function is called before the *stackaddr* attribute has been set, the behavior is unspecified.

The behavior is undefined if the value specified by the *attr* argument to *pthread\_attr\_getstack()* or *pthread\_attr\_setstack()* does not refer to an initialized thread attributes object.

**RETURN VALUE**

Upon successful completion, these functions shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

The *pthread\_attr\_getstack()* function shall store the stack attribute values in *stackaddr* and *stacksize* if successful.

**ERRORS**

The *pthread\_attr\_setstack()* function shall fail if:

[EINVAL] The value of *stacksize* is less than {PTHREAD\_STACK\_MIN} or exceeds an implementation-defined limit.

The *pthread\_attr\_setstack()* function may fail if:

[EINVAL] The value of *stackaddr* does not have proper alignment to be used as a stack, or ((**char** \*)*stackaddr* + *stacksize*) lacks proper alignment.

[EACCES] The stack page(s) described by *stackaddr* and *stacksize* are not both readable and writable by the thread.

These functions shall not return an error code of [EINTR].

## EXAMPLES

None.

## APPLICATION USAGE

These functions are appropriate for use by applications in an environment where the stack for a thread must be placed in some particular region of memory.

While it might seem that an application could detect stack overflow by providing a protected page outside the specified stack region, this cannot be done portably. Implementations are free to place the thread's initial stack pointer anywhere within the specified region to accommodate the machine's stack pointer behavior and allocation requirements. Furthermore, on some architectures, such as the IA-64, "overflow" might mean that two separate stack pointers allocated within the region will overlap somewhere in the middle of the region.

After a successful call to *pthread\_attr\_setstack()*, the storage area specified by the *stackaddr* parameter is under the control of the implementation, as described in [Section 2.9.8](#) (on page 522).

The specification of the *stackaddr* attribute presents several ambiguities that make portable use of these functions impossible. For example, the standard allows implementations to impose arbitrary alignment requirements on *stackaddr*. Applications cannot assume that a buffer obtained from *malloc()* is suitably aligned. Note that although the *stacksize* value passed to *pthread\_attr\_setstack()* must satisfy alignment requirements, the same is not true for *pthread\_attr\_setstacksize()* where the implementation must increase the specified size if necessary to achieve the proper alignment.

## RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread\_attr\_getstack()* or *pthread\_attr\_setstack()* does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 6. Developed as part of the XSI option and brought into the BASE by IEEE PASC Interpretation 1003.1 #101.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/83 is applied, updating the APPLICATION USAGE section to refer to [Section 2.9.8](#) (on page 522).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC/D6/84 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

## Issue 7

SD5-XSH-ERN-66 is applied, correcting the use of *attr* in the [EINVAL] error condition.

Austin Group Interpretation 1003.1-2001 #057 is applied, clarifying the behavior if the function is called before the *stackaddr* attribute is set.

SD5-XSH-ERN-157 is applied, updating the APPLICATION USAGE section.

The description of the *stackaddr* attribute is updated in the DESCRIPTION and APPLICATION USAGE sections.

51637  
51638

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

51639 **NAME**

51640 pthread\_attr\_getstacksize, pthread\_attr\_setstacksize — get and set the stacksize attribute

51641 **SYNOPSIS**

```
51642 TSS      #include <pthread.h>
51643
51643      int pthread_attr_getstacksize(const pthread_attr_t *restrict attr,
51644                                   size_t *restrict stacksize);
51645      int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);
```

51646 **DESCRIPTION**

51647 The *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* functions, respectively, shall get and  
51648 set the thread creation *stacksize* attribute in the *attr* object.

51649 The *stacksize* attribute shall define the minimum stack size (in bytes) allocated for the created  
51650 threads stack.

51651 The behavior is undefined if the value specified by the *attr* argument to  
51652 *pthread\_attr\_getstacksize()* or *pthread\_attr\_setstacksize()* does not refer to an initialized thread  
51653 attributes object.

51654 **RETURN VALUE**

51655 Upon successful completion, *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* shall  
51656 return a value of 0; otherwise, an error number shall be returned to indicate the error.

51657 The *pthread\_attr\_getstacksize()* function stores the *stacksize* attribute value in *stacksize* if  
51658 successful.

51659 **ERRORS**

51660 The *pthread\_attr\_setstacksize()* function shall fail if:

51661 [EINVAL] The value of *stacksize* is less than {PTHREAD\_STACK\_MIN} or exceeds a  
51662 system-imposed limit.

51663 These functions shall not return an error code of [EINTR].

51664 **EXAMPLES**

51665 None.

51666 **APPLICATION USAGE**

51667 None.

51668 **RATIONALE**

51669 If an implementation detects that the value specified by the *attr* argument to  
51670 *pthread\_attr\_getstacksize()* or *pthread\_attr\_setstacksize()* does not refer to an initialized thread  
51671 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

51672 **FUTURE DIRECTIONS**

51673 None.

51674 **SEE ALSO**

51675 *pthread\_attr\_destroy()*, *pthread\_attr\_getdetachstate()*, *pthread\_create()*

51676 XBD <limits.h>, <pthread.h>

51677 **CHANGE HISTORY**

51678 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

51679 The *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* functions are marked as part of the  
51680 Threads and Thread Stack Size Attribute options.  
51681

51682 The **restrict** keyword is added to the *pthread\_attr\_getstacksize()* prototype for alignment with the  
51683 ISO/IEC 9899:1999 standard.

51684 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/43 is applied, correcting the margin code  
51685 in the SYNOPSIS from TSA to TSS and updating the CHANGE HISTORY from “Thread Stack  
51686 Address Attribute” option to “Thread Stack Size Attribute” option.

51687 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/87 is applied, updating the ERRORS  
51688 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute  
51689 object.

**Issue 7**

51690 The *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* functions are marked only as part of  
51691 the Thread Stack Size Attribute option as the Threads option is now part of the Base.  
51692

51693 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
51694 results in undefined behavior.

51695 **NAME**

51696 pthread\_attr\_init — initialize the thread attributes object

51697 **SYNOPSIS**

51698 #include <pthread.h>

51699 int pthread\_attr\_init(pthread\_attr\_t \*attr);

51700 **DESCRIPTION**

51701 Refer to *pthread\_attr\_destroy()*.

51702 **NAME**

51703 pthread\_attr\_setdetachstate — set the detachstate attribute

51704 **SYNOPSIS**

51705 #include &lt;pthread.h&gt;

51706 int pthread\_attr\_setdetachstate(pthread\_attr\_t \*attr, int detachstate);

51707 **DESCRIPTION**51708 Refer to *pthread\_attr\_getdetachstate()*.

51709 **NAME**

51710 pthread\_attr\_setguardsize — set the thread guardsize attribute

51711 **SYNOPSIS**

51712 #include &lt;pthread.h&gt;

51713 int pthread\_attr\_setguardsize(pthread\_attr\_t \*attr,  
51714 size\_t guardsize);51715 **DESCRIPTION**51716 Refer to *pthread\_attr\_getguardsize()*.

51717 **NAME**51718 pthread\_attr\_setinheritsched — set the inheritsched attribute (**REALTIME THREADS**)51719 **SYNOPSIS**

```
51720 TPS    #include <pthread.h>
51721
51721    int pthread_attr_setinheritsched(pthread_attr_t *attr,
51722    int inheritsched);
```

51723 **DESCRIPTION**51724 Refer to *pthread\_attr\_getinheritsched()*.

51725 **NAME**

51726 pthread\_attr\_setschedparam — set the schedparam attribute

51727 **SYNOPSIS**

51728 #include &lt;pthread.h&gt;

```
51729 int pthread_attr_setschedparam(pthread_attr_t *restrict attr,  
51730                               const struct sched_param *restrict param);
```

51731 **DESCRIPTION**51732 Refer to *pthread\_attr\_getschedparam()*.

51733 **NAME**51734 pthread\_attr\_setschedpolicy — set the schedpolicy attribute (**REALTIME THREADS**)51735 **SYNOPSIS**

```
51736 TPS    #include <pthread.h>
51737        int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);
```

51738 **DESCRIPTION**51739 Refer to *pthread\_attr\_getschedpolicy()*.

51740 **NAME**51741 pthread\_attr\_setscope — set the contention scope attribute (**REALTIME THREADS**)51742 **SYNOPSIS**51743 TPS `#include <pthread.h>`51744 `int pthread_attr_setscope(pthread_attr_t *attr, int contention_scope);`51745 **DESCRIPTION**51746 Refer to *pthread\_attr\_getscope()*.

51747 **NAME**

51748 pthread\_attr\_setstack — set the stack attribute

51749 **SYNOPSIS**51750 TSA TSS `#include <pthread.h>`51751 `int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,`  
51752 `size_t stacksize);`51753 **DESCRIPTION**51754 Refer to *pthread\_attr\_getstack()*.

51755 **NAME**

51756 pthread\_attr\_setstacksize — set the stacksize attribute

51757 **SYNOPSIS**51758 TSS `#include <pthread.h>`51759 `int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);`51760 **DESCRIPTION**51761 Refer to *pthread\_attr\_getstacksize()*.

51762 **NAME**

51763 pthread\_barrier\_destroy, pthread\_barrier\_init — destroy and initialize a barrier object

51764 **SYNOPSIS**

```
51765 #include <pthread.h>
51766 int pthread_barrier_destroy(pthread_barrier_t *barrier);
51767 int pthread_barrier_init(pthread_barrier_t *restrict barrier,
51768     const pthread_barrierattr_t *restrict attr, unsigned count);
```

51769 **DESCRIPTION**

51770 The *pthread\_barrier\_destroy()* function shall destroy the barrier referenced by *barrier* and release  
 51771 any resources used by the barrier. The effect of subsequent use of the barrier is undefined until  
 51772 the barrier is reinitialized by another call to *pthread\_barrier\_init()*. An implementation may use  
 51773 this function to set *barrier* to an invalid value. The results are undefined if  
 51774 *pthread\_barrier\_destroy()* is called when any thread is blocked on the barrier, or if this function is  
 51775 called with an uninitialized barrier.

51776 The *pthread\_barrier\_init()* function shall allocate any resources required to use the barrier  
 51777 referenced by *barrier* and shall initialize the barrier with attributes referenced by *attr*. If *attr* is  
 51778 NULL, the default barrier attributes shall be used; the effect is the same as passing the address of  
 51779 a default barrier attributes object. The results are undefined if *pthread\_barrier\_init()* is called  
 51780 when any thread is blocked on the barrier (that is, has not returned from the  
 51781 *pthread\_barrier\_wait()* call). The results are undefined if a barrier is used without first being  
 51782 initialized. The results are undefined if *pthread\_barrier\_init()* is called specifying an already  
 51783 initialized barrier.

51784 The *count* argument specifies the number of threads that must call *pthread\_barrier\_wait()* before  
 51785 any of them successfully return from the call. The value specified by *count* must be greater than  
 51786 zero.

51787 If the *pthread\_barrier\_init()* function fails, the barrier shall not be initialized and the contents of  
 51788 *barrier* are undefined.

51789 See [Section 2.9.9](#) (on page 523) for further requirements. |

51790 **RETURN VALUE**

51791 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
 51792 be returned to indicate the error.

51793 **ERRORS**

51794 The *pthread\_barrier\_init()* function shall fail if:

51795 [EAGAIN] The system lacks the necessary resources to initialize another barrier.

51796 [EINVAL] The value specified by *count* is equal to zero.

51797 [ENOMEM] Insufficient memory exists to initialize the barrier.

51798 These functions shall not return an error code of [EINTR].

51799 **EXAMPLES**

51800 None.

51801 **APPLICATION USAGE**

51802 None.

51803 **RATIONALE**

51804 If an implementation detects that the value specified by the *barrier* argument to  
 51805 *pthread\_barrier\_destroy()* does not refer to an initialized barrier object, it is recommended that the  
 51806 function should fail and report an [EINVAL] error.

51807 If an implementation detects that the value specified by the *attr* argument to  
 51808 *pthread\_barrier\_init()* does not refer to an initialized barrier attributes object, it is recommended  
 51809 that the function should fail and report an [EINVAL] error.

51810 If an implementation detects that the value specified by the *barrier* argument to  
 51811 *pthread\_barrier\_destroy()* or *pthread\_barrier\_init()* refers to a barrier that is in use (for example, in  
 51812 a *pthread\_barrier\_wait()* call) by another thread, or detects that the value specified by the *barrier*  
 51813 argument to *pthread\_barrier\_init()* refers to an already initialized barrier object, it is  
 51814 recommended that the function should fail and report an [EBUSY] error.

51815 **FUTURE DIRECTIONS**

51816 None.

51817 **SEE ALSO**51818 *pthread\_barrier\_wait()*

51819 XBD &lt;pthread.h&gt;

51820 **CHANGE HISTORY**

51821 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

51822 **Issue 7**

51823 The *pthread\_barrier\_destroy()* and *pthread\_barrier\_init()* functions are moved from the Barriers  
 51824 option to the Base.

51825 The [EINVAL] error for an uninitialized barrier object and an uninitialized barrier attributes  
 51826 object is removed; this condition results in undefined behavior.

51827 The [EBUSY] error for a barrier that is in use or an already initialized barrier object is removed;  
 51828 this condition results in undefined behavior.

**51829 NAME**

51830 pthread\_barrier\_wait — synchronize at a barrier

**51831 SYNOPSIS**

51832 #include <pthread.h>

51833 int pthread\_barrier\_wait(pthread\_barrier\_t \*barrier);

**51834 DESCRIPTION**

51835 The *pthread\_barrier\_wait()* function shall synchronize participating threads at the barrier  
51836 referenced by *barrier*. The calling thread shall block until the required number of threads have  
51837 called *pthread\_barrier\_wait()* specifying the barrier.

51838 When the required number of threads have called *pthread\_barrier\_wait()* specifying the barrier,  
51839 the constant PTHREAD\_BARRIER\_SERIAL\_THREAD shall be returned to one unspecified  
51840 thread and zero shall be returned to each of the remaining threads. At this point, the barrier shall  
51841 be reset to the state it had as a result of the most recent *pthread\_barrier\_init()* function that  
51842 referenced it.

51843 The constant PTHREAD\_BARRIER\_SERIAL\_THREAD is defined in <pthread.h> and its value  
51844 shall be distinct from any other value returned by *pthread\_barrier\_wait()*.

51845 The results are undefined if this function is called with an uninitialized barrier.

51846 If a signal is delivered to a thread blocked on a barrier, upon return from the signal handler the  
51847 thread shall resume waiting at the barrier if the barrier wait has not completed (that is, if the  
51848 required number of threads have not arrived at the barrier during the execution of the signal  
51849 handler); otherwise, the thread shall continue as normal from the completed barrier wait. Until  
51850 the thread in the signal handler returns from it, it is unspecified whether other threads may  
51851 proceed past the barrier once they have all reached it.

51852 A thread that has blocked on a barrier shall not prevent any unblocked thread that is eligible to  
51853 use the same processing resources from eventually making forward progress in its execution.  
51854 Eligibility for processing resources shall be determined by the scheduling policy.

**51855 RETURN VALUE**

51856 Upon successful completion, the *pthread\_barrier\_wait()* function shall return  
51857 PTHREAD\_BARRIER\_SERIAL\_THREAD for a single (arbitrary) thread synchronized at the  
51858 barrier and zero for each of the other threads. Otherwise, an error number shall be returned to  
51859 indicate the error.

**51860 ERRORS**

51861 This function shall not return an error code of [EINTR].

**51862 EXAMPLES**

51863 None.

**51864 APPLICATION USAGE**

51865 Applications using this function may be subject to priority inversion, as discussed in XBD  
51866 [Section 3.291](#) (on page 80).

**51867 RATIONALE**

51868 If an implementation detects that the value specified by the *barrier* argument to  
51869 *pthread\_barrier\_wait()* does not refer to an initialized barrier object, it is recommended that the  
51870 function should fail and report an [EINVAL] error.

51871 **FUTURE DIRECTIONS**

51872 None.

51873 **SEE ALSO**

51874 *pthread\_barrier\_destroy()*

51875 XBD [Section 3.291](#) (on page 80), [Section 4.12](#) (on page 111), [<pthread.h>](#)

51876 **CHANGE HISTORY**

51877 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

51878 In the SYNOPSIS, the inclusion of [<sys/types.h>](#) is no longer required.

51879 **Issue 7**

51880 The *pthread\_barrier\_wait()* function is moved from the Barriers option to the Base.

51881 The [EINVAL] error for an uninitialized barrier object is removed; this condition results in  
51882 undefined behavior.

**51883 NAME**

51884 pthread\_barrierattr\_destroy, pthread\_barrierattr\_init — destroy and initialize the barrier  
 51885 attributes object

**51886 SYNOPSIS**

51887 #include <pthread.h>  
 51888 int pthread\_barrierattr\_destroy(pthread\_barrierattr\_t \*attr);  
 51889 int pthread\_barrierattr\_init(pthread\_barrierattr\_t \*attr);

**51890 DESCRIPTION**

51891 The *pthread\_barrierattr\_destroy()* function shall destroy a barrier attributes object. A destroyed  
 51892 *attr* attributes object can be reinitialized using *pthread\_barrierattr\_init()*; the results of otherwise  
 51893 referencing the object after it has been destroyed are undefined. An implementation may cause  
 51894 *pthread\_barrierattr\_destroy()* to set the object referenced by *attr* to an invalid value.

51895 The *pthread\_barrierattr\_init()* function shall initialize a barrier attributes object *attr* with the  
 51896 default value for all of the attributes defined by the implementation.

51897 If *pthread\_barrierattr\_init()* is called specifying an already initialized *attr* attributes object, the  
 51898 results are undefined.

51899 After a barrier attributes object has been used to initialize one or more barriers, any function  
 51900 affecting the attributes object (including destruction) shall not affect any previously initialized  
 51901 barrier.

51902 The behavior is undefined if the value specified by the *attr* argument to  
 51903 *pthread\_barrierattr\_destroy()* does not refer to an initialized barrier attributes object.

**51904 RETURN VALUE**

51905 If successful, the *pthread\_barrierattr\_destroy()* and *pthread\_barrierattr\_init()* functions shall return  
 51906 zero; otherwise, an error number shall be returned to indicate the error.

**51907 ERRORS**

51908 The *pthread\_barrierattr\_init()* function shall fail if:

51909 [ENOMEM] Insufficient memory exists to initialize the barrier attributes object.

51910 These functions shall not return an error code of [EINTR].

**51911 EXAMPLES**

51912 None.

**51913 APPLICATION USAGE**

51914 None.

**51915 RATIONALE**

51916 If an implementation detects that the value specified by the *attr* argument to  
 51917 *pthread\_barrierattr\_destroy()* does not refer to an initialized barrier attributes object, it is  
 51918 recommended that the function should fail and report an [EINVAL] error.

**51919 FUTURE DIRECTIONS**

51920 None.

**51921 SEE ALSO**

51922 *pthread\_barrierattr\_getpshared()*

51923 XBD <pthread.h>

51924 **CHANGE HISTORY**

51925 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

51926 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

51927 **Issue 7**

51928 The *pthread\_barrierattr\_destroy()* and *pthread\_barrierattr\_init()* functions are moved from the  
51929 Barriers option to the Base.

51930 The [EINVAL] error for an uninitialized barrier attributes object is removed; this condition  
51931 results in undefined behavior.

**51932 NAME**

51933 pthread\_barrierattr\_getpshared, pthread\_barrierattr\_setpshared — get and set the process-  
 51934 shared attribute of the barrier attributes object

**51935 SYNOPSIS**

```
51936 TSH #include <pthread.h>
51937
51937 int pthread_barrierattr_getpshared(const pthread_barrierattr_t
51938     *restrict attr, int *restrict pshared);
51939 int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
51940     int pshared);
```

**51941 DESCRIPTION**

51942 The *pthread\_barrierattr\_getpshared()* function shall obtain the value of the *process-shared* attribute  
 51943 from the attributes object referenced by *attr*. The *pthread\_barrierattr\_setpshared()* function shall  
 51944 set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

51945 The *process-shared* attribute is set to PTHREAD\_PROCESS\_SHARED to permit a barrier to be  
 51946 operated upon by any thread that has access to the memory where the barrier is allocated. See  
 51947 [Section 2.9.9](#) (on page 523) for further requirements. The default value of the attribute shall be  
 51948 PTHREAD\_PROCESS\_PRIVATE. Both constants PTHREAD\_PROCESS\_SHARED and  
 51949 PTHREAD\_PROCESS\_PRIVATE are defined in **<pthread.h>**.

51950 Additional attributes, their default values, and the names of the associated functions to get and  
 51951 set those attribute values are implementation-defined.

51952 The behavior is undefined if the value specified by the *attr* argument to  
 51953 *pthread\_barrierattr\_getpshared()* or *pthread\_barrierattr\_setpshared()* does not refer to an initialized  
 51954 barrier attributes object.

**51955 RETURN VALUE**

51956 If successful, the *pthread\_barrierattr\_getpshared()* function shall return zero and store the value of  
 51957 the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise,  
 51958 an error number shall be returned to indicate the error.

51959 If successful, the *pthread\_barrierattr\_setpshared()* function shall return zero; otherwise, an error  
 51960 number shall be returned to indicate the error.

**51961 ERRORS**

51962 The *pthread\_barrierattr\_setpshared()* function may fail if:

51963 [EINVAL] The new value specified for the *process-shared* attribute is not one of the legal  
 51964 values PTHREAD\_PROCESS\_SHARED or PTHREAD\_PROCESS\_PRIVATE.

51965 These functions shall not return an error code of [EINTR].

**51966 EXAMPLES**

51967 None.

**51968 APPLICATION USAGE**

51969 The *pthread\_barrierattr\_getpshared()* and *pthread\_barrierattr\_setpshared()* functions are part of the  
 51970 Thread Process-Shared Synchronization option and need not be provided on all  
 51971 implementations.

**51972 RATIONALE**

51973 If an implementation detects that the value specified by the *attr* argument to  
 51974 *pthread\_barrierattr\_getpshared()* or *pthread\_barrierattr\_setpshared()* does not refer to an initialized  
 51975 barrier attributes object, it is recommended that the function should fail and report an [EINVAL]

51976 error.

51977 **FUTURE DIRECTIONS**

51978 None.

51979 **SEE ALSO**

51980 *pthread\_barrier\_destroy()*, *pthread\_barrierattr\_destroy()*

51981 XBD <pthread.h>

51982 **CHANGE HISTORY**

51983 First released in Issue 6. Derived from IEEE Std 1003.1j-2000

51984 **Issue 7**

51985 The *pthread\_barrierattr\_getpshared()* and *pthread\_barrierattr\_setpshared()* functions are marked |  
51986 only as part of the Thread Process-Shared Synchronization option as the Threads option is now |  
51987 part of the Base.

51988 The [EINVAL] error for an uninitialized barrier attributes object is removed; this condition  
51989 results in undefined behavior.

51990 **NAME**

51991 pthread\_barrierattr\_init — initialize the barrier attributes object

51992 **SYNOPSIS**

51993 #include &lt;pthread.h&gt;

51994 int pthread\_barrierattr\_init(pthread\_barrierattr\_t \*attr);

51995 **DESCRIPTION**51996 Refer to *pthread\_barrierattr\_destroy()*.

51997 **NAME**

51998 pthread\_barrierattr\_setpshared — set the process-shared attribute of the barrier attributes object

51999 **SYNOPSIS**

```
52000 TSH      #include <pthread.h>
52001          int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
52002          int pshared);
```

52003 **DESCRIPTION**

52004 Refer to *pthread\_barrierattr\_getpshared()*.

52005 **NAME**

52006 pthread\_cancel — cancel execution of a thread

52007 **SYNOPSIS**

52008 #include &lt;pthread.h&gt;

52009 int pthread\_cancel(pthread\_t thread);

52010 **DESCRIPTION**

52011 The *pthread\_cancel()* function shall request that *thread* be canceled. The target thread's  
52012 cancelability state and type determines when the cancellation takes effect. When the cancellation  
52013 is acted on, the cancellation cleanup handlers for *thread* shall be called. When the last  
52014 cancellation cleanup handler returns, the thread-specific data destructor functions shall be called  
52015 for *thread*. When the last destructor function returns, *thread* shall be terminated.

52016 The cancellation processing in the target thread shall run asynchronously with respect to the  
52017 calling thread returning from *pthread\_cancel()*.

52018 **RETURN VALUE**

52019 If successful, the *pthread\_cancel()* function shall return zero; otherwise, an error number shall be  
52020 returned to indicate the error.

52021 **ERRORS**52022 The *pthread\_cancel()* function shall not return an error code of [EINTR].52023 **EXAMPLES**

52024 None.

52025 **APPLICATION USAGE**

52026 None.

52027 **RATIONALE**

52028 Two alternative functions were considered for sending the cancellation notification to a thread.  
52029 One would be to define a new SIGCANCEL signal that had the cancellation semantics when  
52030 delivered; the other was to define the new *pthread\_cancel()* function, which would trigger the  
52031 cancellation semantics.

52032 The advantage of a new signal was that so much of the delivery criteria were identical to that  
52033 used when trying to deliver a signal that making cancellation notification a signal was seen as  
52034 consistent. Indeed, many implementations implement cancellation using a special signal. On the  
52035 other hand, there would be no signal functions that could be used with this signal except  
52036 *pthread\_kill()*, and the behavior of the delivered cancellation signal would be unlike any  
52037 previously existing defined signal.

52038 The benefits of a special function include the recognition that this signal would be defined  
52039 because of the similar delivery criteria and that this is the only common behavior between a  
52040 cancellation request and a signal. In addition, the cancellation delivery mechanism does not  
52041 have to be implemented as a signal. There are also strong, if not stronger, parallels with  
52042 language exception mechanisms than with signals that are potentially obscured if the delivery  
52043 mechanism is visibly closer to signals.

52044 In the end, it was considered that as there were so many exceptions to the use of the new signal  
52045 with existing signals functions it would be misleading. A special function has resolved this  
52046 problem. This function was carefully defined so that an implementation wishing to provide the  
52047 cancellation functions on top of signals could do so. The special function also means that  
52048 implementations are not obliged to implement cancellation with signals.

52049 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
52050 that the function should fail and report an [ESRCH] error.

52051 **FUTURE DIRECTIONS**

52052 None.

52053 **SEE ALSO**52054 *pthread\_exit()*, *pthread\_cond\_timedwait()*, *pthread\_join()*, *pthread\_setcancelstate()*

52055 XBD &lt;pthread.h&gt;

52056 **CHANGE HISTORY**

52057 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52058 **Issue 6**52059 The *pthread\_cancel()* function is marked as part of the Threads option.52060 **Issue 7**52061 The *pthread\_cancel()* function is moved from the Threads option to the Base.

52062 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

**NAME**

pthread\_cleanup\_pop, pthread\_cleanup\_push — establish cancellation handlers

**SYNOPSIS**

```
#include <pthread.h>

void pthread_cleanup_pop(int execute);
void pthread_cleanup_push(void (*routine)(void*), void *arg);
```

**DESCRIPTION**

The *pthread\_cleanup\_pop()* function shall remove the routine at the top of the calling thread's cancellation cleanup stack and optionally invoke it (if *execute* is non-zero).

The *pthread\_cleanup\_push()* function shall push the specified cancellation cleanup handler *routine* onto the calling thread's cancellation cleanup stack. The cancellation cleanup handler shall be popped from the cancellation cleanup stack and invoked with the argument *arg* when:

- The thread exits (that is, calls *pthread\_exit()*).
- The thread acts upon a cancellation request.
- The thread calls *pthread\_cleanup\_pop()* with a non-zero *execute* argument.

It is unspecified whether *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* are macros or functions. If a macro definition is suppressed in order to access an actual function, or a program defines an external identifier with any of these names, the behavior is undefined. The application shall ensure that they appear as statements, and in pairs within the same lexical scope (that is, the *pthread\_cleanup\_push()* macro may be thought to expand to a token list whose first token is '`{`' with *pthread\_cleanup\_pop()* expanding to a token list whose last token is the corresponding '`}`').

The effect of calling *longjmp()* or *siglongjmp()* is undefined if there have been any calls to *pthread\_cleanup\_push()* or *pthread\_cleanup\_pop()* made without the matching call since the jump buffer was filled. The effect of calling *longjmp()* or *siglongjmp()* from inside a cancellation cleanup handler is also undefined unless the jump buffer was also filled in the cancellation cleanup handler.

The effect of the use of **return**, **break**, **continue**, and **goto** to prematurely leave a code block described by a pair of *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* functions calls is undefined.

**RETURN VALUE**

The *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* functions shall not return a value.

**ERRORS**

No errors are defined.

These functions shall not return an error code of [EINTR].

**EXAMPLES**

The following is an example using thread primitives to implement a cancelable, writers-priority read-write lock:

```
typedef struct {
    pthread_mutex_t lock;
    pthread_cond_t rcond,
        wcond;
    int lock_count; /* < 0 .. Held by writer. */
                  /* > 0 .. Held by lock_count readers. */
                  /* = 0 .. Held by nobody. */
```

```
52108     int waiting_writers; /* Count of waiting writers. */
52109 } rwlock;

52110 void
52111 waiting_reader_cleanup(void *arg)
52112 {
52113     rwlock *l;
52114
52115     l = (rwlock *) arg;
52116     pthread_mutex_unlock(&l->lock);
52117 }
52118 void
52119 lock_for_read(rwlock *l)
52120 {
52121     pthread_mutex_lock(&l->lock);
52122     pthread_cleanup_push(waiting_reader_cleanup, l);
52123     while ((l->lock_count < 0) || (l->waiting_writers != 0))
52124         pthread_cond_wait(&l->rcond, &l->lock);
52125     l->lock_count++;
52126     /*
52127      * Note the pthread_cleanup_pop executes
52128      * waiting_reader_cleanup.
52129      */
52130     pthread_cleanup_pop(1);
52131 }
52132 void
52133 release_read_lock(rwlock *l)
52134 {
52135     pthread_mutex_lock(&l->lock);
52136     if (--l->lock_count == 0)
52137         pthread_cond_signal(&l->wcond);
52138     pthread_mutex_unlock(&l->lock);
52139 }
52140 void
52141 waiting_writer_cleanup(void *arg)
52142 {
52143     rwlock *l;
52144
52145     l = (rwlock *) arg;
52146     if (--l->waiting_writers == 0) && (l->lock_count >= 0) {
52147         /*
52148          * This only happens if we have been canceled. If the
52149          * lock is not held by a writer, there may be readers who
52150          * were blocked because waiting_writers was positive; they
52151          * can now be unblocked.
52152          */
52153         pthread_cond_broadcast(&l->rcond);
52154     }
52155     pthread_mutex_unlock(&l->lock);
52156 }
52157 void
```

```
52156     lock_for_write(rwlock *l)
52157     {
52158         pthread_mutex_lock(&l->lock);
52159         l->waiting_writers++;
52160         pthread_cleanup_push(waiting_writer_cleanup, l);
52161         while (l->lock_count != 0)
52162             pthread_cond_wait(&l->wcond, &l->lock);
52163         l->lock_count = -1;
52164         /*
52165          * Note the pthread_cleanup_pop executes
52166          * waiting_writer_cleanup.
52167          */
52168         pthread_cleanup_pop(1);
52169     }
52170
52171 void
52172 release_write_lock(rwlock *l)
52173 {
52174     pthread_mutex_lock(&l->lock);
52175     l->lock_count = 0;
52176     if (l->waiting_writers == 0)
52177         pthread_cond_broadcast(&l->rcond);
52178     else
52179         pthread_cond_signal(&l->wcond);
52180     pthread_mutex_unlock(&l->lock);
52181 }
52182 /*
52183  * This function is called to initialize the read/write lock.
52184  */
52185 void
52186 initialize_rwlock(rwlock *l)
52187 {
52188     pthread_mutex_init(&l->lock, pthread_mutexattr_default);
52189     pthread_cond_init(&l->wcond, pthread_condattr_default);
52190     pthread_cond_init(&l->rcond, pthread_condattr_default);
52191     l->lock_count = 0;
52192     l->waiting_writers = 0;
52193 }
52194
52195 reader_thread()
52196 {
52197     lock_for_read(&lock);
52198     pthread_cleanup_push(release_read_lock, &lock);
52199     /*
52200      * Thread has read lock.
52201      */
52202     pthread_cleanup_pop(1);
52203 }
52204
52205 writer_thread()
52206 {
52207     lock_for_write(&lock);
52208     pthread_cleanup_push(release_write_lock, &lock);
```

```

52206      /*
52207      * Thread has write lock.
52208      */
52209      pthread_cleanup_pop(1);
52210  }

```

## APPLICATION USAGE

The two routines that push and pop cancellation cleanup handlers, *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()*, can be thought of as left and right-parentheses. They always need to be matched.

## RATIONALE

The restriction that the two routines that push and pop cancellation cleanup handlers, *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()*, have to appear in the same lexical scope allows for efficient macro or compiler implementations and efficient storage management. A sample implementation of these routines as macros might look like this:

```

52220  #define pthread_cleanup_push(rtn,arg) { \
52221      struct _pthread_handler_rec __cleanup_handler, *__head; \
52222      __cleanup_handler.rtn = rtn; \
52223      __cleanup_handler.arg = arg; \
52224      (void) pthread_getspecific(_pthread_handler_key, &__head); \
52225      __cleanup_handler.next = *__head; \
52226      *__head = &__cleanup_handler;
52227
52228  #define pthread_cleanup_pop(ex) \
52229      *__head = __cleanup_handler.next; \
52230      if (ex) (*__cleanup_handler.rtn)(__cleanup_handler.arg); \
52231  }

```

A more ambitious implementation of these routines might do even better by allowing the compiler to note that the cancellation cleanup handler is a constant and can be expanded inline.

This volume of POSIX.1-2008 currently leaves unspecified the effect of calling *longjmp()* from a signal handler executing in a POSIX System Interfaces function. If an implementation wants to allow this and give the programmer reasonable behavior, the *longjmp()* function has to call all cancellation cleanup handlers that have been pushed but not popped since the time *setjmp()* was called.

Consider a multi-threaded function called by a thread that uses signals. If a signal were delivered to a signal handler during the operation of *qsort()* and that handler were to call *longjmp()* (which, in turn, did *not* call the cancellation cleanup handlers) the helper threads created by the *qsort()* function would not be canceled. Instead, they would continue to execute and write into the argument array even though the array might have been popped off the stack.

