8. The token **NUMBER** shall represent a numeric constant. Its form and numeric value shall either be equivalent to the **decimal-floating-constant** token as specified by the ISO C standard, or it shall be a sequence of decimal digits and shall be evaluated as an integer constant in decimal. In addition, implementations may accept numeric constants with the form and numeric value equivalent to the **hexadecimal-constant** and **hexadecimal-floating-constant** tokens as specified by the ISO C standard.

If the value is too large or too small to be representable (see Section 1.1.2, on page 2321), the behavior is undefined.

9. A sequence of underscores, digits, and alphabetic characters from the portable character set (see XBD Section 6.1, on page 125), beginning with an <underscore> or alphabetic character, shall be considered a word.

10. The following words are keywords that shall be recognized as individual tokens; the name of the token is the same as the keyword:

|                 |               |             |                 |              |               |
|-----------------|---------------|-------------|-----------------|--------------|---------------|
| <b>BEGIN</b>    | <b>delete</b> | <b>END</b>  | <b>function</b> | <b>in</b>    | <b>printf</b> |
| <b>break</b>    | <b>do</b>     | <b>exit</b> | <b>getline</b>  | <b>next</b>  | <b>return</b> |
| <b>continue</b> | <b>else</b>   | <b>for</b>  | <b>if</b>       | <b>print</b> | <b>while</b>  |

11. The following words are names of built-in functions and shall be recognized as the token **BUILTIN\_FUNC\_NAME**:

|              |               |              |                |                |                |
|--------------|---------------|--------------|----------------|----------------|----------------|
| <b>atan2</b> | <b>gsub</b>   | <b>log</b>   | <b>split</b>   | <b>sub</b>     | <b>toupper</b> |
| <b>close</b> | <b>index</b>  | <b>match</b> | <b>sprintf</b> | <b>substr</b>  |                |
| <b>cos</b>   | <b>int</b>    | <b>rand</b>  | <b>sqrt</b>    | <b>system</b>  |                |
| <b>exp</b>   | <b>length</b> | <b>sin</b>   | <b>srand</b>   | <b>tolower</b> |                |

The above-listed keywords and names of built-in functions are considered reserved words.

12. The token **NAME** shall consist of a word that is not a keyword or a name of a built-in function and is not followed immediately (without any delimiters) by the ' ( ' character.
13. The token **FUNC\_NAME** shall consist of a word that is not a keyword or a name of a built-in function, followed immediately (without any delimiters) by the ' ( ' character. The ' ( ' character shall not be included as part of the token.

14. The following two-character sequences shall be recognized as the named tokens:

| Token Name | Sequence | Token Name | Sequence |
|------------|----------|------------|----------|
| ADD_ASSIGN | +=       | NO_MATCH   | !~       |
| SUB_ASSIGN | --       | EQ         | ==       |
| MUL_ASSIGN | *=       | LE         | <=       |
| DIV_ASSIGN | /=       | GE         | >=       |
| MOD_ASSIGN | %=       | NE         | !=       |
| POW_ASSIGN | ^=       | INCR       | ++       |
| OR         |          | DECR       | --       |
| AND        | &&       | APPEND     | >>       |

15. The following single characters shall be recognized as tokens whose names are the character:

<newline> { } ( ) [ ] , ; + - \* % ^ ! > < | ? : ~ \$ =

There is a lexical ambiguity between the token **ERE** and the tokens **'/'** and **DIV\_ASSIGN**. When an input sequence begins with a <slash> character in any syntactic context where the token **'/'** or **DIV\_ASSIGN** could appear as the next token in a valid program, the longer of those two tokens that can be recognized shall be recognized. In any other syntactic context where the token **ERE** could appear as the next token in a valid program, the token **ERE** shall be recognized.

## EXIT STATUS

The following exit values shall be returned:

0 All input files were processed successfully.

>0 An error occurred.

The exit status can be altered within the program by using an **exit** expression.

## CONSEQUENCES OF ERRORS

If any *file* operand is specified and the named file cannot be accessed, *awk* shall write a diagnostic message to standard error and terminate without any further action.

If the program specified by either the *program* operand or a *progfile* operand is not a valid *awk* program (as specified in the EXTENDED DESCRIPTION section), the behavior is undefined.

## APPLICATION USAGE

The **index**, **length**, **match**, and **substr** functions should not be confused with similar functions in the ISO C standard; the *awk* versions deal with characters, while the ISO C standard deals with bytes.

Because the concatenation operation is represented by adjacent expressions rather than an explicit operator, it is often necessary to use parentheses to enforce the proper evaluation precedence.

When using *awk* to process pathnames, it is recommended that **LC\_ALL**, or at least **LC\_CTYPE** and **LC\_COLLATE**, are set to **POSIX** or **C** in the environment, since pathnames can contain byte sequences that do not form valid characters in some locales, in which case the utility's behavior would be undefined. In the **POSIX** locale each byte is a valid single-byte character, and therefore this problem is avoided.

On implementations where the **"=="** operator checks if strings collate equally, applications needing to check whether strings are identical can use:

```
length(a) == length(b) && index(a,b) == 1
```

On implementations where the "==" operator checks if strings are identical, applications needing to check whether strings collate equally can use:

```
a <= b && a >= b
```

## EXAMPLES

The *awk* program specified in the command line is most easily specified within single-quotes (for example, '*program*') for applications using *sh*, because *awk* programs commonly contain characters that are special to the shell, including double-quotes. In the cases where an *awk* program contains single-quote characters, it is usually easiest to specify most of the program as strings within single-quotes concatenated by the shell with quoted single-quote characters. For example:

```
awk '/'\''/ { print "quote:", $0 }'
```

prints all lines from the standard input containing a single-quote character, prefixed with *quote*..

The following are examples of simple *awk* programs:

1. Write to the standard output all input lines for which field 3 is greater than 5:

```
$3 > 5
```

2. Write every tenth line:

```
(NR % 10) == 0
```

3. Write any line with a substring matching the regular expression:

```
/(G|D)(2[0-9][[:alpha:]]*)/
```

4. Print any line with a substring containing a 'G' or 'D', followed by a sequence of digits and characters. This example uses character classes **digit** and **alpha** to match language-independent digit and alphabetic characters respectively:

```
/(G|D)([[:digit:]][[:alpha:]]*)/
```

5. Write any line in which the second field matches the regular expression and the fourth field does not:

```
$2 ~ /xyz/ && $4 !~ /xyz/
```

6. Write any line in which the second field contains a <backslash>:

```
$2 ~ /\\"/>

```

7. Write any line in which the second field contains a <backslash>. Note that <backslash>-escapes are interpreted twice; once in lexical processing of the string and once in processing the regular expression:

```
$2 ~ "\\\"/>

```

8. Write the second to the last and the last field in each line. Separate the fields by a <colon>:

```
{OFS=":";print $(NF-1), $NF}
```

9. Write the line number and number of fields in each line. The three strings representing the line number, the <colon>, and the number of fields are concatenated and that string is written to standard output:

```
{print NR ":" NF}
```

10. Write lines longer than 72 characters:
- ```
length($0) > 72
```
11. Write the first two fields in opposite order separated by **OFS**:
- ```
{ print $2, $1 }
```
12. Same, with input fields separated by a <comma> or <space> and <tab> characters, or both:
- ```
BEGIN { FS = ",[ \t]*|[ \t]+" }
{ print $2, $1 }
```
13. Add up the first column, print sum, and average:
- ```
{ s += $1 }
END { print "sum is ", s, " average is", s/NR }
```
14. Write fields in reverse order, one per line (many lines out for each line in):
- ```
{ for (i = NF; i > 0; --i) print $i }
```
15. Write all lines between occurrences of the strings **start** and **stop**:
- ```
/start/, /stop/
```
16. Write all lines whose first field is different from the previous one:
- ```
$1 != prev { print; prev = $1 }
```
17. Simulate *echo*:
- ```
BEGIN {
    for (i = 1; i < ARGV; ++i)
        printf("%s%s", ARGV[i], i==ARGC-1?"\n":" ")
}
```
18. Write the path prefixes contained in the *PATH* environment variable, one per line:
- ```
BEGIN {
    n = split (ENVIRON["PATH"], path, ":")
    for (i = 1; i <= n; ++i)
        print path[i]
}
```
19. If there is a file named **input** containing page headers of the form:
- Page #
- and a file named **program** that contains:
- ```
/Page/    { $2 = n++; }
          { print }
```
- then the command line:
- ```
awk -f program n=5 input
```
- prints the file **input**, filling in page numbers starting at 5.

## RATIONALE

This description is based on the new *awk*, “nawk”, (see the referenced *The AWK Programming Language*), which introduced a number of new features to the historical *awk*:

1. New keywords: **delete**, **do**, **function**, **return**
2. New built-in functions: **atan2**, **close**, **cos**, **gsub**, **match**, **rand**, **sin**, **srand**, **sub**, **system**
3. New predefined variables: **FNR**, **ARGC**, **ARGV**, **RSTART**, **RLENGTH**, **SUBSEP**
4. New expression operators: **?**, **:**, **..**, **^**
5. The **FS** variable and the third argument to **split**, now treated as extended regular expressions.
6. The operator precedence, changed to more closely match the C language. Two examples of code that operate differently are:

```
while ( n /= 10 > 1 ) ...
if ( !"wk" ~ /bwk/ ) ...
```

Several features have been added based on newer implementations of *awk*:

- Multiple instances of **-f profile** are permitted.
- The new option **-v assignment**.
- The new predefined variable **ENVIRON**.
- New built-in functions **toupper** and **tolower**.
- More formatting capabilities are added to **printf** to match the ISO C standard.

Earlier versions of this standard required implementations to support multiple adjacent `<semicolon>`s, lines with one or more `<semicolon>` before a rule (*pattern-action* pairs), and lines with only `<semicolon>`(s). These are not required by this standard and are considered poor programming practice, but can be accepted by an implementation of *awk* as an extension.

The overall *awk* syntax has always been based on the C language, with a few features from the shell command language and other sources. Because of this, it is not completely compatible with any other language, which has caused confusion for some users. It is not the intent of the standard developers to address such issues. A few relatively minor changes toward making the language more compatible with the ISO C standard were made; most of these changes are based on similar changes in recent implementations, as described above. There remain several C-language conventions that are not in *awk*. One of the notable ones is the `<comma>` operator, which is commonly used to specify multiple expressions in the C language **for** statement. Also, there are various places where *awk* is more restrictive than the C language regarding the type of expression that can be used in a given context. These limitations are due to the different features that the *awk* language does provide.

Regular expressions in *awk* have been extended somewhat from historical implementations to make them a pure superset of extended regular expressions, as defined by POSIX.1-2008 (see XBD Section 9.4, on page 188). The main extensions are internationalization features and interval expressions. Historical implementations of *awk* have long supported `<backslash>`-escape sequences as an extension to extended regular expressions, and this extension has been retained despite inconsistency with other utilities. The number of escape sequences recognized in both extended regular expressions and strings has varied (generally increasing with time) among implementations. The set specified by POSIX.1-2008 includes most sequences known to be supported by popular implementations and by the ISO C standard. One sequence that is not supported is hexadecimal value escapes beginning with `'\x'`. This would

allow values expressed in more than 9 bits to be used within *awk* as in the ISO C standard. However, because this syntax has a non-deterministic length, it does not permit the subsequent character to be a hexadecimal digit. This limitation can be dealt with in the C language by the use of lexical string concatenation. In the *awk* language, concatenation could also be a solution for strings, but not for extended regular expressions (either lexical ERE tokens or strings used dynamically as regular expressions). Because of this limitation, the feature has not been added to POSIX.1-2008.

When a string variable is used in a context where an extended regular expression normally appears (where the lexical token ERE is used in the grammar) the string does not contain the literal `<slash>` characters.

Some versions of *awk* allow the form:

```
func name(args, ... ) { statements }
```

This has been deprecated by the authors of the language, who asked that it not be specified.

Historical implementations of *awk* produce an error if a **next** statement is executed in a **BEGIN** action, and cause *awk* to terminate if a **next** statement is executed in an **END** action. This behavior has not been documented, and it was not believed that it was necessary to standardize it.

The specification of conversions between string and numeric values is much more detailed than in the documentation of historical implementations or in the referenced *The AWK Programming Language*. Although most of the behavior is designed to be intuitive, the details are necessary to ensure compatible behavior from different implementations. This is especially important in relational expressions since the types of the operands determine whether a string or numeric comparison is performed. From the perspective of an application developer, it is usually sufficient to expect intuitive behavior and to force conversions (by adding zero or concatenating a null string) when the type of an expression does not obviously match what is needed. The intent has been to specify historical practice in almost all cases. The one exception is that, in historical implementations, variables and constants maintain both string and numeric values after their original value is converted by any use. This means that referencing a variable or constant can have unexpected side-effects. For example, with historical implementations the following program:

```
{
    a = "+2"
    b = 2
    if (NR % 2)
        c = a + b
    if (a == b)
        print "numeric comparison"
    else
        print "string comparison"
}
```

would perform a numeric comparison (and output numeric comparison) for each odd-numbered line, but perform a string comparison (and output string comparison) for each even-numbered line. POSIX.1-2008 ensures that comparisons will be numeric if necessary. With historical implementations, the following program:

```
BEGIN {
    OFMT = "%e"
    print 3.14
```

```

80703         OFMT = "%f"
80704         print 3.14
80705     }

```

80706 would output "3.140000e+00" twice, because in the second **print** statement the constant  
 80707 "3.14" would have a string value from the previous conversion. POSIX.1-2008 requires that the  
 80708 output of the second **print** statement be "3.140000". The behavior of historical  
 80709 implementations was seen as too unintuitive and unpredictable.

80710 It was pointed out that with the rules contained in early drafts, the following script would print  
 80711 nothing:

```

80712 BEGIN {
80713     y[1.5] = 1
80714     OFMT = "%e"
80715     print y[1.5]
80716 }

```

80717 Therefore, a new variable, **CONVFMT**, was introduced. The **OFMT** variable is now restricted to  
 80718 affecting output conversions of numbers to strings and **CONVFMT** is used for internal  
 80719 conversions, such as comparisons or array indexing. The default value is the same as that for  
 80720 **OFMT**, so unless a program changes **CONVFMT** (which no historical program would do), it  
 80721 will receive the historical behavior associated with internal string conversions.

80722 The POSIX *awk* lexical and syntactic conventions are specified more formally than in other  
 80723 sources. Again the intent has been to specify historical practice. One convention that may not be  
 80724 obvious from the formal grammar as in other verbal descriptions is where <newline> characters  
 80725 are acceptable. There are several obvious placements such as terminating a statement, and a  
 80726 <backslash> can be used to escape <newline> characters between any lexical tokens. In addition,  
 80727 <newline> characters without <backslash> characters can follow a comma, an open brace, a  
 80728 logical AND operator ("&&"), a logical OR operator (" || "), the **do** keyword, the **else** keyword,  
 80729 and the closing parenthesis of an **if**, **for**, or **while** statement. For example:

```

80730 { print $1,
80731     $2 }

```

80732 The requirement that *awk* add a trailing <newline> to the program argument text is to simplify  
 80733 the grammar, making it match a text file in form. There is no way for an application or test suite  
 80734 to determine whether a literal <newline> is added or whether *awk* simply acts as if it did.

80735 POSIX.1-2008 requires several changes from historical implementations in order to support  
 80736 internationalization. Probably the most subtle of these is the use of the decimal-point character,  
 80737 defined by the *LC\_NUMERIC* category of the locale, in representations of floating-point  
 80738 numbers. This locale-specific character is used in recognizing numeric input, in converting  
 80739 between strings and numeric values, and in formatting output. However, regardless of locale,  
 80740 the <period> character (the decimal-point character of the POSIX locale) is the decimal-point  
 80741 character recognized in processing *awk* programs (including assignments in command line  
 80742 arguments). This is essentially the same convention as the one used in the ISO C standard. The  
 80743 difference is that the C language includes the *setlocale()* function, which permits an application  
 80744 to modify its locale. Because of this capability, a C application begins executing with its locale set  
 80745 to the C locale, and only executes in the environment-specified locale after an explicit call to  
 80746 *setlocale()*. However, adding such an elaborate new feature to the *awk* language was seen as  
 80747 inappropriate for POSIX.1-2008. It is possible to execute an *awk* program explicitly in any desired  
 80748 locale by setting the environment in the shell.

80749 The undefined behavior resulting from NULs in extended regular expressions allows future

extensions for the GNU *gawk* program to process binary data.

The behavior in the case of invalid *awk* programs (including lexical, syntactic, and semantic errors) is undefined because it was considered overly limiting on implementations to specify. In most cases such errors can be expected to produce a diagnostic and a non-zero exit status. However, some implementations may choose to extend the language in ways that make use of certain invalid constructs. Other invalid constructs might be deemed worthy of a warning, but otherwise cause some reasonable behavior. Still other constructs may be very difficult to detect in some implementations. Also, different implementations might detect a given error during an initial parsing of the program (before reading any input files) while others might detect it when executing the program after reading some input. Implementors should be aware that diagnosing errors as early as possible and producing useful diagnostics can ease debugging of applications, and thus make an implementation more usable.

The unspecified behavior from using multi-character **RS** values is to allow possible future extensions based on extended regular expressions used for record separators. Historical implementations take the first character of the string and ignore the others.

Unspecified behavior when *split(string,array,<null>)* is used is to allow a proposed future extension that would split up a string into an array of individual characters.

In the context of the **getline** function, equally good arguments for different precedences of the **|** and **<** operators can be made. Historical practice has been that:

```
getline < "a" "b"
```

is parsed as:

```
( getline < "a" ) "b"
```

although many would argue that the intent was that the file **ab** should be read. However:

```
getline < "x" + 1
```

parses as:

```
getline < ( "x" + 1 )
```

Similar problems occur with the **|** version of **getline**, particularly in combination with **\$**. For example:

```
$"echo hi" | getline
```

(This situation is particularly problematic when used in a **print** statement, where the **|getline** part might be a redirection of the **print**.)

Since in most cases such constructs are not (or at least should not) be used (because they have a natural ambiguity for which there is no conventional parsing), the meaning of these constructs has been made explicitly unspecified. (The effect is that a conforming application that runs into the problem must parenthesize to resolve the ambiguity.) There appeared to be few if any actual uses of such constructs.

Grammars can be written that would cause an error under these circumstances. Where backwards-compatibility is not a large consideration, implementors may wish to use such grammars.

Some historical implementations have allowed some built-in functions to be called without an argument list, the result being a default argument list chosen in some “reasonable” way. Use of **length** as a synonym for **length(\$0)** is the only one of these forms that is thought to be widely known or widely used; this particular form is documented in various places (for example, most

historical *awk* reference pages, although not in the referenced *The AWK Programming Language*) as legitimate practice. With this exception, default argument lists have always been undocumented and vaguely defined, and it is not at all clear how (or if) they should be generalized to user-defined functions. They add no useful functionality and preclude possible future extensions that might need to name functions without calling them. Not standardizing them seems the simplest course. The standard developers considered that **length** merited special treatment, however, since it has been documented in the past and sees possibly substantial use in historical programs. Accordingly, this usage has been made legitimate, but Issue 5 removed the obsolescent marking for XSI-conforming implementations and many otherwise conforming applications depend on this feature.

In **sub** and **gsub**, if *repl* is a string literal (the lexical token **STRING**), then two consecutive <backslash> characters should be used in the string to ensure a single <backslash> will precede the <ampersand> when the resultant string is passed to the function. (For example, to specify one literal <ampersand> in the replacement string, use **gsub(ERE, "\\&")**.)

Historically, the only special character in the *repl* argument of **sub** and **gsub** string functions was the <ampersand> ('&') character and preceding it with the <backslash> character was used to turn off its special meaning.

The description in the ISO POSIX-2:1993 standard introduced behavior such that the <backslash> character was another special character and it was unspecified whether there were any other special characters. This description introduced several portability problems, some of which are described below, and so it has been replaced with the more historical description. Some of the problems include:

- Historically, to create the replacement string, a script could use **gsub(ERE, "\\&")**, but with the ISO POSIX-2:1993 standard wording, it was necessary to use **gsub(ERE, "\\&&")**. The <backslash> characters are doubled here because all string literals are subject to lexical analysis, which would reduce each pair of <backslash> characters to a single <backslash> before being passed to **gsub**.
- Since it was unspecified what the special characters were, for portable scripts to guarantee that characters are printed literally, each character had to be preceded with a <backslash>. (For example, a portable script had to use **gsub(ERE, "\\h\\i")** to produce a replacement string of "hi".)

The description for comparisons in the ISO POSIX-2:1993 standard did not properly describe historical practice because of the way numeric strings are compared as numbers. The current rules cause the following code:

```
if (0 == "000")
    print "strange, but true"
else
    print "not true"
```

to do a numeric comparison, causing the **if** to succeed. It should be intuitively obvious that this is incorrect behavior, and indeed, no historical implementation of *awk* actually behaves this way.

To fix this problem, the definition of *numeric string* was enhanced to include only those values obtained from specific circumstances (mostly external sources) where it is not possible to determine unambiguously whether the value is intended to be a string or a numeric.

Variables that are assigned to a numeric string shall also be treated as a numeric string. (For example, the notion of a numeric string can be propagated across assignments.) In comparisons, all variables having the uninitialized value are to be treated as a numeric operand evaluating to the numeric value zero.

Uninitialized variables include all types of variables including scalars, array elements, and fields. The definition of an uninitialized value in [Variables and Special Variables](#) (on page 2479) is necessary to describe the value placed on uninitialized variables and on fields that are valid (for example, `< $NF`) but have no characters in them and to describe how these variables are to be used in comparisons. A valid field, such as `$1`, that has no characters in it can be obtained from an input line of `"\t\t"` when `FS='\t'`. Historically, the comparison (`$1<10`) was done numerically after evaluating `$1` to the value zero.

The phrase "... also shall have the numeric value of the numeric string" was removed from several sections of the ISO POSIX-2:1993 standard because it specifies an unnecessary implementation detail. It is not necessary for POSIX.1-2008 to specify that these objects be assigned two different values. It is only necessary to specify that these objects may evaluate to two different values depending on context.

Historical implementations of *awk* did not parse hexadecimal integer or floating constants like `"0xa"` and `"0xap0"`. Due to an oversight, the 2001 through 2004 editions of this standard required support for hexadecimal floating constants. This was due to the reference to `atof()`. This version of the standard allows but does not require implementations to use `atof()` and includes a description of how floating-point numbers are recognized as an alternative to match historic behavior. The intent of this change is to allow implementations to recognize floating-point constants according to either the ISO/IEC 9899:1990 standard or ISO/IEC 9899:1999 standard, and to allow (but not require) implementations to recognize hexadecimal integer constants.

Historical implementations of *awk* did not support floating-point infinities and NaNs in *numeric strings*; e.g., `"-INF"` and `"NaN"`. However, implementations that use the `atof()` or `strtod()` functions to do the conversion picked up support for these values if they used a ISO/IEC 9899:1999 standard version of the function instead of a ISO/IEC 9899:1990 standard version. Due to an oversight, the 2001 through 2004 editions of this standard did not allow support for infinities and NaNs, but in this revision support is allowed (but not required). This is a silent change to the behavior of *awk* programs; for example, in the POSIX locale the expression:

```
("-INF" + 0 < 0)
```

formerly had the value 0 because `"-INF"` converted to 0, but now it may have the value 0 or 1.

## FUTURE DIRECTIONS

A future version of this standard may require the `!="` and `=="` operators to perform string comparisons by checking if the strings are identical (and not by checking if they collate equally).

## CHANGE HISTORY

First released in Issue 2.

## Issue 5

The FUTURE DIRECTIONS section is added.

**Issue 6**

The *awk* utility is aligned with the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE PASC Interpretation 1003.2 #211 is applied, adding the sentence “An occurrence of two consecutive <backslash> characters shall be interpreted as just a single literal <backslash> character.” into the description of the **sub** string function.

**Issue 7**

PASC Interpretation 1003.2-1992 #107 (SD5-XCU-ERN-73) is applied, updating the description of the **OFS** variable.

Austin Group Interpretation 1003.1-2001 #189 is applied.

Austin Group Interpretation 1003.1-2001 #201 is applied, permitting implementations to support infinities and NaNs.

SD5-XCU-ERN-79 is applied, restoring the horizontal lines to [Table 4-1](#) (on page 2475), and SD5-XCU-ERN-80 is applied, changing the order of some table entries.

SD5-XCU-ERN-87 is applied, updating the descriptive text of the Grammar.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

The EXTENDED DESCRIPTION is changed to make the support of hexadecimal integer and floating constants optional.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0057 [224], XCU/TC1-2008/0058 [454], XCU/TC1-2008/0059 [224], XCU/TC1-2008/0060 [224], XCU/TC1-2008/0061 [254], XCU/TC1-2008/0062 [254], XCU/TC1-2008/0063 [224], and XCU/TC1-2008/0064 [454] are applied.

**NAME**

basename — return non-directory portion of a pathname

**SYNOPSIS**

basename *string* [*suffix*]

**DESCRIPTION**

The *string* operand shall be treated as a pathname, as defined in XBD [Section 3.271](#) (on page 76). The string *string* shall be converted to the filename corresponding to the last pathname component in *string* and then the suffix string *suffix*, if present, shall be removed. This shall be done by performing actions equivalent to the following steps in order:

1. If *string* is a null string, it is unspecified whether the resulting string is ' . ' or a null string. In either case, skip steps 2 through 6.
2. If *string* is " / ", it is implementation-defined whether steps 3 to 6 are skipped or processed.
3. If *string* consists entirely of <slash> characters, *string* shall be set to a single <slash> character. In this case, skip steps 4 to 6.
4. If there are any trailing <slash> characters in *string*, they shall be removed.
5. If there are any <slash> characters remaining in *string*, the prefix of *string* up to and including the last <slash> character in *string* shall be removed.
6. If the *suffix* operand is present, is not identical to the characters remaining in *string*, and is identical to a suffix of the characters remaining in *string*, the suffix *suffix* shall be removed from *string*. Otherwise, *string* is not modified by this step. It shall not be considered an error if *suffix* is not found in *string*.

The resulting string shall be written to standard output.

**OPTIONS**

None.

**OPERANDS**

The following operands shall be supported:

<i>string</i>	A string.
<i>suffix</i>	A string.

**STDIN**

Not used.

**INPUT FILES**

None.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *basename*:

<i>LANG</i>	Provide a default value for the internationalization variables that are unset or null. (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)
<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).

80947 **LC\_MESSAGES**

80948 Determine the locale that should be used to affect the format and contents of  
 80949 diagnostic messages written to standard error.

80950 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

80951 **ASYNCHRONOUS EVENTS**

80952 Default.

80953 **STDOUT**

80954 The *basename* utility shall write a line to the standard output in the following format:

80955 "%s\n", *<resulting string>*

80956 **STDERR**

80957 The standard error shall be used only for diagnostic messages.

80958 **OUTPUT FILES**

80959 None.

80960 **EXTENDED DESCRIPTION**

80961 None.

80962 **EXIT STATUS**

80963 The following exit values shall be returned:

80964 0 Successful completion.

80965 >0 An error occurred.

80966 **CONSEQUENCES OF ERRORS**

80967 Default.

80968 **APPLICATION USAGE**

80969 The definition of *pathname* specifies implementation-defined behavior for pathnames starting  
 80970 with two <slash> characters. Therefore, applications shall not arbitrarily add <slash> characters  
 80971 to the beginning of a pathname unless they can ensure that there are more or less than two or are  
 80972 prepared to deal with the implementation-defined consequences.

80973 **EXAMPLES**

80974 If the string *string* is a valid pathname:

80975 `$(basename -- "string")`

80976 produces a filename that could be used to open the file named by *string* in the directory returned  
 80977 by:

80978 `$(dirname -- "string")`

80979 If the string *string* is not a valid pathname, the same algorithm is used, but the result need not be  
 80980 a valid filename. The *basename* utility is not expected to make any judgements about the validity  
 80981 of *string* as a pathname; it just follows the specified algorithm to produce a result string.

80982 The following shell script compiles `/usr/src/cmd/cat.c` and moves the output to a file named **cat**  
 80983 in the current directory when invoked with the argument `/usr/src/cmd/cat` or with the argument  
 80984 `/usr/src/cmd/cat.c`:

80985 `c99 -- "$(dirname -- "$1")/$(basename -- "$1" .c).c" &&  
 80986 mv a.out "$(basename -- "$1" .c)"`

80987 The EXAMPLES section of the *basename()* function (see XSH [basename\(\)](#)) includes a table +  
 80988 showing examples of the results of processing several sample pathnames by the *basename()* and +

80989 *dirname()* functions and by the *basename* and *dirname* utilities.

#### 80990 RATIONALE

80991 The behaviors of *basename* and *dirname* have been coordinated so that when *string* is a valid  
80992 pathname:

80993 `$(basename -- "string")`

80994 would be a valid filename for the file in the directory:

80995 `$(dirname -- "string")`

80996 This would not work for the early proposal versions of these utilities due to the way it specified  
80997 handling of trailing <slash> characters.

80998 Since the definition of *pathname* specifies implementation-defined behavior for pathnames  
80999 starting with two <slash> characters, this volume of POSIX.1-2008 specifies similar  
81000 implementation-defined behavior for the *basename* and *dirname* utilities.

#### 81001 FUTURE DIRECTIONS

81002 None.

#### 81003 SEE ALSO

81004 [Section 2.5](#) (on page 2339), *dirname*

81005 XBD [Section 3.271](#) (on page 76), [Chapter 8](#) (on page 173)

81006 XSH *basename()*, *dirname()* +

#### 81007 CHANGE HISTORY

81008 First released in Issue 2.

#### 81009 Issue 6

81010 IEEE PASC Interpretation 1003.2 #164 is applied.

81011 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 81012 Issue 7

81013 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0065 [192,538], XCU/TC1-2008/0066  
81014 [192,538], and XCU/TC1-2008/0067 [192,430,538] are applied.

81015 **NAME**

81016 batch — schedule commands to be executed in a batch queue

81017 **SYNOPSIS**81018 *batch*81019 **DESCRIPTION**81020 The *batch* utility shall read commands from standard input and schedule them for execution in a  
81021 batch queue. It shall be the equivalent of the command:81022 `at -q b -m now`81023 where queue *b* is a special *at* queue, specifically for batch jobs. Batch jobs shall be submitted to  
81024 the batch queue with no time constraints and shall be run by the system using algorithms, based  
81025 on unspecified factors, that may vary with each invocation of *batch*.81026 XSI Users shall be permitted to use *batch* if their name appears in the file **at.allow** which is located in  
81027 an implementation-defined directory. If that file does not exist, the file **at.deny**, which is located  
81028 in an implementation-defined directory, shall be checked to determine whether the user shall be  
81029 denied access to *batch*. If neither file exists, only a process with appropriate privileges shall be  
81030 allowed to submit a job. If only **at.deny** exists and is empty, global usage shall be permitted. The  
81031 **at.allow** and **at.deny** files shall consist of one user name per line.81032 **OPTIONS**

81033 None.

81034 **OPERANDS**

81035 None.

81036 **STDIN**81037 The standard input shall be a text file consisting of commands acceptable to the shell command  
81038 language described in [Chapter 2](#) (on page 2335).81039 **INPUT FILES**81040 XSI The text files **at.allow** and **at.deny**, which are located in an implementation-defined directory,  
81041 shall contain zero or more user names, one per line, of users who are, respectively, authorized or  
81042 denied access to the *at* and *batch* utilities.81043 **ENVIRONMENT VARIABLES**81044 The following environment variables shall affect the execution of *batch*:81045 **LANG** Provide a default value for the internationalization variables that are unset or null.  
81046 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
81047 variables used to determine the values of locale categories.)81048 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
81049 internationalization variables.81050 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
81051 characters (for example, single-byte as opposed to multi-byte characters in  
81052 arguments and input files).81053 **LC\_MESSAGES**81054 Determine the locale that should be used to affect the format and contents of  
81055 diagnostic messages written to standard error and informative messages written to  
81056 standard output.81057 **LC\_TIME** Determine the format and contents for date and time strings written by *batch*.

81058	XSI	<b>NLSPATH</b>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
81059		<b>SHELL</b>	Determine the name of a command interpreter to be used to invoke the at-job. If the variable is unset or null, <i>sh</i> shall be used. If it is set to a value other than a name for <i>sh</i> , the implementation shall do one of the following: use that shell; use <i>sh</i> ; use the login shell from the user database; any of the preceding accompanied by a warning diagnostic about which was chosen.
81060			
81061			
81062			
81063			
81064		<b>TZ</b>	Determine the timezone. The job shall be submitted for execution at the time specified by <i>timespec</i> or <i>-t time</i> relative to the timezone specified by the <i>TZ</i> variable. If <i>timespec</i> specifies a timezone, it overrides <i>TZ</i> . If <i>timespec</i> does not specify a timezone and <i>TZ</i> is unset or null, an unspecified default timezone shall be used.
81065			
81066			
81067			
81068			
81069		<b>ASYNCHRONOUS EVENTS</b>	
81070			Default.
81071		<b>STDOUT</b>	
81072			When standard input is a terminal, prompts of unspecified format for each line of the user input described in the STDIN section may be written to standard output.
81073			
81074		<b>STDERR</b>	
81075			The following shall be written to standard error when a job has been successfully submitted:
81076			"job %s at %s\n", <i>at_job_id</i> , < <i>date</i> >
81077			where <i>date</i> shall be equivalent in format to the output of:
81078			<i>date</i> + "%a %b %e %T %Y"
81079			The date and time written shall be adjusted so that they appear in the timezone of the user (as determined by the <i>TZ</i> variable).
81080			
81081			Neither this, nor warning messages concerning the selection of the command interpreter, are considered a diagnostic that changes the exit status.
81082			
81083			Diagnostic messages, if any, shall be written to standard error.
81084		<b>OUTPUT FILES</b>	
81085			None.
81086		<b>EXTENDED DESCRIPTION</b>	
81087			None.
81088		<b>EXIT STATUS</b>	
81089			The following exit values shall be returned:
81090			0 Successful completion.
81091			>0 An error occurred.
81092		<b>CONSEQUENCES OF ERRORS</b>	
81093			The job shall not be scheduled.

**81094 APPLICATION USAGE**

81095 It may be useful to redirect standard output within the specified commands.

**81096 EXAMPLES**

81097 1. This sequence can be used at a terminal:

```
81098 batch
81099 sort < file >outfile
81100 EOT
```

81101 2. This sequence, which demonstrates redirecting standard error to a pipe, is useful in a  
81102 command procedure (the sequence of output redirection specifications is significant):

```
81103 batch <<!  
81104 diff file1 file2 2>&1 >outfile | mailx mygroup  
81105 !
```

**81106 RATIONALE**

81107 Early proposals described *batch* in a manner totally separated from *at*, even though the historical  
81108 model treated it almost as a synonym for *at -qb*. A number of features were added to list and  
81109 control batch work separately from those in *at*. Upon further reflection, it was decided that the  
81110 benefit of this did not merit the change to the historical interface.

81111 The *-m* option was included on the equivalent *at* command because it is historical practice to  
81112 mail results to the submitter, even if all job-produced output is redirected. As explained in the  
81113 RATIONALE for *at*, the **now** keyword submits the job for immediate execution (after scheduling  
81114 delays), despite some historical systems where *at now* would have been considered an error.

**81115 FUTURE DIRECTIONS**

81116 None.

**81117 SEE ALSO**

81118 *at*

81119 XBD Chapter 8 (on page 173)

**81120 CHANGE HISTORY**

81121 First released in Issue 2.

**81122 Issue 6**

81123 This utility is marked as part of the User Portability Utilities option.

81124 The NAME is changed to align with the IEEE P1003.2b draft standard.

81125 The normative text is reworded to avoid use of the term “must” for application requirements.

**81126 Issue 7**

81127 The *batch* utility is moved from the User Portability Utilities option to the Base. User Portability  
81128 Utilities is now an option for interactive utilities.

81129 SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced  
81130 by the *batch* utility.

81131 **NAME**

81132       bc — arbitrary-precision arithmetic language

81133 **SYNOPSIS**81134       bc [-l] [*file...*]81135 **DESCRIPTION**

81136       The *bc* utility shall implement an arbitrary precision calculator. It shall take input from any files  
 81137       given, then read from the standard input. If the standard input and standard output to *bc* are  
 81138       attached to a terminal, the invocation of *bc* shall be considered to be *interactive*, causing  
 81139       behavioral constraints described in the following sections.

81140 **OPTIONS**81141       The *bc* utility shall conform to XBD [Section 12.2](#) (on page 216).

81142       The following option shall be supported:

81143       -l           (The letter ell.) Define the math functions and initialize *scale* to 20, instead of the  
 81144       default zero; see the EXTENDED DESCRIPTION section.

81145 **OPERANDS**

81146       The following operand shall be supported:

81147       *file*        A pathname of a text file containing *bc* program statements. After all *files* have  
 81148       been read, *bc* shall read the standard input.

81149 **STDIN**

81150       See the INPUT FILES section.

81151 **INPUT FILES**

81152       Input files shall be text files containing a sequence of comments, statements, and function  
 81153       definitions that shall be executed as they are read.

81154 **ENVIRONMENT VARIABLES**81155       The following environment variables shall affect the execution of *bc*:

81156       LANG        Provide a default value for the internationalization variables that are unset or null.  
 81157                   (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 81158                   variables used to determine the values of locale categories.)

81159       LC\_ALL      If set to a non-empty string value, override the values of all the other  
 81160       internationalization variables.

81161       LC\_CTYPE    Determine the locale for the interpretation of sequences of bytes of text data as  
 81162       characters (for example, single-byte as opposed to multi-byte characters in  
 81163       arguments and input files).

81164       LC\_MESSAGES

81165                   Determine the locale that should be used to affect the format and contents of  
 81166       diagnostic messages written to standard error.

81167 xSI       NLSPATH   Determine the location of message catalogs for the processing of LC\_MESSAGES.

81168 **ASYNCHRONOUS EVENTS**

81169       Default.

81170 **STDOUT**

81171       The output of the *bc* utility shall be controlled by the program read, and consist of zero or more  
 81172       lines containing the value of all executed expressions without assignments. The radix and  
 81173       precision of the output shall be controlled by the values of the **obase** and **scale** variables; see the  
 81174       EXTENDED DESCRIPTION section.

81175 **STDERR**

81176 The standard error shall be used only for diagnostic messages.

81177 **OUTPUT FILES**

81178 None.

81179 **EXTENDED DESCRIPTION**81180 **Grammar**

81181 The grammar in this section and the lexical conventions in the following section shall together  
 81182 describe the syntax for *bc* programs. The general conventions for this style of grammar are  
 81183 described in [Section 1.3](#) (on page 2325). A valid program can be represented as the non-terminal  
 81184 symbol **program** in the grammar. This formal syntax shall take precedence over the text syntax  
 81185 description.

81275                                     | named_expression INCR_DECR
81276                                     | named_expression ASSIGN_OP expression
81277                                     | Length '(' expression ')'
81278                                     | Sqrt '(' expression ')'
81279                                     | Scale '(' expression ')'
81280                                     ;
81281     named_expression                  : LETTER
81282                                     | LETTER '[' expression ']'
81283                                     | Scale
81284                                     | Ibase
81285                                     | Obase
81286                                     ;

```

### Lexical Conventions in bc

The lexical conventions for *bc* programs, with respect to the preceding grammar, shall be as follows:

1. Except as noted, *bc* shall recognize the longest possible token or delimiter beginning at a given point.
2. A comment shall consist of any characters beginning with the two adjacent characters `"/*"` and terminated by the next occurrence of the two adjacent characters `"*/"`. Comments shall have no effect except to delimit lexical tokens.
3. The `<newline>` shall be recognized as the token **NEWLINE**.
4. The token **STRING** shall represent a string constant; it shall consist of any characters beginning with the double-quote character (`'"`) and terminated by another occurrence of the double-quote character. The value of the string is the sequence of all characters between, but not including, the two double-quote characters. All characters shall be taken literally from the input, and there is no way to specify a string containing a double-quote character. The length of the value of each string shall be limited to `{BC_STRING_MAX}` bytes.
5. A `<blank>` shall have no effect except as an ordinary character if it appears within a **STRING** token, or to delimit a lexical token other than **STRING**.
6. The combination of a `<backslash>` character immediately followed by a `<newline>` shall have no effect other than to delimit lexical tokens with the following exceptions:

- 81307 • It shall be interpreted as the character sequence "\<newline>" in **STRING** tokens.
- 81308 • It shall be ignored as part of a multi-line **NUMBER** token.

81309 7. The token **NUMBER** shall represent a numeric constant. It shall be recognized by the  
81310 following grammar:

```
81311 NUMBER : integer
81312         | '.' integer
81313         | integer '.'
81314         | integer '.' integer
81315         ;

81316 integer : digit
81317         | integer digit
81318         ;

81319 digit   : 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7
81320         | 8 | 9 | A | B | C | D | E | F
81321         ;
```

81322 8. The value of a **NUMBER** token shall be interpreted as a numeral in the base specified by  
81323 the value of the internal register **ibase** (described below). Each of the **digit** characters  
81324 shall have the value from 0 to 15 in the order listed here, and the <period> character shall  
81325 represent the radix point. The behavior is undefined if digits greater than or equal to the  
81326 value of **ibase** appear in the token. However, note the exception for single-digit values  
81327 being assigned to **ibase** and **obase** themselves, in [Operations in bc](#) (on page 2519).

81328 9. The following keywords shall be recognized as tokens:

81329 <b>auto</b>	<b>ibase</b>	<b>length</b>	<b>return</b>	<b>while</b>
81330 <b>break</b>	<b>if</b>	<b>obase</b>	<b>scale</b>	
81331 <b>define</b>	<b>for</b>	<b>quit</b>	<b>sqrt</b>	

81332 10. Any of the following characters occurring anywhere except within a keyword shall be  
81333 recognized as the token **LETTER**:

81334 a b c d e f g h i j k l m n o p q r s t u v w x y z

81335 11. The following single-character and two-character sequences shall be recognized as the  
81336 token **ASSIGN\_OP**:

81337 = += -= \*= /= %= ^=

81338 12. If an '=' character, as the beginning of a token, is followed by a '-' character with no  
81339 intervening delimiter, the behavior is undefined.

81340 13. The following single-characters shall be recognized as the token **MUL\_OP**:

81341 \* / %

81342 14. The following single-character and two-character sequences shall be recognized as the  
81343 token **REL\_OP**:

81344 == <= >= != < >

81345 15. The following two-character sequences shall be recognized as the token **INCR\_DECR**:

81346 ++ --

16. The following single characters shall be recognized as tokens whose names are the character:

<newline> ( ) , + - ; [ ] ^ { }

17. The token **EOF** is returned when the end of input is reached.

### Operations in bc

There are three kinds of identifiers: ordinary identifiers, array identifiers, and function identifiers. All three types consist of single lowercase letters. Array identifiers shall be followed by square brackets ("[]"). An array subscript is required except in an argument or auto list. Arrays are singly dimensioned and can contain up to {BC\_DIM\_MAX} elements. Indexing shall begin at zero so an array is indexed from 0 to {BC\_DIM\_MAX}-1. Subscripts shall be truncated to integers. The application shall ensure that function identifiers are followed by parentheses, possibly enclosing arguments. The three types of identifiers do not conflict.

The following table summarizes the rules for precedence and associativity of all operators. Operators on the same line shall have the same precedence; rows are in order of decreasing precedence.

**Table 4-3** Operators in *bc*

Operator	Associativity
++, --	N/A
unary -	N/A
^	Right to left
*, /, %	Left to right
+, binary -	Left to right
=, +=, -=, *=, /=, %=, ^=	Right to left
==, <=, >=, !=, <, >	None

Each expression or named expression has a *scale*, which is the number of decimal digits that shall be maintained as the fractional portion of the expression.

*Named expressions* are places where values are stored. Named expressions shall be valid on the left side of an assignment. The value of a named expression shall be the value stored in the place named. Simple identifiers and array elements are named expressions; they have an initial value of zero and an initial scale of zero.

The internal registers **scale**, **ibase**, and **obase** are all named expressions. The scale of an expression consisting of the name of one of these registers shall be zero; values assigned to any of these registers are truncated to integers. The **scale** register shall contain a global value used in computing the scale of expressions (as described below). The value of the register **scale** is limited to  $0 \leq \text{scale} \leq \{\text{BC\_SCALE\_MAX}\}$  and shall have a default value of zero. The **ibase** and **obase** registers are the input and output number radix, respectively. The value of **ibase** shall be limited to:

$$2 \leq \text{ibase} \leq 16$$

The value of **obase** shall be limited to:

$$2 \leq \text{obase} \leq \{\text{BC\_BASE\_MAX}\}$$

When either **ibase** or **obase** is assigned a single **digit** value from the list in [Lexical Conventions in bc](#) (on page 2517), the value shall be assumed in hexadecimal. (For example, **ibase=A** sets to base ten, regardless of the current **ibase** value.) Otherwise, the behavior is undefined when

digits greater than or equal to the value of **ibase** appear in the input. Both **ibase** and **obase** shall have initial values of 10.

Internal computations shall be conducted as if in decimal, regardless of the input and output bases, to the specified number of decimal digits. When an exact result is not achieved (for example, **scale**=0; 3.2/1), the result shall be truncated.

For all values of **obase** specified by this volume of POSIX.1-2008, *bc* shall output numeric values by performing each of the following steps in order:

1. If the value is less than zero, a <hyphen-minus> ( ' - ' ) character shall be output.
2. One of the following is output, depending on the numerical value:
  - If the absolute value of the numerical value is greater than or equal to one, the integer portion of the value shall be output as a series of digits appropriate to **obase** (as described below), most significant digit first. The most significant non-zero digit shall be output next, followed by each successively less significant digit.
  - If the absolute value of the numerical value is less than one but greater than zero and the scale of the numerical value is greater than zero, it is unspecified whether the character 0 is output.
  - If the numerical value is zero, the character 0 shall be output.
3. If the scale of the value is greater than zero and the numeric value is not zero, a <period> character shall be output, followed by a series of digits appropriate to **obase** (as described below) representing the most significant portion of the fractional part of the value. If *s* represents the scale of the value being output, the number of digits output shall be *s* if **obase** is 10, less than or equal to *s* if **obase** is greater than 10, or greater than or equal to *s* if **obase** is less than 10. For **obase** values other than 10, this should be the number of digits needed to represent a precision of 10<sup>s</sup>.

For **obase** values from 2 to 16, valid digits are the first **obase** of the single characters:

0 1 2 3 4 5 6 7 8 9 A B C D E F

which represent the values zero to 15, inclusive, respectively.

For bases greater than 16, each digit shall be written as a separate multi-digit decimal number. Each digit except the most significant fractional digit shall be preceded by a single <space>. For bases from 17 to 100, *bc* shall write two-digit decimal numbers; for bases from 101 to 1 000, three-digit decimal strings, and so on. For example, the decimal number 1 024 in base 25 would be written as:

Δ01Δ15Δ24

and in base 125, as:

Δ008Δ024

Very large numbers shall be split across lines with 70 characters per line in the POSIX locale; other locales may split at different character boundaries. Lines that are continued shall end with a <backslash>.

A function call shall consist of a function name followed by parentheses containing a <comma>-separated list of expressions, which are the function arguments. A whole array passed as an argument shall be specified by the array name followed by empty square brackets. All function arguments shall be passed by value. As a result, changes made to the formal parameters shall have no effect on the actual arguments. If the function terminates by executing

81433 a **return** statement, the value of the function shall be the value of the expression in the  
 81434 parentheses of the **return** statement or shall be zero if no expression is provided or if there is no  
 81435 **return** statement.

81436 The result of **sqrt**(*expression*) shall be the square root of the expression. The result shall be  
 81437 truncated in the least significant decimal place. The scale of the result shall be the scale of the  
 81438 expression or the value of **scale**, whichever is larger.

81439 The result of **length**(*expression*) shall be the total number of significant decimal digits in the  
 81440 expression. The scale of the result shall be zero.

81441 The result of **scale**(*expression*) shall be the scale of the expression. The scale of the result shall be  
 81442 zero.

81443 A numeric constant shall be an expression. The scale shall be the number of digits that follow the  
 81444 radix point in the input representing the constant, or zero if no radix point appears.

81445 The sequence ( *expression* ) shall be an expression with the same value and scale as *expression*.  
 81446 The parentheses can be used to alter the normal precedence.

81447 The semantics of the unary and binary operators are as follows:

81448 *-expression*

81449 The result shall be the negative of the *expression*. The scale of the result shall be the scale of  
 81450 *expression*.

81451 The unary increment and decrement operators shall not modify the scale of the named  
 81452 expression upon which they operate. The scale of the result shall be the scale of that named  
 81453 expression.

81454 *++named-expression*

81455 The named expression shall be incremented by one. The result shall be the value of the  
 81456 named expression after incrementing.

81457 *--named-expression*

81458 The named expression shall be decremented by one. The result shall be the value of the  
 81459 named expression after decrementing.

81460 *named-expression++*

81461 The named expression shall be incremented by one. The result shall be the value of the  
 81462 named expression before incrementing.

81463 *named-expression--*

81464 The named expression shall be decremented by one. The result shall be the value of the  
 81465 named expression before decrementing.

81466 The exponentiation operator, <circumflex> ( ' ^ ' ), shall bind right to left.

81467 *expression^expression*

81468 The result shall be the first *expression* raised to the power of the second *expression*. If the  
 81469 second expression is not an integer, the behavior is undefined. If *a* is the scale of the left  
 81470 expression and *b* is the absolute value of the right expression, the scale of the result shall be:

81471 if *b* >= 0 min(*a* \* *b*, max(scale, *a*)) if *b* < 0 scale

81472 The multiplicative operators ( ' \* ', ' / ', ' % ' ) shall bind left to right.

81473 *expression\*expression*

81474 The result shall be the product of the two expressions. If *a* and *b* are the scales of the two  
 81475 expressions, then the scale of the result shall be:

81476  $\min(a+b, \max(\text{scale}, a, b))$

81477 *expression / expression*

81478 The result shall be the quotient of the two expressions. The scale of the result shall be the  
81479 value of **scale**.

81480 *expression % expression*

81481 For expressions *a* and *b*, *a % b* shall be evaluated equivalent to the steps:

81482 1. Compute *a / b* to current scale.

81483 2. Use the result to compute:

81484  $a - (a / b) * b$

81485 to scale:

81486  $\max(\text{scale} + \text{scale}(b), \text{scale}(a))$

81487 The scale of the result shall be:

81488  $\max(\text{scale} + \text{scale}(b), \text{scale}(a))$

81489 When **scale** is zero, the '**%**' operator is the mathematical remainder operator.

81490 The additive operators ('+', '-') shall bind left to right.

81491 *expression + expression*

81492 The result shall be the sum of the two expressions. The scale of the result shall be the  
81493 maximum of the scales of the expressions.

81494 *expression - expression*

81495 The result shall be the difference of the two expressions. The scale of the result shall be the  
81496 maximum of the scales of the expressions.

81497 The assignment operators ('=', '+=', '-=', '\*=', '/=', '%=', '^=') shall bind right to left.

81498 *named-expression = expression*

81499 This expression shall result in assigning the value of the expression on the right to the  
81500 named expression on the left. The scale of both the named expression and the result shall be  
81501 the scale of *expression*.

81502 The compound assignment forms:

81503 *named-expression <operator>= expression*

81504 shall be equivalent to:

81505 *named-expression = named-expression <operator> expression*

81506 except that the *named-expression* shall be evaluated only once.

81507 Unlike all other operators, the relational operators ('<', '>', '<=', '>=', '==', '!=') shall be  
81508 only valid as the object of an **if**, **while**, or inside a **for** statement.

81509 *expression1 < expression2*

81510 The relation shall be true if the value of *expression1* is strictly less than the value of  
81511 *expression2*.

81512 *expression1 > expression2*

81513 The relation shall be true if the value of *expression1* is strictly greater than the value of  
81514 *expression2*.

81515 *expression1* <=*expression2*  
 81516 The relation shall be true if the value of *expression1* is less than or equal to the value of  
 81517 *expression2*.

81518 *expression1* >=*expression2*  
 81519 The relation shall be true if the value of *expression1* is greater than or equal to the value of  
 81520 *expression2*.

81521 *expression1* ==*expression2*  
 81522 The relation shall be true if the values of *expression1* and *expression2* are equal.

81523 *expression1* !=*expression2*  
 81524 The relation shall be true if the values of *expression1* and *expression2* are unequal.

81525 There are only two storage classes in *bc*: global and automatic (local). Only identifiers that are  
 81526 local to a function need be declared with the **auto** command. The arguments to a function shall  
 81527 be local to the function. All other identifiers are assumed to be global and available to all  
 81528 functions. All identifiers, global and local, have initial values of zero. Identifiers declared as auto  
 81529 shall be allocated on entry to the function and released on returning from the function. They  
 81530 therefore do not retain values between function calls. Auto arrays shall be specified by the array  
 81531 name followed by empty square brackets. On entry to a function, the old values of the names  
 81532 that appear as parameters and as automatic variables shall be pushed onto a stack. Until the  
 81533 function returns, reference to these names shall refer only to the new values.

81534 References to any of these names from other functions that are called from this function also  
 81535 refer to the new value until one of those functions uses the same name for a local variable.

81536 When a statement is an expression, unless the main operator is an assignment, execution of the  
 81537 statement shall write the value of the expression followed by a <newline>.

81538 When a statement is a string, execution of the statement shall write the value of the string.

81539 Statements separated by <semicolon> or <newline> characters shall be executed sequentially. In  
 81540 an interactive invocation of *bc*, each time a <newline> is read that satisfies the grammatical  
 81541 production:

81542 `input_item : semicolon_list NEWLINE`

81543 the sequential list of statements making up the **semicolon\_list** shall be executed immediately  
 81544 and any output produced by that execution shall be written without any delay due to buffering.

81545 In an **if** statement (**if**(*relation*) *statement*), the *statement* shall be executed if the relation is true.

81546 The **while** statement (**while**(*relation*) *statement*) implements a loop in which the *relation* is tested;  
 81547 each time the *relation* is true, the *statement* shall be executed and the *relation* retested. When the  
 81548 *relation* is false, execution shall resume after *statement*.

81549 A **for** statement(**for**(*expression*; *relation*; *expression*) *statement*) shall be the same as:

81550 `first-expression`  
 81551 `while (relation) {`  
 81552 `statement`  
 81553 `last-expression`  
 81554 `}`

81555 The application shall ensure that all three expressions are present.

81556 The **break** statement shall cause termination of a **for** or **while** statement.

81557 The **auto** statement (**auto** *identifier* [*identifier*] ...) shall cause the values of the identifiers to be

pushed down. The identifiers can be ordinary identifiers or array identifiers. Array identifiers shall be specified by following the array name by empty square brackets. The application shall ensure that the **auto** statement is the first statement in a function definition.

A **define** statement:

```
define LETTER ( opt_parameter_list ) {
    opt_auto_define_list
    statement_list
}
```

defines a function named **LETTER**. If a function named **LETTER** was previously defined, the **define** statement shall replace the previous definition. The expression:

```
LETTER ( opt_argument_list )
```

shall invoke the function named **LETTER**. The behavior is undefined if the number of arguments in the invocation does not match the number of parameters in the definition. Functions shall be defined before they are invoked. A function shall be considered to be defined within its own body, so recursive calls are valid. The values of numeric constants within a function shall be interpreted in the base specified by the value of the **ibase** register when the function is invoked.

The **return** statements (**return** and **return(expression)**) shall cause termination of a function, popping of its auto variables, and specification of the result of the function. The first form shall be equivalent to **return(0)**. The value and scale of the result returned by the function shall be the value and scale of the expression returned.

The **quit** statement (**quit**) shall stop execution of a *bc* program at the point where the statement occurs in the input, even if it occurs in a function definition, or in an **if**, **for**, or **while** statement.

The following functions shall be defined when the **-l** option is specified:

**s(expression)**

Sine of argument in radians.

**c(expression)**

Cosine of argument in radians.

**a(expression)**

Arctangent of argument.

**l(expression)**

Natural logarithm of argument.

**e(expression)**

Exponential function of argument.

**j(expression1, expression2)**

Bessel function of *expression2* of the first kind of integer order *expression1*.

The scale of the result returned by these functions shall be the value of the **scale** register at the time the function is invoked. The value of the **scale** register after these functions have completed their execution shall be the same value it had upon invocation. The behavior is undefined if any of these functions is invoked with an argument outside the domain of the mathematical function.

81599 **EXIT STATUS**

81600 The following exit values shall be returned:

81601 0 All input files were processed successfully.

81602 *unspecified* An error occurred.81603 **CONSEQUENCES OF ERRORS**81604 If any *file* operand is specified and the named file cannot be accessed, *bc* shall write a diagnostic message to standard error and terminate without any further action.81606 In an interactive invocation of *bc*, the utility should print an error message and recover following any error in the input. In a non-interactive invocation of *bc*, invalid input causes undefined behavior.81609 **APPLICATION USAGE**81610 Automatic variables in *bc* do not work in exactly the same way as in either C or PL/1.81611 For historical reasons, the exit status from *bc* cannot be relied upon to indicate that an error has occurred. Returning zero after an error is possible. Therefore, *bc* should be used primarily by interactive users (who can react to error messages) or by application programs that can somehow validate the answers returned as not including error messages.81615 The *bc* utility always uses the <period> ( ' . ' ) character to represent a radix point, regardless of any decimal-point character specified as part of the current locale. In languages like C or *awk*, the <period> character is used in program source, so it can be portable and unambiguous, while the locale-specific character is used in input and output. Because there is no distinction between source and input in *bc*, this arrangement would not be possible. Using the locale-specific character in *bc*'s input would introduce ambiguities into the language; consider the following example in a locale with a <comma> as the decimal-point character:

```
81622 define f(a,b) {
81623     ...
81624 }
81625 ...
81626 f(1,2,3)
```

81627 Because of such ambiguities, the &lt;period&gt; character is used in input. Having input follow different conventions from output would be confusing in either pipeline usage or interactive usage, so the &lt;period&gt; is also used in output.

81630 **EXAMPLES**81631 In the shell, the following assigns an approximation of the first ten digits of ' $\pi$ ' to the variable *x*:81632 `x=$(printf "%s\n" 'scale = 10; 104348/33215' | bc)`81633 The following *bc* program prints the same approximation of ' $\pi$ ', with a label, to standard output:

```
81635 scale = 10
81636 "pi equals "
81637 104348 / 33215
```

81638 The following defines a function to compute an approximate value of the exponential function (note that such a function is predefined if the `-l` option is specified):

```
81640 scale = 20
81641 define e(x){
81642     auto a, b, c, i, s
```

```

81643     a = 1
81644     b = 1
81645     s = 1
81646     for (i = 1; 1 == 1; i++){
81647         a = a*x
81648         b = b*i
81649         c = a/b
81650         if (c == 0) {
81651             return(s)
81652         }
81653         s = s+c
81654     }
81655 }

```

The following prints approximate values of the exponential function of the first ten integers:

```

81657 for (i = 1; i <= 10; ++i) {
81658     e(i)
81659 }

```

## RATIONALE

The *bc* utility is implemented historically as a front-end processor for *dc*; *dc* was not selected to be part of this volume of POSIX.1-2008 because *bc* was thought to have a more intuitive programmatic interface. Current implementations that implement *bc* using *dc* are expected to be compliant.

The exit status for error conditions has been left unspecified for several reasons:

- The *bc* utility is used in both interactive and non-interactive situations. Different exit codes may be appropriate for the two uses.
- It is unclear when a non-zero exit should be given; divide-by-zero, undefined functions, and syntax errors are all possibilities.
- It is not clear what utility the exit status has.
- In the 4.3 BSD, System V, and Ninth Edition implementations, *bc* works in conjunction with *dc*. The *dc* utility is the parent, *bc* is the child. This was done to cleanly terminate *bc* if *dc* aborted.

The decision to have *bc* exit upon encountering an inaccessible input file is based on the belief that *bc file1 file2* is used most often when at least *file1* contains data/function declarations/initializations. Having *bc* continue with prerequisite files missing is probably not useful. There is no implication in the CONSEQUENCES OF ERRORS section that *bc* must check all its files for accessibility before opening any of them.

There was considerable debate on the appropriateness of the language accepted by *bc*. Several reviewers preferred to see either a pure subset of the C language or some changes to make the language more compatible with C. While the *bc* language has some obvious similarities to C, it has never claimed to be compatible with any version of C. An interpreter for a subset of C might be a very worthwhile utility, and it could potentially make *bc* obsolete. However, no such utility is known in historical practice, and it was not within the scope of this volume of POSIX.1-2008 to define such a language and utility. If and when they are defined, it may be appropriate to include them in a future version of this standard. This left the following alternatives:

1. Exclude any calculator language from this volume of POSIX.1-2008.

The consensus of the standard developers was that a simple programmatic calculator language is very useful for both applications and interactive users. The only arguments for excluding any calculator were that it would become obsolete if and when a C-compatible one emerged, or that the absence would encourage the development of such a C-compatible one. These arguments did not sufficiently address the needs of current application developers.

2. Standardize the historical *dc*, possibly with minor modifications.

The consensus of the standard developers was that *dc* is a fundamentally less usable language and that that would be far too severe a penalty for avoiding the issue of being similar to but incompatible with C.

3. Standardize the historical *bc*, possibly with minor modifications.

This was the approach taken. Most of the proponents of changing the language would not have been satisfied until most or all of the incompatibilities with C were resolved. Since most of the changes considered most desirable would break historical applications and require significant modification to historical implementations, almost no modifications were made. The one significant modification that was made was the replacement of the historical *bc* assignment operators "*=*", and so on, with the more modern "*+=*", and so on. The older versions are considered to be fundamentally flawed because of the lexical ambiguity in uses like *a=-1*.

In order to permit implementations to deal with backwards-compatibility as they see fit, the behavior of this one ambiguous construct was made undefined. (At least three implementations have been known to support this change already, so the degree of change involved should not be great.)

The '*%*' operator is the mathematical remainder operator when **scale** is zero. The behavior of this operator for other values of **scale** is from historical implementations of *bc*, and has been maintained for the sake of historical applications despite its non-intuitive nature.

Historical implementations permit setting **ibase** and **obase** to a broader range of values. This includes values less than 2, which were not seen as sufficiently useful to standardize. These implementations do not interpret input properly for values of **ibase** that are greater than 16. This is because numeric constants are recognized syntactically, rather than lexically, as described in this volume of POSIX.1-2008. They are built from lexical tokens of single hexadecimal digits and <period> characters. Since <blank> characters between tokens are not visible at the syntactic level, it is not possible to recognize the multi-digit "digits" used in the higher bases properly. The ability to recognize input in these bases was not considered useful enough to require modifying these implementations. Note that the recognition of numeric constants at the syntactic level is not a problem with conformance to this volume of POSIX.1-2008, as it does not impact the behavior of conforming applications (and correct *bc* programs). Historical implementations also accept input with all of the digits '*0*'–'*9*' and '*A*'–'*F*' regardless of the value of **ibase**; since digits with value greater than or equal to **ibase** are not really appropriate, the behavior when they appear is undefined, except for the common case of:

```
ibase=8;
/* Process in octal base. */
...
ibase=A
/* Restore decimal base. */
```

In some historical implementations, if the expression to be written is an uninitialized array

81734 element, a leading <space> and/or up to four leading 0 characters may be output before the  
81735 character zero. This behavior is considered a bug; it is unlikely that any currently conforming  
81736 application relies on:

81737 `echo 'b[3]' | bc`

81738 returning 00000 rather than 0.

81739 Exact calculation of the number of fractional digits to output for a given value in a base other  
81740 than 10 can be computationally expensive. Historical implementations use a faster  
81741 approximation, and this is permitted. Note that the requirements apply only to values of **obase**  
81742 that this volume of POSIX.1-2008 requires implementations to support (in particular, not to 1, 0,  
81743 or negative bases, if an implementation supports them as an extension).

81744 Historical implementations of *bc* did not allow array parameters to be passed as the last  
81745 parameter to a function. New implementations are encouraged to remove this restriction even  
81746 though it is not required by the grammar.

#### 81747 **FUTURE DIRECTIONS**

81748 None.

#### 81749 **SEE ALSO**

81750 [Section 1.3](#) (on page 2325), *awk*

81751 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

#### 81752 **CHANGE HISTORY**

81753 First released in Issue 4.

##### 81754 **Issue 5**

81755 The FUTURE DIRECTIONS section is added.

##### 81756 **Issue 6**

81757 Updated to align with the IEEE P1003.2b draft standard, which included resolution of several  
81758 interpretations of the ISO POSIX-2: 1993 standard.

81759 The normative text is reworded to avoid use of the term “must” for application requirements.

##### 81760 **Issue 7**

81761 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

81762 **NAME**81763 `bg` — run jobs in the background81764 **SYNOPSIS**81765 UP `bg [job_id...]`81766 **DESCRIPTION**

81767 If job control is enabled (see the description of `set -m`), the `bg` utility shall resume suspended jobs  
 81768 from the current environment (see [Section 2.12](#), on page 2371) by running them as background  
 81769 jobs. If the job specified by `job_id` is already a running background job, the `bg` utility shall have  
 81770 no effect and shall exit successfully.

81771 Using `bg` to place a job into the background shall cause its process ID to become “known in the  
 81772 current shell execution environment”, as if it had been started as an asynchronous list; see  
 81773 [Section 2.9.3.1](#) (on page 2360).

81774 **OPTIONS**

81775 None.

81776 **OPERANDS**

81777 The following operand shall be supported:

81778 `job_id` Specify the job to be resumed as a background job. If no `job_id` operand is given,  
 81779 the most recently suspended job shall be used. The format of `job_id` is described in  
 81780 XBD [Section 3.204](#) (on page 66).

81781 **STDIN**

81782 Not used.

81783 **INPUT FILES**

81784 None.

81785 **ENVIRONMENT VARIABLES**81786 The following environment variables shall affect the execution of `bg`:

81787 `LANG` Provide a default value for the internationalization variables that are unset or null.  
 81788 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 81789 variables used to determine the values of locale categories.)

81790 `LC_ALL` If set to a non-empty string value, override the values of all the other  
 81791 internationalization variables.

81792 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
 81793 characters (for example, single-byte as opposed to multi-byte characters in  
 81794 arguments).

81795 `LC_MESSAGES`

81796 Determine the locale that should be used to affect the format and contents of  
 81797 diagnostic messages written to standard error.

81798 XSI `NLSPATH` Determine the location of message catalogs for the processing of `LC_MESSAGES`.

81799 **ASYNCHRONOUS EVENTS**

81800 Default.

81801 **STDOUT**81802 The output of `bg` shall consist of a line in the format:81803 `"[%d] %s\n", <job-number>, <command>`

81804 where the fields are as follows:

81805 <job-number> A number that can be used to identify the job to the *wait*, *fg*, and *kill* utilities. Using  
81806 these utilities, the job can be identified by prefixing the job number with ' % '.

81807 <command> The associated command that was given to the shell.

#### 81808 **STDERR**

81809 The standard error shall be used only for diagnostic messages.

#### 81810 **OUTPUT FILES**

81811 None.

#### 81812 **EXTENDED DESCRIPTION**

81813 None.

#### 81814 **EXIT STATUS**

81815 The following exit values shall be returned:

81816 0 Successful completion.

81817 >0 An error occurred.

#### 81818 **CONSEQUENCES OF ERRORS**

81819 If job control is disabled, the *bg* utility shall exit with an error and no job shall be placed in the  
81820 background.

#### 81821 **APPLICATION USAGE**

81822 A job is generally suspended by typing the SUSP character (<control>-Z on most systems); see  
81823 XBD [Chapter 11](#) (on page 199). At that point, *bg* can put the job into the background. This is  
81824 most effective when the job is expecting no terminal input and its output has been redirected to  
81825 non-terminal files. A background job can be forced to stop when it has terminal output by  
81826 issuing the command:

81827 `stty tostop`

81828 A background job can be stopped with the command:

81829 `kill -s stop job ID`

81830 The *bg* utility does not work as expected when it is operating in its own utility execution  
81831 environment because that environment has no suspended jobs. In the following examples:

81832 ... | xargs bg  
81833 (bg)

81834 each *bg* operates in a different environment and does not share its parent shell's understanding  
81835 of jobs. For this reason, *bg* is generally implemented as a shell regular built-in.

#### 81836 **EXAMPLES**

81837 None.

#### 81838 **RATIONALE**

81839 The extensions to the shell specified in this volume of POSIX.1-2008 have mostly been based on  
81840 features provided by the KornShell. The job control features provided by *bg*, *fg*, and *jobs* are also  
81841 based on the KornShell. The standard developers examined the characteristics of the C shell  
81842 versions of these utilities and found that differences exist. Despite widespread use of the C shell,  
81843 the KornShell versions were selected for this volume of POSIX.1-2008 to maintain a degree of  
81844 uniformity with the rest of the KornShell features selected (such as the very popular command  
81845 line editing features).

81846 The *bg* utility is expected to wrap its output if the output exceeds the number of display  
81847 columns.

81848 **FUTURE DIRECTIONS**

81849 None.

81850 **SEE ALSO**

81851 [Section 2.9.3.1](#) (on page 2360), *fg*, *kill*, *jobs*, *wait*

81852 XBD [Section 3.204](#) (on page 66), [Chapter 8](#) (on page 173), [Chapter 11](#) (on page 199)

81853 **CHANGE HISTORY**

81854 First released in Issue 4.

81855 **Issue 6**

81856 This utility is marked as part of the User Portability Utilities option.

81857 The JC margin marker on the SYNOPSIS is removed since support for Job Control is mandatory  
81858 in this version. This is a FIPS requirement.

81859 **Issue 7**

81860 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**NAME**

c99 — compile standard C programs

**SYNOPSIS**