Note that the specified cleanup handling mechanism is especially tied to the C language and, while the requirement for a uniform mechanism for expressing cleanup is language-independent, the mechanism used in other languages may be quite different. In addition, this mechanism is really only necessary due to the lack of a real exception mechanism in the C language, which would be the ideal solution.

There is no notion of a cancellation cleanup-safe function. If an application has no cancellation points in its signal handlers, blocks any signal whose handler may have cancellation points while calling async-unsafe functions, or disables cancellation while calling async-unsafe functions, all functions may be safely called from cancellation cleanup routines.

52256 XBD **<pthread.h>**

**52257 CHANGE HISTORY**

52258 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**52259 Issue 6**

52260 The *pthread\_cleanup\_pop()* and *pthread\_cleanup\_push()* functions are marked as part of the  
52261 Threads option.

52262 The APPLICATION USAGE section is added.

52263 The normative text is updated to avoid use of the term “must” for application requirements.

52264 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/88 is applied, updating the  
52265 DESCRIPTION to describe the consequences of prematurely leaving a code block defined by the  
52266 *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* functions.

**52267 Issue 7**

52268 The *pthread\_cleanup\_pop()* and *pthread\_cleanup\_push()* functions are moved from the Threads  
52269 option to the Base.

52270 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0454 [229] is applied.

## 52271 NAME

52272 pthread\_cond\_broadcast, pthread\_cond\_signal — broadcast or signal a condition

## 52273 SYNOPSIS

```
52274 #include <pthread.h>
52275 int pthread_cond_broadcast(pthread_cond_t *cond);
52276 int pthread_cond_signal(pthread_cond_t *cond);
```

## 52277 DESCRIPTION

52278 These functions shall unblock threads blocked on a condition variable.

52279 The *pthread\_cond\_broadcast()* function shall unblock all threads currently blocked on the  
52280 specified condition variable *cond*.

52281 The *pthread\_cond\_signal()* function shall unblock at least one of the threads that are blocked on  
52282 the specified condition variable *cond* (if any threads are blocked on *cond*).

52283 If more than one thread is blocked on a condition variable, the scheduling policy shall determine  
52284 the order in which threads are unblocked. When each thread unblocked as a result of a  
52285 *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()* returns from its call to *pthread\_cond\_wait()* or  
52286 *pthread\_cond\_timedwait()*, the thread shall own the mutex with which it called  
52287 *pthread\_cond\_wait()* or *pthread\_cond\_timedwait()*. The thread(s) that are unblocked shall contend  
52288 for the mutex according to the scheduling policy (if applicable), and as if each had called  
52289 *pthread\_mutex\_lock()*.

52290 The *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()* functions may be called by a thread  
52291 whether or not it currently owns the mutex that threads calling *pthread\_cond\_wait()* or  
52292 *pthread\_cond\_timedwait()* have associated with the condition variable during their waits;  
52293 however, if predictable scheduling behavior is required, then that mutex shall be locked by the  
52294 thread calling *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()*.

52295 The *pthread\_cond\_broadcast()* and *pthread\_cond\_signal()* functions shall have no effect if there are  
52296 no threads currently blocked on *cond*.

52297 The behavior is undefined if the value specified by the *cond* argument to *pthread\_cond\_broadcast()*  
52298 or *pthread\_cond\_signal()* does not refer to an initialized condition variable.

## 52299 RETURN VALUE

52300 If successful, the *pthread\_cond\_broadcast()* and *pthread\_cond\_signal()* functions shall return zero;  
52301 otherwise, an error number shall be returned to indicate the error.

## 52302 ERRORS

52303 These functions shall not return an error code of [EINTR].

## 52304 EXAMPLES

52305 None.

## 52306 APPLICATION USAGE

52307 The *pthread\_cond\_broadcast()* function is used whenever the shared-variable state has been  
52308 changed in a way that more than one thread can proceed with its task. Consider a single  
52309 producer/multiple consumer problem, where the producer can insert multiple items on a list  
52310 that is accessed one item at a time by the consumers. By calling the *pthread\_cond\_broadcast()*  
52311 function, the producer would notify all consumers that might be waiting, and thereby the  
52312 application would receive more throughput on a multi-processor. In addition,  
52313 *pthread\_cond\_broadcast()* makes it easier to implement a read-write lock. The  
52314 *pthread\_cond\_broadcast()* function is needed in order to wake up all waiting readers when a  
52315 writer releases its lock. Finally, the two-phase commit algorithm can use this broadcast function  
52316 to notify all clients of an impending transaction commit.

It is not safe to use the *pthread\_cond\_signal()* function in a signal handler that is invoked asynchronously. Even if it were safe, there would still be a race between the test of the Boolean *pthread\_cond\_wait()* that could not be efficiently eliminated.

Mutexes and condition variables are thus not suitable for releasing a waiting thread by signaling from code running in a signal handler.

## RATIONALE

If an implementation detects that the value specified by the *cond* argument to *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()* does not refer to an initialized condition variable, it is recommended that the function should fail and report an [EINVAL] error.

## Multiple Awakenings by Condition Signal

On a multi-processor, it may be impossible for an implementation of *pthread\_cond\_signal()* to avoid the unblocking of more than one thread blocked on a condition variable. For example, consider the following partial implementation of *pthread\_cond\_wait()* and *pthread\_cond\_signal()*, executed by two threads in the order given. One thread is trying to wait on the condition variable, another is concurrently executing *pthread\_cond\_signal()*, while a third thread is already waiting.

```
pthread_cond_wait(mutex, cond):
    value = cond->value; /* 1 */
    pthread_mutex_unlock(mutex); /* 2 */
    pthread_mutex_lock(cond->mutex); /* 10 */
    if (value == cond->value) { /* 11 */
        me->next_cond = cond->waiter;
        cond->waiter = me;
        pthread_mutex_unlock(cond->mutex);
        unable_to_run(me);
    } else
        pthread_mutex_unlock(cond->mutex); /* 12 */
    pthread_mutex_lock(mutex); /* 13 */

pthread_cond_signal(cond):
    pthread_mutex_lock(cond->mutex); /* 3 */
    cond->value++; /* 4 */
    if (cond->waiter) { /* 5 */
        sleeper = cond->waiter; /* 6 */
        cond->waiter = sleeper->next_cond; /* 7 */
        able_to_run(sleeper); /* 8 */
    }
    pthread_mutex_unlock(cond->mutex); /* 9 */
```

The effect is that more than one thread can return from its call to *pthread\_cond\_wait()* or *pthread\_cond\_timedwait()* as a result of one call to *pthread\_cond\_signal()*. This effect is called “spurious wakeup”. Note that the situation is self-correcting in that the number of threads that are so awakened is finite; for example, the next thread to call *pthread\_cond\_wait()* after the sequence of events above blocks.

While this problem could be resolved, the loss of efficiency for a fringe condition that occurs only rarely is unacceptable, especially given that one has to check the predicate associated with a condition variable anyway. Correcting this problem would unnecessarily reduce the degree of concurrency in this basic building block for all higher-level synchronization operations.

An added benefit of allowing spurious wakeups is that applications are forced to code a

52364 predicate-testing-loop around the condition wait. This also makes the application tolerate  
52365 superfluous condition broadcasts or signals on the same condition variable that may be coded in  
52366 some other part of the application. The resulting applications are thus more robust. Therefore,  
52367 POSIX.1-2008 explicitly documents that spurious wakeups may occur.

52368 **FUTURE DIRECTIONS**

52369 None.

52370 **SEE ALSO**

52371 *pthread\_cond\_destroy()*, *pthread\_cond\_timedwait()*

52372 XBD Section 4.12 (on page 111), **<pthread.h>**

52373 **CHANGE HISTORY**

52374 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52375 **Issue 6**

52376 The *pthread\_cond\_broadcast()* and *pthread\_cond\_signal()* functions are marked as part of the  
52377 Threads option.

52378 The APPLICATION USAGE section is added.

52379 **Issue 7**

52380 The *pthread\_cond\_broadcast()* and *pthread\_cond\_signal()* functions are moved from the Threads  
52381 option to the Base.

52382 The [EINVAL] error for an uninitialized condition variable is removed; this condition results in  
52383 undefined behavior.

**NAME**

pthread\_cond\_destroy, pthread\_cond\_init — destroy and initialize condition variables

**SYNOPSIS**

```
#include <pthread.h>

int pthread_cond_destroy(pthread_cond_t *cond);
int pthread_cond_init(pthread_cond_t *restrict cond,
    const pthread_condattr_t *restrict attr);
pthread_cond_t cond = PTHREAD_COND_INITIALIZER;
```

**DESCRIPTION**

The *pthread\_cond\_destroy()* function shall destroy the given condition variable specified by *cond*; the object becomes, in effect, uninitialized. An implementation may cause *pthread\_cond\_destroy()* to set the object referenced by *cond* to an invalid value. A destroyed condition variable object can be reinitialized using *pthread\_cond\_init()*; the results of otherwise referencing the object after it has been destroyed are undefined.

It shall be safe to destroy an initialized condition variable upon which no threads are currently blocked. Attempting to destroy a condition variable upon which other threads are currently blocked results in undefined behavior.

The *pthread\_cond\_init()* function shall initialize the condition variable referenced by *cond* with attributes referenced by *attr*. If *attr* is NULL, the default condition variable attributes shall be used; the effect is the same as passing the address of a default condition variable attributes object. Upon successful initialization, the state of the condition variable shall become initialized.

See [Section 2.9.9](#) (on page 523) for further requirements.

Attempting to initialize an already initialized condition variable results in undefined behavior.

In cases where default condition variable attributes are appropriate, the macro PTHREAD\_COND\_INITIALIZER can be used to initialize condition variables. The effect shall be equivalent to dynamic initialization by a call to *pthread\_cond\_init()* with parameter *attr* specified as NULL, except that no error checks are performed.

The behavior is undefined if the value specified by the *cond* argument to *pthread\_cond\_destroy()* does not refer to an initialized condition variable.

The behavior is undefined if the value specified by the *attr* argument to *pthread\_cond\_init()* does not refer to an initialized condition variable attributes object.

**RETURN VALUE**

If successful, the *pthread\_cond\_destroy()* and *pthread\_cond\_init()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The *pthread\_cond\_init()* function shall fail if:

[EAGAIN]      The system lacked the necessary resources (other than memory) to initialize another condition variable.

[ENOMEM]      Insufficient memory exists to initialize the condition variable.

These functions shall not return an error code of [EINTR].

## EXAMPLES

A condition variable can be destroyed immediately after all the threads that are blocked on it are awakened. For example, consider the following code:

```

struct list {
    pthread_mutex_t lm;
    ...
}

struct elt {
    key k;
    int busy;
    pthread_cond_t notbusy;
    ...
}

/* Find a list element and reserve it. */
struct elt *
list_find(struct list *lp, key k)
{
    struct elt *ep;

    pthread_mutex_lock(&lp->lm);
    while ((ep = find_elt(l, k) != NULL) && ep->busy)
        pthread_cond_wait(&ep->notbusy, &lp->lm);
    if (ep != NULL)
        ep->busy = 1;
    pthread_mutex_unlock(&lp->lm);
    return(ep);
}

delete_elt(struct list *lp, struct elt *ep)
{
    pthread_mutex_lock(&lp->lm);
    assert(ep->busy);
    ... remove ep from list ...
    ep->busy = 0; /* Paranoid. */
    (A) pthread_cond_broadcast(&ep->notbusy);
    pthread_mutex_unlock(&lp->lm);
    (B) pthread_cond_destroy(&ep->notbusy);
    free(ep);
}

```

In this example, the condition variable and its list element may be freed (line B) immediately after all threads waiting for it are awakened (line A), since the mutex and the code ensure that no other thread can touch the element to be deleted.

## APPLICATION USAGE

None.

## RATIONALE

If an implementation detects that the value specified by the *cond* argument to *pthread\_cond\_destroy()* does not refer to an initialized condition variable, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *cond* argument to

52471 *pthread\_cond\_destroy()* or *pthread\_cond\_init()* refers to a condition variable that is in use (for  
 52472 example, in a *pthread\_cond\_wait()* call) by another thread, or detects that the value specified by  
 52473 the *cond* argument to *pthread\_cond\_init()* refers to an already initialized condition variable, it is  
 52474 recommended that the function should fail and report an [EBUSY] error.

52475 If an implementation detects that the value specified by the *attr* argument to *pthread\_cond\_init()*  
 52476 does not refer to an initialized condition variable attributes object, it is recommended that the  
 52477 function should fail and report an [EINVAL] error.

52478 See also *pthread\_mutex\_destroy()*.

#### 52484 CHANGE HISTORY

52485 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 52486 Issue 6

52487 The *pthread\_cond\_destroy()* and *pthread\_cond\_init()* functions are marked as part of the Threads  
 52488 option.

52489 IEEE PASC Interpretation 1003.1c #34 is applied, updating the DESCRIPTION.

52490 The **restrict** keyword is added to the *pthread\_cond\_init()* prototype for alignment with the  
 52491 ISO/IEC 9899:1999 standard.

#### 52492 Issue 7

52493 The *pthread\_cond\_destroy()* and *pthread\_cond\_init()* functions are moved from the Threads option  
 52494 to the Base.

52495 The [EINVAL] error for an uninitialized condition variable and an uninitialized condition  
 52496 variable attributes object is removed; this condition results in undefined behavior.

52497 The [EBUSY] error for a condition variable already in use or an already initialized condition  
 52498 variable is removed; this condition results in undefined behavior.

52499 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0455 [70] is applied.

# pthread\_cond\_signal()

System Interfaces

## 52500 NAME

52501 pthread\_cond\_signal — signal a condition

## 52502 SYNOPSIS

52503 #include <pthread.h>

52504 int pthread\_cond\_signal(pthread\_cond\_t \*cond);

## 52505 DESCRIPTION

52506 Refer to *pthread\_cond\_broadcast()*.

**NAME**

pthread\_cond\_timedwait, pthread\_cond\_wait — wait on a condition

**SYNOPSIS**

```
#include <pthread.h>

int pthread_cond_timedwait(pthread_cond_t *restrict cond,
    pthread_mutex_t *restrict mutex,
    const struct timespec *restrict abstime);
int pthread_cond_wait(pthread_cond_t *restrict cond,
    pthread_mutex_t *restrict mutex);
```

**DESCRIPTION**

The *pthread\_cond\_timedwait()* and *pthread\_cond\_wait()* functions shall block on a condition variable. The application shall ensure that these functions are called with *mutex* locked by the calling thread; otherwise, an error (for PTHREAD\_MUTEX\_ERRORCHECK and robust mutexes) or undefined behavior (for other mutexes) results.

These functions atomically release *mutex* and cause the calling thread to block on the condition variable *cond*; atomically here means “atomically with respect to access by another thread to the mutex and then the condition variable”. That is, if another thread is able to acquire the mutex after the about-to-block thread has released it, then a subsequent call to *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()* in that thread shall behave as if it were issued after the about-to-block thread has blocked.

Upon successful return, the mutex shall have been locked and shall be owned by the calling thread. If *mutex* is a robust mutex where an owner terminated while holding the lock and the state is recoverable, the mutex shall be acquired even though the function returns an error code.

When using condition variables there is always a Boolean predicate involving shared variables associated with each condition wait that is true if the thread should proceed. Spurious wakeups from the *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()* functions may occur. Since the return from *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()* does not imply anything about the value of this predicate, the predicate should be re-evaluated upon such return.

When a thread waits on a condition variable, having specified a particular mutex to either the *pthread\_cond\_timedwait()* or the *pthread\_cond\_wait()* operation, a dynamic binding is formed between that mutex and condition variable that remains in effect as long as at least one thread is blocked on the condition variable. During this time, the effect of an attempt by any thread to wait on that condition variable using a different mutex is undefined. Once all waiting threads have been unblocked (as by the *pthread\_cond\_broadcast()* operation), the next wait operation on that condition variable shall form a new dynamic binding with the mutex specified by that wait operation. Even though the dynamic binding between condition variable and mutex may be removed or replaced between the time a thread is unblocked from a wait on the condition variable and the time that it returns to the caller or begins cancellation cleanup, the unblocked thread shall always re-acquire the mutex specified in the condition wait operation call from which it is returning.

A condition wait (whether timed or not) is a cancellation point. When the cancelability type of a thread is set to PTHREAD\_CANCEL\_DEFERRED, a side-effect of acting upon a cancellation request while in a condition wait is that the mutex is (in effect) re-acquired before calling the first cancellation cleanup handler. The effect is as if the thread were unblocked, allowed to execute up to the point of returning from the call to *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()*, but at that point notices the cancellation request and instead of returning to the caller of *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()*, starts the thread cancellation activities, which includes calling cancellation cleanup handlers.

52555 A thread that has been unblocked because it has been canceled while blocked in a call to  
 52556 *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()* shall not consume any condition signal that may  
 52557 be directed concurrently at the condition variable if there are other threads blocked on the  
 52558 condition variable.

52559 The *pthread\_cond\_timedwait()* function shall be equivalent to *pthread\_cond\_wait()*, except that an  
 52560 error is returned if the absolute time specified by *abstime* passes (that is, system time equals or  
 52561 exceeds *abstime*) before the condition *cond* is signaled or broadcasted, or if the absolute time  
 52562 specified by *abstime* has already been passed at the time of the call. When such timeouts occur,  
 52563 *pthread\_cond\_timedwait()* shall nonetheless release and re-acquire the mutex referenced by *mutex*,  
 52564 and may consume a condition signal directed concurrently at the condition variable.

52565 The condition variable shall have a clock attribute which specifies the clock that shall be used to  
 52566 measure the time specified by the *abstime* argument. The *pthread\_cond\_timedwait()* function is  
 52567 also a cancellation point.

52568 If a signal is delivered to a thread waiting for a condition variable, upon return from the signal  
 52569 handler the thread resumes waiting for the condition variable as if it was not interrupted, or it  
 52570 shall return zero due to spurious wakeup.

52571 The behavior is undefined if the value specified by the *cond* or *mutex* argument to these  
 52572 functions does not refer to an initialized condition variable or an initialized mutex object,  
 52573 respectively.

#### 52574 RETURN VALUE

52575 Except for [ETIMEDOUT], [ENOTRECOVERABLE], and [EOWNERDEAD], all these error +  
 52576 checks shall act as if they were performed immediately at the beginning of processing for the  
 52577 function and shall cause an error return, in effect, prior to modifying the state of the mutex  
 52578 specified by *mutex* or the condition variable specified by *cond*.

52579 Upon successful completion, a value of zero shall be returned; otherwise, an error number shall  
 52580 be returned to indicate the error.

#### 52581 ERRORS

52582 These functions shall fail if:

52583 [ENOTRECOVERABLE]

52584 The state protected by the mutex is not recoverable.

52585 [EOWNERDEAD]

52586 The mutex is a robust mutex and the process containing the previous owning  
 52587 thread terminated while holding the mutex lock. The mutex lock shall be  
 52588 acquired by the calling thread and it is up to the new owner to make the state  
 52589 consistent.

52590 [EPERM]

52591 The mutex type is PTHREAD\_MUTEX\_ERRORCHECK or the mutex is a  
 robust mutex, and the current thread does not own the mutex.

52592 The *pthread\_cond\_timedwait()* function shall fail if:

52593 [ETIMEDOUT] The time specified by *abstime* to *pthread\_cond\_timedwait()* has passed.

52594 [EINVAL] The *abstime* argument specified a nanosecond value less than zero or greater  
 52595 than or equal to 1000 million.

52596 These functions may fail if:

52597 [EOWNERDEAD]

52598 The mutex is a robust mutex and the previous owning thread terminated  
52599 while holding the mutex lock. The mutex lock shall be acquired by the calling  
52600 thread and it is up to the new owner to make the state consistent.

52601 These functions shall not return an error code of [EINTR].

## 52602 EXAMPLES

52603 None.

## 52604 APPLICATION USAGE

52605 Applications that have assumed that non-zero return values are errors will need updating for  
52606 use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting  
52607 a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error  
52608 returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If  
52609 an application is supposed to work with normal and robust mutexes, it should check all return  
52610 values for error conditions and if necessary take appropriate action.

## 52611 RATIONALE

52612 If an implementation detects that the value specified by the *cond* argument to  
52613 *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()* does not refer to an initialized condition  
52614 variable, or detects that the value specified by the *mutex* argument to *pthread\_cond\_timedwait()* or  
52615 *pthread\_cond\_wait()* does not refer to an initialized mutex object, it is recommended that the  
52616 function should fail and report an [EINVAL] error.

## 52617 Condition Wait Semantics

52618 It is important to note that when *pthread\_cond\_wait()* and *pthread\_cond\_timedwait()* return  
52619 without error, the associated predicate may still be false. Similarly, when  
52620 *pthread\_cond\_timedwait()* returns with the timeout error, the associated predicate may be true  
52621 due to an unavoidable race between the expiration of the timeout and the predicate state change.

52622 The application needs to recheck the predicate on any return because it cannot be sure there is  
52623 another thread waiting on the thread to handle the signal, and if there is not then the signal is  
52624 lost. The burden is on the application to check the predicate.

52625 Some implementations, particularly on a multi-processor, may sometimes cause multiple  
52626 threads to wake up when the condition variable is signaled simultaneously on different  
52627 processors.

52628 In general, whenever a condition wait returns, the thread has to re-evaluate the predicate  
52629 associated with the condition wait to determine whether it can safely proceed, should wait  
52630 again, or should declare a timeout. A return from the wait does not imply that the associated  
52631 predicate is either true or false.

52632 It is thus recommended that a condition wait be enclosed in the equivalent of a “while loop”  
52633 that checks the predicate.

### Timed Wait Semantics

An absolute time measure was chosen for specifying the timeout parameter for two reasons. First, a relative time measure can be easily implemented on top of a function that specifies absolute time, but there is a race condition associated with specifying an absolute timeout on top of a function that specifies relative timeouts. For example, assume that `clock_gettime()` returns the current time and `cond_relative_timed_wait()` uses relative timeouts:

```
clock_gettime(CLOCK_REALTIME, &now)
reltime = sleep_til_this_absolute_time - now;
cond_relative_timed_wait(c, m, &reltime);
```

If the thread is preempted between the first statement and the last statement, the thread blocks for too long. Blocking, however, is irrelevant if an absolute timeout is used. An absolute timeout also need not be recomputed if it is used multiple times in a loop, such as that enclosing a condition wait.

For cases when the system clock is advanced discontinuously by an operator, it is expected that implementations process any timed wait expiring at an intervening time as if that time had actually occurred.

### Cancellation and Condition Wait

A condition wait, whether timed or not, is a cancellation point. That is, the functions `pthread_cond_wait()` or `pthread_cond_timedwait()` are points where a pending (or concurrent) cancellation request is noticed. The reason for this is that an indefinite wait is possible at these points—whatever event is being waited for, even if the program is totally correct, might never occur; for example, some input data being awaited might never be sent. By making condition wait a cancellation point, the thread can be canceled and perform its cancellation cleanup handler even though it may be stuck in some indefinite wait.

A side-effect of acting on a cancellation request while a thread is blocked on a condition variable is to re-acquire the mutex before calling any of the cancellation cleanup handlers. This is done in order to ensure that the cancellation cleanup handler is executed in the same state as the critical code that lies both before and after the call to the condition wait function. This rule is also required when interfacing to POSIX threads from languages, such as Ada or C++, which may choose to map cancellation onto a language exception; this rule ensures that each exception handler guarding a critical section can always safely depend upon the fact that the associated mutex has already been locked regardless of exactly where within the critical section the exception was raised. Without this rule, there would not be a uniform rule that exception handlers could follow regarding the lock, and so coding would become very cumbersome.

Therefore, since *some* statement has to be made regarding the state of the lock when a cancellation is delivered during a wait, a definition has been chosen that makes application coding most convenient and error free.

When acting on a cancellation request while a thread is blocked on a condition variable, the implementation is required to ensure that the thread does not consume any condition signals directed at that condition variable if there are any other threads waiting on that condition variable. This rule is specified in order to avoid deadlock conditions that could occur if these two independent requests (one acting on a thread and the other acting on the condition variable) were not processed independently.

**Performance of Mutexes and Condition Variables**

Mutexes are expected to be locked only for a few instructions. This practice is almost automatically enforced by the desire of programmers to avoid long serial regions of execution (which would reduce total effective parallelism).

When using mutexes and condition variables, one tries to ensure that the usual case is to lock the mutex, access shared data, and unlock the mutex. Waiting on a condition variable should be a relatively rare situation. For example, when implementing a read-write lock, code that acquires a read-lock typically needs only to increment the count of readers (under mutual-exclusion) and return. The calling thread would actually wait on the condition variable only when there is already an active writer. So the efficiency of a synchronization operation is bounded by the cost of mutex lock/unlock and not by condition wait. Note that in the usual case there is no context switch.

This is not to say that the efficiency of condition waiting is unimportant. Since there needs to be at least one context switch per Ada rendezvous, the efficiency of waiting on a condition variable is important. The cost of waiting on a condition variable should be little more than the minimal cost for a context switch plus the time to unlock and lock the mutex.

**Features of Mutexes and Condition Variables**

It had been suggested that the mutex acquisition and release be decoupled from condition wait. This was rejected because it is the combined nature of the operation that, in fact, facilitates realtime implementations. Those implementations can atomically move a high-priority thread between the condition variable and the mutex in a manner that is transparent to the caller. This can prevent extra context switches and provide more deterministic acquisition of a mutex when the waiting thread is signaled. Thus, fairness and priority issues can be dealt with directly by the scheduling discipline. Furthermore, the current condition wait operation matches existing practice.

**Scheduling Behavior of Mutexes and Condition Variables**

Synchronization primitives that attempt to interfere with scheduling policy by specifying an ordering rule are considered undesirable. Threads waiting on mutexes and condition variables are selected to proceed in an order dependent upon the scheduling policy rather than in some fixed order (for example, FIFO or priority). Thus, the scheduling policy determines which thread(s) are awakened and allowed to proceed.

**Timed Condition Wait**

The `pthread_cond_timedwait()` function allows an application to give up waiting for a particular condition after a given amount of time. An example of its use follows:

```
(void) pthread_mutex_lock(&t.mn);
    t.waiters++;
    clock_gettime(CLOCK_REALTIME, &ts);
    ts.tv_sec += 5;
    rc = 0;
    while (! mypredicate(&t) && rc == 0)
        rc = pthread_cond_timedwait(&t.cond, &t.mn, &ts);
    t.waiters--;
    if (rc == 0 || mypredicate(&t))
        setmystate(&t);
(void) pthread_mutex_unlock(&t.mn);
```

52722 By making the timeout parameter absolute, it does not need to be recomputed each time the  
52723 program checks its blocking predicate. If the timeout was relative, it would have to be  
52724 recomputed before each call. This would be especially difficult since such code would need to  
52725 take into account the possibility of extra wakeups that result from extra broadcasts or signals on  
52726 the condition variable that occur before either the predicate is true or the timeout is due.

#### 52727 **FUTURE DIRECTIONS**

#### 52732 **CHANGE HISTORY**

52733 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 52734 **Issue 6**

52735 The *pthread\_cond\_timedwait()* and *pthread\_cond\_wait()* functions are marked as part of the  
52736 Threads option.

52737 The Open Group Corrigendum U021/9 is applied, correcting the prototype for the  
52738 *pthread\_cond\_wait()* function.

52739 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics  
52740 for the Clock Selection option.

52741 The ERRORS section has an additional case for [EPERM] in response to IEEE PASC  
52742 Interpretation 1003.1c #28.

52743 The **restrict** keyword is added to the *pthread\_cond\_timedwait()* and *pthread\_cond\_wait()*  
52744 prototypes for alignment with the ISO/IEC 9899:1999 standard.

52745 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/89 is applied, updating the  
52746 DESCRIPTION for consistency with the *pthread\_cond\_destroy()* function that states it is safe to  
52747 destroy an initialized condition variable upon which no threads are currently blocked.

52748 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/90 is applied, updating words in the  
52749 DESCRIPTION from “the cancelability enable state” to “the cancelability type”.

52750 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/91 is applied, updating the ERRORS  
52751 section to remove the error case related to *abstime* from the *pthread\_cond\_wait()* function, and to  
52752 make the error case related to *abstime* mandatory for *pthread\_cond\_timedwait()* for consistency  
52753 with other functions.

52754 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/92 is applied, adding a new paragraph to  
52755 the RATIONALE section stating that an application should check the predicate on any return  
52756 from this function.

#### 52757 **Issue 7**

52758 SD5-XSH-ERN-44 is applied, changing the definition of the “shall fail” case of the [EINVAL]  
52759 error.

52760 Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

52761 The *pthread\_cond\_timedwait()* and *pthread\_cond\_wait()* functions are moved from the Threads  
52762 option to the Base.

52763 The [EINVAL] error for an uninitialized condition variable or uninitialized mutex object is  
52764 removed; this condition results in undefined behavior"

52765 The [EPERM] error is revised and moved to the “shall fail” list of error conditions for the  
52766 *pthread\_cond\_timedwait()* function.

52767 The DESCRIPTION is updated to clarify the behavior when *mutex* is a robust mutex.

52768 The ERRORS section is updated to include “shall fail” cases for  
52769 PTHREAD\_MUTEX\_ERRORCHECK mutexes.

52770 The DESCRIPTION is rewritten to clarify that undefined behavior occurs only for mutexes  
52771 where the [EPERM] error is not mandated.

52772 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0456 [91,286,437] and  
52773 XSH/TC1-2008/0457 [239] are applied.

## 52774 NAME

52775 pthread\_condattr\_destroy, pthread\_condattr\_init — destroy and initialize the condition variable  
52776 attributes object

## 52777 SYNOPSIS

```
52778 #include <pthread.h>
52779
52779 int pthread_condattr_destroy(pthread_condattr_t *attr);
52780 int pthread_condattr_init(pthread_condattr_t *attr);
```

## 52781 DESCRIPTION

52782 The *pthread\_condattr\_destroy()* function shall destroy a condition variable attributes object; the  
52783 object becomes, in effect, uninitialized. An implementation may cause *pthread\_condattr\_destroy()*  
52784 to set the object referenced by *attr* to an invalid value. A destroyed *attr* attributes object can be  
52785 reinitialized using *pthread\_condattr\_init()*; the results of otherwise referencing the object after it  
52786 has been destroyed are undefined.

52787 The *pthread\_condattr\_init()* function shall initialize a condition variable attributes object *attr* with  
52788 the default value for all of the attributes defined by the implementation.

52789 Results are undefined if *pthread\_condattr\_init()* is called specifying an already initialized *attr*  
52790 attributes object.

52791 After a condition variable attributes object has been used to initialize one or more condition  
52792 variables, any function affecting the attributes object (including destruction) shall not affect any  
52793 previously initialized condition variables.

52794 This volume of POSIX.1-2008 requires two attributes, the *clock* attribute and the *process-shared*  
52795 attribute.

52796 Additional attributes, their default values, and the names of the associated functions to get and  
52797 set those attribute values are implementation-defined.

52798 The behavior is undefined if the value specified by the *attr* argument to  
52799 *pthread\_condattr\_destroy()* does not refer to an initialized condition variable attributes object.

## 52800 RETURN VALUE

52801 If successful, the *pthread\_condattr\_destroy()* and *pthread\_condattr\_init()* functions shall return  
52802 zero; otherwise, an error number shall be returned to indicate the error.

## 52803 ERRORS

52804 The *pthread\_condattr\_init()* function shall fail if:

52805 [ENOMEM] Insufficient memory exists to initialize the condition variable attributes object.

52806 These functions shall not return an error code of [EINTR].

## 52807 EXAMPLES

52808 None.

## 52809 APPLICATION USAGE

52810 None.

## 52811 RATIONALE

52812 A *process-shared* attribute has been defined for condition variables for the same reason it has been  
52813 defined for mutexes.

52814 If an implementation detects that the value specified by the *attr* argument to  
52815 *pthread\_condattr\_destroy()* does not refer to an initialized condition variable attributes object, it is  
52816 recommended that the function should fail and report an [EINVAL] error.

52817 See also *pthread\_attr\_destroy()* and *pthread\_mutex\_destroy()*.

52818 **FUTURE DIRECTIONS**

52819 None.

52820 **SEE ALSO**

52821 *pthread\_attr\_destroy()*, *pthread\_cond\_destroy()*, *pthread\_condattr\_getpshared()*, *pthread\_create()*,  
52822 *pthread\_mutex\_destroy()*

52823 XBD <pthread.h>

52824 **CHANGE HISTORY**

52825 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52826 **Issue 6**

52827 The *pthread\_condattr\_destroy()* and *pthread\_condattr\_init()* functions are marked as part of the  
52828 Threads option.

52829 **Issue 7**

52830 The *pthread\_condattr\_destroy()* and *pthread\_condattr\_init()* functions are moved from the Threads  
52831 option to the Base.

52832 The [EINVAL] error for an uninitialized condition variable attributes object is removed; this  
52833 condition results in undefined behavior.

## 52834 NAME

52835 pthread\_condattr\_getclock, pthread\_condattr\_setclock — get and set the clock selection  
52836 condition variable attribute

## 52837 SYNOPSIS

```
52838 #include <pthread.h>
52839 int pthread_condattr_getclock(const pthread_condattr_t *restrict attr,
52840                             clockid_t *restrict clock_id);
52841 int pthread_condattr_setclock(pthread_condattr_t *attr,
52842                             clockid_t clock_id);
```

## 52843 DESCRIPTION

52844 The *pthread\_condattr\_getclock()* function shall obtain the value of the *clock* attribute from the  
52845 attributes object referenced by *attr*.

52846 The *pthread\_condattr\_setclock()* function shall set the *clock* attribute in an initialized attributes  
52847 object referenced by *attr*. If *pthread\_condattr\_setclock()* is called with a *clock\_id* argument that  
52848 refers to a CPU-time clock, the call shall fail.

52849 The *clock* attribute is the clock ID of the clock that shall be used to measure the timeout service of  
52850 *pthread\_cond\_timedwait()*. The default value of the *clock* attribute shall refer to the system clock.

52851 The behavior is undefined if the value specified by the *attr* argument to  
52852 *pthread\_condattr\_getclock()* or *pthread\_condattr\_setclock()* does not refer to an initialized condition  
52853 variable attributes object.

## 52854 RETURN VALUE

52855 If successful, the *pthread\_condattr\_getclock()* function shall return zero and store the value of the  
52856 clock attribute of *attr* into the object referenced by the *clock\_id* argument. Otherwise, an error  
52857 number shall be returned to indicate the error.

52858 If successful, the *pthread\_condattr\_setclock()* function shall return zero; otherwise, an error  
52859 number shall be returned to indicate the error.

## 52860 ERRORS

52861 The *pthread\_condattr\_setclock()* function may fail if:

52862 [EINVAL] The value specified by *clock\_id* does not refer to a known clock, or is a CPU-  
52863 time clock.

52864 These functions shall not return an error code of [EINTR].

## 52865 EXAMPLES

52866 None.

## 52867 APPLICATION USAGE

52868 None.

## 52869 RATIONALE

52870 If an implementation detects that the value specified by the *attr* argument to  
52871 *pthread\_condattr\_getclock()* or *pthread\_condattr\_setclock()* does not refer to an initialized condition  
52872 variable attributes object, it is recommended that the function should fail and report an  
52873 [EINVAL] error.

## 52874 FUTURE DIRECTIONS

52875 None.

**SEE ALSO**

*pthread\_cond\_destroy()*, *pthread\_cond\_timedwait()*, *pthread\_condattr\_destroy()*,  
*pthread\_condattr\_getpshared()*, *pthread\_create()*, *pthread\_mutex\_destroy()*

XBD <pthread.h>

**CHANGE HISTORY**

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

**Issue 7**

The *pthread\_condattr\_getclock()* and *pthread\_condattr\_setclock()* functions are moved from the Clock Selection option to the Base.

The [EINVAL] error for an uninitialized condition variable attributes object is removed; this condition results in undefined behavior.

## NAME

pthread\_condattr\_getpshared, pthread\_condattr\_setpshared — get and set the process-shared condition variable attributes

## SYNOPSIS

```
TSH #include <pthread.h>

int pthread_condattr_getpshared(const pthread_condattr_t *restrict attr,
    int *restrict pshared);
int pthread_condattr_setpshared(pthread_condattr_t *attr,
    int pshared);
```

## DESCRIPTION

The *pthread\_condattr\_getpshared()* function shall obtain the value of the *process-shared* attribute from the attributes object referenced by *attr*.

The *pthread\_condattr\_setpshared()* function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

The *process-shared* attribute is set to `PTHREAD_PROCESS_SHARED` to permit a condition variable to be operated upon by any thread that has access to the memory where the condition variable is allocated, even if the condition variable is allocated in memory that is shared by multiple processes. See [Section 2.9.9](#) (on page 523) for further requirements. The default value of the attribute is `PTHREAD_PROCESS_PRIVATE`.

The behavior is undefined if the value specified by the *attr* argument to *pthread\_condattr\_getpshared()* or *pthread\_condattr\_setpshared()* does not refer to an initialized condition variable attributes object.

## RETURN VALUE

If successful, the *pthread\_condattr\_setpshared()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

If successful, the *pthread\_condattr\_getpshared()* function shall return zero and store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise, an error number shall be returned to indicate the error.

## ERRORS

The *pthread\_condattr\_setpshared()* function may fail if:

[EINVAL] The new value specified for the attribute is outside the range of legal values for that attribute.

These functions shall not return an error code of [EINTR].

## EXAMPLES

None.

## APPLICATION USAGE

None.

## RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread\_condattr\_getpshared()* or *pthread\_condattr\_setpshared()* does not refer to an initialized condition variable attributes object, it is recommended that the function should fail and report an [EINVAL] error.

52929 **FUTURE DIRECTIONS**

52930 None.

52931 **SEE ALSO**52932 *pthread\_create()*, *pthread\_cond\_destroy()*, *pthread\_condattr\_destroy()*, *pthread\_mutex\_destroy()*

52933 XBD &lt;pthread.h&gt;

52934 **CHANGE HISTORY**

52935 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52936 **Issue 6**52937 The *pthread\_condattr\_getpshared()* and *pthread\_condattr\_setpshared()* functions are marked as part  
52938 of the Threads and Thread Process-Shared Synchronization options.52939 The **restrict** keyword is added to the *pthread\_condattr\_getpshared()* prototype for alignment with  
52940 the ISO/IEC 9899:1999 standard.52941 **Issue 7**52942 The *pthread\_condattr\_getpshared()* and *pthread\_condattr\_setpshared()* functions are marked only as |  
52943 part of the Thread Process-Shared Synchronization option as the Threads option is now part of |  
52944 the Base.52945 The [EINVAL] error for an uninitialized condition variable attributes object is removed; this  
52946 condition results in undefined behavior.

52947 **NAME**

52948 pthread\_condattr\_init — initialize the condition variable attributes object

52949 **SYNOPSIS**

52950 #include &lt;pthread.h&gt;

52951 int pthread\_condattr\_init(pthread\_condattr\_t \*attr);

52952 **DESCRIPTION**52953 Refer to *pthread\_condattr\_destroy()*.

52954 **NAME**

52955 pthread\_condattr\_setclock — set the clock selection condition variable attribute

52956 **SYNOPSIS**

52957 #include &lt;pthread.h&gt;

52958 int pthread\_condattr\_setclock(pthread\_condattr\_t \*attr,

52959 clockid\_t clock\_id);

52960 **DESCRIPTION**52961 Refer to *pthread\_condattr\_getclock()*.

52962 **NAME**

52963 pthread\_condattr\_setpshared — set the process-shared condition variable attribute

52964 **SYNOPSIS**

```
52965 TSH      #include <pthread.h>
52966          int pthread_condattr_setpshared(pthread_condattr_t *attr,
52967          int pshared);
```

52968 **DESCRIPTION**52969 Refer to *pthread\_condattr\_getpshared()*.

52970 **NAME**

52971 pthread\_create — thread creation

52972 **SYNOPSIS**

```
52973 #include <pthread.h>
52974 int pthread_create(pthread_t *restrict thread,
52975     const pthread_attr_t *restrict attr,
52976     void *(*start_routine)(void*), void *restrict arg);
```

52977 **DESCRIPTION**

52978 The *pthread\_create()* function shall create a new thread, with attributes specified by *attr*, within a  
 52979 process. If *attr* is NULL, the default attributes shall be used. If the attributes specified by *attr* are  
 52980 modified later, the thread's attributes shall not be affected. Upon successful completion,  
 52981 *pthread\_create()* shall store the ID of the created thread in the location referenced by *thread*.

52982 The thread is created executing *start\_routine* with *arg* as its sole argument. If the *start\_routine*  
 52983 returns, the effect shall be as if there was an implicit call to *pthread\_exit()* using the return value  
 52984 of *start\_routine* as the exit status. Note that the thread in which *main()* was originally invoked  
 52985 differs from this. When it returns from *main()*, the effect shall be as if there was an implicit call to  
 52986 *exit()* using the return value of *main()* as the exit status.

52987 The signal state of the new thread shall be initialized as follows:

- 52988 • The signal mask shall be inherited from the creating thread.
- 52989 • The set of signals pending for the new thread shall be empty.

52990 XSI The thread-local current locale and the alternate stack shall not be inherited.

52991 The floating-point environment shall be inherited from the creating thread.

52992 If *pthread\_create()* fails, no new thread is created and the contents of the location referenced by  
 52993 *thread* are undefined.

52994 TCT If `_POSIX_THREAD_CPUTIME` is defined, the new thread shall have a CPU-time clock  
 52995 accessible, and the initial value of this clock shall be set to zero.

52996 The behavior is undefined if the value specified by the *attr* argument to *pthread\_create()* does not  
 52997 refer to an initialized thread attributes object.

52998 **RETURN VALUE**

52999 If successful, the *pthread\_create()* function shall return zero; otherwise, an error number shall be  
 53000 returned to indicate the error.

53001 **ERRORS**

53002 The *pthread\_create()* function shall fail if:

53003 [EAGAIN] The system lacked the necessary resources to create another thread, or the  
 53004 system-imposed limit on the total number of threads in a process  
 53005 {PTHREAD\_THREADS\_MAX} would be exceeded.

53006 [EPERM] The caller does not have appropriate privileges to set the required scheduling  
 53007 parameters or scheduling policy.

53008 The *pthread\_create()* function shall not return an error code of [EINTR].

## EXAMPLES

None.

## APPLICATION USAGE

There is no requirement on the implementation that the ID of the created thread be available before the newly created thread starts executing. The calling thread can obtain the ID of the created thread through the *thread* argument of the *pthread\_create()* function, and the newly created thread can obtain its ID by a call to *pthread\_self()*.

## RATIONALE

A suggested alternative to *pthread\_create()* would be to define two separate operations: create and start. Some applications would find such behavior more natural. Ada, in particular, separates the “creation” of a task from its “activation”.

Splitting the operation was rejected by the standard developers for many reasons:

- The number of calls required to start a thread would increase from one to two and thus place an additional burden on applications that do not require the additional synchronization. The second call, however, could be avoided by the additional complication of a start-up state attribute.
- An extra state would be introduced: “created but not started”. This would require the standard to specify the behavior of the thread operations when the target has not yet started executing.
- For those applications that require such behavior, it is possible to simulate the two separate steps with the facilities that are currently provided. The *start\_routine()* can synchronize by waiting on a condition variable that is signaled by the start operation.

An Ada implementor can choose to create the thread at either of two points in the Ada program: when the task object is created, or when the task is activated (generally at a “begin”). If the first approach is adopted, the *start\_routine()* needs to wait on a condition variable to receive the order to begin “activation”. The second approach requires no such condition variable or extra synchronization. In either approach, a separate Ada task control block would need to be created when the task object is created to hold rendezvous queues, and so on.

An extension of the preceding model would be to allow the state of the thread to be modified between the create and start. This would allow the thread attributes object to be eliminated. This has been rejected because:

- All state in the thread attributes object has to be able to be set for the thread. This would require the definition of functions to modify thread attributes. There would be no reduction in the number of function calls required to set up the thread. In fact, for an application that creates all threads using identical attributes, the number of function calls required to set up the threads would be dramatically increased. Use of a thread attributes object permits the application to make one set of attribute setting function calls. Otherwise, the set of attribute setting function calls needs to be made for each thread creation.
- Depending on the implementation architecture, functions to set thread state would require kernel calls, or for other implementation reasons would not be able to be implemented as macros, thereby increasing the cost of thread creation.
- The ability for applications to segregate threads by class would be lost.

Another suggested alternative uses a model similar to that for process creation, such as “thread fork”. The fork semantics would provide more flexibility and the “create” function can be implemented simply by doing a thread fork followed immediately by a call to the desired “start

routine” for the thread. This alternative has these problems:

- For many implementations, the entire stack of the calling thread would need to be duplicated, since in many architectures there is no way to determine the size of the calling frame.
- Efficiency is reduced since at least some part of the stack has to be copied, even though in most cases the thread never needs the copied context, since it merely calls the desired start routine.

If an implementation detects that the value specified by the *attr* argument to *pthread\_create()* does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

*fork()*, *pthread\_exit()*, *pthread\_join()*

XBD Section 4.12 (on page 111), **<pthread.h>**

#### CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### Issue 6

The *pthread\_create()* function is marked as part of the Threads option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EPERM] mandatory error condition is added.

The thread CPU-time clock semantics are added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread\_create()* prototype for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION is updated to make it explicit that the floating-point environment is inherited from the creating thread.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/44 is applied, adding text that the alternate stack is not inherited.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/93 is applied, updating the ERRORS section to remove the mandatory [EINVAL] error (“The value specified by *attr* is invalid”), and adding the optional [EINVAL] error (“The attributes specified by *attr* are invalid”).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/94 is applied, adding the APPLICATION USAGE section.

#### Issue 7

The *pthread\_create()* function is moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0458 [302] is applied.

**53094 NAME**

53095 pthread\_detach — detach a thread

**53096 SYNOPSIS**

```
53097 #include <pthread.h>
53098 int pthread_detach(pthread_t thread);
```

**53099 DESCRIPTION**

53100 The *pthread\_detach()* function shall indicate to the implementation that storage for the thread  
 53101 *thread* can be reclaimed when that thread terminates. If *thread* has not terminated,  
 53102 *pthread\_detach()* shall not cause it to terminate.

53103 The behavior is undefined if the value specified by the *thread* argument to *pthread\_detach()* does  
 53104 not refer to a joinable thread.

**53105 RETURN VALUE**

53106 If the call succeeds, *pthread\_detach()* shall return 0; otherwise, an error number shall be returned  
 53107 to indicate the error.

**53108 ERRORS**

53109 The *pthread\_detach()* function shall not return an error code of [EINTR].

**53110 EXAMPLES**

53111 None.

**53112 APPLICATION USAGE**

53113 None.

**53114 RATIONALE**

53115 The *pthread\_join()* or *pthread\_detach()* functions should eventually be called for every thread that  
 53116 is created so that storage associated with the thread may be reclaimed.

53117 It has been suggested that a “detach” function is not necessary; the *detachstate* thread creation  
 53118 attribute is sufficient, since a thread need never be dynamically detached. However, need arises  
 53119 in at least two cases:

- 53120 1. In a cancellation handler for a *pthread\_join()* it is nearly essential to have a  
 53121 *pthread\_detach()* function in order to detach the thread on which *pthread\_join()* was  
 53122 waiting. Without it, it would be necessary to have the handler do another *pthread\_join()* to  
 53123 attempt to detach the thread, which would both delay the cancellation processing for an  
 53124 unbounded period and introduce a new call to *pthread\_join()*, which might itself need a  
 53125 cancellation handler. A dynamic detach is nearly essential in this case.
- 53126 2. In order to detach the “initial thread” (as may be desirable in processes that set up server  
 53127 threads).

53128 If an implementation detects that the value specified by the *thread* argument to *pthread\_detach()*  
 53129 does not refer to a joinable thread, it is recommended that the function should fail and report an  
 53130 [EINVAL] error.

53131 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
 53132 that the function should fail and report an [ESRCH] error.

**53133 FUTURE DIRECTIONS**

53134 None.

**53135 SEE ALSO**

53136 *pthread\_join()*

53137 XBD <pthread.h>

**53138 CHANGE HISTORY**

53139 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**53140 Issue 6**

53141 The *pthread\_detach()* function is marked as part of the Threads option.

53142 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/95 is applied, updating the ERRORS  
53143 section so that the [EINVAL] and [ESRCH] error cases become optional.

**53144 Issue 7**

53145 The *pthread\_detach()* function is moved from the Threads option to the Base.

53146 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

53147 The [EINVAL] error for a non-joinable thread is removed; this condition results in undefined  
53148 behavior.

53149 **NAME**

53150 pthread\_equal — compare thread IDs

53151 **SYNOPSIS**

53152 #include <pthread.h>

53153 int pthread\_equal(pthread\_t t1, pthread\_t t2);

53154 **DESCRIPTION**

53155 This function shall compare the thread IDs *t1* and *t2*.

53156 **RETURN VALUE**

53157 The *pthread\_equal()* function shall return a non-zero value if *t1* and *t2* are equal; otherwise, zero  
53158 shall be returned.

53159 If either *t1* or *t2* are not valid thread IDs, the behavior is undefined.

53160 **ERRORS**

53161 No errors are defined.

53162 The *pthread\_equal()* function shall not return an error code of [EINTR].

53163 **EXAMPLES**

53164 None.

53165 **APPLICATION USAGE**

53166 None.

53167 **RATIONALE**

53168 Implementations may choose to define a thread ID as a structure. This allows additional  
53169 flexibility and robustness over using an **int**. For example, a thread ID could include a sequence  
53170 number that allows detection of “dangling IDs” (copies of a thread ID that has been detached).  
53171 Since the C language does not support comparison on structure types, the *pthread\_equal()*  
53172 function is provided to compare thread IDs.

53173 **FUTURE DIRECTIONS**

53174 None.

53175 **SEE ALSO**

53176 *pthread\_create()*, *pthread\_self()*

53177 XBD <pthread.h>

53178 **CHANGE HISTORY**

53179 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

53180 **Issue 6**

53181 The *pthread\_equal()* function is marked as part of the Threads option.

53182 **Issue 7**

53183 The *pthread\_equal()* function is moved from the Threads option to the Base.

**53184 NAME**

53185 pthread\_exit — thread termination

**53186 SYNOPSIS**

53187 #include <pthread.h>

53188 void pthread\_exit(void \*value\_ptr);

**53189 DESCRIPTION**

53190 The *pthread\_exit()* function shall terminate the calling thread and make the value *value\_ptr*  
53191 available to any successful join with the terminating thread. Any cancellation cleanup handlers  
53192 that have been pushed and not yet popped shall be popped in the reverse order that they were  
53193 pushed and then executed. After all cancellation cleanup handlers have been executed, if the  
53194 thread has any thread-specific data, appropriate destructor functions shall be called in an  
53195 unspecified order. Thread termination does not release any application visible process resources,  
53196 including, but not limited to, mutexes and file descriptors, nor does it perform any process-level  
53197 cleanup actions, including, but not limited to, calling any *atexit()* routines that may exist.

53198 An implicit call to *pthread\_exit()* is made when a thread other than the thread in which *main()*  
53199 was first invoked returns from the start routine that was used to create it. The function's return  
53200 value shall serve as the thread's exit status.

53201 The behavior of *pthread\_exit()* is undefined if called from a cancellation cleanup handler or  
53202 destructor function that was invoked as a result of either an implicit or explicit call to  
53203 *pthread\_exit()*.

53204 After a thread has terminated, the result of access to local (auto) variables of the thread is  
53205 undefined. Thus, references to local variables of the exiting thread should not be used for the  
53206 *pthread\_exit()* *value\_ptr* parameter value.

53207 The process shall exit with an exit status of 0 after the last thread has been terminated. The  
53208 behavior shall be as if the implementation called *exit()* with a zero argument at thread  
53209 termination time.

**53210 RETURN VALUE**

53211 The *pthread\_exit()* function cannot return to its caller.

**53212 ERRORS**

53213 No errors are defined.

**53214 EXAMPLES**

53215 None.

**53216 APPLICATION USAGE**

53217 None.

**53218 RATIONALE**

53219 The normal mechanism by which a thread terminates is to return from the routine that was  
53220 specified in the *pthread\_create()* call that started it. The *pthread\_exit()* function provides the  
53221 capability for a thread to terminate without requiring a return from the start routine of that  
53222 thread, thereby providing a function analogous to *exit()*.

53223 Regardless of the method of thread termination, any cancellation cleanup handlers that have  
53224 been pushed and not yet popped are executed, and the destructors for any existing thread-  
53225 specific data are executed. This volume of POSIX.1-2008 requires that cancellation cleanup  
53226 handlers be popped and called in order. After all cancellation cleanup handlers have been  
53227 executed, thread-specific data destructors are called, in an unspecified order, for each item of  
53228 thread-specific data that exists in the thread. This ordering is necessary because cancellation  
53229 cleanup handlers may rely on thread-specific data.

53230 As the meaning of the status is determined by the application (except when the thread has been  
53231 canceled, in which case it is PTHREAD\_CANCELED), the implementation has no idea what an  
53232 illegal status value is, which is why no address error checking is done.

53233 **FUTURE DIRECTIONS**

53234 None.

53238 **CHANGE HISTORY**

53239 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

53240 **Issue 6**

53241 The *pthread\_exit()* function is marked as part of the Threads option.

53242 **Issue 7**

53243 The *pthread\_exit()* function is moved from the Threads option to the Base.

**53244 NAME**

53245 pthread\_getconcurrency, pthread\_setconcurrency — get and set the level of concurrency

**53246 SYNOPSIS**

```
53247 OB XSI #include <pthread.h>
53248 int pthread_getconcurrency(void);
53249 int pthread_setconcurrency(int new_level);
```

**53250 DESCRIPTION**

53251 Unbound threads in a process may or may not be required to be simultaneously active. By  
 53252 default, the threads implementation ensures that a sufficient number of threads are active so that  
 53253 the process can continue to make progress. While this conserves system resources, it may not  
 53254 produce the most effective level of concurrency.

53255 The *pthread\_setconcurrency()* function allows an application to inform the threads  
 53256 implementation of its desired concurrency level, *new\_level*. The actual level of concurrency  
 53257 provided by the implementation as a result of this function call is unspecified.

53258 If *new\_level* is zero, it causes the implementation to maintain the concurrency level at its  
 53259 discretion as if *pthread\_setconcurrency()* had never been called.

53260 The *pthread\_getconcurrency()* function shall return the value set by a previous call to the  
 53261 *pthread\_setconcurrency()* function. If the *pthread\_setconcurrency()* function was not previously  
 53262 called, this function shall return zero to indicate that the implementation is maintaining the  
 53263 concurrency level.

53264 A call to *pthread\_setconcurrency()* shall inform the implementation of its desired concurrency  
 53265 level. The implementation shall use this as a hint, not a requirement.

53266 If an implementation does not support multiplexing of user threads on top of several kernel-  
 53267 scheduled entities, the *pthread\_setconcurrency()* and *pthread\_getconcurrency()* functions are  
 53268 provided for source code compatibility but they shall have no effect when called. To maintain  
 53269 the function semantics, the *new\_level* parameter is saved when *pthread\_setconcurrency()* is called  
 53270 so that a subsequent call to *pthread\_getconcurrency()* shall return the same value.

**53271 RETURN VALUE**

53272 If successful, the *pthread\_setconcurrency()* function shall return zero; otherwise, an error number  
 53273 shall be returned to indicate the error.

53274 The *pthread\_getconcurrency()* function shall always return the concurrency level set by a previous  
 53275 call to *pthread\_setconcurrency()*. If the *pthread\_setconcurrency()* function has never been called,  
 53276 *pthread\_getconcurrency()* shall return zero.

**53277 ERRORS**

53278 The *pthread\_setconcurrency()* function shall fail if:

53279 [EINVAL] The value specified by *new\_level* is negative.

53280 [EAGAIN] The value specified by *new\_level* would cause a system resource to be  
 53281 exceeded.

53282 The *pthread\_setconcurrency()* function shall not return an error code of [EINTR].

**53283 EXAMPLES**

53284 None.

**53285 APPLICATION USAGE**

53286 Application developers should note that an implementation can always ignore any calls to  
53287 *pthread\_setconcurrency()* and return a constant for *pthread\_getconcurrency()*. For this reason, it is  
53288 not recommended that portable applications use this function.

**53289 RATIONALE**

53290 None.

**53291 FUTURE DIRECTIONS**

53292 These functions may be removed in a future version.

**53293 SEE ALSO**

53294 XBD [<pthread.h>](#)

**53295 CHANGE HISTORY**

53296 First released in Issue 5.

**53297 Issue 7**

53298 SD5-XSH-ERN-184 is applied.

53299 The *pthread\_getconcurrency()* and *pthread\_setconcurrency()* functions are marked obsolescent.

53300 **NAME**

53301 pthread\_getcpuclockid — access a thread CPU-time clock (ADVANCED REALTIME  
53302 THREADS)

53303 **SYNOPSIS**

```
53304 TCT #include <pthread.h>
53305      #include <time.h>
53306      int pthread_getcpuclockid(pthread_t thread_id, clockid_t *clock_id);
```

53307 **DESCRIPTION**

53308 The *pthread\_getcpuclockid()* function shall return in *clock\_id* the clock ID of the CPU-time clock of  
53309 the thread specified by *thread\_id*, if the thread specified by *thread\_id* exists.

53310 **RETURN VALUE**

53311 Upon successful completion, *pthread\_getcpuclockid()* shall return zero; otherwise, an error  
53312 number shall be returned to indicate the error.

53313 **ERRORS**

53314 No errors are defined.

53315 **EXAMPLES**

53316 None.

53317 **APPLICATION USAGE**

53318 The *pthread\_getcpuclockid()* function is part of the Thread CPU-Time Clocks option and need not  
53319 be provided on all implementations.

53320 **RATIONALE**

53321 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
53322 that the function should fail and report an [ESRCH] error.

53323 **FUTURE DIRECTIONS**

53324 None.

53325 **SEE ALSO**

53327 XBD *<pthread.h>*, *<time.h>*

53328 **CHANGE HISTORY**

53329 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

53330 In the SYNOPSIS, the inclusion of *<sys/types.h>* is no longer required.

53331 **Issue 7**

53332 The *pthread\_getcpuclockid()* function is marked only as part of the Thread CPU-Time Clocks  
53333 option as the Threads option is now part of the Base.

53334 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

**NAME**

pthread\_getschedparam, pthread\_setschedparam — dynamic thread scheduling parameters access (**REALTIME THREADS**)

**SYNOPSIS**

```

#include <pthread.h>

int pthread_getschedparam(pthread_t thread, int *restrict policy,
    struct sched_param *restrict param);
int pthread_setschedparam(pthread_t thread, int policy,
    const struct sched_param *param);

```

**DESCRIPTION**

The *pthread\_getschedparam()* and *pthread\_setschedparam()* functions shall, respectively, get and set the scheduling policy and parameters of individual threads within a multi-threaded process to be retrieved and set. For SCHED\_FIFO and SCHED\_RR, the only required member of the **sched\_param** structure is the priority *sched\_priority*. For SCHED\_OTHER, the affected scheduling parameters are implementation-defined.

The *pthread\_getschedparam()* function shall retrieve the scheduling policy and scheduling parameters for the thread whose thread ID is given by *thread* and shall store those values in *policy* and *param*, respectively. The priority value returned from *pthread\_getschedparam()* shall be the value specified by the most recent *pthread\_setschedparam()*, *pthread\_setschedprio()*, or *pthread\_create()* call affecting the target thread. It shall not reflect any temporary adjustments to its priority as a result of any priority inheritance or ceiling functions. The *pthread\_setschedparam()* function shall set the scheduling policy and associated scheduling parameters for the thread whose thread ID is given by *thread* to the policy and associated parameters provided in *policy* and *param*, respectively.

The *policy* parameter may have the value SCHED\_OTHER, SCHED\_FIFO, or SCHED\_RR. The scheduling parameters for the SCHED\_OTHER policy are implementation-defined. The SCHED\_FIFO and SCHED\_RR policies shall have a single scheduling parameter, *priority*.

If **\_POSIX\_THREAD\_SPORADIC\_SERVER** is defined, then the *policy* argument may have the value SCHED\_SPORADIC, with the exception for the *pthread\_setschedparam()* function that if the scheduling policy was not SCHED\_SPORADIC at the time of the call, it is implementation-defined whether the function is supported; in other words, the implementation need not allow the application to dynamically change the scheduling policy to SCHED\_SPORADIC. The sporadic server scheduling policy has the associated parameters *sched\_ss\_low\_priority*, *sched\_ss\_repl\_period*, *sched\_ss\_init\_budget*, *sched\_priority*, and *sched\_ss\_max\_repl*. The specified *sched\_ss\_repl\_period* shall be greater than or equal to the specified *sched\_ss\_init\_budget* for the function to succeed; if it is not, then the function shall fail. The value of *sched\_ss\_max\_repl* shall be within the inclusive range [1, {SS\_REPL\_MAX}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

If the *pthread\_setschedparam()* function fails, the scheduling parameters shall not be changed for the target thread.

**RETURN VALUE**

If successful, the *pthread\_getschedparam()* and *pthread\_setschedparam()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The *pthread\_getschedparam()* function shall fail if:

[ENOTSUP] An attempt was made to set the policy or scheduling parameters to an unsupported value.

[ENOTSUP] An attempt was made to dynamically change the scheduling policy to SCHED\_SPORADIC, and the implementation does not support this change.

The *pthread\_getschedparam()* function may fail if:

[EINVAL] The value specified by *policy* or one of the scheduling parameters associated with the scheduling policy *policy* is invalid.

[EPERM] The caller does not have appropriate privileges to set either the scheduling parameters or the scheduling policy of the specified thread.

[EPERM] The implementation does not allow the application to modify one of the parameters to the value specified.

These functions shall not return an error code of [EINTR].

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended that the function should fail and report an [ESRCH] error.

**FUTURE DIRECTIONS**

None.

XBD <pthread.h>, <sched.h>

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

The *pthread\_getschedparam()* and *pthread\_setschedparam()* functions are marked as part of the Threads and Thread Execution Scheduling options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Execution Scheduling option.

The Open Group Corrigendum U026/2 is applied, correcting the prototype for the *pthread\_setschedparam()* function so that its second argument is of type **int**.

The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread\_getschedparam()* prototype for alignment with the ISO/IEC 9899:1999 standard.

The Open Group Corrigendum U047/1 is applied.

IEEE PASC Interpretation 1003.1 #96 is applied, noting that priority values can also be set by a call to the *pthread\_setschedprio()* function.

53421 **Issue 7**

53422 The *pthread\_getschedparam()* and *pthread\_setschedparam()* functions are marked only as part of the  
53423 Thread Execution Scheduling option as the Threads option is now part of the Base.

53424 Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements  
53425 for the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values.

53426 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.  
53427 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0459 [314] is applied.

53428 **NAME**

53429 pthread\_getspecific, pthread\_setspecific — thread-specific data management

53430 **SYNOPSIS**

53431 #include &lt;pthread.h&gt;

53432 void \*pthread\_getspecific(pthread\_key\_t key);

53433 int pthread\_setspecific(pthread\_key\_t key, const void \*value);

53434 **DESCRIPTION**53435 The *pthread\_getspecific()* function shall return the value currently bound to the specified *key* on  
53436 behalf of the calling thread.53437 The *pthread\_setspecific()* function shall associate a thread-specific *value* with a *key* obtained via a  
53438 previous call to *pthread\_key\_create()*. Different threads may bind different values to the same  
53439 key. These values are typically pointers to blocks of dynamically allocated memory that have  
53440 been reserved for use by the calling thread.53441 The effect of calling *pthread\_getspecific()* or *pthread\_setspecific()* with a *key* value not obtained  
53442 from *pthread\_key\_create()* or after *key* has been deleted with *pthread\_key\_delete()* is undefined.53443 Both *pthread\_getspecific()* and *pthread\_setspecific()* may be called from a thread-specific data  
53444 destructor function. A call to *pthread\_getspecific()* for the thread-specific data *key* being  
53445 destroyed shall return the value NULL, unless the value is changed (after the destructor starts)  
53446 by a call to *pthread\_setspecific()*. Calling *pthread\_setspecific()* from a thread-specific data  
53447 destructor routine may result either in lost storage (after at least  
53448 PTHREAD\_DESTRUCTOR\_ITERATIONS attempts at destruction) or in an infinite loop.

53449 Both functions may be implemented as macros.

53450 **RETURN VALUE**53451 The *pthread\_getspecific()* function shall return the thread-specific data value associated with the  
53452 given *key*. If no thread-specific data value is associated with *key*, then the value NULL shall be  
53453 returned.53454 If successful, the *pthread\_setspecific()* function shall return zero; otherwise, an error number shall  
53455 be returned to indicate the error.53456 **ERRORS**53457 No errors are returned from *pthread\_getspecific()*.53458 The *pthread\_setspecific()* function shall fail if:

53459 [ENOMEM] Insufficient memory exists to associate the non-NULL value with the key.

53460 The *pthread\_setspecific()* function shall not return an error code of [EINTR].53461 **EXAMPLES**

53462 None.

53463 **APPLICATION USAGE**

53464 None.

53465 **RATIONALE**53466 Performance and ease-of-use of *pthread\_getspecific()* are critical for functions that rely on  
53467 maintaining state in thread-specific data. Since no errors are required to be detected by it, and  
53468 since the only error that could be detected is the use of an invalid key, the function to  
53469 *pthread\_getspecific()* has been designed to favor speed and simplicity over error reporting.53470 If an implementation detects that the value specified by the *key* argument to *pthread\_setspecific()*  
53471 does not refer to a key value obtained from *pthread\_key\_create()* or refers to a key that has been

53472 deleted with *pthread\_key\_delete()*, it is recommended that the function should fail and report an  
53473 [EINVAL] error.

#### 53474 FUTURE DIRECTIONS

53475 None.

#### 53476 SEE ALSO

53477 *pthread\_key\_create()*

53478 XBD <pthread.h>

#### 53479 CHANGE HISTORY

53480 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

##### 53481 Issue 6

53482 The *pthread\_getspecific()* and *pthread\_setspecific()* functions are marked as part of the Threads  
53483 option.

53484 IEEE PASC Interpretation 1003.1c #3 (Part 6) is applied, updating the DESCRIPTION.

53485 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/96 is applied, updating the ERRORS  
53486 section so that the [ENOMEM] error case is changed from “to associate the value with the key”  
53487 to “to associate the non-NULL value with the key”.

##### 53488 Issue 7

53489 Austin Group Interpretation 1003.1-2001 #063 is applied, updating the ERRORS section.

53490 The *pthread\_getspecific()* and *pthread\_setspecific()* functions are moved from the Threads option to  
53491 the Base.

53492 The [EINVAL] error for a key value not obtained from *pthread\_key\_create()* or a key deleted with  
53493 *pthread\_key\_delete()* is removed; this condition results in undefined behavior.

53494 **NAME**

53495 pthread\_join — wait for thread termination

53496 **SYNOPSIS**

53497 #include &lt;pthread.h&gt;

53498 int pthread\_join(pthread\_t thread, void \*\*value\_ptr);

53499 **DESCRIPTION**

53500 The *pthread\_join()* function shall suspend execution of the calling thread until the target *thread*  
 53501 terminates, unless the target *thread* has already terminated. On return from a successful  
 53502 *pthread\_join()* call with a non-NULL *value\_ptr* argument, the value passed to *pthread\_exit()* by  
 53503 the terminating thread shall be made available in the location referenced by *value\_ptr*. When a  
 53504 *pthread\_join()* returns successfully, the target thread has been terminated. The results of multiple  
 53505 simultaneous calls to *pthread\_join()* specifying the same target thread are undefined. If the  
 53506 thread calling *pthread\_join()* is canceled, then the target thread shall not be detached.

53507 It is unspecified whether a thread that has exited but remains unjoined counts against  
 53508 {PTHREAD\_THREADS\_MAX}.

53509 The behavior is undefined if the value specified by the *thread* argument to *pthread\_join()* does not  
 53510 refer to a joinable thread.

53511 The behavior is undefined if the value specified by the *thread* argument to *pthread\_join()* refers to  
 53512 the calling thread.

53513 **RETURN VALUE**

53514 If successful, the *pthread\_join()* function shall return zero; otherwise, an error number shall be  
 53515 returned to indicate the error.