```
c99 [options...] pathname [[pathname] [-I directory]
[-L directory] [-l library]]...
```

**DESCRIPTION**

The *c99* utility is an interface to the standard C compilation system; it shall accept source code conforming to the ISO C standard. The system conceptually consists of a compiler and link editor. The input files referenced by *pathname* operands and *-I* option-arguments shall be compiled and linked to produce an executable file. (It is unspecified whether the linking occurs entirely within the operation of *c99*; some implementations may produce objects that are not fully resolved until the file is executed.)

If the *-c* option is specified, for all *pathname* operands of the form *file.c*, the files:

```
$(basename pathname .c).o
```

shall be created as the result of successful compilation. If the *-c* option is not specified, it is unspecified whether such *.o* files are created or deleted for the *file.c* operands.

If there are no options that prevent link editing (such as *-c* or *-E*), and all input files compile and link without error, the resulting executable file shall be written according to the *-o outfile* option (if present) or to the file *a.out*.

The executable file shall be created as specified in [Section 1.1.1.4](#) (on page 2318), except that the file permission bits shall be set to:

```
S_IRWXO | S_IRWXG | S_IRWXU
```

and the bits specified by the *umask* of the process shall be cleared.

**OPTIONS**

The *c99* utility shall conform to XBD [Section 12.2](#) (on page 216), except that:

- Options can be interspersed with operands.
- The order of specifying the *-L* and *-I* options, and the order of specifying *-l* options with respect to *pathname* operands is significant.
- Conforming applications shall specify each option separately; that is, grouping option letters (for example, *-cO*) need not be recognized by all implementations.

The following options shall be supported:

*-c* Suppress the link-edit phase of the compilation, and do not remove any object files that are produced.

*-D name[=value]*

Define *name* as if by a C-language **#define** directive. If no *=value* is given, a value of 1 shall be used. The *-D* option has lower precedence than the *-U* option. That is, if *name* is used in both a *-U* and a *-D* option, *name* shall be undefined regardless of the order of the options. Additional implementation-defined *names* may be provided by the compiler. Implementations shall support at least 2 048 bytes of *-D* definitions and 256 *names*.

81901	–E	Copy C-language source files to standard output, executing all preprocessor directives; no compilation shall be performed. If any operand is not a text file, the effects are unspecified.	
81902			
81903			
81904	–g	Produce symbolic information in the object or executable files; the nature of this information is unspecified, and may be modified by implementation-defined interactions with other options.	
81905			
81906			
81907	–I <i>directory</i>	Change the algorithm for searching for headers whose names are not absolute pathnames to look in the directory named by the <i>directory</i> pathname before looking in the usual places. Thus, headers whose names are enclosed in double-quotes (" ") shall be searched for first in the directory of the file with the <b>#include</b> line, then in directories named in –I options, and last in the usual places. For headers whose names are enclosed in angle brackets ("< >"), the header shall be searched for only in directories named in –I options and then in the usual places. Directories named in –I options shall be searched in the order specified. If the –I option is used to specify a directory that is one of the usual places searched by default, the results are unspecified. Implementations shall support at least ten instances of this option in a single <i>c99</i> command invocation.	
81908			
81909			
81910			
81911			
81912			
81913			
81914			
81915			
81916			
81917			
81918	–L <i>directory</i>	Change the algorithm of searching for the libraries named in the –I objects to look in the directory named by the <i>directory</i> pathname before looking in the usual places. Directories named in –L options shall be searched in the order specified. If the –L option is used to specify a directory that is one of the usual places searched by default, the results are unspecified. Implementations shall support at least ten instances of this option in a single <i>c99</i> command invocation. If a directory specified by a –L option contains files with names starting with any of the strings "libc.", "libl.", "libpthread.", "libm.", "librt.", "libtrace.", "libxnet.", or "liby.", the results are unspecified.	
81919			
81920			
81921			
81922			
81923			
81924			
81925			
81926			
81927	–l <i>library</i>	Search the library named <b>liblibrary.a</b> . A library shall be searched when its name is encountered, so the placement of a –l option is significant. Several standard libraries can be specified in this manner, as described in the EXTENDED DESCRIPTION section. Implementations may recognize implementation-defined suffixes other than <b>.a</b> as denoting libraries.	
81928			
81929			
81930			
81931			
81932	–O <i>optlevel</i>	Specify the level of code optimization. If the <i>optlevel</i> option-argument is the digit '0', all special code optimizations shall be disabled. If it is the digit '1', the nature of the optimization is unspecified. If the –O option is omitted, the nature of the system's default optimization is unspecified. It is unspecified whether code generated in the presence of the –O 0 option is the same as that generated when –O is omitted. Other <i>optlevel</i> values may be supported.	
81933			
81934			
81935			
81936			
81937			
81938	–o <i>outfile</i>	Use the pathname <i>outfile</i> , instead of the default <b>a.out</b> , for the executable file produced. If the –o option is present with –c or –E, the result is unspecified.	
81939			
81940	–s	Produce object or executable files, or both, from which symbolic and other information not required for proper execution using the <i>exec</i> family defined in the System Interfaces volume of POSIX.1-2008 has been removed (stripped). If both –g and –s options are present, the action taken is unspecified.	
81941			
81942			
81943			
81944	–U <i>name</i>	Remove any initial definition of <i>name</i> .	
81945		Multiple instances of the –D, –I, –L, –l, and –U options can be specified.	

**OPERANDS**

The application shall ensure that at least one *pathname* operand is specified. The following forms for *pathname* operands shall be supported:

*file.c* A C-language source file to be compiled and optionally linked. The application shall ensure that the operand is of this form if the `-c` option is used.

*file.a* A library of object files typically produced by the *ar* utility, and passed directly to the link editor. Implementations may recognize implementation-defined suffixes other than *.a* as denoting object file libraries.

*file.o* An object file produced by *c99 -c* and passed directly to the link editor. Implementations may recognize implementation-defined suffixes other than *.o* as denoting object files.

The processing of other files is implementation-defined.

**STDIN**

Not used.

**INPUT FILES**

Each input file shall be one of the following: a text file containing a C-language source program, an object file in the format produced by *c99 -c*, or a library of object files, in the format produced by archiving zero or more object files, using *ar*. Implementations may supply additional utilities that produce files in these formats. Additional input file formats are implementation-defined.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *c99*:

*LANG* Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

*LC\_ALL* If set to a non-empty string value, override the values of all the other internationalization variables.

*LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).

*LC\_MESSAGES*

Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

*NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

*TMPDIR* Provide a pathname that should override the default directory for temporary files, if any. On XSI-conforming systems, provide a pathname that shall override the default directory for temporary files, if any.

**ASYNCHRONOUS EVENTS**

Default.

**STDOUT**

If more than one *pathname* operand ending in *.c* (or possibly other unspecified suffixes) is given, for each such file:

"%s:\n", *<pathname>*

may be written. These messages, if written, shall precede the processing of each input file; they

81989 shall not be written to the standard output if they are written to the standard error, as described  
81990 in the STDERR section.

81991 If the **-E** option is specified, the standard output shall be a text file that represents the results of  
81992 the preprocessing stage of the language; it may contain extra information appropriate for  
81993 subsequent compilation passes.

#### 81994 **STDERR**

81995 The standard error shall be used only for diagnostic messages. If more than one *pathname*  
81996 operand ending in **.c** (or possibly other unspecified suffixes) is given, for each such file:

81997 `"%s:\n", <pathname>`

81998 may be written to allow identification of the diagnostic and warning messages with the  
81999 appropriate input file. These messages, if written, shall precede the processing of each input file;  
82000 they shall not be written to the standard error if they are written to the standard output, as  
82001 described in the STDOUT section.

82002 This utility may produce warning messages about certain conditions that do not warrant  
82003 returning an error (non-zero) exit value.

#### 82004 **OUTPUT FILES**

82005 Object files or executable files or both are produced in unspecified formats. If the pathname of  
82006 an object file or executable file to be created by *c99* resolves to an existing directory entry for a  
82007 file that is not a regular file, it is unspecified whether *c99* shall attempt to create the file or shall  
82008 issue a diagnostic and exit with a non-zero exit status.

#### 82009 **EXTENDED DESCRIPTION**

##### 82010 **Standard Libraries**

82011 The *c99* utility shall recognize the following **-l** options for standard libraries:

82012 **-l c** This option shall make available all interfaces referenced in the System Interfaces  
82013 volume of POSIX.1-2008, with the possible exception of those interfaces listed as  
82014 residing in **<aio.h>**, **<arpa/inet.h>**, **<complex.h>**, **<fenv.h>**, **<math.h>**,  
82015 **<mqueue.h>**, **<netdb.h>**, **<net/if.h>**, **<netinet/in.h>**, **<pthread.h>**, **<sched.h>**,  
82016 **<semaphore.h>**, **<spawn.h>**, **<sys/socket.h>**, *pthread\_kill()*, and *pthread\_sigmask()*  
82017 in **<signal.h>**, **<trace.h>**, interfaces marked as optional in **<sys/mman.h>**,  
82018 interfaces marked as ADV (Advisory Information) in **<fcntl.h>**, and interfaces  
82019 beginning with the prefix *clock\_* or *timer\_* in **<time.h>**. This option shall not be  
82020 required to be present to cause a search of this library.

82021 **-l l** This option shall make available all interfaces required by the C-language output  
82022 of *lex* that are not made available through the **-l c** option.

82023 **-l pthread** This option shall make available all interfaces referenced in **<pthread.h>** and  
82024 *pthread\_kill()* and *pthread\_sigmask()* referenced in **<signal.h>**. An implementation  
82025 may search this library in the absence of this option.

82026 **-l m** This option shall make available all interfaces referenced in **<math.h>**,  
82027 **<complex.h>**, and **<fenv.h>**. An implementation may search this library in the  
82028 absence of this option.

82029 **-l rt** This option shall make available all interfaces referenced in **<aio.h>**, **<mqueue.h>**,  
82030 **<sched.h>**, **<semaphore.h>**, and **<spawn.h>**, interfaces marked as optional in  
82031 **<sys/mman.h>**, interfaces marked as ADV (Advisory Information) in **<fcntl.h>**,  
82032 and interfaces beginning with the prefix *clock\_* and *timer\_* in **<time.h>**. An

- 82033 implementation may search this library in the absence of this option.
- 82034 OB **-l trace** This option shall make available all interfaces referenced in `<trace.h>`. An  
82035 implementation may search this library in the absence of this option.
- 82036 **-l xnet** This option shall make available all interfaces referenced in `<arpa/inet.h>`,  
82037 `<netdb.h>`, `<net/if.h>`, `<netinet/in.h>`, and `<sys/socket.h>`. An implementation  
82038 may search this library in the absence of this option.
- 82039 **-l y** This option shall make available all interfaces required by the C-language output  
82040 of *yacc* that are not made available through the **-l c** option.
- 82041 In the absence of options that inhibit invocation of the link editor, such as **-c** or **-E**, the *c99* utility  
82042 shall cause the equivalent of a **-l c** option to be passed to the link editor after the last *pathname*  
82043 operand or **-l** option, causing it to be searched after all other object files and libraries are loaded.
- 82044 OB It is unspecified whether the libraries **libc.a**, **libl.a**, **libm.a**, **libpthread.a**, **librt.a**, **libtrace.a**,  
82045 **libxnet.a**, or **liby.a** exist as regular files. The implementation may accept as **-l** option-arguments  
82046 names of objects that do not exist as regular files.

## 82047 External Symbols

82048 The C compiler and link editor shall support the significance of external symbols up to a length  
82049 of at least 31 bytes; the action taken upon encountering symbols exceeding the implementation-  
82050 defined maximum symbol length is unspecified.

82051 The compiler and link editor shall support a minimum of 511 external symbols per source or  
82052 object file, and a minimum of 4095 external symbols in total. A diagnostic message shall be  
82053 written to the standard output if the implementation-defined limit is exceeded; other actions are  
82054 unspecified.

## 82055 Header Search

82056 If a file with the same name as one of the standard headers defined in XBD Chapter 13 (on page  
82057 219), not provided as part of the implementation, is placed in any of the usual places that are  
82058 searched by default for headers, the results are unspecified.

## 82059 Programming Environments

82060 All implementations shall support one of the following programming environments as a default.  
82061 Implementations may support more than one of the following programming environments.  
82062 Applications can use *sysconf()* or *getconf* to determine which programming environments are  
82063 supported.

Table 4-4 Programming Environments: Type Sizes

Programming Environment <i>getconf</i> Name	Bits in int	Bits in long	Bits in pointer	Bits in off_t
_POSIX_V7_ILP32_OFF32	32	32	32	32
_POSIX_V7_ILP32_OFFBIG	32	32	32	≥64
_POSIX_V7_LP64_OFF64	32	64	64	64
_POSIX_V7_LPBIG_OFFBIG	≥32	≥64	≥64	≥64

All implementations shall support one or more environments where the widths of the following types are no greater than the width of type **long**:

<b>blksize_t</b>	<b>ptrdiff_t</b>	<b>tcflag_t</b>
<b>cc_t</b>	<b>size_t</b>	<b>wchar_t</b>
<b>mode_t</b>	<b>speed_t</b>	<b>wint_t</b>
<b>nfds_t</b>	<b>ssize_t</b>	
<b>pid_t</b>	<b>suseconds_t</b>	

The executable files created when these environments are selected shall be in a proper format for execution by the *exec* family of functions. Each environment may be one of the ones in Table 4-4, or it may be another environment. The names for the environments that meet this requirement shall be output by a *getconf* command using the `_POSIX_V7_WIDTH_RESTRICTED_ENVS` argument, as a <newline>-separated list of names suitable for use with the *getconf* `-v` option. If more than one environment meets the requirement, the names of all such environments shall be output on separate lines. Any of these names can then be used in a subsequent *getconf* command to obtain the flags specific to that environment with the following suffixes added as appropriate:

`_CFLAGS` To get the C compiler flags.

`_LDFLAGS` To get the linker/loader flags.

`_LIBS` To get the libraries.

This requirement may be removed in a future version.

When this utility processes a file containing a function called *main()*, it shall be defined with a return type equivalent to **int**. Using return from the initial call to *main()* shall be equivalent (other than with respect to language scope issues) to calling *exit()* with the returned value. Reaching the end of the initial call to *main()* shall be equivalent to calling *exit(0)*. The implementation shall not declare a prototype for this function.

Implementations provide configuration strings for C compiler flags, linker/loader flags, and libraries for each supported environment. When an application needs to use a specific programming environment rather than the implementation default programming environment while compiling, the application shall first verify that the implementation supports the desired environment. If the desired programming environment is supported, the application shall then invoke *c99* with the appropriate C compiler flags as the first options for the compile, the appropriate linker/loader flags after any other options except `-l` but before any operands or `-l` options, and the appropriate libraries at the end of the operands and `-l` options.

Conforming applications shall not attempt to link together object files compiled for different programming models. Applications shall also be aware that binary data placed in shared memory or in files might not be recognized by applications built for other programming models.

82106

**Table 4-5** Programming Environments: c99 Arguments

Programming Environment <i>getconf</i> Name	Use	c99 Arguments <i>getconf</i> Name
_POSIX_V7_ILP32_OFF32	C Compiler Flags Linker/Loader Flags Libraries	POSIX_V7_ILP32_OFF32_CFLAGS POSIX_V7_ILP32_OFF32_LDFLAGS POSIX_V7_ILP32_OFF32_LIBS
_POSIX_V7_ILP32_OFFBIG	C Compiler Flags Linker/Loader Flags Libraries	POSIX_V7_ILP32_OFFBIG_CFLAGS POSIX_V7_ILP32_OFFBIG_LDFLAGS POSIX_V7_ILP32_OFFBIG_LIBS
_POSIX_V7_LP64_OFF64	C Compiler Flags Linker/Loader Flags Libraries	POSIX_V7_LP64_OFF64_CFLAGS POSIX_V7_LP64_OFF64_LDFLAGS POSIX_V7_LP64_OFF64_LIBS
_POSIX_V7_LPBIG_OFFBIG	C Compiler Flags Linker/Loader Flags Libraries	POSIX_V7_LPBIG_OFFBIG_CFLAGS POSIX_V7_LPBIG_OFFBIG_LDFLAGS POSIX_V7_LPBIG_OFFBIG_LIBS

In addition to the type size programming environments above, all implementations also support a multi-threaded programming environment that is orthogonal to all of the programming environments listed above. The *getconf* utility can be used to get flags for the threaded programming environment, as indicated in Table 4-6.

82125

**Table 4-6** Threaded Programming Environment: c99 Arguments

Programming Environment <i>getconf</i> Name	Use	c99 Arguments <i>getconf</i> Name
_POSIX_THREADS	C Compiler Flags Linker/Loader Flags	POSIX_V7_THREADS_CFLAGS POSIX_V7_THREADS_LDFLAGS

These programming environment flags may be used in conjunction with any of the type size programming environments supported by the implementation.

**EXIT STATUS**

The following exit values shall be returned:

0 Successful compilation or link edit.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

When c99 encounters a compilation error that causes an object file not to be created, it shall write a diagnostic to standard error and continue to compile other source code operands, but it shall not perform the link phase and it shall return a non-zero exit status. If the link edit is unsuccessful, a diagnostic message shall be written to standard error and c99 exits with a non-zero status. A conforming application shall rely on the exit status of c99, rather than on the existence or mode of the executable file.

## APPLICATION USAGE

Since the `c99` utility usually creates files in the current directory during the compilation process, it is typically necessary to run the `c99` utility in a directory in which a file can be created.

On systems providing POSIX Conformance (see XBD Chapter 2, on page 15), `c99` is required only with the C-Language Development option; XSI-conformant systems always provide `c99`.

Some historical implementations have created `.o` files when `-c` is not specified and more than one source file is given. Since this area is left unspecified, the application cannot rely on `.o` files being created, but it also must be prepared for any related `.o` files that already exist being deleted at the completion of the link edit.

There is the possible implication that if a user supplies versions of the standard functions (before they would be encountered by an implicit `-l c` or explicit `-l m`), that those versions would be used in place of the standard versions. There are various reasons this might not be true (functions defined as macros, manipulations for clean name space, and so on), so the existence of files named in the same manner as the standard libraries within the `-L` directories is explicitly stated to produce unspecified behavior.

All of the functions specified in the System Interfaces volume of POSIX.1-2008 may be made visible by implementations when the Standard C Library is searched. Conforming applications must explicitly request searching the other standard libraries when functions made visible by those libraries are used.

In the ISO C standard the mapping from physical source characters to the C source character set is implementation-defined. Implementations may strip white-space characters before the terminating `<newline>` of a (physical) line as part of this mapping and, as a consequence of this, one or more white-space characters (and no other characters) between a `<backslash>` character and the `<newline>` character that terminates the line produces implementation-defined results. Portable applications should not use such constructs.

Some `c99` compilers not conforming to POSIX.1-2008 do not support trigraphs by default.

## EXAMPLES

1. The following usage example compiles `foo.c` and creates the executable file `foo`:

```
c99 -o foo foo.c
```

The following usage example compiles `foo.c` and creates the object file `foo.o`:

```
c99 -c foo.c
```

The following usage example compiles `foo.c` and creates the executable file `a.out`:

```
c99 foo.c
```

The following usage example compiles `foo.c`, links it with `bar.o`, and creates the executable file `a.out`. It may also create and leave `foo.o`:

```
c99 foo.c bar.o
```

2. The following example shows how an application using threads interfaces can test for support of and use a programming environment supporting 32-bit `int`, `long`, and `pointer` types and an `off_t` type using at least 64 bits:

```
offbig_env=$(getconf _POSIX_V7_ILP32_OFFBIG)
if [ $offbig_env != "-1" ] && [ $offbig_env != "undefined" ]
then
    c99 $(getconf POSIX_V7_ILP32_OFFBIG_CFLAGS) \
```

```

82186      $(getconf POSIX_V7_THREADS_CFLAGS) -D_XOPEN_SOURCE=700 \
82187      $(getconf POSIX_V7_ILP32_OFFBIG_LDFLAGS) \
82188      $(getconf POSIX_V7_THREADS_LDFLAGS) foo.c -o foo \
82189      $(getconf POSIX_V7_ILP32_OFFBIG_LIBS) \
82190      -l pthread
82191 else
82192     echo ILP32_OFFBIG programming environment not supported
82193     exit 1
82194 fi

```

3. The following examples clarify the use and interactions of `-L` and `-l` options.

Consider the case in which module **a.c** calls function *f()* in library **libQ.a**, and module **b.c** calls function *g()* in library **libp.a**. Assume that both libraries reside in **/a/b/c**. The command line to compile and link in the desired way is:

```
c99 -L /a/b/c main.o a.c -l Q b.c -l p
```

In this case the `-L` option need only precede the first `-l` option, since both **libQ.a** and **libp.a** reside in the same directory.

Multiple `-L` options can be used when library name collisions occur. Building on the previous example, suppose that the user wants to use a new **libp.a**, in **/a/a/a**, but still wants *f()* from **/a/b/c/libQ.a**:

```
c99 -L /a/a/a -L /a/b/c main.o a.c -l Q b.c -l p
```

In this example, the linker searches the `-L` options in the order specified, and finds **/a/a/a/libp.a** before **/a/b/c/libp.a** when resolving references for **b.c**. The order of the `-l` options is still important, however.

4. The following example shows how an application can use a programming environment where the widths of the following types:

**blksize\_t, cc\_t, mode\_t, nfsd\_t, pid\_t, ptrdiff\_t, size\_t, speed\_t, ssize\_t, suseconds\_t, tflag\_t, wchar\_t, wint\_t**

are no greater than the width of type **long**:

```

82213 # First choose one of the listed environments ...
82214
82215 # ... if there are no additional constraints, the first one will do:
82216 CENV=$(getconf POSIX_V7_WIDTH_RESTRICTED_ENVS | head -n 1)
82217
82218 # ... or, if an environment that supports large files is preferred,
82219 # look for names that contain "OFF64" or "OFFBIG". (This chooses
82220 # the last one in the list if none match.)
82221 for CENV in $(getconf POSIX_V7_WIDTH_RESTRICTED_ENVS)
82222 do
82223     case $CENV in
82224         *OFF64*|*OFFBIG*) break ;;
82225     esac
82226 done
82227
82228 # The chosen environment name can now be used like this:
82229
82230 c99 $(getconf ${CENV}_CFLAGS) -D _POSIX_C_SOURCE=200809L \
82231     $(getconf ${CENV}_LDFLAGS) foo.c -o foo \
82232     $(getconf ${CENV}_LIBS)

```

## RATIONALE

The *c99* utility is based on the *c89* utility originally introduced in the ISO POSIX-2:1993 standard.

Some of the changes from *c89* include the ability to intersperse options and operands (which many *c89* implementations allowed despite it not being specified), the description of `-l` as an option instead of an operand, and the modification to the contents of the Standard Libraries section to account for new headers and options; for example, `<spawn.h>` added to the description of `-l rt`, and `-l trace` added for the Tracing option.

POSIX.1-2008 specifies that the *c99* utility must be able to use regular files for `*.o` files and for `a.out` files. Implementations are free to overwrite existing files of other types when attempting to create object files and executable files, but are not required to do so. If something other than a regular file is specified and using it fails for any reason, *c99* is required to issue a diagnostic message and exit with a non-zero exit status. But for some file types, the problem may not be noticed for a long time. For example, if a FIFO named `a.out` exists in the current directory, *c99* may attempt to open `a.out` and will hang in the `open()` call until another process opens the FIFO for reading. Then *c99* may write most of the `a.out` to the FIFO and fail when it tries to seek back close to the start of the file to insert a timestamp (FIFOs are not seekable files). The *c99* utility is also allowed to issue a diagnostic immediately if it encounters an `a.out` or `*.o` file that is not a regular file. For portable use, applications should ensure that any `a.out`, `-o` option-argument, or `*.o` files corresponding to any `*.c` files do not conflict with names already in use that are not regular files or symbolic links that point to regular files.

On many systems, multi-threaded applications run in a programming environment that is distinct from that used by single-threaded applications. This multi-threaded programming environment (in addition to needing to specify `-l pthread` at link time) may require additional flags to be set when headers are processed at compile time (`-D_REENTRANT` being common). This programming environment is orthogonal to the type size programming environments discussed above and listed in Table 4-4 (on page 2537). This version of the standard adds *getconf* utility calls to provide the C compiler flags and linker/loader flags needed to support multi-threaded applications. Note that on a system where single-threaded applications are a special case of a multi-threaded application, both of these *getconf* calls may return NULL strings; on other implementations both of these strings may be non-NULL strings.

The C standardization committee invented trigraphs (e.g., "??!" to represent ' | ') to address character portability problems in development environments based on national variants of the 7-bit ISO/IEC 646:1991 standard character set. However, these environments were already obsolete by the time the first ISO C standard was published, and in practice trigraphs have not been used for their intended purpose, and usually are intended to have their original meaning in K&R C. For example, in practice a C-language source string like "What??!" is usually intended to end in two <question-mark> characters and an <exclamation-mark>, not in ' | '.

When the `-E` option is used, execution of some `#pragma` preprocessor directives may simply result in a copy of the directive being included in the output as part of the allowed extra information used by subsequent compilation passes (see STDOUT).

## FUTURE DIRECTIONS

Unlike all of the other non-OB-shaded utilities in this standard, a utility by this name probably will not appear in the next version of this standard. This utility's name is tied to the current revision of the ISO C standard at the time this standard is approved. Since the ISO C standard and this standard are maintained by different organizations on different schedules, we cannot predict what the compiler will be named in the next version of the standard.

XSH *exec*, *sysconf*()

**CHANGE HISTORY**

First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/12 is applied, correcting the EXTENDED DESCRIPTION of **-l c** and **-l m**. Previously, the text did not take into account the presence of the *c99* math headers.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/13 is applied, changing the reference to the **libxnet** library to **libxnet.a**.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/5 is applied, updating the OPTIONS section, so that the names of files contained in the directory specified by the **-L** option are not assumed to end in the **.a** suffix. The set of library prefixes is also updated.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/6 is applied, removing the lead underscore from the `POSIX_V6_WIDTH_RESTRICTED_ENVS` variable in the EXTENDED DESCRIPTION and the EXAMPLES sections.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #020 (SD5-XCU-ERN-10) is applied, adding to the OUTPUT FILES section and also adding associated RATIONALE.

Austin Group Interpretation 1003.1-2001 #095 is applied, clarifying the **-l library** operand.

Austin Group Interpretation 1003.1-2001 #166 is applied.

Austin Group Interpretation 1003.1-2001 #190 is applied, clarifying the handling of trailing white-space characters.

Austin Group Interpretation 1003.1-2001 #191 is applied, adding APPLICATION USAGE and RATIONALE regarding C-language trigraphs.

SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not apply (options can be interspersed with operands).

SD5-XCU-ERN-11 is applied, adding the **<net/if.h>** header to the descriptions of **-l c** and **-l xnet**.

SD5-XCU-ERN-65 is applied, updating the EXAMPLES section.

SD5-XCU-ERN-67 and SD5-XCU-ERN-97 are applied, updating the SYNOPSIS.

SD5-XCU-ERN-133 is applied, updating the EXTENDED DESCRIPTION.

The *getconf* variables for the supported programming environments are updated to be V7.

The **-l trace** operand is marked obsolescent.

The *c99* reference page is rewritten to describe **-l** as an option rather than an operand.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0068 [129], XCU/TC1-2008/0069 [187], XCU/TC1-2008/0070 [187], XCU/TC1-2008/0071 [131], XCU/TC1-2008/0072 [187], and XCU/TC1-2008/0073 [364,430] are applied.

82316 **NAME**

82317 cal — print a calendar

82318 **SYNOPSIS**82319 XSI cal **[[month] year]**82320 **DESCRIPTION**

82321 The *cal* utility shall write a calendar to standard output using the Julian calendar for dates from  
 82322 January 1, 1 through September 2, 1752 and the Gregorian calendar for dates from September 14,  
 82323 1752 through December 31, 9999 as though the Gregorian calendar had been adopted on  
 82324 September 14, 1752.

82325 If no operands are given, *cal* shall produce a one-month calendar for the current month in the  
 82326 current year. If only the *year* operand is given, *cal* shall produce a calendar for all twelve months  
 82327 in the given calendar year. If both *month* and *year* operands are given, *cal* shall produce a one-  
 82328 month calendar for the given month in the given year.

82329 **OPTIONS**

82330 None.

82331 **OPERANDS**

82332 The following operands shall be supported:

82333 *month* Specify the month to be displayed, represented as a decimal integer from 1  
 82334 (January) to 12 (December).

82335 *year* Specify the year for which the calendar is displayed, represented as a decimal  
 82336 integer from 1 to 9999.

82337 **STDIN**

82338 Not used.

82339 **INPUT FILES**

82340 None.

82341 **ENVIRONMENT VARIABLES**82342 The following environment variables shall affect the execution of *cal*:

82343 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 82344 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 82345 variables used to determine the values of locale categories.)

82346 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 82347 internationalization variables.

82348 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 82349 characters (for example, single-byte as opposed to multi-byte characters in  
 82350 arguments).

82351 *LC\_MESSAGES*

82352 Determine the locale that should be used to affect the format and contents of  
 82353 diagnostic messages written to standard error, and informative messages written  
 82354 to standard output.

82355 *LC\_TIME* Determine the format and contents of the calendar.

82356 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

82357           TZ           Determine the timezone used to calculate the value of the current month.

82358 **ASYNCHRONOUS EVENTS**

82359           Default.

82360 **STDOUT**

82361           The standard output shall be used to display the calendar, in an unspecified format.

82362 **STDERR**

82363           The standard error shall be used only for diagnostic messages.

82364 **OUTPUT FILES**

82365           None.

82366 **EXTENDED DESCRIPTION**

82367           None.

82368 **EXIT STATUS**

82369           The following exit values shall be returned:

82370           0   Successful completion.

82371           >0  An error occurred.

82372 **CONSEQUENCES OF ERRORS**

82373           Default.

82374 **APPLICATION USAGE**

82375           Note that:

82376           cal 83

82377           refers to A.D. 83, not 1983.

82378 **EXAMPLES**

82379           None.

82380 **RATIONALE**

82381           Earlier versions of this standard incorrectly required that the command:

82382           cal 2000

82383           write a one-month calendar for the current calendar month (no matter what the current year is)  
82384           in the year 2000 to standard output. This did not match historic practice in any known version of  
82385           the *cal* utility. The description has been updated to match historic practice. When only the *year*  
82386           operand is given, *cal* writes a twelve-month calendar for the specified year.

82387 **FUTURE DIRECTIONS**

82388           A future version of this standard may support locale-specific recognition of the date of adoption  
82389           of the Gregorian calendar.

82390 **SEE ALSO**

82391           XBD [Chapter 8](#) (on page 173)

82392 **CHANGE HISTORY**

82393           First released in Issue 2.

82394 **Issue 6**

82395           The DESCRIPTION is updated to allow for traditional behavior for years before the adoption of  
82396           the Gregorian calendar.

82397 **Issue 7**

82398 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82399 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0074 [56] and XCU/TC1-2008/0075  
82400 [56] are applied.

82401 **NAME**

82402       cat — concatenate and print files

82403 **SYNOPSIS**82404       cat [-u] [*file*...]82405 **DESCRIPTION**82406       The *cat* utility shall read files in sequence and shall write their contents to the standard output in  
82407       the same sequence.82408 **OPTIONS**82409       The *cat* utility shall conform to XBD [Section 12.2](#) (on page 216).

82410       The following option shall be supported:

82411       -u           Write bytes from the input file to the standard output without delay as each is  
82412       read.82413 **OPERANDS**

82414       The following operand shall be supported:

82415       *file*        A pathname of an input file. If no *file* operands are specified, the standard input  
82416       shall be used. If a *file* is '-', the *cat* utility shall read from the standard input at  
82417       that point in the sequence. The *cat* utility shall not close and reopen standard input  
82418       when it is referenced in this way, but shall accept multiple occurrences of '-' as a  
82419       *file* operand.82420 **STDIN**82421       The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
82422       See the INPUT FILES section.82423 **INPUT FILES**

82424       The input files can be any file type.

82425 **ENVIRONMENT VARIABLES**82426       The following environment variables shall affect the execution of *cat*:82427       LANG        Provide a default value for the internationalization variables that are unset or null.  
82428       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
82429       variables used to determine the values of locale categories.)82430       LC\_ALL       If set to a non-empty string value, override the values of all the other  
82431       internationalization variables.82432       LC\_CTYPE     Determine the locale for the interpretation of sequences of bytes of text data as  
82433       characters (for example, single-byte as opposed to multi-byte characters in  
82434       arguments).

82435       LC\_MESSAGES

82436       Determine the locale that should be used to affect the format and contents of  
82437       diagnostic messages written to standard error.

82438 XSI       NLSPATH   Determine the location of message catalogs for the processing of LC\_MESSAGES.

82439 **ASYNCHRONOUS EVENTS**

82440       Default.

82441 **STDOUT**

82442 The standard output shall contain the sequence of bytes read from the input files. Nothing else  
 82443 shall be written to the standard output. If the standard output is a regular file, and is the same +  
 82444 file as any of the input file operands, the implementation may treat this as an error.

82445 **STDERR**

82446 The standard error shall be used only for diagnostic messages.

82447 **OUTPUT FILES**

82448 None.

82449 **EXTENDED DESCRIPTION**

82450 None.

82451 **EXIT STATUS**

82452 The following exit values shall be returned:

82453 0 All input files were output successfully.

82454 >0 An error occurred.

82455 **CONSEQUENCES OF ERRORS**

82456 Default.

82457 **APPLICATION USAGE**

82458 The **-u** option has value in prototyping non-blocking reads from FIFOs. The intent is to support  
 82459 the following sequence:

```
82460 mkfifo foo
82461 cat -u foo > /dev/ttyl3 &
82462 cat -u > foo
```

82463 It is unspecified whether standard output is or is not buffered in the default case. This is  
 82464 sometimes of interest when standard output is associated with a terminal, since buffering may  
 82465 delay the output. The presence of the **-u** option guarantees that unbuffered I/O is available. It is  
 82466 implementation-defined whether the *cat* utility buffers output if the **-u** option is not specified.  
 82467 Traditionally, the **-u** option is implemented using the equivalent of the *setvbuf()* function  
 82468 defined in the System Interfaces volume of POSIX.1-2008.

82469 **EXAMPLES**

82470 The following command:

```
82471 cat myfile
```

82472 writes the contents of the file **myfile** to standard output.

82473 The following command:

```
82474 cat doc1 doc2 > doc.all
```

82475 concatenates the files **doc1** and **doc2** and writes the result to **doc.all**.

82476 Because of the shell language mechanism used to perform output redirection, a command such  
 82477 as this:

```
82478 cat doc doc.end > doc
```

82479 causes the original data in **doc** to be lost before *cat* even begins execution. This is true whether |  
 82480 the *cat* command fails with an error or silently succeeds (the specification allows both |  
 82481 behaviors). In order to append the contents of **doc.end** without losing the original contents of |  
 82482 **doc**, this command should be used instead: |

82483 `cat doc.end >> doc`

82484 The command:

82485 `cat start - middle - end > file`

82486 when standard input is a terminal, gets two arbitrary pieces of input from the terminal with a  
82487 single invocation of *cat*. Note, however, that if standard input is a regular file, this would be  
82488 equivalent to the command:

82489 `cat start - middle /dev/null end > file`

82490 because the entire contents of the file would be consumed by *cat* the first time '-' was used as a  
82491 *file* operand and an end-of-file condition would be detected immediately when '-' was  
82492 referenced the second time.

#### 82493 RATIONALE

82494 Historical versions of the *cat* utility include the *-e*, *-t*, and *-v*, options which permit the ends of  
82495 lines, <tab> characters, and invisible characters, respectively, to be rendered visible in the  
82496 output. The standard developers omitted these options because they provide too fine a degree of  
82497 control over what is made visible, and similar output can be obtained using a command such as:

82498 `sed -n l pathname`

82499 The latter also has the advantage that its output is unambiguous, whereas the output of  
82500 historical *cat -etv* is not.

82501 The *-s* option was omitted because it corresponds to different functions in BSD and System  
82502 V-based systems. The BSD *-s* option to squeeze blank lines can be accomplished by the shell  
82503 script shown in the following example:

```
82504 sed -n '  
82505 # Write non-empty lines.  
82506 ./ {  
82507     p  
82508     d  
82509 }  
82510 # Write a single empty line, then look for more empty lines.  
82511 /^$/ p  
82512 # Get next line, discard the held <newline> (empty line),  
82513 # and look for more empty lines.  
82514 :Empty  
82515 /^$/ {  
82516     N  
82517     s/./.  
82518     b Empty  
82519 }  
82520 # Write the non-empty line before going back to search  
82521 # for the first in a set of empty lines.  
82522 p  
82523 '
```

82524 The System V *-s* option to silence error messages can be accomplished by redirecting the  
82525 standard error. Note that the BSD documentation for *cat* uses the term "blank line" to mean the  
82526 same as the POSIX "empty line": a line consisting only of a <newline>.

82527 The BSD *-n* option was omitted because similar functionality can be obtained from the *-n*  
82528 option of the *pr* utility.

82529 **FUTURE DIRECTIONS**

82530 None.

82531 **SEE ALSO**82532 *more*82533 XBD *Chapter 8* (on page 173), *Section 12.2* (on page 216)82534 XSH *setvbuf()*82535 **CHANGE HISTORY**

82536 First released in Issue 2.

82537 **Issue 7**

82538 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82539 SD5-XCU-ERN-174 is applied, changing the RATIONALE.

**NAME**

cd — change the working directory

**SYNOPSIS**

cd [-L|-P] [*directory*]

cd -

**DESCRIPTION**

The *cd* utility shall change the working directory of the current shell execution environment (see [Section 2.12](#), on page 2371) by executing the following steps in sequence. (In the following steps, the symbol **curpath** represents an intermediate value used to simplify the description of the algorithm used by *cd*. There is no requirement that **curpath** be made visible to the application.)

1. If no *directory* operand is given and the *HOME* environment variable is empty or undefined, the default behavior is implementation-defined and no further steps shall be taken.
2. If no *directory* operand is given and the *HOME* environment variable is set to a non-empty value, the *cd* utility shall behave as if the *directory* named in the *HOME* environment variable was specified as the *directory* operand.
3. If the *directory* operand begins with a <slash> character, set **curpath** to the operand and proceed to step 7.
4. If the first component of the *directory* operand is dot or dot-dot, proceed to step 6.
5. Starting with the first pathname in the <colon>-separated pathnames of *CDPATH* (see the ENVIRONMENT VARIABLES section) if the pathname is non-null, test if the concatenation of that pathname, a <slash> character if that pathname did not end with a <slash> character, and the *directory* operand names a directory. If the pathname is null, test if the concatenation of dot, a <slash> character, and the operand names a directory. In either case, if the resulting string names an existing directory, set **curpath** to that string and proceed to step 7. Otherwise, repeat this step with the next pathname in *CDPATH* until all pathnames have been tested.
6. Set **curpath** to the *directory* operand.
7. If the *-P* option is in effect, proceed to step 10. If **curpath** does not begin with a <slash> character, set **curpath** to the string formed by the concatenation of the value of *PWD*, a <slash> character if the value of *PWD* did not end with a <slash> character, and **curpath**.
8. The **curpath** value shall then be converted to canonical form as follows, considering each component from beginning to end, in sequence:
  - a. Dot components and any <slash> characters that separate them from the next component shall be deleted.
  - b. For each dot-dot component, if there is a preceding component and it is neither root nor dot-dot, then:
    - i. If the preceding component does not refer (in the context of pathname resolution with symbolic links followed) to a directory, then the *cd* utility shall display an appropriate error message and no further steps shall be taken.
    - ii. The preceding component, all <slash> characters separating the preceding component from dot-dot, dot-dot, and all <slash> characters separating dot-dot from the following component (if any) shall be deleted.

- c. An implementation may further simplify **curpath** by removing any trailing <slash> characters that are not also leading <slash> characters, replacing multiple non-leading consecutive <slash> characters with a single <slash>, and replacing three or more leading <slash> characters with a single <slash>. If, as a result of this canonicalization, the **curpath** variable is null, no further steps shall be taken.
9. If **curpath** is longer than {PATH\_MAX} bytes (including the terminating null) and the *directory* operand was not longer than {PATH\_MAX} bytes (including the terminating null), then **curpath** shall be converted from an absolute pathname to an equivalent relative pathname if possible. This conversion shall always be considered possible if the value of *PWD*, with a trailing <slash> added if it does not already have one, is an initial substring of **curpath**. Whether or not it is considered possible under other circumstances is unspecified. Implementations may also apply this conversion if **curpath** is not longer than {PATH\_MAX} bytes or the *directory* operand was longer than {PATH\_MAX} bytes.
10. The *cd* utility shall then perform actions equivalent to the *chdir()* function called with **curpath** as the *path* argument. If these actions fail for any reason, the *cd* utility shall display an appropriate error message and the remainder of this step shall not be executed. If the **-P** option is not in effect, the *PWD* environment variable shall be set to the value that **curpath** had on entry to step 9 (i.e., before conversion to a relative pathname). If the **-P** option is in effect, the *PWD* environment variable shall be set to the string that would be output by *pwd -P*. If there is insufficient permission on the new directory, or on any parent of that directory, to determine the current working directory, the value of the *PWD* environment variable is unspecified.

If, during the execution of the above steps, the *PWD* environment variable is set, the *OLDPWD* environment variable shall also be set to the value of the old working directory (that is the current working directory immediately prior to the call to *cd*).

## OPTIONS

The *cd* utility shall conform to XBD [Section 12.2](#) (on page 216).

The following options shall be supported by the implementation:

- L** Handle the operand dot-dot logically; symbolic link components shall not be resolved before dot-dot components are processed (see steps 8. and 9. in the DESCRIPTION).
- P** Handle the operand dot-dot physically; symbolic link components shall be resolved before dot-dot components are processed (see step 7. in the DESCRIPTION).

If both **-L** and **-P** options are specified, the last of these options shall be used and all others ignored. If neither **-L** nor **-P** is specified, the operand shall be handled dot-dot logically; see the DESCRIPTION.

## OPERANDS

The following operands shall be supported:

- directory* An absolute or relative pathname of the directory that shall become the new working directory. The interpretation of a relative pathname by *cd* depends on the **-L** option and the *CDPATH* and *PWD* environment variables. If *directory* is an empty string, the results are unspecified.
- When a <hyphen-minus> is used as the operand, this shall be equivalent to the command:
- ```
cd "$OLDPWD" && pwd
```

82630 which changes to the previous working directory and then writes its name.

#### 82631 **STDIN**

82632 Not used.

#### 82633 **INPUT FILES**

82634 None.

#### 82635 **ENVIRONMENT VARIABLES**

82636 The following environment variables shall affect the execution of *cd*:

82637 *CDPATH* A <colon>-separated list of pathnames that refer to directories. The *cd* utility shall  
82638 use this list in its attempt to change the directory, as described in the  
82639 DESCRIPTION. An empty string in place of a directory pathname represents the  
82640 current directory. If *CDPATH* is not set, it shall be treated as if it were an empty  
82641 string.

82642 *HOME* The name of the directory, used when no *directory* operand is specified.

82643 *LANG* Provide a default value for the internationalization variables that are unset or null.  
82644 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
82645 variables used to determine the values of locale categories.)

82646 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
82647 internationalization variables.

82648 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
82649 characters (for example, single-byte as opposed to multi-byte characters in  
82650 arguments).

82651 *LC\_MESSAGES*

82652 Determine the locale that should be used to affect the format and contents of  
82653 diagnostic messages written to standard error.

82654 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

82655 *OLDPWD* A pathname of the previous working directory, used by *cd -*.

82656 *PWD* This variable shall be set as specified in the DESCRIPTION. If an application sets  
82657 or unsets the value of *PWD*, the behavior of *cd* is unspecified.

#### 82658 **ASYNCHRONOUS EVENTS**

82659 Default.

#### 82660 **STDOUT**

82661 If a non-empty directory name from *CDPATH* is used, or if *cd -* is used, an absolute pathname of  
82662 the new working directory shall be written to the standard output as follows:

82663 "%s\n", <new directory>

82664 Otherwise, there shall be no output.

#### 82665 **STDERR**

82666 The standard error shall be used only for diagnostic messages.

#### 82667 **OUTPUT FILES**

82668 None.

82669 **EXTENDED DESCRIPTION**

82670 None.

82671 **EXIT STATUS**

82672 The following exit values shall be returned:

82673 0 The directory was successfully changed.

82674 &gt;0 An error occurred.

82675 **CONSEQUENCES OF ERRORS**

82676 The working directory shall remain unchanged.

82677 **APPLICATION USAGE**82678 Since *cd* affects the current shell execution environment, it is always provided as a shell regular  
82679 built-in. If it is called in a subshell or separate utility execution environment, such as one of the  
82680 following:82681 (cd /tmp)  
82682 nohup cd  
82683 find . -exec cd {} \;

82684 it does not affect the working directory of the caller's environment.

82685 The user must have execute (search) permission in *directory* in order to change to it.82686 **EXAMPLES**82687 The following template can be used to perform processing in the directory specified by *location*  
82688 and end up in the current working directory in use before the first *cd* command was issued:82689 cd *location*  
82690 if [ \$? -ne 0 ]  
82691 then  
82692 print error message  
82693 exit 1  
82694 fi  
82695 ... do whatever is desired as long as the OLDPWD environment variable  
82696 is not modified  
82697 cd -82698 **RATIONALE**82699 The use of the *CDPATH* was introduced in the System V shell. Its use is analogous to the use of  
82700 the *PATH* variable in the shell. The BSD C shell used a shell parameter *cdpath* for this purpose.82701 A common extension when *HOME* is undefined is to get the login directory from the user  
82702 database for the invoking user. This does not occur on System V implementations.82703 Some historical shells, such as the KornShell, took special actions when the directory name  
82704 contained a dot-dot component, selecting the logical parent of the directory, rather than the  
82705 actual parent directory; that is, it moved up one level toward the '/' in the pathname,  
82706 remembering what the user typed, rather than performing the equivalent of:

82707 chdir("../");

82708 In such a shell, the following commands would not necessarily produce equivalent output for all  
82709 directories:

82710 cd .. &amp;&amp; ls ls ..

82711 This behavior is now the default. It is not consistent with the definition of dot-dot in most

82712 historical practice; that is, while this behavior has been optionally available in the KornShell,  
82713 other shells have historically not supported this functionality. The logical pathname is stored in  
82714 the *PWD* environment variable when the *cd* utility completes and this value is used to construct  
82715 the next directory name if *cd* is invoked with the *-L* option.

#### 82716 FUTURE DIRECTIONS

82717 None.

#### 82718 SEE ALSO

82719 [Section 2.12](#) (on page 2371), *pwd*

82720 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

82721 XSH *chdir()*

#### 82722 CHANGE HISTORY

82723 First released in Issue 2.

#### 82724 Issue 6

82725 The following new requirements on POSIX implementations derive from alignment with the  
82726 Single UNIX Specification:

- 82727 • The *cd* *-* operand, *PWD*, and *OLDPWD* are added.

82728 The *-L* and *-P* options are added to align with the IEEE P1003.2b draft standard. This also  
82729 includes the introduction of a new description to include the effect of these options.

82730 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/14 is applied, changing the SYNOPSIS to  
82731 make it clear that the *-L* and *-P* options are mutually-exclusive.

#### 82732 Issue 7

82733 Austin Group Interpretation 1003.1-2001 #037 is applied.

82734 Austin Group Interpretation 1003.1-2001 #199 is applied, clarifying how the *cd* utility handles  
82735 concatenation of two pathnames when the first pathname ends in a <slash> character.

82736 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82737 Step 7 of the processing performed by *cd* is revised to refer to **curpath** instead of “the operand”.

82738 Changes to the *pwd* utility and *PWD* environment variable have been made to match the  
82739 changes to the *getcwd()* function made for Austin Group Interpretation 1003.1-2001 #140.

82740 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0076 [230], XCU/TC1-2008/0077  
82741 [240], XCU/TC1-2008/0078 [240], and XCU/TC1-2008/0079 [123] are applied.

82742 **NAME**

82743 cflow — generate a C-language flowgraph (DEVELOPMENT)

82744 **SYNOPSIS**

```
82745 XSI cflow [-r] [-d num] [-D name[=def]]... [-i incl] [-I dir]...
82746 [-U dir]... file...
```

82747 **DESCRIPTION**

82748 The *cflow* utility shall analyze a collection of object files or assembler, C-language, *lex*, or *yacc*  
 82749 source files, and attempt to build a graph, written to standard output, charting the external  
 82750 references.

82751 **OPTIONS**

82752 The *cflow* utility shall conform to XBD [Section 12.2](#) (on page 216), except that the order of the **-D**,  
 82753 **-I**, and **-U** options (which are identical to their interpretation by *c99*) is significant.

82754 The following options shall be supported:

- 82755 **-d num** Indicate the depth at which the flowgraph is cut off. The application shall ensure  
 82756 that the argument *num* is a decimal integer. By default this is a very large number  
 82757 (typically greater than 32 000). Attempts to set the cut-off depth to a non-positive  
 82758 integer shall be ignored.
- 82759 **-i incl** Increase the number of included symbols. The *incl* option-argument is one of the  
 82760 following characters:
- 82761 *x* Include external and static data symbols. The default shall be to include only  
 82762 functions in the flowgraph.
- 82763 *\_* (Underscore) Include names that begin with an <underscore>. The default  
 82764 shall be to exclude these functions (and data if **-i x** is used).
- 82765 **-r** Reverse the caller: callee relationship, producing an inverted listing showing the  
 82766 callers of each function. The listing shall also be sorted in lexicographical order by  
 82767 callee.

82768 **OPERANDS**

82769 The following operand is supported:

- 82770 *file* The pathname of a file for which a graph is to be generated. Filenames suffixed by  
 82771 **.l** shall be taken to be *lex* input, **.y** as *yacc* input, **.c** as *c99* input, and **.i** as the  
 82772 output of *c99* **-E**. Such files shall be processed as appropriate, determined by their  
 82773 suffix.
- 82774 Files suffixed by **.s** (conventionally assembler source) may have more limited  
 82775 information extracted from them.

82776 **STDIN**

82777 Not used.

82778 **INPUT FILES**

82779 The input files shall be object files or assembler, C-language, *lex*, or *yacc* source files.

82780 **ENVIRONMENT VARIABLES**

82781 The following environment variables shall affect the execution of *cflow*:

- 82782 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 82783 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 82784 variables used to determine the values of locale categories.)

82785 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
82786 internationalization variables.

82787 *LC\_COLLATE*  
82788 Determine the locale for the ordering of the output when the *-r* option is used.

82789 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
82790 characters (for example, single-byte as opposed to multi-byte characters in  
82791 arguments and input files).

82792 *LC\_MESSAGES*  
82793 Determine the locale that should be used to affect the format and contents of  
82794 diagnostic messages written to standard error.

82795 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 82796 **ASYNCHRONOUS EVENTS**

82797 Default.

## 82798 **STDOUT**

82799 The flowgraph written to standard output shall be formatted as follows:

82800 "%d %s:%s\n", <reference number>, <global>, <definition>

82801 Each line of output begins with a reference (that is, line) number, followed by indentation of at  
82802 least one column position per level. This is followed by the name of the global, a <colon>, and  
82803 its definition. Normally globals are only functions not defined as an external or beginning with  
82804 an <underscore>; see the *OPTIONS* section for the *-i* inclusion option. For information extracted  
82805 from C-language source, the definition consists of an abstract type declaration (for example, **char**  
82806 \*) and, delimited by angle brackets, the name of the source file and the line number where the  
82807 definition was found. Definitions extracted from object files indicate the filename and location  
82808 counter under which the symbol appeared (for example, *text*).

82809 Once a definition of a name has been written, subsequent references to that name contain only  
82810 the reference number of the line where the definition can be found. For undefined references,  
82811 only "< >" shall be written.

## 82812 **STDERR**

82813 The standard error shall be used only for diagnostic messages.

## 82814 **OUTPUT FILES**

82815 None.

## 82816 **EXTENDED DESCRIPTION**

82817 None.

## 82818 **EXIT STATUS**

82819 The following exit values shall be returned:

82820 0 Successful completion.

82821 >0 An error occurred.

## 82822 **CONSEQUENCES OF ERRORS**

82823 Default.

**APPLICATION USAGE**

Files produced by *lex* and *yacc* cause the reordering of line number declarations, and this can confuse *cflow*. To obtain proper results, the input of *yacc* or *lex* must be directed to *cflow*.

**EXAMPLES**

Given the following in **file.c**:

```
int i;
int f();
int g();
int h();
int
main()
{
    f();
    g();
    f();
}
int
f()
{
    i = h();
}
```

The command:

```
cflow -i x file.c
```

produces the output:

```
1 main: int(), <file.c 6>
2   f: int(), <file.c 13>
3     h: <>
4     i: int, <file.c 1>
5   g: <>
```

XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

**CHANGE HISTORY**

First released in Issue 2.

**Issue 6**

The normative text is reworded to avoid use of the term “must” for application requirements.

**Issue 7**

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**NAME**

`chgrp` — change the file group ownership

**SYNOPSIS**

`chgrp [-h] group file...`

`chgrp -R [-H|-L|-P] group file...`

**DESCRIPTION**

The `chgrp` utility shall set the group ID of the file named by each *file* operand to the group ID specified by the *group* operand.

For each *file* operand, or, if the `-R` option is used, each file encountered while walking the directory trees specified by the *file* operands, the `chgrp` utility shall perform actions equivalent to the `chown()` function defined in the System Interfaces volume of POSIX.1-2008, called with the following arguments:

- The *file* operand shall be used as the *path* argument.
- The user ID of the file shall be used as the *owner* argument.
- The specified group ID shall be used as the *group* argument.

Unless `chgrp` is invoked by a process with appropriate privileges, the set-user-ID and set-group-ID bits of a regular file shall be cleared upon successful completion; the set-user-ID and set-group-ID bits of other file types may be cleared.

**OPTIONS**

The `chgrp` utility shall conform to XBD [Section 12.2](#) (on page 216).

The following options shall be supported by the implementation:

- h** For each *file* operand that names a file of type symbolic link, `chgrp` shall attempt to set the group ID of the symbolic link instead of the file referenced by the symbolic link.
- H** If the `-R` option is specified and a symbolic link referencing a file of type directory is specified on the command line, `chgrp` shall change the group of the directory referenced by the symbolic link and all files in the file hierarchy below it.
- L** If the `-R` option is specified and a symbolic link referencing a file of type directory is specified on the command line or encountered during the traversal of a file hierarchy, `chgrp` shall change the group of the directory referenced by the symbolic link and all files in the file hierarchy below it.
- P** If the `-R` option is specified and a symbolic link is specified on the command line or encountered during the traversal of a file hierarchy, `chgrp` shall change the group ID of the symbolic link. The `chgrp` utility shall not follow the symbolic link to any other part of the file hierarchy.
- R** Recursively change file group IDs. For each *file* operand that names a directory, `chgrp` shall change the group of the directory and all files in the file hierarchy below it. Unless a `-H`, `-L`, or `-P` option is specified, it is unspecified which of these options will be used as the default.

Specifying more than one of the mutually-exclusive options `-H`, `-L`, and `-P` shall not be considered an error. The last option specified shall determine the behavior of the utility.

**82907 OPERANDS**

82908 The following operands shall be supported:

82909 *group* A group name from the group database or a numeric group ID. Either specifies a  
 82910 group ID to be given to each file named by one of the *file* operands. If a numeric  
 82911 *group* operand exists in the group database as a group name, the group ID number  
 82912 associated with that group name is used as the group ID.

82913 *file* A pathname of a file whose group ID is to be modified.

**82914 STDIN**

82915 Not used.

**82916 INPUT FILES**

82917 None.

**82918 ENVIRONMENT VARIABLES**

82919 The following environment variables shall affect the execution of *chgrp*:

82920 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 82921 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 82922 variables used to determine the values of locale categories.)

82923 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 82924 internationalization variables.

82925 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 82926 characters (for example, single-byte as opposed to multi-byte characters in  
 82927 arguments).

82928 *LC\_MESSAGES*

82929 Determine the locale that should be used to affect the format and contents of  
 82930 diagnostic messages written to standard error.

82931 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**82932 ASYNCHRONOUS EVENTS**

82933 Default.

**82934 STDOUT**

82935 Not used.

**82936 STDERR**

82937 The standard error shall be used only for diagnostic messages.

**82938 OUTPUT FILES**

82939 None.

**82940 EXTENDED DESCRIPTION**

82941 None.

**82942 EXIT STATUS**

82943 The following exit values shall be returned:

82944 0 The utility executed successfully and all requested changes were made.

82945 >0 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

Only the owner of a file or the user with appropriate privileges may change the owner or group of a file.

Some implementations restrict the use of *chgrp* to a user with appropriate privileges when the *group* specified is not the effective group ID or one of the supplementary group IDs of the calling process.

**EXAMPLES**

None.

**RATIONALE**

The System V and BSD versions use different exit status codes. Some implementations used the exit status as a count of the number of errors that occurred; this practice is unworkable since it can overflow the range of valid exit status values. The standard developers chose to mask these by specifying only 0 and >0 as exit values.

The functionality of *chgrp* is described substantially through references to *chown()*. In this way, there is no duplication of effort required for describing the interactions of permissions, multiple groups, and so on.

**FUTURE DIRECTIONS**

None.

XSH *chown()*

**CHANGE HISTORY**

First released in Issue 2.

**Issue 6**

New options **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These options affect the processing of symbolic links.

IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS section to "Default."

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/15 is applied, changing the SYNOPSIS to make it clear that **-h** and **-R** are optional.

**Issue 7**

SD5-XCU-ERN-8 is applied, removing the **-R** from the first line of the SYNOPSIS.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0080 [237,341] is applied.

82983 **NAME**

82984       chmod — change the file modes

82985 **SYNOPSIS**82986       chmod [-R] *mode file...*82987 **DESCRIPTION**82988       The *chmod* utility shall change any or all of the file mode bits of the file named by each *file*  
82989       operand in the way specified by the *mode* operand.82990       It is implementation-defined whether and how the *chmod* utility affects any alternate or  
82991       additional file access control mechanism (see XBD [Section 4.5](#), on page 108) being used for the  
82992       specified file.82993       Only a process whose effective user ID matches the user ID of the file, or a process with  
82994       appropriate privileges, shall be permitted to change the file mode bits of a file.82995       Upon successfully changing the file mode bits of a file, the *chmod* utility shall mark for update  
82996       the last file status change timestamp of the file.82997 **OPTIONS**82998       The *chmod* utility shall conform to XBD [Section 12.2](#) (on page 216).

82999       The following option shall be supported:

83000       **-R**       Recursively change file mode bits. For each *file* operand that names a directory,  
83001       *chmod* shall change the file mode bits of the directory and all files in the file  
83002       hierarchy below it.83003 **OPERANDS**

83004       The following operands shall be supported:

83005       *mode*       Represents the change to be made to the file mode bits of each file named by one of  
83006       the *file* operands; see the EXTENDED DESCRIPTION section.83007       *file*       A pathname of a file whose file mode bits shall be modified.83008 **STDIN**

83009       Not used.

83010 **INPUT FILES**

83011       None.

83012 **ENVIRONMENT VARIABLES**83013       The following environment variables shall affect the execution of *chmod*:83014       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
83015       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
83016       variables used to determine the values of locale categories.)83017       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
83018       internationalization variables.83019       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
83020       characters (for example, single-byte as opposed to multi-byte characters in  
83021       arguments).83022       **LC\_MESSAGES**83023       Determine the locale that should be used to affect the format and contents of  
83024       diagnostic messages written to standard error.

| 83034 | <b>EXTENDED DESCRIPTION</b> |                |                                                                                                                                                        |
| 83035 |                             |                | The <i>mode</i> operand shall be either a <i>symbolic_mode</i> expression or a non-negative octal integer. The                                         |
| 83036 |                             |                | <i>symbolic_mode</i> form is described by the grammar later in this section.                                                                           |
| 83037 |                             |                | Each <b>clause</b> shall specify an operation to be performed on the current file mode bits of each <i>file</i> .                                      |
| 83038 |                             |                | The operations shall be performed on each <i>file</i> in the order in which the <b>clauses</b> are specified.                                          |
| 83039 |                             |                | The <b>who</b> symbols <b>u</b> , <b>g</b> , and <b>o</b> shall specify the <i>user</i> , <i>group</i> , and <i>other</i> parts of the file mode bits, |
| 83040 |                             |                | respectively. A <b>who</b> consisting of the symbol <b>a</b> shall be equivalent to <b>ugo</b> .                                                       |
| 83041 |                             |                | The <b>perm</b> symbols <b>r</b> , <b>w</b> , and <b>x</b> represent the <i>read</i> , <i>write</i> , and <i>execute/search</i> portions of file mode  |
| 83042 |                             |                | bits, respectively. The <b>perm</b> symbol <b>s</b> shall represent the <i>set-user-ID-on-execution</i> (when <b>who</b>                               |
| 83043 |                             |                | contains or implies <b>u</b> ) and <i>set-group-ID-on-execution</i> (when <b>who</b> contains or implies <b>g</b> ) bits.                              |
| 83044 |                             |                | The <b>perm</b> symbol <b>X</b> shall represent the execute/search portion of the file mode bits if the file is a                                      |
| 83045 |                             |                | directory or if the current (unmodified) file mode bits have at least one of the execute bits                                                          |
| 83046 |                             |                | ( <i>S_IXUSR</i> , <i>S_IXGRP</i> , or <i>S_IXOTH</i> ) set. It shall be ignored if the file is not a directory and none of                            |
| 83047 |                             |                | the execute bits are set in the current file mode bits.                                                                                                |
| 83048 |                             |                | The <b>permcop</b> symbols <b>u</b> , <b>g</b> , and <b>o</b> shall represent the current permissions associated with the                              |
| 83049 |                             |                | user, group, and other parts of the file mode bits, respectively. For the remainder of this section,                                                   |
| 83050 |                             |                | <b>perm</b> refers to the non-terminals <b>perm</b> and <b>permcop</b> in the grammar.                                                                 |
| 83051 |                             |                | If multiple <b>actionlists</b> are grouped with a single <b>wholist</b> in the grammar, each <b>actionlist</b> shall be                                |
| 83052 |                             |                | applied in the order specified with that <b>wholist</b> . The <i>op</i> symbols shall represent the operation                                          |
| 83053 |                             |                | performed, as follows:                                                                                                                                 |
| 83054 |                             | +              | If <b>perm</b> is not specified, the '+' operation shall not change the file mode bits.                                                                |
| 83055 |                             |                | If <b>who</b> is not specified, the file mode bits represented by <b>perm</b> for the owner, group, and                                                |
| 83056 |                             |                | other permissions, except for those with corresponding bits in the file mode creation mask                                                             |
| 83057 |                             |                | of the invoking process, shall be set.                                                                                                                 |
| 83058 |                             |                | Otherwise, the file mode bits represented by the specified <b>who</b> and <b>perm</b> values shall be set.                                             |
| 83059 |                             | –              | If <b>perm</b> is not specified, the '–' operation shall not change the file mode bits.                                                                |
| 83060 |                             |                | If <b>who</b> is not specified, the file mode bits represented by <b>perm</b> for the owner, group, and                                                |
| 83061 |                             |                | other permissions, except for those with corresponding bits in the file mode creation mask                                                             |
| 83062 |                             |                | of the invoking process, shall be cleared.                                                                                                             |
| 83063 |                             |                | Otherwise, the file mode bits represented by the specified <b>who</b> and <b>perm</b> values shall be                                                  |
| 83064 |                             |                | cleared.                                                                                                                                               |
| 83065 |                             | =              | Clear the file mode bits specified by the <b>who</b> value, or, if no <b>who</b> value is specified, all of the                                        |
| 83066 |                             |                | file mode bits specified in this volume of POSIX.1-2008.                                                                                               |

If **perm** is not specified, the '=' operation shall make no further modifications to the file mode bits.

If **who** is not specified, the file mode bits represented by **perm** for the owner, group, and other permissions, except for those with corresponding bits in the file mode creation mask of the invoking process, shall be set.

Otherwise, the file mode bits represented by the specified **who** and **perm** values shall be set.

When using the symbolic mode form on a regular file, it is implementation-defined whether or not:

- Requests to set the set-user-ID-on-execution or set-group-ID-on-execution bit when all execute bits are currently clear and none are being set are ignored.
- Requests to clear all execute bits also clear the set-user-ID-on-execution and set-group-ID-on-execution bits.
- Requests to clear the set-user-ID-on-execution or set-group-ID-on-execution bits when all execute bits are currently clear are ignored. However, if the command *ls -l file* writes an *s* in the position indicating that the set-user-ID-on-execution or set-group-ID-on-execution is set, the commands *chmod u-s file* or *chmod g-s file*, respectively, shall not be ignored.

When using the symbolic mode form on other file types, it is implementation-defined whether or not requests to set or clear the set-user-ID-on-execution or set-group-ID-on-execution bits are honored.

If the **who** symbol **o** is used in conjunction with the **perm** symbol **s** with no other **who** symbols being specified, the set-user-ID-on-execution and set-group-ID-on-execution bits shall not be modified. It shall not be an error to specify the **who** symbol **o** in conjunction with the **perm** symbol **s**.

The **perm** symbol **t** shall specify the S\_ISVTX bit. When used with a file of type directory, it can be used with the **who** symbol **a**, or with no **who** symbol. It shall not be an error to specify a **who** symbol of **u**, **g**, or **o** in conjunction with the **perm** symbol **t**, but the meaning of these combinations is unspecified. The effect when using the **perm** symbol **t** with any file type other than directory is unspecified.

For an octal integer *mode* operand, the file mode bits shall be set absolutely.

For each bit set in the octal number, the corresponding file permission bit shown in the following table shall be set; all other file permission bits shall be cleared. For regular files, for each bit set in the octal number corresponding to the set-user-ID-on-execution or the set-group-ID-on-execution, bits shown in the following table shall be set; if these bits are not set in the octal number, they are cleared. For other file types, it is implementation-defined whether or not requests to set or clear the set-user-ID-on-execution or set-group-ID-on-execution bits are honored.

| Octal | Mode Bit | Octal | Mode Bit | Octal | Mode Bit | Octal | Mode Bit |
|-------|----------|-------|----------|-------|----------|-------|----------|
| 4000  | S_ISUID  | 0400  | S_IRUSR  | 0040  | S_IRGRP  | 0004  | S_IROTH  |
| 2000  | S_ISGID  | 0200  | S_IWUSR  | 0020  | S_IWGRP  | 0002  | S_IWOTH  |
| 1000  | S_ISVTX  | 0100  | S_IXUSR  | 0010  | S_IXGRP  | 0001  | S_IXOTH  |

When bits are set in the octal number other than those listed in the table above, the behavior is unspecified.

**Grammar for chmod**

The grammar and lexical conventions in this section describe the syntax for the *symbolic\_mode* operand. The general conventions for this style of grammar are described in [Section 1.3](#) (on page 2325). A valid *symbolic\_mode* can be represented as the non-terminal symbol *symbolic\_mode* in the grammar. This formal syntax shall take precedence over the preceding text syntax description.

The lexical processing is based entirely on single characters. Implementations need not allow <blank> characters within the single argument being processed.

```
%start      symbolic_mode
%%

symbolic_mode      : clause
                    | symbolic_mode ',' clause
                    ;

clause              : actionlist
                    | wholist actionlist
                    ;

wholist              : who
                    | wholist who
                    ;

who                  : 'u' | 'g' | 'o' | 'a'
                    ;

actionlist           : action
                    | actionlist action
                    ;

action               : op
                    | op permlist
                    | op permcopy
                    ;

permcopy             : 'u' | 'g' | 'o'
                    ;

op                   : '+' | '-' | '='
                    ;

permlist             : perm
                    | perm permlist
                    ;

XSI perm             : 'r' | 'w' | 'x' | 'X' | 's' | 't'
                    ;
```

**EXIT STATUS**

The following exit values shall be returned:

- 0 The utility executed successfully and all requested changes were made.
- >0 An error occurred.

## CONSEQUENCES OF ERRORS

Default.

## APPLICATION USAGE

Some implementations of the *chmod* utility change the mode of a directory before the files in the directory when performing a recursive (**-R** option) change; others change the directory mode after the files in the directory. If an application tries to remove read or search permission for a file hierarchy, the removal attempt fails if the directory is changed first; on the other hand, trying to re-enable permissions to a restricted hierarchy fails if directories are changed last. Users should not try to make a hierarchy inaccessible to themselves.

Some implementations of *chmod* never used the *umask* of the process when changing modes; systems conformant with this volume of POSIX.1-2008 do so when **who** is not specified. Note the difference between:

```
chmod a-w file
```

which removes all write permissions, and:

```
chmod -- -w file
```

which removes write permissions that would be allowed if **file** was created with the same *umask*.

Conforming applications should never assume that they know how the set-user-ID and set-group-ID bits on directories are interpreted.

## EXAMPLES

| Mode         | Results                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------|
| <i>a+=</i>   | Equivalent to <i>a+,a=</i> ; clears all file mode bits.                                            |
| <i>go+-w</i> | Equivalent to <i>go+,go-w</i> ; clears group and other write bits.                                 |
| <i>g=o-w</i> | Equivalent to <i>g=o,g-w</i> ; sets group bit to match other bits and then clears group write bit. |
| <i>g-r+w</i> | Equivalent to <i>g-r,g+w</i> ; clears group read bit and sets group write bit.                     |
| <i>uo=g</i>  | Sets owner bits to match group bits and sets other bits to match group bits.                       |

## RATIONALE

The functionality of *chmod* is described substantially through references to concepts defined in the System Interfaces volume of POSIX.1-2008. In this way, there is less duplication of effort required for describing the interactions of permissions. However, the behavior of this utility is not described in terms of the *chmod()* function from the System Interfaces volume of POSIX.1-2008 because that specification requires certain side-effects upon alternate file access control mechanisms that might not be appropriate, depending on the implementation.

Implementations that support mandatory file and record locking as specified by the 1984 /usr/group standard historically used the combination of set-group-ID bit set and group execute bit clear to indicate mandatory locking. This condition is usually set or cleared with the symbolic mode **perm** symbol **l** instead of the **perm** symbols **s** and **x** so that the mandatory locking mode is not changed without explicit indication that that was what the user intended. Therefore, the details on how the implementation treats these conditions must be defined in the documentation. This volume of POSIX.1-2008 does not require mandatory locking (nor does the System Interfaces volume of POSIX.1-2008), but does allow it as an extension. However, this volume of POSIX.1-2008 does require that the *ls* and *chmod* utilities work consistently in this

area. If *ls -l file* indicates that the set-group-ID bit is set, *chmod g-s file* must clear it (assuming appropriate privileges exist to change modes).

The System V and BSD versions use different exit status codes. Some implementations used the exit status as a count of the number of errors that occurred; this practice is unworkable since it can overflow the range of valid exit status values. This problem is avoided here by specifying only 0 and >0 as exit values.

The System Interfaces volume of POSIX.1-2008 indicates that implementation-defined restrictions may cause the S\_ISUID and S\_ISGID bits to be ignored. This volume of POSIX.1-2008 allows the *chmod* utility to choose to modify these bits before calling *chmod()* (or some function providing equivalent capabilities) for non-regular files. Among other things, this allows implementations that use the set-user-ID and set-group-ID bits on directories to enable extended features to handle these extensions in an intelligent manner.

The **X perm** symbol was adopted from BSD-based systems because it provides commonly desired functionality when doing recursive (**-R** option) modifications. Similar functionality is not provided by the *find* utility. Historical BSD versions of *chmod*, however, only supported **X** with *op+*; it has been extended in this volume of POSIX.1-2008 because it is also useful with *op=*. (It has also been added for *op-* even though it duplicates **x**, in this case, because it is intuitive and easier to explain.)

The grammar was extended with the *permcopy* non-terminal to allow historical-practice forms of symbolic modes like **o=u -g** (that is, set the “other” permissions to the permissions of “owner” minus the permissions of “group”).

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 2.

## Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- Octal modes have been kept and made mandatory despite being marked obsolescent in the ISO POSIX-2: 1993 standard.

IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS section to “Default.”.

The Open Group Base Resolution bwg2001-010 is applied, adding the description of the S\_ISVTX bit and the **t perm** symbol as part of the XSI option.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/16 is applied, changing the XSI shaded text in the EXTENDED DESCRIPTION from:

“The **perm** symbol **t** shall specify the S\_ISVTX bit and shall apply to directories only. The effect when using it with any other file type is unspecified. It can be used with the **who** symbols **o**, **a**, or with no **who** symbol. It shall not be an error to specify a **who** symbol of **u** or **g** in conjunction with the **perm** symbol **t**; it shall be ignored for **u** and **g**.”

83240 to:

83241 “The **perm** symbol **t** shall specify the S\_ISVTX bit. When used with a file of type directory,  
83242 it can be used with the **who** symbol **a**, or with no **who** symbol. It shall not be an error to  
83243 specify a **who** symbol of **u**, **g**, or **o** in conjunction with the **perm** symbol **t**, but the meaning  
83244 of these combinations is unspecified. The effect when using the **perm** symbol **t** with any  
83245 file type other than directory is unspecified.”

83246 This change is to permit historical behavior.

83247 **Issue 7**

83248 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

83249 Austin Group Interpretation 1003.1-2001 #130 is applied, adding text to the DESCRIPTION  
83250 about about marking for update the last file status change timestamp of the file.

**NAME**

chown — change the file ownership

**SYNOPSIS**

chown [-h] owner[:group] file...

chown -R [-H|-L|-P] owner[:group] file...

**DESCRIPTION**

The *chown* utility shall set the user ID of the file named by each *file* operand to the user ID specified by the *owner* operand.

For each *file* operand, or, if the **-R** option is used, each file encountered while walking the directory trees specified by the *file* operands, the *chown* utility shall perform actions equivalent to the *chown()* function defined in the System Interfaces volume of POSIX.1-2008, called with the following arguments:

1. The *file* operand shall be used as the *path* argument.
2. The user ID indicated by the *owner* portion of the first operand shall be used as the *owner* argument.
3. If the *group* portion of the first operand is given, the group ID indicated by it shall be used as the *group* argument; otherwise, the group ownership shall not be changed.

Unless *chown* is invoked by a process with appropriate privileges, the set-user-ID and set-group-ID bits of a regular file shall be cleared upon successful completion; the set-user-ID and set-group-ID bits of other file types may be cleared.

**OPTIONS**

The *chown* utility shall conform to XBD [Section 12.2](#) (on page 216).

The following options shall be supported by the implementation:

- h** For each file operand that names a file of type symbolic link, *chown* shall attempt to set the user ID of the symbolic link. If a group ID was specified, for each file operand that names a file of type symbolic link, *chown* shall attempt to set the group ID of the symbolic link.
- H** If the **-R** option is specified and a symbolic link referencing a file of type directory is specified on the command line, *chown* shall change the user ID (and group ID, if specified) of the directory referenced by the symbolic link and all files in the file hierarchy below it.
- L** If the **-R** option is specified and a symbolic link referencing a file of type directory is specified on the command line or encountered during the traversal of a file hierarchy, *chown* shall change the user ID (and group ID, if specified) of the directory referenced by the symbolic link and all files in the file hierarchy below it.
- P** If the **-R** option is specified and a symbolic link is specified on the command line or encountered during the traversal of a file hierarchy, *chown* shall change the owner ID (and group ID, if specified) of the symbolic link. The *chown* utility shall not follow the symbolic link to any other part of the file hierarchy.
- R** Recursively change file user and group IDs. For each *file* operand that names a directory, *chown* shall change the user ID (and group ID, if specified) of the directory and all files in the file hierarchy below it. Unless a **-H**, **-L**, or **-P** option is specified, it is unspecified which of these options will be used as the default.

Specifying more than one of the mutually-exclusive options **-H**, **-L**, and **-P** shall not be

83295 considered an error. The last option specified shall determine the behavior of the utility.

#### 83296 OPERANDS

83297 The following operands shall be supported:

83298 *owner[:group]* A user ID and optional group ID to be assigned to *file*. The *owner* portion of this  
 83299 operand shall be a user name from the user database or a numeric user ID. Either  
 83300 specifies a user ID which shall be given to each file named by one of the *file*  
 83301 operands. If a numeric *owner* operand exists in the user database as a user name,  
 83302 the user ID number associated with that user name shall be used as the user ID.  
 83303 Similarly, if the *group* portion of this operand is present, it shall be a group name  
 83304 from the group database or a numeric group ID. Either specifies a group ID which  
 83305 shall be given to each file. If a numeric group operand exists in the group database  
 83306 as a group name, the group ID number associated with that group name shall be  
 83307 used as the group ID.

83308 *file* A pathname of a file whose user ID is to be modified.

#### 83309 STDIN

83310 Not used.

#### 83311 INPUT FILES

83312 None.

#### 83313 ENVIRONMENT VARIABLES

83314 The following environment variables shall affect the execution of *chown*:

83315 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 83316 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 83317 variables used to determine the values of locale categories.)

83318 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 83319 internationalization variables.

83320 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 83321 characters (for example, single-byte as opposed to multi-byte characters in  
 83322 arguments).

83323 *LC\_MESSAGES*

83324 Determine the locale that should be used to affect the format and contents of  
 83325 diagnostic messages written to standard error.

83326 *XSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 83327 ASYNCHRONOUS EVENTS

83328 Default.

#### 83329 STDOUT

83330 Not used.

#### 83331 STDERR

83332 The standard error shall be used only for diagnostic messages.

#### 83333 OUTPUT FILES

83334 None.

83335 **EXTENDED DESCRIPTION**

83336 None.

83337 **EXIT STATUS**

83338 The following exit values shall be returned:

83339 0 The utility executed successfully and all requested changes were made.

83340 &gt;0 An error occurred.

83341 **CONSEQUENCES OF ERRORS**

83342 Default.

83343 **APPLICATION USAGE**83344 Only the owner of a file or the user with appropriate privileges may change the owner or group  
83345 of a file.83346 Some implementations restrict the use of *chown* to a user with appropriate privileges.83347 **EXAMPLES**

83348 None.

83349 **RATIONALE**83350 The System V and BSD versions use different exit status codes. Some implementations used the  
83351 exit status as a count of the number of errors that occurred; this practice is unworkable since it  
83352 can overflow the range of valid exit status values. These are masked by specifying only 0 and >0  
83353 as exit values.83354 The functionality of *chown* is described substantially through references to functions in the  
83355 System Interfaces volume of POSIX.1-2008. In this way, there is no duplication of effort required  
83356 for describing the interactions of permissions, multiple groups, and so on.83357 The 4.3 BSD method of specifying both owner and group was included in this volume of  
83358 POSIX.1-2008 because:

- 83359 • There are cases where the desired end condition could not be achieved using the *chgrp* and  
83360 *chown* (that only changed the user ID) utilities. (If the current owner is not a member of the  
83361 desired group and the desired owner is not a member of the current group, the *chown()*  
83362 function could fail unless both owner and group are changed at the same time.)
- 83363 • Even if they could be changed independently, in cases where both are being changed, there  
83364 is a 100% performance penalty caused by being forced to invoke both utilities.

83365 The BSD syntax *user[.group]* was changed to *user[:group]* in this volume of POSIX.1-2008 because  
83366 the <period> is a valid character in login names (as specified by the Base Definitions volume of  
83367 POSIX.1-2008, login names consist of characters in the portable filename character set). The  
83368 <colon> character was chosen as the replacement for the <period> character because it would  
83369 never be allowed as a character in a user name or group name on historical implementations.83370 The **-R** option is considered by some observers as an undesirable departure from the historical  
83371 UNIX system tools approach; since a tool, *find*, already exists to recurse over directories, there  
83372 seemed to be no good reason to require other tools to have to duplicate that functionality.  
83373 However, the **-R** option was deemed an important user convenience, is far more efficient than  
83374 forking a separate process for each element of the directory hierarchy, and is in widespread  
83375 historical use.

83376 **FUTURE DIRECTIONS**

83377 None.

83378 **SEE ALSO**83379 *chgrp, chmod*83380 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)83381 XSH *chown()*83382 **CHANGE HISTORY**

83383 First released in Issue 2.

83384 **Issue 6**83385 New options **-h**, **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These  
83386 options affect the processing of symbolic links.

83387 The normative text is reworded to avoid use of the term “must” for application requirements.

83388 IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS  
83389 section to “Default.”.83390 The “otherwise, ...” text in item 3. of the DESCRIPTION is changed to “otherwise, the group  
83391 ownership shall not be changed”.83392 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/17 is applied, changing the SYNOPSIS to  
83393 make it clear that **-h** and **-R** are optional.83394 **Issue 7**83395 SD5-XCU-ERN-9 is applied, removing the **-R** from the first line of the SYNOPSIS.

83396 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

83397 The description of the **-h** and **-P** options is revised.

83398 **NAME**

83399 cksum — write file checksums and sizes

83400 **SYNOPSIS**83401 cksum [*file*...]83402 **DESCRIPTION**

83403 The *cksum* utility shall calculate and write to standard output a cyclic redundancy check (CRC)  
 83404 for each input file, and also write to standard output the number of octets in each file. The CRC  
 83405 used is based on the polynomial used for CRC error checking in the ISO/IEC 8802-3:1996  
 83406 standard (Ethernet).

83407 The encoding for the CRC checksum is defined by the generating polynomial:

$$83408 G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

83409 Mathematically, the CRC value corresponding to a given file shall be defined by the following  
 83410 procedure:

- 83411 1. The *n* bits to be evaluated are considered to be the coefficients of a mod 2 polynomial  
 83412 *M*(*x*) of degree *n*−1. These *n* bits are the bits from the file, with the most significant bit  
 83413 being the most significant bit of the first octet of the file and the last bit being the least  
 83414 significant bit of the last octet, padded with zero bits (if necessary) to achieve an integral  
 83415 number of octets, followed by one or more octets representing the length of the file as a  
 83416 binary value, least significant octet first. The smallest number of octets capable of  
 83417 representing this integer shall be used.
- 83418 2. *M*(*x*) is multiplied by  $x^{32}$  (that is, shifted left 32 bits) and divided by *G*(*x*) using mod 2  
 83419 division, producing a remainder *R*(*x*) of degree ≤ 31.
- 83420 3. The coefficients of *R*(*x*) are considered to be a 32-bit sequence.
- 83421 4. The bit sequence is complemented and the result is the CRC.

83422 **OPTIONS**

83423 None.

83424 **OPERANDS**

83425 The following operand shall be supported:

83426 *file* A pathname of a file to be checked. If no *file* operands are specified, the standard  
 83427 input shall be used.

83428 **STDIN**

83429 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 83430 operand is '−' and the implementation treats the '−' as meaning standard input. Otherwise,  
 83431 the standard input shall not be used. See the INPUT FILES section.

83432 **INPUT FILES**

83433 The input files can be any file type.

83434 **ENVIRONMENT VARIABLES**83435 The following environment variables shall affect the execution of *cksum*:

- 83436 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 83437 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 83438 variables used to determine the values of locale categories.)
- 83439 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 83440 internationalization variables.

83441 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 83442 characters (for example, single-byte as opposed to multi-byte characters in  
 83443 arguments).

83444 **LC\_MESSAGES**  
 83445 Determine the locale that should be used to affect the format and contents of  
 83446 diagnostic messages written to standard error.

83447 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

## 83448 **ASYNCHRONOUS EVENTS**

83449 Default.

## 83450 **STDOUT**

83451 For each file processed successfully, the *cksum* utility shall write in the following format:

83452 "%u %d %s\n", <checksum>, <# of octets>, <pathname>

83453 If no *file* operand was specified, the pathname and its leading <space> shall be omitted.

## 83454 **STDERR**

83455 The standard error shall be used only for diagnostic messages.

## 83456 **OUTPUT FILES**

83457 None.

## 83458 **EXTENDED DESCRIPTION**

83459 None.

## 83460 **EXIT STATUS**

83461 The following exit values shall be returned:

83462 0 All files were processed successfully.

83463 >0 An error occurred.

## 83464 **CONSEQUENCES OF ERRORS**

83465 Default.

## 83466 **APPLICATION USAGE**

83467 The *cksum* utility is typically used to quickly compare a suspect file against a trusted version of  
 83468 the same, such as to ensure that files transmitted over noisy media arrive intact. However, this  
 83469 comparison cannot be considered cryptographically secure. The chances of a damaged file  
 83470 producing the same CRC as the original are small; deliberate deception is difficult, but probably  
 83471 not impossible.

83472 Although input files to *cksum* can be any type, the results need not be what would be expected  
 83473 on character special device files or on file types not described by the System Interfaces volume of  
 83474 POSIX.1-2008. Since this volume of POSIX.1-2008 does not specify the block size used when  
 83475 doing input, checksums of character special files need not process all of the data in those files.

83476 The algorithm is expressed in terms of a bitstream divided into octets. If a file is transmitted  
 83477 between two systems and undergoes any data transformation (such as changing little-endian  
 83478 byte ordering to big-endian), identical CRC values cannot be expected. Implementations  
 83479 performing such transformations may extend *cksum* to handle such situations.

## 83480 **EXAMPLES**

83481 None.

## RATIONALE

The following C-language program can be used as a model to describe the algorithm. It assumes that a **char** is one octet. It also assumes that the entire file is available for one pass through the function. This was done for simplicity in demonstrating the algorithm, rather than as an implementation model.

83558         }

83559         return ~s;
83560     }

```

The historical practice of writing the number of “blocks” has been changed to writing the number of octets, since the latter is not only more useful, but also since historical implementations have not been consistent in defining what a “block” meant.

The algorithm used was selected to increase the operational robustness of *cksum*. Neither the System V nor BSD *sum* algorithm was selected. Since each of these was different and each was the default behavior on those systems, no realistic compromise was available if either were selected—some set of historical applications would break. Therefore, the name was changed to *cksum*. Although the historical *sum* commands will probably continue to be provided for many years, programs designed for portability across systems should use the new name.

The algorithm selected is based on that used by the ISO/IEC 8802-3:1996 standard (Ethernet) for the frame check sequence field. The algorithm used does not match the technical definition of a *checksum*; the term is used for historical reasons. The length of the file is included in the CRC calculation because this parallels inclusion of a length field by Ethernet in its CRC, but also because it guards against inadvertent collisions between files that begin with different series of zero octets. The chance that two different files produce identical CRCs is much greater when their lengths are not considered. Keeping the length and the checksum of the file itself separate would yield a slightly more robust algorithm, but historical usage has always been that a single number (the checksum as printed) represents the signature of the file. It was decided that historical usage was the more important consideration.

Early proposals contained modifications to the Ethernet algorithm that involved extracting table values whenever an intermediate result became zero. This was demonstrated to be less robust than the current method and mathematically difficult to describe or justify.

The calculation used is identical to that given in pseudo-code in the referenced Sarwate article. The pseudo-code rendition is:

```
X <- 0; Y <- 0;
for i <- m -1 step -1 until 0 do
  begin
    T <- X(1) ^ A[i];
    X(1) <- X(0); X(0) <- Y(1); Y(1) <- Y(0); Y(0) <- 0;
    comment: f[T] and f'[T] denote the T-th words in the
             table f and f' ;
    X <- X ^ f[T]; Y <- Y ^ f'[T];
  end
```

The pseudo-code is reproduced exactly as given; however, note that in the case of *cksum*, **A[i]** represents a byte of the file, the words **X** and **Y** are treated as a single 32-bit value, and the tables **f** and **f'** are a single table containing 32-bit values.

The referenced Sarwate article also discusses generating the table.

Austin Group Interpretation 1003.1-2001 #092 is applied.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0081 [446] is applied.

83608 **NAME**83609 `cmp` — compare two files83610 **SYNOPSIS**83611 `cmp [-l|-s] file1 file2`83612 **DESCRIPTION**

83613 The *cmp* utility shall compare two files. The *cmp* utility shall write no output if the files are the  
 83614 same. Under default options, if they differ, it shall write to standard output the byte and line  
 83615 number at which the first difference occurred. Bytes and lines shall be numbered beginning with  
 83616 1.

83617 **OPTIONS**83618 The *cmp* utility shall conform to XBD [Section 12.2](#) (on page 216).

83619 The following options shall be supported:

83620 **-l** (Lowercase ell.) Write the byte number (decimal) and the differing bytes (octal) for  
 83621 each difference.

83622 **-s** Write nothing to standard output or standard error when files differ; indicate |  
 83623 differing files through exit status only. It is unspecified whether a diagnostic |  
 83624 message is written to standard error when an error is encountered; if a message is |  
 83625 not written, the error is indicated through exit status only.

83626 **OPERANDS**

83627 The following operands shall be supported:

83628 *file1* A pathname of the first file to be compared. If *file1* is '-', the standard input shall  
 83629 be used.

83630 *file2* A pathname of the second file to be compared. If *file2* is '-', the standard input  
 83631 shall be used.

83632 If both *file1* and *file2* refer to standard input or refer to the same FIFO special, block special, or  
 83633 character special file, the results are undefined.

83634 **STDIN**

83635 The standard input shall be used only if the *file1* or *file2* operand refers to standard input. See the  
 83636 INPUT FILES section.

83637 **INPUT FILES**

83638 The input files can be any file type.

83639 **ENVIRONMENT VARIABLES**83640 The following environment variables shall affect the execution of *cmp*:

83641 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 83642 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 83643 variables used to determine the values of locale categories.)

83644 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 83645 internationalization variables.

83646 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 83647 characters (for example, single-byte as opposed to multi-byte characters in  
 83648 arguments).

83649 **LC\_MESSAGES**

83650 Determine the locale that should be used to affect the format and contents of  
 83651 diagnostic messages written to standard error and informative messages written to

83652 standard output.

83653 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 83654 ASYNCHRONOUS EVENTS

83655 Default.

## 83656 STDOUT

83657 In the POSIX locale, results of the comparison shall be written to standard output. When no  
83658 options are used, the format shall be:

83659 "%s %s differ: char %d, line %d\n", *file1*, *file2*,  
83660 <byte number>, <line number>

83661 When the *-l* option is used, the format shall be:

83662 "%d %o %o\n", <byte number>, <differing byte>,  
83663 <differing byte>

83664 for each byte that differs. The first <differing byte> number is from *file1* while the second is from  
83665 *file2*. In both cases, <byte number> shall be relative to the beginning of the file, beginning with 1.

83666 No output shall be written to standard output when the *-s* option is used.

## 83667 STDERR

83668 The standard error shall be used only for diagnostic messages. If the *-l* option is used and *file1*  
83669 and *file2* differ in length, or if the *-s* option is not used and *file1* and *file2* are identical for the  
83670 entire length of the shorter file, in the POSIX locale the following diagnostic message shall be  
83671 written:

83672 "cmp: EOF on %s%s\n", <name of shorter file>, <additional info>

83673 The <additional info> field shall either be null or a string that starts with a <blank> and contains  
83674 no <newline> characters. Some implementations report on the number of lines in this case.

83675 If the *-s* option is used and an error occurs, it is unspecified whether a diagnostic message is +  
83676 written to standard error.

## 83677 OUTPUT FILES

83678 None.

## 83679 EXTENDED DESCRIPTION

83680 None.

## 83681 EXIT STATUS

83682 The following exit values shall be returned:

83683 0 The files are identical.

83684 1 The files are different; this includes the case where one file is identical to the first part of the  
83685 other.

83686 >1 An error occurred.

## 83687 CONSEQUENCES OF ERRORS

83688 Default.

## APPLICATION USAGE

Although input files to *cmp* can be any type, the results might not be what would be expected on character special device files or on file types not described by the System Interfaces volume of POSIX.1-2008. Since this volume of POSIX.1-2008 does not specify the block size used when doing input, comparisons of character special files need not compare all of the data in those files.

For files which are not text files, line numbers simply reflect the presence of a <newline>, without any implication that the file is organized into lines.

Since the behavior of *-s* differs between implementations as to whether error messages are written, the only way to ensure consistent behavior of *cmp* when *-s* is used is to redirect standard error to */dev/null*.

If error messages are wanted, instead of using *-s* standard output should be redirected to */dev/null*, and anything written to standard error should be discarded if the exit status is 1. For example:

```
silent_cmp() {
    # compare files with no output except error messages
    message=$(cmp "$@" 2>&1 >/dev/null)
    status=$?
    case $status in
        0|1) ;;
        *) printf '%s\n' "$message" ;;
    esac
    return $status
}
```

## EXAMPLES

None.

## RATIONALE

The global language in [Section 1.4](#) (on page 2326) indicates that using two mutually-exclusive options together produces unspecified results. Some System V implementations consider the option usage:

```
cmp -l -s ...
```

to be an error. They also treat:

```
cmp -s -l ...
```

as if no options were specified. Both of these behaviors are considered bugs, but are allowed.

The word **char** in the standard output format comes from historical usage, even though it is actually a byte number. When *cmp* is supported in other locales, implementations are encouraged to use the word *byte* or its equivalent in another language. Users should not interpret this difference to indicate that the functionality of the utility changed between locales.

Some implementations report on the number of lines in the identical-but-shorter file case. This is allowed by the inclusion of the <additional info> fields in the output format. The restriction on having a leading <blank> and no <newline> characters is to make parsing for the filename easier. It is recognized that some filenames containing white-space characters make parsing difficult anyway, but the restriction does aid programs used on systems where the names are predominantly well behaved.

83732 **FUTURE DIRECTIONS**

83733 Future versions of this standard may require that diagnostic messages are written to standard |  
83734 error when the `-s` option is specified.

83737 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

83738 **CHANGE HISTORY**

83739 First released in Issue 2.

83740 **Issue 7**

83741 SD5-XCU-ERN-96 is applied, updating the STDERR section.

83742 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

83743 **NAME**83744 `comm` — select or reject lines common to two files83745 **SYNOPSIS**83746 `comm [-123] file1 file2`83747 **DESCRIPTION**

83748 The *comm* utility shall read *file1* and *file2*, which should be ordered in the current collating  
 83749 sequence, and produce three text columns as output: lines only in *file1*, lines only in *file2*, and  
 83750 lines in both files.

83751 If the lines in both files are not ordered according to the collating sequence of the current locale,  
 83752 the results are unspecified.

83753 If the collating sequence of the current locale does not have a total ordering of all characters (see +  
 83754 XBD Section 7.3.2, on page 147) and any lines from the input files collate equally but are not +  
 83755 identical, *comm* should treat them as different lines but may treat them as being the same. If it +  
 83756 treats them as different, *comm* should expect them to be ordered according to a further byte-by- +  
 83757 byte comparison using the collating sequence for the POSIX locale and if they are not ordered in +  
 83758 this way, the output of *comm* can identify such lines as being both unique to *file1* and unique to +  
 83759 *file2* instead of being in both files.

83760 **OPTIONS**83761 The *comm* utility shall conform to XBD Section 12.2 (on page 216).

83762 The following options shall be supported:

- 83763 **-1** Suppress the output column of lines unique to *file1*.
- 83764 **-2** Suppress the output column of lines unique to *file2*.
- 83765 **-3** Suppress the output column of lines duplicated in *file1* and *file2*.

83766 **OPERANDS**

83767 The following operands shall be supported:

- 83768 *file1* A pathname of the first file to be compared. If *file1* is '-', the standard input shall  
 83769 be used.
- 83770 *file2* A pathname of the second file to be compared. If *file2* is '-', the standard input  
 83771 shall be used.

83772 If both *file1* and *file2* refer to standard input or to the same FIFO special, block special, or  
 83773 character special file, the results are undefined.

83774 **STDIN**

83775 The standard input shall be used only if one of the *file1* or *file2* operands refers to standard input.  
 83776 See the INPUT FILES section.

83777 **INPUT FILES**

83778 The input files shall be text files.

83779 **ENVIRONMENT VARIABLES**83780 The following environment variables shall affect the execution of *comm*:

- 83781 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 83782 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 83783 variables used to determine the values of locale categories.)

83784 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
83785 internationalization variables.

83786 *LC\_COLLATE*  
83787 Determine the locale for the collating sequence *comm* expects to have been used  
83788 when the input files were sorted.

83789 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
83790 characters (for example, single-byte as opposed to multi-byte characters in  
83791 arguments and input files).

83792 *LC\_MESSAGES*  
83793 Determine the locale that should be used to affect the format and contents of  
83794 diagnostic messages written to standard error.

83795 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 83796 ASYNCHRONOUS EVENTS

83797 Default.

## 83798 STDOUT

83799 The *comm* utility shall produce output depending on the options selected. If the *-1*, *-2*, and *-3*  
83800 options are all selected, *comm* shall write nothing to standard output.

83801 If the *-1* option is not selected, lines contained only in *file1* shall be written using the format:

83802 "%s\n", <line in file1>

83803 If the *-2* option is not selected, lines contained only in *file2* are written using the format:

83804 "%s%s\n", <lead>, <line in file2>

83805 where the string <lead> is as follows:

83806 <tab> The *-1* option is not selected.

83807 null string The *-1* option is selected.

83808 If the *-3* option is not selected, lines contained in both files shall be written using the format:

83809 "%s%s\n", <lead>, <line in both>

83810 where the string <lead> is as follows:

83811 <tab><tab> Neither the *-1* nor the *-2* option is selected.

83812 <tab> Exactly one of the *-1* and *-2* options is selected.

83813 null string Both the *-1* and *-2* options are selected.

83814 If the input files were ordered according to the collating sequence of the current locale, the lines  
83815 written shall be in the collating sequence of the current locale. If the input files contained any  
83816 lines that collated equally but were not identical and within each file those lines were ordered  
83817 according to a further byte-by-byte comparison using the collating sequence for the POSIX  
83818 locale, and *comm* treated them as different lines, then lines written that collate equally but are not  
83819 identical should be ordered according to a further byte-by-byte comparison using the collating  
83820 sequence for the POSIX locale.

## 83821 STDERR

83822 The standard error shall be used only for diagnostic messages.

83823 **OUTPUT FILES**

83824 None.

83825 **EXTENDED DESCRIPTION**

83826 None.

83827 **EXIT STATUS**

83828 The following exit values shall be returned:

83829 0 All input files were successfully output as specified.

83830 &gt;0 An error occurred.

83831 **CONSEQUENCES OF ERRORS**

83832 Default.

83833 **APPLICATION USAGE**83834 If the input files are not properly presorted, the output of *comm* might not be useful.

83835 When using *comm* to process pathnames, it is recommended that LC\_ALL, or at least LC\_CTYPE +  
 83836 and LC\_COLLATE, are set to POSIX or C in the environment, since pathnames can contain byte +  
 83837 sequences that do not form valid characters in some locales, in which case the utility's behavior +  
 83838 would be undefined. In the POSIX locale each byte is a valid single-byte character, and therefore +  
 83839 this problem is avoided. +

83840 If the collating sequence of the current locale does not have a total ordering of all characters, this +  
 83841 can affect the behavior of *comm* in the following ways: +

- 83842 • If *comm* treats lines as being the same only if they are identical, some lines can be +  
 83843 misleadingly identified as being both unique to *file1* and unique to *file2*. +
- 83844 • If *comm* treats lines as being the same if they collate equally and a line from *file1* collates +  
 83845 equally with a line from *file2* but is not identical to it, one of the lines is misleadingly +  
 83846 identified as being in both files and the other is not written to the output at all. +

83847 Such problems can be avoided by forcing the use of the POSIX locale; for example, the following +  
 83848 identifies lines in both *file1* and *file2*: +

```
83849 LC_ALL=POSIX sort file1 > file1.posix +
83850 LC_ALL=POSIX sort file2 > file2.posix +
83851 LC_ALL=POSIX comm -12 file1.posix file2.posix | sort +
```

83852 The final *sort* re-sorts the output of *comm* according to the collating sequence of the original +  
 83853 locale. Doing this might be difficult if more than one column is output and leading <blank>s +  
 83854 cannot be ignored. +

83855 **EXAMPLES**

83856 If a file named **xcu** contains a sorted list of the utilities in this volume of POSIX.1-2008, a file  
 83857 named **xpg3** contains a sorted list of the utilities specified in the X/Open Portability Guide, Issue  
 83858 3, and a file named **svid89** contains a sorted list of the utilities in the System V Interface  
 83859 Definition Third Edition:

```
83860 comm -23 xcu xpg3 | comm -23 - svid89
```

83861 would print a list of utilities in this volume of POSIX.1-2008 not specified by either of the other  
 83862 documents:

```
83863 comm -12 xcu xpg3 | comm -12 - svid89
```

83864 would print a list of utilities specified by all three documents, and:

83865           comm -l2 xpg3 svid89 | comm -23 - xcu

83866           would print a list of utilities specified by both XPG3 and the SVID, but not specified in this  
83867           volume of POSIX.1-2008.

83868 **RATIONALE**

83869           None.

83870 **FUTURE DIRECTIONS**

83871           A future version of this standard may require that if any lines from the input files collate equally |  
83872           but are not identical, then *comm* treats them as different lines and expects them to be ordered |  
83873           according to a further byte-by-byte comparison using the collating sequence for the POSIX |  
83874           locale. |

83875           A future version of this standard may require that if the input files contained any lines that |  
83876           collated equally but were not identical and within each file those lines were ordered according to |  
83877           a further byte-by-byte comparison using the collating sequence for the POSIX locale, then lines |  
83878           written that collate equally but are not identical are ordered according to a further byte-by-byte |  
83879           comparison using the collating sequence for the POSIX locale.

83882           XBD [Section 7.3.2](#) (on page 147), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

83883 **CHANGE HISTORY**

83884           First released in Issue 2.

83885 **Issue 6**

83886           The normative text is reworded to avoid use of the term “must” for application requirements.

83887 **NAME**83888        `command` — execute a simple command83889 **SYNOPSIS**83890        `command` [-p] *command\_name* [*argument...*]83891        `command` [-p][-v|-V] *command\_name*83892 **DESCRIPTION**83893        The *command* utility shall cause the shell to treat the arguments as a simple command,  
83894        suppressing the shell function lookup that is described in [Section 2.9.1.1](#) (on page 2357), item 1b.83895        If the *command\_name* is the same as the name of one of the special built-in utilities, the special  
83896        properties in the enumerated list at the beginning of [Section 2.14](#) (on page 2374) shall not occur.  
83897        In every other respect, if *command\_name* is not the name of a function, the effect of *command*  
83898        (with no options) shall be the same as omitting *command*.83899        When the `-v` or `-V` option is used, the *command* utility shall provide information concerning  
83900        how a command name is interpreted by the shell.83901 **OPTIONS**83902        The *command* utility shall conform to XBD [Section 12.2](#) (on page 216).

83903        The following options shall be supported:

83904        **-p**        Perform the command search using a default value for *PATH* that is guaranteed to  
83905        find all of the standard utilities.83906        **-v**        Write a string to standard output that indicates the pathname or command that  
83907        will be used by the shell, in the current shell execution environment (see [Section](#)  
83908        [2.12](#), on page 2371), to invoke *command\_name*, but do not invoke *command\_name*.83909                • Utilities, regular built-in utilities, *command\_names* including a `<slash>`  
83910                character, and any implementation-defined functions that are found using  
83911                the *PATH* variable (as described in [Section 2.9.1.1](#), on page 2357), shall be  
83912                written as absolute pathnames.83913                • Shell functions, special built-in utilities, regular built-in utilities not  
83914                associated with a *PATH* search, and shell reserved words shall be written as  
83915                just their names.83916                • An alias shall be written as a command line that represents its alias  
83917                definition.83918                • Otherwise, no output shall be written and the exit status shall reflect that the  
83919                name was not found.83920        **-V**        Write a string to standard output that indicates how the name given in the  
83921        *command\_name* operand will be interpreted by the shell, in the current shell  
83922        execution environment (see [Section 2.12](#), on page 2371), but do not invoke  
83923        *command\_name*. Although the format of this string is unspecified, it shall indicate  
83924        in which of the following categories *command\_name* falls and shall include the  
83925        information stated:83926                • Utilities, regular built-in utilities, and any implementation-defined functions  
83927                that are found using the *PATH* variable (as described in [Section 2.9.1.1](#), on  
83928                page 2357), shall be identified as such and include the absolute pathname in  
83929                the string.

- 83930 • Other shell functions shall be identified as functions.
- 83931 • Aliases shall be identified as aliases and their definitions included in the
- 83932 string.
- 83933 • Special built-in utilities shall be identified as special built-in utilities.
- 83934 • Regular built-in utilities not associated with a *PATH* search shall be identified
- 83935 as regular built-in utilities. (The term “regular” need not be used.)
- 83936 • Shell reserved words shall be identified as reserved words.

#### 83937 OPERANDS

83938 The following operands shall be supported:

83939 *argument* One of the strings treated as an argument to *command\_name*.

83940 *command\_name*

83941 The name of a utility or a special built-in utility.

#### 83942 STDIN

83943 Not used.

#### 83944 INPUT FILES

83945 None.

#### 83946 ENVIRONMENT VARIABLES

83947 The following environment variables shall affect the execution of *command*:

83948 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 83949 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 83950 variables used to determine the values of locale categories.)

83951 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 83952 internationalization variables.

83953 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 83954 characters (for example, single-byte as opposed to multi-byte characters in  
 83955 arguments).

83956 *LC\_MESSAGES*

83957 Determine the locale that should be used to affect the format and contents of  
 83958 diagnostic messages written to standard error and informative messages written to  
 83959 standard output.

83960 *XS* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

83961 *PATH* Determine the search path used during the command search described in [Section](#)  
 83962 [2.9.1.1](#) (on page 2357), except as described under the *-p* option.

#### 83963 ASYNCHRONOUS EVENTS

83964 Default.

#### 83965 STDOUT

83966 When the *-v* option is specified, standard output shall be formatted as:

83967 "%s\n", <pathname or command>

83968 When the *-V* option is specified, standard output shall be formatted as:

83969 "%s\n", <unspecified>

**83970 STDERR**

83971 The standard error shall be used only for diagnostic messages.

**83972 OUTPUT FILES**

83973 None.

**83974 EXTENDED DESCRIPTION**

83975 None.

**83976 EXIT STATUS**

83977 When the `-v` or `-V` options are specified, the following exit values shall be returned:

83978 0 Successful completion.

83979 >0 The *command\_name* could not be found or an error occurred.

83980 Otherwise, the following exit values shall be returned:

83981 126 The utility specified by *command\_name* was found but could not be invoked.

83982 127 An error occurred in the *command* utility or the utility specified by *command\_name* could not  
83983 be found.

83984 Otherwise, the exit status of *command* shall be that of the simple command specified by the  
83985 arguments to *command*.

**83986 CONSEQUENCES OF ERRORS**

83987 Default.

**83988 APPLICATION USAGE**

83989 The order for command search allows functions to override regular built-ins and path searches.  
83990 This utility is necessary to allow functions that have the same name as a utility to call the utility  
83991 (instead of a recursive call to the function).

83992 The system default path is available using *getconf*; however, since *getconf* may need to have the  
83993 *PATH* set up before it can be called itself, the following can be used:

83994 `command -p getconf PATH`

83995 There are some advantages to suppressing the special characteristics of special built-ins on  
83996 occasion. For example:

83997 `command exec > unwritable-file`

83998 does not cause a non-interactive script to abort, so that the output status can be checked by the  
83999 script.

84000 The *command*, *env*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if an  
84001 error occurs so that applications can distinguish “failure to find a utility” from “invoked utility  
84002 exited with an error indication”. The value 127 was chosen because it is not commonly used for  
84003 other meanings; most utilities use small values for “normal error conditions” and the values  
84004 above 128 can be confused with termination due to receipt of a signal. The value 126 was chosen  
84005 in a similar manner to indicate that the utility could be found, but not invoked. Some scripts  
84006 produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
84007 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
84008 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
84009 any other reason.

84010 Since the `-v` and `-V` options of *command* produce output in relation to the current shell execution  
84011 environment, *command* is generally provided as a shell regular built-in. If it is called in a subshell  
84012 or separate utility execution environment, such as one of the following:

```
84013 (PATH=foo command -v)
84014 nohup command -v
```

84015 it does not necessarily produce correct results. For example, when called with *nohup* or an *exec*  
 84016 function, in a separate utility execution environment, most implementations are not able to  
 84017 identify aliases, functions, or special built-ins.

84018 Two types of regular built-ins could be encountered on a system and these are described  
 84019 separately by *command*. The description of command search in [Section 2.9.1.1](#) (on page 2357)  
 84020 allows for a standard utility to be implemented as a regular built-in as long as it is found in the  
 84021 appropriate place in a *PATH* search. So, for example, *command -v true* might yield */bin/true* or  
 84022 some similar pathname. Other implementation-defined utilities that are not defined by this  
 84023 volume of POSIX.1-2008 might exist only as built-ins and have no pathname associated with  
 84024 them. These produce output identified as (regular) built-ins. Applications encountering these are  
 84025 not able to count on *execing* them, using them with *nohup*, overriding them with a different  
 84026 *PATH*, and so on.

## 84027 EXAMPLES

- 84028 1. Make a version of *cd* that always prints out the new working directory exactly once:

```
84029 cd() {
84030     command cd "$@" >/dev/null
84031     pwd
84032 }
```

- 84033 2. Start off a “secure shell script” in which the script avoids being spoofed by its parent:

```
84034 IFS='
84035 '
84036 # The preceding value should be <space><tab><newline>.
84037 # Set IFS to its default value.
84038 \unalias -a
84039 # Unset all possible aliases.
84040 # Note that unalias is escaped to prevent an alias
84041 # being used for unalias.
84042 unset -f command
84043 # Ensure command is not a user function.
84044 PATH="$(command -p getconf PATH):$PATH"
84045 # Put on a reliable PATH prefix.
84046 # ...
```

84047 At this point, given correct permissions on the directories called by *PATH*, the script has  
 84048 the ability to ensure that any utility it calls is the intended one. It is being very cautious  
 84049 because it assumes that implementation extensions may be present that would allow user  
 84050 functions to exist when it is invoked; this capability is not specified by this volume of  
 84051 POSIX.1-2008, but it is not prohibited as an extension. For example, the *ENV* variable  
 84052 precedes the invocation of the script with a user start-up script. Such a script could define  
 84053 functions to spoof the application.

## 84054 RATIONALE

84055 Since *command* is a regular built-in utility it is always found prior to the *PATH* search.

84056 There is nothing in the description of *command* that implies the command line is parsed any  
 84057 differently from that of any other simple command. For example:

command a | b ; c

is not parsed in any special way that causes ' | ' or ' ; ' to be treated other than a pipe operator or <semicolon> or that prevents function lookup on **b** or **c**.

The *command* utility is somewhat similar to the Eighth Edition shell *builtin* command, but since *command* also goes to the file system to search for utilities, the name *builtin* would not be intuitive.

The *command* utility is most likely to be provided as a regular built-in. It is not listed as a special built-in for the following reasons:

- The removal of exportable functions made the special precedence of a special built-in unnecessary.
- A special built-in has special properties (see [Section 2.14](#), on page 2374) that were inappropriate for invoking other utilities. For example, two commands such as:

```
date > unwritable-file
```

```
command date > unwritable-file
```

would have entirely different results; in a non-interactive script, the former would continue to execute the next command, the latter would abort. Introducing this semantic difference along with suppressing functions was seen to be non-intuitive.

The **-p** option is present because it is useful to be able to ensure a safe path search that finds all the standard utilities. This search might not be identical to the one that occurs through one of the *exec* functions (as defined in the System Interfaces volume of POSIX.1-2008) when *PATH* is unset. At the very least, this feature is required to allow the script to access the correct version of *getconf* so that the value of the default path can be accurately retrieved.

The *command* **-v** and **-V** options were added to satisfy requirements from users that are currently accomplished by three different historical utilities: *type* in the System V shell, *whence* in the KornShell, and *which* in the C shell. Since there is no historical agreement on how and what to accomplish here, the POSIX *command* utility was enhanced and the historical utilities were left unmodified. The C shell *which* merely conducts a path search. The KornShell *whence* is more elaborate—in addition to the categories required by POSIX, it also reports on tracked aliases, exported aliases, and undefined functions.

The output format of **-V** was left mostly unspecified because human users are its only audience. Applications should not be written to care about this information; they can use the output of **-v** to differentiate between various types of commands, but the additional information that may be emitted by the more verbose **-V** is not needed and should not be arbitrarily constrained in its verbosity or localization for application parsing reasons.

## FUTURE DIRECTIONS

None.

84098 **CHANGE HISTORY**

84099 First released in Issue 4.

84100 **Issue 7**84101 Austin Group Interpretation 1003.1-2001 #196 is applied, changing the SYNOPSIS to allow `-p` to  
84102 be used with `-v` (or `-V`).

84103 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84104 The *command* utility is moved from the User Portability Utilities option to the Base. User  
84105 Portability Utilities is now an option for interactive utilities.84106 The APPLICATION USAGE and EXAMPLES are revised to replace the non-standard  
84107 *getconf\_CS\_PATH* with *getconf PATH*.

84108 **NAME**

84109 compress — compress data

84110 **SYNOPSIS**84111 XSI `compress [-fv] [-b bits] [file...]`84112 `compress [-cfv] [-b bits] [file]`84113 **DESCRIPTION**84114 The *compress* utility shall attempt to reduce the size of the named files by using adaptive Lempel-  
84115 Ziv coding algorithm.84116 **Note:** Lempel-Ziv is US Patent 4464650, issued to William Eastman, Abraham Lempel, Jacob Ziv,  
84117 Martin Cohn on August 7th, 1984, and assigned to Sperry Corporation.84118 Lempel-Ziv-Welch compression is covered by US Patent 4558302, issued to Terry A. Welch on  
84119 December 10th, 1985, and assigned to Sperry Corporation.84120 On systems not supporting adaptive Lempel-Ziv coding algorithm, the input files shall not be  
84121 changed and an error value greater than two shall be returned. Except when the output is to the  
84122 standard output, each file shall be replaced by one with the extension *.Z*. If the invoking process  
84123 has appropriate privileges, the ownership, modes, access time, and modification time of the  
84124 original file are preserved. If appending the *.Z* to the filename would make the name exceed  
84125 {NAME\_MAX} bytes, the command shall fail. If no files are specified, the standard input shall be  
84126 compressed to the standard output.84127 **OPTIONS**84128 The *compress* utility shall conform to XBD [Section 12.2](#) (on page 216).

84129 The following options shall be supported:

84130 **-b *bits*** Specify the maximum number of bits to use in a code. For a conforming  
84131 application, the *bits* argument shall be:84132  $9 \leq bits \leq 14$ 84133 The implementation may allow *bits* values of greater than 14. The default is 14, 15,  
84134 or 16.84135 **-c** Cause *compress* to write to the standard output; the input file is not changed, and  
84136 no *.Z* files are created.84137 **-f** Force compression of *file*, even if it does not actually reduce the size of the file, or if  
84138 the corresponding *file.Z* file already exists. If the **-f** option is not given, and the  
84139 process is not running in the background, the user is prompted as to whether an  
84140 existing *file.Z* file should be overwritten. If the response is affirmative, the existing  
84141 file will be overwritten.84142 **-v** Write the percentage reduction of each file to standard error.84143 **OPERANDS**

84144 The following operand shall be supported:

84145 *file* A pathname of a file to be compressed.84146 **STDIN**84147 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.

**INPUT FILES**

If *file* operands are specified, the input files contain the data to be compressed.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *compress*:

**LANG** Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

**LC\_ALL** If set to a non-empty string value, override the values of all the other internationalization variables.

**LC\_COLLATE**

Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements used in the extended regular expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

**LC\_CTYPE**

Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments), the behavior of character classes used in the extended regular expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

**LC\_MESSAGES**

Determine the locale used to process affirmative responses, and the locale used to affect the format and contents of diagnostic messages, prompts, and the output from the **-v** option written to standard error.

**NLSPATH**

Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**ASYNCHRONOUS EVENTS**

Default.

**STDOUT**

If no *file* operands are specified, or if a *file* operand is **'-'**, or if the **-c** option is specified, the standard output contains the compressed output.

**STDERR**

The standard error shall be used only for diagnostic and prompt messages and the output from **-v**.

**OUTPUT FILES**

The output files shall contain the compressed output. The format of compressed files is unspecified and interchange of such files between implementations (including access via unspecified file sharing mechanisms) is not required by POSIX.1-2008.

**EXTENDED DESCRIPTION**

None.

**EXIT STATUS**

The following exit values shall be returned:

0 Successful completion.

1 An error occurred.

2 One or more files were not compressed because they would have increased in size (and the **-f** option was not specified).

84190 >2 An error occurred.

#### 84191 CONSEQUENCES OF ERRORS

84192 The input file shall remain unmodified.

#### 84193 APPLICATION USAGE

84194 The amount of compression obtained depends on the size of the input, the number of *bits* per  
84195 code, and the distribution of common substrings. Typically, text such as source code or English is  
84196 reduced by 50-60%. Compression is generally much better than that achieved by Huffman  
84197 coding or adaptive Huffman coding (*compact*), and takes less time to compute.

84198 Although *compress* strictly follows the default actions upon receipt of a signal or when an error  
84199 occurs, some unexpected results may occur. In some implementations it is likely that a partially  
84200 compressed file is left in place, alongside its uncompressed input file. Since the general  
84201 operation of *compress* is to delete the uncompressed file only after the *.Z* file has been  
84202 successfully filled, an application should always carefully check the exit status of *compress* before  
84203 arbitrarily deleting files that have like-named neighbors with *.Z* suffixes.

84204 The limit of 14 on the *bits* option-argument is to achieve portability to all systems (within the  
84205 restrictions imposed by the lack of an explicit published file format). Some implementations  
84206 based on 16-bit architectures cannot support 15 or 16-bit uncompression.

#### 84207 EXAMPLES

84208 None.

#### 84209 RATIONALE

84210 None.

#### 84211 FUTURE DIRECTIONS

84212 None.

84214 *uncompress*, *zcat*

84215 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

#### 84216 CHANGE HISTORY

84217 First released in Issue 4.

#### 84218 Issue 6

84219 The normative text is reworded to avoid use of the term “must” for application requirements.

84220 An error case is added for systems not supporting adaptive Lempel-Ziv coding.

#### 84221 Issue 7

84222 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84223 Austin Group Interpretation 1003.1-2001 #125 is applied, revising the ENVIRONMENT  
84224 VARIABLES section.

84225 **NAME**84226 `cp` — copy files84227 **SYNOPSIS**84228 `cp [-Pfp] source_file target_file`84229 `cp [-Pfp] source_file... target`84230 `cp -R [-H|-L|-P] [-fip] source_file... target`84231 **DESCRIPTION**

84232 The first synopsis form is denoted by two operands, neither of which are existing files of type  
 84233 directory. The `cp` utility shall copy the contents of *source\_file* (or, if *source\_file* is a file of type  
 84234 symbolic link, the contents of the file referenced by *source\_file*) to the destination path named by  
 84235 *target\_file*.

84236 The second synopsis form is denoted by two or more operands where the `-R` option is not  
 84237 specified and the first synopsis form is not applicable. It shall be an error if any *source\_file* is a file  
 84238 of type directory, if *target* does not exist, or if *target* does not name a directory. The `cp` utility shall  
 84239 copy the contents of each *source\_file* (or, if *source\_file* is a file of type symbolic link, the contents of  
 84240 the file referenced by *source\_file*) to the destination path named by the concatenation of *target*, a  
 84241 single `<slash>` character if *target* did not end in a `<slash>`, and the last component of *source\_file*.

84242 The third synopsis form is denoted by two or more operands where the `-R` option is specified.  
 84243 The `cp` utility shall copy each file in the file hierarchy rooted in each *source\_file* to a destination  
 84244 path named as follows:

- 84245 • If *target* exists and names an existing directory, the name of the corresponding destination  
 84246 path for each file in the file hierarchy shall be the concatenation of *target*, a single `<slash>`  
 84247 character if *target* did not end in a `<slash>`, and the pathname of the file relative to the  
 84248 directory containing *source\_file*.
- 84249 • If *target* does not exist and two operands are specified, the name of the corresponding  
 84250 destination path for *source\_file* shall be *target*; the name of the corresponding destination  
 84251 path for all other files in the file hierarchy shall be the concatenation of *target*, a `<slash>`  
 84252 character, and the pathname of the file relative to *source\_file*.

84253 It shall be an error if *target* does not exist and more than two operands are specified, or if *target*  
 84254 exists and does not name a directory.

84255 In the following description, the term *dest\_file* refers to the file named by the destination path.  
 84256 The term *source\_file* refers to the file that is being copied, whether specified as an operand or a  
 84257 file in a file hierarchy rooted in a *source\_file* operand. If *source\_file* is a file of type symbolic link:

- 84258 • If the `-R` option was not specified, `cp` shall take actions based on the type and contents of  
 84259 the file referenced by the symbolic link, and not by the symbolic link itself, unless the `-P`  
 84260 option was specified.
- 84261 • If the `-R` option was specified:
  - 84262 — If none of the options `-H`, `-L`, nor `-P` were specified, it is unspecified which of `-H`,  
 84263 `-L`, or `-P` will be used as a default.
  - 84264 — If the `-H` option was specified, `cp` shall take actions based on the type and contents of  
 84265 the file referenced by any symbolic link specified as a *source\_file* operand.
  - 84266 — If the `-L` option was specified, `cp` shall take actions based on the type and contents of  
 84267 the file referenced by any symbolic link specified as a *source\_file* operand or any  
 84268 symbolic links encountered during traversal of a file hierarchy.

- If the **-P** option was specified, *cp* shall copy any symbolic link specified as a *source\_file* operand and any symbolic links encountered during traversal of a file hierarchy, and shall not follow any symbolic links.

For each *source\_file*, the following steps shall be taken:

1. If *source\_file* references the same file as *dest\_file*, *cp* may write a diagnostic message to standard error; it shall do nothing more with *source\_file* and shall go on to any remaining files.
2. If *source\_file* is of type directory, the following steps shall be taken:
  - a. If the **-R** option was not specified, *cp* shall write a diagnostic message to standard error, do nothing more with *source\_file*, and go on to any remaining files.
  - b. If *source\_file* was not specified as an operand and *source\_file* is dot or dot-dot, *cp* shall do nothing more with *source\_file* and go on to any remaining files.
  - c. If *dest\_file* exists and it is a file type not specified by the System Interfaces volume of POSIX.1-2008, the behavior is implementation-defined.
  - d. If *dest\_file* exists and it is not of type directory, *cp* shall write a diagnostic message to standard error, do nothing more with *source\_file* or any files below *source\_file* in the file hierarchy, and go on to any remaining files.
  - e. If the directory *dest\_file* does not exist, it shall be created with file permission bits set to the same value as those of *source\_file*, modified by the file creation mask of the user if the **-p** option was not specified, and then bitwise-inclusively OR'ed with S\_IRWXU. If *dest\_file* cannot be created, *cp* shall write a diagnostic message to standard error, do nothing more with *source\_file*, and go on to any remaining files. It is unspecified if *cp* attempts to copy files in the file hierarchy rooted in *source\_file*.
  - f. The files in the directory *source\_file* shall be copied to the directory *dest\_file*, taking the four steps (1 to 4) listed here with the files as *source\_files*.
  - g. If *dest\_file* was created, its file permission bits shall be changed (if necessary) to be the same as those of *source\_file*, modified by the file creation mask of the user if the **-p** option was not specified.
  - h. The *cp* utility shall do nothing more with *source\_file* and go on to any remaining files.
3. If *source\_file* is of type regular file, the following steps shall be taken:
  - a. The behavior is unspecified if *dest\_file* exists and was written by a previous step. Otherwise, if *dest\_file* exists, the following steps shall be taken:
    - i. If the **-i** option is in effect, the *cp* utility shall write a prompt to the standard error and read a line from the standard input. If the response is not affirmative, *cp* shall do nothing more with *source\_file* and go on to any remaining files.
    - ii. A file descriptor for *dest\_file* shall be obtained by performing actions equivalent to the *open()* function defined in the System Interfaces volume of POSIX.1-2008 called using *dest\_file* as the *path* argument, and the bitwise-inclusive OR of O\_WRONLY and O\_TRUNC as the *oflag* argument.
    - iii. If the attempt to obtain a file descriptor fails and the **-f** option is in effect, *cp* shall attempt to remove the file by performing actions equivalent to the *unlink()* function defined in the System Interfaces volume of POSIX.1-2008

- 84313 called using *dest\_file* as the *path* argument. If this attempt succeeds, *cp* shall  
84314 continue with step 3b.
- 84315 b. If *dest\_file* does not exist, a file descriptor shall be obtained by performing actions  
84316 equivalent to the *open()* function defined in the System Interfaces volume of  
84317 POSIX.1-2008 called using *dest\_file* as the *path* argument, and the bitwise-inclusive  
84318 OR of *O\_WRONLY* and *O\_CREAT* as the *oflag* argument. The file permission bits  
84319 of *source\_file* shall be the *mode* argument.
- 84320 c. If the attempt to obtain a file descriptor fails, *cp* shall write a diagnostic message to  
84321 standard error, do nothing more with *source\_file*, and go on to any remaining files.
- 84322 d. The contents of *source\_file* shall be written to the file descriptor. Any write errors  
84323 shall cause *cp* to write a diagnostic message to standard error and continue to step  
84324 3e.
- 84325 e. The file descriptor shall be closed.
- 84326 f. The *cp* utility shall do nothing more with *source\_file*. If a write error occurred in  
84327 step 3d, it is unspecified if *cp* continues with any remaining files. If no write error  
84328 occurred in step 3d, *cp* shall go on to any remaining files.
- 84329 4. Otherwise, the **-R** option was specified, and the following steps shall be taken:
- 84330 a. The *dest\_file* shall be created with the same file type as *source\_file*.
- 84331 b. If *source\_file* is a file of type FIFO, the file permission bits shall be the same as those  
84332 of *source\_file*, modified by the file creation mask of the user if the **-p** option was not  
84333 specified. Otherwise, the permissions, owner ID, and group ID of *dest\_file* are  
84334 implementation-defined.
- 84335 If this creation fails for any reason, *cp* shall write a diagnostic message to standard  
84336 error, do nothing more with *source\_file*, and go on to any remaining files.
- 84337 c. If *source\_file* is a file of type symbolic link, and the options require the symbolic link  
84338 itself to be acted upon, the pathname contained in *dest\_file* shall be the same as the  
84339 pathname contained in *source\_file*.
- 84340 If this fails for any reason, *cp* shall write a diagnostic message to standard error, do  
84341 nothing more with *source\_file*, and go on to any remaining files.
- 84342 If the implementation provides additional or alternate access control mechanisms (see XBD  
84343 [Section 4.5](#), on page 108), their effect on copies of files is implementation-defined.

## 84344 OPTIONS

84345 The *cp* utility shall conform to XBD [Section 12.2](#) (on page 216).

84346 The following options shall be supported:

- 84347 **-f** If a file descriptor for a destination file cannot be obtained, as described in step  
84348 3.a.ii., attempt to unlink the destination file and proceed.
- 84349 **-H** Take actions based on the type and contents of the file referenced by any symbolic  
84350 link specified as a *source\_file* operand.
- 84351 **-i** Write a prompt to standard error before copying to any existing non-directory  
84352 destination file. If the response from the standard input is affirmative, the copy  
84353 shall be attempted; otherwise, it shall not.

|       |                              |                                                                                                                                                                                                                                      |
|-------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 84354 | –L                           | Take actions based on the type and contents of the file referenced by any symbolic link specified as a <i>source_file</i> operand or any symbolic links encountered during traversal of a file hierarchy.                            |
| 84355 |                              |                                                                                                                                                                                                                                      |
| 84356 |                              |                                                                                                                                                                                                                                      |
| 84357 | –P                           | Take actions on any symbolic link specified as a <i>source_file</i> operand or any symbolic link encountered during traversal of a file hierarchy.                                                                                   |
| 84358 |                              |                                                                                                                                                                                                                                      |
| 84359 | –p                           | Duplicate the following characteristics of each source file in the corresponding destination file:                                                                                                                                   |
| 84360 |                              |                                                                                                                                                                                                                                      |
| 84361 |                              | 1. The time of last data modification and time of last access. If this duplication fails for any reason, <i>cp</i> shall write a diagnostic message to standard error.                                                               |
| 84362 |                              |                                                                                                                                                                                                                                      |
| 84363 |                              | 2. The user ID and group ID. If this duplication fails for any reason, it is unspecified whether <i>cp</i> writes a diagnostic message to standard error.                                                                            |
| 84364 |                              |                                                                                                                                                                                                                                      |
| 84365 |                              | 3. The file permission bits and the S_ISUID and S_ISGID bits. Other, implementation-defined, bits may be duplicated as well. If this duplication fails for any reason, <i>cp</i> shall write a diagnostic message to standard error. |
| 84366 |                              |                                                                                                                                                                                                                                      |
| 84367 |                              |                                                                                                                                                                                                                                      |
| 84368 |                              | If the user ID or the group ID cannot be duplicated, the file permission bits S_ISUID and S_ISGID shall be cleared. If these bits are present in the source file but                                                                 |
| 84369 |                              | are not duplicated in the destination file, it is unspecified whether <i>cp</i> writes a                                                                                                                                             |
| 84370 |                              | diagnostic message to standard error.                                                                                                                                                                                                |
| 84371 |                              |                                                                                                                                                                                                                                      |
| 84372 |                              | The order in which the preceding characteristics are duplicated is unspecified. The                                                                                                                                                  |
| 84373 |                              | <i>dest_file</i> shall not be deleted if these characteristics cannot be preserved.                                                                                                                                                  |

| 84430 |                               |                                                                                                                                                                                                                                                                                                                                                          |

**APPLICATION USAGE**

The set-user-ID and set-group-ID bits are explicitly cleared when files are created. This is to prevent users from creating programs that are set-user-ID or set-group-ID to them when copying files or to make set-user-ID or set-group-ID files accessible to new groups of users. For example, if a file is set-user-ID and the copy has a different group ID than the source, a new group of users has execute permission to a set-user-ID program than did previously. In particular, this is a problem for superusers copying users' trees.