53516 **ERRORS**53517 The *pthread\_join()* function may fail if:

53518 [EDEADLK] A deadlock was detected.

53519 The *pthread\_join()* function shall not return an error code of [EINTR].53520 **EXAMPLES**

53521 An example of thread creation and deletion follows:

```

53522 typedef struct {
53523     int *ar;
53524     long n;
53525 } subarray;

53526 void *
53527 incer(void *arg)
53528 {
53529     long i;

53530     for (i = 0; i < ((subarray *)arg)->n; i++)
53531         ((subarray *)arg)->ar[i]++;
53532 }

53533 int main(void)
53534 {
53535     int          ar[1000000];
53536     pthread_t    th1, th2;
53537     subarray     sb1, sb2;

```

```

53538         sb1.ar = &ar[0];
53539         sb1.n  = 500000;
53540         (void) pthread_create(&th1, NULL, incer, &sb1);

53541         sb2.ar = &ar[500000];
53542         sb2.n  = 500000;
53543         (void) pthread_create(&th2, NULL, incer, &sb2);

53544         (void) pthread_join(th1, NULL);
53545         (void) pthread_join(th2, NULL);
53546         return 0;
53547     }

```

## APPLICATION USAGE

None.

## RATIONALE

The *pthread\_join()* function is a convenience that has proven useful in multi-threaded applications. It is true that a programmer could simulate this function if it were not provided by passing extra state as part of the argument to the *start\_routine()*. The terminating thread would set a flag to indicate termination and broadcast a condition that is part of that state; a joining thread would wait on that condition variable. While such a technique would allow a thread to wait on more complex conditions (for example, waiting for multiple threads to terminate), waiting on individual thread termination is considered widely useful. Also, including the *pthread\_join()* function in no way precludes a programmer from coding such complex waits. Thus, while not a primitive, including *pthread\_join()* in this volume of POSIX.1-2008 was considered valuable.

The *pthread\_join()* function provides a simple mechanism allowing an application to wait for a thread to terminate. After the thread terminates, the application may then choose to clean up resources that were used by the thread. For instance, after *pthread\_join()* returns, any application-provided stack storage could be reclaimed.

The *pthread\_join()* or *pthread\_detach()* function should eventually be called for every thread that is created with the *detachstate* attribute set to *PTHREAD\_CREATE\_JOINABLE* so that storage associated with the thread may be reclaimed.

The interaction between *pthread\_join()* and cancellation is well-defined for the following reasons:

- The *pthread\_join()* function, like all other non-async-cancel-safe functions, can only be called with deferred cancelability type.
- Cancellation cannot occur in the disabled cancelability state.

Thus, only the default cancelability state need be considered. As specified, either the *pthread\_join()* call is canceled, or it succeeds, but not both. The difference is obvious to the application, since either a cancellation handler is run or *pthread\_join()* returns. There are no race conditions since *pthread\_join()* was called in the deferred cancelability state.

If an implementation detects that the value specified by the *thread* argument to *pthread\_join()* does not refer to a joinable thread, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *thread* argument to *pthread\_join()* refers to the calling thread, it is recommended that the function should fail and report an [EDEADLK] error.

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended

53583 that the function should fail and report an [ESRCH] error.

53584 **FUTURE DIRECTIONS**

53589 **CHANGE HISTORY**

53590 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

53591 **Issue 6**

53592 The *pthread\_join()* function is marked as part of the Threads option.

53593 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/97 is applied, updating the ERRORS  
53594 section so that the [EINVAL] error is made optional and the words “the implementation has  
53595 detected” are removed from it.

53596 **Issue 7**

53597 The *pthread\_join()* function is moved from the Threads option to the Base.

53598 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

53599 The [EINVAL] error for a non-joinable thread is removed; this condition results in undefined  
53600 behavior.

53601 The [EDEADLK] error for the calling thread is removed; this condition results in undefined  
53602 behavior.

53603 **NAME**

53604 pthread\_key\_create — thread-specific data key creation

53605 **SYNOPSIS**

```
53606 #include <pthread.h>
53607 int pthread_key_create(pthread_key_t *key, void (*destructor)(void*));
```

53608 **DESCRIPTION**

53609 The *pthread\_key\_create()* function shall create a thread-specific data key visible to all threads in  
 53610 the process. Key values provided by *pthread\_key\_create()* are opaque objects used to locate  
 53611 thread-specific data. Although the same key value may be used by different threads, the values  
 53612 bound to the key by *pthread\_setspecific()* are maintained on a per-thread basis and persist for the  
 53613 life of the calling thread.

53614 Upon key creation, the value NULL shall be associated with the new key in all active threads.  
 53615 Upon thread creation, the value NULL shall be associated with all defined keys in the new  
 53616 thread.

53617 An optional destructor function may be associated with each key value. At thread exit, if a key  
 53618 value has a non-NULL destructor pointer, and the thread has a non-NULL value associated with  
 53619 that key, the value of the key is set to NULL, and then the function pointed to is called with the  
 53620 previously associated value as its sole argument. The order of destructor calls is unspecified if  
 53621 more than one destructor exists for a thread when it exits.

53622 If, after all the destructors have been called for all non-NULL values with associated destructors,  
 53623 there are still some non-NULL values with associated destructors, then the process is repeated.  
 53624 If, after at least {PTHREAD\_DESTRUCTOR\_ITERATIONS} iterations of destructor calls for  
 53625 outstanding non-NULL values, there are still some non-NULL values with associated  
 53626 destructors, implementations may stop calling destructors, or they may continue calling  
 53627 destructors until no non-NULL values with associated destructors exist, even though this might  
 53628 result in an infinite loop.

53629 **RETURN VALUE**

53630 If successful, the *pthread\_key\_create()* function shall store the newly created key value at *\*key* and  
 53631 shall return zero. Otherwise, an error number shall be returned to indicate the error.

53632 **ERRORS**

53633 The *pthread\_key\_create()* function shall fail if:

53634 [EAGAIN] The system lacked the necessary resources to create another thread-specific  
 53635 data key, or the system-imposed limit on the total number of keys per process  
 53636 {PTHREAD\_KEYS\_MAX} has been exceeded.

53637 [ENOMEM] Insufficient memory exists to create the key.

53638 The *pthread\_key\_create()* function shall not return an error code of [EINTR].

53639 **EXAMPLES**

53640 The following example demonstrates a function that initializes a thread-specific data key when it  
 53641 is first called, and associates a thread-specific object with each calling thread, initializing this  
 53642 object when necessary.

```
53643 static pthread_key_t key;
53644 static pthread_once_t key_once = PTHREAD_ONCE_INIT;

53645 static void
53646 make_key( )
53647 {
```

```

53648     (void) pthread_key_create(&key, NULL);
53649 }
53650 func()
53651 {
53652     void *ptr;
53653     (void) pthread_once(&key_once, make_key);
53654     if ((ptr = pthread_getspecific(key)) == NULL) {
53655         ptr = malloc(OBJECT_SIZE);
53656         ...
53657         (void) pthread_setspecific(key, ptr);
53658     }
53659     ...
53660 }

```

Note that the key has to be initialized before *pthread\_getspecific()* or *pthread\_setspecific()* can be used. The *pthread\_key\_create()* call could either be explicitly made in a module initialization routine, or it can be done implicitly by the first call to a module as in this example. Any attempt to use the key before it is initialized is a programming error, making the code below incorrect.

```

53665 static pthread_key_t key;
53666 func()
53667 {
53668     void *ptr;
53669     /* KEY NOT INITIALIZED!!! THIS WON'T WORK!!! */
53670     if ((ptr = pthread_getspecific(key)) == NULL &&
53671         pthread_setspecific(key, NULL) != 0) {
53672         pthread_key_create(&key, NULL);
53673         ...
53674     }
53675 }

```

## APPLICATION USAGE

None.

## RATIONALE

### Destructor Functions

Normally, the value bound to a key on behalf of a particular thread is a pointer to storage allocated dynamically on behalf of the calling thread. The destructor functions specified with *pthread\_key\_create()* are intended to be used to free this storage when the thread exits. Thread cancellation cleanup handlers cannot be used for this purpose because thread-specific data may persist outside the lexical scope in which the cancellation cleanup handlers operate.

If the value associated with a key needs to be updated during the lifetime of the thread, it may be necessary to release the storage associated with the old value before the new value is bound. Although the *pthread\_setspecific()* function could do this automatically, this feature is not needed often enough to justify the added complexity. Instead, the programmer is responsible for freeing the stale storage:

```

53690 pthread_getspecific(key, &old);
53691 new = allocate();
53692 destructor(old);

```

53693 pthread\_setspecific(key, new);

53694 **Note:** The above example could leak storage if run with asynchronous cancellation enabled. No such  
 53695 problems occur in the default cancellation state if no cancellation points occur between the get  
 53696 and set.

53697 There is no notion of a destructor-safe function. If an application does not call *pthread\_exit()*  
 53698 from a signal handler, or if it blocks any signal whose handler may call *pthread\_exit()* while  
 53699 calling async-unsafe functions, all functions may be safely called from destructors.

#### 53700 Non-Idempotent Data Key Creation

53701 There were requests to make *pthread\_key\_create()* idempotent with respect to a given *key* address  
 53702 parameter. This would allow applications to call *pthread\_key\_create()* multiple times for a given  
 53703 *key* address and be guaranteed that only one key would be created. Doing so would require the  
 53704 key value to be previously initialized (possibly at compile time) to a known null value and  
 53705 would require that implicit mutual-exclusion be performed based on the address and contents of  
 53706 the *key* parameter in order to guarantee that exactly one key would be created.

53707 Unfortunately, the implicit mutual-exclusion would not be limited to only *pthread\_key\_create()*.  
 53708 On many implementations, implicit mutual-exclusion would also have to be performed by  
 53709 *pthread\_getspecific()* and *pthread\_setspecific()* in order to guard against using incompletely stored  
 53710 or not-yet-visible key values. This could significantly increase the cost of important operations,  
 53711 particularly *pthread\_getspecific()*.

53712 Thus, this proposal was rejected. The *pthread\_key\_create()* function performs no implicit  
 53713 synchronization. It is the responsibility of the programmer to ensure that it is called exactly once  
 53714 per key before use of the key. Several straightforward mechanisms can already be used to  
 53715 accomplish this, including calling explicit module initialization functions, using mutexes, and  
 53716 using *pthread\_once()*. This places no significant burden on the programmer, introduces no  
 53717 possibly confusing *ad hoc* implicit synchronization mechanism, and potentially allows  
 53718 commonly used thread-specific data operations to be more efficient.

#### 53719 FUTURE DIRECTIONS

53720 None.

#### 53721 SEE ALSO

53722 *pthread\_getspecific()*, *pthread\_key\_delete()*

53723 XBD <pthread.h>

#### 53724 CHANGE HISTORY

53725 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 53726 Issue 6

53727 The *pthread\_key\_create()* function is marked as part of the Threads option.

53728 IEEE PASC Interpretation 1003.1c #8 is applied, updating the DESCRIPTION.

#### 53729 Issue 7

53730 The *pthread\_key\_create()* function is moved from the Threads option to the Base.

**NAME**

pthread\_key\_delete — thread-specific data key deletion

**SYNOPSIS**

```
#include <pthread.h>
```

```
int pthread_key_delete(pthread_key_t key);
```

**DESCRIPTION**

The *pthread\_key\_delete()* function shall delete a thread-specific data key previously returned by *pthread\_key\_create()*. The thread-specific data values associated with *key* need not be NULL at the time *pthread\_key\_delete()* is called. It is the responsibility of the application to free any application storage or perform any cleanup actions for data structures related to the deleted key or associated thread-specific data in any threads; this cleanup can be done either before or after *pthread\_key\_delete()* is called. Any attempt to use *key* following the call to *pthread\_key\_delete()* results in undefined behavior.

The *pthread\_key\_delete()* function shall be callable from within destructor functions. No destructor functions shall be invoked by *pthread\_key\_delete()*. Any destructor function that may have been associated with *key* shall no longer be called upon thread exit.

**RETURN VALUE**

If successful, the *pthread\_key\_delete()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The *pthread\_key\_delete()* function shall not return an error code of [EINTR].

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

A thread-specific data key deletion function has been included in order to allow the resources associated with an unused thread-specific data key to be freed. Unused thread-specific data keys can arise, among other scenarios, when a dynamically loaded module that allocated a key is unloaded.

Conforming applications are responsible for performing any cleanup actions needed for data structures associated with the key to be deleted, including data referenced by thread-specific data values. No such cleanup is done by *pthread\_key\_delete()*. In particular, destructor functions are not called. There are several reasons for this division of responsibility:

1. The associated destructor functions used to free thread-specific data at thread exit time are only guaranteed to work correctly when called in the thread that allocated the thread-specific data. (Destructors themselves may utilize thread-specific data.) Thus, they cannot be used to free thread-specific data in other threads at key deletion time. Attempting to have them called by other threads at key deletion time would require other threads to be asynchronously interrupted. But since interrupted threads could be in an arbitrary state, including holding locks necessary for the destructor to run, this approach would fail. In general, there is no safe mechanism whereby an implementation could free thread-specific data at key deletion time.
2. Even if there were a means of safely freeing thread-specific data associated with keys to be deleted, doing so would require that implementations be able to enumerate the threads with non-NULL data and potentially keep them from creating more thread-

specific data while the key deletion is occurring. This special case could cause extra synchronization in the normal case, which would otherwise be unnecessary.

For an application to know that it is safe to delete a key, it has to know that all the threads that might potentially ever use the key do not attempt to use it again. For example, it could know this if all the client threads have called a cleanup procedure declaring that they are through with the module that is being shut down, perhaps by setting a reference count to zero.

If an implementation detects that the value specified by the *key* argument to *pthread\_key\_delete()* does not refer to a key value obtained from *pthread\_key\_create()* or refers to a key that has been deleted with *pthread\_key\_delete()*, it is recommended that the function should fail and report an [EINVAL] error.

#### 53787 FUTURE DIRECTIONS

53788 None.

#### 53789 SEE ALSO

53790 *pthread\_key\_create()*

53791 XBD <pthread.h>

#### 53792 CHANGE HISTORY

53793 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 53794 Issue 6

53795 The *pthread\_key\_delete()* function is marked as part of the Threads option.

#### 53796 Issue 7

53797 The *pthread\_key\_delete()* function is moved from the Threads option to the Base.

53798 The [EINVAL] error for a key value not obtained from *pthread\_key\_create()* or a key deleted with  
53799 *pthread\_key\_delete()* is removed; this condition results in undefined behavior.

53800 **NAME**

53801 pthread\_kill — send a signal to a thread

53802 **SYNOPSIS**

```
53803 CX      #include <signal.h>
53804      int pthread_kill(pthread_t thread, int sig);
```

53805 **DESCRIPTION**53806 The *pthread\_kill()* function shall request that a signal be delivered to the specified thread.53807 As in *kill()*, if *sig* is zero, error checking shall be performed but no signal shall actually be sent.53808 **RETURN VALUE**

53809 Upon successful completion, the function shall return a value of zero. Otherwise, the function  
 53810 shall return an error number. If the *pthread\_kill()* function fails, no signal shall be sent.

53811 **ERRORS**53812 The *pthread\_kill()* function shall fail if:53813 [EINVAL] The value of the *sig* argument is an invalid or unsupported signal number.53814 The *pthread\_kill()* function shall not return an error code of [EINTR].53815 **EXAMPLES**

53816 None.

53817 **APPLICATION USAGE**

53818 The *pthread\_kill()* function provides a mechanism for asynchronously directing a signal at a  
 53819 thread in the calling process. This could be used, for example, by one thread to affect broadcast  
 53820 delivery of a signal to a set of threads.

53821 Note that *pthread\_kill()* only causes the signal to be handled in the context of the given thread;  
 53822 the signal action (termination or stopping) affects the process as a whole.

53823 **RATIONALE**

53824 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
 53825 that the function should fail and report an [ESRCH] error.

53826 Existing implementations vary on the result of a *pthread\_kill()* with a thread ID indicating an +  
 53827 inactive thread (a terminated thread that has not been detached or joined). Some indicate success +  
 53828 on such a call, while others give an error of [ESRCH]. Since the definition of thread lifetime in +  
 53829 this volume of POSIX.1-2008 covers inactive threads, the [ESRCH] error as described is +  
 53830 inappropriate in this case. In particular, this means that an application cannot have one thread +  
 53831 check for termination of another with *pthread\_kill()*.

53832 **FUTURE DIRECTIONS**

53833 A future version of this standard may require that *pthread\_kill()* not fail with [ESRCH] in the |  
 53834 case of sending signals to an inactive thread (a terminated thread not yet detached or joined), |  
 53835 even though no signal will be delivered because the thread is no longer running.

53836 **SEE ALSO**53837 *kill()*, *pthread\_self()*, *raise()*53838 XBD *<signal.h>*

53839 **CHANGE HISTORY**

53840 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

53841 **Issue 6**

53842 The *pthread\_kill()* function is marked as part of the Threads option.

53843 The APPLICATION USAGE section is added.

53844 **Issue 7**

53845 The *pthread\_kill()* function is moved from the Threads option to the Base.

53846 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

**53847 NAME**

53848 pthread\_mutex\_consistent — mark state protected by robust mutex as consistent

**53849 SYNOPSIS**

53850 #include <pthread.h>

53851 int pthread\_mutex\_consistent(pthread\_mutex\_t \*mutex);

**53852 DESCRIPTION**

53853 If *mutex* is a robust mutex in an inconsistent state, the *pthread\_mutex\_consistent()* function can be  
53854 used to mark the state protected by the mutex referenced by *mutex* as consistent again.

53855 If an owner of a robust mutex terminates while holding the mutex, the mutex becomes  
53856 inconsistent and the next thread that acquires the mutex lock shall be notified of the state by the  
53857 return value [EOWNERDEAD]. In this case, the mutex does not become normally usable again  
53858 until the state is marked consistent.

53859 If the thread which acquired the mutex lock with the return value [EOWNERDEAD] terminates  
53860 before calling either *pthread\_mutex\_consistent()* or *pthread\_mutex\_unlock()*, the next thread that  
53861 acquires the mutex lock shall be notified about the state of the mutex by the return value  
53862 [EOWNERDEAD].

53863 The behavior is undefined if the value specified by the *mutex* argument to  
53864 *pthread\_mutex\_consistent()* does not refer to an initialized mutex.

**53865 RETURN VALUE**

53866 Upon successful completion, the *pthread\_mutex\_consistent()* function shall return zero.  
53867 Otherwise, an error value shall be returned to indicate the error.

**53868 ERRORS**

53869 The *pthread\_mutex\_consistent()* function shall fail if:

53870 [EINVAL] The mutex object referenced by *mutex* is not robust or does not protect an  
53871 inconsistent state.

53872 These functions shall not return an error code of [EINTR].

**53873 EXAMPLES**

53874 None.

**53875 APPLICATION USAGE**

53876 The *pthread\_mutex\_consistent()* function is only responsible for notifying the implementation that  
53877 the state protected by the mutex has been recovered and that normal operations with the mutex  
53878 can be resumed. It is the responsibility of the application to recover the state so it can be reused.  
53879 If the application is not able to perform the recovery, it can notify the implementation that the  
53880 situation is unrecoverable by a call to *pthread\_mutex\_unlock()* without a prior call to  
53881 *pthread\_mutex\_consistent()*, in which case subsequent threads that attempt to lock the mutex will  
53882 fail to acquire the lock and be returned [ENOTRECOVERABLE].

**53883 RATIONALE**

53884 If an implementation detects that the value specified by the *mutex* argument to  
53885 *pthread\_mutex\_consistent()* does not refer to an initialized mutex, it is recommended that the  
53886 function should fail and report an [EINVAL] error.

**53887 FUTURE DIRECTIONS**

53888 None.

53893

SEE ALSO

pthread\_mutex\_lock(), pthread\_mutexattr\_getrobust()

XBD <pthread.h>

CHANGE HISTORY

First released in Issue 7.

**53894 NAME**

53895 pthread\_mutex\_destroy, pthread\_mutex\_init — destroy and initialize a mutex

**53896 SYNOPSIS**

```
53897 #include <pthread.h>
53898 int pthread_mutex_destroy(pthread_mutex_t *mutex);
53899 int pthread_mutex_init(pthread_mutex_t *restrict mutex,
53900     const pthread_mutexattr_t *restrict attr);
53901 pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;
```

**53902 DESCRIPTION**

53903 The *pthread\_mutex\_destroy()* function shall destroy the mutex object referenced by *mutex*; the  
 53904 mutex object becomes, in effect, uninitialized. An implementation may cause  
 53905 *pthread\_mutex\_destroy()* to set the object referenced by *mutex* to an invalid value.

53906 A destroyed mutex object can be reinitialized using *pthread\_mutex\_init()*; the results of otherwise  
 53907 referencing the object after it has been destroyed are undefined.

53908 It shall be safe to destroy an initialized mutex that is unlocked. Attempting to destroy a locked  
 53909 mutex, or a mutex that another thread is attempting to lock, or a mutex that is being used in a  
 53910 *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()* call by another thread, results in undefined  
 53911 behavior.

53912 The *pthread\_mutex\_init()* function shall initialize the mutex referenced by *mutex* with attributes  
 53913 specified by *attr*. If *attr* is NULL, the default mutex attributes are used; the effect shall be the  
 53914 same as passing the address of a default mutex attributes object. Upon successful initialization,  
 53915 the state of the mutex becomes initialized and unlocked.

53916 See [Section 2.9.9](#) (on page 523) for further requirements.

53917 Attempting to initialize an already initialized mutex results in undefined behavior.

53918 In cases where default mutex attributes are appropriate, the macro  
 53919 PTHREAD\_MUTEX\_INITIALIZER can be used to initialize mutexes. The effect shall be  
 53920 equivalent to dynamic initialization by a call to *pthread\_mutex\_init()* with parameter *attr*  
 53921 specified as NULL, except that no error checks are performed.

53922 The behavior is undefined if the value specified by the *mutex* argument to  
 53923 *pthread\_mutex\_destroy()* does not refer to an initialized mutex.

53924 The behavior is undefined if the value specified by the *attr* argument to *pthread\_mutex\_init()*  
 53925 does not refer to an initialized mutex attributes object.

**53926 RETURN VALUE**

53927 If successful, the *pthread\_mutex\_destroy()* and *pthread\_mutex\_init()* functions shall return zero;  
 53928 otherwise, an error number shall be returned to indicate the error.

**53929 ERRORS**

53930 The *pthread\_mutex\_init()* function shall fail if:

- |       |          |                                                                                            |
|-------|----------|--------------------------------------------------------------------------------------------|
| 53931 | [EAGAIN] | The system lacked the necessary resources (other than memory) to initialize another mutex. |
| 53932 |          |                                                                                            |
| 53933 | [ENOMEM] | Insufficient memory exists to initialize the mutex.                                        |
| 53934 | [EPERM]  | The caller does not have the privilege to perform the operation.                           |

53935 The *pthread\_mutex\_init()* function may fail if:

53936 [EINVAL] The attributes object referenced by *attr* has the robust mutex attribute set

53937 without the process-shared attribute being set.

53938 These functions shall not return an error code of [EINTR].

#### 53939 EXAMPLES

53940 None.

#### 53941 APPLICATION USAGE

53942 None.

#### 53943 RATIONALE

53944 If an implementation detects that the value specified by the *mutex* argument to

53945 *pthread\_mutex\_destroy()* does not refer to an initialized mutex, it is recommended that the

53946 function should fail and report an [EINVAL] error.

53947 If an implementation detects that the value specified by the *mutex* argument to

53948 *pthread\_mutex\_destroy()* or *pthread\_mutex\_init()* refers to a locked mutex or a mutex that is

53949 referenced (for example, while being used in a *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()*)

53950 by another thread, or detects that the value specified by the *mutex* argument to

53951 *pthread\_mutex\_init()* refers to an already initialized mutex, it is recommended that the function

53952 should fail and report an [EBUSY] error.

53953 If an implementation detects that the value specified by the *attr* argument to

53954 *pthread\_mutex\_init()* does not refer to an initialized mutex attributes object, it is recommended

53955 that the function should fail and report an [EINVAL] error.

#### 53956 Alternate Implementations Possible

53957 This volume of POSIX.1-2008 supports several alternative implementations of mutexes. An

53958 implementation may store the lock directly in the object of type **pthread\_mutex\_t**. Alternatively,

53959 an implementation may store the lock in the heap and merely store a pointer, handle, or unique

53960 ID in the mutex object. Either implementation has advantages or may be required on certain

53961 hardware configurations. So that portable code can be written that is invariant to this choice, this

53962 volume of POSIX.1-2008 does not define assignment or equality for this type, and it uses the

53963 term “initialize” to reinforce the (more restrictive) notion that the lock may actually reside in the

53964 mutex object itself.

53965 Note that this precludes an over-specification of the type of the mutex or condition variable and

53966 motivates the opaqueness of the type.

53967 An implementation is permitted, but not required, to have *pthread\_mutex\_destroy()* store an

53968 illegal value into the mutex. This may help detect erroneous programs that try to lock (or

53969 otherwise reference) a mutex that has already been destroyed.

#### 53970 Tradeoff Between Error Checks and Performance Supported

53971 Many error conditions that can occur are not required to be detected by the implementation in

53972 order to let implementations trade off performance *versus* degree of error checking according to

53973 the needs of their specific applications and execution environment. As a general rule, conditions

53974 caused by the system (such as insufficient memory) are required to be detected, but conditions

53975 caused by an erroneously coded application (such as failing to provide adequate

53976 synchronization to prevent a mutex from being deleted while in use) are specified to result in

53977 undefined behavior.

53978 A wide range of implementations is thus made possible. For example, an implementation

intended for application debugging may implement all of the error checks, but an implementation running a single, provably correct application under very tight performance constraints in an embedded computer might implement minimal checks. An implementation might even be provided in two versions, similar to the options that compilers provide: a full-checking, but slower version; and a limited-checking, but faster version. To forbid this optionality would be a disservice to users.

By carefully limiting the use of “undefined behavior” only to things that an erroneous (badly coded) application might do, and by defining that resource-not-available errors are mandatory, this volume of POSIX.1-2008 ensures that a fully-conforming application is portable across the full range of implementations, while not forcing all implementations to add overhead to check for numerous things that a correct program never does. When the behavior is undefined, no error number is specified to be returned on implementations that do detect the condition. This is because undefined behavior means *anything* can happen, which includes returning with any value (which might happen to be a valid, but different, error number). However, since the error number might be useful to application developers when diagnosing problems during application development, a recommendation is made in rationale that implementors should return a particular error number if their implementation does detect the condition.

### Why No Limits are Defined

Defining symbols for the maximum number of mutexes and condition variables was considered but rejected because the number of these objects may change dynamically. Furthermore, many implementations place these objects into application memory; thus, there is no explicit maximum.

### Static Initializers for Mutexes and Condition Variables

Providing for static initialization of statically allocated synchronization objects allows modules with private static synchronization variables to avoid runtime initialization tests and overhead. Furthermore, it simplifies the coding of self-initializing modules. Such modules are common in C libraries, where for various reasons the design calls for self-initialization instead of requiring an explicit module initialization function to be called. An example use of static initialization follows.

Without static initialization, a self-initializing routine *foo()* might look as follows:

```
static pthread_once_t foo_once = PTHREAD_ONCE_INIT;
static pthread_mutex_t foo_mutex;

void foo_init()
{
    pthread_mutex_init(&foo_mutex, NULL);
}

void foo()
{
    pthread_once(&foo_once, foo_init);
    pthread_mutex_lock(&foo_mutex);
    /* Do work. */
    pthread_mutex_unlock(&foo_mutex);
}
```

With static initialization, the same routine could be coded as follows:

```
static pthread_mutex_t foo_mutex = PTHREAD_MUTEX_INITIALIZER;
```

```
54024 void foo()  
54025 {  
54026     pthread_mutex_lock(&foo_mutex);  
54027     /* Do work. */  
54028     pthread_mutex_unlock(&foo_mutex);  
54029 }
```

54030 Note that the static initialization both eliminates the need for the initialization test inside  
54031 *pthread\_once()* and the fetch of *&foo\_mutex* to learn the address to be passed to  
54032 *pthread\_mutex\_lock()* or *pthread\_mutex\_unlock()*.

54033 Thus, the C code written to initialize static objects is simpler on all systems and is also faster on a  
54034 large class of systems; those where the (entire) synchronization object can be stored in  
54035 application memory.

54036 Yet the locking performance question is likely to be raised for machines that require mutexes to  
54037 be allocated out of special memory. Such machines actually have to have mutexes and possibly  
54038 condition variables contain pointers to the actual hardware locks. For static initialization to work  
54039 on such machines, *pthread\_mutex\_lock()* also has to test whether or not the pointer to the actual  
54040 lock has been allocated. If it has not, *pthread\_mutex\_lock()* has to initialize it before use. The  
54041 reservation of such resources can be made when the program is loaded, and hence return codes  
54042 have not been added to mutex locking and condition variable waiting to indicate failure to  
54043 complete initialization.

54044 This runtime test in *pthread\_mutex\_lock()* would at first seem to be extra work; an extra test is  
54045 required to see whether the pointer has been initialized. On most machines this would actually  
54046 be implemented as a fetch of the pointer, testing the pointer against zero, and then using the  
54047 pointer if it has already been initialized. While the test might seem to add extra work, the extra  
54048 effort of testing a register is usually negligible since no extra memory references are actually  
54049 done. As more and more machines provide caches, the real expenses are memory references, not  
54050 instructions executed.

54051 Alternatively, depending on the machine architecture, there are often ways to eliminate *all*  
54052 overhead in the most important case: on the lock operations that occur *after* the lock has been  
54053 initialized. This can be done by shifting more overhead to the less frequent operation:  
54054 initialization. Since out-of-line mutex allocation also means that an address has to be  
54055 dereferenced to find the actual lock, one technique that is widely applicable is to have static  
54056 initialization store a bogus value for that address; in particular, an address that causes a machine  
54057 fault to occur. When such a fault occurs upon the first attempt to lock such a mutex, validity  
54058 checks can be done, and then the correct address for the actual lock can be filled in. Subsequent  
54059 lock operations incur no extra overhead since they do not “fault”. This is merely one technique  
54060 that can be used to support static initialization, while not adversely affecting the performance of  
54061 lock acquisition. No doubt there are other techniques that are highly machine-dependent.

54062 The locking overhead for machines doing out-of-line mutex allocation is thus similar for  
54063 modules being implicitly initialized, where it is improved for those doing mutex allocation  
54064 entirely inline. The inline case is thus made much faster, and the out-of-line case is not  
54065 significantly worse.

54066 Besides the issue of locking performance for such machines, a concern is raised that it is possible  
54067 that threads would serialize contending for initialization locks when attempting to finish  
54068 initializing statically allocated mutexes. (Such finishing would typically involve taking an  
54069 internal lock, allocating a structure, storing a pointer to the structure in the mutex, and releasing  
54070 the internal lock.) First, many implementations would reduce such serialization by hashing on  
54071 the mutex address. Second, such serialization can only occur a bounded number of times. In

particular, it can happen at most as many times as there are statically allocated synchronization objects. Dynamically allocated objects would still be initialized via *pthread\_mutex\_init()* or *pthread\_cond\_init()*.

Finally, if none of the above optimization techniques for out-of-line allocation yields sufficient performance for an application on some implementation, the application can avoid static initialization altogether by explicitly initializing all synchronization objects with the corresponding *pthread\_\*\_init()* functions, which are supported by all implementations. An implementation can also document the tradeoffs and advise which initialization technique is more efficient for that particular implementation.

### Destroying Mutexes

A mutex can be destroyed immediately after it is unlocked. However, since attempting to destroy a locked mutex, or a mutex that another thread is attempting to lock, or a mutex that is being used in a *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()* call by another thread, results in undefined behavior, care must be taken to ensure that no other thread may be referencing the mutex.

### Robust Mutexes

Implementations are required to provide robust mutexes for mutexes with the process-shared attribute set to `PTHREAD_PROCESS_SHARED`. Implementations are allowed, but not required, to provide robust mutexes when the process-shared attribute is set to `PTHREAD_PROCESS_PRIVATE`.

### FUTURE DIRECTIONS

None.

### CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### Issue 6

The *pthread\_mutex\_destroy()* and *pthread\_mutex\_init()* functions are marked as part of the Threads option.

The *pthread\_mutex\_timedlock()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1c #34 is applied, updating the DESCRIPTION.

The **restrict** keyword is added to the *pthread\_mutex\_init()* prototype for alignment with the ISO/IEC 9899: 1999 standard.

#### Issue 7

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

The *pthread\_mutex\_destroy()* and *pthread\_mutex\_init()* functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized mutex or an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

54114 The [EBUSY] error for a locked mutex, a mutex that is referenced, or an already initialized mutex  
54115 is removed; this condition results in undefined behavior.

54116 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0460 [70,428] is applied.

54117 **NAME**

54118 pthread\_mutex\_getprioceiling, pthread\_mutex\_setprioceiling — get and set the priority ceiling  
 54119 of a mutex (**REALTIME THREADS**)

54120 **SYNOPSIS**

```
54121 RPP|TPP #include <pthread.h>
54122
54122 int pthread_mutex_getprioceiling(const pthread_mutex_t *restrict mutex,
54123 int *restrict prioceiling);
54124
54124 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
54125 int prioceiling, int *restrict old_ceiling);
```

54126 **DESCRIPTION**

54127 The *pthread\_mutex\_getprioceiling()* function shall return the current priority ceiling of the mutex.

54128 The *pthread\_mutex\_setprioceiling()* function shall attempt to lock the mutex as if by a call to  
 54129 *pthread\_mutex\_lock()*, except that the process of locking the mutex need not adhere to the priority  
 54130 protect protocol. On acquiring the mutex it shall change the mutex's priority ceiling and then  
 54131 release the mutex as if by a call to *pthread\_mutex\_unlock()*. When the change is successful, the  
 54132 previous value of the priority ceiling shall be returned in *old\_ceiling*.

54133 If the *pthread\_mutex\_setprioceiling()* function fails, the mutex priority ceiling shall not be  
 54134 changed.

54135 **RETURN VALUE**

54136 If successful, the *pthread\_mutex\_getprioceiling()* and *pthread\_mutex\_setprioceiling()* functions shall  
 54137 return zero; otherwise, an error number shall be returned to indicate the error.