**EXAMPLES**

None.

**RATIONALE**

The `-i` option exists on BSD systems, giving applications and users a way to avoid accidentally removing files when copying. Although the 4.3 BSD version does not prompt if the standard input is not a terminal, the standard developers decided that use of `-i` is a request for interaction, so when the destination path exists, the utility takes instructions from whatever responds on standard input.

The exact format of the interactive prompts is unspecified. Only the general nature of the contents of prompts are specified because implementations may desire more descriptive prompts than those used on historical implementations. Therefore, an application using the `-i` option relies on the system to provide the most suitable dialog directly with the user, based on the behavior specified.

The `-p` option is historical practice on BSD systems, duplicating the time of last data modification and time of last access. This volume of POSIX.1-2008 extends it to preserve the user and group IDs, as well as the file permissions. This requirement has obvious problems in that the directories are almost certainly modified after being copied. This volume of POSIX.1-2008 requires that the modification times be preserved. The statement that the order in which the characteristics are duplicated is unspecified is to permit implementations to provide the maximum amount of security for the user. Implementations should take into account the obvious security issues involved in setting the owner, group, and mode in the wrong order or creating files with an owner, group, or mode different from the final value.

It is unspecified whether `cp` writes diagnostic messages when the user and group IDs cannot be set due to the widespread practice of users using `-p` to duplicate some portion of the file characteristics, indifferent to the duplication of others. Historic implementations only write diagnostic messages on errors other than [EPERM].

Earlier versions of this standard included support for the `-r` option to copy file hierarchies. The `-r` option is historical practice on BSD and BSD-derived systems. This option is no longer specified by POSIX.1-2008 but may be present in some implementations. The `-R` option was added as a close synonym to the `-r` option, selected for consistency with all other options in this volume of POSIX.1-2008 that do recursive directory descent.

The difference between `-R` and the removed `-r` option is in the treatment by `cp` of file types other than regular and directory. It was implementation-defined how the `-` option treated special files to allow both historical implementations and those that chose to support `-r` with the same abilities as `-R` defined by this volume of POSIX.1-2008. The original `-r` flag, for historic reasons, did not handle special files any differently from regular files, but always read the file and copied its contents. This had obvious problems in the presence of special file types; for example, character devices, FIFOs, and sockets.

When a failure occurs during the copying of a file hierarchy, `cp` is required to attempt to copy files that are on the same level in the hierarchy or above the file where the failure occurred. It is unspecified if `cp` shall attempt to copy files below the file where the failure occurred (which

cannot succeed in any case).

Permissions, owners, and groups of created special file types have been deliberately left as implementation-defined. This is to allow systems to satisfy special requirements (for example, allowing users to create character special devices, but requiring them to be owned by a certain group). In general, it is strongly suggested that the permissions, owner, and group be the same as if the user had run the historical *mknod*, *ln*, or other utility to create the file. It is also probable that additional privileges are required to create block, character, or other implementation-defined special file types.

Additionally, the *-p* option explicitly requires that all set-user-ID and set-group-ID permissions be discarded if any of the owner or group IDs cannot be set. This is to keep users from unintentionally giving away special privilege when copying programs.

When creating regular files, historical versions of *cp* use the mode of the source file as modified by the file mode creation mask. Other choices would have been to use the mode of the source file unmodified by the creation mask or to use the same mode as would be given to a new file created by the user (plus the execution bits of the source file) and then modify it by the file mode creation mask. In the absence of any strong reason to change historic practice, it was in large part retained.

When creating directories, historical versions of *cp* use the mode of the source directory, plus read, write, and search bits for the owner, as modified by the file mode creation mask. This is done so that *cp* can copy trees where the user has read permission, but the owner does not. A side-effect is that if the file creation mask denies the owner permissions, *cp* fails. Also, once the copy is done, historical versions of *cp* set the permissions on the created directory to be the same as the source directory, unmodified by the file creation mask.

This behavior has been modified so that *cp* is always able to create the contents of the directory, regardless of the file creation mask. After the copy is done, the permissions are set to be the same as the source directory, as modified by the file creation mask. This latter change from historical behavior is to prevent users from accidentally creating directories with permissions beyond those they would normally set and for consistency with the behavior of *cp* in creating files.

It is not a requirement that *cp* detect attempts to copy a file to itself; however, implementations are strongly encouraged to do so. Historical implementations have detected the attempt in most cases.

There are two methods of copying subtrees in this volume of POSIX.1-2008. The other method is described as part of the *pax* utility (see *pax*). Both methods are historical practice. The *cp* utility provides a simpler, more intuitive interface, while *pax* offers a finer granularity of control. Each provides additional functionality to the other; in particular, *pax* maintains the hard-link structure of the hierarchy, while *cp* does not. It is the intention of the standard developers that the results be similar (using appropriate option combinations in both utilities). The results are not required to be identical; there seemed insufficient gain to applications to balance the difficulty of implementations having to guarantee that the results would be exactly identical.

The wording allowing *cp* to copy a directory to implementation-defined file types not specified by the System Interfaces volume of POSIX.1-2008 is provided so that implementations supporting symbolic links are not required to prohibit copying directories to symbolic links. Other extensions to the System Interfaces volume of POSIX.1-2008 file types may need to use this loophole as well.

**84523 FUTURE DIRECTIONS**

84524 None.

**84529 CHANGE HISTORY**

84530 First released in Issue 2.

**84531 Issue 6**

84532 The **-r** option is marked obsolescent.

84533 The new options **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These  
84534 options affect the processing of symbolic links.

84535 IEEE PASC Interpretation 1003.2 #194 is applied, adding a description of the **-P** option.

84536 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/18 is applied, correcting an error in the  
84537 SEE ALSO section.

**84538 Issue 7**

84539 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
84540 *LC\_MESSAGES* environment variable.

84541 Austin Group Interpretations 1003.1-2001 #092, #164, #165, and #168 are applied.

84542 SD5-XCU-ERN-31 and SD5-XCU-ERN-42 are applied, updating the DESCRIPTION.

84543 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84544 SD5-XCU-ERN-102 is applied, clarifying the **-i** option within the OPTIONS section.

84545 The obsolescent **-r** option is removed.

84546 The **-P** option is added to the SYNOPSIS and to the DESCRIPTION with respect to the **-R**  
84547 option.

84548 **NAME**

84549 crontab — schedule periodic background work

84550 **SYNOPSIS**84551 crontab [*file*]84552 UP crontab [**-e** | **-l** | **-r**]84553 **DESCRIPTION**

84554 UP The *crontab* utility shall create, replace, or edit a user's crontab entry; a crontab entry is a list of  
 84555 commands and the times at which they shall be executed. The new crontab entry can be input by  
 84556 UP specifying *file* or input from standard input if no *file* operand is specified, or by using an editor,  
 84557 if **-e** is specified.

84558 Upon execution of a command from a crontab entry, the implementation shall supply a default  
 84559 environment, defining at least the following environment variables:

84560 *HOME* A pathname of the user's home directory.

84561 *LOGNAME* The user's login name.

84562 *PATH* A string representing a search path guaranteed to find all of the standard utilities.

84563 *SHELL* A pathname of the command interpreter. When *crontab* is invoked as specified by  
 84564 this volume of POSIX.1-2008, the value shall be a pathname for *sh*.

84565 The values of these variables when *crontab* is invoked as specified by this volume of  
 84566 POSIX.1-2008 shall not affect the default values provided when the scheduled command is run.

84567 If standard output and standard error are not redirected by commands executed from the  
 84568 crontab entry, any generated output or errors shall be mailed, via an implementation-defined  
 84569 method, to the user.

84570 XSI Users shall be permitted to use *crontab* if their names appear in the file **cron.allow** which is  
 84571 located in an implementation-defined directory. If that file does not exist, the file **cron.deny**,  
 84572 which is located in an implementation-defined directory, shall be checked to determine whether  
 84573 the user shall be denied access to *crontab*. If neither file exists, only a process with appropriate  
 84574 privileges shall be allowed to submit a job. If only **cron.deny** exists and is empty, global usage  
 84575 shall be permitted. The **cron.allow** and **cron.deny** files shall consist of one user name per line.

84576 **OPTIONS**

84577 The *crontab* utility shall conform to XBD [Section 12.2](#) (on page 216).

84578 The following options shall be supported:

84579 UP **-e** Edit a copy of the invoking user's crontab entry, or create an empty entry to edit if  
 84580 the crontab entry does not exist. When editing is complete, the entry shall be  
 84581 installed as the user's crontab entry.

84582 **-l** (The letter ell.) List the invoking user's crontab entry.

84583 **-r** Remove the invoking user's crontab entry.

84584 **OPERANDS**

84585 The following operand shall be supported:

84586 *file* The pathname of a file that contains specifications, in the format defined in the  
 84587 INPUT FILES section, for crontab entries.

**STDIN**

See the INPUT FILES section.

**INPUT FILES**

In the POSIX locale, the user or application shall ensure that a crontab entry is a text file consisting of lines of six fields each. The fields shall be separated by <blank> characters. The first five fields shall be integer patterns that specify the following:

1. Minute [0,59]
2. Hour [0,23]
3. Day of the month [1,31]
4. Month of the year [1,12]
5. Day of the week ([0,6] with 0=Sunday)

Each of these patterns can be either an <asterisk> (meaning all valid values), an element, or a list of elements separated by <comma> characters. An element shall be either a number or two numbers separated by a <hyphen-minus> (meaning an inclusive range). The specification of days can be made by two fields (day of the month and day of the week). If month, day of month, and day of week are all <asterisk> characters, every day shall be matched. If either the month or day of month is specified as an element or list, but the day of week is an <asterisk>, the month and day of month fields shall specify the days that match. If both month and day of month are specified as an <asterisk>, but day of week is an element or list, then only the specified days of the week match. Finally, if either the month or day of month is specified as an element or list, and the day of week is also specified as an element or list, then any day matching either the month and day of month, or the day of week, shall be matched.

The sixth field of a line in a crontab entry is a string that shall be executed by *sh* at the specified times. A <percent-sign> character in this field shall be translated to a <newline>. Any character preceded by a <backslash> (including the ' % ') shall cause that character to be treated literally. Only the first line (up to a ' % ' or end-of-line) of the command field shall be executed by the command interpreter. The other lines shall be made available to the command as standard input.

Blank lines and those whose first non-<blank> is ' # ' shall be ignored.

XSI

The text files **cron.allow** and **cron.deny**, which are located in an implementation-defined directory, shall contain zero or more user names, one per line, of users who are, respectively, authorized or denied access to the service underlying the *crontab* utility.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *crontab*:

- |                 |                                                                                                                                                                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>EDITOR</i>   | Determine the editor to be invoked when the <b>-e</b> option is specified. The default editor shall be <i>vi</i> .                                                                                                                                 |
| <i>LANG</i>     | Provide a default value for the internationalization variables that are unset or null. (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.) |
| <i>LC_ALL</i>   | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                           |
| <i>LC_CTYPE</i> | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).                                                          |

84631 *LC\_MESSAGES*  
 84632 Determine the locale that should be used to affect the format and contents of  
 84633 diagnostic messages written to standard error.

84634 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

84635 **ASYNCHRONOUS EVENTS**  
 84636 Default.

84637 **STDOUT**  
 84638 If the *-l* option is specified, the crontab entry shall be written to the standard output.

84639 **STDERR**  
 84640 The standard error shall be used only for diagnostic messages.

84641 **OUTPUT FILES**  
 84642 None.

84643 **EXTENDED DESCRIPTION**  
 84644 None.

84645 **EXIT STATUS**  
 84646 The following exit values shall be returned:  
 84647 0 Successful completion.  
 84648 >0 An error occurred.

84649 **CONSEQUENCES OF ERRORS**  
 84650 UP The user's crontab entry is not submitted, removed, *edited*, or listed.

84651 **APPLICATION USAGE**  
 84652 The format of the crontab entry shown here is guaranteed only for the POSIX locale. Other  
 84653 cultures may be supported with substantially different interfaces, although implementations are  
 84654 encouraged to provide comparable levels of functionality.

84655 The default settings of the *HOME*, *LOGNAME*, *PATH*, and *SHELL* variables that are given to the  
 84656 scheduled job are not affected by the settings of those variables when *crontab* is run; as stated,  
 84657 they are defaults. The text about "invoked as specified by this volume of POSIX.1-2008" means  
 84658 that the implementation may provide extensions that allow these variables to be affected at  
 84659 runtime, but that the user has to take explicit action in order to access the extension, such as give  
 84660 a new option flag or modify the format of the crontab entry.

84661 A typical user error is to type only *crontab*; this causes the system to wait for the new crontab  
 84662 entry on standard input. If end-of-file is typed (generally <control>-D), the crontab entry is  
 84663 replaced by an empty file. In this case, the user should type the interrupt character, which  
 84664 prevents the crontab entry from being replaced.

84665 **EXAMPLES**

84666 1. Clean up **core** files every weekday morning at 3:15 am:  
 84667 15 3 \* \* 1-5 find "\$HOME" -name core -exec rm -f {} + 2>/dev/null

84668 2. Mail a birthday greeting:  
 84669 0 12 14 2 \* mailx john%Happy Birthday!%Time for lunch.

84670 3. As an example of specifying the two types of days:  
 84671 0 0 1,15 \* 1

84672 would run a command on the first and fifteenth of each month, as well as on every  
84673 Monday. To specify days by only one field, the other field should be set to '\*'; for  
84674 example:

84675 0 0 \* \* 1

84676 would run a command only on Mondays.

#### 84677 RATIONALE

84678 All references to a *cron* daemon and to *cron files* have been omitted. Although historical  
84679 implementations have used this arrangement, there is no reason to limit future implementations.

84680 This description of *crontab* is designed to support only users with normal privileges. The format  
84681 of the input is based on the System V *crontab*; however, there is no requirement here that the  
84682 actual system database used by the *cron* daemon (or a similar mechanism) use this format  
84683 internally. For example, systems derived from BSD are likely to have an additional field  
84684 appended that indicates the user identity to be used when the job is submitted.

84685 The *-e* option was adopted from the SVID as a user convenience, although it does not exist in all  
84686 historical implementations.

#### 84687 FUTURE DIRECTIONS

84688 None.

#### 84689 SEE ALSO

84690 *at*

84691 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

#### 84692 CHANGE HISTORY

84693 First released in Issue 2.

#### 84694 Issue 6

84695 This utility is marked as part of the User Portability Utilities option.

84696 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 84697 Issue 7

84698 The *crontab* utility (except for the *-e* option) is moved from the User Portability Utilities option  
84699 to the Base. User Portability Utilities is now an option for interactive utilities.

84700 SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced  
84701 by the *crontab* utility.

84702 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84703 The first example is changed to remove the unreliable use of *find | xargs*.

84704 **NAME**

84705       csplit — split files based on context

84706 **SYNOPSIS**84707       csplit [-ks] [-f *prefix*] [-n *number*] *file arg...*84708 **DESCRIPTION**84709       The *csplit* utility shall read the file named by the *file* operand, write all or part of that file into  
84710       other files as directed by the *arg* operands, and write the sizes of the files.84711 **OPTIONS**84712       The *csplit* utility shall conform to XBD [Section 12.2](#) (on page 216).

84713       The following options shall be supported:

84714       **-f** *prefix*     Name the created files *prefix00*, *prefix01*, ..., *prefixn*. The default is *xx00* ... *xxn*. If  
84715       the *prefix* argument would create a filename exceeding {NAME\_MAX} bytes, an  
84716       error shall result, *csplit* shall exit with a diagnostic message, and no files shall be  
84717       created.84718       **-k**            Leave previously created files intact. By default, *csplit* shall remove created files if  
84719       an error occurs.84720       **-n** *number*    Use *number* decimal digits to form filenames for the file pieces. The default shall be  
84721       2.84722       **-s**            Suppress the output of file size messages.84723 **OPERANDS**

84724       The following operands shall be supported:

84725       *file*           The pathname of a text file to be split. If *file* is '-', the standard input shall be  
84726       used.84727       Each *arg* operand can be one of the following:84728       /*regexp*/[*offset*]84729       A file shall be created using the content of the lines from the current line up to, but  
84730       not including, the line that results from the evaluation of the regular expression  
84731       with *offset*, if any, applied. The regular expression *regexp* shall follow the rules for  
84732       basic regular expressions described in XBD [Section 9.3](#) (on page 183). The  
84733       application shall use the sequence "\/" to specify a <slash> character within the  
84734       *regexp*. The optional offset shall be a positive or negative integer value representing a  
84735       number of lines. A positive integer value can be preceded by '+'. If the selection  
84736       of lines from an *offset* expression of this type would create a file with zero lines, or  
84737       one with greater than the number of lines left in the input file, the results are  
84738       unspecified. After the section is created, the current line shall be set to the line that  
84739       results from the evaluation of the regular expression with any offset applied. If the  
84740       current line is the first line in the file and a regular expression operation has not yet  
84741       been performed, the pattern match of *regexp* shall be applied from the current line to  
84742       the end of the file. Otherwise, the pattern match of *regexp* shall be applied from the  
84743       line following the current line to the end of the file.84744       %*regexp*%[*offset*]84745       Equivalent to /*regexp*/[*offset*], except that no file shall be created for the selected  
84746       section of the input file. The application shall use the sequence "%%" to specify a  
84747       <percent-sign> character within the *regexp*.

84748 *line\_no* Create a file from the current line up to (but not including) the line number *line\_no*.  
 84749 Lines in the file shall be numbered starting at one. The current line becomes  
 84750 *line\_no*.

84751 {*num*} Repeat operand. This operand can follow any of the operands described  
 84752 previously. If it follows a *rexp* type operand, that operand shall be applied *num*  
 84753 more times. If it follows a *line\_no* operand, the file shall be split every *line\_no* lines,  
 84754 *num* times, from that point.

84755 An error shall be reported if an operand does not reference a line between the current position  
 84756 and the end of the file.

## 84757 STDIN

84758 See the INPUT FILES section.

## 84759 INPUT FILES

84760 The input file shall be a text file.

## 84761 ENVIRONMENT VARIABLES

84762 The following environment variables shall affect the execution of *csplit*:

84763 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 84764 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 84765 variables used to determine the values of locale categories.)

84766 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 84767 internationalization variables.

84768 *LC\_COLLATE*  
 84769 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 84770 character collating elements within regular expressions.

84771 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 84772 characters (for example, single-byte as opposed to multi-byte characters in  
 84773 arguments and input files) and the behavior of character classes within regular  
 84774 expressions.

84775 *LC\_MESSAGES*  
 84776 Determine the locale that should be used to affect the format and contents of  
 84777 diagnostic messages written to standard error.

84778 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 84779 ASYNCHRONOUS EVENTS

84780 If the *-k* option is specified, created files shall be retained. Otherwise, the default action occurs.

## 84781 STDOUT

84782 Unless the *-s* option is used, the standard output shall consist of one line per file created, with a  
 84783 format as follows:

84784 "%d\n", <file size in bytes>

## 84785 STDERR

84786 The standard error shall be used only for diagnostic messages.

## 84787 OUTPUT FILES

84788 The output files shall contain portions of the original input file; otherwise, unchanged.

84789 **EXTENDED DESCRIPTION**

84790 None.

84791 **EXIT STATUS**

84792 The following exit values shall be returned:

84793 0 Successful completion.

84794 &gt;0 An error occurred.

84795 **CONSEQUENCES OF ERRORS**

84796 By default, created files shall be removed if an error occurs. When the **-k** option is specified,  
 84797 created files shall not be removed if an error occurs.

84798 **APPLICATION USAGE**

84799 None.

84800 **EXAMPLES**84801 1. This example creates four files, **cobol00** ... **cobol03**:84802 `csplit -f cobol file '/procedure division/' /par5./ /par16./`

84803 After editing the split files, they can be recombined as follows:

84804 `cat cobol0[0-3] > file`

84805 Note that this example overwrites the original file.

84806 2. This example would split the file after the first 99 lines, and every 100 lines thereafter, up  
 84807 to 9999 lines; this is because lines in the file are numbered from 1 rather than zero, for  
 84808 historical reasons:

84809 `csplit -k file 100 {99}`

84810 3. Assuming that **prog.c** follows the C-language coding convention of ending routines with  
 84811 a '}' at the beginning of the line, this example creates a file containing each separate C  
 84812 routine (up to 21) in **prog.c**:

84813 `csplit -k prog.c '%main(%' '/^}'+1' {20}`84814 **RATIONALE**84815 The **-n** option was added to extend the range of filenames that could be handled.

84816 Consideration was given to adding a **-a** flag to use the alphabetic filename generation used by  
 84817 the historical *split* utility, but the functionality added by the **-n** option was deemed to make  
 84818 alphabetic naming unnecessary.

84819 **FUTURE DIRECTIONS**

84820 None.

84821 **SEE ALSO**84822 *sed*, *split*84823 XBD [Chapter 8](#) (on page 173), [Section 9.3](#) (on page 183), [Section 12.2](#) (on page 216)84824 **CHANGE HISTORY**

84825 First released in Issue 2.

84826 **Issue 5**

84827 The FUTURE DIRECTIONS section is added.

84828 **Issue 6**

84829 This utility is marked as part of the User Portability Utilities option.

84830 The APPLICATION USAGE section is added.

84831 The description of regular expression operands is changed to align with the IEEE P1003.2b draft  
84832 standard.

84833 The normative text is reworded to avoid use of the term “must” for application requirements.

84834 **Issue 7**

84835 The *csplit* utility is moved from the User Portability Utilities option to the Base. User Portability  
84836 Utilities is now an option for interactive utilities.

84837 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84838 The SYNOPSIS and OPERANDS sections are revised to use a single *arg* to split a file into two  
84839 pieces.

84840 **NAME**84841 `ctags` — create a tags file (**DEVELOPMENT**, **FORTTRAN**)84842 **SYNOPSIS**84843 SD `ctags [-a] [-f tagsfile] pathname...`84844 `ctags -x pathname...`84845 **DESCRIPTION**

84846 The *ctags* utility shall be provided on systems that support the the Software Development  
 84847 Utilities option, and either or both of the C-Language Development Utilities option and  
 84848 FORTRAN Development Utilities option. On other systems, it is optional.

84849 The *ctags* utility shall write a *tagsfile* or an index of objects from C-language or FORTRAN source  
 84850 files specified by the *pathname* operands. The *tagsfile* shall list the locators of language-specific  
 84851 objects within the source files. A locator consists of a name, *pathname*, and either a search  
 84852 pattern or a line number that can be used in searching for the object definition. The objects that  
 84853 shall be recognized are specified in the EXTENDED DESCRIPTION section.

84854 **OPTIONS**84855 The *ctags* utility shall conform to XBD [Section 12.2](#) (on page 216).

84856 The following options shall be supported:

84857 **-a** Append to *tagsfile*.

84858 **-f** *tagsfile* Write the object locator lists into *tagsfile* instead of the default file named **tags** in the  
 84859 current directory.

84860 **-x** Produce a list of object names, the line number, and filename in which each is  
 84861 defined, as well as the text of that line, and write this to the standard output. A  
 84862 *tagsfile* shall not be created when **-x** is specified.

84863 **OPERANDS**84864 The following *pathname* operands are supported:

84865 *file.c* Files with basenames ending with the **.c** suffix shall be treated as C-language  
 84866 source code. Such files that are not valid input to *c99* produce unspecified results.

84867 *file.h* Files with basenames ending with the **.h** suffix shall be treated as C-language  
 84868 source code. Such files that are not valid input to *c99* produce unspecified results.

84869 *file.f* Files with basenames ending with the **.f** suffix shall be treated as FORTRAN-  
 84870 language source code. Such files that are not valid input to *fort77* produce  
 84871 unspecified results.

84872 The handling of other files is implementation-defined.

84873 **STDIN**

84874 See the INPUT FILES section.

84875 **INPUT FILES**

84876 The input files shall be text files containing source code in the language indicated by the  
 84877 operand filename suffixes.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *ctags*:

**LANG** Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

**LC\_ALL** If set to a non-empty string value, override the values of all the other internationalization variables.

**LC\_COLLATE**

Determine the order in which output is sorted for the *-x* option. The POSIX locale determines the order in which the *tagsfile* is written.

**LC\_CTYPE**

Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files). When processing C-language source code, if the locale is not compatible with the C locale described by the ISO C standard, the results are unspecified.

**LC\_MESSAGES**

Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

**XSI NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**ASYNCHRONOUS EVENTS**

Default.

**STDOUT**

The list of object name information produced by the *-x* option shall be written to standard output in the following format:

"%s %d %s %s", <object-name>, <line-number>, <filename>, <text>

where <text> is the text of line <line-number> of file <filename>.

**STDERR**

The standard error shall be used only for diagnostic messages.

**OUTPUT FILES**

When the *-x* option is not specified, the format of the output file shall be:

"%s\t%s\t/%s/\n", <identifier>, <filename>, <pattern>

where <pattern> is a search pattern that could be used by an editor to find the defining instance of <identifier> in <filename> (where *defining instance* is indicated by the declarations listed in the EXTENDED DESCRIPTION).

An optional <circumflex> ('^') can be added as a prefix to <pattern>, and an optional <dollar-sign> can be appended to <pattern> to indicate that the pattern is anchored to the beginning (end) of a line of text. Any <slash> or <backslash> characters in <pattern> shall be preceded by a <backslash> character. The anchoring <circumflex>, <dollar-sign>, and escaping <backslash> characters shall not be considered part of the search pattern. All other characters in the search pattern shall be considered literal characters.

84918 An alternative format is:

84919 "%s\t%s\t%s?\n", <identifier>, <filename>, <pattern>

84920 which is identical to the first format except that <slash> characters in <pattern> shall not be  
84921 preceded by escaping <backslash> characters, and <question-mark> characters in <pattern>  
84922 shall be preceded by <backslash> characters.

84923 A second alternative format is:

84924 "%s\t%s\t%d\n", <identifier>, <filename>, <lineno>

84925 where <lineno> is a decimal line number that could be used by an editor to find <identifier> in  
84926 <filename>.

84927 Neither alternative format shall be produced by *ctags* when it is used as described by  
84928 POSIX.1-2008, but the standard utilities that process tags files shall be able to process those  
84929 formats as well as the first format.

84930 In any of these formats, the file shall be sorted by identifier, based on the collation sequence in  
84931 the POSIX locale.

## 84932 EXTENDED DESCRIPTION

84933 If the operand identifies C-language source, the *ctags* utility shall attempt to produce an output  
84934 line for each of the following objects:

- 84935 • Function definitions
- 84936 • Type definitions
- 84937 • Macros with arguments

84938 It may also produce output for any of the following objects:

- 84939 • Function prototypes
- 84940 • Structures
- 84941 • Unions
- 84942 • Global variable definitions
- 84943 • Enumeration types
- 84944 • Macros without arguments
- 84945 • **#define** statements
- 84946 • **#line** statements

84947 Any **#if** and **#ifdef** statements shall produce no output. The tag **main** is treated specially in C  
84948 programs. The tag formed shall be created by prefixing **M** to the name of the file, with the  
84949 trailing **.c**, and leading pathname components (if any) removed.

84950 On systems that do not support the C-Language Development Utilities option, *ctags* produces  
84951 unspecified results for C-language source code files. It should write to standard error a message  
84952 identifying this condition and cause a non-zero exit status to be produced.

84953 If the operand identifies FORTRAN source, the *ctags* utility shall produce an output line for each  
84954 function definition. It may also produce output for any of the following objects:

- 84955 • Subroutine definitions

- 84956 • COMMON statements
- 84957 • PARAMETER statements
- 84958 • DATA and BLOCK DATA statements
- 84959 • Statement numbers

84960 On systems that do not support the FORTRAN Development Utilities option, *ctags* produces  
 84961 unspecified results for FORTRAN source code files. It should write to standard error a message  
 84962 identifying this condition and cause a non-zero exit status to be produced.

84963 It is implementation-defined what other objects (including duplicate identifiers) produce output.

#### 84964 EXIT STATUS

84965 The following exit values shall be returned:

- 84966 0 Successful completion.
- 84967 >0 An error occurred.

#### 84968 CONSEQUENCES OF ERRORS

84969 Default.

#### 84970 APPLICATION USAGE

84971 The output with `-x` is meant to be a simple index that can be written out as an off-line readable  
 84972 function index. If the input files to *ctags* (such as `.c` files) were not created using the same locale  
 84973 as that in effect when *ctags -x* is run, results might not be as expected.

84974 The description of C-language processing says “attempts to” because the C language can be  
 84975 greatly confused, especially through the use of `#defines`, and this utility would be of no use if  
 84976 the real C preprocessor were run to identify them. The output from *ctags* may be fooled and  
 84977 incorrect for various constructs.

#### 84978 EXAMPLES

84979 None.

#### 84980 RATIONALE

84981 The option list was significantly reduced from that provided by historical implementations. The  
 84982 `-F` option was omitted as redundant, since it is the default. The `-B` option was omitted as being  
 84983 of very limited usefulness. The `-t` option was omitted since the recognition of `typedefs` is now  
 84984 required for C source files. The `-u` option was omitted because the update function was judged  
 84985 to be not only inefficient, but also rarely needed.

84986 An early proposal included a `-w` option to suppress warning diagnostics. Since the types of such  
 84987 diagnostics could not be described, the option was omitted as being not useful.

84988 The text for `LC_CTYPE` about compatibility with the C locale acknowledges that the ISO C  
 84989 standard imposes requirements on the locale used to process C source. This could easily be a  
 84990 superset of that known as “the C locale” by way of implementation extensions, or one of a few  
 84991 alternative locales for systems supporting different codesets. No statement is made for  
 84992 FORTRAN because the ANSI X3.9-1978 standard (FORTRAN 77) does not (yet) define a similar  
 84993 locale concept. However, a general rule in this volume of POSIX.1-2008 is that any time that  
 84994 locales do not match (preparing a file for one locale and processing it in another), the results are  
 84995 suspect.

84996 The collation sequence of the tags file is not affected by `LC_COLLATE` because it is typically not  
 84997 used by human readers, but only by programs such as *vi* to locate the tag within the source files.  
 84998 Using the POSIX locale eliminates some of the problems of coordinating locales between the  
 84999 *ctags* file creator and the *vi* file reader.

Historically, the tags file has been used only by *ex* and *vi*. However, the format of the tags file has been published to encourage other programs to use the tags in new ways. The format allows either patterns or line numbers to find the identifiers because the historical *vi* recognizes either. The *ctags* utility does not produce the format using line numbers because it is not useful following any source file changes that add or delete lines. The documented search patterns match historical practice. It should be noted that literal leading `<circumflex>` or trailing `<dollar-sign>` characters in the search pattern will only behave correctly if anchored to the beginning of the line or end of the line by an additional `<circumflex>` or `<dollar-sign>` character.

Historical implementations also understand the objects used by the languages Pascal and sometimes LISP, and they understand the C source output by *lex* and *yacc*. The *ctags* utility is not required to accommodate these languages, although implementors are encouraged to do so.

The following historical option was not specified, as *vgrind* is not included in this volume of POSIX.1-2008:

**-v** If the `-v` flag is given, an index of the form expected by *vgrind* is produced on the standard output. This listing contains the function name, filename, and page number (assuming 64-line pages). Since the output is sorted into lexicographic order, it may be desired to run the output through *sort -f*. Sample use:

```
ctags -v files | sort -f > index vgrind -x index
```

The special treatment of the tag **main** makes the use of *ctags* practical in directories with more than one program.

## FUTURE DIRECTIONS

None.

XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

## CHANGE HISTORY

First released in Issue 4.

### Issue 5

The FUTURE DIRECTIONS section is added.

### Issue 6

This utility is marked as part of the User Portability Utilities option.

The OUTPUT FILES section is changed to align with the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE PASC Interpretation 1003.2 #168 is applied, changing “create” to “write” in the DESCRIPTION.

### Issue 7

The *ctags* utility is no longer dependent on support for the User Portability Utilities option.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**NAME**

cut — cut out selected fields of each line of a file

**SYNOPSIS**

cut -b *list* [-n] [*file...*]

cut -c *list* [*file...*]

cut -f *list* [-d *delim*] [-s] [*file...*]

**DESCRIPTION**

The *cut* utility shall cut out bytes (**-b** option), characters (**-c** option), or character-delimited fields (**-f** option) from each line in one or more files, concatenate them, and write them to standard output.

**OPTIONS**

The *cut* utility shall conform to XBD [Section 12.2](#) (on page 216).

The application shall ensure that the option-argument *list* (see options **-b**, **-c**, and **-f** below) is a <comma>-separated list or <blank>-separated list of positive numbers and ranges. Ranges can be in three forms. The first is two positive numbers separated by a <hyphen-minus> (*low-high*), which represents all fields from the first number to the second number. The second is a positive number preceded by a <hyphen-minus> (*-high*), which represents all fields from field number 1 to that number. The third is a positive number followed by a <hyphen-minus> (*low-*), which represents that number to the last field, inclusive. The elements in *list* can be repeated, can overlap, and can be specified in any order, but the bytes, characters, or fields selected shall be written in the order of the input data. If an element appears in the selection list more than once, it shall be written exactly once.

The following options shall be supported:

**-b list** Cut based on a *list* of bytes. Each selected byte shall be output unless the **-n** option is also specified. It shall not be an error to select bytes not present in the input line.

**-c list** Cut based on a *list* of characters. Each selected character shall be output. It shall not be an error to select characters not present in the input line.

**-d delim** Set the field delimiter to the character *delim*. The default is the <tab>.

**-f list** Cut based on a *list* of fields, assumed to be separated in the file by a delimiter character (see **-d**). Each selected field shall be output. Output fields shall be separated by a single occurrence of the field delimiter character. Lines with no field delimiters shall be passed through intact, unless **-s** is specified. It shall not be an error to select fields not present in the input line.

**-n** Do not split characters. When specified with the **-b** option, each element in *list* of the form *low-high* (<hyphen-minus>-separated numbers) shall be modified as follows:

- If the byte selected by *low* is not the first byte of a character, *low* shall be decremented to select the first byte of the character originally selected by *low*. If the byte selected by *high* is not the last byte of a character, *high* shall be decremented to select the last byte of the character prior to the character originally selected by *high*, or zero if there is no prior character. If the resulting range element has *high* equal to zero or *low* greater than *high*, the list element shall be dropped from *list* for that input line without causing an error.

Each element in *list* of the form *low-* shall be treated as above with *high* set to the

85083 number of bytes in the current line, not including the terminating <newline>. Each  
 85084 element in *list* of the form *-high* shall be treated as above with *low* set to 1. Each  
 85085 element in *list* of the form *num* (a single number) shall be treated as above with *low*  
 85086 set to *num* and *high* set to *num*.

85087 **-s** Suppress lines with no delimiter characters, when used with the **-f** option. Unless  
 85088 specified, lines with no delimiters shall be passed through untouched.

## 85089 OPERANDS

85090 The following operand shall be supported:

85091 *file* A pathname of an input file. If no *file* operands are specified, or if a *file* operand is  
 85092 '*-*', the standard input shall be used.

## 85093 STDIN

85094 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '*-*'.  
 85095 See the INPUT FILES section.

## 85096 INPUT FILES

85097 The input files shall be text files, except that line lengths shall be unlimited.

## 85098 ENVIRONMENT VARIABLES

85099 The following environment variables shall affect the execution of *cut*:

85100 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 85101 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 85102 variables used to determine the values of locale categories.)

85103 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 85104 internationalization variables.

85105 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 85106 characters (for example, single-byte as opposed to multi-byte characters in  
 85107 arguments and input files).

85108 *LC\_MESSAGES*

85109 Determine the locale that should be used to affect the format and contents of  
 85110 diagnostic messages written to standard error.

85111 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 85112 ASYNCHRONOUS EVENTS

85113 Default.

## 85114 STDOUT

85115 The *cut* utility output shall be a concatenation of the selected bytes, characters, or fields (one of  
 85116 the following):

85117 "%s\n", <concatenation of bytes>

85118 "%s\n", <concatenation of characters>

85119 "%s\n", <concatenation of fields and field delimiters>

## 85120 STDERR

85121 The standard error shall be used only for diagnostic messages.

85122 **OUTPUT FILES**

85123 None.

85124 **EXTENDED DESCRIPTION**

85125 None.

85126 **EXIT STATUS**

85127 The following exit values shall be returned:

85128 0 All input files were output successfully.

85129 &gt;0 An error occurred.

85130 **CONSEQUENCES OF ERRORS**

85131 Default.

85132 **APPLICATION USAGE**

85133 The *cut* and *fold* utilities can be used to create text files out of files with arbitrary line lengths.  
 85134 The *cut* utility should be used when the number of lines (or records) needs to remain constant.  
 85135 The *fold* utility should be used when the contents of long lines need to be kept contiguous.

85136 Earlier versions of the *cut* utility worked in an environment where bytes and characters were  
 85137 considered equivalent (modulo <backspace> and <tab> processing in some implementations). In  
 85138 the extended world of multi-byte characters, the new **-b** option has been added. The **-n** option  
 85139 (used with **-b**) allows it to be used to act on bytes rounded to character boundaries. The  
 85140 algorithm specified for **-n** guarantees that:

85141 `cut -b 1-500 -n file > file1`85142 `cut -b 501- -n file > file2`

85143 ends up with all the characters in **file** appearing exactly once in **file1** or **file2**. (There is,  
 85144 however, a <newline> in both **file1** and **file2** for each <newline> in **file**.)

85145 **EXAMPLES**

85146 Examples of the option qualifier list:

85147 1,4,7 Select the first, fourth, and seventh bytes, characters, or fields and field delimiters.

85148 1-3,8 Equivalent to 1,2,3,8.

85149 -5,10 Equivalent to 1,2,3,4,5,10.

85150 3- Equivalent to third to last, inclusive.

85151 The *low-high* forms are not always equivalent when used with **-b** and **-n** and multi-byte  
 85152 characters; see the description of **-n**.

85153 The following command:

85154 `cut -d : -f 1,6 /etc/passwd`

85155 reads the System V password file (user database) and produces lines of the form:

85156 `<user ID>:<home directory>`

85157 Most utilities in this volume of POSIX.1-2008 work on text files. The *cut* utility can be used to  
 85158 turn files with arbitrary line lengths into a set of text files containing the same data. The *paste*  
 85159 utility can be used to create (or recreate) files with arbitrary line lengths. For example, if **file**  
 85160 contains long lines:

85161 `cut -b 1-500 -n file > file1`85162 `cut -b 501- -n file > file2`

creates **file1** (a text file) with lines no longer than 500 bytes (plus the <newline>) and **file2** that contains the remainder of the data from **file**. (Note that **file2** is not a text file if there are lines in **file** that are longer than 500 + {LINE\_MAX} bytes.) The original file can be recreated from **file1** and **file2** using the command:

```
paste -d "\0" file1 file2 > file
```

## RATIONALE

Some historical implementations do not count <backspace> characters in determining character counts with the **-c** option. This may be useful for using *cut* for processing *nroff* output. It was deliberately decided not to have the **-c** option treat either <backspace> or <tab> characters in any special fashion. The *fold* utility does treat these characters specially.

Unlike other utilities, some historical implementations of *cut* exit after not finding an input file, rather than continuing to process the remaining *file* operands. This behavior is prohibited by this volume of POSIX.1-2008, where only the exit status is affected by this problem.

The behavior of *cut* when provided with either mutually-exclusive options or options that do not work logically together has been deliberately left unspecified in favor of global wording in [Section 1.4](#) (on page 2326).

The OPTIONS section was changed in response to IEEE PASC Interpretation 1003.2 #149. The change represents historical practice on all known systems. The original standard was ambiguous on the nature of the output.

The *list* option-arguments are historically used to select the portions of the line to be written, but do not affect the order of the data. For example:

```
echo abcdefghi | cut -c6,2,4-7,1
```

yields "abdefg".

A proposal to enhance *cut* with the following option:

**-o** Preserve the selected field order. When this option is specified, each byte, character, or field (or ranges of such) shall be written in the order specified by the *list* option-argument, even if this requires multiple outputs of the same bytes, characters, or fields.

was rejected because this type of enhancement is outside the scope of the IEEE P1003.2b draft standard.

## FUTURE DIRECTIONS

None.

[XBD Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

## CHANGE HISTORY

First released in Issue 2.

## Issue 6

The OPTIONS section is changed to align with the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

85202 **Issue 7**

85203 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

85204 SD5-XCU-ERN-171 is applied, adding APPLICATION USAGE.

85205 **NAME**85206 cxref — generate a C-language program cross-reference table (**DEVELOPMENT**)85207 **SYNOPSIS**

```
85208 XSI  cxref [-cs] [-o file] [-w num] [-D name[=def]]... [-I dir]...
85209      [-U name]... file...
```

85210 **DESCRIPTION**

85211 The *cxref* utility shall analyze a collection of C-language *files* and attempt to build a cross-  
 85212 reference table. Information from **#define** lines shall be included in the symbol table. A sorted  
 85213 listing shall be written to standard output of all symbols (auto, static, and global) in each *file*  
 85214 separately, or with the **-c** option, in combination. Each symbol shall contain an <asterisk> before  
 85215 the declaring reference.

85216 **OPTIONS**

85217 The *cxref* utility shall conform to XBD [Section 12.2](#) (on page 216), except that the order of the **-D**,  
 85218 **-I**, and **-U** options (which are identical to their interpretation by *c99*) is significant. The  
 85219 following options shall be supported:

- 85220 **-c** Write a combined cross-reference of all input files.
- 85221 **-s** Operate silently; do not print input filenames.
- 85222 **-o file** Direct output to named *file*.
- 85223 **-w num** Format output no wider than *num* (decimal) columns. This option defaults to 80 if  
 85224 *num* is not specified or is less than 51.
- 85225 **-D** Equivalent to *c99*.
- 85226 **-I** Equivalent to *c99*.
- 85227 **-U** Equivalent to *c99*.

85228 **OPERANDS**

85229 The following operand shall be supported:

- 85230 *file* A pathname of a C-language source file.

85231 **STDIN**

85232 Not used.

85233 **INPUT FILES**

85234 The input files are C-language source files.

85235 **ENVIRONMENT VARIABLES**

85236 The following environment variables shall affect the execution of *cxref*:

- 85237 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 85238 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 85239 variables used to determine the values of locale categories.)
- 85240 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 85241 internationalization variables.
- 85242 **LC\_COLLATE**  
 85243 Determine the locale for the ordering of the output.
- 85244 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 85245 characters (for example, single-byte as opposed to multi-byte characters in  
 85246 arguments and input files).

**LC\_MESSAGES**

Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

**NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**ASYNCHRONOUS EVENTS**

Default.

**STDOUT**

The standard output shall be used for the cross-reference listing, unless the **-o** option is used to select a different output file.

The format of standard output is unspecified, except that the following information shall be included:

- If the **-c** option is not specified, each portion of the listing shall start with the name of the input file on a separate line.
- The name line shall be followed by a sorted list of symbols, each with its associated location pathname, the name of the function in which it appears (if it is not a function name itself), and line number references.
- Each line number may be preceded by an <asterisk> ('\*') flag, meaning that this is the declaring reference. Other single-character flags, with implementation-defined meanings, may be included.

**STDERR**

The standard error shall be used only for diagnostic messages.

**OUTPUT FILES**

The output file named by the **-o** option shall be used instead of standard output.

**EXTENDED DESCRIPTION**

None.

**EXIT STATUS**

The following exit values shall be returned:

- 0 Successful completion.
- >0 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

None.

**EXAMPLES**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

85286 **SEE ALSO**85287 [c99](#)85288 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)85289 **CHANGE HISTORY**

85290 First released in Issue 2.

85291 **Issue 5**85292 In the SYNOPSIS, `[-U dir]` is changed to `[-U name]`.85293 **Issue 6**

85294 The APPLICATION USAGE section is added.

85295 **Issue 7**

85296 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

85297 **NAME**

85298           date — write the date and time

85299 **SYNOPSIS**

85300           date [-u] [+format]

85301 XSI       date [-u] mmddhhmm[[cc]yy]

85302 **DESCRIPTION**

85303 XSI       The *date* utility shall write the date and time to standard output or attempt to set the system  
 85304       date and time. By default, the current date and time shall be written. If an operand beginning  
 85305       with '+' is specified, the output format of *date* shall be controlled by the conversion  
 85306       specifications and other text in the operand.

85307 **OPTIONS**85308       The *date* utility shall conform to XBD Section 12.2 (on page 216).

85309       The following option shall be supported:

85310       -u       Perform operations as if the *TZ* environment variable was set to the string "UTC0",  
 85311       or its equivalent historical value of "GMT0". Otherwise, *date* shall use the timezone  
 85312       indicated by the *TZ* environment variable or the system default if that variable is  
 85313       unset or null.

85314 **OPERANDS**

85315       The following operands shall be supported:

85316       +format   When the format is specified, each conversion specifier shall be replaced in the  
 85317       standard output by its corresponding value. All other characters shall be copied to  
 85318       the output without change. The output shall always be terminated with a  
 85319       <newline>.

85320 **Conversion Specifications**

85321       %a       Locale's abbreviated weekday name.  
 85322       %A       Locale's full weekday name.  
 85323       %b       Locale's abbreviated month name.  
 85324       %B       Locale's full month name.  
 85325       %c       Locale's appropriate date and time representation.  
 85326       %C       Century (a year divided by 100 and truncated to an integer) as a decimal  
 85327       number [00,99].  
 85328       %d       Day of the month as a decimal number [01,31].  
 85329       %D       Date in the format *mm/dd/yy*.  
 85330       %e       Day of the month as a decimal number [1,31] in a two-digit field with  
 85331       leading <space> character fill.  
 85332       %h       A synonym for %b.  
 85333       %H       Hour (24-hour clock) as a decimal number [00,23].  
 85334       %I       Hour (12-hour clock) as a decimal number [01,12].

|       |    |                                                                              |
|-------|----|------------------------------------------------------------------------------|
| 85335 | %j | Day of the year as a decimal number [001,366].                               |
| 85336 | %m | Month as a decimal number [01,12].                                           |
| 85337 | %M | Minute as a decimal number [00,59].                                          |
| 85338 | %n | A <newline>.                                                                 |
| 85339 | %p | Locale's equivalent of either AM or PM.                                      |
| 85340 | %r | 12-hour clock time [01,12] using the AM/PM notation; in the POSIX            |
| 85341 |    | locale, this shall be equivalent to %I:%M:%S %p.                             |
| 85342 | %S | Seconds as a decimal number [00,60].                                         |
| 85343 | %t | A <tab>.                                                                     |
| 85344 | %T | 24-hour clock time [00,23] in the format <i>HH:MM:SS</i> .                   |
| 85345 | %u | Weekday as a decimal number [1,7] (1=Monday).                                |
| 85346 | %U | Week of the year (Sunday as the first day of the week) as a decimal          |
| 85347 |    | number [00,53]. All days in a new year preceding the first Sunday shall be   |
| 85348 |    | considered to be in week 0.                                                  |
| 85349 | %V | Week of the year (Monday as the first day of the week) as a decimal          |
| 85350 |    | number [01,53]. If the week containing January 1 has four or more days in    |
| 85351 |    | the new year, then it shall be considered week 1; otherwise, it shall be the |
| 85352 |    | last week of the previous year, and the next week shall be week 1.           |
| 85353 | %w | Weekday as a decimal number [0,6] (0=Sunday).                                |
| 85354 | %W | Week of the year (Monday as the first day of the week) as a decimal          |
| 85355 |    | number [00,53]. All days in a new year preceding the first Monday shall      |
| 85356 |    | be considered to be in week 0.                                               |
| 85357 | %x | Locale's appropriate date representation.                                    |
| 85358 | %X | Locale's appropriate time representation.                                    |
| 85359 | %y | Year within century [00,99].                                                 |
| 85360 | %Y | Year with century as a decimal number.                                       |
| 85361 | %Z | Timezone name, or no characters if no timezone is determinable.              |
| 85362 | %% | A <percent-sign> character.                                                  |

See XBD [Section 7.3.5](#) (on page 159) for the conversion specifier values in the POSIX locale.

### Modified Conversion Specifications

Some conversion specifiers can be modified by the E and O modifier characters to indicate a different format or specification as specified in the *LC\_TIME* locale description (see XBD [Section 7.3.5](#), on page 159). If the corresponding keyword (see *era*, *era\_year*, *era\_d\_fmt*, and *alt\_digits* in XBD [Section 7.3.5](#), on page 159) is not specified or not supported for the current locale, the unmodified conversion specifier value shall be used.

|       |     |                                                                |
|-------|-----|----------------------------------------------------------------|
| 85372 | %Ec | Locale's alternative appropriate date and time representation. |
|-------|-----|----------------------------------------------------------------|

|       |              |                                                                                                                                           |
|-------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 85373 | %EC          | The name of the base year (period) in the locale's alternative representation.                                                            |
| 85374 |              |                                                                                                                                           |
| 85375 | %Ex          | Locale's alternative date representation.                                                                                                 |
| 85376 | %EX          | Locale's alternative time representation.                                                                                                 |
| 85377 | %Ey          | Offset from %EC (year only) in the locale's alternative representation.                                                                   |
| 85378 | %EY          | Full alternative year representation.                                                                                                     |
| 85379 | %Od          | Day of month using the locale's alternative numeric symbols.                                                                              |
| 85380 | %Oe          | Day of month using the locale's alternative numeric symbols.                                                                              |
| 85381 | %OH          | Hour (24-hour clock) using the locale's alternative numeric symbols.                                                                      |
| 85382 | %OI          | Hour (12-hour clock) using the locale's alternative numeric symbols.                                                                      |
| 85383 | %Om          | Month using the locale's alternative numeric symbols.                                                                                     |
| 85384 | %OM          | Minutes using the locale's alternative numeric symbols.                                                                                   |
| 85385 | %OS          | Seconds using the locale's alternative numeric symbols.                                                                                   |
| 85386 | %Ou          | Weekday as a number in the locale's alternative representation (Monday = 1).                                                              |
| 85387 |              |                                                                                                                                           |
| 85388 | %OU          | Week number of the year (Sunday as the first day of the week) using the locale's alternative numeric symbols.                             |
| 85389 |              |                                                                                                                                           |
| 85390 | %OV          | Week number of the year (Monday as the first day of the week, rules corresponding to %V), using the locale's alternative numeric symbols. |
| 85391 |              |                                                                                                                                           |
| 85392 | %Ow          | Weekday as a number in the locale's alternative representation (Sunday = 0).                                                              |
| 85393 |              |                                                                                                                                           |
| 85394 | %OW          | Week number of the year (Monday as the first day of the week) using the locale's alternative numeric symbols.                             |
| 85395 |              |                                                                                                                                           |
| 85396 | %Oy          | Year (offset from %C) in alternative representation.                                                                                      |
| 85397 | XSI          | <b><code>mmdhmm[[cc]yy]</code></b>                                                                                                        |
| 85398 |              | Attempt to set the system date and time from the value given in the operand. This                                                         |
| 85399 |              | is only possible if the user has appropriate privileges and the system permits the                                                        |
| 85400 |              | setting of the system date and time. The first <i>mm</i> is the month (number); <i>dd</i> is the                                          |
| 85401 |              | day (number); <i>hh</i> is the hour (number, 24-hour system); the second <i>mm</i> is the                                                 |
| 85402 |              | minute (number); <i>cc</i> is the century and is the first two digits of the year (this is                                                |
| 85403 |              | optional); <i>yy</i> is the last two digits of the year and is optional. If century is not                                                |
| 85404 |              | specified, then values in the range [69,99] shall refer to years 1969 to 1999 inclusive,                                                  |
| 85405 |              | and values in the range [00,68] shall refer to years 2000 to 2068 inclusive. The                                                          |
| 85406 |              | current year is the default if <i>yy</i> is omitted.                                                                                      |
| 85407 | <b>Note:</b> | It is expected that in a future version of this standard the default century inferred                                                     |
| 85408 |              | from a 2-digit year will change. (This would apply to all commands accepting a                                                            |
| 85409 |              | 2-digit year as input.)                                                                                                                   |
| 85410 | <b>STDIN</b> |                                                                                                                                           |
| 85411 |              | Not used.                                                                                                                                 |

85412 **INPUT FILES**

85413 None.

85414 **ENVIRONMENT VARIABLES**85415 The following environment variables shall affect the execution of *date*:

85416 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 85417 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 85418 variables used to determine the values of locale categories.)

85419 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 85420 internationalization variables.

85421 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 85422 characters (for example, single-byte as opposed to multi-byte characters in  
 85423 arguments).

85424 *LC\_MESSAGES*

85425 Determine the locale that should be used to affect the format and contents of  
 85426 diagnostic messages written to standard error.

85427 *LC\_TIME* Determine the format and contents of date and time strings written by *date*.

85428 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

85429 *TZ* Determine the timezone in which the time and date are written, unless the *-u*  
 85430 option is specified. If the *TZ* variable is unset or null and *-u* is not specified, an  
 85431 unspecified system default timezone is used.

85432 **ASYNCHRONOUS EVENTS**

85433 Default.

85434 **STDOUT**

85435 When no formatting operand is specified, the output in the POSIX locale shall be equivalent to  
 85436 specifying:

85437 *date* "+%a %b %e %H:%M:%S %Z %Y"85438 **STDERR**

85439 The standard error shall be used only for diagnostic messages.

85440 **OUTPUT FILES**

85441 None.

85442 **EXTENDED DESCRIPTION**

85443 None.

85444 **EXIT STATUS**

85445 The following exit values shall be returned:

85446 0 The date was written successfully.

85447 &gt;0 An error occurred.

85448 **CONSEQUENCES OF ERRORS**

85449 Default.

## APPLICATION USAGE

Conversion specifiers are of unspecified format when not in the POSIX locale. Some of them can contain <newline> characters in some locales, so it may be difficult to use the format shown in standard output for parsing the output of *date* in those locales.

The range of values for %S extends from 0 to 60 seconds to accommodate the occasional leap second.

Although certain of the conversion specifiers in the POSIX locale (such as the name of the month) are shown with initial capital letters, this need not be the case in other locales. Programs using these fields may need to adjust the capitalization if the output is going to be used at the beginning of a sentence.

The date string formatting capabilities are intended for use in Gregorian-style calendars, possibly with a different starting year (or years). The %x and %c conversion specifications, however, are intended for local representation; these may be based on a different, non-Gregorian calendar.

The %C conversion specification was introduced to allow a fallback for the %EC (alternative year format base year); it can be viewed as the base of the current subdivision in the Gregorian calendar. The century number is calculated as the year divided by 100 and truncated to an integer; it should not be confused with the use of ordinal numbers for centuries (for example, "twenty-first century".) Both the %Ey and %y can then be viewed as the offset from %EC and %C, respectively.

The E and O modifiers modify the traditional conversion specifiers, so that they can always be used, even if the implementation (or the current locale) does not support the modifier.

The E modifier supports alternative date formats, such as the Japanese Emperor's Era, as long as these are based on the Gregorian calendar system. Extending the E modifiers to other date elements may provide an implementation-defined extension capable of supporting other calendar systems, especially in combination with the O modifier.

The O modifier supports time and date formats using the locale's alternative numerical symbols, such as Kanji or Hindi digits or ordinal number representation.

Non-European locales, whether they use Latin digits in computational items or not, often have local forms of the digits for use in date formats. This is not totally unknown even in Europe; a variant of dates uses Roman numerals for the months: the third day of September 1991 would be written as 3.IX.1991. In Japan, Kanji digits are regularly used for dates; in Arabic-speaking countries, Hindi digits are used. The %d, %e, %H, %I, %m, %S, %U, %w, %W, and %Y conversion specifications always return the date and time field in Latin digits (that is, 0 to 9). The %O modifier was introduced to support the use for display purposes of non-Latin digits. In the *LC\_TIME* category in *localedef*, the optional **alt\_digits** keyword is intended for this purpose. As an example, assume the following (partial) *localedef* source:

```
alt_digits  " "; "I"; "II"; "III"; "IV"; "V"; "VI"; "VII"; "VIII" \
            "IX"; "X"; "XI"; "XII"
d_fmt      "%e.%Om.%Y"
```

With the above date, the command:

```
date "+%x"
```

would yield 3.IX.1991. With the same **d\_fmt**, but without the **alt\_digits**, the command would yield 3.9.1991.

## 85494 EXAMPLES

- 85495 1. The following are input/output examples of *date* used at arbitrary times in the POSIX  
85496 locale:

85497 \$ date  
85498 **Tue Jun 26 09:58:10 PDT 1990**

85499 \$ date "+DATE: %m/%d/%y%nTIME: %H:%M:%S"  
85500 **DATE: 11/02/91**

## 85523 RATIONALE

85524 Some of the new options for formatting are from the ISO C standard. The **-u** option was  
85525 introduced to allow portable access to Coordinated Universal Time (UTC). The string "GMT0" is  
85526 allowed as an equivalent TZ value to be compatible with all of the systems using the BSD  
85527 implementation, where this option originated.

85528 The %e format conversion specification (adopted from System V) was added because the ISO C  
85529 standard conversion specifications did not provide any way to produce the historical default  
85530 *date* output during the first nine days of any month.

85531 There are two varieties of day and week numbering supported (in addition to any others created  
85532 with the locale-dependent %E and %O modifier characters):

- 85533 • The historical variety in which Sunday is the first day of the week and the weekdays
- 85534 preceding the first Sunday of the year are considered week 0. These are represented by %w
- 85535 and %U. A variant of this is %W, using Monday as the first day of the week, but still
- 85536 referring to week 0. This view of the calendar was retained because so many historical

85537 applications depend on it and the ISO C standard *strftime()* function, on which many *date*  
85538 implementations are based, was defined in this way.

- 85539 • The international standard, based on the ISO 8601: 2004 standard where Monday is the first  
85540 weekday and the algorithm for the first week number is more complex: If the week  
85541 (Monday to Sunday) containing January 1 has four or more days in the new year, then it is  
85542 week 1; otherwise, it is week 53 of the previous year, and the next week is week 1. These  
85543 are represented by the new conversion specifications %u and %V, added as a result of  
85544 international comments.

#### 85545 FUTURE DIRECTIONS

85546 None.

#### 85547 SEE ALSO

85548 XBD [Section 7.3.5](#) (on page 159), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

85549 XSH [fprintf\(\)](#), [strftime\(\)](#)

#### 85550 CHANGE HISTORY

85551 First released in Issue 2.

#### 85552 Issue 5

85553 Changes are made for Year 2000 alignment.

#### 85554 Issue 6

85555 The following new requirements on POSIX implementations derive from alignment with the  
85556 Single UNIX Specification:

- 85557 • The %EX modified conversion specification is added.

85558 The Open Group Corrigendum U048/2 is applied, correcting the examples.

85559 The DESCRIPTION is updated to refer to conversion specifications, instead of field descriptors  
85560 for consistency with the *LC\_TIME* category.

85561 A clarification is made such that the current year is the default if the *yy* argument is omitted  
85562 when setting the system date and time.

85563 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/19 is applied, correcting the CHANGE  
85564 HISTORY section.

## 85565 NAME

85566 dd — convert and copy a file

## 85567 SYNOPSIS

85568 dd [*operand*...]

## 85569 DESCRIPTION

85570 The *dd* utility shall copy the specified input file to the specified output file with possible  
 85571 conversions using specific input and output block sizes. It shall read the input one block at a  
 85572 time, using the specified input block size; it shall then process the block of data actually  
 85573 returned, which could be smaller than the requested block size. It shall apply any conversions  
 85574 that have been specified and write the resulting data to the output in blocks of the specified  
 85575 output block size. If the **bs=expr** operand is specified and no conversions other than **sync**,  
 85576 **noerror**, or **notrunc** are requested, the data returned from each input block shall be written as a  
 85577 separate output block; if the read returns less than a full block and the **sync** conversion is not  
 85578 specified, the resulting output block shall be the same size as the input block. If the **bs=expr**  
 85579 operand is not specified, or a conversion other than **sync**, **noerror**, or **notrunc** is requested, the  
 85580 input shall be processed and collected into full-sized output blocks until the end of the input is  
 85581 reached.

85582 The processing order shall be as follows:

- 85583 1. An input block is read.
- 85584 2. If the input block is shorter than the specified input block size and the **sync** conversion is  
 85585 specified, null bytes shall be appended to the input data up to the specified size. (If either  
 85586 **block** or **unblock** is also specified, <space> characters shall be appended instead of null  
 85587 bytes.) The remaining conversions and output shall include the pad characters as if they  
 85588 had been read from the input.
- 85589 3. If the **bs=expr** operand is specified and no conversion other than **sync** or **noerror** is  
 85590 requested, the resulting data shall be written to the output as a single block, and the  
 85591 remaining steps are omitted.
- 85592 4. If the **swab** conversion is specified, each pair of input data bytes shall be swapped. If  
 85593 there is an odd number of bytes in the input block, the last byte in the input record shall  
 85594 not be swapped.
- 85595 5. Any remaining conversions (**block**, **unblock**, **lcase**, and **ucase**) shall be performed. These  
 85596 conversions shall operate on the input data independently of the input blocking; an input  
 85597 or output fixed-length record may span block boundaries.
- 85598 6. The data resulting from input or conversion or both shall be aggregated into output  
 85599 blocks of the specified size. After the end of input is reached, any remaining output shall  
 85600 be written as a block without padding if **conv=sync** is not specified; thus, the final output  
 85601 block may be shorter than the output block size.

## 85602 OPTIONS

85603 None.

## 85604 OPERANDS

85605 All of the operands shall be processed before any input is read. The following operands shall be  
 85606 supported:

- 85607 **if=file** Specify the input pathname; the default is standard input.
- 85608 **of=file** Specify the output pathname; the default is standard output. If the **seek=expr**  
 85609 conversion is not also specified, the output file shall be truncated before the copy  
 85610 begins if an explicit **of=file** operand is specified, unless **conv=notrunc** is specified.

|       |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 85611 |                               | If <b>seek=expr</b> is specified, but <b>conv=notrunc</b> is not, the effect of the copy shall be to preserve the blocks in the output file over which <i>dd</i> seeks, but no other portion of the output file shall be preserved. (If the size of the seek plus the size of the input file is less than the previous size of the output file, the output file shall be shortened by the copy. If the input file is empty and either the size of the seek is greater than the previous size of the output file or the output file did not previously exist, the size of the output file shall be set to the file offset after the seek.)                          |
| 85612 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 85613 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 85614 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 85615 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 85616 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 85617 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 85650 | <b>block</b>                  | Treat the input as a sequence of <newline>-terminated or end-of-file-terminated variable-length records independent of the input block boundaries. Each record shall be converted to a record with a fixed length specified by the conversion block size. Any <newline> shall be removed from the input line; <space> characters shall be appended to lines that are shorter than their conversion block size to fill the block.                                                                                                                                                                                                                                   |
| 85651 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 85652 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 85655 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|       |                |                                                                                    |
|-------|----------------|------------------------------------------------------------------------------------|
| 85656 |                | Lines that are longer than the conversion block size shall be truncated            |
| 85657 |                | to the largest number of characters that fit into that size; the number of         |
| 85658 |                | truncated lines shall be reported (see the STDERR section).                        |
| 85659 |                | The <b>block</b> and <b>unblock</b> values are mutually-exclusive.                 |
| 85660 | <b>unblock</b> | Convert fixed-length records to variable length. Read a number of bytes            |
| 85661 |                | equal to the conversion block size (or the number of bytes remaining in            |
| 85662 |                | the input, if less than the conversion block size), delete all trailing            |
| 85663 |                | <space> characters, and append a <newline>.                                        |
| 85664 | <b>lcase</b>   | Map uppercase characters specified by the <i>LC_CTYPE</i> keyword                  |
| 85665 |                | <b>tolower</b> to the corresponding lowercase character. Characters for which      |
| 85666 |                | no mapping is specified shall not be modified by this conversion.                  |
| 85667 |                | The <b>lcase</b> and <b>ucase</b> symbols are mutually-exclusive.                  |
| 85668 | <b>ucase</b>   | Map lowercase characters specified by the <i>LC_CTYPE</i> keyword                  |
| 85669 |                | <b>toupper</b> to the corresponding uppercase character. Characters for            |
| 85670 |                | which no mapping is specified shall not be modified by this conversion.            |
| 85671 | <b>swab</b>    | Swap every pair of input bytes.                                                    |
| 85672 | <b>noerror</b> | Do not stop processing on an input error. When an input error occurs, a            |
| 85673 |                | diagnostic message shall be written on standard error, followed by the             |
| 85674 |                | current input and output block counts in the same format as used at                |
| 85675 |                | completion (see the STDERR section). If the <b>sync</b> conversion is              |
| 85676 |                | specified, the missing input shall be replaced with null bytes and                 |
| 85677 |                | processed normally; otherwise, the input block shall be omitted from               |
| 85678 |                | the output.                                                                        |
| 85679 | <b>notrunc</b> | Do not truncate the output file. Preserve blocks in the output file not            |
| 85680 |                | explicitly written by this invocation of the <i>dd</i> utility. (See also the      |
| 85681 |                | preceding <b>of=file</b> operand.)                                                 |
| 85682 | <b>sync</b>    | Pad every input block to the size of the <b>ibs=</b> buffer, appending null        |
| 85683 |                | bytes. (If either <b>block</b> or <b>unblock</b> is also specified, append <space> |
| 85684 |                | characters, rather than null bytes.)                                               |

The behavior is unspecified if operands other than **conv=** are specified more than once.

For the **bs=**, **cbs=**, **ibs=**, and **obs=** operands, the application shall supply an expression specifying a size in bytes. The expression, *expr*, can be:

1. A positive decimal number
2. A positive decimal number followed by *k*, specifying multiplication by 1 024
3. A positive decimal number followed by *b*, specifying multiplication by 512
4. Two or more positive decimal numbers (with or without *k* or *b*) separated by *x*, specifying the product of the indicated values

All of the operands are processed before any input is read.

The following two tables display the octal number character values used for the **ascii** and **ebcdic** conversions (first table) and for the **ibm** conversion (second table). In both tables, the ASCII values are the row and column headers and the EBCDIC values are found at their intersections. For example, ASCII 0012 (LF) is the second row, third column, yielding 0045 in EBCDIC. The inverted tables (for EBCDIC to ASCII conversion) are not shown, but are in one-to-one

85699

85700

85701

correspondence with these tables. The differences between the two tables are highlighted by small boxes drawn around five entries.

Table 4-7 ASCII to EBCDIC Conversion

|             | 0        | 1        | 2        | 3        | 4        | 5        | 6        | 7        |

85703 **STDIN**

85704 If no **if=** operand is specified, the standard input shall be used. See the INPUT FILES section.

85705 **INPUT FILES**

85706 The input file can be any file type.

85707 **ENVIRONMENT VARIABLES**

85708 The following environment variables shall affect the execution of *dd*:

85709 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 85710 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 85711 variables used to determine the values of locale categories.)

85712 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 85713 internationalization variables.

85714 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 85715 characters (for example, single-byte as opposed to multi-byte characters in  
 85716 arguments and input files), the classification of characters as uppercase or  
 85717 lowercase, and the mapping of characters from one case to the other.

85718 **LC\_MESSAGES**

85719 Determine the locale that should be used to affect the format and contents of  
 85720 diagnostic messages written to standard error and informative messages written to  
 85721 standard output.

85722 **XSI NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

85723 **ASYNCHRONOUS EVENTS**

85724 For SIGINT, the *dd* utility shall interrupt its current processing, write status information to  
 85725 standard error, and exit as though terminated by SIGINT. It shall take the standard action for all  
 85726 other signals; see the ASYNCHRONOUS EVENTS section in [Section 1.4](#) (on page 2326).

85727 **STDOUT**

85728 If no **of=** operand is specified, the standard output shall be used. The nature of the output  
 85729 depends on the operands selected.

85730 **STDERR**

85731 On completion, *dd* shall write the number of input and output blocks to standard error. In the  
 85732 POSIX locale the following formats shall be used:

85733 "%u+%u records in\n", <number of whole input blocks>,  
 85734 <number of partial input blocks>

85735 "%u+%u records out\n", <number of whole output blocks>,  
 85736 <number of partial output blocks>

85737 A partial input block is one for which *read()* returned less than the input block size. A partial  
 85738 output block is one that was written with fewer bytes than specified by the output block size.

85739 In addition, when there is at least one truncated block, the number of truncated blocks shall be  
 85740 written to standard error. In the POSIX locale, the format shall be:

85741 "%u truncated %s\n", <number of truncated blocks>, "record" (if  
 85742 <number of truncated blocks> is one) "records" (otherwise)

85743 Diagnostic messages may also be written to standard error.

**OUTPUT FILES**

If the **of=** operand is used, the output shall be the same as described in the STDOUT section.

**EXTENDED DESCRIPTION**

None.

**EXIT STATUS**

The following exit values shall be returned:

0 The input file was copied successfully.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

If an input error is detected and the **noerror** conversion has not been specified, any partial output block shall be written to the output file, a diagnostic message shall be written, and the copy operation shall be discontinued. If some other error is detected, a diagnostic message shall be written and the copy operation shall be discontinued.

**APPLICATION USAGE**

The input and output block size can be specified to take advantage of raw physical I/O.

There are many different versions of the EBCDIC codesets. The ASCII and EBCDIC conversions specified for the *dd* utility perform conversions for the version specified by the tables.

**EXAMPLES**

The following command:

```
dd if=/dev/rmt0h of=/dev/rmt1h
```

copies from tape drive 0 to tape drive 1, using a common historical device naming convention.

The following command:

```
dd ibs=10 skip=1
```

strips the first 10 bytes from standard input.

This example reads an EBCDIC tape blocked ten 80-byte EBCDIC card images per block into the ASCII file *x*:

```
dd if=/dev/tape of=x ibs=800 cbs=80 conv=ascii,lcase
```

**RATIONALE**

The **OPTIONS** section is listed as “None” because there are no options recognized by historical *dd* utilities. Certainly, many of the operands could have been designed to use the Utility Syntax Guidelines, which would have resulted in the classic hyphenated option letters. In this version of this volume of POSIX.1-2008, *dd* retains its curious JCL-like syntax due to the large number of applications that depend on the historical implementation.

A suggested implementation technique for **conv=noerror, sync** is to zero (or <space>-fill, if **blocking** or **unblocking**) the input buffer before each read and to write the contents of the input buffer to the output even after an error. In this manner, any data transferred to the input buffer before the error was detected is preserved. Another point is that a failed read on a regular file or a disk generally does not increment the file offset, and *dd* must then seek past the block on which the error occurred; otherwise, the input error occurs repetitively. When the input is a magnetic tape, however, the tape normally has passed the block containing the error when the error is reported, and thus no seek is necessary.

The default **ibs=** and **obs=** sizes are specified as 512 bytes because there are historical (largely portable) scripts that assume these values. If they were left unspecified, unusual results could

occur if an implementation chose an odd block size.

Historical implementations of *dd* used *creat()* when processing *of=file*. This makes the **seek=** operand unusable except on special files. The **conv=notrunc** feature was added because more recent BSD-based implementations use *open()* (without *O\_TRUNC*) instead of *creat()*, but they fail to delete output file contents after the data copied.

The *w* multiplier (historically meaning *word*), is used in System V to mean 2 and in 4.2 BSD to mean 4. Since *word* is inherently non-portable, its use is not supported by this volume of POSIX.1-2008.

Standard EBCDIC does not have the characters '[' and ']'. The values used in the table are taken from a common print train that does contain them. Other than those characters, the print train values are not filled in, but appear to provide some of the motivation for the historical choice of translations reflected here.

The Standard EBCDIC table provides a 1:1 translation for all 256 bytes.

The IBM EBCDIC table does not provide such a translation. The marked cells in the tables differ in such a way that:

1. EBCDIC 0112 ('&') and 0152 (broken pipe) do not appear in the table.
2. EBCDIC 0137 ('¬') translates to/from ASCII 0236 ('^'). In the standard table, EBCDIC 0232 (no graphic) is used.
3. EBCDIC 0241 ('~') translates to/from ASCII 0176 ('~'). In the standard table, EBCDIC 0137 ('¬') is used.
4. 0255 ('[') and 0275 (']') appear twice, once in the same place as for the standard table and once in place of 0112 ('&') and 0241 ('~').

In net result:

EBCDIC 0275 (']') displaced EBCDIC 0241 ('~') in cell 0345.

That displaced EBCDIC 0137 ('¬') in cell 0176.

That displaced EBCDIC 0232 (no graphic) in cell 0136.

That replaced EBCDIC 0152 (broken pipe) in cell 0313.

EBCDIC 0255 ('[') replaced EBCDIC 0112 ('&').

This translation, however, reflects historical practice that (ASCII) '~' and '¬' were often mapped to each other, as were '[' and '&'; and ']' and (EBCDIC) '~'.

The **cbs** operand is required if any of the **ascii**, **ebcdic**, or **ibm** operands are specified. For the **ascii** operand, the input is handled as described for the **unblock** operand except that characters are converted to ASCII before the trailing <space> characters are deleted. For the **ebcdic** and **ibm** operands, the input is handled as described for the **block** operand except that the characters are converted to EBCDIC or IBM EBCDIC after the trailing <space> characters are added.

The **block** and **unblock** keywords are from historical BSD practice.

The consistent use of the word **record** in standard error messages matches most historical practice. An earlier version of System V used **block**, but this has been updated in more recent releases.

Early proposals only allowed two numbers separated by *x* to be used in a product when specifying **bs=**, **cbs=**, **ibs=**, and **obs=** sizes. This was changed to reflect the historical practice of

- 85828 allowing multiple numbers in the product as provided by Version 7 and all releases of System V  
85829 and BSD.
- 85830 A change to the **swab** conversion is required to match historical practice and is the result of IEEE  
85831 PASC Interpretations 1003.2 #03 and #04, submitted for the ISO POSIX-2: 1993 standard.
- 85832 A change to the handling of SIGINT is required to match historical practice and is the result of  
85833 IEEE PASC Interpretation 1003.2 #06 submitted for the ISO POSIX-2: 1993 standard.
- 85834 **FUTURE DIRECTIONS**
- 85835 None.
- 85836 **SEE ALSO**
- 85837 [Section 1.4](#) (on page 2326), *sed*, *tr*
- 85838 XBD [Chapter 8](#) (on page 173)
- 85839 **CHANGE HISTORY**
- 85840 First released in Issue 2.
- 85841 **Issue 5**
- 85842 The second paragraph of the **cbs=** description is reworded and marked EX.
- 85843 The FUTURE DIRECTIONS section is added.
- 85844 **Issue 6**
- 85845 Changes are made to **swab** conversion and SIGINT handling to align with the IEEE P1003.2b  
85846 draft standard.
- 85847 The normative text is reworded to avoid use of the term “must” for application requirements.
- 85848 IEEE PASC Interpretation 1003.2 #209 is applied, clarifying the interaction between *dd of=file* and  
85849 **conv=notrunc**.
- 85850 **Issue 7**
- 85851 Austin Group Interpretation 1003.1-2001 #102 is applied.
- 85852 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

85853 **NAME**85854       delta — make a delta (change) to an SCCS file (**DEVELOPMENT**)85855 **SYNOPSIS**

85856 XSI       delta [-nps] [-g list] [-m mrlist] [-r SID] [-y[comment]] file...

85857 **DESCRIPTION**85858       The *delta* utility shall be used to permanently introduce into the named SCCS files changes that  
85859       were made to the files retrieved by *get* (called the *g-files*, or generated files).85860 **OPTIONS**85861       The *delta* utility shall conform to XBD [Section 12.2](#) (on page 216), except that the *-y* option has an  
85862       optional option-argument. This optional option-argument shall not be presented as a separate  
85863       argument.

85864       The following options shall be supported:

85865       *-r SID*       Uniquely identify which delta is to be made to the SCCS file. The use of this option  
85866       shall be necessary only if two or more outstanding *get* commands for editing (*get*  
85867       *-e*) on the same SCCS file were done by the same person (login name). The SID  
85868       value specified with the *-r* option can be either the SID specified on the *get*  
85869       command line or the SID to be made as reported by the *get* utility; see *get* (on page  
85870       2812).85871       *-s*           Suppress the report to standard output of the activity associated with each *file*. See  
85872       the STDOUT section.85873       *-n*           Specify retention of the edited *g-file* (normally removed at completion of delta  
85874       processing).85875       *-g list*       Specify a *list* (see *get* for the definition of *list*) of deltas that shall be ignored when  
85876       the file is accessed at the change level (SID) created by this delta.85877       *-m mrlist*     Specify a modification request (MR) number that the application shall supply as  
85878       the reason for creating the new delta. This shall be used if the SCCS file has the *v*  
85879       flag set; see *admin*.85880       If *-m* is not used and *'-'* is not specified as a file argument, and the standard  
85881       input is a terminal, the prompt described in the STDOUT section shall be written  
85882       to standard output before the standard input is read; if the standard input is not a  
85883       terminal, no prompt shall be issued.85884       MRs in a list shall be separated by <blank> characters or escaped <newline>  
85885       characters. An unescaped <newline> shall terminate the MR list. The escape  
85886       character is <backslash>.85887       If the *v* flag has a value, it shall be taken to be the name of a program which  
85888       validates the correctness of the MR numbers. If a non-zero exit status is returned  
85889       from the MR number validation program, the *delta* utility shall terminate. (It is  
85890       assumed that the MR numbers were not all valid.)85891       *-y[comment]*   Describe the reason for making the delta. The *comment* shall be an arbitrary group  
85892       of lines that would meet the definition of a text file. Implementations shall support  
85893       *comments* from zero to 512 bytes and may support longer values. A null string  
85894       (specified as either *-y*, *-y" "*, or in response to a prompt for a comment) shall be  
85895       considered a valid *comment*.85896       If *-y* is not specified and *'-'* is not specified as a file argument, and the standard

85897 input is a terminal, the prompt described in the STDOUT section shall be written  
 85898 to standard output before the standard input is read; if the standard input is not a  
 85899 terminal, no prompt shall be issued. An unescaped <newline> shall terminate the  
 85900 comment text. The escape character is <backslash>.

85901 The `-y` option shall be required if the *file* operand is specified as `'-'`.

85902 **-p** Write (to standard output) the SCCS file differences before and after the delta is  
 85903 applied in *diff* format; see *diff*.

## 85904 OPERANDS

85905 The following operand shall be supported:

85906 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *delta*  
 85907 utility shall behave as though each file in the directory were specified as a named  
 85908 file, except that non-SCCS files (last component of the pathname does not begin  
 85909 with *s*.) and unreadable files shall be silently ignored.

85910 If exactly one *file* operand appears, and it is `'-'`, the standard input shall be read;  
 85911 each line of the standard input shall be taken to be the name of an SCCS file to be  
 85912 processed. Non-SCCS files and unreadable files shall be silently ignored.

## 85913 STDIN

85914 The standard input shall be a text file used only in the following cases:

- 85915 • To read an *mrlist* or a *comment* (see the `-m` and `-y` options).
- 85916 • A *file* operand shall be specified as `'-'`. In this case, the `-y` option must be used to specify  
 85917 the comment, and if the SCCS file has the *v* flag set, the `-m` option must also be used to  
 85918 specify the MR list.

## 85919 INPUT FILES

85920 Input files shall be text files whose data is to be included in the SCCS files. If the first character of  
 85921 any line of an input file is <SOH> in the POSIX locale, the results are unspecified. If this file  
 85922 contains more than 99 999 lines, the number of lines recorded in the header for this file shall be  
 85923 99 999 for this delta.

## 85924 ENVIRONMENT VARIABLES

85925 The following environment variables shall affect the execution of *delta*:

85926 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 85927 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 85928 variables used to determine the values of locale categories.)

85929 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 85930 internationalization variables.

85931 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 85932 characters (for example, single-byte as opposed to multi-byte characters in  
 85933 arguments and input files).

85934 *LC\_MESSAGES*

85935 Determine the locale that should be used to affect the format and contents of  
 85936 diagnostic messages written to standard error, and informative messages written  
 85937 to standard output.

85938 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

85939 **TZ** Determine the timezone in which the time and date are written in the SCCS file. If  
 85940 the *TZ* variable is unset or NULL, an unspecified system default timezone is used.

#### 85941 **ASYNCHRONOUS EVENTS**

85942 If SIGINT is caught, temporary files shall be cleaned up and *delta* shall exit with a non-zero exit  
 85943 code. The standard action shall be taken for all other signals; see [Section 1.4](#) (on page 2326).

#### 85944 **STDOUT**

85945 The standard output shall be used only for the following messages in the POSIX locale:

- 85946 • Prompts (see the *-m* and *-y* options) in the following formats:

85947 "MRs? "

85948 "comments? "

85949 The MR prompt, if written, shall always precede the comments prompt.

- 85950 • A report of each file's activities (unless the *-s* option is specified) in the following format:

85951 "%s\n%d inserted\n%d deleted\n%d unchanged\n", <New SID>,  
 85952 <number of lines inserted>, <number of lines deleted>,  
 85953 <number of lines unchanged>

#### 85954 **STDERR**

85955 The standard error shall be used only for diagnostic messages.

#### 85956 **OUTPUT FILES**

85957 Any SCCS files updated shall be files of an unspecified format.

#### 85958 **EXTENDED DESCRIPTION**

##### 85959 **System Date and Time**

85960 When a *delta* is added to an SCCS file, the system date and time shall be recorded for the new  
 85961 delta. If a *get* is performed using an SCCS file with a date recorded apparently in the future, the  
 85962 behavior is unspecified.

#### 85963 **EXIT STATUS**

85964 The following exit values shall be returned:

85965 0 Successful completion.

85966 >0 An error occurred.

#### 85967 **CONSEQUENCES OF ERRORS**

85968 Default.

#### 85969 **APPLICATION USAGE**

85970 Problems can arise if the system date and time have been modified (for example, put forward  
 85971 and then back again, or unsynchronized clocks across a network) and can also arise when  
 85972 different values of the *TZ* environment variable are used.

85973 Problems of a similar nature can also arise for the operation of the *get* utility, which records the  
 85974 date and time in the file body.

#### 85975 **EXAMPLES**

85976 None.

85977 **RATIONALE**

85978 None.

85979 **FUTURE DIRECTIONS**

85980 None.

85981 **SEE ALSO**85982 [Section 1.4](#) (on page 2326), *admin*, *diff*, *get*, *prs*, *rmdel*85983 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)85984 **CHANGE HISTORY**

85985 First released in Issue 2.

85986 **Issue 5**

85987 The output format description in the STDOUT section is corrected.

85988 **Issue 6**

85989 The APPLICATION USAGE section is added.

85990 The normative text is reworded to avoid use of the term “must” for application requirements.

85991 The Open Group Base Resolution bwg2001-007 is applied as follows:

- 85992 • The use of ‘–’ as a file argument is clarified.
- 85993 • The use of STDIN is added.
- 85994 • The ASYNCHRONOUS EVENTS section is updated to remove the implicit requirement
- 85995 that implementations re-signal themselves when catching a normally fatal signal.
- 85996 • New text is added to the INPUT FILES section warning that the maximum lines recorded
- 85997 in the file is 99 999.

85998 New text is added to the EXTENDED DESCRIPTION and APPLICATION USAGE sections  
85999 regarding how the system date and time may be taken into account, and the TZ environment  
86000 variable is added to the ENVIRONMENT VARIABLES section as per The Open Group Base  
86001 Resolution bwg2001-007.

86002 **Issue 7**

86003 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

86004 **NAME**

86005           df — report free disk space

86006 **SYNOPSIS**86007 XSI       df [-k] [-P] [-t] [*file...*]86008 **DESCRIPTION**

86009 XSI       The *df* utility shall write the amount of available space and file slots for file systems on which  
 86010 the invoking user has appropriate read access. File systems shall be specified by the *file*  
 86011 operands; when none are specified, information shall be written for all file systems. The format  
 86012 of the default output from *df* is unspecified, but all space figures are reported in 512-byte units,  
 86013 unless the **-k** option is specified. This output shall contain at least the file system names, amount  
 86014 XSI       of available space on each of these file systems, and, if no options other than **-t** are specified, the  
 86015 number of free file slots, or *inodes*, available; when **-t** is specified, the output shall contain the  
 86016 total allocated space as well.

86017 **OPTIONS**86018           The *df* utility shall conform to XBD Section 12.2 (on page 216).

86019           The following options shall be supported:

86020       **-k**           Use 1024-byte units, instead of the default 512-byte units, when writing space  
 86021 figures.

86022       **-P**           Produce output in the format described in the STDOUT section.

86023 XSI       **-t**           Include total allocated-space figures in the output.

86024 **OPERANDS**

86025           The following operand shall be supported:

86026       *file*       A pathname of a file within the hierarchy of the desired file system. If a file other than a FIFO, a regular file, a directory, or a special file representing the device  
 86027 XSI       containing the file system (for example, */dev/dsk/0s1*) is specified, the results are  
 86028 unspecified. If the *file* operand names a file other than a special file containing a file  
 86029 system, *df* shall write the amount of free space in the file system containing the  
 86030 specified *file* operand. Otherwise, *df* shall write the amount of free space in that  
 86031 XSI       file system.  
 86032

86033 **STDIN**

86034           Not used.

86035 **INPUT FILES**

86036           None.

86037 **ENVIRONMENT VARIABLES**86038           The following environment variables shall affect the execution of *df*:

86039       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 86040 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 86041 variables used to determine the values of locale categories.)

86042       **LC\_ALL**      If set to a non-empty string value, override the values of all the other  
 86043 internationalization variables.

86044       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
 86045 characters (for example, single-byte as opposed to multi-byte characters in  
 86046 arguments).

86047 *LC\_MESSAGES*  
 86048 Determine the locale that should be used to affect the format and contents of  
 86049 diagnostic messages written to standard error and informative messages written to  
 86050 standard output.

86051 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

86052 **ASYNCHRONOUS EVENTS**  
 86053 Default.

86054 **STDOUT**  
 86055 When both the **-k** and **-P** options are specified, the following header line shall be written (in the  
 86056 POSIX locale):

86057 "Filesystem 1024-blocks Used Available Capacity Mounted on\n"

86058 When the **-P** option is specified without the **-k** option, the following header line shall be written  
 86059 (in the POSIX locale):

86060 "Filesystem 512-blocks Used Available Capacity Mounted on\n"

86061 The implementation may adjust the spacing of the header line and the individual data lines so  
 86062 that the information is presented in orderly columns.

86063 The remaining output with **-P** shall consist of one line of information for each specified file  
 86064 system. These lines shall be formatted as follows:

86065 "%s %d %d %d %d%% %s\n", <file system name>, <total space>,  
 86066 <space used>, <space free>, <percentage used>,  
 86067 <file system root>

86068 In the following list, all quantities expressed in 512-byte units (1 024-byte when **-k** is specified)  
 86069 shall be rounded up to the next higher unit. The fields are:

86070 <file system name>  
 86071 The name of the file system, in an implementation-defined format.

86072 <total space> The total size of the file system in 512-byte units. The exact meaning of this figure  
 86073 is implementation-defined, but should include <space used>, <space free>, plus any  
 86074 space reserved by the system not normally available to a user.

86075 <space used> The total amount of space allocated to existing files in the file system, in 512-byte  
 86076 units.

86077 <space free> The total amount of space available within the file system for the creation of new  
 86078 files by unprivileged users, in 512-byte units. When this figure is less than or equal  
 86079 to zero, it shall not be possible to create any new files on the file system without  
 86080 first deleting others, unless the process has appropriate privileges. The figure  
 86081 written may be less than zero.

86082 <percentage used>  
 86083 The percentage of the normally available space that is currently allocated to all files  
 86084 on the file system. This shall be calculated using the fraction:

86085 
$$\frac{\text{<space used>}}{(\text{<space used>} + \text{<space free>})}$$
  
 86086 expressed as a percentage. This percentage may be greater than 100 if <space free>  
 86087 is less than zero. The percentage value shall be expressed as a positive integer, with  
 86088 any fractional result causing it to be rounded to the next highest integer.

86089 <file system root>

86090 The directory below which the file system hierarchy appears.

86091 XSI The output format is unspecified when **-t** is used.

## 86092 STDERR

86093 The standard error shall be used only for diagnostic messages.

## 86094 OUTPUT FILES

86095 None.

## 86096 EXTENDED DESCRIPTION

86097 None.

## 86098 EXIT STATUS

86099 The following exit values shall be returned:

86100 0 Successful completion.

86101 >0 An error occurred.

## 86102 CONSEQUENCES OF ERRORS

86103 Default.

## 86104 APPLICATION USAGE

86105 On most systems, the “name of the file system, in an implementation-defined format” is the  
86106 special file on which the file system is mounted.

86107 On large file systems, the calculation specified for percentage used can create huge rounding  
86108 errors.

## 86109 EXAMPLES

86110 1. The following example writes portable information about the **/usr** file system:

86111 `df -P /usr`

86112 2. Assuming that **/usr/src** is part of the **/usr** file system, the following produces the same  
86113 output as the previous example:

86114 `df -P /usr/src`

## 86115 RATIONALE

86116 The behavior of *df* with the **-P** option is the default action of the 4.2 BSD *df* utility. The uppercase  
86117 **-P** was selected to avoid collision with a known industry extension using **-p**.

86118 Historical *df* implementations vary considerably in their default output. It was therefore  
86119 necessary to describe the default output in a loose manner to accommodate all known historical  
86120 implementations and to add a portable option (**-P**) to provide information in a portable format.

86121 The use of 512-byte units is historical practice and maintains compatibility with *ls* and other  
86122 utilities in this volume of POSIX.1-2008. This does not mandate that the file system itself be  
86123 based on 512-byte blocks. The **-k** option was added as a compromise measure. It was agreed by  
86124 the standard developers that 512 bytes was the best default unit because of its complete  
86125 historical consistency on System V (*versus* the mixed 512/1024-byte usage on BSD systems), and  
86126 that a **-k** option to switch to 1024-byte units was a good compromise. Users who prefer the  
86127 more logical 1024-byte quantity can easily alias *df* to *df -k* without breaking many historical  
86128 scripts relying on the 512-byte units.

86129 It was suggested that *df* and the various related utilities be modified to access a *BLOCKSIZE*  
86130 environment variable to achieve consistency and user acceptance. Since this is not historical

86131 practice on any system, it is left as a possible area for system extensions and will be re-evaluated  
86132 in a future version if it is widely implemented.

86133 **FUTURE DIRECTIONS**

86134 None.

86135 **SEE ALSO**

86136 *find*

86137 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

86138 **CHANGE HISTORY**

86139 First released in Issue 2.

86140 **Issue 6**

86141 This utility is marked as part of the User Portability Utilities option.

86142 **Issue 7**

86143 Austin Group Interpretation 1003.1-2001 #099 is applied.

86144 The *df* utility is removed from the User Portability Utilities option. User Portability Utilities is  
86145 now an option for interactive utilities.

86146 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

86147 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0082 [156] is applied.

86148 **NAME**

86149 diff — compare two files

86150 **SYNOPSIS**86151 diff [-c|-e|-f|-u|-C *n*|-U *n*] [-br] *file1 file2*86152 **DESCRIPTION**

86153 The *diff* utility shall compare the contents of *file1* and *file2* and write to standard output a list of  
 86154 changes necessary to convert *file1* into *file2*. This list should be minimal. No output shall be  
 86155 produced if the files are identical.

86156 **OPTIONS**86157 The *diff* utility shall conform to XBD [Section 12.2](#) (on page 216).

86158 The following options shall be supported:

86159 **-b** Cause any amount of white space at the end of a line to be treated as a single  
 86160 <newline> (that is, the white-space characters preceding the <newline> are  
 86161 ignored) and other strings of white-space characters, not including <newline>  
 86162 characters, to compare equal.

86163 **-c** Produce output in a form that provides three lines of copied context.

86164 **-C *n*** Produce output in a form that provides *n* lines of copied context (where *n* shall be  
 86165 interpreted as a positive decimal integer).

86166 **-e** Produce output in a form suitable as input for the *ed* utility, which can then be used  
 86167 to convert *file1* into *file2*.

86168 **-f** Produce output in an alternative form, similar in format to **-e**, but not intended to  
 86169 be suitable as input for the *ed* utility, and in the opposite order.

86170 **-r** Apply *diff* recursively to files and directories of the same name when *file1* and *file2*  
 86171 are both directories.

86172 The *diff* utility shall detect infinite loops; that is, entering a previously visited  
 86173 directory that is an ancestor of the last file encountered. When it detects an infinite  
 86174 loop, *diff* shall write a diagnostic message to standard error and shall either recover  
 86175 its position in the hierarchy or terminate.

86176 **-u** Produce output in a form that provides three lines of unified context.

86177 **-U *n*** Produce output in a form that provides *n* lines of unified context (where *n* shall be  
 86178 interpreted as a non-negative decimal integer).

86179 **OPERANDS**

86180 The following operands shall be supported:

86181 *file1, file2* A pathname of a file to be compared. If either the *file1* or *file2* operand is '-', the  
 86182 standard input shall be used in its place.

86183 If both *file1* and *file2* are directories, *diff* shall not compare block special files, character special  
 86184 files, or FIFO special files to any files and shall not compare regular files to directories. Further  
 86185 details are as specified in [Diff Directory Comparison Format](#) (on page 2648). The behavior of *diff*  
 86186 on other file types is implementation-defined when found in directories.

86187 If only one of *file1* and *file2* is a directory, *diff* shall be applied to the non-directory file and the file  
 86188 contained in the directory file with a filename that is the same as the last component of the non-  
 86189 directory file.

86190 **STDIN**

86191 The standard input shall be used only if one of the *file1* or *file2* operands references standard  
86192 input. See the INPUT FILES section.

86193 **INPUT FILES**

86194 The input files may be of any type.

86195 **ENVIRONMENT VARIABLES**

86196 The following environment variables shall affect the execution of *diff*:

86197 **LANG** Provide a default value for the internationalization variables that are unset or null.  
86198 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
86199 variables used to determine the values of locale categories.)

86200 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
86201 internationalization variables.

86202 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
86203 characters (for example, single-byte as opposed to multi-byte characters in  
86204 arguments and input files).

86205 **LC\_MESSAGES**

86206 Determine the locale that should be used to affect the format and contents of  
86207 diagnostic messages written to standard error and informative messages written to  
86208 standard output.

86209 **LC\_TIME** Determine the locale for affecting the format of file timestamps written with the **-C**  
86210 and **-c** options.

86211 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

86212 **TZ** Determine the timezone used for calculating file timestamps written with a context  
86213 format. If **TZ** is unset or null, an unspecified default timezone shall be used.

86214 **ASYNCHRONOUS EVENTS**

86215 Default.

86216 **STDOUT**86217 **Diff Directory Comparison Format**

86218 If both *file1* and *file2* are directories, the following output formats shall be used.

86219 In the POSIX locale, each file that is present in only one directory shall be reported using the  
86220 following format:

86221 "Only in %s: %s\n", <directory pathname>, <filename>

86222 In the POSIX locale, subdirectories that are common to the two directories may be reported with  
86223 the following format:

86224 "Common subdirectories: %s and %s\n", <directory1 pathname>,  
86225 <directory2 pathname>

86226 For each file common to the two directories, if the two files are not to be compared: if the two  
86227 files have the same device ID and file serial number, or are both block special files that refer to  
86228 the same device, or are both character special files that refer to the same device, in the POSIX  
86229 locale the output format is unspecified. Otherwise, in the POSIX locale an unspecified format  
86230 shall be used that contains the pathnames of the two files.

86231 For each file common to the two directories, if the files are compared and are identical, no

output shall be written. If the two files differ, the following format is written:

```
"diff %s %s %s\n", <diff_options>, <filename1>, <filename2>
```

where *<diff\_options>* are the options as specified on the command line.

All directory pathnames listed in this section shall be relative to the original command line arguments. All other names of files listed in this section shall be filenames (pathname components).

### Diff Binary Output Format

In the POSIX locale, if one or both of the files being compared are not text files, it is implementation-defined whether *diff* uses the binary file output format or the other formats as specified below. The binary file output format shall contain the pathnames of two files being compared and the string "differ".

If both files being compared are text files, depending on the options specified, one of the following formats shall be used to write the differences.

### Diff Default Output Format

The default (without *-e*, *-f*, *-c*, *-C*, *-u*, or *-U* options) *diff* utility output shall contain lines of these forms:

```
"%da%d\n", <num1>, <num2>
```

```
"%da%d,%d\n", <num1>, <num2>, <num3>
```

```
"%dd%d\n", <num1>, <num2>
```

```
"%d,%dd%d\n", <num1>, <num2>, <num3>
```

```
"%dc%d\n", <num1>, <num2>
```

```
"%d,%dc%d\n", <num1>, <num2>, <num3>
```

```
"%dc%d,%d\n", <num1>, <num2>, <num3>
```

```
"%d,%dc%d,%d\n", <num1>, <num2>, <num3>, <num4>
```

These lines resemble *ed* subcommands to convert *file1* into *file2*. The line numbers before the action letters shall pertain to *file1*; those after shall pertain to *file2*. Thus, by exchanging *a* for *d* and reading the line in reverse order, one can also determine how to convert *file2* into *file1*. As in *ed*, identical pairs (where *num1*=*num2*) are abbreviated as a single number.

Following each of these lines, *diff* shall write to standard output all lines affected in the first file using the format:

```
"<Δ%s", <line>
```

and all lines affected in the second file using the format:

```
">Δ%s", <line>
```

If there are lines affected in both *file1* and *file2* (as with the *c* subcommand), the changes are separated with a line consisting of three <hyphen-minus> characters:

```
"---\n"
```

**Diff -e Output Format**

With the **-e** option, a script shall be produced that shall, when provided as input to *ed*, along with an appended **w** (write) command, convert *file1* into *file2*. Only the **a** (append), **c** (change), **d** (delete), **i** (insert), and **s** (substitute) commands of *ed* shall be used in this script. Text lines, except those consisting of the single character <period> ( ' . ' ), shall be output as they appear in the file.

**Diff -f Output Format**

With the **-f** option, an alternative format of script shall be produced. It is similar to that produced by **-e**, with the following differences:

1. It is expressed in reverse sequence; the output of **-e** orders changes from the end of the file to the beginning; the **-f** from beginning to end.
2. The command form <lines> <command-letter> used by **-e** is reversed. For example, 10c with **-e** would be c10 with **-f**.
3. The form used for ranges of line numbers is <space>-separated, rather than <comma>-separated.

**Diff -c or -C Output Format**

With the **-c** or **-C** option, the output format shall consist of affected lines along with surrounding lines of context. The affected lines shall show which ones need to be deleted or changed in *file1*, and those added from *file2*. With the **-c** option, three lines of context, if available, shall be written before and after the affected lines. With the **-C** option, the user can specify how many lines of context are written. The exact format follows.

The name and last modification time of each file shall be output in the following format:

```
***  %s %s\n", file1, <file1 timestamp>
---  %s %s\n", file2, <file2 timestamp>
```

Each <file> field shall be the pathname of the corresponding file being compared. The pathname written for standard input is unspecified.

In the POSIX locale, each <timestamp> field shall be equivalent to the output from the following command:

```
date "+%a %b %e %T %Y"
```

without the trailing <newline>, executed at the time of last modification of the corresponding file (or the current time, if the file is standard input).

Then, the following output formats shall be applied for every set of changes.

First, a line shall be written in the following format:

```
"*****\n"
```

Next, the range of lines in *file1* shall be written in the following format if the range contains two or more lines:

```
***  %d,%d *****\n", <beginning line number>, <ending line number>
```

and the following format otherwise:

```
***  %d *****\n", <ending line number>
```

The ending line number of an empty range shall be the number of the preceding line, or 0 if the

86308 range is at the start of the file.

86309 Next, the affected lines along with lines of context (unaffected lines) shall be written. Unaffected  
86310 lines shall be written in the following format:

86311 " $\Delta$ %s", <unaffected\_line>

86312 Deleted lines shall be written as:

86313 " $-\Delta$ %s", <deleted\_line>

86314 Changed lines shall be written as:

86315 "! $\Delta$ %s", <changed\_line>

86316 Next, the range of lines in *file2* shall be written in the following format if the range contains two  
86317 or more lines:

86318 "--- %d,%d ----\n", <beginning line number>, <ending line number>

86319 and the following format otherwise:

86320 "--- %d ----\n", <ending line number>

86321 Then, lines of context and changed lines shall be written as described in the previous formats.  
86322 Lines added from *file2* shall be written in the following format:

86323 "+ $\Delta$ %s", <added\_line>

#### 86324 **Diff -u or -U Output Format**

86325 The -u or -U options behave like the -c or -C options, except that the context lines are not  
86326 repeated; instead, the context, deleted, and added lines are shown together, interleaved. The  
86327 exact format follows.

86328 The name and last modification time of each file shall be output in the following format:

86329 "--- $\Delta$ %s\t%s%\s $\Delta$ %s\n", file1, <file1 timestamp>, <file1 frac>, <file1 zone> |  
86330 "+++ $\Delta$ %s\t%s%\s $\Delta$ %s\n", file2, <file2 timestamp>, <file2 frac>, <file2 zone> |

86331 Each <file> field shall be the pathname of the corresponding file being compared, or the single  
86332 character '-' if standard input is being compared. However, if the pathname contains a <tab>  
86333 or a <newline>, or if it does not consist entirely of characters taken from the portable character  
86334 set, the behavior is implementation-defined.

86335 Each <timestamp> field shall be equivalent to the output from the following command:

86336 date '+%Y-%m-%d $\Delta$ %H:%M:%S'

86337 without the trailing <newline>, executed at the time of last modification of the corresponding  
86338 file (or the current time, if the file is standard input).

86339 Each <frac> field shall be either empty, or a decimal point followed by at least one decimal digit,  
86340 indicating the fractional-seconds part (if any) of the file timestamp. The number of fractional  
86341 digits shall be at least the number needed to represent the file's timestamp without loss of  
86342 information.

86343 Each <zone> field shall be of the form "shhmm", where "shh" is a signed two-digit decimal  
86344 number in the range -24 through +25, and "mm" is an unsigned two-digit decimal number in the  
86345 range 00 through 59. It represents the timezone of the timestamp as the number of hours (hh)  
86346 and minutes (mm) east (+) or west (-) of UTC for the timestamp. If the hours and minutes are  
86347 both zero, the sign shall be '+'. However, if the timezone is not an integral number of minutes

86348 away from UTC, the <zone> field is implementation-defined.

86349 Then, the following output formats shall be applied for every set of changes.

86350 First, the range of lines in each file shall be written in the following format:

86351 "@@Δ-%sΔ+%sΔ@@", <file1 range>, <file2 range>

86352 Each <range> field shall be of the form:

86353 "%ld", <beginning line number>

86354 or: +

86355 "%ld,1", <beginning line number> +

86356 if the range contains exactly one line, and:

86357 "%ld,%ld", <beginning line number>, <number of lines>

86358 otherwise. If a range is empty, its beginning line number shall be the number of the line just

86359 before the range, or 0 if the empty range starts the file.

86360 Next, the affected lines along with lines of context shall be written. Each non-empty unaffected

86361 line shall be written in the following format:

86362 "Δ%s", <unaffected\_line>

86363 where the contents of the unaffected line shall be taken from *file1*. It is implementation-defined

86364 whether an empty unaffected line is written as an empty line or a line containing a single

86365 <space> character. This line also represents the same line of *file2*, even though *file2*'s line may

86366 contain different contents due to the **-b**. Deleted lines shall be written as:

86367 "-%s", <deleted\_line>

86368 Added lines shall be written as:

86369 "+%s", <added\_line>

86370 The order of lines written shall be the same as that of the corresponding file. A deleted line shall

86371 never be written immediately after an added line.

86372 If **-U n** is specified, the output shall contain no more than  $2n$  consecutive unaffected lines; and if

86373 the output contains an affected line and this line is adjacent to up to  $n$  consecutive unaffected

86374 lines in the corresponding file, the output shall contain these unaffected lines. **-u** shall act like

86375 **-U3**.

86376 **STDERR**

86377 The standard error shall be used only for diagnostic messages.

86378 **OUTPUT FILES**

86379 None.

86380 **EXTENDED DESCRIPTION**

86381 None.

86382 **EXIT STATUS**

86383 The following exit values shall be returned:

86384 0 No differences were found.

86385 1 Differences were found.

86386 >1 An error occurred.

## 86387 CONSEQUENCES OF ERRORS

86388 Default.

## 86389 APPLICATION USAGE

86390 If lines at the end of a file are changed and other lines are added, *diff* output may show this as a  
 86391 delete and add, as a change, or as a change and add; *diff* is not expected to know which  
 86392 happened and users should not care about the difference in output as long as it clearly shows  
 86393 the differences between the files.

## 86394 EXAMPLES

86395 If **dir1** is a directory containing a directory named **x**, **dir2** is a directory containing a directory  
 86396 named **x**, **dir1/x** and **dir2/x** both contain files named **date.out**, and **dir2/x** contains a file named **y**,  
 86397 the command:

86398 `diff -r dir1 dir2`

86399 could produce output similar to:

```
86400 Common subdirectories: dir1/x and dir2/x
86401 Only in dir2/x: y
86402 diff -r dir1/x/date.out dir2/x/date.out
86403 1c1
86404 < Mon Jul 2 13:12:16 PDT 1990
86405 ---
86406 > Tue Jun 19 21:41:39 PDT 1990
```

## 86407 RATIONALE

86408 The **-h** option was omitted because it was insufficiently specified and does not add to  
 86409 applications portability.

86410 Historical implementations employ algorithms that do not always produce a minimum list of  
 86411 differences; the current language about making every effort is the best this volume of  
 86412 POSIX.1-2008 can do, as there is no metric that could be employed to judge the quality of  
 86413 implementations against any and all file contents. The statement “This list should be minimal”  
 86414 clearly implies that implementations are not expected to provide the following output when  
 86415 comparing two 100-line files that differ in only one character on a single line:

```
86416 1,100c1,100
86417 all 100 lines from file1 preceded with "< "
86418 ---
86419 all 100 lines from file2 preceded with "> "
```

86420 The “Only in” messages required when the **-r** option is specified are not used by most historical  
 86421 implementations if the **-e** option is also specified. It is required here because it provides useful  
 86422 information that must be provided to update a target directory hierarchy to match a source  
 86423 hierarchy. The “Common subdirectories” messages are written by System V and 4.3 BSD when  
 86424 the **-r** option is specified. They are allowed here but are not required because they are reporting  
 86425 on something that is the same, not reporting a difference, and are not needed to update a target  
 86426 hierarchy.

86427 The **-c** option, which writes output in a format using lines of context, has been included. The  
 86428 format is useful for a variety of reasons, among them being much improved readability and the  
 86429 ability to understand difference changes when the target file has line numbers that differ from  
 86430 another similar, but slightly different, copy. The *patch* utility is most valuable when working  
 86431 with difference listings using a context format. The BSD version of **-c** takes an optional

argument specifying the amount of context. Rather than overloading `-c` and breaking the Utility Syntax Guidelines for *diff*, the standard developers decided to add a separate option for specifying a context diff with a specified amount of context (`-C`). Also, the format for context diffs was extended slightly in 4.3 BSD to allow multiple changes that are within context lines from each other to be merged together. The output format contains an additional four `<asterisk>` characters after the range of affected lines in the first filename. This was to provide a flag for old programs (like old versions of *patch*) that only understand the old context format. The version of context described here does not require that multiple changes within context lines be merged, but it does not prohibit it either. The extension is upwards-compatible, so any vendors that wish to retain the old version of *diff* can do so by adding the extra four `<asterisk>` characters (that is, utilities that currently use *diff* and understand the new merged format will also understand the old unmerged format, but not *vice versa*).

The `-u` and `-U` options of GNU *diff* have been included. Their output format, designed by Wayne Davison, takes up less space than `-c` and `-C` format, and in many cases is easier to read. The format's timestamps do not vary by locale, so *LC\_TIME* does not affect it. The format's line numbers are rendered with the `%ld` format, not `%d`, because the file format notation rules would allow extra `<blank>` characters to appear around the numbers.

The substitute command was added as an additional format for the `-e` option. This was added to provide implementations with a way to fix the classic "dot alone on a line" bug present in many versions of *diff*. Since many implementations have fixed this bug, the standard developers decided not to standardize broken behavior, but rather to provide the necessary tool for fixing the bug. One way to fix this bug is to output two periods whenever a lone period is needed, then terminate the append command with a period, and then use the substitute command to convert the two periods into one period.

The BSD-derived `-r` option was added to provide a mechanism for using *diff* to compare two file system trees. This behavior is useful, is standard practice on all BSD-derived systems, and is not easily reproducible with the *find* utility.

The requirement that *diff* not compare files in some circumstances, even though they have the same name, is based on the actual output of historical implementations. The specified behavior precludes the problems arising from running into FIFOs and other files that would cause *diff* to hang waiting for input with no indication to the user that *diff* was hung. An earlier version of this standard specified the output format more precisely, but in practice this requirement was widely ignored and the benefit of standardization seemed small, so it is now unspecified. In most common usage, *diff -r* should indicate differences in the file hierarchies, not the difference of contents of devices pointed to by the hierarchies.

Many early implementations of *diff* require seekable files. Since the System Interfaces volume of POSIX.1-2008 supports named pipes, the standard developers decided that such a restriction was unreasonable. Note also that the allowed filename – almost always refers to a pipe.

No directory search order is specified for *diff*. The historical ordering is, in fact, not optimal, in that it prints out all of the differences at the current level, including the statements about all common subdirectories before recursing into those subdirectories.

The message:

```
"diff %s %s %s\n", <diff_options>, <filename1>, <filename2>
```

does not vary by locale because it is the representation of a command, not an English sentence.

**86476 FUTURE DIRECTIONS**

86477 None.

**86478 SEE ALSO**

86479 *cmp, comm, ed, find*

86480 XBD Chapter 8 (on page 173), Section 12.2 (on page 216)

**86481 CHANGE HISTORY**

86482 First released in Issue 2.

**86483 Issue 5**

86484 The FUTURE DIRECTIONS section is added.

**86485 Issue 6**

86486 The following new requirements on POSIX implementations derive from alignment with the  
86487 Single UNIX Specification:

- 86488 • The `-f` option is added.

86489 The output format for `-c` or `-C` format is changed to align with changes to the IEEE P1003.2b  
86490 draft standard resulting from IEEE PASC Interpretation 1003.2 #71.

86491 The normative text is reworded to avoid use of the term “must” for application requirements.

86492 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/20 is applied, changing the STDOUT  
86493 section. This changes the specification of *diff* `-c` so that it agrees with existing practice when  
86494 contexts contain zero lines or one line.

**86495 Issue 7**

86496 Austin Group Interpretations 1003.1-2001 #115 and #114 are applied.

86497 Austin Group Interpretation 1003.1-2001 #192 is applied, clarifying the behavior if both files are  
86498 non-text files.

86499 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

86500 SD5-XCU-ERN-103 and SD5-XCU-ERN-120 are applied, adding the `-u` option.

86501 **NAME**

86502       dirname — return the directory portion of a pathname

86503 **SYNOPSIS**86504       dirname *string*86505 **DESCRIPTION**

86506       The *string* operand shall be treated as a pathname, as defined in XBD [Section 3.271](#) (on page 76).  
 86507       The string *string* shall be converted to the name of the directory containing the filename  
 86508       corresponding to the last pathname component in *string*, performing actions equivalent to the  
 86509       following steps in order:

- 86510           1. If *string* is *//*, skip steps 2 to 5.
- 86511           2. If *string* consists entirely of <slash> characters, *string* shall be set to a single <slash>  
 86512           character. In this case, skip steps 3 to 8.
- 86513           3. If there are any trailing <slash> characters in *string*, they shall be removed.
- 86514           4. If there are no <slash> characters remaining in *string*, *string* shall be set to a single  
 86515           <period> character. In this case, skip steps 5 to 8.
- 86516           5. If there are any trailing non-<slash> characters in *string*, they shall be removed.
- 86517           6. If the remaining *string* is *//*, it is implementation-defined whether steps 7 and 8 are  
 86518           skipped or processed.
- 86519           7. If there are any trailing <slash> characters in *string*, they shall be removed.
- 86520           8. If the remaining *string* is empty, *string* shall be set to a single <slash> character.

86521       The resulting string shall be written to standard output.

86522 **OPTIONS**

86523       None.

86524 **OPERANDS**

86525       The following operand shall be supported:

86526       *string*       A string.86527 **STDIN**

86528       Not used.

86529 **INPUT FILES**

86530       None.

86531 **ENVIRONMENT VARIABLES**86532       The following environment variables shall affect the execution of *dirname*:

86533       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 86534       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 86535       variables used to determine the values of locale categories.)

86536       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 86537       internationalization variables.

86538       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 86539       characters (for example, single-byte as opposed to multi-byte characters in  
 86540       arguments).

86541 **LC\_MESSAGES**

86542 Determine the locale that should be used to affect the format and contents of  
 86543 diagnostic messages written to standard error.

86544 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

86545 **ASYNCHRONOUS EVENTS**

86546 Default.

86547 **STDOUT**

86548 The *dirname* utility shall write a line to the standard output in the following format:

86549 "%s\n", *<resulting string>*

86550 **STDERR**

86551 The standard error shall be used only for diagnostic messages.

86552 **OUTPUT FILES**

86553 None.

86554 **EXTENDED DESCRIPTION**

86555 None.

86556 **EXIT STATUS**

86557 The following exit values shall be returned:

86558 0 Successful completion.

86559 >0 An error occurred.

86560 **CONSEQUENCES OF ERRORS**

86561 Default.

86562 **APPLICATION USAGE**

86563 The definition of *pathname* specifies implementation-defined behavior for pathnames starting  
 86564 with two <slash> characters. Therefore, applications shall not arbitrarily add <slash> characters  
 86565 to the beginning of a pathname unless they can ensure that there are more or less than two or are  
 86566 prepared to deal with the implementation-defined consequences.

86567 **EXAMPLES**

86568 The EXAMPLES section of the *basename()* function (see XSH *basename()*) includes a table |  
 86569 showing examples of the results of processing several sample pathnames by the *basename()* and |  
 86570 *dirname()* functions and by the *basename* and *dirname* utilities.

86571 See also the examples for the *basename* utility.

86572 **RATIONALE**

86573 The behaviors of *basename* and *dirname* in this volume of POSIX.1-2008 have been coordinated so -  
 86574 that when *string* is a valid pathname:

86575 `$(basename -- "string")`

86576 would be a valid filename for the file in the directory:

86577 `$(dirname -- "string")`

86578 This would not work for the versions of these utilities in early proposals due to the way  
 86579 processing of trailing <slash> characters was specified. Consideration was given to leaving  
 86580 processing unspecified if there were trailing <slash> characters, but this cannot be done; XBD  
 86581 Section 3.271 (on page 76) allows trailing <slash> characters. The *basename* and *dirname* utilities  
 86582 have to specify consistent handling for all valid pathnames.

86583 **FUTURE DIRECTIONS**

86584 None.

86585 **SEE ALSO**86586 [Section 2.5](#) (on page 2339), *basename*86587 [XBD Section 3.271](#) (on page 76), [Chapter 8](#) (on page 173)86588 XSH *basename()*, *dirname()* +86589 **CHANGE HISTORY**

86590 First released in Issue 2.

86591 **Issue 7**86592 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0083 [192,430], XCU/TC1-2008/0084  
86593 [192], and XCU/TC1-2008/0085 [192] are applied.

**NAME**

**du** — estimate file space usage

**SYNOPSIS**

**du** [**-a** | **-s**] [**-kx**] [**-H** | **-L**] [*file*...]

**DESCRIPTION**

By default, the *du* utility shall write to standard output the size of the file space allocated to, and the size of the file space allocated to each subdirectory of, the file hierarchy rooted in each of the specified files. By default, when a symbolic link is encountered on the command line or in the file hierarchy, *du* shall count the size of the symbolic link (rather than the file referenced by the link), and shall not follow the link to another portion of the file hierarchy. The size of the file space allocated to a file of type directory shall be defined as the sum total of space allocated to all files in the file hierarchy rooted in the directory plus the space allocated to the directory itself.

When *du* cannot *stat()* files or *stat()* or read directories, it shall report an error condition and the final exit status is affected. A file that occurs multiple times under one file operand and that has a link count greater than 1 shall be counted and written for only one entry. It is implementation-defined whether a file that has a link count no greater than 1 is counted and written just once, or is counted and written for each occurrence. It is implementation-defined whether a file that occurs under one file operand is counted for other file operands. The directory entry that is selected in the report is unspecified. By default, file sizes shall be written in 512-byte units, rounded up to the next 512-byte unit.

**OPTIONS**

The *du* utility shall conform to XBD [Section 12.2](#) (on page 216).

The following options shall be supported:

**-a** In addition to the default output, report the size of each file not of type directory in the file hierarchy rooted in the specified file. The **-a** option shall not affect whether non-directories given as *file* operands are listed.

**-H** If a symbolic link is specified on the command line, *du* shall count the size of the file or file hierarchy referenced by the link.

**-k** Write the files sizes in units of 1 024 bytes, rather than the default 512-byte units.

**-L** If a symbolic link is specified on the command line or encountered during the traversal of a file hierarchy, *du* shall count the size of the file or file hierarchy referenced by the link.

**-s** Instead of the default output, report only the total sum for each of the specified files.

**-x** When evaluating file sizes, evaluate only those files that have the same device as the file specified by the *file* operand.

Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered an error. The last option specified shall determine the behavior of the utility.

**OPERANDS**

The following operand shall be supported:

*file* The pathname of a file whose size is to be written. If no *file* is specified, the current directory shall be used.

86636 **STDIN**

86637 Not used.

86638 **INPUT FILES**

86639 None.

86640 **ENVIRONMENT VARIABLES**86641 The following environment variables shall affect the execution of *du*:

86642 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 86643 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 86644 variables used to determine the values of locale categories.)

86645 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 86646 internationalization variables.

86647 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 86648 characters (for example, single-byte as opposed to multi-byte characters in  
 86649 arguments).

86650 *LC\_MESSAGES*

86651 Determine the locale that should be used to affect the format and contents of  
 86652 diagnostic messages written to standard error.

86653 *XSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

86654 **ASYNCHRONOUS EVENTS**

86655 Default.

86656 **STDOUT**

86657 The output from *du* shall consist of the amount of space allocated to a file and the name of the  
 86658 file, in the following format:

86659 "%d %s\n", *<size>*, *<pathname>*86660 **STDERR**

86661 The standard error shall be used only for diagnostic messages.

86662 **OUTPUT FILES**

86663 None.

86664 **EXTENDED DESCRIPTION**

86665 None.

86666 **EXIT STATUS**

86667 The following exit values shall be returned:

86668 0 Successful completion.

86669 &gt;0 An error occurred.

86670 **CONSEQUENCES OF ERRORS**

86671 Default.

**APPLICATION USAGE**

None.

**EXAMPLES**

None.

**RATIONALE**

The use of 512-byte units is historical practice and maintains compatibility with *ls* and other utilities in this volume of POSIX.1-2008. This does not mandate that the file system itself be based on 512-byte blocks. The **-k** option was added as a compromise measure. It was agreed by the standard developers that 512 bytes was the best default unit because of its complete historical consistency on System V (*versus* the mixed 512/1024-byte usage on BSD systems), and that a **-k** option to switch to 1024-byte units was a good compromise. Users who prefer the 1024-byte quantity can easily alias *du* to *du -k* without breaking the many historical scripts relying on the 512-byte units.

The **-b** option was added to an early proposal to provide a resolution to the situation where System V and BSD systems give figures for file sizes in *blocks*, which is an implementation-defined concept. (In common usage, the block size is 512 bytes for System V and 1024 bytes for BSD systems.) However, **-b** was later deleted, since the default was eventually decided as 512-byte units.

Historical file systems provided no way to obtain exact figures for the space allocation given to files. There are two known areas of inaccuracies in historical file systems: cases of *indirect blocks* being used by the file system or *sparse* files yielding incorrectly high values. An indirect block is space used by the file system in the storage of the file, but that need not be counted in the space allocated to the file. A *sparse* file is one in which an *lseek()* call has been made to a position beyond the end of the file and data has subsequently been written at that point. A file system need not allocate all the intervening zero-filled blocks to such a file. It is up to the implementation to define exactly how accurate its methods are.

The **-a** and **-s** options were mutually-exclusive in the original version of *du*. The POSIX Shell and Utilities description is implied by the language in the SVID where **-s** is described as causing “only the grand total” to be reported. Some systems may produce output for **-sa**, but a Strictly Conforming POSIX Shell and Utilities Application cannot use that combination.

The **-a** and **-s** options were adopted from the SVID except that the System V behavior of not listing non-directories explicitly given as operands, unless the **-a** option is specified, was considered a bug; the BSD-based behavior (report for all operands) is mandated. The default behavior of *du* in the SVID with regard to reporting the failure to read files (it produces no messages) was considered counter-intuitive, and thus it was specified that the POSIX Shell and Utilities default behavior shall be to produce such messages. These messages can be turned off with shell redirection to achieve the System V behavior.

The **-x** option is historical practice on recent BSD systems. It has been adopted by this volume of POSIX.1-2008 because there was no other historical method of limiting the *du* search to a single file hierarchy. This limitation of the search is necessary to make it possible to obtain file space usage information about a file system on which other file systems are mounted, without having to resort to a lengthy *find* and *awk* script.

**FUTURE DIRECTIONS**

A future version of this standard may require that a file that occurs multiple times shall be counted and written for only one entry, even if the occurrences are under different file operands.

86717 **SEE ALSO**86718 *ls*86719 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)86720 XSH *fstatat()*86721 **CHANGE HISTORY**

86722 First released in Issue 2.

86723 **Issue 6**

86724 This utility is marked as part of the User Portability Utilities option.

86725 The APPLICATION USAGE section is added.

86726 The obsolescent **-r** option is removed.86727 The Open Group Corrigendum U025/3 is applied. The *du* utility is reinstated, as it had  
86728 incorrectly been marked LEGACY in Issue 5.86729 The **-H** and **-L** options for symbolic links are added as described in the IEEE P1003.2b draft  
86730 standard.86731 **Issue 7**86732 The *du* utility is moved from the User Portability Utilities option to the Base. User Portability  
86733 Utilities is now an option for interactive utilities.

86734 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

86735 **NAME**

86736 echo — write arguments to standard output

86737 **SYNOPSIS**86738 echo [*string*...]86739 **DESCRIPTION**

86740 The *echo* utility writes its arguments to standard output, followed by a <newline>. If there are  
 86741 no arguments, only the <newline> is written.

86742 **OPTIONS**

86743 The *echo* utility shall not recognize the "--" argument in the manner specified by Guideline 10  
 86744 of XBD [Section 12.2](#) (on page 216); "--" shall be recognized as a string operand.

86745 Implementations shall not support any options.

86746 **OPERANDS**

86747 The following operands shall be supported:

86748 *string* A string to be written to standard output. If the first operand is **-n**, or if any of the  
 86749 operands contain a <backslash> character, the results are implementation-defined.

86750 XSI On XSI-conformant systems, if the first operand is **-n**, it shall be treated as a string,  
 86751 not an option. The following character sequences shall be recognized on XSI-  
 86752 conformant systems within any of the arguments:

|       |              |                                                                                                                                                                                 |
|-------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 86753 | <b>\a</b>    | Write an <alert>.                                                                                                                                                               |
| 86754 | <b>\b</b>    | Write a <backspace>.                                                                                                                                                            |
| 86755 | <b>\c</b>    | Suppress the <newline> that otherwise follows the final argument in the<br>86756 output. All characters following the ' <b>\c</b> ' in the arguments shall be<br>86757 ignored. |
| 86758 | <b>\f</b>    | Write a <form-feed>.                                                                                                                                                            |
| 86759 | <b>\n</b>    | Write a <newline>.                                                                                                                                                              |
| 86760 | <b>\r</b>    | Write a <carriage-return>.                                                                                                                                                      |
| 86761 | <b>\t</b>    | Write a <tab>.                                                                                                                                                                  |
| 86762 | <b>\v</b>    | Write a <vertical-tab>.                                                                                                                                                         |
| 86763 | <b>\\</b>    | Write a <backslash> character.                                                                                                                                                  |
| 86764 | <b>\0num</b> | Write an 8-bit value that is the zero, one, two, or three-digit octal number<br>86765 <i>num</i> .                                                                              |

86766 **STDIN**

86767 Not used.

86768 **INPUT FILES**

86769 None.

86770 **ENVIRONMENT VARIABLES**86771 The following environment variables shall affect the execution of *echo*:

86772 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 86773 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 86774 variables used to determine the values of locale categories.)

86775 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 86776 internationalization variables.

86777 XSI *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 86778 characters (for example, single-byte as opposed to multi-byte characters in  
 86779 arguments).

86780 *LC\_MESSAGES*  
 86781 Determine the locale that should be used to affect the format and contents of  
 86782 diagnostic messages written to standard error.

86783 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

86784 **ASYNCHRONOUS EVENTS**  
 86785 Default.

86786 **STDOUT**  
 86787 The *echo* utility arguments shall be separated by single <space> characters and a <newline>  
 86788 XSI character shall follow the last argument. Output transformations shall occur based on the  
 86789 escape sequences in the input. See the OPERANDS section.

86790 **STDERR**  
 86791 The standard error shall be used only for diagnostic messages.

86792 **OUTPUT FILES**  
 86793 None.

86794 **EXTENDED DESCRIPTION**  
 86795 None.

86796 **EXIT STATUS**  
 86797 The following exit values shall be returned:  
 86798 0 Successful completion.  
 86799 >0 An error occurred.

86800 **CONSEQUENCES OF ERRORS**  
 86801 Default.

86802 **APPLICATION USAGE**  
 86803 It is not possible to use *echo* portably across all POSIX systems unless both *-n* (as the first  
 86804 argument) and escape sequences are omitted.

86805 The *printf* utility can be used portably to emulate any of the traditional behaviors of the *echo*  
 86806 utility as follows (assuming that *IFS* has its standard value or is unset):

- 86807 • The historic System V *echo* and the requirements on XSI implementations in this volume of  
 86808 POSIX.1-2008 are equivalent to:

```
86809 printf "%b\n" "$*"
86810
```

- 86810 • The BSD *echo* is equivalent to:

```
86811 if [ "X$1" = "X-n" ]
86812 then
86813     shift
86814     printf "%s" "$*"
86815 else
86816     printf "%s\n" "$*"
86817 fi
```

86818 New applications are encouraged to use *printf* instead of *echo*.

#### 86819 EXAMPLES

86820 None.

#### 86821 RATIONALE

86822 The *echo* utility has not been made obsolescent because of its extremely widespread use in  
86823 historical applications. Conforming applications that wish to do prompting without <newline>  
86824 characters or that could possibly be expecting to echo a **-n**, should use the *printf* utility derived  
86825 from the Ninth Edition system.

86826 As specified, *echo* writes its arguments in the simplest of ways. The two different historical  
86827 versions of *echo* vary in fatally incompatible ways.

86828 The BSD *echo* checks the first argument for the string **-n** which causes it to suppress the  
86829 <newline> that would otherwise follow the final argument in the output.

86830 The System V *echo* does not support any options, but allows escape sequences within its  
86831 operands, as described for XSI implementations in the OPERANDS section.

86832 The *echo* utility does not support Utility Syntax Guideline 10 because historical applications  
86833 depend on *echo* to echo *all* of its arguments, except for the **-n** option in the BSD version.

#### 86834 FUTURE DIRECTIONS

86835 None.

#### 86836 SEE ALSO

86837 *printf*

86838 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

#### 86839 CHANGE HISTORY

86840 First released in Issue 2.

##### 86841 Issue 5

86842 In the OPTIONS section, the last sentence is changed to indicate that implementations “do not”  
86843 support any options; in the previous issue this said “need not”.

##### 86844 Issue 6

86845 The following new requirements on POSIX implementations derive from alignment with the  
86846 Single UNIX Specification:

- 86847 • A set of character sequences is defined as *string* operands.
- 86848 • *LC\_CTYPE* is added to the list of environment variables affecting *echo*.
- 86849 • In the OPTIONS section, implementations shall not support any options.

86850 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/21 is applied, so that the *echo* utility can  
86851 accommodate historical BSD behavior.

##### 86852 Issue 7

86853 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

86854 **NAME**

86855 ed — edit text

86856 **SYNOPSIS**86857 ed [-p *string*] [-s] [*file*]86858 **DESCRIPTION**

86859 The *ed* utility is a line-oriented text editor that uses two modes: *command mode* and *input mode*. In  
 86860 command mode the input characters shall be interpreted as commands, and in input mode they  
 86861 shall be interpreted as text. See the EXTENDED DESCRIPTION section.

86862 If an operand is '-', the results are unspecified.

86863 **OPTIONS**

86864 The *ed* utility shall conform to XBD Section 12.2 (on page 216), except for the unspecified usage  
 86865 of '-'.

86866 The following options shall be supported:

86867 -p *string* Use *string* as the prompt string when in command mode. By default, there shall be  
 86868 no prompt string.

86869 -s Suppress the writing of byte counts by **e**, **E**, **r**, and **w** commands and of the '!'  
 86870 prompt after a *!command*.

86871 **OPERANDS**

86872 The following operand shall be supported:

86873 *file* If the *file* argument is given, *ed* shall simulate an **e** command on the file named by  
 86874 the pathname, *file*, before accepting commands from the standard input.

86875 **STDIN**

86876 The standard input shall be a text file consisting of commands, as described in the EXTENDED  
 86877 DESCRIPTION section.

86878 **INPUT FILES**

86879 The input files shall be text files.

86880 **ENVIRONMENT VARIABLES**

86881 The following environment variables shall affect the execution of *ed*:

86882 *HOME* Determine the pathname of the user's home directory.

86883 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 86884 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 86885 variables used to determine the values of locale categories.)

86886 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 86887 internationalization variables.

86888 *LC\_COLLATE*

86889 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 86890 character collating elements within regular expressions.

86891 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 86892 characters (for example, single-byte as opposed to multi-byte characters in  
 86893 arguments and input files) and the behavior of character classes within regular  
 86894 expressions.

86895 **LC\_MESSAGES**

86896 Determine the locale that should be used to affect the format and contents of  
 86897 diagnostic messages written to standard error and informative messages written to  
 86898 standard output.

86899 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

86900 **ASYNCHRONOUS EVENTS**

86901 The *ed* utility shall take the standard action for all signals (see the ASYNCHRONOUS EVENTS  
 86902 section in [Section 1.4](#), on page 2326) with the following exceptions:

86903 **SIGINT** The *ed* utility shall interrupt its current activity, write the string "?\n" to standard  
 86904 output, and return to command mode (see the EXTENDED DESCRIPTION  
 86905 section).

86906 **SIGHUP** If the buffer is not empty and has changed since the last write, the *ed* utility shall  
 86907 attempt to write a copy of the buffer in a file. First, the file named **ed.hup** in the  
 86908 current directory shall be used; if that fails, the file named **ed.hup** in the directory  
 86909 named by the *HOME* environment variable shall be used. In any case, the *ed* utility  
 86910 shall exit without writing the file to the currently remembered pathname and  
 86911 without returning to command mode.

86912 **SIGQUIT** The *ed* utility shall ignore this event.

86913 **STDOUT**

86914 Various editing commands and the prompting feature (see **-p**) write to standard output, as  
 86915 described in the EXTENDED DESCRIPTION section.

86916 **STDERR**

86917 The standard error shall be used only for diagnostic messages.

86918 **OUTPUT FILES**

86919 The output files shall be text files whose formats are dependent on the editing commands given.

86920 **EXTENDED DESCRIPTION**

86921 The *ed* utility shall operate on a copy of the file it is editing; changes made to the copy shall have  
 86922 no effect on the file until a **w** (write) command is given. The copy of the text is called the *buffer*.

86923 Commands to *ed* have a simple and regular structure: zero, one, or two *addresses* followed by a  
 86924 single-character *command*, possibly followed by parameters to that command. These addresses  
 86925 specify one or more lines in the buffer. Every command that requires addresses has default  
 86926 addresses, so that the addresses very often can be omitted. If the **-p** option is specified, the  
 86927 prompt string shall be written to standard output before each command is read.

86928 In general, only one command can appear on a line. Certain commands allow text to be input.  
 86929 This text is placed in the appropriate place in the buffer. While *ed* is accepting text, it is said to be  
 86930 in *input mode*. In this mode, no commands shall be recognized; all input is merely collected.  
 86931 Input mode is terminated by entering a line consisting of two characters: a <period> ( ' . ' )  
 86932 followed by a <newline>. This line is not considered part of the input text.

## Regular Expressions in ed

The *ed* utility shall support basic regular expressions, as described in XBD [Section 9.3](#) (on page 183). Since regular expressions in *ed* are always matched against single lines (excluding the terminating <newline> characters), never against any larger section of text, there is no way for a regular expression to match a <newline>.