54138 **ERRORS**

54139 These functions shall fail if:

54140 [EINVAL] The protocol attribute of *mutex* is PTHREAD\_PRIO\_NONE.

54141 [EPERM] The implementation requires appropriate privileges to perform the operation  
 54142 and the caller does not have appropriate privileges.

54143 The *pthread\_mutex\_setprioceiling()* function shall fail if:

54144 [EAGAIN] The mutex could not be acquired because the maximum number of recursive  
 54145 locks for *mutex* has been exceeded.

54146 [EDEADLK] The mutex type is PTHREAD\_MUTEX\_ERRORCHECK and the current  
 54147 thread already owns the mutex.

54148 [EINVAL] The mutex was created with the protocol attribute having the value  
 54149 PTHREAD\_PRIO\_PROTECT and the calling thread's priority is higher than  
 54150 the mutex's current priority ceiling, and the implementation adheres to the  
 54151 priority protect protocol in the process of locking the mutex.

54152 [ENOTRECOVERABLE]

54153 The mutex is a robust mutex and the state protected by the mutex is not  
 54154 recoverable.

54155 [EOWNERDEAD]

54156 The mutex is a robust mutex and the process containing the previous owning  
 54157 thread terminated while holding the mutex lock. The mutex lock shall be  
 54158 acquired by the calling thread and it is up to the new owner to make the state  
 54159 consistent (see *pthread\_mutex\_lock()*).

54160 The *pthread\_mutex\_setprioceiling()* function may fail if:

54161 [EDEADLK] A deadlock condition was detected.

54162 [EINVAL] The priority requested by *prioceiling* is out of range.

54163 [EOWNERDEAD]

54164 The mutex is a robust mutex and the previous owning thread terminated

54165 while holding the mutex lock. The mutex lock shall be acquired by the calling

54166 thread and it is up to the new owner to make the state consistent (see

54167 *pthread\_mutex\_lock()*).

54168 These functions shall not return an error code of [EINTR].

#### 54169 EXAMPLES

#### 54180 CHANGE HISTORY

54181 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

54182 Marked as part of the Realtime Threads Feature Group.

#### 54183 Issue 6

54184 The *pthread\_mutex\_getprioceiling()* and *pthread\_mutex\_setprioceiling()* functions are marked as

54185 part of the Threads and Thread Priority Protection options.

54186 The [ENOSYS] error conditions have been removed.

54187 The *pthread\_mutex\_timedlock()* function is added to the SEE ALSO section for alignment with

54188 IEEE Std 1003.1d-1999.

54189 The **restrict** keyword is added to the *pthread\_mutex\_getprioceiling()* and

54190 *pthread\_mutex\_setprioceiling()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

#### 54191 Issue 7

54192 SD5-XSH-ERN-39 is applied.

54193 Austin Group Interpretation 1003.1-2001 #052 is applied, adding [EDEADLK] as a “may fail”

54194 error.

54195 SD5-XSH-ERN-158 is applied, updating the ERRORS section to include a “shall fail” error case

54196 for when the protocol attribute of *mutex* is PTHREAD\_PRIO\_NONE.

54197 The *pthread\_mutex\_getprioceiling()* and *pthread\_mutex\_setprioceiling()* functions are moved from

54198 the Threads option to require support of either the Robust Mutex Priority Protection option or

54199 the Non-Robust Mutex Priority Protection option.

54200  
54201

The DESCRIPTION and ERRORS sections are updated to account properly for all of the various mutex types.

54202 **NAME**

54203 pthread\_mutex\_init — destroy and initialize a mutex

54204 **SYNOPSIS**

54205 #include &lt;pthread.h&gt;

54206 int pthread\_mutex\_init(pthread\_mutex\_t \*restrict mutex,

54207 const pthread\_mutexattr\_t \*restrict attr);

54208 pthread\_mutex\_t mutex = PTHREAD\_MUTEX\_INITIALIZER;

54209 **DESCRIPTION**54210 Refer to *pthread\_mutex\_destroy()*.

**NAME**

pthread\_mutex\_lock, pthread\_mutex\_trylock, pthread\_mutex\_unlock — lock and unlock a mutex

**SYNOPSIS**

```
#include <pthread.h>

int pthread_mutex_lock(pthread_mutex_t *mutex);
int pthread_mutex_trylock(pthread_mutex_t *mutex);
int pthread_mutex_unlock(pthread_mutex_t *mutex);
```

**DESCRIPTION**

The mutex object referenced by *mutex* shall be locked by a call to *pthread\_mutex\_lock()* that returns zero or [EOWNERDEAD]. If the mutex is already locked by another thread, the calling thread shall block until the mutex becomes available. This operation shall return with the mutex object referenced by *mutex* in the locked state with the calling thread as its owner. If a thread attempts to relock a mutex that it has already locked, *pthread\_mutex\_lock()* shall behave as described in the **Relock** column of the following table. If a thread attempts to unlock a mutex that it has not locked or a mutex which is unlocked, *pthread\_mutex\_unlock()* shall behave as described in the **Unlock When Not Owner** column of the following table.

| Mutex Type | Robustness | Relock                   | Unlock When Not Owner |
|------------|------------|--------------------------|-----------------------|
| NORMAL     | non-robust | deadlock                 | undefined behavior    |
| NORMAL     | robust     | deadlock                 | error returned        |
| ERRORCHECK | either     | error returned           | error returned        |
| RECURSIVE  | either     | recursive<br>(see below) | error returned        |
| DEFAULT    | non-robust | undefined<br>behavior†   | undefined behavior†   |
| DEFAULT    | robust     | undefined<br>behavior†   | error returned        |

† If the mutex type is PTHREAD\_MUTEX\_DEFAULT, the behavior of *pthread\_mutex\_lock()* may correspond to one of the three other standard mutex types as described in the table above. If it does not correspond to one of those three, the behavior is undefined for the cases marked †.

Where the table indicates recursive behavior, the mutex shall maintain the concept of a lock count. When a thread successfully acquires a mutex for the first time, the lock count shall be set to one. Every time a thread relocks this mutex, the lock count shall be incremented by one. Each time the thread unlocks the mutex, the lock count shall be decremented by one. When the lock count reaches zero, the mutex shall become available for other threads to acquire.

The *pthread\_mutex\_trylock()* function shall be equivalent to *pthread\_mutex\_lock()*, except that if the mutex object referenced by *mutex* is currently locked (by any thread, including the current thread), the call shall return immediately. If the mutex type is PTHREAD\_MUTEX\_RECURSIVE and the mutex is currently owned by the calling thread, the mutex lock count shall be incremented by one and the *pthread\_mutex\_trylock()* function shall immediately return success.

The *pthread\_mutex\_unlock()* function shall release the mutex object referenced by *mutex*. The manner in which a mutex is released is dependent upon the mutex's type attribute. If there are threads blocked on the mutex object referenced by *mutex* when *pthread\_mutex\_unlock()* is called, resulting in the mutex becoming available, the scheduling policy shall determine which thread shall acquire the mutex.

54257 (In the case of PTHREAD\_MUTEX\_RECURSIVE mutexes, the mutex shall become available  
54258 when the count reaches zero and the calling thread no longer has any locks on this mutex.)

54259 If a signal is delivered to a thread waiting for a mutex, upon return from the signal handler the  
54260 thread shall resume waiting for the mutex as if it was not interrupted.

54261 If *mutex* is a robust mutex and the process containing the owning thread terminated while  
54262 holding the mutex lock, a call to *pthread\_mutex\_lock()* shall return the error value  
54263 [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread terminated while holding  
54264 the mutex lock, a call to *pthread\_mutex\_lock()* may return the error value [EOWNERDEAD] even  
54265 if the process in which the owning thread resides has not terminated. In these cases, the mutex is  
54266 locked by the thread but the state it protects is marked as inconsistent. The application should  
54267 ensure that the state is made consistent for reuse and when that is complete call  
54268 *pthread\_mutex\_consistent()*. If the application is unable to recover the state, it should unlock the  
54269 mutex without a prior call to *pthread\_mutex\_consistent()*, after which the mutex is marked  
54270 permanently unusable.

54271 If *mutex* does not refer to an initialized mutex object, the behavior of *pthread\_mutex\_lock()*,  
54272 *pthread\_mutex\_trylock()*, and *pthread\_mutex\_unlock()* is undefined.

#### 54273 RETURN VALUE

54274 If successful, the *pthread\_mutex\_lock()*, *pthread\_mutex\_trylock()*, and *pthread\_mutex\_unlock()*  
54275 functions shall return zero; otherwise, an error number shall be returned to indicate the error.

#### 54276 ERRORS

54277 The *pthread\_mutex\_lock()* and *pthread\_mutex\_trylock()* functions shall fail if:

54278 [EAGAIN] The mutex could not be acquired because the maximum number of recursive  
54279 locks for *mutex* has been exceeded.

54280 RPP|TPP [EINVAL] The *mutex* was created with the protocol attribute having the value  
54281 PTHREAD\_PRIO\_PROTECT and the calling thread's priority is higher than  
54282 the mutex's current priority ceiling.

54283 [ENOTRECOVERABLE]  
54284 The state protected by the mutex is not recoverable.

54285 [EOWNERDEAD]  
54286 The mutex is a robust mutex and the process containing the previous owning  
54287 thread terminated while holding the mutex lock. The mutex lock shall be  
54288 acquired by the calling thread and it is up to the new owner to make the state  
54289 consistent.

54290 The *pthread\_mutex\_lock()* function shall fail if:

54291 [EDEADLK] The mutex type is PTHREAD\_MUTEX\_ERRORCHECK and the current  
54292 thread already owns the mutex.

54293 The *pthread\_mutex\_trylock()* function shall fail if:

54294 [EBUSY] The *mutex* could not be acquired because it was already locked.

54295 The *pthread\_mutex\_unlock()* function shall fail if:

54296 [EPERM] The mutex type is PTHREAD\_MUTEX\_ERRORCHECK or  
54297 PTHREAD\_MUTEX\_RECURSIVE, or the mutex is a robust mutex, and the  
54298 current thread does not own the mutex.

54299 The *pthread\_mutex\_lock()* and *pthread\_mutex\_trylock()* functions may fail if:

54300 [EOWNERDEAD]  
54301 The mutex is a robust mutex and the previous owning thread terminated  
54302 while holding the mutex lock. The mutex lock shall be acquired by the calling  
54303 thread and it is up to the new owner to make the state consistent.

54304 The *pthread\_mutex\_lock()* function may fail if:

54305 [EDEADLK] A deadlock condition was detected.

54306 These functions shall not return an error code of [EINTR].

#### 54307 **EXAMPLES**

54308 None.

#### 54309 **APPLICATION USAGE**

54310 Applications that have assumed that non-zero return values are errors will need updating for  
54311 use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting  
54312 a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error  
54313 returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If  
54314 an application is supposed to work with normal and robust mutexes it should check all return  
54315 values for error conditions and if necessary take appropriate action.

#### 54316 **RATIONALE**

54317 Mutex objects are intended to serve as a low-level primitive from which other thread  
54318 synchronization functions can be built. As such, the implementation of mutexes should be as  
54319 efficient as possible, and this has ramifications on the features available at the interface.

54320 The mutex functions and the particular default settings of the mutex attributes have been  
54321 motivated by the desire to not preclude fast, inlined implementations of mutex locking and  
54322 unlocking.

54323 Since most attributes only need to be checked when a thread is going to be blocked, the use of  
54324 attributes does not slow the (common) mutex-locking case.

54325 Likewise, while being able to extract the thread ID of the owner of a mutex might be desirable, it  
54326 would require storing the current thread ID when each mutex is locked, and this could incur  
54327 unacceptable levels of overhead. Similar arguments apply to a *mutex\_tryunlock* operation.

54328 For further rationale on the extended mutex types, see XRAT [Threads Extensions](#) (on page 3631).

54329 If an implementation detects that the value specified by the *mutex* argument does not refer to an  
54330 initialized mutex object, it is recommended that the function should fail and report an [EINVAL]  
54331 error.

#### 54332 **FUTURE DIRECTIONS**

54333 None.

#### 54334 **SEE ALSO**

#### 54338 **CHANGE HISTORY**

54339 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

The *pthread\_mutex\_lock()*, *pthread\_mutex\_trylock()*, and *pthread\_mutex\_unlock()* functions are marked as part of the Threads option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The behavior when attempting to relock a mutex is defined.

The *pthread\_mutex\_timedlock()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/98 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition. The RATIONALE section is also reworded to take into account non-XSI-conformant systems.

**Issue 7**

SD5-XSH-ERN-43 is applied, marking the “shall fail” case of the [EINVAL] error as dependent on the Thread Priority Protection option.

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

The *pthread\_mutex\_lock()*, *pthread\_mutex\_trylock()*, and *pthread\_mutex\_unlock()* functions are moved from the Threads option to the Base.

The following extended mutex types are moved from the XSI option to the Base:

PTHREAD\_MUTEX\_NORMAL  
PTHREAD\_MUTEX\_ERRORCHECK  
PTHREAD\_MUTEX\_RECURSIVE  
PTHREAD\_MUTEX\_DEFAULT

The DESCRIPTION is updated to clarify the behavior when *mutex* does not refer to an initialized mutex.

The ERRORS section is updated to account properly for all of the various mutex types.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0461 [121], XSH/TC1-2008/0462 [92,428], and XSH/TC1-2008/0463 [121] are applied.

54367 **NAME**

54368 pthread\_mutex\_setprioceiling — change the priority ceiling of a mutex (REALTIME  
54369 THREADS)

54370 **SYNOPSIS**

```
54371 RPP|TPP #include <pthread.h>  
54372 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,  
54373 int prioceiling, int *restrict old_ceiling);
```

54374 **DESCRIPTION**

54375 Refer to *pthread\_mutex\_getprioceiling()*.

**NAME**

pthread\_mutex\_timedlock — lock a mutex

**SYNOPSIS**

```
#include <pthread.h>
#include <time.h>
```

```
int pthread_mutex_timedlock(pthread_mutex_t *restrict mutex,
    const struct timespec *restrict abstime);
```

**DESCRIPTION**

The *pthread\_mutex\_timedlock()* function shall lock the mutex object referenced by *mutex*. If the mutex is already locked, the calling thread shall block until the mutex becomes available as in the *pthread\_mutex\_lock()* function. If the mutex cannot be locked without waiting for another thread to unlock the mutex, this wait shall be terminated when the specified timeout expires.

The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall be the resolution of the clock on which it is based. The **timespec** data type is defined in the **<time.h>** header.

Under no circumstance shall the function fail with a timeout if the mutex can be locked immediately. The validity of the *abstime* parameter need not be checked if the mutex can be locked immediately.

RPI | TPI

As a consequence of the priority inheritance rules (for mutexes initialized with the Prio\_Inherit protocol), if a timed mutex wait is terminated because its timeout expires, the priority of the owner of the mutex shall be adjusted as necessary to reflect the fact that this thread is no longer among the threads waiting for the mutex.

If *mutex* is a robust mutex and the process containing the owning thread terminated while holding the mutex lock, a call to *pthread\_mutex\_timedlock()* shall return the error value [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread terminated while holding the mutex lock, a call to *pthread\_mutex\_timedlock()* may return the error value [EOWNERDEAD] even if the process in which the owning thread resides has not terminated. In these cases, the mutex is locked by the thread but the state it protects is marked as inconsistent. The application should ensure that the state is made consistent for reuse and when that is complete call *pthread\_mutex\_consistent()*. If the application is unable to recover the state, it should unlock the mutex without a prior call to *pthread\_mutex\_consistent()*, after which the mutex is marked permanently unusable.

If *mutex* does not refer to an initialized mutex object, the behavior is undefined.

**RETURN VALUE**

If successful, the *pthread\_mutex\_timedlock()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The *pthread\_mutex\_timedlock()* function shall fail if:

[EAGAIN]           The mutex could not be acquired because the maximum number of recursive locks for *mutex* has been exceeded.

54420 [EDEADLK] The mutex type is PTHREAD\_MUTEX\_ERRORCHECK and the current  
 54421 thread already owns the mutex.

54422 [EINVAL] The mutex was created with the protocol attribute having the value  
 54423 PTHREAD\_PRIO\_PROTECT and the calling thread's priority is higher than  
 54424 the mutex' current priority ceiling.

54425 [EINVAL] The process or thread would have blocked, and the *abstime* parameter  
 54426 specified a nanoseconds field value less than zero or greater than or equal to  
 54427 1 000 million.

54428 [ENOTRECOVERABLE]  
 54429 The state protected by the mutex is not recoverable.

54430 [EOWNERDEAD]  
 54431 The mutex is a robust mutex and the process containing the previous owning  
 54432 thread terminated while holding the mutex lock. The mutex lock shall be  
 54433 acquired by the calling thread and it is up to the new owner to make the state  
 54434 consistent.

54435 [ETIMEDOUT] The mutex could not be locked before the specified timeout expired.

54436 The *pthread\_mutex\_timedlock()* function may fail if:

54437 [EDEADLK] A deadlock condition was detected.

54438 [EOWNERDEAD]  
 54439 The mutex is a robust mutex and the previous owning thread terminated  
 54440 while holding the mutex lock. The mutex lock shall be acquired by the calling  
 54441 thread and it is up to the new owner to make the state consistent.

54442 This function shall not return an error code of [EINTR].

**EXAMPLES**

54443 None.  
 54444

**APPLICATION USAGE**

54446 Applications that have assumed that non-zero return values are errors will need updating for  
 54447 use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting  
 54448 a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error  
 54449 returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If  
 54450 an application is supposed to work with normal and robust mutexes, it should check all return  
 54451 values for error conditions and if necessary take appropriate action.

**RATIONALE**

54452 Refer to *pthread\_mutex\_lock()*.  
 54453

**FUTURE DIRECTIONS**

54454 None.

**CHANGE HISTORY**

54459 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.  
 54460  
 54461 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/99 is applied, marking the last paragraph  
 54462 in the DESCRIPTION as part of the Thread Priority Inheritance option.

- 54463 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/100 is applied, updating the ERRORS  
54464 section so that the [EDEADLK] error includes detection of a deadlock condition.
- 54465 **Issue 7**
- 54466 Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.
- 54467 The *pthread\_mutex\_timedlock()* function is moved from the Timeouts option to the Base.
- 54468 Functionality relating to the Timers option is moved to the Base.
- 54469 The DESCRIPTION is updated to clarify the behavior when *mutex* does not refer to an initialized  
54470 mutex.
- 54471 The ERRORS section is updated to account properly for all of the various mutex types.

54472 **NAME**

54473 pthread\_mutex\_trylock, pthread\_mutex\_unlock — lock and unlock a mutex

54474 **SYNOPSIS**

54475 #include &lt;pthread.h&gt;

54476 int pthread\_mutex\_trylock(pthread\_mutex\_t \*mutex);

54477 int pthread\_mutex\_unlock(pthread\_mutex\_t \*mutex);

54478 **DESCRIPTION**54479 Refer to *pthread\_mutex\_lock()*.

**54480 NAME**

54481 pthread\_mutexattr\_destroy, pthread\_mutexattr\_init — destroy and initialize the mutex  
 54482 attributes object

**54483 SYNOPSIS**

54484 #include <pthread.h>  
 54485 int pthread\_mutexattr\_destroy(pthread\_mutexattr\_t \*attr);  
 54486 int pthread\_mutexattr\_init(pthread\_mutexattr\_t \*attr);

**54487 DESCRIPTION**

54488 The *pthread\_mutexattr\_destroy()* function shall destroy a mutex attributes object; the object  
 54489 becomes, in effect, uninitialized. An implementation may cause *pthread\_mutexattr\_destroy()* to  
 54490 set the object referenced by *attr* to an invalid value.

54491 A destroyed *attr* attributes object can be reinitialized using *pthread\_mutexattr\_init()*; the results of  
 54492 otherwise referencing the object after it has been destroyed are undefined.

54493 The *pthread\_mutexattr\_init()* function shall initialize a mutex attributes object *attr* with the  
 54494 default value for all of the attributes defined by the implementation.

54495 Results are undefined if *pthread\_mutexattr\_init()* is called specifying an already initialized *attr*  
 54496 attributes object.

54497 After a mutex attributes object has been used to initialize one or more mutexes, any function  
 54498 affecting the attributes object (including destruction) shall not affect any previously initialized  
 54499 mutexes.

54500 The behavior is undefined if the value specified by the *attr* argument to  
 54501 *pthread\_mutexattr\_destroy()* does not refer to an initialized mutex attributes object.

**54502 RETURN VALUE**

54503 Upon successful completion, *pthread\_mutexattr\_destroy()* and *pthread\_mutexattr\_init()* shall  
 54504 return zero; otherwise, an error number shall be returned to indicate the error.

**54505 ERRORS**

54506 The *pthread\_mutexattr\_init()* function shall fail if:

54507 [ENOMEM] Insufficient memory exists to initialize the mutex attributes object.

54508 These functions shall not return an error code of [EINTR].

**54509 EXAMPLES**

54510 None.

**54511 APPLICATION USAGE**

54512 None.

**54513 RATIONALE**

54514 If an implementation detects that the value specified by the *attr* argument to  
 54515 *pthread\_mutexattr\_destroy()* does not refer to an initialized mutex attributes object, it is  
 54516 recommended that the function should fail and report an [EINVAL] error.

54517 See *pthread\_attr\_destroy()* for a general explanation of attributes. Attributes objects allow  
 54518 implementations to experiment with useful extensions and permit extension of this volume of  
 54519 POSIX.1-2008 without changing the existing functions. Thus, they provide for future  
 54520 extensibility of this volume of POSIX.1-2008 and reduce the temptation to standardize  
 54521 prematurely on semantics that are not yet widely implemented or understood.

54522 Examples of possible additional mutex attributes that have been discussed are *spin\_only*,  
 54523 *limited\_spin*, *no\_spin*, *recursive*, and *metered*. (To explain what the latter attributes might mean:

recursive mutexes would allow for multiple re-locking by the current owner; metered mutexes would transparently keep records of queue length, wait time, and so on.) Since there is not yet wide agreement on the usefulness of these resulting from shared implementation and usage experience, they are not yet specified in this volume of POSIX.1-2008. Mutex attributes objects, however, make it possible to test out these concepts for possible standardization at a later time.

### Mutex Attributes and Performance

Care has been taken to ensure that the default values of the mutex attributes have been defined such that mutexes initialized with the defaults have simple enough semantics so that the locking and unlocking can be done with the equivalent of a test-and-set instruction (plus possibly a few other basic instructions).

There is at least one implementation method that can be used to reduce the cost of testing at lock-time if a mutex has non-default attributes. One such method that an implementation can employ (and this can be made fully transparent to fully conforming POSIX applications) is to secretly pre-lock any mutexes that are initialized to non-default attributes. Any later attempt to lock such a mutex causes the implementation to branch to the “slow path” as if the mutex were unavailable; then, on the slow path, the implementation can do the “real work” to lock a non-default mutex. The underlying unlock operation is more complicated since the implementation never really wants to release the pre-lock on this kind of mutex. This illustrates that, depending on the hardware, there may be certain optimizations that can be used so that whatever mutex attributes are considered “most frequently used” can be processed most efficiently.

### Process Shared Memory and Synchronization

The existence of memory mapping functions in this volume of POSIX.1-2008 leads to the possibility that an application may allocate the synchronization objects from this section in memory that is accessed by multiple processes (and therefore, by threads of multiple processes).

In order to permit such usage, while at the same time keeping the usual case (that is, usage within a single process) efficient, a *process-shared* option has been defined.

If an implementation supports the `_POSIX_THREAD_PROCESS_SHARED` option, then the *process-shared* attribute can be used to indicate that mutexes or condition variables may be accessed by threads of multiple processes.

The default setting of `PTHREAD_PROCESS_PRIVATE` has been chosen for the *process-shared* attribute so that the most efficient forms of these synchronization objects are created by default.

Synchronization variables that are initialized with the `PTHREAD_PROCESS_PRIVATE` *process-shared* attribute may only be operated on by threads in the process that initialized them. Synchronization variables that are initialized with the `PTHREAD_PROCESS_SHARED` *process-shared* attribute may be operated on by any thread in any process that has access to it. In particular, these processes may exist beyond the lifetime of the initializing process. For example, the following code implements a simple counting semaphore in a mapped file that may be used by many processes.

```
/* sem.h */
struct semaphore {
    pthread_mutex_t lock;
    pthread_cond_t nonzero;
    unsigned count;
};
typedef struct semaphore semaphore_t;
```

```

54569 semaphore_t *semaphore_create(char *semaphore_name);
54570 semaphore_t *semaphore_open(char *semaphore_name);
54571 void semaphore_post(semaphore_t *semap);
54572 void semaphore_wait(semaphore_t *semap);
54573 void semaphore_close(semaphore_t *semap);

54574 /* sem.c */
54575 #include <sys/types.h>
54576 #include <sys/stat.h>
54577 #include <sys/mman.h>
54578 #include <fcntl.h>
54579 #include <pthread.h>
54580 #include "sem.h"

54581 semaphore_t *
54582 semaphore_create(char *semaphore_name)
54583 {
54584     int fd;
54585     semaphore_t *semap;
54586     pthread_mutexattr_t psharedm;
54587     pthread_condattr_t psharedc;

54588     fd = open(semaphore_name, O_RDWR | O_CREAT | O_EXCL, 0666);
54589     if (fd < 0)
54590         return (NULL);
54591     (void) ftruncate(fd, sizeof(semaphore_t));
54592     (void) pthread_mutexattr_init(&psharedm);
54593     (void) pthread_mutexattr_setpshared(&psharedm,
54594         PTHREAD_PROCESS_SHARED);
54595     (void) pthread_condattr_init(&psharedc);
54596     (void) pthread_condattr_setpshared(&psharedc,
54597         PTHREAD_PROCESS_SHARED);
54598     semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
54599         PROT_READ | PROT_WRITE, MAP_SHARED,
54600         fd, 0);
54601     close (fd);
54602     (void) pthread_mutex_init(&semap->lock, &psharedm);
54603     (void) pthread_cond_init(&semap->nonzero, &psharedc);
54604     semap->count = 0;
54605     return (semap);
54606 }

54607 semaphore_t *
54608 semaphore_open(char *semaphore_name)
54609 {
54610     int fd;
54611     semaphore_t *semap;

54612     fd = open(semaphore_name, O_RDWR, 0666);
54613     if (fd < 0)
54614         return (NULL);
54615     semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
54616         PROT_READ | PROT_WRITE, MAP_SHARED,
54617         fd, 0);

```

```

54618         close (fd);
54619         return (semap);
54620     }

54621     void
54622     semaphore_post(semaphore_t *semap)
54623     {
54624         pthread_mutex_lock(&semap->lock);
54625         if (semap->count == 0)
54626             pthread_cond_signal(&semap->nonzero);
54627         semap->count++;
54628         pthread_mutex_unlock(&semap->lock);
54629     }

54630     void
54631     semaphore_wait(semaphore_t *semap)
54632     {
54633         pthread_mutex_lock(&semap->lock);
54634         while (semap->count == 0)
54635             pthread_cond_wait(&semap->nonzero, &semap->lock);
54636         semap->count--;
54637         pthread_mutex_unlock(&semap->lock);
54638     }

54639     void
54640     semaphore_close(semaphore_t *semap)
54641     {
54642         munmap((void *) semap, sizeof(semaphore_t));
54643     }

```

The following code is for three separate processes that create, post, and wait on a semaphore in the file **/tmp/semaphore**. Once the file is created, the post and wait programs increment and decrement the counting semaphore (waiting and waking as required) even though they did not initialize the semaphore.

```

54648     /* create.c */
54649     #include "pthread.h"
54650     #include "sem.h"

54651     int
54652     main()
54653     {
54654         semaphore_t *semap;

54655         semap = semaphore_create("/tmp/semaphore");
54656         if (semap == NULL)
54657             exit(1);
54658         semaphore_close(semap);
54659         return (0);
54660     }

54661     /* post */
54662     #include "pthread.h"
54663     #include "sem.h"

54664     int

```

```

54665     main()
54666     {
54667         semaphore_t *semaph;
54668
54669         semaph = semaphore_open("/tmp/semaphore");
54670         if (semaph == NULL)
54671             exit(1);
54672         semaphore_post(semaph);
54673         semaphore_close(semaph);
54674         return (0);
54675     }
54676
54677     /* wait */
54678     #include "pthread.h"
54679     #include "sem.h"
54680
54681     int
54682     main()
54683     {
54684         semaphore_t *semaph;
54685
54686         semaph = semaphore_open("/tmp/semaphore");
54687         if (semaph == NULL)
54688             exit(1);
54689         semaphore_wait(semaph);
54690         semaphore_close(semaph);
54691         return (0);
54692     }

```

**FUTURE DIRECTIONS**

None.

XBD <pthread.h>

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

The *pthread\_mutexattr\_destroy()* and *pthread\_mutexattr\_init()* functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1c #27 is applied, updating the ERRORS section.

**Issue 7**

The *pthread\_mutexattr\_destroy()* and *pthread\_mutexattr\_init()* functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

**54705 NAME**

54706 pthread\_mutexattr\_getprioceiling, pthread\_mutexattr\_setprioceiling — get and set the  
 54707 prioceiling attribute of the mutex attributes object (**REALTIME THREADS**)

**54708 SYNOPSIS**

```
54709 RPP|TPP #include <pthread.h>
54710
54710 int pthread_mutexattr_getprioceiling(const pthread_mutexattr_t
54711     *restrict attr, int *restrict prioceiling);
54712 int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,
54713     int prioceiling);
```

**54714 DESCRIPTION**

54715 The *pthread\_mutexattr\_getprioceiling()* and *pthread\_mutexattr\_setprioceiling()* functions,  
 54716 respectively, shall get and set the priority ceiling attribute of a mutex attributes object pointed to  
 54717 by *attr* which was previously created by the function *pthread\_mutexattr\_init()*.

54718 The *prioceiling* attribute contains the priority ceiling of initialized mutexes. The values of  
 54719 *prioceiling* are within the maximum range of priorities defined by SCHED\_FIFO.

54720 The *prioceiling* attribute defines the priority ceiling of initialized mutexes, which is the minimum  
 54721 priority level at which the critical section guarded by the mutex is executed. In order to avoid  
 54722 priority inversion, the priority ceiling of the mutex shall be set to a priority higher than or equal  
 54723 to the highest priority of all the threads that may lock that mutex. The values of *prioceiling* are  
 54724 within the maximum range of priorities defined under the SCHED\_FIFO scheduling policy.

54725 The behavior is undefined if the value specified by the *attr* argument to  
 54726 *pthread\_mutexattr\_getprioceiling()* or *pthread\_mutexattr\_setprioceiling()* does not refer to an  
 54727 initialized mutex attributes object.

**54728 RETURN VALUE**

54729 Upon successful completion, the *pthread\_mutexattr\_getprioceiling()* and  
 54730 *pthread\_mutexattr\_setprioceiling()* functions shall return zero; otherwise, an error number shall be  
 54731 returned to indicate the error.

**54732 ERRORS**

54733 These functions may fail if:

54734 [EINVAL] The value specified by *prioceiling* is invalid.

54735 [EPERM] The caller does not have the privilege to perform the operation.

54736 These functions shall not return an error code of [EINTR].

**54737 EXAMPLES**

54738 None.

**54739 APPLICATION USAGE**

54740 None.

**54741 RATIONALE**

54742 If an implementation detects that the value specified by the *attr* argument to  
 54743 *pthread\_mutexattr\_getprioceiling()* or *pthread\_mutexattr\_setprioceiling()* does not refer to an  
 54744 initialized mutex attributes object, it is recommended that the function should fail and report an  
 54745 [EINVAL] error.

54746 **FUTURE DIRECTIONS**

54747 None.

54748 **SEE ALSO**54749 *pthread\_cond\_destroy()*, *pthread\_create()*, *pthread\_mutex\_destroy()*

54750 XBD &lt;pthread.h&gt;

54751 **CHANGE HISTORY**

54752 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

54753 Marked as part of the Realtime Threads Feature Group.

54754 **Issue 6**54755 The *pthread\_mutexattr\_getprioceiling()* and *pthread\_mutexattr\_setprioceiling()* functions are marked  
54756 as part of the Threads and Thread Priority Protection options.54757 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
54758 implementation does not support the Thread Priority Protection option.54759 The [ENOTSUP] error condition has been removed since these functions do not have a *protocol*  
54760 argument.54761 The **restrict** keyword is added to the *pthread\_mutexattr\_getprioceiling()* prototype for alignment  
54762 with the ISO/IEC 9899:1999 standard.54763 **Issue 7**54764 The *pthread\_mutexattr\_getprioceiling()* and *pthread\_mutexattr\_setprioceiling()* functions are moved  
54765 from the Threads option to require support of either the Robust Mutex Priority Protection option  
54766 or the Non-Robust Mutex Priority Protection option.54767 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition  
54768 results in undefined behavior.

54769 **NAME**

54770 pthread\_mutexattr\_getprotocol, pthread\_mutexattr\_setprotocol — get and set the protocol  
 54771 attribute of the mutex attributes object (**REALTIME THREADS**)

54772 **SYNOPSIS**

```
54773 MC1 #include <pthread.h>
54774
54775 int pthread_mutexattr_getprotocol(const pthread_mutexattr_t
54776     *restrict attr, int *restrict protocol);
54777 int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,
54778     int protocol);
```

54778 **DESCRIPTION**

54779 The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions, respectively,  
 54780 shall get and set the protocol attribute of a mutex attributes object pointed to by *attr* which was  
 54781 previously created by the function *pthread\_mutexattr\_init()*.

54782 The *protocol* attribute defines the protocol to be followed in utilizing mutexes. The value of  
 54783 *protocol* may be one of:

```
54784 RPI | TPI PTHREAD_PRIO_INHERIT
54785 MC1 PTHREAD_PRIO_NONE
54786 RPP | TPP PTHREAD_PRIO_PROTECT
```

54787 which are defined in the **<pthread.h>** header. The default value of the attribute shall be  
 54788 PTHREAD\_PRIO\_NONE.

54789 When a thread owns a mutex with the PTHREAD\_PRIO\_NONE *protocol* attribute, its priority  
 54790 and scheduling shall not be affected by its mutex ownership.