A null RE shall be equivalent to the last RE encountered.

Regular expressions are used in addresses to specify lines, and in some commands (for example, the **s** substitute command) to specify portions of a line to be substituted.

## Addresses in ed

Addressing in *ed* relates to the current line. Generally, the current line is the last line affected by a command. The current line number is the address of the current line. If the edit buffer is not empty, the initial value for the current line shall be the last line in the edit buffer; otherwise, zero.

Addresses shall be constructed as follows:

1. The <period> character ( ' . ' ) shall address the current line.
2. The <dollar-sign> character ( ' \$ ' ) shall address the last line of the edit buffer.
3. The positive decimal number *n* shall address the *n*th line of the edit buffer.
4. The <apostrophe>-*x* character pair ( " ' *x* " ) shall address the line marked with the mark name character *x*, which shall be a lowercase letter from the portable character set. It shall be an error if the character has not been set to mark a line or if the line that was marked is not currently present in the edit buffer.
5. A BRE enclosed by <slash> characters ( ' / ' ) shall address the first line found by searching forwards from the line following the current line toward the end of the edit buffer and stopping at the first line for which the line excluding the terminating <newline> matches the BRE. The BRE consisting of a null BRE delimited by a pair of <slash> characters shall address the next line for which the line excluding the terminating <newline> matches the last BRE encountered. In addition, the second <slash> can be omitted at the end of a command line. Within the BRE, a <backslash>-<slash> pair ( " \ / " ) shall represent a literal <slash> instead of the BRE delimiter. If necessary, the search shall wrap around to the beginning of the buffer and continue up to and including the current line, so that the entire buffer is searched.
6. A BRE enclosed by <question-mark> characters ( ' ? ' ) shall address the first line found by searching backwards from the line preceding the current line toward the beginning of the edit buffer and stopping at the first line for which the line excluding the terminating <newline> matches the BRE. The BRE consisting of a null BRE delimited by a pair of <question-mark> characters ( " ? ? " ) shall address the previous line for which the line excluding the terminating <newline> matches the last BRE encountered. In addition, the second <question-mark> can be omitted at the end of a command line. Within the BRE, a <backslash>-<question-mark> pair ( " \ ? " ) shall represent a literal <question-mark> instead of the BRE delimiter. If necessary, the search shall wrap around to the end of the buffer and continue up to and including the current line, so that the entire buffer is searched.
7. A <plus-sign> ( ' + ' ) or <hyphen-minus> character ( ' - ' ) followed by a decimal number shall address the current line plus or minus the number. A <plus-sign> or <hyphen-minus> character not followed by a decimal number shall address the current line plus or minus 1.

Addresses can be followed by zero or more address offsets, optionally <blank>-separated. Address offsets are constructed as follows:

- A <plus-sign> or <hyphen-minus> character followed by a decimal number shall add or subtract, respectively, the indicated number of lines to or from the address. A <plus-sign> or <hyphen-minus> character not followed by a decimal number shall add or subtract 1 to or from the address.
- A decimal number shall add the indicated number of lines to the address.

It shall not be an error for an intermediate address value to be less than zero or greater than the last line in the edit buffer. It shall be an error for the final address value to be less than zero or greater than the last line in the edit buffer. It shall be an error if a search for a BRE fails to find a matching line.

Commands accept zero, one, or two addresses. If more than the required number of addresses are provided to a command that requires zero addresses, it shall be an error. Otherwise, if more than the required number of addresses are provided to a command, the addresses specified first shall be evaluated and then discarded until the maximum number of valid addresses remain, for the specified command.

Addresses shall be separated from each other by a <comma> (',' ) or <semicolon> character (';'). In the case of a <semicolon> separator, the current line ('.') shall be set to the first address, and only then will the second address be calculated. This feature can be used to determine the starting line for forwards and backwards searches; see rules 5. and 6.

Addresses can be omitted on either side of the <comma> or <semicolon> separator, in which case the resulting address pairs shall be as follows:

| Specified | Resulting   |
|-----------|-------------|
| ,         | 1 , \$      |
| , addr    | 1 , addr    |
| addr ,    | addr , addr |
| ;         | . ; \$      |
| ; addr    | . ; addr    |
| addr ;    | addr ; addr |

Any <blank> characters included between addresses, address separators, or address offsets shall be ignored.

### Commands in ed

In the following list of *ed* commands, the default addresses are shown in parentheses. The number of addresses shown in the default shall be the number expected by the command. The parentheses are not part of the address; they show that the given addresses are the default.

It is generally invalid for more than one command to appear on a line. However, any command (except **e**, **E**, **f**, **q**, **Q**, **r**, **w**, and **!**) can be suffixed by the letter **l**, **n**, or **p**; in which case, except for the **l**, **n**, and **p** commands, the command shall be executed and then the new current line shall be written as described below under the **l**, **n**, and **p** commands. When an **l**, **n**, or **p** suffix is used with an **l**, **n**, or **p** command, the command shall write to standard output as described below, but it is unspecified whether the suffix writes the current line again in the requested format or whether the suffix has no effect. For example, the **pl** command (base **p** command with an **l** suffix) shall either write just the current line or write it twice—once as specified for **p** and once as specified for **l**. Also, the **g**, **G**, **v**, and **V** commands shall take a command as a parameter.

Each address component can be preceded by zero or more <blank> characters. The command

letter can be preceded by zero or more <blank> characters. If a suffix letter (**l**, **n**, or **p**) is given, the application shall ensure that it immediately follows the command.

The **e**, **E**, **f**, **r**, and **w** commands shall take an optional *file* parameter, separated from the command letter by one or more <blank> characters.

If changes have been made in the buffer since the last **w** command that wrote the entire buffer, *ed* shall warn the user if an attempt is made to destroy the editor buffer via the **e** or **q** commands. The *ed* utility shall write the string:

" ?\n"

(followed by an explanatory message if *help mode* has been enabled via the **H** command) to standard output and shall continue in command mode with the current line number unchanged. If the **e** or **q** command is repeated with no intervening command, it shall take effect.

If a terminal disconnect (see XBD Chapter 11 (on page 199), Modem Disconnect and Closing a Device Terminal), is detected:

- If accompanied by a SIGHUP signal, the *ed* utility shall operate as described in the ASYNCHRONOUS EVENTS section for a SIGHUP signal.
- If not accompanied by a SIGHUP signal, the *ed* utility shall act as if an end-of-file had been detected on standard input.

If an end-of-file is detected on standard input:

- If the *ed* utility is in input mode, *ed* shall terminate input mode and return to command mode. It is unspecified if any partially entered lines (that is, input text without a terminating <newline>) are discarded from the input text.
- If the *ed* utility is in command mode, it shall act as if a **q** command had been entered.

If the closing delimiter of an RE or of a replacement string (for example, ' / ') in a **g**, **G**, **s**, **v**, or **V** command would be the last character before a <newline>, that delimiter can be omitted, in which case the addressed line shall be written. For example, the following pairs of commands are equivalent:

```
s/s1/s2      s/s1/s2/p
g/s1         g/s1/p
?s1         ?s1?
```

If an invalid command is entered, *ed* shall write the string:

" ?\n"

(followed by an explanatory message if *help mode* has been enabled via the **H** command) to standard output and shall continue in command mode with the current line number unchanged.

## Append Command

*Synopsis:*     ( . ) a  
                 <text>  
                 .

The **a** command shall read the given text and append it after the addressed line; the current line number shall become the address of the last inserted line or, if there were none, the addressed line. Address 0 shall be valid for this command; it shall cause the appended text to be placed at the beginning of the buffer.

**Change Command**

*Synopsis:*     ( . , . ) c  
                  <text>  
                  .

The **c** command shall delete the addressed lines, then accept input text that replaces these lines; the current line shall be set to the address of the last line input; or, if there were none, at the line after the last line deleted; if the lines deleted were originally at the end of the buffer, the current line number shall be set to the address of the new last line; if no lines remain in the buffer, the current line number shall be set to zero. Address 0 shall be valid for this command; it shall be interpreted as if address 1 were specified.

**Delete Command**

*Synopsis:*     ( . , . ) d

The **d** command shall delete the addressed lines from the buffer. The address of the line after the last line deleted shall become the current line number; if the lines deleted were originally at the end of the buffer, the current line number shall be set to the address of the new last line; if no lines remain in the buffer, the current line number shall be set to zero.

**Edit Command**

*Synopsis:*     e [*file*]

The **e** command shall delete the entire contents of the buffer and then read in the file named by the pathname *file*. The current line number shall be set to the address of the last line of the buffer. If no pathname is given, the currently remembered pathname, if any, shall be used (see the **f** command). The number of bytes read shall be written to standard output, unless the **-s** option was specified, in the following format:

"%d\n", <number of bytes read>

The name *file* shall be remembered for possible use as a default pathname in subsequent **e**, **E**, **r**, and **w** commands. If *file* is replaced by '!', the rest of the line shall be taken to be a shell command line whose output is to be read. Such a shell command line shall not be remembered as the current *file*. All marks shall be discarded upon the completion of a successful **e** command. If the buffer has changed since the last time the entire buffer was written, the user shall be warned, as described previously.

**Edit Without Checking Command**

*Synopsis:*     E [*file*]

The **E** command shall possess all properties and restrictions of the **e** command except that the editor shall not check to see whether any changes have been made to the buffer since the last **w** command.

**Filename Command**

*Synopsis:*     **f** [*file*]

If *file* is given, the **f** command shall change the currently remembered pathname to *file*; whether the name is changed or not, it shall then write the (possibly new) currently remembered pathname to the standard output in the following format:

"%s\n", <pathname>

The current line number shall be unchanged.

**Global Command**

*Synopsis:*     (1,\$)g/RE/command list

In the **g** command, the first step shall be to mark every line for which the line excluding the terminating <newline> matches the given RE. Then, going sequentially from the beginning of the file to the end of the file, the given *command list* shall be executed for each marked line, with the current line number set to the address of that line. Any line modified by the *command list* shall be unmarked. When the **g** command completes, the current line number shall have the value assigned by the last command in the *command list*. If there were no matching lines, the current line number shall not be changed. A single command or the first of a list of commands shall appear on the same line as the global command. All lines of a multi-line list except the last line shall be ended with a <backslash> preceding the terminating <newline>; the **a**, **i**, and **c** commands and associated input are permitted. The ' . ' terminating input mode can be omitted if it would be the last line of the *command list*. An empty *command list* shall be equivalent to the **p** command. The use of the **g**, **G**, **v**, **V**, and **!** commands in the *command list* produces undefined results. Any character other than <space> or <newline> can be used instead of a <slash> to delimit the RE. Within the RE, the RE delimiter itself can be used as a literal character if it is preceded by a <backslash>.

**Interactive Global Command**

*Synopsis:*     (1,\$)G/RE/

In the **G** command, the first step shall be to mark every line for which the line excluding the terminating <newline> matches the given RE. Then, for every such line, that line shall be written, the current line number shall be set to the address of that line, and any one command (other than one of the **a**, **c**, **i**, **g**, **G**, **v**, and **V** commands) shall be read and executed. A <newline> shall act as a null command (causing no action to be taken on the current line); an '&' shall cause the re-execution of the most recent non-null command executed within the current invocation of **G**. Note that the commands input as part of the execution of the **G** command can address and affect any lines in the buffer. Any line modified by the command shall be unmarked. The final value of the current line number shall be the value set by the last command successfully executed. (Note that the last command successfully executed shall be the **G** command itself if a command fails or the null command is specified.) If there were no matching lines, the current line number shall not be changed. The **G** command can be terminated by a SIGINT signal. Any character other than <space> or <newline> can be used instead of a <slash> to delimit the RE and the replacement. Within the RE, the RE delimiter itself can be used as a literal character if it is preceded by a <backslash>.

**Help Command**

*Synopsis:*     h

The **h** command shall write a short message to standard output that explains the reason for the most recent '?' notification. The current line number shall be unchanged.

**Help-Mode Command**

*Synopsis:*     H

The **H** command shall cause *ed* to enter a mode in which help messages (see the **h** command) shall be written to standard output for all subsequent '?' notifications. The **H** command alternately shall turn this mode on and off; it is initially off. If the help-mode is being turned on, the **H** command also explains the previous '?' notification, if there was one. The current line number shall be unchanged.

**Insert Command**

*Synopsis:*     ( . ) i  
                  <text>  
                  .

The **i** command shall insert the given text before the addressed line; the current line is set to the last inserted line or, if there was none, to the addressed line. This command differs from the **a** command only in the placement of the input text. Address 0 shall be valid for this command; it shall be interpreted as if address 1 were specified.

**Join Command**

*Synopsis:*     ( . , . + 1 ) j

The **j** command shall join contiguous lines by removing the appropriate <newline> characters. If exactly one address is given, this command shall do nothing. If lines are joined, the current line number shall be set to the address of the joined line; otherwise, the current line number shall be unchanged.

**Mark Command**

*Synopsis:*     ( . ) kx

The **k** command shall mark the addressed line with name *x*, which the application shall ensure is a lowercase letter from the portable character set. The address " 'x' " shall then refer to this line; the current line number shall be unchanged.

**List Command**

*Synopsis:*     ( . , . ) l

The **l** command shall write to standard output the addressed lines in a visually unambiguous form. The characters listed in XBD Table 5-1 (on page 121) ('\\', '\a', '\b', '\f', '\r', '\t', '\v') shall be written as the corresponding escape sequence; the '\n' in that table is not applicable. Non-printable characters not in the table shall be written as one three-digit octal number (with a preceding <backslash> character) for each byte in the character (most significant byte first).

Long lines shall be folded, with the point of folding indicated by <newline> preceded by a <backslash>; the length at which folding occurs is unspecified, but should be appropriate for the

output device. The end of each line shall be marked with a '\$', and '\$' characters within the text shall be written with a preceding <backslash>. An l command can be appended to any other command other than e, E, f, q, Q, r, w, or !. The current line number shall be set to the address of the last line written.

### Move Command

*Synopsis:* ( , . ) *m* *address*

The **m** command shall reposition the addressed lines after the line addressed by *address*. Address 0 shall be valid for *address* and cause the addressed lines to be moved to the beginning of the buffer. It shall be an error if *address* falls within the range of moved lines. The current line number shall be set to the address of the last line moved.

### Number Command

*Synopsis:* ( , . ) *n*

The **n** command shall write to standard output the addressed lines, preceding each line by its line number and a <tab>; the current line number shall be set to the address of the last line written. The **n** command can be appended to any command other than e, E, f, q, Q, r, w, or !.

### Print Command

*Synopsis:* ( , . ) *p*

The **p** command shall write to standard output the addressed lines; the current line number shall be set to the address of the last line written. The **p** command can be appended to any command other than e, E, f, q, Q, r, w, or !.

### Prompt Command

*Synopsis:* *P*

The **P** command shall cause *ed* to prompt with an <asterisk> ('\*') (or *string*, if **-p** is specified) for all subsequent commands. The **P** command alternatively shall turn this mode on and off; it shall be initially on if the **-p** option is specified; otherwise, off. The current line number shall be unchanged.

### Quit Command

*Synopsis:* *q*

The **q** command shall cause *ed* to exit. If the buffer has changed since the last time the entire buffer was written, the user shall be warned, as described previously.

### Quit Without Checking Command

*Synopsis:* *Q*

The **Q** command shall cause *ed* to exit without checking whether changes have been made in the buffer since the last **w** command.

**Read Command**

*Synopsis:*     (\$)*r* [*file*]

The *r* command shall read in the file named by the pathname *file* and append it after the addressed line. If no *file* argument is given, the currently remembered pathname, if any, shall be used (see the *e* and *f* commands). The currently remembered pathname shall not be changed unless there is no remembered pathname. Address 0 shall be valid for *r* and shall cause the file to be read at the beginning of the buffer. If the read is successful, and *-s* was not specified, the number of bytes read shall be written to standard output in the following format:

"%d\n", <number of bytes read>

The current line number shall be set to the address of the last line read in. If *file* is replaced by '!', the rest of the line shall be taken to be a shell command line whose output is to be read. Such a shell command line shall not be remembered as the current pathname.

**Substitute Command**

*Synopsis:*     (. . .)*s*/RE/*replacement/flags*

The *s* command shall search each addressed line for an occurrence of the specified RE and replace either the first or all (non-overlapped) matched strings with the *replacement*; see the following description of the *g* suffix. It is an error if the substitution fails on every addressed line. Any character other than <space> or <newline> can be used instead of a <slash> to delimit the RE and the replacement. Within the RE, the RE delimiter itself can be used as a literal character if it is preceded by a <backslash>. The current line shall be set to the address of the last line on which a substitution occurred.

An <ampersand> ('&') appearing in the *replacement* shall be replaced by the string matching the RE on the current line. The special meaning of '&' in this context can be suppressed by preceding it by <backslash>. As a more general feature, the characters '\n', where *n* is a digit, shall be replaced by the text matched by the corresponding back-reference expression. If the corresponding back-reference expression does not match, then the characters '\n' shall be replaced by the empty string. When the character '%' is the only character in the *replacement*, the *replacement* used in the most recent substitute command shall be used as the *replacement* in the current substitute command; if there was no previous substitute command, the use of '%' in this manner shall be an error. The '%' shall lose its special meaning when it is in a replacement string of more than one character or is preceded by a <backslash>. For each <backslash> encountered in scanning *replacement* from beginning to end, the following character shall lose its special meaning (if any). It is unspecified what special meaning is given to any character other than <backslash>, '&', '%', or digits.

A line can be split by substituting a <newline> into it. The application shall ensure it escapes the <newline> in the *replacement* by preceding it by <backslash>. Such substitution cannot be done as part of a *g* or *v* command list. The current line number shall be set to the address of the last line on which a substitution is performed. If no substitution is performed, the current line number shall be unchanged. If a line is split, a substitution shall be considered to have been performed on each of the new lines for the purpose of determining the new current line number. A substitution shall be considered to have been performed even if the replacement string is identical to the string that it replaces.

The application shall ensure that the value of *flags* is zero or more of:

*count*     Substitute for the *count*th occurrence only of the RE found on each addressed line.

- 87258 **g** Globally substitute for all non-overlapping instances of the RE rather than just the first  
87259 one. If both **g** and *count* are specified, the results are unspecified.
- 87260 **l** Write to standard output the final line in which a substitution was made. The line shall  
87261 be written in the format specified for the **l** command.
- 87262 **n** Write to standard output the final line in which a substitution was made. The line shall  
87263 be written in the format specified for the **n** command.
- 87264 **p** Write to standard output the final line in which a substitution was made. The line shall  
87265 be written in the format specified for the **p** command.

## 87266 **Copy Command**

87267 *Synopsis:* ( . , . ) *taddress*

87268 The **t** command shall be equivalent to the **m** command, except that a copy of the addressed lines  
87269 shall be placed after address *address* (which can be 0); the current line number shall be set to the  
87270 address of the last line added.

## 87271 **Undo Command**

87272 *Synopsis:* **u**

87273 The **u** command shall nullify the effect of the most recent command that modified anything in  
87274 the buffer, namely the most recent **a**, **c**, **d**, **g**, **i**, **j**, **m**, **r**, **s**, **t**, **u**, **v**, **G**, or **V** command. All changes  
87275 made to the buffer by a **g**, **G**, **v**, or **V** global command shall be undone as a single change; if no  
87276 changes were made by the global command (such as with **g/RE/p**), the **u** command shall have  
87277 no effect. The current line number shall be set to the value it had immediately before the  
87278 command being undone started.

## 87279 **Global Non-Matched Command**

87280 *Synopsis:* ( 1 , \$ ) **v/RE/command list**

87281 This command shall be equivalent to the global command **g** except that the lines that are marked  
87282 during the first step shall be those for which the line excluding the terminating <newline> does  
87283 not match the RE.

## 87284 **Interactive Global Not-Matched Command**

87285 *Synopsis:* ( 1 , \$ ) **V/RE/**

87286 This command shall be equivalent to the interactive global command **G** except that the lines that  
87287 are marked during the first step shall be those for which the line excluding the terminating  
87288 <newline> does not match the RE.

## 87289 **Write Command**

87290 *Synopsis:* ( 1 , \$ ) **w** [*file*]

87291 The **w** command shall write the addressed lines into the file named by the pathname *file*. The  
87292 command shall create the file, if it does not exist, or shall replace the contents of the existing file.  
87293 The currently remembered pathname shall not be changed unless there is no remembered  
87294 pathname. If no pathname is given, the currently remembered pathname, if any, shall be used  
87295 (see the **e** and **f** commands); the current line number shall be unchanged. If the command is  
87296 successful, the number of bytes written shall be written to standard output, unless the **-s** option  
87297 was specified, in the following format:

87298 "%d\n", <number of bytes written>

87299 If *file* begins with '!', the rest of the line shall be taken to be a shell command line whose  
87300 standard input shall be the addressed lines. Such a shell command line shall not be remembered  
87301 as the current pathname. This usage of the write command with '!' shall not be considered as a  
87302 "last **w** command that wrote the entire buffer", as described previously; thus, this alone shall  
87303 not prevent the warning to the user if an attempt is made to destroy the editor buffer via the **e** or  
87304 **q** commands.

### 87305 **Line Number Command**

87306 *Synopsis:* (\$) =

87307 The line number of the addressed line shall be written to standard output in the following  
87308 format:

87309 "%d\n", <line number>

87310 The current line number shall be unchanged by this command.

### 87311 **Shell Escape Command**

87312 *Synopsis:* !*command*

87313 The remainder of the line after the '!' shall be sent to the command interpreter to be  
87314 interpreted as a shell command line. Within the text of that shell command line, the unescaped  
87315 character '%' shall be replaced with the remembered pathname; if a '!' appears as the first  
87316 character of the command, it shall be replaced with the text of the previous shell command  
87317 executed via '!'. Thus, "!!" shall repeat the previous !*command*. If any replacements of '%' or  
87318 '!' are performed, the modified line shall be written to the standard output before *command* is  
87319 executed. The ! command shall write:

87320 "!\n"

87321 to standard output upon completion, unless the -s option is specified. The current line number  
87322 shall be unchanged.

### 87323 **Null Command**

87324 *Synopsis:* (. +1)

87325 An address alone on a line shall cause the addressed line to be written. A <newline> alone shall  
87326 be equivalent to "+1p". The current line number shall be set to the address of the written line.

## 87327 **EXIT STATUS**

87328 The following exit values shall be returned:

87329 0 Successful completion without any file or command errors.

87330 >0 An error occurred.

## 87331 **CONSEQUENCES OF ERRORS**

87332 When an error in the input script is encountered, or when an error is detected that is a  
87333 consequence of the data (not) present in the file or due to an external condition such as a read or  
87334 write error:

- 87335 • If the standard input is a terminal device file, all input shall be flushed, and a new  
87336 command read.

- If the standard input is a regular file, *ed* shall terminate with a non-zero exit status.

## APPLICATION USAGE

Because of the extremely terse nature of the default error messages, the prudent script writer begins the *ed* input commands with an **H** command, so that if any errors do occur at least some clue as to the cause is made available.

In earlier versions of this standard, an obsolescent `–` option was described. This is no longer specified. Applications should use the `–s` option. Using `–` as a *file* operand now produces unspecified results. This allows implementations to continue to support the former required behavior.

## EXAMPLES

None.

## RATIONALE

The initial description of this utility was adapted from the SVID. It contains some features not found in Version 7 or BSD-derived systems. Some of the differences between the POSIX and BSD *ed* utilities include, but need not be limited to:

- The BSD `–` option does not suppress the `'!'` prompt after a `!` command.
- BSD does not support the special meanings of the `'%'` and `'!'` characters within a `!` command.
- BSD does not support the *addresses* `' ; '` and `' , '`.
- BSD allows the command/suffix pairs **pp**, **ll**, and so on, which are unspecified in this volume of POSIX.1-2008.
- BSD does not support the `'!'` character part of the **e**, **r**, or **w** commands.
- A failed **g** command in BSD sets the line number to the last line searched if there are no matches.
- BSD does not default the *command list* to the **p** command.
- BSD does not support the **G**, **h**, **H**, **n**, or **V** commands.
- On BSD, if there is no inserted text, the insert command changes the current line to the referenced line `–1`; that is, the line before the specified line.
- On BSD, the *join* command with only a single address changes the current line to that address.
- BSD does not support the **P** command; moreover, in BSD it is synonymous with the **p** command.
- BSD does not support the *undo* of the commands **j**, **m**, **r**, **s**, or **t**.
- The Version 7 *ed* command **W**, and the BSD *ed* commands **W**, **wq**, and **z** are not present in this volume of POSIX.1-2008.

The `–s` option was added to allow the functionality of the removed `–` option in a manner compatible with the Utility Syntax Guidelines.

In early proposals there was a limit, `{ED_FILE_MAX}`, that described the historical limitations of some *ed* utilities in their handling of large files; some of these have had problems with files larger than 100 000 bytes. It was this limitation that prompted much of the desire to include a *split* command in this volume of POSIX.1-2008. Since this limit was removed, this volume of POSIX.1-2008 requires that implementations document the file size limits imposed by *ed* in the

conformance document. The limit {ED\_LINE\_MAX} was also removed; therefore, the global limit {LINE\_MAX} is used for input and output lines.

The manner in which the **l** command writes non-printable characters was changed to avoid the historical backspace-overstrike method. On video display terminals, the overstrike is ambiguous because most terminals simply replace overstruck characters, making the **l** format not useful for its intended purpose of unambiguously understanding the content of the line. The historical <backslash>-escapes were also ambiguous. (The string "a\0011" could represent a line containing those six characters or a line containing the three characters 'a', a byte with a binary value of 1, and a 1.) In the format required here, a <backslash> appearing in the line is written as "\\ " so that the output is truly unambiguous. The method of marking the ends of lines was adopted from the *ex* editor and is required for any line ending in <space> characters; the '\$' is placed on all lines so that a real '\$' at the end of a line cannot be misinterpreted.

Earlier versions of this standard allowed for implementations with bytes other than eight bits, but this has been modified in this version.

The description of how a NUL is written was removed. The NUL character cannot be in text files, and this volume of POSIX.1-2008 should not dictate behavior in the case of undefined, erroneous input.

Unlike some of the other editing utilities, the filenames accepted by the **E**, **e**, **R**, and **r** commands are not patterns.

Early proposals stated that the **-p** option worked only when standard input was associated with a terminal device. This has been changed to conform to historical implementations, thereby allowing applications to interpose themselves between a user and the *ed* utility.

The form of the substitute command that uses the **n** suffix was limited in some historical documentation (where this was described incorrectly as "backreferencing"). This limit has been omitted because there is no reason why an editor processing lines of {LINE\_MAX} length should have this restriction. The command **s/x/X/2047** should be able to substitute the 2047th occurrence of 'x' on a line.

The use of printing commands with printing suffixes (such as **pn**, **lp**, and so on) was made unspecified because BSD-based systems allow this, whereas System V does not.

Some BSD-based systems exit immediately upon receipt of end-of-file if all of the lines in the file have been deleted. Since this volume of POSIX.1-2008 refers to the **q** command in this instance, such behavior is not allowed.

Some historical implementations returned exit status zero even if command errors had occurred; this is not allowed by this volume of POSIX.1-2008.

Some historical implementations contained a bug that allowed a single <period> to be entered in input mode as <backslash> <period> <newline>. This is not allowed by *ed* because there is no description of escaping any of the characters in input mode; <backslash> characters are entered into the buffer exactly as typed. The typical method of entering a single <period> has been to precede it with another character and then use the substitute command to delete that character.

It is difficult under some modes of some versions of historical operating system terminal drivers to distinguish between an end-of-file condition and terminal disconnect. POSIX.1-2008 does not require implementations to distinguish between the two situations, which permits historical implementations of the *ed* utility on historical platforms to conform. Implementations are encouraged to distinguish between the two, if possible, and take appropriate action on terminal disconnect.

Historically, *ed* accepted a zero address for the **a** and **r** commands in order to insert text at the

start of the edit buffer. When the buffer was empty the command `. =` returned zero. POSIX.1-2008 requires conformance to historical practice.

For consistency with the `a` and `r` commands and better user functionality, the `i` and `c` commands must also accept an address of 0, in which case `0i` is treated as `1i` and likewise for the `c` command.

All of the following are valid addresses:

```
+++           Three lines after the current line.
/pattern/-    One line before the next occurrence of pattern.
-2           Two lines before the current line.
3 ---- 2      Line one (note the intermediate negative address).
1 2 3         Line six.
```

Any number of addresses can be provided to commands taking addresses; for example, `"1,2,3,4,5p"` prints lines 4 and 5, because two is the greatest valid number of addresses accepted by the `print` command. This, in combination with the `<semicolon>` delimiter, permits users to create commands based on ordered patterns in the file. For example, the command `"3;/foo/;+2p"` will display the first line after line 3 that contains the pattern `foo`, plus the next two lines. Note that the address `"3;"` must still be evaluated before being discarded, because the search origin for the `"/foo/"` command depends on this.

Historically, `ed` disallowed address chains, as discussed above, consisting solely of `<comma>` or `<semicolon>` separators; for example, `","` or `";;"` were considered an error. For consistency of address specification, this restriction is removed. The following table lists some of the address forms now possible:

| Address | Addr1 | Addr2 | Status     | Comment               |
|---------|-------|-------|------------|-----------------------|
| 7,      | 7     | 7     | Historical | Valid, but erroneous. |
| 7,5,    | 5     | 5     | Historical |                       |
| 7,5,9   | 5     | 9     | Historical |                       |
| 7,9     | 7     | 9     | Historical |                       |
| 7,+     | 7     | 8     | Historical |                       |
| ,       | 1     | \$    | Historical |                       |
| ,7      | 1     | 7     | Extension  |                       |
| ,,      | \$    | \$    | Extension  |                       |
| ,i      | \$    | \$    | Extension  |                       |
| 7i      | 7     | 7     | Historical |                       |
| 7i5i    | 5     | 5     | Historical |                       |
| 7i5i9   | 5     | 9     | Historical |                       |
| 7i5,9   | 5     | 9     | Historical |                       |
| 7i\$;4  | \$    | 4     | Historical |                       |
| 7i9     | 7     | 9     | Historical |                       |
| 7i+     | 7     | 8     | Historical |                       |
| i       | .     | \$    | Historical |                       |
| i7      | .     | 7     | Extension  |                       |
| ii      | \$    | \$    | Extension  |                       |
| i,      | \$    | \$    | Extension  |                       |

Historically, `ed` accepted the `'^'` character as an address, in which case it was identical to the `<hyphen-minus>` character. POSIX.1-2008 does not require or prohibit this behavior.

**87470 FUTURE DIRECTIONS**

87471 None.

**87472 SEE ALSO**

87473 [Section 1.4](#) (on page 2326), *ex*, *sed*, *sh*, *vi*

87474 XBD [Table 5-1](#) (on page 121), [Chapter 8](#) (on page 173), [Section 9.3](#) (on page 183), [Chapter 11](#) (on  
87475 page 199), [Section 12.2](#) (on page 216)

**87476 CHANGE HISTORY**

87477 First released in Issue 2.

**87478 Issue 5**

87479 In the OPTIONS section, the meaning of `-s` and `-` is clarified.

87480 A second FUTURE DIRECTION is added.

**87481 Issue 6**

87482 The obsolescent single-minus form is removed.

87483 A second APPLICATION USAGE note is added.

87484 The Open Group Corrigendum U025/2 is applied, correcting the description of the Edit section.

87485 The *ed* utility is updated to align with the IEEE P1003.2b draft standard. This includes addition  
87486 of the treatment of the SIGQUIT signal, changes to *ed* addressing, and changes to processing  
87487 when end-of-file is detected and when terminal disconnect is detected.

87488 The normative text is reworded to avoid use of the term “must” for application requirements.

87489 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/22 is applied, adding the text: “Any line  
87490 modified by the *command list* shall be unmarked.” to the **G** command. This change corresponds  
87491 to a similar change made to the **g** command in the first version of this standard.

87492 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/7 is applied, removing text describing  
87493 behavior on systems with bytes consisting of more than eight bits.

**87494 Issue 7**

87495 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if an operand is  
87496 ‘-’.

87497 Austin Group Interpretation 1003.1-2001 #036 is applied, clarifying the behavior for BREs.

87498 SD5-XCU-ERN-94 is applied, updating text in the EXTENDED DESCRIPTION where a terminal  
87499 disconnect is detected (in Commands in *ed*).

87500 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

87501 SD5-XCU-ERN-135 is applied, removing some RATIONALE text that is no longer applicable.

87502 **NAME**87503 `env` — set the environment for command invocation87504 **SYNOPSIS**87505 `env [-i] [name=value]... [utility [argument...]]`87506 **DESCRIPTION**87507 The *env* utility shall obtain the current environment, modify it according to its arguments, then  
87508 invoke the utility named by the *utility* operand with the modified environment.87509 Optional arguments shall be passed to *utility*.87510 If no *utility* operand is specified, the resulting environment shall be written to the standard  
87511 output, with one *name=value* pair per line.

87512 If the first argument is '-', the results are unspecified.

87513 **OPTIONS**87514 The *env* utility shall conform to XBD [Section 12.2](#) (on page 216), except for the unspecified usage  
87515 of '-'.  
87516 The following options shall be supported:

87516 The following options shall be supported:

87517 **-i** Invoke *utility* with exactly the environment specified by the arguments; the  
87518 inherited environment shall be ignored completely.87519 **OPERANDS**

87520 The following operands shall be supported:

87521 *name=value* Arguments of the form *name=value* shall modify the execution environment, and  
87522 shall be placed into the inherited environment before the *utility* is invoked.87523 *utility* The name of the utility to be invoked. If the *utility* operand names any of the  
87524 special built-in utilities in [Section 2.14](#) (on page 2374), the results are undefined.87525 *argument* A string to pass as an argument for the invoked utility.87526 **STDIN**

87527 Not used.

87528 **INPUT FILES**

87529 None.

87530 **ENVIRONMENT VARIABLES**87531 The following environment variables shall affect the execution of *env*:87532 *LANG* Provide a default value for the internationalization variables that are unset or null.  
87533 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
87534 variables used to determine the values of locale categories.)87535 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
87536 internationalization variables.87537 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
87538 characters (for example, single-byte as opposed to multi-byte characters in  
87539 arguments).87540 *LC\_MESSAGES*87541 Determine the locale that should be used to affect the format and contents of  
87542 diagnostic messages written to standard error.

| 87566 |     | 127                           | The utility specified by <i>utility</i> could not be found.                                                                                         |
| 87567 |     | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                     |
| 87568 |     |                               | Default.                                                                                                                                            |
| 87569 |     | <b>APPLICATION USAGE</b>      |                                                                                                                                                     |
| 87570 |     |                               | The <i>command</i> , <i>env</i> , <i>nice</i> , <i>nohup</i> , <i>time</i> , and <i>xargs</i> utilities have been specified to use exit code 127 if |
| 87571 |     |                               | an error occurs so that applications can distinguish “failure to find a utility” from “invoked                                                      |
| 87572 |     |                               | utility exited with an error indication”. The value 127 was chosen because it is not commonly                                                       |
| 87573 |     |                               | used for other meanings; most utilities use small values for “normal error conditions” and the                                                      |
| 87574 |     |                               | values above 128 can be confused with termination due to receipt of a signal. The value 126 was                                                     |
| 87575 |     |                               | chosen in a similar manner to indicate that the utility could be found, but not invoked. Some                                                       |
| 87576 |     |                               | scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction                                                    |
| 87577 |     |                               | between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to                                                    |
| 87578 |     |                               | <i>exec</i> the utility fail with [ENOENT], and uses 126 when any attempt to <i>exec</i> the utility fails for                                      |
| 87579 |     |                               | any other reason.                                                                                                                                   |
| 87580 |     |                               | Historical implementations of the <i>env</i> utility use the <i>execvp()</i> or <i>execlp()</i> functions defined in the                            |
| 87581 |     |                               | System Interfaces volume of POSIX.1-2008 to invoke the specified utility; this provides better                                                      |
| 87582 |     |                               | performance and keeps users from having to escape characters with special meaning to the shell.                                                     |
| 87583 |     |                               | Therefore, shell functions, special built-ins, and built-ins that are only provided by the shell are                                                |
| 87584 |     |                               | not found.                                                                                                                                          |

**EXAMPLES**

The following command:

```
env -i PATH=/mybin:"$PATH" $(getconf V7_ENV) mygrep xyz myfile
```

invokes the command *mygrep* with a new *PATH* value as the only entry in its environment other than any variables required by the implementation for conformance. In this case, *PATH* is used to locate *mygrep*, which is expected to reside in */mybin*.

**RATIONALE**

As with all other utilities that invoke other utilities, this volume of POSIX.1-2008 only specifies what *env* does with standard input, standard output, standard error, input files, and output files. If a utility is executed, it is not constrained by the specification of input and output by *env*.

The *-i* option was added to allow the functionality of the removed *-* option in a manner compatible with the Utility Syntax Guidelines. It is possible to create a non-conforming environment using the *-i* option, as it may remove environment variables required by the implementation for conformance. The following will preserve these environment variables as well as preserve the *PATH* for conforming utilities:

```
IFS='
# The preceding value should be <space><tab><newline>.
# Set IFS to its default value.

set -f
# disable pathname expansion

\unalias -a
# Unset all possible aliases.
# Note that unalias is escaped to prevent an alias
# being used for unalias.
# This step is not strictly necessary, since aliases are not inherited,
# and the ENV environment variable is only used by interactive shells,
# the only way any aliases can exist in a script is if it defines them
# itself.

unset -f env getconf
# Ensure env and getconf are not user functions.

env -i $(getconf V7_ENV) PATH="$(getconf PATH)" command
```

Some have suggested that *env* is redundant since the same effect is achieved by:

```
name=value ... utility [ argument ... ]
```

The example is equivalent to *env* when an environment variable is being added to the environment of the command, but not when the environment is being set to the given value. The *env* utility also writes out the current environment if invoked without arguments. There is sufficient functionality beyond what the example provides to justify inclusion of *env*.

**FUTURE DIRECTIONS**

None.

87628 **CHANGE HISTORY**

87629 First released in Issue 2.

87630 **Issue 7**87631 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first  
87632 argument is '–'.87633 Austin Group Interpretation 1003.1-2001 #047 is applied, providing RATIONALE on how to use  
87634 the *env* utility to preserve a conforming environment.

87635 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

87636 The EXAMPLES section is revised to change the use of *env* –i.

## 87637 NAME

87638 ex — text editor

## 87639 SYNOPSIS

87640 UP `ex [-rR] [-s|-v] [-c command] [-t tagstring] [-w size] [file...]`

## 87641 DESCRIPTION

87642 The *ex* utility is a line-oriented text editor. There are two other modes of the editor—open and  
 87643 visual—in which screen-oriented editing is available. This is described more fully by the *ex* **open**  
 87644 and **visual** commands and in *vi*.

87645 If an operand is ‘-’, the results are unspecified.

87646 This section uses the term *edit buffer* to describe the current working text. No specific  
 87647 implementation is implied by this term. All editing changes are performed on the edit buffer,  
 87648 and no changes to it shall affect any file until an editor command writes the file.

87649 Certain terminals do not have all the capabilities necessary to support the complete *ex* definition,  
 87650 such as the full-screen editing commands (*visual mode* or *open mode*). When these commands  
 87651 cannot be supported on such terminals, this condition shall not produce an error message such  
 87652 as “not an editor command” or report a syntax error. The implementation may either accept the  
 87653 commands and produce results on the screen that are the result of an unsuccessful attempt to  
 87654 meet the requirements of this volume of POSIX.1-2008 or report an error describing the terminal-  
 87655 related deficiency.

## 87656 OPTIONS

87657 The *ex* utility shall conform to XBD [Section 12.2](#) (on page 216), except for the unspecified usage  
 87658 of ‘-’, and that ‘+’ may be recognized as an option delimiter as well as ‘-’.

87659 The following options shall be supported:

87660 **-c *command*** Specify an initial command to be executed in the first edit buffer loaded from an  
 87661 existing file (see the EXTENDED DESCRIPTION section). Implementations may  
 87662 support more than a single **-c** option. In such implementations, the specified  
 87663 commands shall be executed in the order specified on the command line.

87664 **-r** Recover the named files (see the EXTENDED DESCRIPTION section). Recovery  
 87665 information for a file shall be saved during an editor or system crash (for example,  
 87666 when the editor is terminated by a signal which the editor can catch), or after the  
 87667 use of an *ex* **preserve** command.

87668 A *crash* in this context is an unexpected failure of the system or utility that requires  
 87669 restarting the failed system or utility. A system crash implies that any utilities  
 87670 running at the time also crash. In the case of an editor or system crash, the number  
 87671 of changes to the edit buffer (since the most recent **preserve** command) that will be  
 87672 recovered is unspecified.

87673 If no *file* operands are given and the **-t** option is not specified, all other options, the  
 87674 *EXINIT* variable, and any **.exrc** files shall be ignored; a list of all recoverable files  
 87675 available to the invoking user shall be written, and the editor shall exit normally  
 87676 without further action.

87677 **-R** Set **readonly** edit option.

87678 **-s** Prepare *ex* for batch use by taking the following actions:

- 87679 • Suppress writing prompts and informational (but not diagnostic) messages.
- 87680 • Ignore the value of *TERM* and any implementation default terminal type and
- 87681 assume the terminal is a type incapable of supporting open or visual modes;
- 87682 see the **visual** command and the description of *vi*.
- 87683 • Suppress the use of the *EXINIT* environment variable and the reading of any
- 87684 **.exrc** file; see the EXTENDED DESCRIPTION section.
- 87685 • Suppress autoindentation, ignoring the value of the **autoindent** edit option.
- 87686 **-t tagstring** Edit the file containing the specified *tagstring*; see *ctags*. The tags feature
- 87687 represented by **-t tagstring** and the **tag** command is optional. It shall be provided
- 87688 on any system that also provides a conforming implementation of *ctags*; otherwise,
- 87689 the use of **-t** produces undefined results. On any system, it shall be an error to
- 87690 specify more than a single **-t** option.
- 87691 **-v** Begin in visual mode (see *vi*).
- 87692 **-w size** Set the value of the *window* editor option to *size*.

## 87693 OPERANDS

87694 The following operand shall be supported:

87695 *file* A pathname of a file to be edited.

## 87696 STDIN

87697 The standard input consists of a series of commands and input text, as described in the

87698 EXTENDED DESCRIPTION section. The implementation may limit each line of standard input

87699 to a length of {LINE\_MAX}.

87700 If the standard input is not a terminal device, it shall be as if the **-s** option had been specified.

87701 If a read from the standard input returns an error, or if the editor detects an end-of-file condition

87702 from the standard input, it shall be equivalent to a SIGHUP asynchronous event.

## 87703 INPUT FILES

87704 Input files shall be text files or files that would be text files except for an incomplete last line that

87705 is not longer than {LINE\_MAX}-1 bytes in length and contains no NUL characters. By default,

87706 any incomplete last line shall be treated as if it had a trailing <newline>. The editing of other

87707 forms of files may optionally be allowed by *ex* implementations.

87708 The **.exrc** files and source files shall be text files consisting of *ex* commands; see the EXTENDED

87709 DESCRIPTION section.

87710 By default, the editor shall read lines from the files to be edited without interpreting any of those

87711 lines as any form of editor command.

## 87712 ENVIRONMENT VARIABLES

87713 The following environment variables shall affect the execution of *ex*:

87714 **COLUMNS** Override the system-selected horizontal screen size. See XBD Chapter 8 (on page

87715 173) for valid values and results when it is unset or null.

87716 **EXINIT** Determine a list of *ex* commands that are executed on editor start-up. See the

87717 EXTENDED DESCRIPTION section for more details of the initialization phase.

87718 **HOME** Determine a pathname of a directory that shall be searched for an editor start-up

87719 file named **.exrc**; see the EXTENDED DESCRIPTION section.

|       |                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 87720 | <i>LANG</i>                                                                                                                                                                                                                                                                                                                                                                   | Provide a default value for the internationalization variables that are unset or null. (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)                                                                                                                                                |
| 87721 |                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 87722 |                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                   |

| 87751 | A complete write is a write of the entire contents of the edit buffer to a file of a type other than a terminal device, or the saving of the edit buffer caused by the user executing the <i>ex</i> <b>preserve</b> command. Writing the contents of the edit buffer to a temporary file that will be removed when the editor exits shall not be considered a complete write. |                                                                                                                                                                                                                                                                                                                                                                                                   |

| 87759 |                                                                                                                                                                                                                                                                                                                                                                               | Otherwise, if executing an open or visual text input mode command, <i>ex</i> in receipt of <i>SIGINT</i> shall behave identically to its receipt of the <ESC> character.                                                                                                                                                                                                                          |
| 87760 |                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 87761 |                                                                                                                                                                                                                                                                                                                                                                               | Otherwise:                                                                                                                                                                                                                                                                                                                                                                                        |

- 87762 1. If executing an *ex* text input mode command, all input lines that have been  
87763 completely entered shall be resolved into the edit buffer, and any partially  
87764 entered line shall be discarded.
- 87765 2. If there is a currently executing command, it shall be aborted and a message  
87766 displayed. Unless otherwise specified by the *ex* or *vi* command descriptions,  
87767 it is unspecified whether any lines modified by the executing command  
87768 appear modified, or as they were before being modified by the executing  
87769 command, in the buffer.
- 87770 If the currently executing command was a motion command, its associated  
87771 command shall be discarded.
- 87772 3. If in open or visual command mode, the terminal shall be alerted.
- 87773 4. The editor shall then return to command mode.
- 87774 SIGCONT The screen shall be refreshed if in open or visual mode.
- 87775 SIGHUP If the edit buffer has been modified since the last complete write, *ex* shall attempt  
87776 to save the edit buffer so that it can be recovered later using the **-r** option or the *ex*  
87777 **recover** command. The editor shall not write the file or return to command or text  
87778 input mode, and shall terminate with a non-zero exit status.
- 87779 SIGTERM Refer to SIGHUP.
- 87780 The action taken for all other signals is unspecified.
- 87781 **STDOUT**
- 87782 The standard output shall be used only for writing prompts to the user, for informational  
87783 messages, and for writing lines from the file.
- 87784 **STDERR**
- 87785 The standard error shall be used only for diagnostic messages.
- 87786 **OUTPUT FILES**
- 87787 The output from *ex* shall be text files.
- 87788 **EXTENDED DESCRIPTION**
- 87789 Only the *ex* mode of the editor is described in this section. See *vi* for additional editing  
87790 capabilities available in *ex*.
- 87791 When an error occurs, *ex* shall write a message. If the terminal supports a standout mode (such  
87792 as inverse video), the message shall be written in standout mode. If the terminal does not  
87793 support a standout mode, and the edit option **errorbells** is set, an alert action shall precede the  
87794 error message.
- 87795 By default, *ex* shall start in command mode, which shall be indicated by a **:** prompt; see the  
87796 **prompt** command. Text input mode can be entered by the **append**, **insert**, or **change** commands;  
87797 it can be exited (and command mode re-entered) by typing a **<period>** (**' . '**) alone at the  
87798 beginning of a line.

## Initialization in ex and vi

The following symbols are used in this and following sections to specify locations in the edit buffer:

### *alternate and current pathnames*

Two pathnames, named *current* and *alternate*, are maintained by the editor. Any *ex* commands that take filenames as arguments shall set them as follows:

1. If a *file* argument is specified to the *ex* **edit**, **ex**, or **recover** commands, or if an *ex* **tag** command replaces the contents of the edit buffer.
  - a. If the command replaces the contents of the edit buffer, the current pathname shall be set to the *file* argument or the file indicated by the tag, and the alternate pathname shall be set to the previous value of the current pathname.
  - b. Otherwise, the alternate pathname shall be set to the *file* argument.
2. If a *file* argument is specified to the *ex* **next** command:
  - a. If the command replaces the contents of the edit buffer, the current pathname shall be set to the first *file* argument, and the alternate pathname shall be set to the previous value of the current pathname.
3. If a *file* argument is specified to the *ex* **file** command, the current pathname shall be set to the *file* argument, and the alternate pathname shall be set to the previous value of the current pathname.
4. If a *file* argument is specified to the *ex* **read** and **write** commands (that is, when reading or writing a file, and not to the program named by the **shell** edit option), or a *file* argument is specified to the *ex* **xit** command:
  - a. If the current pathname has no value, the current pathname shall be set to the *file* argument.
  - b. Otherwise, the alternate pathname shall be set to the *file* argument.

If the alternate pathname is set to the previous value of the current pathname when the current pathname had no previous value, then the alternate pathname shall have no value as a result.

### *current line*

The line of the edit buffer referenced by the cursor. Each command description specifies the current line after the command has been executed, as the *current line value*. When the edit buffer contains no lines, the current line shall be zero; see [Addressing in ex](#) (on page 2692).

### *current column*

The current display line column occupied by the cursor. (The columns shall be numbered beginning at 1.) Each command description specifies the current column after the command has been executed, as the *current column value*. This column is an *ideal* column that is remembered over the lifetime of the editor. The actual display line column upon which the cursor rests may be different from the current column; see the cursor positioning discussion in [Command Descriptions in vi](#) (on page 3365).

### *set to non-<blank>*

A description for a current column value, meaning that the current column shall be set to the last display line column on which is displayed any part of the first non-<blank> of the line. If the line has no non-<blank> non-<newline> characters, the current column shall be set to the last display line column on which is displayed any part of the last non-<newline>

87843 character in the line. If the line is empty, the current column shall be set to column position  
87844 1.

87845 The length of lines in the edit buffer may be limited to {LINE\_MAX} bytes. In open and visual  
87846 mode, the length of lines in the edit buffer may be limited to the number of characters that will  
87847 fit in the display. If either limit is exceeded during editing, an error message shall be written. If  
87848 either limit is exceeded by a line read in from a file, an error message shall be written and the  
87849 edit session may be terminated.

87850 If the editor stops running due to any reason other than a user command, and the edit buffer has  
87851 been modified since the last complete write, it shall be equivalent to a SIGHUP asynchronous  
87852 event. If the system crashes, it shall be equivalent to a SIGHUP asynchronous event.

87853 During initialization (before the first file is copied into the edit buffer or any user commands  
87854 from the terminal are processed) the following shall occur:

- 87855 1. If the environment variable *EXINIT* is set, the editor shall execute the *ex* commands  
87856 contained in that variable.
- 87857 2. If the *EXINIT* variable is not set, and all of the following are true:
  - 87858 a. The *HOME* environment variable is not null and not empty.
  - 87859 b. The file **.exrc** in the directory referred to by the *HOME* environment variable:
    - 87860 i. Exists
    - 87861 ii. Is owned by the same user ID as the real user ID of the process or the  
87862 process has appropriate privileges
    - 87863 iii. Is not writable by anyone other than the owner

87864 the editor shall execute the *ex* commands contained in that file.

- 87865 3. If and only if all of the following are true:
  - 87866 a. The current directory is not referred to by the *HOME* environment variable.
  - 87867 b. A command in the *EXINIT* environment variable or a command in the **.exrc** file in  
87868 the directory referred to by the *HOME* environment variable sets the editor option  
87869 **exrc**.
  - 87870 c. The **.exrc** file in the current directory:
    - 87871 i. Exists
    - 87872 ii. Is owned by the same user ID as the real user ID of the process, or by one of  
87873 a set of implementation-defined user IDs
    - 87874 iii. Is not writable by anyone other than the owner

87875 the editor shall attempt to execute the *ex* commands contained in that file.

87876 Lines in any **.exrc** file that are blank lines shall be ignored. If any **.exrc** file exists, but is not read  
87877 for ownership or permission reasons, it shall be an error.

87878 After the *EXINIT* variable and any **.exrc** files are processed, the first file specified by the user  
87879 shall be edited, as follows:

- 87880 1. If the user specified the **-t** option, the effect shall be as if the *ex tag* command was entered  
87881 with the specified argument, with the exception that if tag processing does not result in a  
87882 file to edit, the effect shall be as described in step 3. below.

2. Otherwise, if the user specified any command line *file* arguments, the effect shall be as if the *ex* **edit** command was entered with the first of those arguments as its *file* argument.
3. Otherwise, the effect shall be as if the *ex* **edit** command was entered with a nonexistent filename as its *file* argument. It is unspecified whether this action shall set the current pathname. In an implementation where this action does not set the current pathname, any editor command using the current pathname shall fail until an editor command sets the current pathname.

If the **-r** option was specified, the first time a file in the initial argument list or a file specified by the **-t** option is edited, if recovery information has previously been saved about it, that information shall be recovered and the editor shall behave as if the contents of the edit buffer have already been modified. If there are multiple instances of the file to be recovered, the one most recently saved shall be recovered, and an informational message that there are previous versions of the file that can be recovered shall be written. If no recovery information about a file is available, an informational message to this effect shall be written, and the edit shall proceed as usual.

If the **-c** option was specified, the first time a file that already exists (including a file that might not exist but for which recovery information is available, when the **-r** option is specified) replaces or initializes the contents of the edit buffer, the current line shall be set to the last line of the edit buffer, the current column shall be set to non-`<blank>`, and the *ex* commands specified with the **-c** option shall be executed. In this case, the current line and current column shall not be set as described for the command associated with the replacement or initialization of the edit buffer contents. However, if the **-t** option or a **tag** command is associated with this action, the **-c** option commands shall be executed and then the movement to the tag shall be performed.

The current argument list shall initially be set to the filenames specified by the user on the command line. If no filenames are specified by the user, the current argument list shall be empty. If the **-t** option was specified, it is unspecified whether any filename resulting from tag processing shall be prepended to the current argument list. In the case where the filename is added as a prefix to the current argument list, the current argument list reference shall be set to that filename. In the case where the filename is not added as a prefix to the current argument list, the current argument list reference shall logically be located before the first of the filenames specified on the command line (for example, a subsequent *ex* **next** command shall edit the first filename from the command line). If the **-t** option was not specified, the current argument list reference shall be to the first of the filenames on the command line.

### Addressing in *ex*

Addressing in *ex* relates to the current line and the current column; the address of a line is its 1-based line number, the address of a column is its 1-based count from the beginning of the line. Generally, the current line is the last line affected by a command. The current line number is the address of the current line. In each command description, the effect of the command on the current line number and the current column is described.

Addresses are constructed as follows:

1. The character `'.'` (period) shall address the current line.
2. The character `'$'` shall address the last line of the edit buffer.
3. The positive decimal number *n* shall address the *n*th line of the edit buffer.
4. The address `"'x"` refers to the line marked with the mark name character `'x'`, which shall be a lowercase letter from the portable character set, the backquote character, or the single-quote character. It shall be an error if the line that was marked is not currently

present in the edit buffer or the mark has not been set. Lines can be marked with the *ex mark* or *k* commands, or the *vi m* command.

5. A regular expression enclosed by <slash> characters ( '/' ) shall address the first line found by searching forwards from the line following the current line toward the end of the edit buffer and stopping at the first line for which the line excluding the terminating <newline> matches the regular expression. As stated in [Regular Expressions in ex](#) (on page 2723), an address consisting of a null regular expression delimited by <slash> characters ( " / / " ) shall address the next line for which the line excluding the terminating <newline> matches the last regular expression encountered. In addition, the second <slash> can be omitted at the end of a command line. If the **wrapscan** edit option is set, the search shall wrap around to the beginning of the edit buffer and continue up to and including the current line, so that the entire edit buffer is searched. Within the regular expression, the sequence "\/" shall represent a literal <slash> instead of the regular expression delimiter.
6. A regular expression enclosed in <question-mark> characters ( ' ? ' ) shall address the first line found by searching backwards from the line preceding the current line toward the beginning of the edit buffer and stopping at the first line for which the line excluding the terminating <newline> matches the regular expression. An address consisting of a null regular expression delimited by <question-mark> characters ( " ? ? " ) shall address the previous line for which the line excluding the terminating <newline> matches the last regular expression encountered. In addition, the second <question-mark> can be omitted at the end of a command line. If the **wrapscan** edit option is set, the search shall wrap around from the beginning of the edit buffer to the end of the edit buffer and continue up to and including the current line, so that the entire edit buffer is searched. Within the regular expression, the sequence "\?" shall represent a literal <question-mark> instead of the RE delimiter.
7. A <plus-sign> ( '+' ) or a <hyphen-minus> ( '-' ) followed by a decimal number shall address the current line plus or minus the number. A '+' or '-' not followed by a decimal number shall address the current line plus or minus 1.

Addresses can be followed by zero or more address offsets, optionally <blank>-separated. Address offsets are constructed as follows:

1. A '+' or '-' immediately followed by a decimal number shall add (subtract) the indicated number of lines to (from) the address. A '+' or '-' not followed by a decimal number shall add (subtract) 1 to (from) the address.
2. A decimal number shall add the indicated number of lines to the address.

It shall not be an error for an intermediate address value to be less than zero or greater than the last line in the edit buffer. It shall be an error for the final address value to be less than zero or greater than the last line in the edit buffer.

Commands take zero, one, or two addresses; see the descriptions of *1addr* and *2addr* in [Command Descriptions in ex](#) (on page 2699). If more than the required number of addresses are provided to a command that requires zero addresses, it shall be an error. Otherwise, if more than the required number of addresses are provided to a command, the addresses specified first shall be evaluated and then discarded until the maximum number of valid addresses remain.

Addresses shall be separated from each other by a <comma> ( ',' ) or a <semicolon> ( ';' ). If no address is specified before or after a <comma> or <semicolon> separator, it shall be as if the address of the current line was specified before or after the separator. In the case of a <semicolon> separator, the current line ( '.' ) shall be set to the first address, and only then will

the next address be calculated. This feature can be used to determine the starting line for forwards and backwards searches (see rules 5. and 6.).

A <percent-sign> ( ' % ' ) shall be equivalent to entering the two addresses " 1 , \$ " .

Any delimiting <blank> characters between addresses, address separators, or address offsets shall be discarded.

### Command Line Parsing in ex

The following symbol is used in this and following sections to describe parsing behavior:

*escape* If a character is referred to as "<backslash>-escaped" or "<control>-V-escaped", it shall mean that the character acquired or lost a special meaning by virtue of being preceded, respectively, by a <backslash> or <control>-V character. Unless otherwise specified, the escaping character shall be discarded at that time and shall not be further considered for any purpose.

Command-line parsing shall be done in the following steps. For each step, characters already evaluated shall be ignored; that is, the phrase "leading character" refers to the next character that has not yet been evaluated.

1. Leading <colon> characters shall be skipped.
  2. Leading <blank> characters shall be skipped.
  3. If the leading character is a double-quote character, the characters up to and including the next non-<backslash>-escaped <newline> shall be discarded, and any subsequent characters shall be parsed as a separate command.
  4. Leading characters that can be interpreted as addresses shall be evaluated; see [Addressing in ex](#) (on page 2692).
  5. Leading <blank> characters shall be skipped.
  6. If the next character is a <vertical-line> character or a <newline>:
    - a. If the next character is a <newline>:
      - i. If *ex* is in open or visual mode, the current line shall be set to the last address specified, if any.
      - ii. Otherwise, if the last command was terminated by a <vertical-line> character, no action shall be taken; for example, the command " | | <newline> " shall execute two implied commands, not three.
      - iii. Otherwise, step 6.b. shall apply.
    - b. Otherwise, the implied command shall be the **print** command. The last #, **p**, and **l** flags specified to any *ex* command shall be remembered and shall apply to this implied command. Executing the *ex* **number**, **print**, or **list** command shall set the remembered flags to #, nothing, and **l**, respectively, plus any other flags specified for that execution of the **number**, **print**, or **list** command.
- If *ex* is not currently performing a **global** or **v** command, and no address or count is specified, the current line shall be incremented by 1 before the command is executed. If incrementing the current line would result in an address past the last line in the edit buffer, the command shall fail, and the increment shall not happen.

- 88016 c. The <newline> or <vertical-line> character shall be discarded and any subsequent  
88017 characters shall be parsed as a separate command.
- 88018 7. The command name shall be comprised of the next character (if the character is not  
88019 alphabetic), or the next character and any subsequent alphabetic characters (if the  
88020 character is alphabetic), with the following exceptions:
- 88021 a. Commands that consist of any prefix of the characters in the command name  
88022 **delete**, followed immediately by any of the characters 'l', 'p', '+', '-', or '#'  
88023 shall be interpreted as a **delete** command, followed by a <blank>, followed by the  
88024 characters that were not part of the prefix of the **delete** command. The maximum  
88025 number of characters shall be matched to the command name **delete**; for example,  
88026 "del" shall not be treated as "de" followed by the flag l.
- 88027 b. Commands that consist of the character 'k', followed by a character that can be  
88028 used as the name of a mark, shall be equivalent to the mark command followed by  
88029 a <blank>, followed by the character that followed the 'k'.
- 88030 c. Commands that consist of the character 's', followed by characters that could be  
88031 interpreted as valid options to the s command, shall be the equivalent of the s  
88032 command, without any pattern or replacement values, followed by a <blank>,  
88033 followed by the characters after the 's'.
- 88034 8. The command name shall be matched against the possible command names, and a  
88035 command name that contains a prefix matching the characters specified by the user shall  
88036 be the executed command. In the case of commands where the characters specified by the  
88037 user could be ambiguous, the executed command shall be as follows:

|    |        |    |       |    |       |
|----|--------|----|-------|----|-------|
| a  | append | n  | next  | t  | t     |
| c  | change | p  | print | u  | undo  |
| ch | change | pr | print | un | undo  |
| e  | edit   | r  | read  | v  | v     |
| m  | move   | re | read  | w  | write |
| ma | mark   | s  | s     |    |       |

- 88044 Implementation extensions with names causing similar ambiguities shall not be checked  
88045 for a match until all possible matches for commands specified by POSIX.1-2008 have been  
88046 checked.
- 88047 9. If the command is a ! command, or if the command is a **read** command followed by zero  
88048 or more <blank> characters and a !, or if the command is a **write** command followed by  
88049 one or more <blank> characters and a !, the rest of the command shall include all  
88050 characters up to a non-<backslash>-escaped <newline>. The <newline> shall be  
88051 discarded and any subsequent characters shall be parsed as a separate *ex* command.
- 88052 10. Otherwise, if the command is an **edit**, **ex**, or **next** command, or a **visual** command while  
88053 in open or visual mode, the next part of the command shall be parsed as follows:
- 88054 a. Any '!' character immediately following the command shall be skipped and be  
88055 part of the command.
- 88056 b. Any leading <blank> characters shall be skipped and be part of the command.
- 88057 c. If the next character is a '+', characters up to the first non-<backslash>-escaped  
88058 <newline> or non-<backslash>-escaped <blank> shall be skipped and be part of  
88059 the command.

- 88060 d. The rest of the command shall be determined by the steps specified in paragraph  
88061 12.
- 88062 11. Otherwise, if the command is a **global**, **open**, **s**, or **v** command, the next part of the  
88063 command shall be parsed as follows:
- 88064 a. Any leading <blank> characters shall be skipped and be part of the command.
- 88065 b. If the next character is not an alphanumeric, double-quote, <newline>,  
88066 <backslash>, or <vertical-line> character:
- 88067 i. The next character shall be used as a command delimiter.
- 88068 ii. If the command is a **global**, **open**, or **v** command, characters up to the first  
88069 non-<backslash>-escaped <newline>, or first non-<backslash>-escaped  
88070 delimiter character, shall be skipped and be part of the command.
- 88071 iii. If the command is an **s** command, characters up to the first  
88072 non-<backslash>-escaped <newline>, or second non-<backslash>-escaped  
88073 delimiter character, shall be skipped and be part of the command.
- 88074 c. If the command is a **global** or **v** command, characters up to the first  
88075 non-<backslash>-escaped <newline> shall be skipped and be part of the  
88076 command.
- 88077 d. Otherwise, the rest of the command shall be determined by the steps specified in  
88078 paragraph 12.
- 88079 12. Otherwise:
- 88080 a. If the command was a **map**, **unmap**, **abbreviate**, or **unabbreviate** command,  
88081 characters up to the first non-<control>-V-escaped <newline>, <vertical-line>, or  
88082 double-quote character shall be skipped and be part of the command.
- 88083 b. Otherwise, characters up to the first non-<backslash>-escaped <newline>,  
88084 <vertical-line>, or double-quote character shall be skipped and be part of the  
88085 command.
- 88086 c. If the command was an **append**, **change**, or **insert** command, and the step 12.b.  
88087 ended at a <vertical-line> character, any subsequent characters, up to the next  
88088 non-<backslash>-escaped <newline> shall be used as input text to the command.
- 88089 d. If the command was ended by a double-quote character, all subsequent characters,  
88090 up to the next non-<backslash>-escaped <newline>, shall be discarded.
- 88091 e. The terminating <newline> or <vertical-line> character shall be discarded and any  
88092 subsequent characters shall be parsed as a separate *ex* command.

88093 Command arguments shall be parsed as described by the Synopsis and Description of each  
88094 individual *ex* command. This parsing shall not be <blank>-sensitive, except for the **!** argument,  
88095 which must follow the command name without intervening <blank> characters, and where it  
88096 would otherwise be ambiguous. For example, *count* and *flag* arguments need not be  
88097 <blank>-separated because "d22p" is not ambiguous, but *file* arguments to the *ex* **next**  
88098 command must be separated by one or more <blank> characters. Any <blank> in command  
88099 arguments for the **abbreviate**, **unabbreviate**, **map**, and **unmap** commands can be  
88100 <control>-V-escaped, in which case the <blank> shall not be used as an argument delimiter. Any  
88101 <blank> in the command argument for any other command can be <backslash>-escaped, in  
88102 which case that <blank> shall not be used as an argument delimiter.

88103 Within command arguments for the **abbreviate**, **unabbreviate**, **map**, and **unmap** commands,

any character can be <control>-V-escaped. All such escaped characters shall be treated literally and shall have no special meaning. Within command arguments for all other *ex* commands that are not regular expressions or replacement strings, any character that would otherwise have a special meaning can be <backslash>-escaped. Escaped characters shall be treated literally, without special meaning as shell expansion characters or '!', '%', and '#' expansion characters. See [Regular Expressions in ex](#) (on page 2723) and [Replacement Strings in ex](#) (on page 2724) for descriptions of command arguments that are regular expressions or replacement strings.

Non-<backslash>-escaped '%' characters appearing in *file* arguments to any *ex* command shall be replaced by the current pathname; unescaped '#' characters shall be replaced by the alternate pathname. It shall be an error if '%' or '#' characters appear unescaped in an argument and their corresponding values are not set.