54791 RPI When a thread is blocking higher priority threads because of owning one or more robust  
 54792 mutexes with the PTHREAD\_PRIO\_INHERIT *protocol* attribute, it shall execute at the higher of  
 54793 its priority or the priority of the highest priority thread waiting on any of the robust mutexes  
 54794 owned by this thread and initialized with this protocol.

54795 TPI When a thread is blocking higher priority threads because of owning one or more non-robust  
 54796 mutexes with the PTHREAD\_PRIO\_INHERIT *protocol* attribute, it shall execute at the higher of  
 54797 its priority or the priority of the highest priority thread waiting on any of the non-robust  
 54798 mutexes owned by this thread and initialized with this protocol.

54799 RPP When a thread owns one or more robust mutexes initialized with the  
 54800 PTHREAD\_PRIO\_PROTECT protocol, it shall execute at the higher of its priority or the highest  
 54801 of the priority ceilings of all the robust mutexes owned by this thread and initialized with this  
 54802 attribute, regardless of whether other threads are blocked on any of these robust mutexes or not.

54803 TPP When a thread owns one or more non-robust mutexes initialized with the  
 54804 PTHREAD\_PRIO\_PROTECT protocol, it shall execute at the higher of its priority or the highest  
 54805 of the priority ceilings of all the non-robust mutexes owned by this thread and initialized with  
 54806 this attribute, regardless of whether other threads are blocked on any of these non-robust  
 54807 mutexes or not.

54808 While a thread is holding a mutex which has been initialized with the  
 54809 PTHREAD\_PRIO\_INHERIT or PTHREAD\_PRIO\_PROTECT protocol attributes, it shall not be  
 54810 subject to being moved to the tail of the scheduling queue at its priority in the event that its  
 54811 original priority is changed, such as by a call to *sched\_setparam()*. Likewise, when a thread

54812 unlocks a mutex that has been initialized with the PTHREAD\_PRIO\_INHERIT or  
 54813 PTHREAD\_PRIO\_PROTECT protocol attributes, it shall not be subject to being moved to the tail  
 54814 of the scheduling queue at its priority in the event that its original priority is changed.

54815 If a thread simultaneously owns several mutexes initialized with different protocols, it shall  
 54816 execute at the highest of the priorities that it would have obtained by each of these protocols.

54817 RPI | TPI When a thread makes a call to *pthread\_mutex\_lock()*, the mutex was initialized with the protocol  
 54818 attribute having the value PTHREAD\_PRIO\_INHERIT, when the calling thread is blocked  
 54819 because the mutex is owned by another thread, that owner thread shall inherit the priority level  
 54820 of the calling thread as long as it continues to own the mutex. The implementation shall update  
 54821 its execution priority to the maximum of its assigned priority and all its inherited priorities.  
 54822 Furthermore, if this owner thread itself becomes blocked on another mutex with the *protocol*  
 54823 attribute having the value PTHREAD\_PRIO\_INHERIT, the same priority inheritance effect shall  
 54824 be propagated to this other owner thread, in a recursive manner.

54825 The behavior is undefined if the value specified by the *attr* argument to  
 54826 *pthread\_mutexattr\_getprotocol()* or *pthread\_mutexattr\_setprotocol()* does not refer to an initialized  
 54827 mutex attributes object.

#### 54828 RETURN VALUE

54829 Upon successful completion, the *pthread\_mutexattr\_getprotocol()* and  
 54830 *pthread\_mutexattr\_setprotocol()* functions shall return zero; otherwise, an error number shall be  
 54831 returned to indicate the error.

#### 54832 ERRORS

54833 The *pthread\_mutexattr\_setprotocol()* function shall fail if:

54834 [ENOTSUP] The value specified by *protocol* is an unsupported value.

54835 The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions may fail if:

54836 [EINVAL] The value specified by *protocol* is invalid.

54837 [EPERM] The caller does not have the privilege to perform the operation.

54838 These functions shall not return an error code of [EINTR].

#### 54839 EXAMPLES

54840 None.

#### 54841 APPLICATION USAGE

54842 None.

#### 54843 RATIONALE

54844 If an implementation detects that the value specified by the *attr* argument to  
 54845 *pthread\_mutexattr\_getprotocol()* or *pthread\_mutexattr\_setprotocol()* does not refer to an initialized  
 54846 mutex attributes object, it is recommended that the function should fail and report an [EINVAL]  
 54847 error.

#### 54848 FUTURE DIRECTIONS

54849 None.

#### 54850 SEE ALSO

54851 *pthread\_cond\_destroy()*, *pthread\_create()*, *pthread\_mutex\_destroy()*

54852 XBD <pthread.h>

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Marked as part of the Realtime Threads Feature Group.

**Issue 6**

The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions are marked as part of the Threads option and either the Thread Priority Protection or Thread Priority Inheritance options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Priority Protection or Thread Priority Inheritance options.

The **restrict** keyword is added to the *pthread\_mutexattr\_getprotocol()* prototype for alignment with the ISO/IEC 9899:1999 standard.

**Issue 7**

SD5-XSH-ERN-135 is applied, updating the DESCRIPTION to define a default value for the *protocol* attribute.

SD5-XSH-ERN-188 is applied, updating the DESCRIPTION.

The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions are moved from the Threads option to require support of either the Non-Robust Mutex Priority Protection option or the Non-Robust Mutex Priority Inheritance option or the Robust Mutex Priority Protection option or the Robust Mutex Priority Inheritance option.

The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

54875 **NAME**

54876 pthread\_mutexattr\_getpshared, pthread\_mutexattr\_setpshared — get and set the process-shared  
 54877 attribute

54878 **SYNOPSIS**

```
54879 TSH #include <pthread.h>
54880
54880 int pthread_mutexattr_getpshared(const pthread_mutexattr_t
54881     *restrict attr, int *restrict pshared);
54882 int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
54883     int pshared);
```

54884 **DESCRIPTION**

54885 The *pthread\_mutexattr\_getpshared()* function shall obtain the value of the *process-shared* attribute  
 54886 from the attributes object referenced by *attr*.

54887 The *pthread\_mutexattr\_setpshared()* function shall set the *process-shared* attribute in an initialized  
 54888 attributes object referenced by *attr*.

54889 The *process-shared* attribute is set to `PTHREAD_PROCESS_SHARED` to permit a mutex to be  
 54890 operated upon by any thread that has access to the memory where the mutex is allocated, even if  
 54891 the mutex is allocated in memory that is shared by multiple processes. See [Section 2.9.9](#) (on page  
 54892 523) for further requirements. The default value of the attribute shall be  
 54893 `PTHREAD_PROCESS_PRIVATE`.

54894 The behavior is undefined if the value specified by the *attr* argument to  
 54895 *pthread\_mutexattr\_getpshared()* or *pthread\_mutexattr\_setpshared()* does not refer to an initialized  
 54896 mutex attributes object.

54897 **RETURN VALUE**

54898 Upon successful completion, *pthread\_mutexattr\_setpshared()* shall return zero; otherwise, an error  
 54899 number shall be returned to indicate the error.

54900 Upon successful completion, *pthread\_mutexattr\_getpshared()* shall return zero and store the value  
 54901 of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter.  
 54902 Otherwise, an error number shall be returned to indicate the error.

54903 **ERRORS**

54904 The *pthread\_mutexattr\_setpshared()* function may fail if:

54905 [EINVAL] The new value specified for the attribute is outside the range of legal values  
 54906 for that attribute.

54907 These functions shall not return an error code of [EINTR].

54908 **EXAMPLES**

54909 None.

54910 **APPLICATION USAGE**

54911 None.

54912 **RATIONALE**

54913 If an implementation detects that the value specified by the *attr* argument to  
 54914 *pthread\_mutexattr\_getpshared()* or *pthread\_mutexattr\_setpshared()* does not refer to an initialized  
 54915 mutex attributes object, it is recommended that the function should fail and report an [EINVAL]  
 54916 error.

54917 **FUTURE DIRECTIONS**

54918 None.

54919 **SEE ALSO**54920 *pthread\_cond\_destroy()*, *pthread\_create()*, *pthread\_mutex\_destroy()*, *pthread\_mutexattr\_destroy()*

54921 XBD &lt;pthread.h&gt;

54922 **CHANGE HISTORY**

54923 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

54924 **Issue 6**54925 The *pthread\_mutexattr\_getpshared()* and *pthread\_mutexattr\_setpshared()* functions are marked as  
54926 part of the Threads and Thread Process-Shared Synchronization options.54927 The **restrict** keyword is added to the *pthread\_mutexattr\_getpshared()* prototype for alignment  
54928 with the ISO/IEC 9899:1999 standard.54929 **Issue 7**54930 The *pthread\_mutexattr\_getpshared()* and *pthread\_mutexattr\_setpshared()* functions are marked only |  
54931 as part of the Thread Process-Shared Synchronization option as the Threads option is now part |  
54932 of the Base.54933 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition  
54934 results in undefined behavior.

**NAME**

pthread\_mutexattr\_getrobust, pthread\_mutexattr\_setrobust — get and set the mutex robust attribute

**SYNOPSIS**

```
#include <pthread.h>

int pthread_mutexattr_getrobust(const pthread_mutexattr_t *restrict
    attr, int *restrict robust);
int pthread_mutexattr_setrobust(pthread_mutexattr_t *attr,
    int robust);
```

**DESCRIPTION**

The *pthread\_mutexattr\_getrobust()* and *pthread\_mutexattr\_setrobust()* functions, respectively, shall get and set the mutex *robust* attribute. This attribute is set in the *robust* parameter. Valid values for *robust* include:

**PTHREAD\_MUTEX\_STALLED**

No special actions are taken if the owner of the mutex is terminated while holding the mutex lock. This can lead to deadlocks if no other thread can unlock the mutex.

This is the default value.

**PTHREAD\_MUTEX\_ROBUST**

If the process containing the owning thread of a robust mutex terminates while holding the mutex lock, the next thread that acquires the mutex shall be notified about the termination by the return value [EOWNERDEAD] from the locking function. If the owning thread of a robust mutex terminates while holding the mutex lock, the next thread that attempts to acquire the mutex may be notified about the termination by the return value [EOWNERDEAD]. The notified thread can then attempt to make the state protected by the mutex consistent again, and if successful can mark the mutex state as consistent by calling *pthread\_mutex\_consistent()*. After a subsequent successful call to *pthread\_mutex\_unlock()*, the mutex lock shall be released and can be used normally by other threads. If the mutex is unlocked without a call to *pthread\_mutex\_consistent()*, it shall be in a permanently unusable state and all attempts to lock the mutex shall fail with the error [ENOTRECOVERABLE]. The only permissible operation on such a mutex is *pthread\_mutex\_destroy()*.

The behavior is undefined if the value specified by the *attr* argument to *pthread\_mutexattr\_getrobust()* or *pthread\_mutexattr\_setrobust()* does not refer to an initialized mutex attributes object.

**RETURN VALUE**

Upon successful completion, the *pthread\_mutexattr\_getrobust()* function shall return zero and store the value of the *robust* attribute of *attr* into the object referenced by the *robust* parameter. Otherwise, an error value shall be returned to indicate the error. If successful, the *pthread\_mutexattr\_setrobust()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The *pthread\_mutexattr\_setrobust()* function shall fail if:

[EINVAL] The value of *robust* is invalid.

These functions shall not return an error code of [EINTR].

**EXAMPLES**

None.

**APPLICATION USAGE**

The actions required to make the state protected by the mutex consistent again are solely dependent on the application. If it is not possible to make the state of a mutex consistent, robust mutexes can be used to notify this situation by calling *pthread\_mutex\_unlock()* without a prior call to *pthread\_mutex\_consistent()*.

If the state is declared inconsistent by calling *pthread\_mutex\_unlock()* without a prior call to *pthread\_mutex\_consistent()*, a possible approach could be to destroy the mutex and then reinitialize it. However, it should be noted that this is possible only in certain situations where the state protected by the mutex has to be reinitialized and coordination achieved with other threads blocked on the mutex, because otherwise a call to a locking function with a reference to a mutex object invalidated by a call to *pthread\_mutex\_destroy()* results in undefined behavior.

**RATIONALE**

If an implementation detects that the value specified by the *attr* argument to *pthread\_mutexattr\_getrobust()* or *pthread\_mutexattr\_setrobust()* does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*pthread\_mutex\_consistent()*, *pthread\_mutex\_destroy()*, *pthread\_mutex\_lock()*

XBD <pthread.h>

**CHANGE HISTORY**

First released in Issue 7.

55003 **NAME**

55004 pthread\_mutexattr\_gettype, pthread\_mutexattr\_settype — get and set the mutex type attribute

55005 **SYNOPSIS**

```
55006 #include <pthread.h>
55007 int pthread_mutexattr_gettype(const pthread_mutexattr_t *restrict attr,
55008 int *restrict type);
55009 int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type);
```

55010 **DESCRIPTION**

55011 The *pthread\_mutexattr\_gettype()* and *pthread\_mutexattr\_settype()* functions, respectively, shall get  
 55012 and set the mutex *type* attribute. This attribute is set in the *type* parameter to these functions. The  
 55013 default value of the *type* attribute is PTHREAD\_MUTEX\_DEFAULT.

55014 The type of mutex is contained in the *type* attribute of the mutex attributes. Valid mutex types  
 55015 include:

```
55016 PTHREAD_MUTEX_NORMAL
55017 PTHREAD_MUTEX_ERRORCHECK
55018 PTHREAD_MUTEX_RECURSIVE
55019 PTHREAD_MUTEX_DEFAULT
```

55020 The mutex type affects the behavior of calls which lock and unlock the mutex. See  
 55021 *pthread\_mutex\_lock()* for details. An implementation may map PTHREAD\_MUTEX\_DEFAULT  
 55022 to one of the other mutex types.

55023 The behavior is undefined if the value specified by the *attr* argument to  
 55024 *pthread\_mutexattr\_gettype()* or *pthread\_mutexattr\_settype()* does not refer to an initialized mutex  
 55025 attributes object.

55026 **RETURN VALUE**

55027 Upon successful completion, the *pthread\_mutexattr\_gettype()* function shall return zero and store  
 55028 the value of the *type* attribute of *attr* into the object referenced by the *type* parameter. Otherwise,  
 55029 an error shall be returned to indicate the error.

55030 If successful, the *pthread\_mutexattr\_settype()* function shall return zero; otherwise, an error  
 55031 number shall be returned to indicate the error.

55032 **ERRORS**

55033 The *pthread\_mutexattr\_settype()* function shall fail if:

55034 [EINVAL] The value *type* is invalid.

55035 These functions shall not return an error code of [EINTR].

55036 **EXAMPLES**

55037 None.

55038 **APPLICATION USAGE**

55039 It is advised that an application should not use a PTHREAD\_MUTEX\_RECURSIVE mutex with  
 55040 condition variables because the implicit unlock performed for a *pthread\_cond\_timedwait()* or  
 55041 *pthread\_cond\_wait()* may not actually release the mutex (if it had been locked multiple times). If  
 55042 this happens, no other thread can satisfy the condition of the predicate.

55043 **RATIONALE**

55044 If an implementation detects that the value specified by the *attr* argument to  
 55045 *pthread\_mutexattr\_gettype()* or *pthread\_mutexattr\_settype()* does not refer to an initialized mutex  
 55046 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

55047 **FUTURE DIRECTIONS**

55048 None.

55049 **SEE ALSO**55050 *pthread\_cond\_timedwait()*, *pthread\_mutex\_lock()*55051 XBD **<pthread.h>**55052 **CHANGE HISTORY**

55053 First released in Issue 5.

55054 **Issue 6**

55055 The Open Group Corrigendum U033/3 is applied. The SYNOPSIS for  
55056 *pthread\_mutexattr\_gettype()* is updated so that the first argument is of type **const**  
55057 **pthread\_mutexattr\_t** \*.

55058 The **restrict** keyword is added to the *pthread\_mutexattr\_gettype()* prototype for alignment with  
55059 the ISO/IEC 9899:1999 standard.

55060 **Issue 7**

55061 The *pthread\_mutexattr\_gettype()* and *pthread\_mutexattr\_settype()* functions are moved from the  
55062 XSI option to the Base.

55063 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition  
55064 results in undefined behavior.

55065 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0464 [121] is applied.

55066 **NAME**

55067 pthread\_mutexattr\_init — initialize the mutex attributes object

55068 **SYNOPSIS**

55069 #include &lt;pthread.h&gt;

55070 int pthread\_mutexattr\_init(pthread\_mutexattr\_t \*attr);

55071 **DESCRIPTION**55072 Refer to *pthread\_mutexattr\_destroy()*.

55074 pthread\_mutexattr\_setprioceiling — set the prioceiling attribute of the mutex attributes object  
55075 (**REALTIME THREADS**)

55076 **SYNOPSIS**

```
55077 RPP|TPP #include <pthread.h>  
55078 int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,  
55079 int prioceiling);
```

55080 **DESCRIPTION**

55081 Refer to *pthread\_mutexattr\_getprioceiling()*.

55082 **NAME**

55083 pthread\_mutexattr\_setprotocol — set the protocol attribute of the mutex attributes object  
55084 (**REALTIME THREADS**)

55085 **SYNOPSIS**

```
55086 MC1 #include <pthread.h>  
55087 int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,  
55088     int protocol);
```

55089 **DESCRIPTION**

55090 Refer to *pthread\_mutexattr\_getprotocol()*.

55091 **NAME**

55092 pthread\_mutexattr\_setpshared — set the process-shared attribute

55093 **SYNOPSIS**

```
55094 TSH      #include <pthread.h>
55095          int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
55096          int pshared);
```

55097 **DESCRIPTION**55098 Refer to *pthread\_mutexattr\_getpshared()*.

55099 **NAME**

55100 pthread\_mutexattr\_setrobust — get and set the mutex robust attribute

55101 **SYNOPSIS**

55102 #include &lt;pthread.h&gt;

55103 int pthread\_mutexattr\_setrobust(pthread\_mutexattr\_t \*attr,

55104 int robust);

55105 **DESCRIPTION**55106 Refer to *pthread\_mutexattr\_getrobust()*.

55107 **NAME**

55108 pthread\_mutexattr\_settype — set the mutex type attribute

55109 **SYNOPSIS**

55110 #include &lt;pthread.h&gt;

55111 int pthread\_mutexattr\_settype(pthread\_mutexattr\_t \*attr, int type);

55112 **DESCRIPTION**55113 Refer to *pthread\_mutexattr\_gettype()*.

## 55114 NAME

55115 pthread\_once — dynamic package initialization

## 55116 SYNOPSIS

```
55117 #include <pthread.h>
55118 int pthread_once(pthread_once_t *once_control,
55119                 void (*init_routine)(void));
55120 pthread_once_t once_control = PTHREAD_ONCE_INIT;
```

## 55121 DESCRIPTION

55122 The first call to *pthread\_once()* by any thread in a process, with a given *once\_control*, shall call the  
 55123 *init\_routine* with no arguments. Subsequent calls of *pthread\_once()* with the same *once\_control*  
 55124 shall not call the *init\_routine*. On return from *pthread\_once()*, *init\_routine* shall have completed.  
 55125 The *once\_control* parameter shall determine whether the associated initialization routine has been  
 55126 called.

55127 The *pthread\_once()* function is not a cancellation point. However, if *init\_routine* is a cancellation  
 55128 point and is canceled, the effect on *once\_control* shall be as if *pthread\_once()* was never called.

55129 If the call to *init\_routine* is terminated by a call to *longjmp()*, *\_longjmp()*, or *siglongjmp()*, the +  
 55130 behavior is undefined. +

55131 The constant PTHREAD\_ONCE\_INIT is defined in the **<pthread.h>** header.

55132 The behavior of *pthread\_once()* is undefined if *once\_control* has automatic storage duration or is  
 55133 not initialized by PTHREAD\_ONCE\_INIT.

## 55134 RETURN VALUE

55135 Upon successful completion, *pthread\_once()* shall return zero; otherwise, an error number shall  
 55136 be returned to indicate the error.

## 55137 ERRORS

55138 The *pthread\_once()* function shall not return an error code of [EINTR].

## 55139 EXAMPLES

55140 None.

## 55141 APPLICATION USAGE

55142 If *init\_routine* recursively calls *pthread\_once()* with the same *once\_control*, the recursive call will |  
 55143 not call the specified *init\_routine*, and thus the specified *init\_routine* will not complete, and thus |  
 55144 the recursive call to *pthread\_once()* will not return. Use of *longjmp()*, *\_longjmp()*, or *siglongjmp()* |  
 55145 within an *init\_routine* to jump to a point outside of *init\_routine* prevents *init\_routine* from |  
 55146 returning.

## 55147 RATIONALE

55148 Some C libraries are designed for dynamic initialization. That is, the global initialization for the  
 55149 library is performed when the first procedure in the library is called. In a single-threaded  
 55150 program, this is normally implemented using a static variable whose value is checked on entry  
 55151 to a routine, as follows:

```
55152 static int random_is_initialized = 0;
55153 extern void initialize_random();
55154 int random_function()
55155 {
55156     if (random_is_initialized == 0) {
55157         initialize_random();
55158         random_is_initialized = 1;
```

```

55159     }
55160     ... /* Operations performed after initialization. */
55161 }

```

55162 To keep the same structure in a multi-threaded program, a new primitive is needed. Otherwise,  
 55163 library initialization has to be accomplished by an explicit call to a library-exported initialization  
 55164 function prior to any use of the library.

55165 For dynamic library initialization in a multi-threaded process, if an initialization flag is used the  
 55166 flag needs to be protected against modification by multiple threads simultaneously calling into  
 55167 the library. This can be done by using a mutex (initialized by assigning  
 55168 PTHREAD\_MUTEX\_INITIALIZER). However, the better solution is to use *pthread\_once()* which  
 55169 is designed for exactly this purpose, as follows:

```

55170 #include <pthread.h>
55171 static pthread_once_t random_is_initialized = PTHREAD_ONCE_INIT;
55172 extern void initialize_random();
55173
55174 int random_function()
55175 {
55176     (void) pthread_once(&random_is_initialized, initialize_random);
55177     ... /* Operations performed after initialization. */
55178 }

```

55178 If an implementation detects that the value specified by the *once\_control* argument to  
 55179 *pthread\_once()* does not refer to a **pthread\_once\_t** object initialized by PTHREAD\_ONCE\_INIT,  
 55180 it is recommended that the function should fail and report an [EINVAL] error.

#### 55181 FUTURE DIRECTIONS

55182 None.

#### 55183 SEE ALSO

55184 XBD [<pthread.h>](#)

#### 55185 CHANGE HISTORY

55186 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 55187 Issue 6

55188 The *pthread\_once()* function is marked as part of the Threads option.

55189 The [EINVAL] error is added as a “may fail” case for if either argument is invalid.

#### 55190 Issue 7

55191 The *pthread\_once()* function is moved from the Threads option to the Base.

55192 The [EINVAL] error for an uninitialized **pthread\_once\_t** object is removed; this condition results  
 55193 in undefined behavior.

## 55194 NAME

55195 pthread\_rwlock\_destroy, pthread\_rwlock\_init — destroy and initialize a read-write lock object

## 55196 SYNOPSIS

```
55197 #include <pthread.h>
55198 int pthread_rwlock_destroy(pthread_rwlock_t *rwlock);
55199 int pthread_rwlock_init(pthread_rwlock_t *restrict rwlock,
55200     const pthread_rwlockattr_t *restrict attr);
55201 pthread_rwlock_t rwlock = PTHREAD_RWLOCK_INITIALIZER;
```

## 55202 DESCRIPTION

55203 The *pthread\_rwlock\_destroy()* function shall destroy the read-write lock object referenced by  
 55204 *rwlock* and release any resources used by the lock. The effect of subsequent use of the lock is  
 55205 undefined until the lock is reinitialized by another call to *pthread\_rwlock\_init()*. An  
 55206 implementation may cause *pthread\_rwlock\_destroy()* to set the object referenced by *rwlock* to an  
 55207 invalid value. Results are undefined if *pthread\_rwlock\_destroy()* is called when any thread holds  
 55208 *rwlock*. Attempting to destroy an uninitialized read-write lock results in undefined behavior.

55209 The *pthread\_rwlock\_init()* function shall allocate any resources required to use the read-write lock  
 55210 referenced by *rwlock* and initializes the lock to an unlocked state with attributes referenced by  
 55211 *attr*. If *attr* is NULL, the default read-write lock attributes shall be used; the effect is the same as  
 55212 passing the address of a default read-write lock attributes object. Once initialized, the lock can be  
 55213 used any number of times without being reinitialized. Results are undefined if  
 55214 *pthread\_rwlock\_init()* is called specifying an already initialized read-write lock. Results are  
 55215 undefined if a read-write lock is used without first being initialized.

55216 If the *pthread\_rwlock\_init()* function fails, *rwlock* shall not be initialized and the contents of *rwlock*  
 55217 are undefined.

55218 See [Section 2.9.9](#) (on page 523) for further requirements. |

55219 In cases where default read-write lock attributes are appropriate, the macro  
 55220 PTHREAD\_RWLOCK\_INITIALIZER can be used to initialize read-write locks. The effect shall  
 55221 be equivalent to dynamic initialization by a call to *pthread\_rwlock\_init()* with the *attr* parameter  
 55222 specified as NULL, except that no error checks are performed.

55223 The behavior is undefined if the value specified by the *attr* argument to *pthread\_rwlock\_init()*  
 55224 does not refer to an initialized read-write lock attributes object.

## 55225 RETURN VALUE

55226 If successful, the *pthread\_rwlock\_destroy()* and *pthread\_rwlock\_init()* functions shall return zero;  
 55227 otherwise, an error number shall be returned to indicate the error.

## 55228 ERRORS

55229 The *pthread\_rwlock\_init()* function shall fail if:

55230 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize  
 55231 another read-write lock.

55232 [ENOMEM] Insufficient memory exists to initialize the read-write lock.

55233 [EPERM] The caller does not have the privilege to perform the operation.

55234 These functions shall not return an error code of [EINTR].

**EXAMPLES**

None.

**APPLICATION USAGE**

Applications using these and related read-write lock functions may be subject to priority inversion, as discussed in XBD [Section 3.291](#) (on page 80).

**RATIONALE**

If an implementation detects that the value specified by the *rwlock* argument to *pthread\_rwlock\_destroy()* does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *attr* argument to *pthread\_rwlock\_init()* does not refer to an initialized read-write lock attributes object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *rwlock* argument to *pthread\_rwlock\_destroy()* or *pthread\_rwlock\_init()* refers to a locked read-write lock object, or detects that the value specified by the *rwlock* argument to *pthread\_rwlock\_init()* refers to an already initialized read-write lock object, it is recommended that the function should fail and report an [EBUSY] error.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 5.

**Issue 6**

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension). The initializer macro is also deleted from the SYNOPSIS.

- The DESCRIPTION is updated as follows:

- It explicitly notes allocation of resources upon initialization of a read-write lock object.

- A paragraph is added specifying that copies of read-write lock objects may not be used.

- An [EINVAL] error is added to the ERRORS section for *pthread\_rwlock\_init()*, indicating that the *rwlock* value is invalid.

- The SEE ALSO section is updated.

The **restrict** keyword is added to the *pthread\_rwlock\_init()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/45 is applied, adding APPLICATION USAGE relating to priority inversion.

55278 **Issue 7**

55279 Austin Group Interpretation 1003.1-2001 #048 is applied, adding the  
55280 PTHREAD\_RWLOCK\_INITIALIZER macro.

55281 The *pthread\_rwlock\_destroy()* and *pthread\_rwlock\_init()* functions are moved from the Threads  
55282 option to the Base.

55283 The [EINVAL] error for an uninitialized read-write lock object or read-write lock attributes  
55284 object is removed; this condition results in undefined behavior.

55285 The [EBUSY] error for a locked read-write lock object or an already initialized read-write lock  
55286 object is removed; this condition results in undefined behavior.

55287 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0465 [70] is applied.

**55288 NAME**

55289 pthread\_rwlock\_rdlock, pthread\_rwlock\_tryrdlock — lock a read-write lock object for reading

**55290 SYNOPSIS**

```
55291 #include <pthread.h>
55292 int pthread_rwlock_rdlock(pthread_rwlock_t *rwlock);
55293 int pthread_rwlock_tryrdlock(pthread_rwlock_t *rwlock);
```

**55294 DESCRIPTION**

55295 The *pthread\_rwlock\_rdlock()* function shall apply a read lock to the read-write lock referenced by  
 55296 *rwlock*. The calling thread acquires the read lock if a writer does not hold the lock and there are  
 55297 no writers blocked on the lock.

55298 TPS If the Thread Execution Scheduling option is supported, and the threads involved in the lock are  
 55299 executing with the scheduling policies SCHED\_FIFO or SCHED\_RR, the calling thread shall not  
 55300 acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on  
 55301 the lock; otherwise, the calling thread shall acquire the lock.

55302 TPS TSP If the Thread Execution Scheduling option is supported, and the threads involved in the lock are  
 55303 executing with the SCHED\_SPORADIC scheduling policy, the calling thread shall not acquire  
 55304 the lock if a writer holds the lock or if writers of higher or equal priority are blocked on the lock;  
 55305 otherwise, the calling thread shall acquire the lock.

55306 If the Thread Execution Scheduling option is not supported, it is implementation-defined  
 55307 whether the calling thread acquires the lock when a writer does not hold the lock and there are  
 55308 writers blocked on the lock. If a writer holds the lock, the calling thread shall not acquire the  
 55309 read lock. If the read lock is not acquired, the calling thread shall block until it can acquire the  
 55310 lock. The calling thread may deadlock if at the time the call is made it holds a write lock.

55311 A thread may hold multiple concurrent read locks on *rwlock* (that is, successfully call the  
 55312 *pthread\_rwlock\_rdlock()* function *n* times). If so, the application shall ensure that the thread  
 55313 performs matching unlocks (that is, it calls the *pthread\_rwlock\_unlock()* function *n* times).

55314 The maximum number of simultaneous read locks that an implementation guarantees can be  
 55315 applied to a read-write lock shall be implementation-defined. The *pthread\_rwlock\_rdlock()*  
 55316 function may fail if this maximum would be exceeded.

55317 The *pthread\_rwlock\_tryrdlock()* function shall apply a read lock as in the *pthread\_rwlock\_rdlock()*  
 55318 function, with the exception that the function shall fail if the equivalent *pthread\_rwlock\_rdlock()*  
 55319 call would have blocked the calling thread. In no case shall the *pthread\_rwlock\_tryrdlock()*  
 55320 function ever block; it always either acquires the lock or fails and returns immediately.

55321 Results are undefined if any of these functions are called with an uninitialized read-write lock.

55322 If a signal is delivered to a thread waiting for a read-write lock for reading, upon return from the  
 55323 signal handler the thread resumes waiting for the read-write lock for reading as if it was not  
 55324 interrupted.

**55325 RETURN VALUE**

55326 If successful, the *pthread\_rwlock\_rdlock()* function shall return zero; otherwise, an error number  
 55327 shall be returned to indicate the error.

55328 The *pthread\_rwlock\_tryrdlock()* function shall return zero if the lock for reading on the read-write  
 55329 lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to  
 55330 indicate the error.

## ERRORS

The *pthread\_rwlock\_tryrdlock()* function shall fail if:

[EBUSY]           The read-write lock could not be acquired for reading because a writer holds the lock or a writer with the appropriate priority was blocked on it.

The *pthread\_rwlock\_rdlock()* and *pthread\_rwlock\_tryrdlock()* functions may fail if:

[EAGAIN]           The read lock could not be acquired because the maximum number of read locks for *rwlock* has been exceeded.

The *pthread\_rwlock\_rdlock()* function may fail if:

[EDEADLK]           A deadlock condition was detected or the current thread already owns the read-write lock for writing.

These functions shall not return an error code of [EINTR].

## EXAMPLES

None.

## APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in XBD [Section 3.291](#) (on page 80).

## RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread\_rwlock\_rdlock()* or *pthread\_rwlock\_tryrdlock()* does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 5.

## Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The DESCRIPTION is updated as follows:
  - Conditions under which writers have precedence over readers are specified.
  - Failure of *pthread\_rwlock\_tryrdlock()* is clarified.
  - A paragraph on the maximum number of read locks is added.
- In the ERRORS sections, [EBUSY] is modified to take into account write priority, and [EDEADLK] is deleted as a *pthread\_rwlock\_tryrdlock()* error.

- 55370                   • The SEE ALSO section is updated.
- 55371                   IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/101 is applied, updating the ERRORS
- 55372                   section so that the [EDEADLK] error includes detection of a deadlock condition.
- 55373   **Issue 7**
- 55374                   The *pthread\_rwlock\_rdlock()* and *pthread\_rwlock\_tryrdlock()* functions are moved from the Threads
- 55375                   option to the Base.
- 55376                   The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results
- 55377                   in undefined behavior.

55378 **NAME**

55379 pthread\_rwlock\_timedrdlock — lock a read-write lock for reading

55380 **SYNOPSIS**

```
55381 #include <pthread.h>
55382 #include <time.h>

55383 int pthread_rwlock_timedrdlock(pthread_rwlock_t *restrict rwlock,
55384                               const struct timespec *restrict abstime);
```

55385 **DESCRIPTION**

55386 The *pthread\_rwlock\_timedrdlock()* function shall apply a read lock to the read-write lock  
 55387 referenced by *rwlock* as in the *pthread\_rwlock\_rdlock()* function. However, if the lock cannot be  
 55388 acquired without waiting for other threads to unlock the lock, this wait shall be terminated  
 55389 when the specified timeout expires. The timeout shall expire when the absolute time specified  
 55390 by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value  
 55391 of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already  
 55392 been passed at the time of the call.

55393 The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall  
 55394 be the resolution of the CLOCK\_REALTIME clock. The **timespec** data type is defined in the  
 55395 **<time.h>** header. Under no circumstances shall the function fail with a timeout if the lock can be  
 55396 acquired immediately. The validity of the *abstime* parameter need not be checked if the lock can  
 55397 be immediately acquired.

55398 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-  
 55399 write lock via a call to *pthread\_rwlock\_timedrdlock()*, upon return from the signal handler the  
 55400 thread shall resume waiting for the lock as if it was not interrupted.

55401 The calling thread may deadlock if at the time the call is made it holds a write lock on *rwlock*.  
 55402 The results are undefined if this function is called with an uninitialized read-write lock.