Non-<backslash>-escaped '!' characters in the arguments to either the *ex* ! command or the open and visual mode ! command, or in the arguments to the *ex* **read** command, where the first non-<blank> after the command name is a '!' character, or in the arguments to the *ex* **write** command where the command name is followed by one or more <blank> characters and the first non-<blank> after the command name is a '!' character, shall be replaced with the arguments to the last of those three commands as they appeared after all unescaped '%', '#', and '!' characters were replaced. It shall be an error if '!' characters appear unescaped in one of these commands and there has been no previous execution of one of these commands.

If an error occurs during the parsing or execution of an *ex* command:

- An informational message to this effect shall be written. Execution of the *ex* command shall stop, and the cursor (for example, the current line and column) shall not be further modified.
- If the *ex* command resulted from a map expansion, all characters from that map expansion shall be discarded, except as otherwise specified by the **map** command.
- Otherwise, if the *ex* command resulted from the processing of an *EXINIT* environment variable, a **.exrc** file, a **:source** command, a **-c** option, or a **+command** specified to an *ex* **edit**, **ex**, **next**, or **visual** command, no further commands from the source of the commands shall be executed.
- Otherwise, if the *ex* command resulted from the execution of a buffer or a **global** or **v** command, no further commands caused by the execution of the buffer or the **global** or **v** command shall be executed.
- Otherwise, if the *ex* command was not terminated by a <newline>, all characters up to and including the next non-<backslash>-escaped <newline> shall be discarded.

### Input Editing in ex

The following symbol is used in this and the following sections to specify command actions:

*word* In the POSIX locale, a word consists of a maximal sequence of letters, digits, and underscores, delimited at both ends by characters other than letters, digits, or underscores, or by the beginning or end of a line or the edit buffer.

When accepting input characters from the user, in either *ex* command mode or *ex* text input mode, *ex* shall enable canonical mode input processing, as defined in the System Interfaces volume of POSIX.1-2008.

If in *ex* text input mode:

1. If the **number** edit option is set, *ex* shall prompt for input using the line number that would be assigned to the line if it is entered, in the format specified for the *ex* **number** command.
2. If the **autoindent** edit option is set, *ex* shall prompt for input using **autoindent** characters, as described by the **autoindent** edit option. **autoindent** characters shall follow the line number, if any.

If in *ex* command mode:

1. If the **prompt** edit option is set, input shall be prompted for using a single ' : ' character; otherwise, there shall be no prompt.

The input characters in the following sections shall have the following effects on the input line.

## Scroll

*Synopsis:*      eof

See the description of the *stty* eof character in *stty*.

If in *ex* command mode:

If the eof character is the first character entered on the line, the line shall be evaluated as if it contained two characters: a <control>-D and a <newline>.

Otherwise, the eof character shall have no special meaning.

If in *ex* text input mode:

If the cursor follows an **autoindent** character, the **autoindent** characters in the line shall be modified so that a part of the next text input character will be displayed on the first column in the line after the previous **shiftwidth** edit option column boundary, and the user shall be prompted again for input for the same line.

Otherwise, if the cursor follows a ' 0 ', which follows an **autoindent** character, and the ' 0 ' was the previous text input character, the ' 0 ' and all **autoindent** characters in the line shall be discarded, and the user shall be prompted again for input for the same line.

Otherwise, if the cursor follows a ' ^ ', which follows an **autoindent** character, and the ' ^ ' was the previous text input character, the ' ^ ' and all **autoindent** characters in the line shall be discarded, and the user shall be prompted again for input for the same line. In addition, the **autoindent** level for the next input line shall be derived from the same line from which the **autoindent** level for the current input line was derived.

Otherwise, if there are no **autoindent** or text input characters in the line, the eof character shall be discarded.

Otherwise, the eof character shall have no special meaning.

**<newline>**

*Synopsis:*     <newline>  
                  <control>-J

If in *ex* command mode:

Cause the command line to be parsed; <control>-J shall be mapped to the <newline> for this purpose.

If in *ex* text input mode:

Terminate the current line. If there are no characters other than **autoindent** characters on the line, all characters on the line shall be discarded.

Prompt for text input on a new line after the current line. If the **autoindent** edit option is set, an appropriate number of **autoindent** characters shall be added as a prefix to the line as described by the *ex* **autoindent** edit option.

**<backslash>**

*Synopsis:*     <backslash>

Allow the entry of a subsequent <newline> or <control>-J as a literal character, removing any special meaning that it may have to the editor during text input mode. The <backslash> character shall be retained and evaluated when the command line is parsed, or retained and included when the input text becomes part of the edit buffer.

**<control>-V**

*Synopsis:*     <control>-V

Allow the entry of any subsequent character as a literal character, removing any special meaning that it may have to the editor during text input mode. The <control>-V character shall be discarded before the command line is parsed or the input text becomes part of the edit buffer.

If the “literal next” functionality is performed by the underlying system, it is implementation-defined whether a character other than <control>-V performs this function.

**<control>-W**

*Synopsis:*     <control>-W

Discard the <control>-W, and the word previous to it in the input line, including any <blank> characters following the word and preceding the <control>-W. If the “word erase” functionality is performed by the underlying system, it is implementation-defined whether a character other than <control>-W performs this function.

**Command Descriptions in ex**

The following symbols are used in this section to represent command modifiers. Some of these modifiers can be omitted, in which case the specified defaults shall be used.

*laddr*       A single line address, given in any of the forms described in [Addressing in ex](#) (on page 2692); the default shall be the current line ( ' . ' ), unless otherwise specified.

If the line address is zero, it shall be an error, unless otherwise specified in the following command descriptions.

|       |               |                                                                                                                                |
|-------|---------------|--------------------------------------------------------------------------------------------------------------------------------|
| 88219 |               | If the edit buffer is empty, and the address is specified with a command other than                                            |
| 88220 |               | <b>=, append, insert, open, put, read,</b> or <b>visual</b> , or the address is not zero, it shall be                          |
| 88221 |               | an error.                                                                                                                      |
| 88222 | <i>2addr</i>  | Two addresses specifying an inclusive range of lines. If no addresses are specified,                                           |
| 88223 |               | the default for <i>2addr</i> shall be the current line only (" . , . "), unless otherwise                                      |
| 88224 |               | specified in the following command descriptions. If one address is specified, <i>2addr</i>                                     |
| 88225 |               | shall specify that line only, unless otherwise specified in the following command                                              |
| 88226 |               | descriptions.                                                                                                                  |
| 88227 |               | It shall be an error if the first address is greater than the second address.                                                  |
| 88228 |               | If the edit buffer is empty, and the two addresses are specified with a command                                                |
| 88229 |               | other than the <b>!, write, wq,</b> or <b>xit</b> commands, or either address is not zero, it shall                            |
| 88230 |               | be an error.                                                                                                                   |
| 88231 | <i>count</i>  | A positive decimal number. If <i>count</i> is specified, it shall be equivalent to specifying                                  |
| 88232 |               | an additional address to the command, unless otherwise specified by the following                                              |
| 88233 |               | command descriptions. The additional address shall be equal to the last address                                                |
| 88234 |               | specified to the command (either explicitly or by default) plus <i>count</i> –1.                                               |
| 88235 |               | If this would result in an address greater than the last line of the edit buffer, it shall                                     |
| 88236 |               | be corrected to equal the last line of the edit buffer.                                                                        |
| 88237 | <i>flags</i>  | One or more of the characters <b>'+', '-'</b> , <b>'#'</b> , <b>'p'</b> , or <b>'l'</b> (ell). The flag characters             |
| 88238 |               | can be <blank>-separated, and in any order or combination. The characters <b>'#'</b> ,                                         |
| 88239 |               | <b>'p'</b> , and <b>'l'</b> shall cause lines to be written in the format specified by the <b>print</b>                        |
| 88240 |               | command with the specified <i>flags</i> .                                                                                      |
| 88241 |               | The lines to be written are as follows:                                                                                        |
| 88242 |               | 1. All edit buffer lines written during the execution of the <i>ex</i> <b>&amp;</b> , <b>~</b> , <b>list</b> , <b>number</b> , |
| 88243 |               | <b>open</b> , <b>print</b> , <b>s</b> , <b>visual</b> , and <b>z</b> commands shall be written as specified by <i>flags</i> .  |
| 88244 |               | 2. After the completion of an <i>ex</i> command with a flag as an argument, the                                                |
| 88245 |               | current line shall be written as specified by <i>flags</i> , unless the current line was                                       |
| 88246 |               | the last line written by the command.                                                                                          |
| 88247 |               | The characters <b>'+'</b> and <b>'-'</b> cause the value of the current line after the execution                               |
| 88248 |               | of the <i>ex</i> command to be adjusted by the offset address as described in <a href="#">Addressing</a>                       |
| 88249 |               | <a href="#">in ex</a> (on page 2692). This adjustment shall occur before the current line is written                           |
| 88250 |               | as described in 2. above.                                                                                                      |
| 88251 |               | The default for <i>flags</i> shall be none.                                                                                    |
| 88252 | <i>buffer</i> | One of a number of named areas for holding text. The named buffers are specified                                               |
| 88253 |               | by the alphanumeric characters of the POSIX locale. There shall also be one                                                    |
| 88254 |               | "unnamed" buffer. When no buffer is specified for editor commands that use a                                                   |
| 88255 |               | buffer, the unnamed buffer shall be used. Commands that store text into buffers                                                |
| 88256 |               | shall store the text as it was before the command took effect, and shall store text                                            |
| 88257 |               | occurring earlier in the file before text occurring later in the file, regardless of how                                       |
| 88258 |               | the text region was specified. Commands that store text into buffers shall store the                                           |
| 88259 |               | text into the unnamed buffer as well as any specified buffer.                                                                  |
| 88260 |               | In <i>ex</i> commands, buffer names are specified as the name by itself. In open or visual                                     |
| 88261 |               | mode commands the name is preceded by a double-quote ( <b>' '</b> ) character.                                                 |
| 88262 |               | If the specified buffer name is an uppercase character, and the buffer contents are                                            |
| 88263 |               | to be modified, the buffer shall be appended to rather than being overwritten. If                                              |

the buffer is not being modified, specifying the buffer name in lowercase and uppercase shall have identical results.

There shall also be buffers named by the numbers 1 through 9. In open and visual mode, if a region of text including characters from more than a single line is being modified by the *vi* **c** or **d** commands, the motion character associated with the **c** or **d** commands specifies that the buffer text shall be in line mode, or the commands **%**, **'**, **/**, **?**, **(**, **)**, **N**, **n**, **{**, or **}** are used to define a region of text for the **c** or **d** commands, the contents of buffers 1 through 8 shall be moved into the buffer named by the next numerically greater value, the contents of buffer 9 shall be discarded, and the region of text shall be copied into buffer 1. This shall be in addition to copying the text into a user-specified buffer or unnamed buffer, or both. Numeric buffers can be specified as a source buffer for open and visual mode commands; however, specifying a numeric buffer as the write target of an open or visual mode command shall have unspecified results.

The text of each buffer shall have the characteristic of being in either line or character mode. Appending text to a non-empty buffer shall set the mode to match the characteristic of the text being appended. Appending text to a buffer shall cause the creation of at least one additional line in the buffer. All text stored into buffers by *ex* commands shall be in line mode. The *ex* commands that use buffers as the source of text specify individually how buffers of different modes are handled. Each open or visual mode command that uses buffers for any purpose specifies individually the mode of the text stored into the buffer and how buffers of different modes are handled.

*file* Command text used to derive a pathname. The default shall be the current pathname, as defined previously, in which case, if no current pathname has yet been established it shall be an error, except where specifically noted in the individual command descriptions that follow. If the command text contains any of the characters **'**, **~**, **'**, **{**, **'**, **[**, **'**, **\***, **'**, **?**, **'**, **\$**, **'**, **"**, backquote, single-quote, and **<backslash>**, it shall be subjected to the process of "shell expansions", as described below; if more than a single pathname results and the command expects only one, it shall be an error.

The process of shell expansions in the editor shall be done as follows. The *ex* utility shall pass two arguments to the program named by the shell edit option; the first shall be **-c**, and the second shall be the string "echo" and the command text as a single argument. The standard output and standard error of that command shall replace the command text.

**!** A character that can be appended to the command name to modify its operation, as detailed in the individual command descriptions. With the exception of the *ex* **read**, **write**, and **!** commands, the **'** character shall only act as a modifier if there are no **<blank>** characters between it and the command name.

*remembered search direction*

The *vi* commands **N** and **n** begin searching in a forwards or backwards direction in the edit buffer based on a remembered search direction, which is initially unset, and is set by the *ex* **global**, **v**, **s**, and **tag** commands, and the *vi* **/** and **?** commands.

**Abbreviate**

*Synopsis:*     ab[*breviate*][*lhs rhs*]

If *lhs* and *rhs* are not specified, write the current list of abbreviations and do nothing more.

Implementations may restrict the set of characters accepted in *lhs* or *rhs*, except that printable characters and <blank> characters shall not be restricted. Additional restrictions shall be implementation-defined.

In both *lhs* and *rhs*, any character may be escaped with a <control>-V, in which case the character shall not be used to delimit *lhs* from *rhs*, and the escaping <control>-V shall be discarded.

In open and visual text input mode, if a non-word or <ESC> character that is not escaped by a <control>-V character is entered after a word character, a check shall be made for a set of characters matching *lhs*, in the text input entered during this command. If it is found, the effect shall be as if *rhs* was entered instead of *lhs*.

The set of characters that are checked is defined as follows:

1. If there are no characters inserted before the word and non-word or <ESC> characters that triggered the check, the set of characters shall consist of the word character.
2. If the character inserted before the word and non-word or <ESC> characters that triggered the check is a word character, the set of characters shall consist of the characters inserted immediately before the triggering characters that are word characters, plus the triggering word character.
3. If the character inserted before the word and non-word or <ESC> characters that triggered the check is not a word character, the set of characters shall consist of the characters that were inserted before the triggering characters that are neither <blank> characters nor word characters, plus the triggering word character.

It is unspecified whether the *lhs* argument entered for the *ex* **abbreviate** and **unabbreviate** commands is replaced in this fashion. Regardless of whether or not the replacement occurs, the effect of the command shall be as if the replacement had not occurred.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Append**

*Synopsis:*     [*laddr*] a[*ppend*][!]

Enter *ex* text input mode; the input text shall be placed after the specified line. If line zero is specified, the text shall be placed at the beginning of the edit buffer.

This command shall be affected by the **number** and **autoindent** edit options; following the command name with '!' shall cause the **autoindent** edit option setting to be toggled for the duration of this command only.

*Current line:* Set to the last input line; if no lines were input, set to the specified line, or to the first line of the edit buffer if a line of zero was specified, or zero if the edit buffer is empty.

*Current column:* Set to non-<blank>.

**Arguments**

*Synopsis:*     ar[gs]

Write the current argument list, with the current argument-list entry, if any, between ' [ ' and ' ] ' characters.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Change**

*Synopsis:*     [2addr] c[hange][!][count]

Enter *ex* text input mode; the input text shall replace the specified lines. The specified lines shall be copied into the unnamed buffer, which shall become a line mode buffer.

This command shall be affected by the **number** and **autoindent** edit options; following the command name with ' ! ' shall cause the **autoindent** edit option setting to be toggled for the duration of this command only.

*Current line:* Set to the last input line; if no lines were input, set to the line before the first address, or to the first line of the edit buffer if there are no lines preceding the first address, or to zero if the edit buffer is empty.

*Current column:* Set to non-<blank>.

**Change Directory**

*Synopsis:*     chd[ir][!][directory]  
              cd[!][directory]

Change the current working directory to *directory*.

If no *directory* argument is specified, and the *HOME* environment variable is set to a non-null and non-empty value, *directory* shall default to the value named in the *HOME* environment variable. If the *HOME* environment variable is empty or is undefined, the default value of *directory* is implementation-defined.

If no ' ! ' is appended to the command name, and the edit buffer has been modified since the last complete write, and the current pathname does not begin with a ' / ', it shall be an error.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Copy**

*Synopsis:*     [2addr] co[py] laddr [flags]  
              [2addr] t laddr [flags]

Copy the specified lines after the specified destination line; line zero specifies that the lines shall be placed at the beginning of the edit buffer.

*Current line:* Set to the last line copied.

*Current column:* Set to non-<blank>.

**Delete**

*Synopsis:*     `[2addr] d[delete][buffer][count][flags]`

Delete the specified lines into a buffer (defaulting to the unnamed buffer), which shall become a line-mode buffer.

Flags can immediately follow the command name; see [Command Line Parsing in ex](#) (on page 2694).

*Current line:* Set to the line following the deleted lines, or to the last line in the edit buffer if that line is past the end of the edit buffer, or to zero if the edit buffer is empty.

*Current column:* Set to non-<blank>.

**Edit**

*Synopsis:*     `e[dit][!][+command][file]`  
               `ex[!][+command][file]`

If no `'!'` is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error.

If *file* is specified, replace the current contents of the edit buffer with the current contents of *file*, and set the current pathname to *file*. If *file* is not specified, replace the current contents of the edit buffer with the current contents of the file named by the current pathname. If for any reason the current contents of the file cannot be accessed, the edit buffer shall be empty.

The `+command` option shall be <blank>-delimited; <blank> characters within the `+command` can be escaped by preceding them with a <backslash> character. The `+command` shall be interpreted as an *ex* command immediately after the contents of the edit buffer have been replaced and the current line and column have been set.

If the edit buffer is empty:

*Current line:* Set to 0.

*Current column:* Set to 1.

Otherwise, if executed while in *ex* command mode or if the `+command` argument is specified:

*Current line:* Set to the last line of the edit buffer.

*Current column:* Set to non-<blank>.

Otherwise, if *file* is omitted or results in the current pathname:

*Current line:* Set to the first line of the edit buffer.

*Current column:* Set to non-<blank>.

Otherwise, if *file* is the same as the last file edited, the line and column shall be set as follows; if the file was previously edited, the line and column may be set as follows:

*Current line:* Set to the last value held when that file was last edited. If this value is not a valid line in the new edit buffer, set to the first line of the edit buffer.

*Current column:* If the current line was set to the last value held when the file was last edited, set to the last value held when the file was last edited. Otherwise, or if the last value is not a valid column in the new edit buffer, set to non-<blank>.

Otherwise:

*Current line*: Set to the first line of the edit buffer.

*Current column*: Set to non-<blank>.

## File

*Synopsis:*     f[file][file]

If a *file* argument is specified, the alternate pathname shall be set to the current pathname, and the current pathname shall be set to *file*.

Write an informational message. If the file has a current pathname, it shall be included in this message; otherwise, the message shall indicate that there is no current pathname. If the edit buffer contains lines, the current line number and the number of lines in the edit buffer shall be included in this message; otherwise, the message shall indicate that the edit buffer is empty. If the edit buffer has been modified since the last complete write, this fact shall be included in this message. If the **readonly** edit option is set, this fact shall be included in this message. The message may contain other unspecified information.

*Current line*: Unchanged.

*Current column*: Unchanged.

## Global

*Synopsis:*     [2addr] g[lobal] /pattern/ [commands]  
                  [2addr] v /pattern/ [commands]

The optional '!' character after the **global** command shall be the same as executing the **v** command.

If *pattern* is empty (for example, " / ") or not specified, the last regular expression used in the editor command shall be used as the *pattern*. The *pattern* can be delimited by <slash> characters (shown in the Synopsis), as well as any non-alphanumeric or non-<blank> other than <backslash>, <vertical-line>, <newline>, or double-quote.

If no lines are specified, the lines shall default to the entire file.

The **global** and **v** commands are logically two-pass operations. First, mark the lines within the specified lines for which the line excluding the terminating <newline> matches (**global**) or does not match (**v** or **global!**) the specified pattern. Second, execute the *ex* commands given by *commands*, with the current line ( ' . ' ) set to each marked line. If an error occurs during this process, or the contents of the edit buffer are replaced (for example, by the *ex* :**edit** command) an error message shall be written and no more commands resulting from the execution of this command shall be processed.

Multiple *ex* commands can be specified by entering multiple commands on a single line using a <vertical-line> to delimit them, or one per line, by escaping each <newline> with a <backslash>.

If no commands are specified:

1. If in *ex* command mode, it shall be as if the **print** command were specified.
2. Otherwise, no command shall be executed.

For the **append**, **change**, and **insert** commands, the input text shall be included as part of the command, and the terminating <period> can be omitted if the command ends the list of commands. The **open** and **visual** commands can be specified as one of the commands, in which

case each marked line shall cause the editor to enter open or visual mode. If open or visual mode is exited using the *vi* **Q** command, the current line shall be set to the next marked line, and open or visual mode reentered, until the list of marked lines is exhausted.

The **global**, **v**, and **undo** commands cannot be used in *commands*. Marked lines may be deleted by commands executed for lines occurring earlier in the file than the marked lines. In this case, no commands shall be executed for the deleted lines.

If the remembered search direction is not set, the **global** and **v** commands shall set it to forward.

The **autoprint** and **autoindent** edit options shall be inhibited for the duration of the **g** or **v** command.

*Current line*: If no commands executed, set to the last marked line. Otherwise, as specified for the executed *ex* commands.

*Current column*: If no commands are executed, set to non-<blank>; otherwise, as specified for the individual *ex* commands.

## Insert

*Synopsis*:     [*laddr*] i[nsert][!]

Enter *ex* text input mode; the input text shall be placed before the specified line. If the line is zero or 1, the text shall be placed at the beginning of the edit buffer.

This command shall be affected by the **number** and **autoindent** edit options; following the command name with '!' shall cause the **autoindent** edit option setting to be toggled for the duration of this command only.

*Current line*: Set to the last input line; if no lines were input, set to the line before the specified line, or to the first line of the edit buffer if there are no lines preceding the specified line, or zero if the edit buffer is empty.

*Current column*: Set to non-<blank>.

## Join

*Synopsis*:     [*2addr*] j[oin][!][*count*][*flags*]

If *count* is specified:

If no address was specified, the **join** command shall behave as if *2addr* were the current line and the current line plus *count* (*.*, *.* + *count*).

If one address was specified, the **join** command shall behave as if *2addr* were the specified address and the specified address plus *count* (*addr*, *addr* + *count*).

If two addresses were specified, the **join** command shall behave as if an additional address, equal to the last address plus *count* -1 (*addr1*, *addr2*, *addr2* + *count* -1), was specified.

If this would result in a second address greater than the last line of the edit buffer, it shall be corrected to be equal to the last line of the edit buffer.

If no *count* is specified:

88498 If no address was specified, the **join** command shall behave as if *2addr* were the current  
 88499 line and the next line (*.*, *.* +1).

88500 If one address was specified, the **join** command shall behave as if *2addr* were the specified  
 88501 address and the next line (*addr*, *addr* +1).

88502 Join the text from the specified lines together into a single line, which shall replace the specified  
 88503 lines.

88504 If a '!' character is appended to the command name, the **join** shall be without modification of  
 88505 any line, independent of the current locale.

88506 Otherwise, in the POSIX locale, set the current line to the first of the specified lines, and then, for  
 88507 each subsequent line, proceed as follows:

- 88508 1. Discard leading <space> characters from the line to be joined.
- 88509 2. If the line to be joined is now empty, delete it, and skip steps 3 through 5.
- 88510 3. If the current line ends in a <blank>, or the first character of the line to be joined is a ' ) ' character, join the lines without further modification.
- 88511 3. If the current line ends in a <blank>, or the first character of the line to be joined is a ' ) ' character, join the lines without further modification.
- 88512 4. If the last character of the current line is a ' . ' , join the lines with two <space> characters  
 88513 between them.
- 88514 5. Otherwise, join the lines with a single <space> between them.

88515 *Current line*: Set to the first line specified.

88516 *Current column*: Set to non-<blank>.

## 88517 List

88518 *Synopsis*: `[2addr] l[ist][count][flags]`

88519 This command shall be equivalent to the *ex* command:

88520 `[2addr] p[rint][count] l[flags]`

88521 See [Print](#) (on page 2711).

## 88522 Map

88523 *Synopsis*: `map[!][lhs rhs]`

88524 If *lhs* and *rhs* are not specified:

- 88525 1. If '!' is specified, write the current list of text input mode maps.
- 88526 2. Otherwise, write the current list of command mode maps.
- 88527 3. Do nothing more.

88528 Implementations may restrict the set of characters accepted in *lhs* or *rhs*, except that printable  
 88529 characters and <blank> characters shall not be restricted. Additional restrictions shall be  
 88530 implementation-defined. In both *lhs* and *rhs*, any character can be escaped with a <control>-V, in  
 88531 which case the character shall not be used to delimit *lhs* from *rhs*, and the escaping <control>-V  
 88532 shall be discarded.

88533 If the character '!' is appended to the **map** command name, the mapping shall be effective  
 88534 during open or visual text input mode rather than **open** or **visual** command mode. This allows  
 88535 *lhs* to have two different **map** definitions at the same time: one for command mode and one for

88536 text input mode.

88537 For command mode mappings:

88538 When the *lhs* is entered as any part of a *vi* command in open or visual mode (but not as  
88539 part of the arguments to the command), the action shall be as if the corresponding *rhs* had  
88540 been entered.

88541 If any character in the command, other than the first, is escaped using a <control>-V  
88542 character, that character shall not be part of a match to an *lhs*.

88543 It is unspecified whether implementations shall support **map** commands where the *lhs* is  
88544 more than a single character in length, where the first character of the *lhs* is printable.

88545 If *lhs* contains more than one character and the first character is '#', followed by a  
88546 sequence of digits corresponding to a numbered function key, then when this function key  
88547 is typed it shall be mapped to *rhs*. Characters other than digits following a '#' character  
88548 also represent the function key named by the characters in the *lhs* following the '#' and  
88549 may be mapped to *rhs*. It is unspecified how function keys are named or what function  
88550 keys are supported.

88551 For text input mode mappings:

88552 When the *lhs* is entered as any part of text entered in open or visual text input modes, the  
88553 action shall be as if the corresponding *rhs* had been entered.

88554 If any character in the input text is escaped using a <control>-V character, that character  
88555 shall not be part of a match to an *lhs*.

88556 It is unspecified whether the *lhs* text entered for subsequent **map** or **unmap** commands is  
88557 replaced with the *rhs* text for the purposes of the screen display; regardless of whether or  
88558 not the display appears as if the corresponding *rhs* text was entered, the effect of the  
88559 command shall be as if the *lhs* text was entered.

88560 If only part of the *lhs* is entered, it is unspecified how long the editor will wait for additional,  
88561 possibly matching characters before treating the already entered characters as not matching the  
88562 *lhs*.

88563 The *rhs* characters shall themselves be subject to remapping, unless otherwise specified by the  
88564 **remap** edit option, except that if the characters in *lhs* occur as prefix characters in *rhs*, those  
88565 characters shall not be remapped.

88566 On block-mode terminals, the mapping need not occur immediately (for example, it may occur  
88567 after the terminal transmits a group of characters to the system), but it shall achieve the same  
88568 results as if it occurred immediately.

88569 *Current line*: Unchanged.

88570 *Current column*: Unchanged.

**Mark**

*Synopsis:*     [*laddr*] ma[*rk*] *character*  
                   [*laddr*] *k character*

Implementations shall support *character* values of a single lowercase letter of the POSIX locale and the backquote and single-quote characters; support of other characters is implementation-defined.

If executing the *vi m* command, set the specified mark to the current line and 1-based numbered character referenced by the current column, if any; otherwise, column position 1.

Otherwise, set the specified mark to the specified line and 1-based numbered first non-<blank> non-<newline> in the line, if any; otherwise, the last non-<newline> in the line, if any; otherwise, column position 1.

The mark shall remain associated with the line until the mark is reset or the line is deleted. If a deleted line is restored by a subsequent **undo** command, any marks previously associated with the line, which have not been reset, shall be restored as well. Any use of a mark not associated with a current line in the edit buffer shall be an error.

The marks ' and ' shall be set as described previously, immediately before the following events occur in the editor:

1. The use of ' \$ ' as an *ex* address
2. The use of a positive decimal number as an *ex* address
3. The use of a search command as an *ex* address
4. The use of a mark reference as an *ex* address
5. The use of the following open and visual mode commands: <control>-], %, (, ), [, ], {, }
6. The use of the following open and visual mode commands: ', **G**, **H**, **L**, **M**, **z** if the current line will change as a result of the command
7. The use of the open and visual mode commands: /, ?, **N**, ', **n** if the current line or column will change as a result of the command
8. The use of the *ex* mode commands: **z**, **undo**, **global**, **v**

For rules 1., 2., 3., and 4., the ' and ' marks shall not be set if the *ex* command is parsed as specified by rule 6.a. in [Command Line Parsing in ex](#) (on page 2694).

For rules 5., 6., and 7., the ' and ' marks shall not be set if the commands are used as motion commands in open and visual mode.

For rules 1., 2., 3., 4., 5., 6., 7., and 8., the ' and ' marks shall not be set if the command fails.

The ' and ' marks shall be set as described previously, each time the contents of the edit buffer are replaced (including the editing of the initial buffer), if in open or visual mode, or if in **ex** mode and the edit buffer is not empty, before any commands or movements (including commands or movements specified by the **-c** or **-t** options or the **+command** argument) are executed on the edit buffer. If in open or visual mode, the marks shall be set as if executing the *vi m* command; otherwise, as if executing the *ex mark* command.

When changing from **ex** mode to open or visual mode, if the ' and ' marks are not already set, the ' and ' marks shall be set as described previously.

*Current line:* Unchanged.

88612 *Current column*: Unchanged.

## 88613 **Move**

88614 *Synopsis*:     `[2addr] m[ove] 1addr [flags]`

88615 Move the specified lines after the specified destination line. A destination of line zero specifies  
88616 that the lines shall be placed at the beginning of the edit buffer. It shall be an error if the  
88617 destination line is within the range of lines to be moved.

88618 *Current line*: Set to the last of the moved lines.

88619 *Current column*: Set to non-<blank>.

## 88620 **Next**

88621 *Synopsis*:     `n[ext][!][+command][file ...]`

88622 If no '!' is appended to the command name, and the edit buffer has been modified since the  
88623 last complete write, it shall be an error, unless the file is successfully written as specified by the  
88624 **autowrite** option.

88625 If one or more files is specified:

- 88626     1. Set the argument list to the specified filenames.
- 88627     2. Set the current argument list reference to be the first entry in the argument list.
- 88628     3. Set the current pathname to the first filename specified.

88629 Otherwise:

- 88630     1. It shall be an error if there are no more filenames in the argument list after the filename  
88631       currently referenced.
- 88632     2. Set the current pathname and the current argument list reference to the filename after the  
88633       filename currently referenced in the argument list.

88634 Replace the contents of the edit buffer with the contents of the file named by the current  
88635 pathname. If for any reason the contents of the file cannot be accessed, the edit buffer shall be  
88636 empty.

88637 This command shall be affected by the **autowrite** and **writeany** edit options.

88638 The *+command* option shall be <blank>-delimited; <blank> characters can be escaped by  
88639 preceding them with a <backslash> character. The *+command* shall be interpreted as an *ex*  
88640 command immediately after the contents of the edit buffer have been replaced and the current  
88641 line and column have been set.

88642 *Current line*: Set as described for the **edit** command.

88643 *Current column*: Set as described for the **edit** command.

**Number**

*Synopsis:*    [2addr] nu[mber][count][flags]  
               [2addr] #[count][flags]

These commands shall be equivalent to the *ex* command:

[2addr] p[rint][count] #[flags]

See [Print](#).

**Open**

*Synopsis:*    [1addr] o[pen] /pattern/ [flags]

This command need not be supported on block-mode terminals or terminals with insufficient capabilities. If standard input, standard output, or standard error are not terminal devices, the results are unspecified.

Enter open mode.

The trailing delimiter can be omitted from *pattern* at the end of the command line. If *pattern* is empty (for example, " / / ") or not specified, the last regular expression used in the editor shall be used as the pattern. The pattern can be delimited by <slash> characters (shown in the Synopsis), as well as any alphanumeric, or non-<blank> other than <backslash>, <vertical-line>, <newline>, or double-quote.

*Current line:* Set to the specified line.

*Current column:* Set to non-<blank>.

**Preserve**

*Synopsis:*    pre[serve]

Save the edit buffer in a form that can later be recovered by using the **-r** option or by using the *ex* **recover** command. After the file has been preserved, a mail message shall be sent to the user. This message shall be readable by invoking the *mailx* utility. The message shall contain the name of the file, the time of preservation, and an *ex* command that could be used to recover the file. Additional information may be included in the mail message.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Print**

*Synopsis:*    [2addr] p[rint][count][flags]

Write the addressed lines. The behavior is unspecified if the number of columns on the display is less than the number of columns required to write any single character in the lines being written.

Non-printable characters, except for the <tab>, shall be written as implementation-defined multi-character sequences.

If the # flag is specified or the **number** edit option is set, each line shall be preceded by its line number in the following format:

"%6dΔΔ", <line number>

If the l flag is specified or the **list** edit option is set:

1. The characters listed in XBD Table 5-1 (on page 121) shall be written as the corresponding escape sequence.
2. Non-printable characters not in XBD Table 5-1 (on page 121) shall be written as one three-digit octal number (with a preceding <backslash>) for each byte in the character (most significant byte first).
3. The end of each line shall be marked with a '\$', and literal '\$' characters within the line shall be written with a preceding <backslash>.

Long lines shall be folded; the length at which folding occurs is unspecified, but should be appropriate for the output terminal, considering the number of columns of the terminal.

If a line is folded, and the **l** flag is not specified and the **list** edit option is not set, it is unspecified whether a multi-column character at the folding position is separated; it shall not be discarded.

*Current line*: Set to the last written line.

*Current column*: Unchanged if the current line is unchanged; otherwise, set to non-<blank>.

## Put

*Synopsis*:     [*laddr*] pu[t][*buffer*]

Append text from the specified buffer (by default, the unnamed buffer) to the specified line; line zero specifies that the text shall be placed at the beginning of the edit buffer. Each portion of a line in the buffer shall become a new line in the edit buffer, regardless of the mode of the buffer.

*Current line*: Set to the last line entered into the edit buffer.

*Current column*: Set to non-<blank>.

## Quit

*Synopsis*:     q[uit][!]

If no '!' is appended to the command name:

1. If the edit buffer has been modified since the last complete write, it shall be an error.
2. If there are filenames in the argument list after the filename currently referenced, and the last command was not a **quit**, **wq**, **xit**, or **ZZ** (see [Exit](#), on page 3399) command, it shall be an error.

Otherwise, terminate the editing session.

## Read

*Synopsis*:     [*laddr*] r[ead][!][*file*]

If '!' is not the first non-<blank> to follow the command name, a copy of the specified file shall be appended into the edit buffer after the specified line; line zero specifies that the copy shall be placed at the beginning of the edit buffer. The number of lines and bytes read shall be written. If no *file* is named, the current pathname shall be the default. If there is no current pathname, then *file* shall become the current pathname. If there is no current pathname or *file* operand, it shall be an error. Specifying a *file* that is not of type regular shall have unspecified results.

Otherwise, if *file* is preceded by '!', the rest of the line after the '!' shall have '%', '#', and '!' characters expanded as described in [Command Line Parsing in ex](#) (on page 2694).

The *ex* utility shall then pass two arguments to the program named by the shell edit option; the

first shall be **-c** and the second shall be the expanded arguments to the **read** command as a single argument. The standard input of the program shall be set to the standard input of the *ex* program when it was invoked. The standard error and standard output of the program shall be appended into the edit buffer after the specified line.

Each line in the copied file or program output (as delimited by <newline> characters or the end of the file or output if it is not immediately preceded by a <newline>), shall be a separate line in the edit buffer. Any occurrences of <carriage-return> and <newline> pairs in the output shall be treated as single <newline> characters.

The special meaning of the '!' following the **read** command can be overridden by escaping it with a <backslash> character.

*Current line*: If no lines are added to the edit buffer, unchanged. Otherwise, if in open or visual mode, set to the first line entered into the edit buffer. Otherwise, set to the last line entered into the edit buffer.

*Current column*: Set to non-<blank>.

## Recover

*Synopsis:*     **rec[over][!]** *file*

If no '!' is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error.

If no *file* operand is specified, then the current pathname shall be used. If there is no current pathname or *file* operand, it shall be an error.

If no recovery information has previously been saved about *file*, the **recover** command shall behave identically to the **edit** command, and an informational message to this effect shall be written.

Otherwise, set the current pathname to *file*, and replace the current contents of the edit buffer with the recovered contents of *file*. If there are multiple instances of the file to be recovered, the one most recently saved shall be recovered, and an informational message that there are previous versions of the file that can be recovered shall be written. The editor shall behave as if the contents of the edit buffer have already been modified.

*Current file*: Set as described for the **edit** command.

*Current column*: Set as described for the **edit** command.

## Rewind

*Synopsis:*     **rew[ind][!]**

If no '!' is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error, unless the file is successfully written as specified by the **autowrite** option.

If the argument list is empty, it shall be an error.

The current argument list reference and the current pathname shall be set to the first filename in the argument list.

Replace the contents of the edit buffer with the contents of the file named by the current pathname. If for any reason the contents of the file cannot be accessed, the edit buffer shall be empty.

This command shall be affected by the **autowrite** and **writeln** edit options.

*Current line*: Set as described for the **edit** command.

*Current column*: Set as described for the **edit** command.

## Set

*Synopsis*:     `se[t][option[=value]] ...][nooption ...][option? ...][all]`

When no arguments are specified, write the value of the **term** edit option and those options whose values have been changed from the default settings; when the argument *all* is specified, write all of the option values.

Giving an option name followed by the character '?' shall cause the current value of that option to be written. The '?' can be separated from the option name by zero or more <blank> characters. The '?' shall be necessary only for Boolean valued options. Boolean options can be given values by the form **set option** to turn them on or **set nooption** to turn them off; string and numeric options can be assigned by the form **set option=value**. Any <blank> characters in strings can be included as is by preceding each <blank> with an escaping <backslash>. More than one option can be set or listed by a single set command by specifying multiple arguments, each separated from the next by one or more <blank> characters.

See [Edit Options in ex](#) (on page 2724) for details about specific options.

*Current line*: Unchanged.

*Current column*: Unchanged.

## Shell

*Synopsis*:     `sh[ell]`

Invoke the program named in the **shell** edit option with the single argument **-i** (interactive mode). Editing shall be resumed when the program exits.

*Current line*: Unchanged.

*Current column*: Unchanged.

## Source

*Synopsis*:     `so[urce] file`

Read and execute *ex* commands from *file*. Lines in the file that are blank lines shall be ignored.

*Current line*: As specified for the individual *ex* commands.

*Current column*: As specified for the individual *ex* commands.

## Substitute

*Synopsis*:     `[2addr] s[ubstitute][/pattern/repl][options][count][flags]`

`[2addr] &[options][count][flags]`

`[2addr] ~[options][count][flags]`

Replace the first instance of the pattern *pattern* by the string *repl* on each specified line. (See [Regular Expressions in ex](#) (on page 2723) and [Replacement Strings in ex](#) (on page 2724).) Any non-alphabetic, non-<blank> delimiter other than <backslash>, '&|', <newline>, or double-quote can be used instead of '/'. <backslash> characters can be used to escape delimiters, <backslash> characters, and other special characters.

88801 The trailing delimiter can be omitted from *pattern* or from *repl* at the end of the command line. If  
88802 both *pattern* and *repl* are not specified or are empty (for example, `"/ /"`), the last `s` command  
88803 shall be repeated. If only *pattern* is not specified or is empty, the last regular expression used in  
88804 the editor shall be used as the pattern. If only *repl* is not specified or is empty, the pattern shall be  
88805 replaced by nothing. If the entire replacement pattern is `' % '`, the last replacement pattern to an  
88806 `s` command shall be used.

88807 Entering a <carriage-return> in *repl* (which requires an escaping <backslash> in *ex* mode and an  
88808 escaping <control>-V in open or *vi* mode) shall split the line at that point, creating a new line in  
88809 the edit buffer. The <carriage-return> shall be discarded.

88810 If *options* includes the letter `'g'` (**global**), all non-overlapping instances of the pattern in the line  
88811 shall be replaced.

88812 If *options* includes the letter `'c'` (**confirm**), then before each substitution the line shall be written;  
88813 the written line shall reflect all previous substitutions. On the following line, <space> characters  
88814 shall be written beneath the characters from the line that are before the *pattern* to be replaced,  
88815 and `'^'` characters written beneath the characters included in the *pattern* to be replaced. The *ex*  
88816 utility shall then wait for a response from the user. An affirmative response shall cause the  
88817 substitution to be done, while any other input shall not make the substitution. An affirmative  
88818 response shall consist of a line with the affirmative response (as defined by the current locale) at  
88819 the beginning of the line. This line shall be subject to editing in the same way as the *ex* command  
88820 line.

88821 If interrupted (see the ASYNCHRONOUS EVENTS section), any modifications confirmed by the  
88822 user shall be preserved in the edit buffer after the interrupt.

88823 If the remembered search direction is not set, the `s` command shall set it to forward.

88824 In the second Synopsis, the `&` command shall repeat the previous substitution, as if the `&`  
88825 command were replaced by:

88826 `s/pattern/repl/`

88827 where *pattern* and *repl* are as specified in the previous `s`, `&`, or `~` command.

88828 In the third Synopsis, the `~` command shall repeat the previous substitution, as if the `'~'` were  
88829 replaced by:

88830 `s/pattern/repl/`

88831 where *pattern* shall be the last regular expression specified to the editor, and *repl* shall be from  
88832 the previous substitution (including `&` and `~`) command.

88833 These commands shall be affected by the `LC_MESSAGES` environment variable.

88834 *Current line*: Set to the last line in which a substitution occurred, or, unchanged if no substitution  
88835 occurred.

88836 *Current column*: Set to non-<blank>.

**Suspend**

*Synopsis:*     su[suspend][!]  
                 st[op][!]

Allow control to return to the invoking process; *ex* shall suspend itself as if it had received the SIGTSTP signal. The suspension shall occur only if job control is enabled in the invoking shell (see the description of *set -m*).

These commands shall be affected by the **autowrite** and **writeany** edit options.

The current **susp** character (see *stty*) shall be equivalent to the **suspend** command.

**Tag**

*Synopsis:*     ta[g][!] tagstring

The results are unspecified if the format of a tags file is not as specified by the *ctags* utility (see *ctags*) description.

The **tag** command shall search for *tagstring* in the tag files referred to by the **tag** edit option, in the order they are specified, until a reference to *tagstring* is found. Files shall be searched from beginning to end. If no reference is found, it shall be an error and an error message to this effect shall be written. If the reference is not found, or if an error occurs while processing a file referred to in the **tag** edit option, it shall be an error, and an error message shall be written at the first occurrence of such an error.

Otherwise, if the tags file contained a pattern, the pattern shall be treated as a regular expression used in the editor; for example, for the purposes of the **s** command.

If the *tagstring* is in a file with a different name than the current pathname, set the current pathname to the name of that file, and replace the contents of the edit buffer with the contents of that file. In this case, if no '!' is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error, unless the file is successfully written as specified by the **autowrite** option.

This command shall be affected by the **autowrite**, **tag**, **taglength**, and **writeany** edit options.

*Current line:* If the tags file contained a line number, set to that line number. If the line number is larger than the last line in the edit buffer, an error message shall be written and the current line shall be set as specified for the **edit** command.

If the tags file contained a pattern, set to the first occurrence of the pattern in the file. If no matching pattern is found, an error message shall be written and the current line shall be set as specified for the **edit** command.

*Current column:* If the tags file contained a line-number reference and that line-number was not larger than the last line in the edit buffer, or if the tags file contained a pattern and that pattern was found, set to non-<blank>. Otherwise, set as specified for the **edit** command.

**Unabbreviate**

*Synopsis:*     una[bbrev] lhs

If *lhs* is not an entry in the current list of abbreviations (see [Abbreviate](#), on page 2702), it shall be an error. Otherwise, delete *lhs* from the list of abbreviations.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Undo**

*Synopsis:*     u[ndo]

Reverse the changes made by the last command that modified the contents of the edit buffer, including **undo**. For this purpose, the **global**, **v**, **open**, and **visual** commands, and commands resulting from buffer executions and mapped character expansions, are considered single commands.

If no action that can be undone preceded the **undo** command, it shall be an error.

If the **undo** command restores lines that were marked, the mark shall also be restored unless it was reset subsequent to the deletion of the lines.

*Current line:*

1. If lines are added or changed in the file, set to the first line added or changed.
2. Set to the line before the first line deleted, if it exists.
3. Set to 1 if the edit buffer is not empty.
4. Set to zero.

*Current column:* Set to non-<blank>.

**Unmap**

*Synopsis:*     unm[ap][!] lhs

If '!' is appended to the command name, and if *lhs* is not an entry in the list of text input mode map definitions, it shall be an error. Otherwise, delete *lhs* from the list of text input mode map definitions.

If no '!' is appended to the command name, and if *lhs* is not an entry in the list of command mode map definitions, it shall be an error. Otherwise, delete *lhs* from the list of command mode map definitions.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Version**

*Synopsis:*     `ve[rsion]`

Write a message containing version information for the editor. The format of the message is unspecified.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Visual**

*Synopsis:*     `[laddr] vi[sual][type][count][flags]`

If *ex* is currently in open or visual mode, the Synopsis and behavior of the visual command shall be the same as the **edit** command, as specified by **Edit** (on page 2704).

Otherwise, this command need not be supported on block-mode terminals or terminals with insufficient capabilities. If standard input, standard output, or standard error are not terminal devices, the results are unspecified.

If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in **window**, on page 2731). If the '^' type character was also specified, the **window** edit option shall be set before being used by the type character.

Enter visual mode. If *type* is not specified, it shall be as if a *type* of '+' was specified. The *type* shall cause the following effects:

- + Place the beginning of the specified line at the top of the display.
- Place the end of the specified line at the bottom of the display.
- . Place the beginning of the specified line in the middle of the display.
- ^ If the specified line is less than or equal to the value of the **window** edit option, set the line to 1; otherwise, decrement the line by the value of the **window** edit option minus 1. Place the beginning of this line as close to the bottom of the displayed lines as possible, while still displaying the value of the **window** edit option number of lines.

*Current line:* Set to the specified line.

*Current column:* Set to non-<blank>.

**Write**

*Synopsis:*     `[2addr] w[rite][!][>][file]`  
                   `[2addr] w[rite][!][file]`  
                   `[2addr] wq[!][>][file]`

If no lines are specified, the lines shall default to the entire file.

The command **wq** shall be equivalent to a **write** command followed by a **quit** command; **wq!** shall be equivalent to **write!** followed by **quit**. In both cases, if the **write** command fails, the **quit** shall not be attempted.

If the command name is not followed by one or more <blank> characters, or *file* is not preceded by a '!' character, the **write** shall be to a file.

1. If the >> argument is specified, and the file already exists, the lines shall be appended to the file instead of replacing its contents. If the >> argument is specified, and the file does not already exist, it is unspecified whether the write shall proceed as if the >> argument

- 88943 had not been specified or if the **write** shall fail.
- 88944 2. If the **readonly** edit option is set (see **readonly**, on page 2728), the **write** shall fail.
- 88945 3. If *file* is specified, and is not the current pathname, and the file exists, the **write** shall fail.
- 88946 4. If *file* is not specified, the current pathname shall be used. If there is no current pathname,
- 88947 the **write** command shall fail.
- 88948 5. If the current pathname is used, and the current pathname has been changed by the **file**
- 88949 or **read** commands, and the file exists, the **write** shall fail. If the **write** is successful,
- 88950 subsequent **writes** shall not fail for this reason (unless the current pathname is changed
- 88951 again).
- 88952 6. If the whole edit buffer is not being written, and the file to be written exists, the **write**
- 88953 shall fail.

88954 For rules 1., 2., 3., and 5., the **write** can be forced by appending the character '**!**' to the

88955 command name.

88956 For rules 2., 3., and 5., the **write** can be forced by setting the **writeany** edit option.

88957 Additional, implementation-defined tests may cause the **write** to fail.

88958 If the edit buffer is empty, a file without any contents shall be written.

88959 An informational message shall be written noting the number of lines and bytes written.

88960 Otherwise, if the command is followed by one or more <blank> characters, and the file is

88961 preceded by '**!**', the rest of the line after the '**!**' shall have '%', '#', and '**!**' characters

88962 expanded as described in **Command Line Parsing in ex** (on page 2694).

88963 The *ex* utility shall then pass two arguments to the program named by the **shell** edit option; the

88964 first shall be **-c** and the second shall be the expanded arguments to the **write** command as a

88965 single argument. The specified lines shall be written to the standard input of the command. The

88966 standard error and standard output of the program, if any, shall be written as described for the

88967 **print** command. If the last character in that output is not a <newline>, a <newline> shall be

88968 written at the end of the output.

88969 The special meaning of the '**!**' following the **write** command can be overridden by escaping it

88970 with a <backslash> character.

88971 *Current line*: Unchanged.

88972 *Current column*: Unchanged.

## 88973 **Write and Exit**

88974 *Synopsis:*     [2addr] x[it][!][file]

88975 If the edit buffer has not been modified since the last complete **write**, **xit** shall be equivalent to

88976 the **quit** command, or if a '**!**' is appended to the command name, to **quit!**.

88977 Otherwise, **xit** shall be equivalent to the **wq** command, or if a '**!**' is appended to the command

88978 name, to **wq!**.

88979 *Current line*: Unchanged.

88980 *Current column*: Unchanged.

**Yank**

*Synopsis:*     `[2addr] ya[nk][buffer][count]`

Copy the specified lines to the specified buffer (by default, the unnamed buffer), which shall become a line-mode buffer.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Adjust Window**

*Synopsis:*     `[1addr] z[!][type ...][count][flags]`

If no line is specified, the current line shall be the default; if *type* is omitted as well, the current line value shall first be incremented by 1. If incrementing the current line would cause it to be greater than the last line in the edit buffer, it shall be an error.

If there are <blank> characters between the *type* argument and the preceding *z* command name or optional '!' character, it shall be an error.

If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in **window**, on page 2731). If *count* is omitted, it shall default to 2 times the value of the **scroll** edit option, or if ! was specified, the number of lines in the display minus 1.

If *type* is omitted, then *count* lines starting with the specified line shall be written. Otherwise, *count* lines starting with the line specified by the *type* argument shall be written.

The *type* argument shall change the lines to be written. The possible values of *type* are as follows:

- The specified line shall be decremented by the following value:

$((\text{number of ``-'' characters}) \times \text{count}) - 1$

If the calculation would result in a number less than 1, it shall be an error. Write lines from the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit buffer has been written.

- + The specified line shall be incremented by the following value:

$((\text{number of ``+'' characters}) - 1) \times \text{count} + 1$

If the calculation would result in a number greater than the last line in the edit buffer, it shall be an error. Write lines from the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit buffer has been written.

**=,.** If more than a single ' .' or '=' is specified, it shall be an error. The following steps shall be taken:

1. If *count* is zero, nothing shall be written.
2. Write as many of the *N* lines before the current line in the edit buffer as exist. If *count* or '!' was specified, *N* shall be:

$(\text{count} - 1) / 2$

Otherwise, *N* shall be:

$(\text{count} - 3) / 2$

If *N* is a number less than 3, no lines shall be written.

- 89019 3. If '=' was specified as the type character, write a line consisting of the smaller of the  
89020 number of columns in the display divided by two, or 40 '-' characters.
- 89021 4. Write the current line.
- 89022 5. Repeat step 3.
- 89023 6. Write as many of the *N* lines after the current line in the edit buffer as exist. *N* shall  
89024 be defined as in step 2. If *N* is a number less than 3, no lines shall be written. If *count*  
89025 is less than 3, no lines shall be written.

89026 ^ The specified line shall be decremented by the following value:

89027  $((\text{number of ``^`` characters}) + 1) \times \text{count} - 1$

89028 If the calculation would result in a number less than 1, it shall be an error. Write lines from  
89029 the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit  
89030 buffer has been written.

89031 *Current line*: Set to the last line written, unless the type is =, in which case, set to the specified  
89032 line.

89033 *Current column*: Set to non-<blank>.

## 89034 Escape

89035 *Synopsis:*       ! *command*  
89036               [*addr*]! *command*

89037 The contents of the line after the '!' shall have '%', '#', and '!' characters expanded as  
89038 described in [Command Line Parsing in ex](#) (on page 2694). If the expansion causes the text of the  
89039 line to change, it shall be redisplayed, preceded by a single '!' character.

89040 The *ex* utility shall execute the program named by the **shell** edit option. It shall pass two  
89041 arguments to the program; the first shall be -c, and the second shall be the expanded arguments  
89042 to the ! command as a single argument.

89043 If no lines are specified, the standard input, standard output, and standard error of the program  
89044 shall be set to the standard input, standard output, and standard error of the *ex* program when it  
89045 was invoked. In addition, a warning message shall be written if the edit buffer has been  
89046 modified since the last complete write, and the **warn** edit option is set.

89047 If lines are specified, they shall be passed to the program as standard input, and the standard  
89048 output and standard error of the program shall replace those lines in the edit buffer. Each line in  
89049 the program output (as delimited by <newline> characters or the end of the output if it is not  
89050 immediately preceded by a <newline>), shall be a separate line in the edit buffer. Any  
89051 occurrences of <carriage-return> and <newline> pairs in the output shall be treated as single  
89052 <newline> characters. The specified lines shall be copied into the unnamed buffer before they  
89053 are replaced, and the unnamed buffer shall become a line-mode buffer.

89054 If in *ex* mode, a single '!' character shall be written when the program completes.

89055 This command shall be affected by the **shell** and **warn** edit options. If no lines are specified, this  
89056 command shall be affected by the **autowrite** and **writany** edit options. If lines are specified, this  
89057 command shall be affected by the **autoprint** edit option.

Current line:

1. If no lines are specified, unchanged.
2. Otherwise, set to the last line read in, if any lines are read in.
3. Otherwise, set to the line before the first line of the lines specified, if that line exists.
4. Otherwise, set to the first line of the edit buffer if the edit buffer is not empty.
5. Otherwise, set to zero.

Current column: If no lines are specified, unchanged. Otherwise, set to non-<blank>.

### Shift Left

Synopsis: `[2addr] <[< ...][count][flags]`

Shift the specified lines to the start of the line; the number of column positions to be shifted shall be the number of command characters times the value of the **shiftwidth** edit option. Only leading <blank> characters shall be deleted or changed into other <blank> characters in shifting; other characters shall not be affected.

Lines to be shifted shall be copied into the unnamed buffer, which shall become a line-mode buffer.

This command shall be affected by the **autoprint** edit option.

Current line: Set to the last line in the lines specified.

Current column: Set to non-<blank>.

### Shift Right

Synopsis: `[2addr] >[> ...][count][flags]`

Shift the specified lines away from the start of the line; the number of column positions to be shifted shall be the number of command characters times the value of the **shiftwidth** edit option. The shift shall be accomplished by adding <blank> characters as a prefix to the line or changing leading <blank> characters into other <blank> characters. Empty lines shall not be changed.

Lines to be shifted shall be copied into the unnamed buffer, which shall become a line-mode buffer.

This command shall be affected by the **autoprint** edit option.

Current line: Set to the last line in the lines specified.

Current column: Set to non-<blank>.

### <control>-D

Synopsis: `<control>-D`

Write the next *n* lines, where *n* is the minimum of the values of the **scroll** edit option and the number of lines after the current line in the edit buffer. If the current line is the last line of the edit buffer it shall be an error.

Current line: Set to the last line written.

Current column: Set to non-<blank>.

**Write Line Number**

*Synopsis:*     `[laddr] = [flags]`

If *line* is not specified, it shall default to the last line in the edit buffer. Write the line number of the specified line.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Execute**

*Synopsis:*     `[2addr] @ buffer`

`[2addr] * buffer`

If no buffer is specified or is specified as '@' or '\*', the last buffer executed shall be used. If no previous buffer has been executed, it shall be an error.

For each line specified by the addresses, set the current line ('.') to the specified line, and execute the contents of the named *buffer* (as they were at the time the @ command was executed) as *ex* commands. For each line of a line-mode buffer, and all but the last line of a character-mode buffer, the *ex* command parser shall behave as if the line was terminated by a <newline>.

If an error occurs during this process, or a line specified by the addresses does not exist when the current line would be set to it, or more than a single line was specified by the addresses, and the contents of the edit buffer are replaced (for example, by the *ex* :edit command) an error message shall be written, and no more commands resulting from the execution of this command shall be processed.

*Current line:* As specified for the individual *ex* commands.

*Current column:* As specified for the individual *ex* commands.

**Regular Expressions in ex**

The *ex* utility shall support regular expressions that are a superset of the basic regular expressions described in XBD [Section 9.3](#) (on page 183). A null regular expression (" / ") shall be equivalent to the last regular expression encountered.

Regular expressions can be used in addresses to specify lines and, in some commands (for example, the **substitute** command), to specify portions of a line to be substituted.

The following constructs can be used to enhance the basic regular expressions:

\< Match the beginning of a *word*. (See the definition of *word* at the beginning of [Command Descriptions in ex](#) (on page 2699).)

\> Match the end of a *word*.

~ Match the replacement part of the last **substitute** command. The <tilde> ('~') character can be escaped in a regular expression to become a normal character with no special meaning. The <backslash> shall be discarded.

When the editor option **magic** is not set, the only characters with special meanings shall be '^' at the beginning of a pattern, '\$' at the end of a pattern, and <backslash>. The characters '.', '\*', '[', and '~' shall be treated as ordinary characters unless preceded by a <backslash>; when preceded by a <backslash> they shall regain their special meaning, or in the case of <backslash>, be handled as a single <backslash>. <backslash> characters used to escape other characters shall be discarded.

## Replacement Strings in ex

The character '&' ('&' if the editor option **magic** is not set) in the replacement string shall stand for the text matched by the pattern to be replaced. The character '~' ('\~' if **magic** is not set) shall be replaced by the replacement part of the previous **substitute** command. The sequence '\n', where *n* is an integer, shall be replaced by the text matched by the corresponding back-reference expression. If the corresponding back-reference expression does not match, then the characters '\n' shall be replaced by the empty string.

The strings '\l', '\u', '\L', and '\U' can be used to modify the case of elements in the replacement string (using the '&' or "\"digit) notation. The string '\l' ('\u') shall cause the character that follows to be converted to lowercase (uppercase). The string '\L' ('\U') shall cause all characters subsequent to it to be converted to lowercase (uppercase) as they are inserted by the substitution until the string '\e' or '\E', or the end of the replacement string, is encountered.

Otherwise, any character following a <backslash> shall be treated as that literal character, and the escaping <backslash> shall be discarded.

An example of case conversion with the **s** command is as follows:

```
:p
The cat sat on the mat.
:s/\<.at\>/\u&/gp
The Cat Sat on the Mat.
:s/S\(.*\)M/S\U\1\eM/p
The Cat SAT ON THE Mat.
```

## Edit Options in ex

The *ex* utility has a number of options that modify its behavior. These options have default settings, which can be changed using the **set** command.

Options are Boolean unless otherwise specified.

### autoindent, ai

[Default *unset*]

If **autoindent** is set, each line in input mode shall be indented (using first as many <tab> characters as possible, as determined by the editor option **tabstop**, and then using <space> characters) to align with another line, as follows:

1. If in open or visual mode and the text input is part of a line-oriented command (see the EXTENDED DESCRIPTION in *vi*), align to the first column.
2. Otherwise, if in open or visual mode, indentation for each line shall be set as follows:
  - a. If a line was previously inserted as part of this command, it shall be set to the indentation of the last inserted line by default, or as otherwise specified for the <control>-D character in *Input Mode Commands* in *vi* (on page 3399).
  - b. Otherwise, it shall be set to the indentation of the previous current line, if any; otherwise, to the first column.
3. For the *ex* **a**, **i**, and **c** commands, indentation for each line shall be set as follows:

- 89176 a. If a line was previously inserted as part of this command, it shall be set to the
- 89177 indentation of the last inserted line by default, or as otherwise specified for the *eof*
- 89178 character in **Scroll** (on page 2698).
- 89179 b. Otherwise, if the command is the *ex a* command, it shall be set to the line
- 89180 appended after, if any; otherwise to the first column.
- 89181 c. Otherwise, if the command is the *ex i* command, it shall be set to the line inserted
- 89182 before, if any; otherwise to the first column.
- 89183 d. Otherwise, if the command is the *ex c* command, it shall be set to the indentation of
- 89184 the line replaced.

#### 89185 **autoprint, ap**

89186 [Default *set*]

89187 If **autoprint** is set, the current line shall be written after each *ex* command that modifies the  
 89188 contents of the current edit buffer, and after each **tag** command for which the tag search pattern  
 89189 was found or tag line number was valid, unless:

- 89190 1. The command was executed while in open or visual mode.
- 89191 2. The command was executed as part of a **global** or **v** command or **@** buffer execution.
- 89192 3. The command was the form of the **read** command that reads a file into the edit buffer.
- 89193 4. The command was the **append**, **change**, or **insert** command.
- 89194 5. The command was not terminated by a <newline>.
- 89195 6. The current line shall be written by a flag specified to the command; for example, **delete #**  
 89196 shall write the current line as specified for the flag modifier to the **delete** command, and  
 89197 not as specified by the **autoprint** edit option.

#### 89198 **autowrite, aw**

89199 [Default *unset*]

89200 If **autowrite** is set, and the edit buffer has been modified since it was last completely written to  
 89201 any file, the contents of the edit buffer shall be written as if the *ex write* command had been  
 89202 specified without arguments, before each command affected by the **autowrite** edit option is  
 89203 executed. Appending the character '!' to the command name of any of the *ex* commands  
 89204 except '!' shall prevent the write. If the write fails, it shall be an error and the command shall  
 89205 not be executed.

#### 89206 **beautify, bf**

89207 XSI [Default *unset*]

89208 If **beautify** is set, all non-printable characters, other than <tab>, <newline>, and <form-feed>  
 89209 characters, shall be discarded from text read in from files.

**89210 directory, dir**

89211 [Default *implementation-defined*]

89212 The value of this option specifies the directory in which the editor buffer is to be placed. If this  
89213 directory is not writable by the user, the editor shall quit.

**89214 edcompatible, ed**

89215 [Default *unset*]

89216 Causes the presence of **g** and **c** suffixes on substitute commands to be remembered, and toggled  
89217 by repeating the suffixes.

**89218 errorbells, eb**

89219 [Default *unset*]

89220 If the editor is in *ex* mode, and the terminal does not support a standout mode (such as inverse  
89221 video), and **errorbells** is set, error messages shall be preceded by alerting the terminal.

**89222 exrc**

89223 [Default *unset*]

89224 If **exrc** is set, *ex* shall access any **.exrc** file in the current directory, as described in [Initialization in](#)  
89225 [ex and vi](#) (on page 2690). If **exrc** is not set, *ex* shall ignore any **.exrc** file in the current directory  
89226 during initialization, unless the current directory is that named by the *HOME* environment  
89227 variable.

**89228 ignorecase, ic**

89229 [Default *unset*]

89230 If **ignorecase** is set, characters that have uppercase and lowercase representations shall have  
89231 those representations considered as equivalent for purposes of regular expression comparison.

89232 The **ignorecase** edit option shall affect all remembered regular expressions; for example,  
89233 unsetting the **ignorecase** edit option shall cause a subsequent *vi n* command to search for the  
89234 last basic regular expression in a case-sensitive fashion.

**89235 list**

89236 [Default *unset*]

89237 If **list** is set, edit buffer lines written while in *ex* command mode shall be written as specified for  
89238 the **print** command with the **l** flag specified. In open or visual mode, each edit buffer line shall  
89239 be displayed as specified for the *ex print* command with the **l** flag specified. In open or visual  
89240 text input mode, when the cursor does not rest on any character in the line, it shall rest on the  
89241 ' \$ ' marking the end of the line.

**magic**

[Default *set*]

If **magic** is set, modify the interpretation of characters in regular expressions and substitution replacement strings (see [Regular Expressions in ex](#) (on page 2723) and [Replacement Strings in ex](#), on page 2724).

**mesg**

[Default *set*]

If **mesg** is set, the permission for others to use the **write** or **talk** commands to write to the terminal shall be turned on while in open or visual mode. The shell-level command **mesg n** shall take precedence over any setting of the *ex* **mesg** option; that is, if **mesg y** was issued before the editor started (or in a shell escape), such as:

```
:!mesg y
```

the **mesg** option in *ex* shall suppress incoming messages, but the **mesg** option shall not enable incoming messages if **mesg n** was issued.

**number, nu**

[Default *unset*]

If **number** is set, edit buffer lines written while in *ex* command mode shall be written with line numbers, in the format specified by the **print** command with the **#** flag specified. In *ex* text input mode, each line shall be preceded by the line number it will have in the file.

In open or visual mode, each edit buffer line shall be displayed with a preceding line number, in the format specified by the *ex* **print** command with the **#** flag specified. This line number shall not be considered part of the line for the purposes of evaluating the current column; that is, column position 1 shall be the first column position after the format specified by the **print** command.

**paragraphs, para**

[Default in the POSIX locale `IPLPPPQPP LIpplpipbp`]

The **paragraphs** edit option shall define additional paragraph boundaries for the open and visual mode commands. The **paragraphs** edit option can be set to a character string consisting of zero or more character pairs. It shall be an error to set it to an odd number of characters.

**prompt**

[Default *set*]

If **prompt** is set, *ex* command mode input shall be prompted for with a <colon> (':'); when unset, no prompt shall be written.

**readonly**[Default *see text*]

If the **readonly** edit option is set, read-only mode shall be enabled (see **Write**, on page 2718). The **readonly** edit option shall be initialized to set if either of the following conditions are true:

- The command-line option **-R** was specified.
- Performing actions equivalent to the *access()* function called with the following arguments indicates that the file lacks write permission:
  1. The current pathname is used as the *path* argument.
  2. The constant **W\_OK** is used as the *amode* argument.

The **readonly** edit option may be initialized to set for other, implementation-defined reasons. The **readonly** edit option shall not be initialized to unset based on any special privileges of the user or process. The **readonly** edit option shall be reinitialized each time that the contents of the edit buffer are replaced (for example, by an **edit** or **next** command) unless the user has explicitly set it, in which case it shall remain set until the user explicitly unsets it. Once unset, it shall again be reinitialized each time that the contents of the edit buffer are replaced.

**redraw**[Default *unset*]

The editor simulates an intelligent terminal on a dumb terminal. (Since this is likely to require a large amount of output to the terminal, it is useful only at high transmission speeds.)

**remap**[Default *set*]

If **remap** is set, map translation shall allow for maps defined in terms of other maps; translation shall continue until a final product is obtained. If unset, only a one-step translation shall be done.