55403 **RETURN VALUE**

55404 The *pthread\_rwlock\_timedrdlock()* function shall return zero if the lock for reading on the read-  
 55405 write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned  
 55406 to indicate the error.

55407 **ERRORS**

55408 The *pthread\_rwlock\_timedrdlock()* function shall fail if:

55409 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

55410 The *pthread\_rwlock\_timedrdlock()* function may fail if:

55411 [EAGAIN] The read lock could not be acquired because the maximum number of read  
 55412 locks for lock would be exceeded.

55413 [EDEADLK] A deadlock condition was detected or the calling thread already holds a write  
 55414 lock on *rwlock*.

55415 [EINVAL] The *abstime* nanosecond value is less than zero or greater than or equal to 1 000  
 55416 million.

55417 This function shall not return an error code of [EINTR].

**EXAMPLES**

None.

**APPLICATION USAGE**

Applications using this function may be subject to priority inversion, as discussed in XBD Section 3.291 (on page 80).

**RATIONALE**

If an implementation detects that the value specified by the *rwlock* argument to *pthread\_rwlock\_timedrdlock()* does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

XBD Section 3.291 (on page 80), Section 4.12 (on page 111), **<pthread.h>**, **<time.h>**

**CHANGE HISTORY**

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/102 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

**Issue 7**

The *pthread\_rwlock\_timedrdlock()* function is moved from the Timeouts option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

**NAME**

pthread\_rwlock\_timedwrlock — lock a read-write lock for writing

**SYNOPSIS**

```
#include <pthread.h>
#include <time.h>

int pthread_rwlock_timedwrlock(pthread_rwlock_t *restrict rwlock,
                               const struct timespec *restrict abstime);
```

**DESCRIPTION**

The *pthread\_rwlock\_timedwrlock()* function shall apply a write lock to the read-write lock referenced by *rwlock* as in the *pthread\_rwlock\_wrlock()* function. However, if the lock cannot be acquired without waiting for other threads to unlock the lock, this wait shall be terminated when the specified timeout expires. The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall be the resolution of the CLOCK\_REALTIME clock. The **timespec** data type is defined in the **<time.h>** header. Under no circumstances shall the function fail with a timeout if the lock can be acquired immediately. The validity of the *abstime* parameter need not be checked if the lock can be immediately acquired.

If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-write lock via a call to *pthread\_rwlock\_timedwrlock()*, upon return from the signal handler the thread shall resume waiting for the lock as if it was not interrupted.

The calling thread may deadlock if at the time the call is made it holds the read-write lock. The results are undefined if this function is called with an uninitialized read-write lock.

**RETURN VALUE**

The *pthread\_rwlock\_timedwrlock()* function shall return zero if the lock for writing on the read-write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The *pthread\_rwlock\_timedwrlock()* function shall fail if:

[ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

The *pthread\_rwlock\_timedwrlock()* function may fail if:

[EDEADLK] A deadlock condition was detected or the calling thread already holds the *rwlock*.

[EINVAL] The *abstime* nanosecond value is less than zero or greater than or equal to 1 000 million.

This function shall not return an error code of [EINTR].

**55479 EXAMPLES**

55480 None.

**55481 APPLICATION USAGE**

55482 Applications using this function may be subject to priority inversion, as discussed in XBD  
55483 [Section 3.291](#) (on page 80).

**55484 RATIONALE**

55485 If an implementation detects that the value specified by the *rwlock* argument to  
55486 *pthread\_rwlock\_timedwrlock()* does not refer to an initialized read-write lock object, it is  
55487 recommended that the function should fail and report an [EINVAL] error.

**55488 FUTURE DIRECTIONS**

55489 None.

**55494 CHANGE HISTORY**

55495 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

55496 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/103 is applied, updating the ERRORS  
55497 section so that the [EDEADLK] error includes detection of a deadlock condition.

**55498 Issue 7**

55499 The *pthread\_rwlock\_timedwrlock()* function is moved from the Timeouts option to the Base.

55500 The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results  
55501 in undefined behavior.

# pthread\_rwlock\_tryrdlock()

System Interfaces

## 55502 NAME

55503 pthread\_rwlock\_tryrdlock — lock a read-write lock object for reading

## 55504 SYNOPSIS

55505 #include <pthread.h>

55506 int pthread\_rwlock\_tryrdlock(pthread\_rwlock\_t \*rwlock);

## 55507 DESCRIPTION

55508 Refer to *pthread\_rwlock\_rdlock()*.

**55509 NAME**

55510 pthread\_rwlock\_trywrlock, pthread\_rwlock\_wrlock — lock a read-write lock object for writing

**55511 SYNOPSIS**

```
55512 #include <pthread.h>
55513 int pthread_rwlock_trywrlock(pthread_rwlock_t *rwlock);
55514 int pthread_rwlock_wrlock(pthread_rwlock_t *rwlock);
```

**55515 DESCRIPTION**

55516 The *pthread\_rwlock\_trywrlock()* function shall apply a write lock like the *pthread\_rwlock\_wrlock()*  
 55517 function, with the exception that the function shall fail if any thread currently holds *rwlock* (for  
 55518 reading or writing).

55519 The *pthread\_rwlock\_wrlock()* function shall apply a write lock to the read-write lock referenced by  
 55520 *rwlock*. The calling thread shall acquire the write lock if no thread (reader or writer) holds the  
 55521 read-write lock *rwlock*. Otherwise, if another thread holds the read-write lock *rwlock*, the calling  
 55522 thread shall block until it can acquire the lock. If a deadlock condition occurs or the calling  
 55523 thread already owns the read-write lock for writing or reading, the call shall either deadlock or  
 55524 return [EDEADLK].

55525 Results are undefined if any of these functions are called with an uninitialized read-write lock.

55526 If a signal is delivered to a thread waiting for a read-write lock for writing, upon return from the  
 55527 signal handler the thread resumes waiting for the read-write lock for writing as if it was not  
 55528 interrupted.

**55529 RETURN VALUE**

55530 The *pthread\_rwlock\_trywrlock()* function shall return zero if the lock for writing on the read-write  
 55531 lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to  
 55532 indicate the error.

55533 If successful, the *pthread\_rwlock\_wrlock()* function shall return zero; otherwise, an error number  
 55534 shall be returned to indicate the error.

**55535 ERRORS**

55536 The *pthread\_rwlock\_trywrlock()* function shall fail if:

55537 [EBUSY] The read-write lock could not be acquired for writing because it was already  
 55538 locked for reading or writing.

55539 The *pthread\_rwlock\_wrlock()* function may fail if:

55540 [EDEADLK] A deadlock condition was detected or the current thread already owns the  
 55541 read-write lock for writing or reading.

55542 These functions shall not return an error code of [EINTR].

**55543 EXAMPLES**

55544 None.

**55545 APPLICATION USAGE**

55546 Applications using these functions may be subject to priority inversion, as discussed in XBD  
 55547 [Section 3.291](#) (on page 80).

**55548 RATIONALE**

55549 If an implementation detects that the value specified by the *rwlock* argument to  
 55550 *pthread\_rwlock\_trywrlock()* or *pthread\_rwlock\_wrlock()* does not refer to an initialized read-write  
 55551 lock object, it is recommended that the function should fail and report an [EINVAL] error.

55552 **FUTURE DIRECTIONS**

55553 None.

55554 **SEE ALSO**

55555 *pthread\_rwlock\_destroy()*, *pthread\_rwlock\_rdlock()*, *pthread\_rwlock\_timedrdlock()*,  
55556 *pthread\_rwlock\_timedwrlock()*, *pthread\_rwlock\_unlock()*

55557 XBD [Section 3.291](#) (on page 80), [Section 4.12](#) (on page 111), [<pthread.h>](#)

55558 **CHANGE HISTORY**

55559 First released in Issue 5.

55560 **Issue 6**

55561 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 55562 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is  
55563 now part of the Threads option (previously it was part of the Read-Write Locks option in  
55564 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 55565 • The [EDEADLK] error is deleted as a *pthread\_rwlock\_trywrlock()* error.
- 55566 • The SEE ALSO section is updated.

55567 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/104 is applied, updating the ERRORS  
55568 section so that the [EDEADLK] error includes detection of a deadlock condition.

55569 **Issue 7**

55570 The *pthread\_rwlock\_trywrlock()* and *pthread\_rwlock\_wrlock()* functions are moved from the  
55571 Threads option to the Base.

55572 The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results  
55573 in undefined behavior.

55574 **NAME**

55575 pthread\_rwlock\_unlock — unlock a read-write lock object

55576 **SYNOPSIS**

55577 #include &lt;pthread.h&gt;

55578 int pthread\_rwlock\_unlock(pthread\_rwlock\_t \*rwlock);

55579 **DESCRIPTION**

55580 The *pthread\_rwlock\_unlock()* function shall release a lock held on the read-write lock object  
55581 referenced by *rwlock*. Results are undefined if the read-write lock *rwlock* is not held by the  
55582 calling thread.

55583 If this function is called to release a read lock from the read-write lock object and there are other  
55584 read locks currently held on this read-write lock object, the read-write lock object remains in the  
55585 read locked state. If this function releases the last read lock for this read-write lock object, the  
55586 read-write lock object shall be put in the unlocked state with no owners.

55587 If this function is called to release a write lock for this read-write lock object, the read-write lock  
55588 object shall be put in the unlocked state.

55589 If there are threads blocked on the lock when it becomes available, the scheduling policy shall  
55590 TPS determine which thread(s) shall acquire the lock. If the Thread Execution Scheduling option is  
55591 supported, when threads executing with the scheduling policies SCHED\_FIFO, SCHED\_RR, or  
55592 SCHED\_SPORADIC are waiting on the lock, they shall acquire the lock in priority order when  
55593 the lock becomes available. For equal priority threads, write locks shall take precedence over  
55594 read locks. If the Thread Execution Scheduling option is not supported, it is implementation-  
55595 defined whether write locks take precedence over read locks.

55596 Results are undefined if this function is called with an uninitialized read-write lock.

55597 **RETURN VALUE**

55598 If successful, the *pthread\_rwlock\_unlock()* function shall return zero; otherwise, an error number  
55599 shall be returned to indicate the error.

55600 **ERRORS**

55601 The *pthread\_rwlock\_unlock()* function shall not return an error code of [EINTR].

55602 **EXAMPLES**

55603 None.

55604 **APPLICATION USAGE**

55605 None.

55606 **RATIONALE**

55607 If an implementation detects that the value specified by the *rwlock* argument to  
55608 *pthread\_rwlock\_unlock()* does not refer to an initialized read-write lock object, it is recommended  
55609 that the function should fail and report an [EINVAL] error.

55610 If an implementation detects that the value specified by the *rwlock* argument to  
55611 *pthread\_rwlock\_unlock()* refers to a read-write lock object for which the current thread does not  
55612 hold a lock, it is recommended that the function should fail and report an [EPERM] error.

55613 **FUTURE DIRECTIONS**

55614 None.

**SEE ALSO**

**CHANGE HISTORY**

First released in Issue 5.

**Issue 6**

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The DESCRIPTION is updated as follows:
  - The conditions under which writers have precedence over readers are specified.
  - The concept of read-write lock owner is deleted.
- The SEE ALSO section is updated.

**Issue 7**

SD5-XSH-ERN-183 is applied.

The *pthread\_rwlock\_unlock()* function is moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

The [EPERM] error for a read-write lock object for which the current thread does not hold a lock is removed; this condition results in undefined behavior.

55637 **NAME**

55638 pthread\_rwlock\_wrlock — lock a read-write lock object for writing

55639 **SYNOPSIS**

55640 #include &lt;pthread.h&gt;

55641 int pthread\_rwlock\_wrlock(pthread\_rwlock\_t \*rwlock);

55642 **DESCRIPTION**55643 Refer to *pthread\_rwlock\_trywrlock()*.

## 55644 NAME

55645 pthread\_rwlockattr\_destroy, pthread\_rwlockattr\_init — destroy and initialize the read-write  
55646 lock attributes object

## 55647 SYNOPSIS

```
55648 #include <pthread.h>
55649 int pthread_rwlockattr_destroy(pthread_rwlockattr_t *attr);
55650 int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);
```

## 55651 DESCRIPTION

55652 The *pthread\_rwlockattr\_destroy()* function shall destroy a read-write lock attributes object. A  
55653 destroyed *attr* attributes object can be reinitialized using *pthread\_rwlockattr\_init()*; the results of  
55654 otherwise referencing the object after it has been destroyed are undefined. An implementation  
55655 may cause *pthread\_rwlockattr\_destroy()* to set the object referenced by *attr* to an invalid value.

55656 The *pthread\_rwlockattr\_init()* function shall initialize a read-write lock attributes object *attr* with  
55657 the default value for all of the attributes defined by the implementation.

55658 Results are undefined if *pthread\_rwlockattr\_init()* is called specifying an already initialized *attr*  
55659 attributes object.

55660 After a read-write lock attributes object has been used to initialize one or more read-write locks,  
55661 any function affecting the attributes object (including destruction) shall not affect any previously  
55662 initialized read-write locks.

55663 The behavior is undefined if the value specified by the *attr* argument to  
55664 *pthread\_rwlockattr\_destroy()* does not refer to an initialized read-write lock attributes object.

## 55665 RETURN VALUE

55666 If successful, the *pthread\_rwlockattr\_destroy()* and *pthread\_rwlockattr\_init()* functions shall return  
55667 zero; otherwise, an error number shall be returned to indicate the error.

## 55668 ERRORS

55669 The *pthread\_rwlockattr\_init()* function shall fail if:

55670 [ENOMEM] Insufficient memory exists to initialize the read-write lock attributes object.

55671 These functions shall not return an error code of [EINTR].

## 55672 EXAMPLES

55673 None.

## 55674 APPLICATION USAGE

55675 None.

## 55676 RATIONALE

55677 If an implementation detects that the value specified by the *attr* argument to  
55678 *pthread\_rwlockattr\_destroy()* does not refer to an initialized read-write lock attributes object, it is  
55679 recommended that the function should fail and report an [EINVAL] error.

## 55680 FUTURE DIRECTIONS

55681 None.

## 55682 SEE ALSO

55683 *pthread\_rwlock\_destroy()*, *pthread\_rwlockattr\_getpshared()*

55684 XBD <pthread.h>

**CHANGE HISTORY**

55685 First released in Issue 5.

**Issue 6**

55688 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 55689 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is
- 55690 now part of the Threads option (previously it was part of the Read-Write Locks option in
- 55691 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 55692 • The SEE ALSO section is updated.

**Issue 7**

55693 The *pthread\_rwlockattr\_destroy()* and *pthread\_rwlockattr\_init()* functions are moved from the

55694 Threads option to the Base.

55695

55696 The [EINVAL] error for an uninitialized read-write lock attributes object is removed; this

55697 condition results in undefined behavior.

## NAME

pthread\_rwlockattr\_getpshared, pthread\_rwlockattr\_setpshared — get and set the process-shared attribute of the read-write lock attributes object

## SYNOPSIS

```
TSH #include <pthread.h>

int pthread_rwlockattr_getpshared(const pthread_rwlockattr_t
    *restrict attr, int *restrict pshared);
int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
    int pshared);
```

## DESCRIPTION

The *pthread\_rwlockattr\_getpshared()* function shall obtain the value of the *process-shared* attribute from the initialized attributes object referenced by *attr*. The *pthread\_rwlockattr\_setpshared()* function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

The *process-shared* attribute shall be set to `PTHREAD_PROCESS_SHARED` to permit a read-write lock to be operated upon by any thread that has access to the memory where the read-write lock is allocated, even if the read-write lock is allocated in memory that is shared by multiple processes. See [Section 2.9.9](#) (on page 523) for further requirements. The default value of the *process-shared* attribute shall be `PTHREAD_PROCESS_PRIVATE`.

Additional attributes, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

The behavior is undefined if the value specified by the *attr* argument to *pthread\_rwlockattr\_getpshared()* or *pthread\_rwlockattr\_setpshared()* does not refer to an initialized read-write lock attributes object.

## RETURN VALUE

Upon successful completion, the *pthread\_rwlockattr\_getpshared()* function shall return zero and store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise, an error number shall be returned to indicate the error.

If successful, the *pthread\_rwlockattr\_setpshared()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

## ERRORS

The *pthread\_rwlockattr\_setpshared()* function may fail if:

[EINVAL] The new value specified for the attribute is outside the range of legal values for that attribute.

These functions shall not return an error code of [EINTR].

## EXAMPLES

None.

## APPLICATION USAGE

None.

## RATIONALE

None.

**55738 FUTURE DIRECTIONS**

55739 None.

**55740 SEE ALSO**

55742 XBD <pthread.h>

**55743 CHANGE HISTORY**

55744 First released in Issue 5.

**55745 Issue 6**

55746 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 55747 • The margin code in the SYNOPSIS is changed to THR TSH to indicate that the  
55748 functionality is now part of the Threads option (previously it was part of the Read-Write  
55749 Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 55750 • The DESCRIPTION notes that additional attributes are implementation-defined.
- 55751 • The SEE ALSO section is updated.

55752 The **restrict** keyword is added to the *pthread\_rwlockattr\_getpshared()* prototype for alignment  
55753 with the ISO/IEC 9899:1999 standard.

**55754 Issue 7**

55755 The *pthread\_rwlockattr\_getpshared()* and *pthread\_rwlockattr\_setpshared()* functions are marked |  
55756 only as part of the Thread Process-Shared Synchronization option as the Threads option is now |  
55757 part of the Base.

55758 The [EINVAL] error for an uninitialized read-write lock attributes object is removed; this  
55759 condition results in undefined behavior.

55760 **NAME**

55761 pthread\_rwlockattr\_init — initialize the read-write lock attributes object

55762 **SYNOPSIS**

55763 #include &lt;pthread.h&gt;

55764 int pthread\_rwlockattr\_init(pthread\_rwlockattr\_t \*attr);

55765 **DESCRIPTION**55766 Refer to *pthread\_rwlockattr\_destroy()*.

55767 **NAME**

55768 pthread\_rwlockattr\_setpshared — set the process-shared attribute of the read-write lock  
55769 attributes object

55770 **SYNOPSIS**

```
55771 TSH    #include <pthread.h>
55772        int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
55773        int pshared);
```

55774 **DESCRIPTION**

55775 Refer to *pthread\_rwlockattr\_getpshared()*.

55776 **NAME**

55777 pthread\_self — get the calling thread ID

55778 **SYNOPSIS**

55779 #include <pthread.h>

55780 pthread\_t pthread\_self(void);

55781 **DESCRIPTION**

55782 The *pthread\_self()* function shall return the thread ID of the calling thread.

55783 **RETURN VALUE**

55784 The *pthread\_self()* function shall always be successful and no return value is reserved to indicate  
55785 an error.

55786 **ERRORS**

55787 No errors are defined.

55788 **EXAMPLES**

55789 None.

55790 **APPLICATION USAGE**

55791 None.

55792 **RATIONALE**

55793 The *pthread\_self()* function provides a capability similar to the *getpid()* function for processes  
55794 and the rationale is the same: the creation call does not provide the thread ID to the created  
55795 thread.

55796 **FUTURE DIRECTIONS**

55797 None.

55798 **SEE ALSO**

55799 *pthread\_create()*, *pthread\_equal()*

55800 XBD <pthread.h>

55801 **CHANGE HISTORY**

55802 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

55803 **Issue 6**

55804 The *pthread\_self()* function is marked as part of the Threads option.

55805 **Issue 7**

55806 Austin Group Interpretation 1003.1-2001 #063 is applied, updating the RETURN VALUE section.

55807 The *pthread\_self()* function is moved from the Threads option to the Base.

**55808 NAME**

55809 pthread\_setcancelstate, pthread\_setcanceltype, pthread\_testcancel — set cancelability state

**55810 SYNOPSIS**

```
55811 #include <pthread.h>
55812 int pthread_setcancelstate(int state, int *oldstate);
55813 int pthread_setcanceltype(int type, int *oldtype);
55814 void pthread_testcancel(void);
```

**55815 DESCRIPTION**

55816 The *pthread\_setcancelstate()* function shall atomically both set the calling thread's cancelability  
 55817 state to the indicated *state* and return the previous cancelability state at the location referenced  
 55818 by *oldstate*. Legal values for *state* are PTHREAD\_CANCEL\_ENABLE and  
 55819 PTHREAD\_CANCEL\_DISABLE.

55820 The *pthread\_setcanceltype()* function shall atomically both set the calling thread's cancelability  
 55821 type to the indicated *type* and return the previous cancelability type at the location referenced by  
 55822 *oldtype*. Legal values for *type* are PTHREAD\_CANCEL\_DEFERRED and  
 55823 PTHREAD\_CANCEL\_ASYNCHRONOUS.

55824 The cancelability state and type of any newly created threads, including the thread in which  
 55825 *main()* was first invoked, shall be PTHREAD\_CANCEL\_ENABLE and  
 55826 PTHREAD\_CANCEL\_DEFERRED respectively.

55827 The *pthread\_testcancel()* function shall create a cancellation point in the calling thread. The  
 55828 *pthread\_testcancel()* function shall have no effect if cancelability is disabled.

**55829 RETURN VALUE**

55830 If successful, the *pthread\_setcancelstate()* and *pthread\_setcanceltype()* functions shall return zero;  
 55831 otherwise, an error number shall be returned to indicate the error.

**55832 ERRORS**

55833 The *pthread\_setcancelstate()* function may fail if:

55834 [EINVAL] The specified state is not PTHREAD\_CANCEL\_ENABLE or  
 55835 PTHREAD\_CANCEL\_DISABLE.

55836 The *pthread\_setcanceltype()* function may fail if:

55837 [EINVAL] The specified type is not PTHREAD\_CANCEL\_DEFERRED or  
 55838 PTHREAD\_CANCEL\_ASYNCHRONOUS.

55839 These functions shall not return an error code of [EINTR].

**55840 EXAMPLES**

55841 None.

**55842 APPLICATION USAGE**

55843 In order to write a signal handler for an asynchronous signal which can run safely in a  
 55844 cancellable thread, *pthread\_setcancelstate()* must be used to disable cancellation for the duration  
 55845 of any calls that the signal handler makes which are cancellation points. However, the standard  
 55846 does not permit strictly conforming applications to call *pthread\_setcancelstate()* from a signal  
 55847 handler since it is not currently required to be async-signal-safe. On implementations where  
 55848 *pthread\_setcancelstate()* is not async-signal-safe, alternatives are to ensure either that the  
 55849 corresponding signals are blocked during execution of functions that are not async-cancel-safe  
 55850 or that cancellation is disabled during times when those signals could be delivered.  
 55851 Implementations are strongly encouraged to make *pthread\_setcancelstate()* async-signal-safe.

**RATIONALE**

The *pthread\_setcancelstate()* and *pthread\_setcanceltype()* functions control the points at which a thread may be asynchronously canceled. For cancellation control to be usable in modular fashion, some rules need to be followed.

An object can be considered to be a generalization of a procedure. It is a set of procedures and global variables written as a unit and called by clients not known by the object. Objects may depend on other objects.

First, cancelability should only be disabled on entry to an object, never explicitly enabled. On exit from an object, the cancelability state should always be restored to its value on entry to the object.

This follows from a modularity argument: if the client of an object (or the client of an object that uses that object) has disabled cancelability, it is because the client does not want to be concerned about cleaning up if the thread is canceled while executing some sequence of actions. If an object is called in such a state and it enables cancelability and a cancellation request is pending for that thread, then the thread is canceled, contrary to the wish of the client that disabled.

Second, the cancelability type may be explicitly set to either *deferred* or *asynchronous* upon entry to an object. But as with the cancelability state, on exit from an object the cancelability type should always be restored to its value on entry to the object.

Finally, only functions that are cancel-safe may be called from a thread that is asynchronously cancelable.

**FUTURE DIRECTIONS**

The *pthread\_setcancelstate()* function may be added to the table of async-signal-safe functions in [Section 2.4.3](#) (on page 490).

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

The *pthread\_setcancelstate()*, *pthread\_setcanceltype()*, and *pthread\_testcancel()* functions are marked as part of the Threads option.

**Issue 7**

The *pthread\_setcancelstate()*, *pthread\_setcanceltype()*, and *pthread\_testcancel()* functions are moved from the Threads option to the Base.

55886 **NAME**

55887 pthread\_setconcurrency — set the level of concurrency

55888 **SYNOPSIS**

```
55889 OB XSI #include <pthread.h>  
55890 int pthread_setconcurrency(int new_level);
```

55891 **DESCRIPTION**55892 Refer to *pthread\_getconcurrency()*.

55893 **NAME**

55894 pthread\_setschedparam — dynamic thread scheduling parameters access (**REALTIME**  
55895 **THREADS**)

55896 **SYNOPSIS**

```
55897 TPS    #include <pthread.h>
55898
55898     int pthread_setschedparam(pthread_t thread, int policy,
55899                               const struct sched_param *param);
```

55900 **DESCRIPTION**

55901 Refer to *pthread\_getschedparam()*.

**55902 NAME**

55903 pthread\_setschedprio — dynamic thread scheduling parameters access (REALTIME  
55904 THREADS)

**55905 SYNOPSIS**

```
55906 TPS #include <pthread.h>  
55907 int pthread_setschedprio(pthread_t thread, int prio);
```

**55908 DESCRIPTION**

55909 The *pthread\_setschedprio()* function shall set the scheduling priority for the thread whose thread  
55910 ID is given by *thread* to the value given by *prio*. See [Scheduling Policies](#) (on page 506) for a  
55911 description on how this function call affects the ordering of the thread in the thread list for its  
55912 new priority.

55913 If the *pthread\_setschedprio()* function fails, the scheduling priority of the target thread shall not be  
55914 changed.

**55915 RETURN VALUE**

55916 If successful, the *pthread\_setschedprio()* function shall return zero; otherwise, an error number  
55917 shall be returned to indicate the error.

**55918 ERRORS**

55919 The *pthread\_setschedprio()* function may fail if:

55920 [EINVAL] The value of *prio* is invalid for the scheduling policy of the specified thread.

55921 [EPERM] The caller does not have appropriate privileges to set the scheduling priority  
55922 of the specified thread.

55923 The *pthread\_setschedprio()* function shall not return an error code of [EINTR].

**55924 EXAMPLES**

55925 None.

**55926 APPLICATION USAGE**

55927 None.

**55928 RATIONALE**

55929 The *pthread\_setschedprio()* function provides a way for an application to temporarily raise its  
55930 priority and then lower it again, without having the undesired side-effect of yielding to other  
55931 threads of the same priority. This is necessary if the application is to implement its own  
55932 strategies for bounding priority inversion, such as priority inheritance or priority ceilings. This  
55933 capability is especially important if the implementation does not support the Thread Priority  
55934 Protection or Thread Priority Inheritance options, but even if those options are supported it is  
55935 needed if the application is to bound priority inheritance for other resources, such as  
55936 semaphores.

55937 The standard developers considered that while it might be preferable conceptually to solve this  
55938 problem by modifying the specification of *pthread\_setschedparam()*, it was too late to make such a  
55939 change, as there may be implementations that would need to be changed. Therefore, this new  
55940 function was introduced.

55941 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
55942 that the function should fail and report an [ESRCH] error.

55943 **FUTURE DIRECTIONS**

55944 None.

55945 **SEE ALSO**

55946 [Scheduling Policies](#) (on page 506), [pthread\\_getschedparam\(\)](#)

55947 XBD [<pthread.h>](#)

55948 **CHANGE HISTORY**

55949 First released in Issue 6. Included as a response to IEEE PASC Interpretation 1003.1 #96.

55950 **Issue 7**

55951 The `pthread_setschedprio()` function is marked only as part of the Thread Execution Scheduling  
55952 option as the Threads option is now part of the Base.

55953 Austin Group Interpretation 1003.1-2001 #069 is applied, updating the [EPERM] error.

55954 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

55955 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0466 [314] is applied.

55956 **NAME**

55957 pthread\_setspecific — thread-specific data management

55958 **SYNOPSIS**

55959 #include &lt;pthread.h&gt;

55960 int pthread\_setspecific(pthread\_key\_t key, const void \*value);

55961 **DESCRIPTION**55962 Refer to *pthread\_getspecific()*.

55963 **NAME**

55964 pthread\_sigmask, sigprocmask — examine and change blocked signals

55965 **SYNOPSIS**

```

55966 CX      #include <signal.h>
55967
55967      int pthread_sigmask(int how, const sigset_t *restrict set,
55968                          sigset_t *restrict oset);
55969
55969      int sigprocmask(int how, const sigset_t *restrict set,
55970                      sigset_t *restrict oset);

```

55971 **DESCRIPTION**

55972 The *pthread\_sigmask()* function shall examine or change (or both) the calling thread's signal  
 55973 mask, regardless of the number of threads in the process. The function shall be equivalent to  
 55974 *sigprocmask()*, without the restriction that the call be made in a single-threaded process.

55975 In a single-threaded process, the *sigprocmask()* function shall examine or change (or both) the  
 55976 signal mask of the calling thread.

55977 If the argument *set* is not a null pointer, it points to a set of signals to be used to change the  
 55978 currently blocked set.

55979 The argument *how* indicates the way in which the set is changed, and the application shall  
 55980 ensure it consists of one of the following values:

55981 SIG\_BLOCK      The resulting set shall be the union of the current set and the signal set  
 55982 pointed to by *set*.

55983 SIG\_SETMASK    The resulting set shall be the signal set pointed to by *set*.

55984 SIG\_UNBLOCK    The resulting set shall be the intersection of the current set and the  
 55985 complement of the signal set pointed to by *set*.

55986 If the argument *oset* is not a null pointer, the previous mask shall be stored in the location  
 55987 pointed to by *oset*. If *set* is a null pointer, the value of the argument *how* is not significant and the  
 55988 thread's signal mask shall be unchanged; thus the call can be used to enquire about currently  
 55989 blocked signals.

55990 If there are any pending unblocked signals after the call to *sigprocmask()*, at least one of those  
 55991 signals shall be delivered before the call to *sigprocmask()* returns.

55992 It is not possible to block those signals which cannot be ignored. This shall be enforced by the  
 55993 system without causing an error to be indicated.

55994 If any of the SIGFPE, SIGILL, SIGSEGV, or SIGBUS signals are generated while they are blocked,  
 55995 the result is undefined, unless the signal was generated by the action of another process, or by  
 55996 one of the functions *kill()*, *pthread\_kill()*, *raise()*, or *sigqueue()*.

55997 If *sigprocmask()* fails, the thread's signal mask shall not be changed.

55998 The use of the *sigprocmask()* function is unspecified in a multi-threaded process.

55999 **RETURN VALUE**

56000 Upon successful completion *pthread\_sigmask()* shall return 0; otherwise, it shall return the  
 56001 corresponding error number.

56002 Upon successful completion, *sigprocmask()* shall return 0; otherwise, -1 shall be returned, *errno*  
 56003 shall be set to indicate the error, and the signal mask of the process shall be unchanged.

**ERRORS**

The *pthread\_sigmask()* and *sigprocmask()* functions shall fail if:

[EINVAL] The value of the *how* argument is not equal to one of the defined values.

The *pthread\_sigmask()* function shall not return an error code of [EINTR].

**EXAMPLES****Signaling in a Multi-Threaded Process**

This example shows the use of *pthread\_sigmask()* in order to deal with signals in a multi-threaded process. It provides a fairly general framework that could be easily adapted/extended.

```
#include <stdio.h>
#include <stdlib.h>
#include <pthread.h>
#include <signal.h>
#include <string.h>
#include <errno.h>
...

static sigset_t  signal_mask; /* signals to block          */

int main (int argc, char *argv[])
{
    pthread_t  sig_thr_id;      /* signal handler thread ID */
    int        rc;              /* return code               */

    sigemptyset (&signal_mask);
    sigaddset (&signal_mask, SIGINT);
    sigaddset (&signal_mask, SIGTERM);
    rc = pthread_sigmask (SIG_BLOCK, &signal_mask, NULL);
    if (rc != 0) {
        /* handle error */
        ...
    }
    /* any newly created threads inherit the signal mask */

    rc = pthread_create (&sig_thr_id, NULL, signal_thread, NULL);
    if (rc != 0) {
        /* handle error */
        ...
    }

    /* APPLICATION CODE */
    ...
}

void *signal_thread (void *arg)
{
    int        sig_caught;      /* signal caught             */
    int        rc;              /* returned code             */

    rc = sigwait (&signal_mask, &sig_caught);
    if (rc != 0) {
        /* handle error */
    }
}
```

```

56049         switch (sig_caught)
56050         {
56051             case SIGINT:      /* process SIGINT */
56052                 ...
56053                 break;
56054             case SIGTERM:     /* process SIGTERM */
56055                 ...
56056                 break;
56057             default:          /* should normally not happen */
56058                 fprintf (stderr, "\nUnexpected signal %d\n", sig_caught);
56059                 break;
56060         }
56061     }

```

## APPLICATION USAGE

None.

## RATIONALE

When a thread's signal mask is changed in a signal-catching function that is installed by *sigaction()*, the restoration of the signal mask on return from the signal-catching function overrides that change (see *sigaction()*). If the signal-catching function was installed with *signal()*, it is unspecified whether this occurs.

See *kill()* for a discussion of the requirement on delivery of signals.

## FUTURE DIRECTIONS

None.

XBD <signal.h>

## CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

### Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

The *pthread\_sigmask()* function is added for alignment with the POSIX Threads Extension.

### Issue 6

The *pthread\_sigmask()* function is marked as part of the Threads option.

The SYNOPSIS for *sigprocmask()* is marked as a CX extension to note that the presence of this function in the <signal.h> header is an extension to the ISO C standard.

The following changes are made for alignment with the ISO POSIX-1:1996 standard:

- The DESCRIPTION is updated to explicitly state the functions which may generate the signal.

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *pthread\_sigmask()* and *sigprocmask()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/105 is applied, updating “process’ signal mask” to “thread’s signal mask” in the DESCRIPTION and RATIONALE sections.

56093 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/106 is applied, adding the example to the  
56094 EXAMPLES section.

56095 **Issue 7**

56096 The *pthread\_sigmask()* function is moved from the Threads option to the Base.

56097 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0467 [319] is applied.

56098 **NAME**

56099 pthread\_spin\_destroy, pthread\_spin\_init — destroy or initialize a spin lock object

56100 **SYNOPSIS**

```
56101 #include <pthread.h>
56102 int pthread_spin_destroy(pthread_spinlock_t *lock);
56103 int pthread_spin_init(pthread_spinlock_t *lock, int pshared);
```

56104 **DESCRIPTION**

56105 The *pthread\_spin\_destroy()* function shall destroy the spin lock referenced by *lock* and release any  
 56106 resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is  
 56107 reinitialized by another call to *pthread\_spin\_init()*. The results are undefined if  
 56108 *pthread\_spin\_destroy()* is called when a thread holds the lock, or if this function is called with an  
 56109 uninitialized thread spin lock.

56110 The *pthread\_spin\_init()* function shall allocate any resources required to use the spin lock  
 56111 referenced by *lock* and initialize the lock to an unlocked state.

56112 TSH If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is  
 56113 PTHREAD\_PROCESS\_SHARED, the implementation shall permit the spin lock to be operated  
 56114 upon by any thread that has access to the memory where the spin lock is allocated, even if it is  
 56115 allocated in memory that is shared by multiple processes.

56116 See [Section 2.9.9](#) (on page 523) for further requirements.

56117 The results are undefined if *pthread\_spin\_init()* is called specifying an already initialized spin  
 56118 lock. The results are undefined if a spin lock is used without first being initialized.

56119 If the *pthread\_spin\_init()* function fails, the lock is not initialized and the contents of *lock* are  
 56120 undefined.

56121 Only the object referenced by *lock* may be used for performing synchronization.

56122 The result of referring to copies of that object in calls to *pthread\_spin\_destroy()*,  
 56123 *pthread\_spin\_lock()*, *pthread\_spin\_trylock()*, or *pthread\_spin\_unlock()* is undefined.

56124 **RETURN VALUE**

56125 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
 56126 be returned to indicate the error.

56127 **ERRORS**

56128 The *pthread\_spin\_init()* function shall fail if:

56129 [EAGAIN] The system lacks the necessary resources to initialize another spin lock.

56130 [ENOMEM] Insufficient memory exists to initialize the lock.

56131 These functions shall not return an error code of [EINTR].

56132 **EXAMPLES**

56133 None.

56134 **APPLICATION USAGE**

56135 None.

56136 **RATIONALE**

56137 If an implementation detects that the value specified by the *lock* argument to  
 56138 *pthread\_spin\_destroy()* does not refer to an initialized spin lock object, it is recommended that the  
 56139 function should fail and report an [EINVAL] error.

56140 If an implementation detects that the value specified by the *lock* argument to

56141 *pthread\_spin\_destroy()* or *pthread\_spin\_init()* refers to a locked spin lock object, or detects that the  
56142 value specified by the *lock* argument to *pthread\_spin\_init()* refers to an already initialized spin  
56143 lock object, it is recommended that the function should fail and report an [EBUSY] error.

#### 56144 FUTURE DIRECTIONS

56145 None.

#### 56146 SEE ALSO

56147 *pthread\_spin\_lock()*, *pthread\_spin\_unlock()*

56148 XBD <pthread.h>

#### 56149 CHANGE HISTORY

56150 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

56151 In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

#### 56152 Issue 7

56153 The *pthread\_spin\_destroy()* and *pthread\_spin\_init()* functions are moved from the Spin Locks  
56154 option to the Base.

56155 The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in  
56156 undefined behavior.

56157 The [EBUSY] error for a locked spin lock object or an already initialized spin lock object is  
56158 removed; this condition results in undefined behavior.

## 56159 NAME

56160 pthread\_spin\_lock, pthread\_spin\_trylock — lock a spin lock object

## 56161 SYNOPSIS

```
56162 #include <pthread.h>
56163 int pthread_spin_lock(pthread_spinlock_t *lock);
56164 int pthread_spin_trylock(pthread_spinlock_t *lock);
```

## 56165 DESCRIPTION

56166 The *pthread\_spin\_lock()* function shall lock the spin lock referenced by *lock*. The calling thread  
56167 shall acquire the lock if it is not held by another thread. Otherwise, the thread shall spin (that is,  
56168 shall not return from the *pthread\_spin\_lock()* call) until the lock becomes available. The results are  
56169 undefined if the calling thread holds the lock at the time the call is made. The  
56170 *pthread\_spin\_trylock()* function shall lock the spin lock referenced by *lock* if it is not held by any  
56171 thread. Otherwise, the function shall fail.

56172 The results are undefined if any of these functions is called with an uninitialized spin lock.

## 56173 RETURN VALUE

56174 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
56175 be returned to indicate the error.

## 56176 ERRORS

56177 The *pthread\_spin\_lock()* function may fail if:

56178 [EDEADLK] A deadlock condition was detected.

56179 The *pthread\_spin\_trylock()* function shall fail if:

56180 [EBUSY] A thread currently holds the lock.

56181 These functions shall not return an error code of [EINTR].

## 56182 EXAMPLES

56183 None.

## 56184 APPLICATION USAGE

56185 Applications using this function may be subject to priority inversion, as discussed in XBD  
56186 [Section 3.291](#) (on page 80).

## 56187 RATIONALE

56188 If an implementation detects that the value specified by the *lock* argument to *pthread\_spin\_lock()*  
56189 or *pthread\_spin\_trylock()* does not refer to an initialized spin lock object, it is recommended that  
56190 the function should fail and report an [EINVAL] error.

56191 If an implementation detects that the value specified by the *lock* argument to *pthread\_spin\_lock()*  
56192 refers to a spin lock object for which the calling thread already holds the lock, it is recommended  
56193 that the function should fail and report an [EDEADLK] error.

## 56194 FUTURE DIRECTIONS

56195 None.

## 56196 SEE ALSO

56197 [pthread\\_spin\\_destroy\(\)](#), [pthread\\_spin\\_unlock\(\)](#)

**CHANGE HISTORY**

- 56199 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.
- 56200
- 56201 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.
- 56202 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/107 is applied, updating the ERRORS
- 56203 section so that the [EDEADLK] error includes detection of a deadlock condition.
- 56204 **Issue 7**
- 56205 The *pthread\_spin\_lock()* and *pthread\_spin\_trylock()* functions are moved from the Spin Locks
- 56206 option to the Base.
- 56207 The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in
- 56208 undefined behavior.
- 56209 The [EDEADLK] error for a spin lock object for which the calling thread already holds the lock is
- 56210 removed; this condition results in undefined behavior.

56211 **NAME**

56212 pthread\_spin\_unlock — unlock a spin lock object

56213 **SYNOPSIS**

56214 #include <pthread.h>

56215 int pthread\_spin\_unlock(pthread\_spinlock\_t \*lock);

56216 **DESCRIPTION**

56217 The *pthread\_spin\_unlock()* function shall release the spin lock referenced by *lock* which was  
56218 locked via the *pthread\_spin\_lock()* or *pthread\_spin\_trylock()* functions.

56219 The results are undefined if the lock is not held by the calling thread.

56220 If there are threads spinning on the lock when *pthread\_spin\_unlock()* is called, the lock becomes  
56221 available and an unspecified spinning thread shall acquire the lock.

56222 The results are undefined if this function is called with an uninitialized thread spin lock.

56223 **RETURN VALUE**

56224 Upon successful completion, the *pthread\_spin\_unlock()* function shall return zero; otherwise, an  
56225 error number shall be returned to indicate the error.

56226 **ERRORS**

56227 This function shall not return an error code of [EINTR].

56228 **EXAMPLES**

56229 None.

56230 **APPLICATION USAGE**

56231 None.

56232 **RATIONALE**

56233 If an implementation detects that the value specified by the *lock* argument to  
56234 *pthread\_spin\_unlock()* does not refer to an initialized spin lock object, it is recommended that the  
56235 function should fail and report an [EINVAL] error.

56236 If an implementation detects that the value specified by the *lock* argument to  
56237 *pthread\_spin\_unlock()* refers to a spin lock object for which the current thread does not hold the  
56238 lock, it is recommended that the function should fail and report an [EPERM] error.

56239 **FUTURE DIRECTIONS**

56240 None.

56241 **SEE ALSO**

56242 *pthread\_spin\_destroy()*, *pthread\_spin\_lock()*

56244 **CHANGE HISTORY**

56245 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

56246 In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

56247 **Issue 7**

56248 The *pthread\_spin\_unlock()* function is moved from the Spin Locks option to the Base.

56249 The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in  
56250 undefined behavior.

56251  
56252

The [EPERM] error for a spin lock object for which the current thread does not hold the lock is removed; this condition results in undefined behavior.

56253 **NAME**

56254 pthread\_testcancel — set cancelability state

56255 **SYNOPSIS**

56256 #include &lt;pthread.h&gt;

56257 void pthread\_testcancel(void);

56258 **DESCRIPTION**56259 Refer to *pthread\_setcancelstate()*.

56260 **NAME**

56261 ptsname — get name of the slave pseudo-terminal device

56262 **SYNOPSIS**

```
56263 XSI      #include <stdlib.h>
56264         char *ptsname(int fildes);
```

56265 **DESCRIPTION**

56266 The *ptsname()* function shall return the name of the slave pseudo-terminal device associated  
 56267 with a master pseudo-terminal device. The *fildes* argument is a file descriptor that refers to the  
 56268 master device. The *ptsname()* function shall return a pointer to a string containing the pathname  
 56269 of the corresponding slave device.

56270 The *ptsname()* function need not be thread-safe.

56271 **RETURN VALUE**

56272 Upon successful completion, *ptsname()* shall return a pointer to a string which is the name of the  
 56273 pseudo-terminal slave device. Upon failure, *ptsname()* shall return a null pointer and may set  
 56274 *errno*. This could occur if *fildes* is an invalid file descriptor or if the slave device name does not  
 56275 exist in the file system.

56276 The application shall not modify the string returned. The returned pointer might be invalidated  
 56277 or the string content might be overwritten by a subsequent call to *ptsname()*. The returned  
 56278 pointer and the string content might also be invalidated if the calling thread is terminated. +

56279 **ERRORS**

56280 The *ptsname()* function may fail if:

|       |          |                                                                                     |  |
|-------|----------|-------------------------------------------------------------------------------------|--|
| 56281 | [EBADF]  | The <i>fildes</i> argument is not a valid file descriptor.                          |  |
| 56282 | [ENOTTY] | The file associated with the <i>fildes</i> argument is not a master pseudo-terminal |  |
| 56283 |          | device.                                                                             |  |

56284 **EXAMPLES**

56285 None.

56286 **APPLICATION USAGE**

56287 None.

56288 **RATIONALE**

56289 See the RATIONALE section for *posix\_openpt()*.

56290 **FUTURE DIRECTIONS**

56291 None.

56292 **SEE ALSO**

56293 *grantpt()*, *open()*, *posix\_openpt()*, *ttynam()*, *unlockpt()*

56294 XBD <stdlib.h>

56295 **CHANGE HISTORY**

56296 First released in Issue 4, Version 2.

56297 **Issue 5**

56298 Moved from X/OPEN UNIX extension to BASE.

56299 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

56300 **Issue 7**

56301 Austin Group Interpretation 1003.1-2001 #156 is applied.

56302 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0468 [75] and XSH/TC1-2008/0469  
56303 [96] are applied.

56304 **NAME**

56305       putc — put a byte on a stream

56306 **SYNOPSIS**

56307       #include &lt;stdio.h&gt;

56308       int putc(int *c*, FILE \**stream*);56309 **DESCRIPTION**

56310 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 56311 conflict between the requirements described here and the ISO C standard is unintentional. This  
 56312 volume of POSIX.1-2008 defers to the ISO C standard.

56313       The *putc()* function shall be equivalent to *fputc()*, except that if it is implemented as a macro it  
 56314 may evaluate *stream* more than once, so the argument should never be an expression with side-  
 56315 effects.

56316 **RETURN VALUE**56317       Refer to *fputc()*.56318 **ERRORS**56319       Refer to *fputc()*.56320 **EXAMPLES**

56321       None.

56322 **APPLICATION USAGE**

56323       Since it may be implemented as a macro, *putc()* may treat a *stream* argument with side-effects  
 56324 incorrectly. In particular, *putc(c,\*f++)* does not necessarily work correctly. Therefore, use of this  
 56325 function is not recommended in such situations; *fputc()* should be used instead.

56326 **RATIONALE**

56327       None.

56328 **FUTURE DIRECTIONS**

56329       None.

56330 **SEE ALSO**56331       Section 2.5 (on page 495), *fputc()*

56332       XBD &lt;stdio.h&gt;

56333 **CHANGE HISTORY**

56334       First released in Issue 1. Derived from Issue 1 of the SVID.

56335 **Issue 7**

56336       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0470 [14] is applied.

# putc\_unlocked()

## 56337 NAME

56338       putc\_unlocked — stdio with explicit client locking

## 56339 SYNOPSIS

```
56340 CX       #include <stdio.h>  
56341       int putc_unlocked(int c, FILE *stream);
```

## 56342 DESCRIPTION

56343       Refer to *getc\_unlocked()*.

56344 **NAME**

56345 putchar — put a byte on a stdout stream

56346 **SYNOPSIS**

56347 #include &lt;stdio.h&gt;

56348 int putchar(int c);

56349 **DESCRIPTION**

56350 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
56351 conflict between the requirements described here and the ISO C standard is unintentional. This  
56352 volume of POSIX.1-2008 defers to the ISO C standard.

56353 The function call *putchar(c)* shall be equivalent to *putc(c,stdout)*.56354 **RETURN VALUE**56355 Refer to *fputc()*.56356 **ERRORS**56357 Refer to *fputc()*.56358 **EXAMPLES**

56359 None.

56360 **APPLICATION USAGE**

56361 None.

56362 **RATIONALE**

56363 None.

56364 **FUTURE DIRECTIONS**

56365 None.

56366 **SEE ALSO**56367 [Section 2.5](#) (on page 495), *putc()*56368 XBD [<stdio.h>](#)56369 **CHANGE HISTORY**

56370 First released in Issue 1. Derived from Issue 1 of the SVID.

56371 **Issue 7**

56372 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0471 [14] is applied.

56373 **NAME**

56374 putchar\_unlocked — stdio with explicit client locking

56375 **SYNOPSIS**

```
56376 CX #include <stdio.h>  
56377 int putchar_unlocked(int c);
```

56378 **DESCRIPTION**56379 Refer to *getc\_unlocked()*.

56380 **NAME**

56381 putenv — change or add a value to an environment

56382 **SYNOPSIS**

```
56383 XSI      #include <stdlib.h>
56384         int putenv(char *string);
```

56385 **DESCRIPTION**

56386 The *putenv()* function shall use the *string* argument to set environment variable values. The  
 56387 *string* argument should point to a string of the form "*name=value*". The *putenv()* function shall  
 56388 make the value of the environment variable *name* equal to *value* by altering an existing variable  
 56389 or creating a new one. In either case, the string pointed to by *string* shall become part of the  
 56390 environment, so altering the string shall change the environment.

56391 The *putenv()* function need not be thread-safe.

56392 **RETURN VALUE**

56393 Upon successful completion, *putenv()* shall return 0; otherwise, it shall return a non-zero value  
 56394 and set *errno* to indicate the error.

56395 **ERRORS**

56396 The *putenv()* function may fail if:

56397 [ENOMEM]        Insufficient memory was available.

56398 **EXAMPLES**56399 **Changing the Value of an Environment Variable**

56400 The following example changes the value of the *HOME* environment variable to the value  
 56401 */usr/home*.

```
56402 #include <stdlib.h>
56403 ...
56404 static char *var = "HOME=/usr/home";
56405 int ret;
56406
56407 ret = putenv(var);
```

56407 **APPLICATION USAGE**

56408 The *putenv()* function manipulates the environment pointed to by *environ*, and can be used in  
 56409 conjunction with *getenv()*.

56410 See *exec()* for restrictions on changing the environment in multi-threaded applications.

56411 This routine may use *malloc()* to enlarge the environment.

56412 A potential error is to call *putenv()* with an automatic variable as the argument, then return from  
 56413 the calling function while *string* is still part of the environment.

56414 Although the space used by *string* is no longer used once a new string which defines *name* is  
 56415 passed to *putenv()*, if any thread in the application has used *getenv()* to retrieve a pointer to this  
 56416 variable, it should not be freed by calling *free()*. If the changed environment variable is one  
 56417 known by the system (such as the locale environment variables) the application should never  
 56418 free the buffer used by earlier calls to *putenv()* for the same variable.

56419 The *setenv()* function is preferred over this function. One reason is that *putenv()* is optional and  
 56420 therefore less portable. Another is that using *putenv()* can slow down environment searches, as  
 56421 explained in the RATIONALE section for *getenv()*.

56422 **RATIONALE**56423 Refer to the RATIONALE section in *setenv()*.56424 **FUTURE DIRECTIONS**

56425 None.

56426 **SEE ALSO**56427 *exec*, *free()*, *getenv()*, *malloc()*, *setenv()*

56429 **CHANGE HISTORY**

56430 First released in Issue 1. Derived from Issue 1 of the SVID.

56431 **Issue 5**56432 The type of the argument to this function is changed from **const char \*** to **char \***. This was  
56433 indicated as a FUTURE DIRECTION in previous issues.

56434 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

56435 **Issue 6**56436 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/48 is applied, clarifying wording in the  
56437 DESCRIPTION and adding a new paragraph into APPLICATION USAGE referring readers to  
56438 *exec*.56439 **Issue 7**

56440 Austin Group Interpretation 1003.1-2001 #156 is applied.

56441 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0472 [167], XSH/TC1-2008/0473 [167],  
56442 XSH/TC1-2008/0474 [273,438], and XSH/TC1-2008/0475 [273] are applied.

**NAME**

putmsg, putpmsg — send a message on a STREAM (STREAMS)

**SYNOPSIS**

```
#include <stropts.h>

int putmsg(int fildes, const struct strbuf *ctlptr,
           const struct strbuf *dataptr, int flags);
int putpmsg(int fildes, const struct strbuf *ctlptr,
            const struct strbuf *dataptr, int band, int flags);
```

**DESCRIPTION**

The *putmsg()* function shall create a message from a process buffer(s) and send the message to a STREAMS file. The message may contain either a data part, a control part, or both. The data and control parts are distinguished by placement in separate buffers, as described below. The semantics of each part are defined by the STREAMS module that receives the message.

The *putpmsg()* function is equivalent to *putmsg()*, except that the process can send messages in different priority bands. Except where noted, all requirements on *putmsg()* also pertain to *putpmsg()*.

The *fildes* argument specifies a file descriptor referencing an open STREAM. The *ctlptr* and *dataptr* arguments each point to a **strbuf** structure.

The *ctlptr* argument points to the structure describing the control part, if any, to be included in the message. The *buf* member in the **strbuf** structure points to the buffer where the control information resides, and the *len* member indicates the number of bytes to be sent. The *maxlen* member is not used by *putmsg()*. In a similar manner, the argument *dataptr* specifies the data, if any, to be included in the message. The *flags* argument indicates what type of message should be sent and is described further below.

To send the data part of a message, the application shall ensure that *dataptr* is not a null pointer and the *len* member of *dataptr* is 0 or greater. To send the control part of a message, the application shall ensure that the corresponding values are set for *ctlptr*. No data (control) part shall be sent if either *dataptr(ctlptr)* is a null pointer or the *len* member of *dataptr(ctlptr)* is set to -1.

For *putmsg()*, if a control part is specified and *flags* is set to RS\_HIPRI, a high priority message shall be sent. If no control part is specified, and *flags* is set to RS\_HIPRI, *putmsg()* shall fail and set *errno* to [EINVAL]. If *flags* is set to 0, a normal message (priority band equal to 0) shall be sent. If a control part and data part are not specified and *flags* is set to 0, no message shall be sent and 0 shall be returned.

For *putpmsg()*, the flags are different. The *flags* argument is a bitmask with the following mutually-exclusive flags defined: MSG\_HIPRI and MSG\_BAND. If *flags* is set to 0, *putpmsg()* shall fail and set *errno* to [EINVAL]. If a control part is specified and *flags* is set to MSG\_HIPRI and *band* is set to 0, a high-priority message shall be sent. If *flags* is set to MSG\_HIPRI and either no control part is specified or *band* is set to a non-zero value, *putpmsg()* shall fail and set *errno* to [EINVAL]. If *flags* is set to MSG\_BAND, then a message shall be sent in the priority band specified by *band*. If a control part and data part are not specified and *flags* is set to MSG\_BAND, no message shall be sent and 0 shall be returned.

The *putmsg()* function shall block if the STREAM write queue is full due to internal flow control conditions, with the following exceptions:

- For high-priority messages, *putmsg()* shall not block on this condition and continues processing the message.
- For other messages, *putmsg()* shall not block but shall fail when the write queue is full and *O\_NONBLOCK* is set.

The *putmsg()* function shall also block, unless prevented by lack of internal resources, while waiting for the availability of message blocks in the STREAM, regardless of priority or whether *O\_NONBLOCK* has been specified. No partial message shall be sent.

#### RETURN VALUE

Upon successful completion, *putmsg()* and *putpmsg()* shall return 0; otherwise, they shall return -1 and set *errno* to indicate the error.

#### ERRORS

The *putmsg()* and *putpmsg()* functions shall fail if:

- |                  |                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [EAGAIN]         | A non-priority message was specified, the <i>O_NONBLOCK</i> flag is set, and the STREAM write queue is full due to internal flow control conditions; or buffers could not be allocated for the message that was to be created.                                                                                                                                                                                 |
| [EBADF]          | <i>fildev</i> is not a valid file descriptor open for writing.                                                                                                                                                                                                                                                                                                                                                 |
| [EINTR]          | A signal was caught during <i>putmsg()</i> .                                                                                                                                                                                                                                                                                                                                                                   |
| [EINVAL]         | An undefined value is specified in <i>flags</i> , or <i>flags</i> is set to <i>RS_HIPRI</i> or <i>MSG_HIPRI</i> and no control part is supplied, or the STREAM or multiplexer referenced by <i>fildev</i> is linked (directly or indirectly) downstream from a multiplexer, or <i>flags</i> is set to <i>MSG_HIPRI</i> and <i>band</i> is non-zero (for <i>putpmsg()</i> only).                                |
| [ENOSR]          | Buffers could not be allocated for the message that was to be created due to insufficient STREAMS memory resources.                                                                                                                                                                                                                                                                                            |
| [ENOSTR]         | A STREAM is not associated with <i>fildev</i> .                                                                                                                                                                                                                                                                                                                                                                |
| [ENXIO]          | A hangup condition was generated downstream for the specified STREAM.                                                                                                                                                                                                                                                                                                                                          |
| [EPIPE] or [EIO] | The <i>fildev</i> argument refers to a STREAMS-based pipe and the other end of the pipe is closed. A SIGPIPE signal is generated for the calling thread.                                                                                                                                                                                                                                                       |
| [ERANGE]         | The size of the data part of the message does not fall within the range specified by the maximum and minimum packet sizes of the topmost STREAM module. This value is also returned if the control part of the message is larger than the maximum configured size of the control part of a message, or if the data part of a message is larger than the maximum configured size of the data part of a message. |

In addition, *putmsg()* and *putpmsg()* shall fail if the STREAM head had processed an asynchronous error before the call. In this case, the value of *errno* does not reflect the result of *putmsg()* or *putpmsg()*, but reflects the prior error.

**EXAMPLES****Sending a High-Priority Message**

The value of *fd* is assumed to refer to an open STREAMS file. This call to *putmsg()* does the following:

1. Creates a high-priority message with a control part and a data part, using the buffers pointed to by *ctrlbuf* and *databuf*, respectively.
2. Sends the message to the STREAMS file identified by *fd*.

```
#include <stropts.h>
#include <string.h>
...
int fd;
char *ctrlbuf = "This is the control part";
char *databuf = "This is the data part";
struct strbuf ctrl;
struct strbuf data;
int ret;

ctrl.buf = ctrlbuf;
ctrl.len = strlen(ctrlbuf);

data.buf = databuf;
data.len = strlen(databuf);

ret = putmsg(fd, &ctrl, &data, MSG_HIPRI);
```

**Using putpmsg()**

This example has the same effect as the previous example. In this example, however, the *putpmsg()* function creates and sends the message to the STREAMS file.

```
#include <stropts.h>
#include <string.h>
...
int fd;
char *ctrlbuf = "This is the control part";
char *databuf = "This is the data part";
struct strbuf ctrl;
struct strbuf data;
int ret;

ctrl.buf = ctrlbuf;
ctrl.len = strlen(ctrlbuf);

data.buf = databuf;
data.len = strlen(databuf);

ret = putpmsg(fd, &ctrl, &data, 0, MSG_HIPRI);
```

**APPLICATION USAGE**

None.

56564 **RATIONALE**

56565 None.

56566 **FUTURE DIRECTIONS**56567 The *putmsg()* and *putpmsg()* functions may be removed in a future version.56568 **SEE ALSO**56569 [Section 2.6](#) (on page 500), *getmsg()*, *poll()*, *read()*, *write()*56570 XBD [<stropts.h>](#)56571 **CHANGE HISTORY**

56572 First released in Issue 4, Version 2.

56573 **Issue 5**

56574 Moved from X/OPEN UNIX extension to BASE.

56575 The following text is removed from the DESCRIPTION: “The STREAM head guarantees that the  
56576 control part of a message generated by *putmsg()* is at least 64 bytes in length”.

56577 **Issue 6**

56578 This function is marked as part of the XSI STREAMS Option Group.

56579 The normative text is updated to avoid use of the term “must” for application requirements.

56580 **Issue 7**56581 The *putmsg()* and *putpmsg()* functions are marked obsolescent.

56582 **NAME**

56583 puts — put a string on standard output

56584 **SYNOPSIS**

56585 #include &lt;stdio.h&gt;

56586 int puts(const char \*s);

56587 **DESCRIPTION**

56588 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 56589 conflict between the requirements described here and the ISO C standard is unintentional. This  
 56590 volume of POSIX.1-2008 defers to the ISO C standard.

56591 The *puts()* function shall write the string pointed to by *s*, followed by a <newline>, to the  
 56592 standard output stream *stdout*. The terminating null byte shall not be written.

56593 CX The last data modification and last file status change timestamps of the file shall be marked for  
 56594 update between the successful execution of *puts()* and the next successful completion of a call to  
 56595 *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.

56596 **RETURN VALUE**

56597 Upon successful completion, *puts()* shall return a non-negative number. Otherwise, it shall  
 56598 CX return EOF, shall set an error indicator for the stream, and *errno* shall be set to indicate the error.

56599 **ERRORS**56600 Refer to *fputc()*.56601 **EXAMPLES**56602 **Printing to Standard Output**

56603 The following example gets the current time, converts it to a string using *localtime()* and  
 56604 *asctime()*, and prints it to standard output using *puts()*. It then prints the number of minutes to  
 56605 an event for which it is waiting.

```
56606 #include <time.h>
56607 #include <stdio.h>
56608 ...
56609 time_t now;
56610 int minutes_to_event;
56611 ...
56612 time(&now);
56613 printf("The time is ");
56614 puts(asctime(localtime(&now)));
56615 printf("There are %d minutes to the event.\n",
56616        minutes_to_event);
56617 ...
```

56618 **APPLICATION USAGE**56619 The *puts()* function appends a <newline>, while *fputs()* does not.

56620 This volume of POSIX.1-2008 requires that successful completion simply return a non-negative  
 56621 integer. There are at least three known different implementation conventions for this  
 56622 requirement:

- 56623 • Return a constant value.

56624                   • Return the last character written.

56625                   • Return the number of bytes written. Note that this implementation convention cannot be

56626                   adhered to for strings longer than {INT\_MAX} bytes as the value would not be

56627                   representable in the return type of the function. For backwards compatibility,

56628                   implementations can return the number of bytes for strings of up to {INT\_MAX} bytes, and

56629                   return {INT\_MAX} for all longer strings.

56630 **RATIONALE**

56631                   None.

56632 **FUTURE DIRECTIONS**

56633                   None.

56637 **CHANGE HISTORY**

56638                   First released in Issue 1. Derived from Issue 1 of the SVID.

56639 **Issue 6**

56640                   Extensions beyond the ISO C standard are marked.

56641 **Issue 7**

56642                   Changes are made related to support for finegrained timestamps.

56643                   POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0476 [174,412] and

56644                   XSH/TC1-2008/0477 [14] are applied.

56645 **NAME**

56646 pututxline — put an entry into the user accounting database

56647 **SYNOPSIS**

```
56648 XSI      #include <utmpx.h>  
56649      struct utmpx *pututxline(const struct utmpx *utmpx);
```

56650 **DESCRIPTION**56651 Refer to *endutxent()*.

56652 **NAME**

56653 putwc — put a wide character on a stream

56654 **SYNOPSIS**

56655 #include &lt;stdio.h&gt;

56656 #include &lt;wchar.h&gt;

56657 wint\_t putwc(wchar\_t wc, FILE \*stream);

56658 **DESCRIPTION**

56659 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
56660 conflict between the requirements described here and the ISO C standard is unintentional. This  
56661 volume of POSIX.1-2008 defers to the ISO C standard.

56662 The *putwc()* function shall be equivalent to *fputwc()*, except that if it is implemented as a macro  
56663 it may evaluate *stream* more than once, so the argument should never be an expression with  
56664 side-effects.

56665 **RETURN VALUE**56666 Refer to *fputwc()*.56667 **ERRORS**56668 Refer to *fputwc()*.56669 **EXAMPLES**

56670 None.

56671 **APPLICATION USAGE**

56672 Since it may be implemented as a macro, *putwc()* may treat a *stream* argument with side-effects  
56673 incorrectly. In particular, *putwc(wc,\*f++)* need not work correctly. Therefore, use of this function  
56674 is not recommended; *fputwc()* should be used instead.

56675 **RATIONALE**

56676 None.

56677 **FUTURE DIRECTIONS**

56678 None.

56679 **SEE ALSO**56680 [Section 2.5](#) (on page 495), *fputwc()*56681 XBD [<stdio.h>](#), [<wchar.h>](#)56682 **CHANGE HISTORY**

56683 First released as a World-wide Portability Interface in Issue 4.

56684 **Issue 5**

56685 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*  
56686 is changed from **wint\_t** to **wchar\_t**.

56687 The Optional Header (OH) marking is removed from **<stdio.h>**.56688 **Issue 7**

56689 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0478 [14] is applied.

56690 **NAME**

56691       putwchar — put a wide character on a stdout stream

56692 **SYNOPSIS**

56693       #include &lt;wchar.h&gt;

56694       wint\_t putwchar(wchar\_t wc);

56695 **DESCRIPTION**

56696 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 56697       conflict between the requirements described here and the ISO C standard is unintentional. This  
 56698       volume of POSIX.1-2008 defers to the ISO C standard.

56699       The function call *putwchar(wc)* shall be equivalent to *putwc(wc,stdout)*.56700 **RETURN VALUE**56701       Refer to *fputwc()*.56702 **ERRORS**56703       Refer to *fputwc()*.56704 **EXAMPLES**

56705       None.

56706 **APPLICATION USAGE**

56707       None.

56708 **RATIONALE**

56709       None.

56710 **FUTURE DIRECTIONS**

56711       None.

56712 **SEE ALSO**56713       Section 2.5 (on page 495), *fputwc()*, *putwc()*

56714       XBD &lt;wchar.h&gt;

56715 **CHANGE HISTORY**

56716       First released in Issue 4.

56717 **Issue 5**

56718       Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*  
 56719       is changed from **wint\_t** to **wchar\_t**.

56720 **Issue 7**

56721       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0479 [14] is applied.

56722 **NAME**

56723       pwrite — write on a file

56724 **SYNOPSIS**

56725       #include &lt;unistd.h&gt;

56726       ssize\_t pwrite(int *fildes*, const void \**buf*, size\_t *nbyte*,56727           off\_t *offset*);56728 **DESCRIPTION**56729       Refer to *write()*.

56730 **NAME**

56731 qsort — sort a table of data

56732 **SYNOPSIS**

56733 #include &lt;stdlib.h&gt;

```
56734 void qsort(void *base, size_t nel, size_t width,
56735           int (*compar)(const void *, const void *));
```

56736 **DESCRIPTION**

56737 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 56738 conflict between the requirements described here and the ISO C standard is unintentional. This  
 56739 volume of POSIX.1-2008 defers to the ISO C standard.

56740 The *qsort()* function shall sort an array of *nel* objects, the initial element of which is pointed to by  
 56741 *base*. The size of each object, in bytes, is specified by the *width* argument. If the *nel* argument has  
 56742 the value zero, the comparison function pointed to by *compar* shall not be called and no  
 56743 rearrangement shall take place.

56744 The application shall ensure that the comparison function pointed to by *compar* does not alter the  
 56745 contents of the array. The implementation may reorder elements of the array between calls to the  
 56746 comparison function, but shall not alter the contents of any individual element.

56747 When the same objects (consisting of *width* bytes, irrespective of their current positions in the  
 56748 array) are passed more than once to the comparison function, the results shall be consistent with  
 56749 one another. That is, they shall define a total ordering on the array.

56750 The contents of the array shall be sorted in ascending order according to a comparison function.  
 56751 The *compar* argument is a pointer to the comparison function, which is called with two  
 56752 arguments that point to the elements being compared. The application shall ensure that the  
 56753 function returns an integer less than, equal to, or greater than 0, if the first argument is  
 56754 considered respectively less than, equal to, or greater than the second. If two members compare  
 56755 as equal, their order in the sorted array is unspecified.

56756 **RETURN VALUE**56757 The *qsort()* function shall not return a value.56758 **ERRORS**

56759 No errors are defined.

56760 **EXAMPLES**

56761 None.

56762 **APPLICATION USAGE**

56763 The comparison function need not compare every byte, so arbitrary data may be contained in  
 56764 the elements in addition to the values being compared.

56765 **RATIONALE**

56766 The requirement that each argument (hereafter referred to as *p*) to the comparison function is a  
 56767 pointer to elements of the array implies that for every call, for each argument separately, all of  
 56768 the following expressions are non-zero:

```
56769 ((char *)p - (char *)base) % width == 0
56770 (char *)p >= (char *)base
56771 (char *)p < (char *)base + nel * width
```

56772 **FUTURE DIRECTIONS**

56773 None.

56774 **SEE ALSO**56775 *alphasort()*56776 XBD *<stdlib.h>*56777 **CHANGE HISTORY**

56778 First released in Issue 1. Derived from Issue 1 of the SVID.

56779 **Issue 6**

56780 The normative text is updated to avoid use of the term “must” for application requirements.