**report**

[Default 5]

The value of this **report** edit option specifies what number of lines being added, copied, deleted, or modified in the edit buffer will cause an informational message to be written to the user. The following conditions shall cause an informational message. The message shall contain the number of lines added, copied, deleted, or modified, but is otherwise unspecified.

- An *ex* or *vi* editor command, other than **open**, **undo**, or **visual**, that modifies at least the value of the **report** edit option number of lines, and which is not part of an *ex* **global** or **v** command, or *ex* or *vi* buffer execution, shall cause an informational message to be written.
- An *ex* **yank** or *vi* **y** or **Y** command, that copies at least the value of the **report** edit option plus 1 number of lines, and which is not part of an *ex* **global** or **v** command, or *ex* or *vi* buffer execution, shall cause an informational message to be written.
- An *ex* **global**, **v**, **open**, **undo**, or **visual** command or *ex* or *vi* buffer execution, that adds or deletes a total of at least the value of the **report** edit option number of lines, and which is not part of an *ex* **global** or **v** command, or *ex* or *vi* buffer execution, shall cause an informational message to be written. (For example, if 3 lines were added and 8 lines deleted during an *ex* **visual** command, 5 would be the number compared against the

89316 **report** edit option after the command completed.)

89317 **scroll, scr**

89318 [Default (number of lines in the display -1)/2]

89319 The value of the **scroll** edit option shall determine the number of lines scrolled by the *ex*  
89320 <control>-D and **z** commands. For the *vi* <control>-D and <control>-U commands, it shall be the  
89321 initial number of lines to scroll when no previous <control>-D or <control>-U command has  
89322 been executed.

89323 **sections**

89324 [Default in the POSIX locale `NHSHH HUnhsh`]

89325 The **sections** edit option shall define additional section boundaries for the open and visual mode  
89326 commands. The **sections** edit option can be set to a character string consisting of zero or more  
89327 character pairs; it shall be an error to set it to an odd number of characters.

89328 **shell, sh**

89329 [Default from the environment variable `SHELL`]

89330 The value of this option shall be a string. The default shall be taken from the `SHELL`  
89331 environment variable. If the `SHELL` environment variable is null or empty, the *sh* (see *sh*) utility  
89332 shall be the default.

89333 **shiftwidth, sw**

89334 [Default 8]

89335 The value of this option shall give the width in columns of an indentation level used during  
89336 autoindentation and by the shift commands (< and >).

89337 **showmatch, sm**

89338 [Default *unset*]

89339 The functionality described for the **showmatch** edit option need not be supported on block-  
89340 mode terminals or terminals with insufficient capabilities.

89341 If **showmatch** is set, in open or visual mode, when a ' ) ' or ' } ' is typed, if the matching ' ( ' or  
89342 ' { ' is currently visible on the display, the matching ' ( ' or ' { ' shall be flagged moving the  
89343 cursor to its location for an unspecified amount of time.

89344 **showmode**

89345 [Default *unset*]

89346 If **showmode** is set, in open or visual mode, the current mode that the editor is in shall be  
89347 displayed on the last line of the display. Command mode and text input mode shall be  
89348 differentiated; other unspecified modes and implementation-defined information may be  
89349 displayed.

**slowopen**

[Default *unset*]

If **slowopen** is set during open and visual text input modes, the editor shall not update portions of the display other than those display line columns that display the characters entered by the user (see [Input Mode Commands in vi](#), on page 3399).

**tabstop, ts**

[Default 8]

The value of this edit option shall specify the column boundary used by a <tab> in the display (see [autoprint, ap](#) (on page 2725) and [Input Mode Commands in vi](#), on page 3399).

**taglength, tl**

[Default zero]

The value of this edit option shall specify the maximum number of characters that are considered significant in the user-specified tag name and in the tag name from the tags file. If the value is zero, all characters in both tag names shall be significant.

**tags**

[Default *see text*]

The value of this edit option shall be a string of <blank>-delimited pathnames of files used by the **tag** command. The default value is unspecified.

**term**

[Default from the environment variable *TERM*]

The value of this edit option shall be a string. The default shall be taken from the *TERM* variable in the environment. If the *TERM* environment variable is empty or null, the default is unspecified. The editor shall use the value of this edit option to determine the type of the display device.

The results are unspecified if the user changes the value of the term edit option after editor initialization.

**terse**

[Default *unset*]

If **terse** is set, error messages may be less verbose. However, except for this caveat, error messages are unspecified. Furthermore, not all error messages need change for different settings of this option.

**warn**

[Default *set*]

If **warn** is set, and the contents of the edit buffer have been modified since they were last completely written, the editor shall write a warning message before certain ! commands (see [Escape](#), on page 2721).

**window**

[Default *see text*]

A value used in open and visual mode, by the <control>-B and <control>-F commands, and, in visual mode, to specify the number of lines displayed when the screen is repainted.

If the **-w** command-line option is not specified, the default value shall be set to the value of the *LINES* environment variable. If the *LINES* environment variable is empty or null, the default shall be the number of lines in the display minus 1.

Setting the **window** edit option to zero or to a value greater than the number of lines in the display minus 1 (either explicitly or based on the **-w** option or the *LINES* environment variable) shall cause the **window** edit option to be set to the number of lines in the display minus 1.

The baud rate of the terminal line may change the default in an implementation-defined manner.

**wrapmargin, wm**

[Default 0]

If the value of this edit option is zero, it shall have no effect.

If not in the POSIX locale, the effect of this edit option is implementation-defined.

Otherwise, it shall specify a number of columns from the ending margin of the terminal.

During open and visual text input modes, for each character for which any part of the character is displayed in a column that is less than **wrapmargin** columns from the ending margin of the display line, the editor shall behave as follows:

1. If the character triggering this event is a <blank>, it, and all immediately preceding <blank> characters on the current line entered during the execution of the current text input command, shall be discarded, and the editor shall behave as if the user had entered a single <newline> instead. In addition, if the next user-entered character is a <space>, it shall be discarded as well.
2. Otherwise, if there are one or more <blank> characters on the current line immediately preceding the last group of inserted non-<blank> characters which was entered during the execution of the current text input command, the <blank> characters shall be replaced as if the user had entered a single <newline> instead.

If the **autoindent** edit option is set, and the events described in 1. or 2. are performed, any <blank> characters at or after the cursor in the current line shall be discarded.

The ending margin shall be determined by the system or overridden by the user, as described for *COLUMNS* in the ENVIRONMENT VARIABLES section and XBD [Chapter 8](#) (on page 173).

89418 **wrapsan, ws**

89419 [Default *set*]

89420 If **wrapsan** is set, searches (the *ex* / or ? addresses, or open and visual mode /, ?, N, and n  
89421 commands) shall wrap around the beginning or end of the edit buffer; when unset, searches  
89422 shall stop at the beginning or end of the edit buffer.

89423 **writeany, wa**

89424 [Default *unset*]

89425 If **writeany** is set, some of the checks performed when executing the *ex* **write** commands shall be  
89426 inhibited, as described in editor option **autowrite**.

## 89427 EXIT STATUS

89428 The following exit values shall be returned:

89429 0 Successful completion.

89430 >0 An error occurred.

## 89431 CONSEQUENCES OF ERRORS

89432 When any error is encountered and the standard input is not a terminal device file, *ex* shall not  
89433 write the file or return to command or text input mode, and shall terminate with a non-zero exit  
89434 status.

89435 Otherwise, when an unrecoverable error is encountered, it shall be equivalent to a SIGHUP  
89436 asynchronous event.

89437 Otherwise, when an error is encountered, the editor shall behave as specified in [Command Line](#)  
89438 [Parsing in ex](#) (on page 2694).

## 89439 APPLICATION USAGE

89440 If a SIGSEGV signal is received while *ex* is saving a file, the file might not be successfully saved.

89441 The **next** command can accept more than one file, so usage such as:

89442 `next `ls [abc]*``

89443 is valid; it would not be valid for the **edit** or **read** commands, for example, because they expect  
89444 only one file and unspecified results occur.

## 89445 EXAMPLES

89446 None.

## 89447 RATIONALE

89448 The *ex/vi* specification is based on the historical practice found in the 4 BSD and System V  
89449 implementations of *ex* and *vi*.

89450 A *restricted editor* (both the historical *red* utility and modifications to *ex*) were considered and  
89451 rejected for inclusion. Neither option provided the level of security that users might expect.

89452 It is recognized that *ex* visual mode and related features would be difficult, if not impossible, to  
89453 implement satisfactorily on a block-mode terminal, or a terminal without any form of cursor  
89454 addressing; thus, it is not a mandatory requirement that such features should work on all  
89455 terminals. It is the intention, however, that an *ex* implementation should provide the full set of  
89456 capabilities on all terminals capable of supporting them.

## Options

The `-c` replacement for `+command` was inspired by the `-e` option of `sed`. Historically, all such commands (see `edit` and `next` as well) were executed from the last line of the edit buffer. This meant, for example, that `+/pattern` would fail unless the `wrapsan` option was set. POSIX.1-2008 requires conformance to historical practice. The `+command` option is no longer specified by POSIX.1-2008 but may be present in some implementations. Historically, some implementations restricted the `ex` commands that could be listed as part of the command line arguments. For consistency, POSIX.1-2008 does not permit these restrictions.

In historical implementations of the editor, the `-R` option (and the `readonly` edit option) only prevented overwriting of files; appending to files was still permitted, mapping loosely into the `cs`h `noclobber` variable. Some implementations, however, have not followed this semantic, and `readonly` does not permit appending either. POSIX.1-2008 follows the latter practice, believing that it is a more obvious and intuitive meaning of `readonly`.

The `-s` option suppresses all interactive user feedback and is useful for editing scripts in batch jobs. The list of specific effects is historical practice. The terminal type “incapable of supporting open and visual modes” has historically been named “dumb”.

The `-t` option was required because the `ctags` utility appears in POSIX.1-2008 and the option is available in all historical implementations of `ex`.

Historically, the `ex` and `vi` utilities accepted a `-x` option, which did encryption based on the algorithm found in the historical `crypt` utility. The `-x` option for encryption, and the associated `crypt` utility, were omitted because the algorithm used was not specifiable and the export control laws of some nations make it difficult to export cryptographic technology. In addition, it did not historically provide the level of security that users might expect.

## Standard Input

An end-of-file condition is not equivalent to an end-of-file character. A common end-of-file character, `<control>-D`, is historically an `ex` command.

There was no maximum line length in historical implementations of `ex`. Specifically, as it was parsed in chunks, the addresses had a different maximum length than the filenames. Further, the maximum line buffer size was declared as `BUFSIZ`, which was different lengths on different systems. This version selected the value of `{LINE_MAX}` to impose a reasonable restriction on portable usage of `ex` and to aid test suite writers in their development of realistic tests that exercise this limit.

## Input Files

It was an explicit decision by the standard developers that a `<newline>` be added to any file lacking one. It was believed that this feature of `ex` and `vi` was relied on by users in order to make text files lacking a trailing `<newline>` more portable. It is recognized that this will require a user-specified option or extension for implementations that permit `ex` and `vi` to edit files of type other than text if such files are not otherwise identified by the system. It was agreed that the ability to edit files of arbitrary type can be useful, but it was not considered necessary to mandate that an `ex` or `vi` implementation be required to handle files other than text files.

The paragraph in the INPUT FILES section, “By default, ...”, is intended to close a long-standing security problem in `ex` and `vi`; that of the “modeline” or “modelines” edit option. This feature allows any line in the first or last five lines of the file containing the strings `"ex:"` or `"vi:"` (and, apparently, `"ei:"` or `"vx:"`) to be a line containing editor commands, and `ex` interprets all the text up to the next `':'` or `<newline>` as a command. Consider the

consequences, for example, of an unsuspecting user using *ex* or *vi* as the editor when replying to a mail message in which a line such as:

```
ex: ! rm -rf :
```

appeared in the signature lines. The standard developers believed strongly that an editor should not by default interpret any lines of a file. Vendors are strongly urged to delete this feature from their implementations of *ex* and *vi*.

## Asynchronous Events

The intention of the phrase “complete write” is that the entire edit buffer be written to stable storage. The note regarding temporary files is intended for implementations that use temporary files to back edit buffers unnamed by the user.

Historically, SIGQUIT was ignored by *ex*, but was the equivalent of the **Q** command in visual mode; that is, it exited visual mode and entered *ex* mode. POSIX.1-2008 permits, but does not require, this behavior. Historically, SIGINT was often used by *vi* users to terminate text input mode (<control>-C is often easier to enter than <ESC>). Some implementations of *vi* alerted the terminal on this event, and some did not. POSIX.1-2008 requires that SIGINT behave identically to <ESC>, and that the terminal not be alerted.

Historically, suspending the *ex* editor during text input mode was similar to SIGINT, as completed lines were retained, but any partial line discarded, and the editor returned to command mode. POSIX.1-2008 is silent on this issue; implementations are encouraged to follow historical practice, where possible.

Historically, the *vi* editor did not treat SIGTSTP as an asynchronous event, and it was therefore impossible to suspend the editor in visual text input mode. There are two major reasons for this. The first is that SIGTSTP is a broadcast signal on UNIX systems, and the chain of events where the shell *execs* an application that then *execs vi* usually caused confusion for the terminal state if SIGTSTP was delivered to the process group in the default manner. The second was that most implementations of the UNIX *curses* package did not handle SIGTSTP safely, and the receipt of SIGTSTP at the wrong time would cause them to crash. POSIX.1-2008 is silent on this issue; implementations are encouraged to treat suspension as an asynchronous event if possible.

Historically, modifications to the edit buffer made before SIGINT interrupted an operation were retained; that is, anywhere from zero to all of the lines to be modified might have been modified by the time the SIGINT arrived. These changes were not discarded by the arrival of SIGINT. POSIX.1-2008 permits this behavior, noting that the **undo** command is required to be able to undo these partially completed commands.

The action taken for signals other than SIGINT, SIGCONT, SIGHUP, and SIGTERM is unspecified because some implementations attempt to save the edit buffer in a useful state when other signals are received.

## Standard Error

For *ex/vi*, diagnostic messages are those messages reported as a result of a failed attempt to invoke *ex* or *vi*, such as invalid options or insufficient resources, or an abnormal termination condition. Diagnostic messages should not be confused with the error messages generated by inappropriate or illegal user commands.

## Initialization in *ex* and *vi*

If an *ex* command (other than **cd**, **chdir**, or **source**) has a filename argument, one or both of the alternate and current pathnames will be set. Informally, they are set as follows:

1. If the *ex* command is one that replaces the contents of the edit buffer, and it succeeds, the current pathname will be set to the filename argument (the first filename argument in the case of the **next** command) and the alternate pathname will be set to the previous current pathname, if there was one.
2. In the case of the file read/write forms of the **read** and **write** commands, if there is no current pathname, the current pathname will be set to the filename argument.
3. Otherwise, the alternate pathname will be set to the filename argument.

For example, **:edit foo** and **:recover foo**, when successful, set the current pathname, and, if there was a previous current pathname, the alternate pathname. The commands **:write**, **!command**, and **:edit** set neither the current or alternate pathnames. If the **:edit foo** command were to fail for some reason, the alternate pathname would be set. The **read** and **write** commands set the alternate pathname to their *file* argument, unless the current pathname is not set, in which case they set the current pathname to their *file* arguments. The alternate pathname was not historically set by the **:source** command. POSIX.1-2008 requires conformance to historical practice. Implementations adding commands that take filenames as arguments are encouraged to set the alternate pathname as described here.

Historically, *ex* and *vi* read the **.exrc** file in the *\$HOME* directory twice, if the editor was executed in the *\$HOME* directory. POSIX.1-2008 prohibits this behavior.

Historically, the 4 BSD *ex* and *vi* read the *\$HOME* and local **.exrc** files if they were owned by the real ID of the user, or the **sourceany** option was set, regardless of other considerations. This was a security problem because it is possible to put normal UNIX system commands inside a **.exrc** file. POSIX.1-2008 does not specify the **sourceany** option, and historical implementations are encouraged to delete it.

The **.exrc** files must be owned by the real ID of the user, and not writable by anyone other than the owner. The appropriate privileges exception is intended to permit users to acquire special privileges, but continue to use the **.exrc** files in their home directories.

System V Release 3.2 and later *vi* implementations added the option **[no]exrc**. The behavior is that local **.exrc** files are read-only if the **exrc** option is set. The default for the **exrc** option was off, so by default, local **.exrc** files were not read. The problem this was intended to solve was that System V permitted users to give away files, so there is no possible ownership or writeability test to ensure that the file is safe. This is still a security problem on systems where users can give away files, but there is nothing additional that POSIX.1-2008 can do. The implementation-defined exception is intended to permit groups to have local **.exrc** files that are shared by users, by creating pseudo-users to own the shared files.

POSIX.1-2008 does not mention system-wide *ex* and *vi* start-up files. While they exist in several implementations of *ex* and *vi*, they are not present in any implementations considered historical practice by POSIX.1-2008. Implementations that have such files should use them only if they are owned by the real user ID or an appropriate user (for example, root on UNIX systems) and if they are not writable by any user other than their owner. System-wide start-up files should be read before the *EXINIT* variable, *\$HOME/.exrc*, or local **.exrc** files are evaluated.

Historically, any *ex* command could be entered in the *EXINIT* variable or the **.exrc** file, although ones requiring that the edit buffer already contain lines of text generally caused historical implementations of the editor to drop **core**. POSIX.1-2008 requires that any *ex* command be

permitted in the *EXINIT* variable and *.exrc* files, for simplicity of specification and consistency, although many of them will obviously fail under many circumstances.

The initialization of the contents of the edit buffer uses the phrase “the effect shall be” with regard to various *ex* commands. The intent of this phrase is that edit buffer contents loaded during the initialization phase not be lost; that is, loading the edit buffer should fail if the *.exrc* file read in the contents of a file and did not subsequently write the edit buffer. An additional intent of this phrase is to specify that the initial current line and column is set as specified for the individual *ex* commands.

Historically, the *-t* option behaved as if the tag search were a *+command*; that is, it was executed from the last line of the file specified by the tag. This resulted in the search failing if the pattern was a forward search pattern and the *wraps* edit option was not set. POSIX.1-2008 does not permit this behavior, requiring that the search for the tag pattern be performed on the entire file, and, if not found, that the current line be set to a more reasonable location in the file.

Historically, the empty edit buffer presented for editing when a file was not specified by the user was unnamed. This is permitted by POSIX.1-2008; however, implementations are encouraged to provide users a temporary filename for this buffer because it permits them the use of *ex* commands that use the current pathname during temporary edit sessions.

Historically, the file specified using the *-t* option was not part of the current argument list. This practice is permitted by POSIX.1-2008; however, implementations are encouraged to include its name in the current argument list for consistency.

Historically, the *-c* command was generally not executed until a file that already exists was edited. POSIX.1-2008 requires conformance to this historical practice. Commands that could cause the *-c* command to be executed include the *ex* commands **edit**, **next**, **recover**, **rewind**, and **tag**, and the *vi* commands *<control>-^* and *<control>-]*. Historically, reading a file into an edit buffer did not cause the *-c* command to be executed (even though it might set the current pathname) with the exception that it did cause the *-c* command to be executed if: the editor was in *ex* mode, the edit buffer had no current pathname, the edit buffer was empty, and no read commands had yet been attempted. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

Historically, the *-r* option was the same as a normal edit session if there was no recovery information available for the file. This allowed users to enter:

```
vi -r *.c
```

and recover whatever files were recoverable. In some implementations, recovery was attempted only on the first file named, and the file was not entered into the argument list; in others, recovery was attempted for each file named. In addition, some historical implementations ignored *-r* if *-t* was specified or did not support command line *file* arguments with the *-t* option. For consistency and simplicity of specification, POSIX.1-2008 disallows these special cases, and requires that recovery be attempted the first time each file is edited.

Historically, *vi* initialized the ‘ and ’ marks, but *ex* did not. This meant that if the first command in *ex* mode was **visual** or if an *ex* command was executed first (for example, *vi +10 file*), *vi* was entered without the marks being initialized. Because the standard developers believed the marks to be generally useful, and for consistency and simplicity of specification, POSIX.1-2008 requires that they always be initialized if in open or visual mode, or if in *ex* mode and the edit buffer is not empty. Not initializing it in *ex* mode if the edit buffer is empty is historical practice; however, it has always been possible to set (and use) marks in empty edit buffers in open and visual mode edit sessions.

## Addressing

Historically, *ex* and *vi* accepted the additional addressing forms '`\/'` and '`\?'`'. They were equivalent to '`/'`' and '`??'`', respectively. They are not required by POSIX.1-2008, mostly because nobody can remember whether they ever did anything different historically.

Historically, *ex* and *vi* permitted an address of zero for several commands, and permitted the % address in empty files for others. For consistency, POSIX.1-2008 requires support for the former in the few commands where it makes sense, and disallows it otherwise. In addition, because POSIX.1-2008 requires that % be logically equivalent to '`1,$`', it is also supported where it makes sense and disallowed otherwise.

Historically, the % address could not be followed by further addresses. For consistency and simplicity of specification, POSIX.1-2008 requires that additional addresses be supported.

All of the following are valid *addresses*:

- `+++` Three lines after the current line.
- `/re/-` One line before the next occurrence of *re*.
- `-2` Two lines before the current line.
- `3 ---- 2` Line one (note intermediate negative address).
- `1 2 3` Line six.

Any number of addresses can be provided to commands taking addresses; for example, '`1,2,3,4,5p`' prints lines 4 and 5, because two is the greatest valid number of addresses accepted by the **print** command. This, in combination with the <semicolon> delimiter, permits users to create commands based on ordered patterns in the file. For example, the command **3;/foo/;+2print** will display the first line after line 3 that contains the pattern *foo*, plus the next two lines. Note that the address **3;** must be evaluated before being discarded because the search origin for the **/foo/** command depends on this.

Historically, values could be added to addresses by including them after one or more <blank> characters; for example, **3 - 5p** wrote the seventh line of the file, and **/foo/ 5** was the same as **/foo/+5**. However, only absolute values could be added; for example, **5 /foo/** was an error. POSIX.1-2008 requires conformance to historical practice. Address offsets are separately specified from addresses because they could historically be provided to visual mode search commands.

Historically, any missing addresses defaulted to the current line. This was true for leading and trailing <comma>-delimited addresses, and for trailing <semicolon>-delimited addresses. For consistency, POSIX.1-2008 requires it for leading <semicolon> addresses as well.

Historically, *ex* and *vi* accepted the '`^`' character as both an address and as a flag offset for commands. In both cases it was identical to the '`-`' character. POSIX.1-2008 does not require or prohibit this behavior.

Historically, the enhancements to basic regular expressions could be used in addressing; for example, '`~'`', '`\<`', and '`\>`'. POSIX.1-2008 requires conformance to historical practice; that is, that regular expression usage be consistent, and that regular expression enhancements be supported wherever regular expressions are used.

## Command Line Parsing in ex

Historical *ex* command parsing was even more complex than that described here. POSIX.1-2008 requires the subset of the command parsing that the standard developers believed was documented and that users could reasonably be expected to use in a portable fashion, and that was historically consistent between implementations. (The discarded functionality is obscure, at best.) Historical implementations will require changes in order to comply with POSIX.1-2008; however, users are not expected to notice any of these changes. Most of the complexity in *ex* parsing is to handle three special termination cases:

1. The **!**, **global**, **v**, and the filter versions of the **read** and **write** commands are delimited by `<newline>` characters (they can contain `<vertical-line>` characters that are usually shell pipes).
2. The **ex**, **edit**, **next**, and **visual** in open and visual mode commands all take *ex* commands, optionally containing `<vertical-line>` characters, as their first arguments.
3. The **s** command takes a regular expression as its first argument, and uses the delimiting characters to delimit the command.

Historically, `<vertical-line>` characters in the `+command` argument of the **ex**, **edit**, **next**, **vi**, and **visual** commands, and in the *pattern* and *replacement* parts of the **s** command, did not delimit the command, and in the filter cases for **read** and **write**, and the **!**, **global**, and **v** commands, they did not delimit the command at all. For example, the following commands are all valid:

```
:edit +25 | s/abc/ABC/ file.c
:s/ | /PIPE/
:read !spell % | columnate
:global/pattern/p | l
:s/a/b/ | s/c/d | set
```

Historically, empty or `<blank>` filled lines in **.exrc** files and **sourced** files (as well as *EXINIT* variables and *ex* command scripts) were treated as default commands; that is, **print** commands. POSIX.1-2008 specifically requires that they be ignored when encountered in **.exrc** and **sourced** files to eliminate a common source of new user error.

Historically, *ex* commands with multiple adjacent (or `<blank>`-separated) vertical lines were handled oddly when executed from *ex* mode. For example, the command `l l l <carriage-return>`, when the cursor was on line 1, displayed lines 2, 3, and 5 of the file. In addition, the command `l` would only display the line after the next line, instead of the next two lines. The former worked more logically when executed from *vi* mode, and displayed lines 2, 3, and 4. POSIX.1-2008 requires the *vi* behavior; that is, a single default command and line number increment for each command separator, and trailing `<newline>` characters after `<vertical-line>` separators are discarded.

Historically, *ex* permitted a single extra `<colon>` as a leading command character; for example, **:g/pattern/:p** was a valid command. POSIX.1-2008 generalizes this to require that any number of leading `<colon>` characters be stripped.

Historically, any prefix of the **delete** command could be followed without intervening `<blank>` characters by a flag character because in the command **d p**, *p* is interpreted as the buffer *p*. POSIX.1-2008 requires conformance to historical practice.

Historically, the **k** command could be followed by the mark name without intervening `<blank>` characters. POSIX.1-2008 requires conformance to historical practice.

Historically, the **s** command could be immediately followed by flag and option characters; for example, **s/e/E/l s|sgc3p** was a valid command. However, flag characters could not stand alone;

for example, the commands **sp** and **s l** would fail, while the command **sgp** and **s gl** would succeed. (Obviously, the '#' flag character was used as a delimiter character if it followed the command.) Another issue was that option characters had to precede flag characters even when the command was fully specified; for example, the command **s/e/E/pg** would fail, while the command **s/e/E/gp** would succeed. POSIX.1-2008 requires conformance to historical practice.

Historically, the first command name that had a prefix matching the input from the user was the executed command; for example, **ve**, **ver**, and **vers** all executed the **version** command. Commands were in a specific order, however, so that **a** matched **append**, not **abbreviate**. POSIX.1-2008 requires conformance to historical practice. The restriction on command search order for implementations with extensions is to avoid the addition of commands such that the historical prefixes would fail to work portably.

Historical implementations of *ex* and *vi* did not correctly handle multiple *ex* commands, separated by <vertical-line> characters, that entered or exited visual mode or the editor. Because implementations of *vi* exist that do not exhibit this failure mode, POSIX.1-2008 does not permit it.

The requirement that alphabetic command names consist of all following alphabetic characters up to the next non-alphabetic character means that alphabetic command names must be separated from their arguments by one or more non-alphabetic characters, normally a <blank> or '!' character, except as specified for the exceptions, the **delete**, **k**, and **s** commands.

Historically, the repeated execution of the *ex* default **print** commands (<control>-D, *eof*, <newline>, <carriage-return>) erased any prompting character and displayed the next lines without scrolling the terminal; that is, immediately below any previously displayed lines. This provided a cleaner presentation of the lines in the file for the user. POSIX.1-2008 does not require this behavior because it may be impossible in some situations; however, implementations are strongly encouraged to provide this semantic if possible.

Historically, it was possible to change files in the middle of a command, and have the rest of the command executed in the new file; for example:

```
:edit +25 file.c | s/abc/ABC/ | 1
```

was a valid command, and the substitution was attempted in the newly edited file. POSIX.1-2008 requires conformance to historical practice. The following commands are examples that exercise the *ex* parser:

```
echo 'foo | bar' > file1; echo 'foo/bar' > file2;
```

```
vi
```

```
:edit +1 | s/|/PIPE/ | w file1 | e file2 | 1 | s/\/SLASH/ | wq
```

Historically, there was no protection in editor implementations to avoid *ex* **global**, **v**, **@**, or **\*** commands changing edit buffers during execution of their associated commands. Because this would almost invariably result in catastrophic failure of the editor, and implementations exist that do exhibit these problems, POSIX.1-2008 requires that changing the edit buffer during a **global** or **v** command, or during a **@** or **\*** command for which there will be more than a single execution, be an error. Implementations supporting multiple edit buffers simultaneously are strongly encouraged to apply the same semantics to switching between buffers as well.

The *ex* command quoting required by POSIX.1-2008 is a superset of the quoting in historical implementations of the editor. For example, it was not historically possible to escape a <blank> in a filename; for example, **:edit foo\\\ bar** would report that too many filenames had been entered for the edit command, and there was no method of escaping a <blank> in the first argument of an **edit**, **ex**, **next**, or **visual** command at all. POSIX.1-2008 extends historical practice, requiring that quoting behavior be made consistent across all *ex* commands, except for

the **map**, **unmap**, **abbreviate**, and **unabbreviate** commands, which historically used <control>-V instead of <backslash> characters for quoting. For those four commands, POSIX.1-2008 requires conformance to historical practice.

Backslash quoting in *ex* is non-intuitive. <backslash>-escapes are ignored unless they escape a special character; for example, when performing *file* argument expansion, the string "\\%" is equivalent to '\%', not "\<current\_pathname>". This can be confusing for users because <backslash> is usually one of the characters that causes shell expansion to be performed, and therefore shell quoting rules must be taken into consideration. Generally, quoting characters are only considered if they escape a special character, and a quoting character must be provided for each layer of parsing for which the character is special. As another example, only a single <backslash> is necessary for the '\1' sequence in substitute replacement patterns, because the character '1' is not special to any parsing layer above it.

<control>-V quoting in *ex* is slightly different from backslash quoting. In the four commands where <control>-V quoting applies (**abbreviate**, **unabbreviate**, **map**, and **unmap**), any character may be escaped by a <control>-V whether it would have a special meaning or not. POSIX.1-2008 requires conformance to historical practice.

Historical implementations of the editor did not require delimiters within character classes to be escaped; for example, the command :s/[/] on the string "xxx/yyy" would delete the '/' from the string. POSIX.1-2008 disallows this historical practice for consistency and because it places a large burden on implementations by requiring that knowledge of regular expressions be built into the editor parser.

Historically, quoting <newline> characters in *ex* commands was handled inconsistently. In most cases, the <newline> character always terminated the command, regardless of any preceding escape character, because <backslash> characters did not escape <newline> characters for most *ex* commands. However, some *ex* commands (for example, **s**, **map**, and **abbreviation**) permitted <newline> characters to be escaped (although in the case of **map** and **abbreviation**, <control>-V characters escaped them instead of <backslash> characters). This was true in not only the command line, but also **.exrc** and **sourced** files. For example, the command:

```
map = foo<control-V><newline>bar
```

would succeed, although it was sometimes difficult to get the <control>-V and the inserted <newline> passed to the *ex* parser. For consistency and simplicity of specification, POSIX.1-2008 requires that it be possible to escape <newline> characters in *ex* commands at all times, using <backslash> characters for most *ex* commands, and using <control>-V characters for the **map** and **abbreviation** commands. For example, the command **print<newline>list** is required to be parsed as the single command **print<newline>list**. While this differs from historical practice, POSIX.1-2008 developers believed it unlikely that any script or user depended on the historical behavior.

Historically, an error in a command specified using the **-c** option did not cause the rest of the **-c** commands to be discarded. POSIX.1-2008 disallows this for consistency with mapped keys, the **@**, **global**, **source**, and **v** commands, the *EXINIT* environment variable, and the **.exrc** files.

## Input Editing in *ex*

One of the common uses of the historical *ex* editor is over slow network connections. Editors that run in canonical mode can require far less traffic to and from, and far less processing on, the host machine, as well as more easily supporting block-mode terminals. For these reasons, POSIX.1-2008 requires that *ex* be implemented using canonical mode input processing, as was done historically.

POSIX.1-2008 does not require the historical 4 BSD input editing characters “word erase” or “literal next”. For this reason, it is unspecified how they are handled by *ex*, although they must have the required effect. Implementations that resolve them after the line has been ended using a <newline> or <control>-M character, and implementations that rely on the underlying system terminal support for this processing, are both conforming. Implementations are strongly urged to use the underlying system functionality, if at all possible, for compatibility with other system text input interfaces.

Historically, when the *eof* character was used to decrement the **autoindent** level, the cursor moved to display the new end of the **autoindent** characters, but did not move the cursor to a new line, nor did it erase the <control>-D character from the line. POSIX.1-2008 does not specify that the cursor remain on the same line or that the rest of the line is erased; however, implementations are strongly encouraged to provide the best possible user interface; that is, the cursor should remain on the same line, and any <control>-D character on the line should be erased.

POSIX.1-2008 does not require the historical 4 BSD input editing character “reprint”, traditionally <control>-R, which redisplayed the current input from the user. For this reason, and because the functionality cannot be implemented after the line has been terminated by the user, POSIX.1-2008 makes no requirements about this functionality. Implementations are strongly urged to make this historical functionality available, if possible.

Historically, <control>-Q did not perform a literal next function in *ex*, as it did in *vi*. POSIX.1-2008 requires conformance to historical practice to avoid breaking historical *ex* scripts and **.exrc** files.

## *eof*

Whether the *eof* character immediately modifies the **autoindent** characters in the prompt is left unspecified so that implementations can conform in the presence of systems that do not support this functionality. Implementations are encouraged to modify the line and redisplay it immediately, if possible.

The specification of the handling of the *eof* character differs from historical practice only in that *eof* characters are not discarded if they follow normal characters in the text input. Historically, they were always discarded.

## Command Descriptions in *ex*

Historically, several commands (for example, **global**, **v**, **visual**, **s**, **write**, **wq**, **yank**, **!**, **<**, **>**, **&**, and **~**) were executable in empty files (that is, the default address(es) were 0), or permitted explicit addresses of 0 (for example, 0 was a valid address, or 0,0 was a valid range). Addresses of 0, or command execution in an empty file, make sense only for commands that add new text to the edit buffer or write commands (because users may wish to write empty files). POSIX.1-2008 requires this behavior for such commands and disallows it otherwise, for consistency and simplicity of specification.

A count to an *ex* command has been historically corrected to be no greater than the last line in a

file; for example, in a five-line file, the command **1,6print** would fail, but the command **1print300** would succeed. POSIX.1-2008 requires conformance to historical practice.

Historically, the use of flags in *ex* commands could be obscure. General historical practice was as described by POSIX.1-2008, but there were some special cases. For instance, the **list**, **number**, and **print** commands ignored trailing address offsets; for example, **3p +++#** would display line 3, and 3 would be the current line after the execution of the command. The **open** and **visual** commands ignored both the trailing offsets and the trailing flags. Also, flags specified to the **open** and **visual** commands interacted badly with the **list** edit option, and setting and then unsetting it during the open/visual session would cause *vi* to stop displaying lines in the specified format. For consistency and simplicity of specification, POSIX.1-2008 does not permit any of these exceptions to the general rule.

POSIX.1-2008 uses the word *copy* in several places when discussing buffers. This is not intended to imply implementation.

Historically, *ex* users could not specify numeric buffers because of the ambiguity this would cause; for example, in the command **3 delete 2**, it is unclear whether 2 is a buffer name or a *count*. POSIX.1-2008 requires conformance to historical practice by default, but does not preclude extensions.

Historically, the contents of the unnamed buffer were frequently discarded after commands that did not explicitly affect it; for example, when using the **edit** command to switch files. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

The *ex* utility did not historically have access to the numeric buffers, and, furthermore, deleting lines in *ex* did not modify their contents. For example, if, after doing a delete in *vi*, the user switched to *ex*, did another delete, and then switched back to *vi*, the contents of the numeric buffers would not have changed. POSIX.1-2008 requires conformance to historical practice. Numeric buffers are described in the *ex* utility in order to confine the description of buffers to a single location in POSIX.1-2008.

The metacharacters that trigger shell expansion in *file* arguments match historical practice, as does the method for doing shell expansion. Implementations wishing to provide users with the flexibility to alter the set of metacharacters are encouraged to provide a **shellmeta** string edit option.

Historically, *ex* commands executed from *vi* refreshed the screen when it did not strictly need to do so; for example, **!date > /dev/null** does not require a screen refresh because the output of the UNIX *date* command requires only a single line of the screen. POSIX.1-2008 requires that the screen be refreshed if it has been overwritten, but makes no requirements as to how an implementation should make that determination. Implementations may prompt and refresh the screen regardless.

## Abbreviate

Historical practice was that characters that were entered as part of an abbreviation replacement were subject to **map** expansions, the **showmatch** edit option, further abbreviation expansions, and so on; that is, they were logically pushed onto the terminal input queue, and were not a simple replacement. POSIX.1-2008 requires conformance to historical practice. Historical practice was that whenever a non-word character (that had not been escaped by a <control>-V) was entered after a word character, *vi* would check for abbreviations. The check was based on the type of the character entered before the word character of the word/non-word pair that triggered the check. The word character of the word/non-word pair that triggered the check and all characters entered before the trigger pair that were of that type were included in the check, with the exception of <blank> characters, which always delimited the abbreviation.

This means that, for the abbreviation to work, the *lhs* must end with a word character, there can be no transitions from word to non-word characters (or *vice versa*) other than between the last and next-to-last characters in the *lhs*, and there can be no <blank> characters in the *lhs*. In addition, because of the historical quoting rules, it was impossible to enter a literal <control>-V in the *lhs*. POSIX.1-2008 requires conformance to historical practice. Historical implementations did not inform users when abbreviations that could never be used were entered; implementations are strongly encouraged to do so.

For example, the following abbreviations will work:

```
:ab (p REPLACE
:ab p REPLACE
:ab ((p REPLACE
```

The following abbreviations will not work:

```
:ab ( REPLACE
:ab (pp REPLACE
```

Historical practice is that words on the *vi* colon command line were subject to abbreviation expansion, including the arguments to the **abbrev** (and more interestingly) the **unabbrev** command. Because there are implementations that do not do abbreviation expansion for the first argument to those commands, this is permitted, but not required, by POSIX.1-2008. However, the following sequence:

```
:ab foo bar
:ab foo baz
```

resulted in the addition of an abbreviation of "baz" for the string "bar" in historical *ex/vi*, and the sequence:

```
:ab foo1 bar
:ab foo2 bar
:unabbreviate foo2
```

deleted the abbreviation "foo1", not "foo2". These behaviors are not permitted by POSIX.1-2008 because they clearly violate the expectations of the user.

It was historical practice that <control>-V, not <backslash>, characters be interpreted as escaping subsequent characters in the **abbreviate** command. POSIX.1-2008 requires conformance to historical practice; however, it should be noted that an abbreviation containing a <blank> will never work.

## Append

Historically, any text following a <vertical-line> command separator after an **append**, **change**, or **insert** command became part of the insert text. For example, in the command:

```
:g/pattern/append|stuff1
```

a line containing the text "stuff1" would be appended to each line matching pattern. It was also historically valid to enter:

```
:append|stuff1
stuff2
.
```

and the text on the *ex* command line would be appended along with the text inserted after it. There was an historical bug, however, that the user had to enter two terminating lines (the ' . '

lines) to terminate text input mode in this case. POSIX.1-2008 requires conformance to historical practice, but disallows the historical need for multiple terminating lines.

### Change

See the RATIONALE for the **append** command. Historical practice for cursor positioning after the change command when no text is input, is as described in POSIX.1-2008. However, one System V implementation is known to have been modified such that the cursor is positioned on the first address specified, and not on the line before the first address. POSIX.1-2008 disallows this modification for consistency.

Historically, the **change** command did not support buffer arguments, although some implementations allow the specification of an optional buffer. This behavior is neither required nor disallowed by POSIX.1-2008.

### Change Directory

A common extension in *ex* implementations is to use the elements of a **cdpath** edit option as prefix directories for *path* arguments to **chdir** that are relative pathnames and that do not have ' . ' or " . . " as their first component. Elements in the **cdpath** edit option are <colon>-separated. The initial value of the **cdpath** edit option is the value of the shell *CDPATH* environment variable. This feature was not included in POSIX.1-2008 because it does not exist in any of the implementations considered historical practice.

### Copy

Historical implementations of *ex* permitted copies to lines inside of the specified range; for example, **:2,5copy3** was a valid command. POSIX.1-2008 requires conformance to historical practice.

### Delete

POSIX.1-2008 requires support for the historical parsing of a **delete** command followed by flags, without any intervening <blank> characters. For example:

**1dp** Deletes the first line and prints the line that was second.

**1delep** As for **1dp**.

**1d** Deletes the first line, saving it in buffer *p*.

**1d p1l** (Pee-one-ell.) Deletes the first line, saving it in buffer *p*, and listing the line that was second.

### Edit

Historically, any *ex* command could be entered as a *+command* argument to the **edit** command, although some (for example, **insert** and **append**) were known to confuse historical implementations. For consistency and simplicity of specification, POSIX.1-2008 requires that any command be supported as an argument to the **edit** command.

Historically, the command argument was executed with the current line set to the last line of the file, regardless of whether the **edit** command was executed from visual mode or not. POSIX.1-2008 requires conformance to historical practice.

Historically, the *+command* specified to the **edit** and **next** commands was delimited by the first <blank>, and there was no way to quote them. For consistency, POSIX.1-2008 requires that the usual *ex* backslash quoting be provided.

Historically, specifying the *+command* argument to the edit command required a filename to be specified as well; for example, **:edit +100** would always fail. For consistency and simplicity of specification, POSIX.1-2008 does not permit this usage to fail for that reason.

Historically, only the cursor position of the last file edited was remembered by the editor. POSIX.1-2008 requires that this be supported; however, implementations are permitted to remember and restore the cursor position for any file previously edited.

## File

Historical versions of the *ex* editor **file** command displayed a current line and number of lines in the edit buffer of 0 when the file was empty, while the *vi* <control>-G command displayed a current line and number of lines in the edit buffer of 1 in the same situation. POSIX.1-2008 does not permit this discrepancy, instead requiring that a message be displayed indicating that the file is empty.

## Global

The two-pass operation of the **global** and **v** commands is not intended to imply implementation, only the required result of the operation.

The current line and column are set as specified for the individual *ex* commands. This requirement is cumulative; that is, the current line and column must track across all the commands executed by the **global** or **v** commands.

## Insert

See the RATIONALE for the **append** command.

Historically, **insert** could not be used with an address of zero; that is, not when the edit buffer was empty. POSIX.1-2008 requires that this command behave consistently with the **append** command.

## Join

The action of the **join** command in relation to the special characters is only defined for the POSIX locale because the correct amount of white space after a period varies; in Japanese none is required, in French only a single space, and so on.

## List

The historical output of the **list** command was potentially ambiguous. The standard developers believed correcting this to be more important than adhering to historical practice, and POSIX.1-2008 requires unambiguous output.

## Map

Historically, command mode maps only applied to command names; for example, if the character 'x' was mapped to 'y', the command **fx** searched for the 'x' character, not the 'y' character. POSIX.1-2008 requires this behavior. Historically, entering <control>-V as the first character of a *vi* command was an error. Several implementations have extended the semantics of *vi* such that <control>-V means that the subsequent command character is not mapped. This is permitted, but not required, by POSIX.1-2008. Regardless, using <control>-V to escape the second or later character in a sequence of characters that might match a **map** command, or any character in text input mode, is historical practice, and stops the entered keys from matching a map. POSIX.1-2008 requires conformance to historical practice.

Historical implementations permitted digits to be used as a **map** command *lhs*, but then ignored the map. POSIX.1-2008 requires that the mapped digits not be ignored.

The historical implementation of the **map** command did not permit **map** commands that were more than a single character in length if the first character was printable. This behavior is permitted, but not required, by POSIX.1-2008.

Historically, mapped characters were remapped unless the **remap** edit option was not set, or the prefix of the mapped characters matched the mapping characters; for example, in the **map**:

```
:map ab abcd
```

the characters "ab" were used as is and were not remapped, but the characters "cd" were mapped if appropriate. This can cause infinite loops in the *vi* mapping mechanisms. POSIX.1-2008 requires conformance to historical practice, and that such loops be interruptible.

Text input maps had the same problems with expanding the *lhs* for the **ex map!** and **unmap!** command as did the **ex abbreviate** and **unabbreviate** commands. See the RATIONALE for the **ex abbreviate** command. POSIX.1-2008 requires similar modification of some historical practice for the **map** and **unmap** commands, as described for the **abbreviate** and **unabbreviate** commands.

Historically, **maps** that were subsets of other **maps** behaved differently depending on the order in which they were defined. For example:

```
:map! ab      short
:map! abc     long
```

would always translate the characters "ab" to "short", regardless of how fast the characters "abc" were entered. If the entry order was reversed:

```
:map! abc     long
:map! ab      short
```

the characters "ab" would cause the editor to pause, waiting for the completing 'c' character, and the characters might never be mapped to "short". For consistency and simplicity of specification, POSIX.1-2008 requires that the shortest match be used at all times.

The length of time the editor spends waiting for the characters to complete the *lhs* is unspecified because the timing capabilities of systems are often inexact and variable, and it may depend on other factors such as the speed of the connection. The time should be long enough for the user to be able to complete the sequence, but not long enough for the user to have to wait. Some implementations of *vi* have added a **keytime** option, which permits users to set the number of 0,1 seconds the editor waits for the completing characters. Because mapped terminal function and cursor keys tend to start with an <ESC> character, and <ESC> is the key ending *vi* text input mode, **maps** starting with <ESC> characters are generally exempted from this timeout period, or, at least timed out differently.

## Mark

Historically, users were able to set the "previous context" marks explicitly. In addition, the **ex** commands **"** and **"** and the *vi* commands **"**, **"**, and **"** all referred to the same mark. In addition, the previous context marks were not set if the command, with which the address setting the mark was associated, failed. POSIX.1-2008 requires conformance to historical practice. Historically, if marked lines were deleted, the mark was also deleted, but would reappear if the change was undone. POSIX.1-2008 requires conformance to historical practice.

The description of the special events that set the ' and ' marks matches historical practice. For example, historically the command **/a/** did not set the ' and ' marks, but the command

90069        **/a/,/b/delete** did.

## 90070        **Next**

90071        Historically, any *ex* command could be entered as a *+command* argument to the **next** command,  
90072        although some (for example, **insert** and **append**) were known to confuse historical  
90073        implementations. POSIX.1-2008 requires that any command be permitted and that it behave as  
90074        specified. The **next** command can accept more than one file, so usage such as:

90075        `next `ls [abc] ``

90076        is valid; it need not be valid for the **edit** or **read** commands, for example, because they expect  
90077        only one filename.

90078        Historically, the **next** command behaved differently from the **:rewind** command in that it  
90079        ignored the force flag if the **autowrite** flag was set. For consistency, POSIX.1-2008 does not  
90080        permit this behavior.

90081        Historically, the **next** command positioned the cursor as if the file had never been edited before,  
90082        regardless. POSIX.1-2008 does not permit this behavior, for consistency with the **edit** command.

90083        Implementations wanting to provide a counterpart to the **next** command that edited the  
90084        previous file have used the command **prev[ious]**, which takes no *file* argument. POSIX.1-2008  
90085        does not require this command.

## 90086        **Open**

90087        Historically, the **open** command would fail if the **open** edit option was not set. POSIX.1-2008  
90088        does not mention the **open** edit option and does not require this behavior. Some historical  
90089        implementations do not permit entering open mode from open or visual mode, only from *ex*  
90090        mode. For consistency, POSIX.1-2008 does not permit this behavior.

90091        Historically, entering open mode from the command line (that is, *vi +open*) resulted in  
90092        anomalous behaviors; for example, the *ex* file and *set* commands, and the *vi* command  
90093        <control>-G did not work. For consistency, POSIX.1-2008 does not permit this behavior.

90094        Historically, the **open** command only permitted ' / ' characters to be used as the search pattern  
90095        delimiter. For consistency, POSIX.1-2008 requires that the search delimiters used by the **s**, **global**,  
90096        and **v** commands be accepted as well.

## 90097        **Preserve**

90098        The **preserve** command does not historically cause the file to be considered unmodified for the  
90099        purposes of future commands that may exit the editor. POSIX.1-2008 requires conformance to  
90100        historical practice.

90101        Historical documentation stated that mail was not sent to the user when preserve was executed;  
90102        however, historical implementations did send mail in this case. POSIX.1-2008 requires  
90103        conformance to the historical implementations.

## Print

The writing of NUL by the **print** command is not specified as a special case because the standard developers did not want to require *ex* to support NUL characters. Historically, characters were displayed using the ARPA standard mappings, which are as follows:

1. Printable characters are left alone.
2. Control characters less than \177 are represented as '^' followed by the character offset from the '@' character in the ASCII map; for example, \007 is represented as '^G'.
3. \177 is represented as '^?' followed by '? '.

The display of characters having their eighth bit set was less standard. Existing implementations use hex (0x00), octal (\000), and a meta-bit display. (The latter displayed bytes that had their eighth bit set as the two characters "M-" followed by the seven-bit display as described above.) The latter probably has the best claim to historical practice because it was used for the **-v** option of 4 BSD and 4 BSD-derived versions of the *cat* utility since 1980.

No specific display format is required by POSIX.1-2008.

Explicit dependence on the ASCII character set has been avoided where possible, hence the use of the phrase an "implementation-defined multi-character sequence" for the display of non-printable characters in preference to the historical usage of, for instance, "^I" for the <tab>. Implementations are encouraged to conform to historical practice in the absence of any strong reason to diverge.

Historically, all *ex* commands beginning with the letter 'p' could be entered using capitalized versions of the commands; for example, **P[rint]**, **Pre[serve]**, and **Pu[t]** were all valid command names. POSIX.1-2008 permits, but does not require, this historical practice because capital forms of the commands are used by some implementations for other purposes.

## Put

Historically, an *ex* **put** command, executed from open or visual mode, was the same as the open or visual mode **P** command, if the buffer was named and was cut in character mode, and the same as the **p** command if the buffer was named and cut in line mode. If the unnamed buffer was the source of the text, the entire line from which the text was taken was usually **put**, and the buffer was handled as if in line mode, but it was possible to get extremely anomalous behavior. In addition, using the **Q** command to switch into *ex* mode, and then doing a **put** often resulted in errors as well, such as appending text that was unrelated to the (supposed) contents of the buffer. For consistency and simplicity of specification, POSIX.1-2008 does not permit these behaviors. All *ex* **put** commands are required to operate in line mode, and the contents of the buffers are not altered by changing the mode of the editor.

## Read

Historically, an *ex* **read** command executed from open or visual mode, executed in an empty file, left an empty line as the first line of the file. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior. Historically, a **read** in open or visual mode from a program left the cursor at the last line read in, not the first. For consistency, POSIX.1-2008 does not permit this behavior.

Historical implementations of *ex* were unable to undo **read** commands that read from the output of a program. For consistency, POSIX.1-2008 does not permit this behavior.

Historically, the *ex* and *vi* message after a successful **read** or **write** command specified "characters", not "bytes". POSIX.1-2008 requires that the number of bytes be displayed, not the

number of characters, because it may be difficult in multi-byte implementations to determine the number of characters read. Implementations are encouraged to clarify the message displayed to the user.

Historically, reads were not permitted on files other than type regular, except that FIFO files could be read (probably only because they did not exist when *ex* and *vi* were originally written). Because the historical *ex* evaluated **read!** and **read !** equivalently, there can be no optional way to force the read. POSIX.1-2008 permits, but does not require, this behavior.

### Recover

Some historical implementations of the editor permitted users to recover the edit buffer contents from a previous edit session, and then exit without saving those contents (or explicitly discarding them). The intent of POSIX.1-2008 in requiring that the edit buffer be treated as already modified is to prevent this user error.

### Rewind

Historical implementations supported the **rewind** command when the user was editing the first file in the list; that is, the file that the **rewind** command would edit. POSIX.1-2008 requires conformance to historical practice.

### Substitute

Historically, *ex* accepted an **r** option to the **s** command. The effect of the **r** option was to use the last regular expression used in any command as the pattern, the same as the **~** command. The **r** option is not required by POSIX.1-2008. Historically, the **c** and **g** options were toggled; for example, the command **:s/abc/def/** was the same as **s/abc/def/ccccgggg**. For simplicity of specification, POSIX.1-2008 does not permit this behavior.

The tilde command is often used to replace the last search RE. For example, in the sequence:

```
s/red/blue/
/green
~
```

the **~** command is equivalent to:

```
s/green/blue/
```

Historically, *ex* accepted all of the following forms:

```
s/abc/def/
s/abc/def
s/abc/
s/abc
```

POSIX.1-2008 requires conformance to this historical practice.

The **s** command presumes that the **'^'** character only occupies a single column in the display. Much of the *ex* and *vi* specification presumes that the **<space>** only occupies a single column in the display. There are no known character sets for which this is not true.

Historically, the final column position for the substitute commands was based on previous column movements; a search for a pattern followed by a substitution would leave the column position unchanged, while a **0** command followed by a substitution would change the column position to the first non-**<blank>**. For consistency and simplicity of specification, POSIX.1-2008 requires that the final column position always be set to the first non-**<blank>**.

## Set

Historical implementations redisplayed all of the options for each occurrence of the **all** keyword. POSIX.1-2008 permits, but does not require, this behavior.

## Tag

No requirement is made as to where *ex* and *vi* shall look for the file referenced by the tag entry. Historical practice has been to look for the path found in the **tags** file, based on the current directory. A useful extension found in some implementations is to look based on the directory containing the tags file that held the entry, as well. No requirement is made as to which reference for the tag in the tags file is used. This is deliberate, in order to permit extensions such as multiple entries in a tags file for a tag.

Because users often specify many different tags files, some of which need not be relevant or exist at any particular time, POSIX.1-2008 requires that error messages about problem tags files be displayed only if the requested tag is not found, and then, only once for each time that the **tag** edit option is changed.

The requirement that the current edit buffer be unmodified is only necessary if the file indicated by the tag entry is not the same as the current file (as defined by the current pathname). Historically, the file would be reloaded if the filename had changed, as well as if the filename was different from the current pathname. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior, requiring that the name be the only factor in the decision.

Historically, *vi* only searched for tags in the current file from the current cursor to the end of the file, and therefore, if the **wrapsan** option was not set, tags occurring before the current cursor were not found. POSIX.1-2008 considers this a bug, and implementations are required to search for the first occurrence in the file, regardless.

## Undo

The **undo** description deliberately uses the word “modified”. The **undo** command is not intended to undo commands that replace the contents of the edit buffer, such as **edit**, **next**, **tag**, or **recover**.

Cursor positioning after the **undo** command was inconsistent in the historical *vi*, sometimes attempting to restore the original cursor position (**global**, **undo**, and **v** commands), and sometimes, in the presence of maps, placing the cursor on the last line added or changed instead of the first. POSIX.1-2008 requires a simplified behavior for consistency and simplicity of specification.

## Version

The **version** command cannot be exactly specified since there is no widely-accepted definition of what the version information should contain. Implementations are encouraged to do something reasonably intelligent.

## Write

Historically, the *ex* and *vi* message after a successful **read** or **write** command specified “characters”, not “bytes”. POSIX.1-2008 requires that the number of bytes be displayed, not the number of characters because it may be difficult in multi-byte implementations to determine the number of characters written. Implementations are encouraged to clarify the message displayed to the user.

Implementation-defined tests are permitted so that implementations can make additional checks; for example, for locks or file modification times.

Historically, attempting to append to a nonexistent file caused an error. It has been left unspecified in POSIX.1-2008 to permit implementations to let the **write** succeed, so that the append semantics are similar to those of the historical *csh*.

Historical *vi* permitted empty edit buffers to be written. However, since the way *vi* got around dealing with “empty” files was to always have a line in the edit buffer, no matter what, it wrote them as files of a single, empty line. POSIX.1-2008 does not permit this behavior.

Historically, *ex* restored standard output and standard error to their values as of when *ex* was invoked, before writes to programs were performed. This could disturb the terminal configuration as well as be a security issue for some terminals. POSIX.1-2008 does not permit this, requiring that the program output be captured and displayed as if by the *ex* **print** command.

## Adjust Window

Historically, the line count was set to the value of the **scroll** option if the type character was end-of-file. This feature was broken on most historical implementations long ago, however, and is not documented anywhere. For this reason, POSIX.1-2008 is resolutely silent.

Historically, the **z** command was <blank>-sensitive and **z +** and **z -** did different things than **z+** and **z-** because the type could not be distinguished from a flag. (The commands **z .** and **z =** were historically invalid.) POSIX.1-2008 requires conformance to this historical practice.

Historically, the **z** command was further <blank>-sensitive in that the *count* could not be <blank>-delimited; for example, the commands **z= 5** and **z- 5** were also invalid. Because the *count* is not ambiguous with respect to either the type character or the flags, this is not permitted by POSIX.1-2008.

## Escape

Historically, *ex* filter commands only read the standard output of the commands, letting standard error appear on the terminal as usual. The *vi* utility, however, read both standard output and standard error. POSIX.1-2008 requires the latter behavior for both *ex* and *vi*, for consistency.

## Shift Left and Shift Right

Historically, it was possible to add shift characters to increase the effect of the command; for example, <<< outdented (or >>> indented) the lines 3 levels of indentation instead of the default 1. POSIX.1-2008 requires conformance to historical practice.

**<control>-D**

Historically, the <control>-D command erased the prompt, providing the user with an unbroken presentation of lines from the edit buffer. This is not required by POSIX.1-2008; implementations are encouraged to provide it if possible. Historically, the <control>-D command took, and then ignored, a *count*. POSIX.1-2008 does not permit this behavior.

**Write Line Number**

Historically, the *ex* = command, when executed in *ex* mode in an empty edit buffer, reported 0, and from open or visual mode, reported 1. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

**Execute**

Historically, *ex* did not correctly handle the inclusion of text input commands (that is, **append**, **insert**, and **change**) in executed buffers. POSIX.1-2008 does not permit this exclusion for consistency.

Historically, the logical contents of the buffer being executed did not change if the buffer itself were modified by the commands being executed; that is, buffer execution did not support self-modifying code. POSIX.1-2008 requires conformance to historical practice.

Historically, the @ command took a range of lines, and the @ buffer was executed once per line, with the current line ( ' . ' ) set to each specified line. POSIX.1-2008 requires conformance to historical practice.

Some historical implementations did not notice if errors occurred during buffer execution. This, coupled with the ability to specify a range of lines for the *ex* @ command, makes it trivial to cause them to drop **core**. POSIX.1-2008 requires that implementations stop buffer execution if any error occurs, if the specified line doesn't exist, or if the contents of the edit buffer itself are replaced (for example, the buffer executes the *ex* :**edit** command).

**Regular Expressions in ex**

Historical practice is that the characters in the replacement part of the last **s** command—that is, those matched by entering a ' ~ ' in the regular expression—were not further expanded by the regular expression engine. So, if the characters contained the string "a . , " they would match 'a' followed by " . , " and not 'a' followed by any character. POSIX.1-2008 requires conformance to historical practice.

**Edit Options in ex**

The following paragraphs describe the historical behavior of some edit options that were not, for whatever reason, included in POSIX.1-2008. Implementations are strongly encouraged to only use these names if the functionality described here is fully supported.

**extended** The **extended** edit option has been used in some implementations of *vi* to provide extended regular expressions instead of basic regular expressions. This option was omitted from POSIX.1-2008 because it is not widespread historical practice.

**flash** The **flash** edit option historically caused the screen to flash instead of beeping on error. This option was omitted from POSIX.1-2008 because it is not found in some historical implementations.

|       |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 90306 | <b>hardtabs</b>  | The <b>hardtabs</b> edit option historically defined the number of columns between hardware tab settings. This option was omitted from POSIX.1-2008 because it was believed to no longer be generally useful.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 90307 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 90327 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 90328 | <b>timeout</b>   | The <b>timeout</b> edit option historically enabled the (now standard) feature of only waiting for a short period before returning keys that could be part of a macro. This feature was omitted from POSIX.1-2008 because its behavior is now standard, it is not widely useful, and it was rarely documented.                                                                                                                                                                                                                                                                                                                                                                                                               |
| 90329 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 90330 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 90331 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 90332 | <b>verbose</b>   | The <b>verbose</b> edit option has been used in some implementations of <i>vi</i> to cause <i>vi</i> to output error messages for common errors; for example, attempting to move the cursor past the beginning or end of the line instead of only alerting the screen. (The historical <i>vi</i> only alerted the terminal and presented no message for such errors. The historical editor option <b>terse</b> did not select when to present error messages, it only made existing error messages more or less verbose.) This option was omitted from POSIX.1-2008 because it is not widespread historical practice; however, implementors are encouraged to use it if they wish to provide error messages for naive users. |

| 90337 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 90338 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 90339 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 90340 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 90341 | <b>wraplen</b>   | The <b>wraplen</b> edit option has been used in some implementations of <i>vi</i> to specify an automatic margin measured from the left margin instead of from the right margin. This is useful when multiple screen sizes are being used to edit a single file. This option was omitted from POSIX.1-2008 because it is not widespread historical practice; however, implementors are encouraged to use it if they add this functionality.                                                                                                                                                                                                                                                                                  |
| 90342 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 90344 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 90345 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 90346 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**autoindent, ai**

Historically, the command **0a** did not do any autoindentation, regardless of the current indentation of line 1. POSIX.1-2008 requires that any indentation present in line 1 be used.

**autoprint, ap**

Historically, the **autoprint** edit option was not completely consistent or based solely on modifications to the edit buffer. Exceptions were the **read** command (when reading from a file, but not from a filter), the **append**, **change**, **insert**, **global**, and **v** commands, all of which were not affected by **autoprint**, and the **tag** command, which was affected by **autoprint**. POSIX.1-2008 requires conformance to historical practice.

Historically, the **autoprint** option only applied to the last of multiple commands entered using <vertical-line> delimiters; for example, **delete** <newline> was affected by **autoprint**, but **delete | version** <newline> was not. POSIX.1-2008 requires conformance to historical practice.

**autowrite, aw**

Appending the '!' character to the *ex* **next** command to avoid performing an automatic write was not supported in historical implementations. POSIX.1-2008 requires that the behavior match the other *ex* commands for consistency.

**ignorecase, ic**

Historical implementations of case-insensitive matching (the **ignorecase** edit option) lead to counter-intuitive situations when uppercase characters were used in range expressions. Historically, the process was as follows:

1. Take a line of text from the edit buffer.
2. Convert uppercase to lowercase in text line.
3. Convert uppercase to lowercase in regular expressions, except in character class specifications.
4. Match regular expressions against text.

This would mean that, with **ignorecase** in effect, the text:

The cat sat on the mat

would be matched by

/^the/

but not by:

/^[A-Z]he/

For consistency with other commands implementing regular expressions, POSIX.1-2008 does not permit this behavior.

### paragraphs, para

The ISO POSIX-2:1993 standard made the default **paragraphs** and **sections** edit options implementation-defined, arguing they were historically oriented to the UNIX system *troff* text formatter, and a “portable user” could use the {, }, [[, ]], (, and ) commands in open or visual mode and have the cursor stop in unexpected places. POSIX.1-2008 specifies their values in the POSIX locale because the unusual grouping (they only work when grouped into two characters at a time) means that they cannot be used for general-purpose movement, regardless.

### readonly

Implementations are encouraged to provide the best possible information to the user as to the read-only status of the file, with the exception that they should not consider the current special privileges of the process. This provides users with a safety net because they must force the overwrite of read-only files, even when running with additional privileges.

The **readonly** edit option specification largely conforms to historical practice. The only difference is that historical implementations did not notice that the user had set the **readonly** edit option in cases where the file was already marked read-only for some reason, and would therefore reinitialize the **readonly** edit option the next time the contents of the edit buffer were replaced. This behavior is disallowed by POSIX.1-2008.

### report

The requirement that lines copied to a buffer interact differently than deleted lines is historical practice. For example, if the **report** edit option is set to 3, deleting 3 lines will cause a report to be written, but 4 lines must be copied before a report is written.

The requirement that the *ex* **global**, **v**, **open**, **undo**, and **visual** commands present reports based on the total number of lines added or deleted during the command execution, and that commands executed by the **global** and **v** commands not present reports, is historical practice. POSIX.1-2008 extends historical practice by requiring that buffer execution be treated similarly. The reasons for this are two-fold. Historically, only the report by the last command executed from the buffer would be seen by the user, as each new report would overwrite the last. In addition, the standard developers believed that buffer execution had more in common with **global** and **v** commands than it did with other *ex* commands, and should behave similarly, for consistency and simplicity of specification.

### showmatch, sm

The length of time the cursor spends on the matching character is unspecified because the timing capabilities of systems are often inexact and variable. The time should be long enough for the user to notice, but not long enough for the user to become annoyed. Some implementations of *vi* have added a **matchtime** option that permits users to set the number of 0,1 second intervals the cursor pauses on the matching character.

### showmode

The **showmode** option has been used in some historical implementations of *ex* and *vi* to display the current editing mode when in open or visual mode. The editing modes have generally included “command” and “input”, and sometimes other modes such as “replace” and “change”. The string was usually displayed on the bottom line of the screen at the far right-hand corner. In addition, a preceding ‘\*’ character often denoted whether the contents of the edit buffer had been modified. The latter display has sometimes been part of the **showmode** option, and sometimes based on another option. This option was not available in the 4 BSD historical

implementation of *vi*, but was viewed as generally useful, particularly to novice users, and is required by POSIX.1-2008.

The **smd** shorthand for the **showmode** option was not present in all historical implementations of the editor. POSIX.1-2008 requires it, for consistency.

Not all historical implementations of the editor displayed a mode string for command mode, differentiating command mode from text input mode by the absence of a mode string. POSIX.1-2008 permits this behavior for consistency with historical practice, but implementations are encouraged to provide a display string for both modes.

### **slowopen**

Historically, the **slowopen** option was automatically set if the terminal baud rate was less than 1 200 baud, or if the baud rate was 1 200 baud and the **redraw** option was not set. The **slowopen** option had two effects. First, when inserting characters in the middle of a line, characters after the cursor would not be pushed ahead, but would appear to be overwritten. Second, when creating a new line of text, lines after the current line would not be scrolled down, but would appear to be overwritten. In both cases, ending text input mode would cause the screen to be refreshed to match the actual contents of the edit buffer. Finally, terminals that were sufficiently intelligent caused the editor to ignore the **slowopen** option. POSIX.1-2008 permits most historical behavior, extending historical practice to require **slowopen** behaviors if the edit option is set by the user.

### **tags**

The default path for tags files is left unspecified as implementations may have their own **tags** implementations that do not correspond to the historical ones. The default **tags** option value should probably at least include the file **./tags**.

### **term**

Historical implementations of *ex* and *vi* ignored changes to the **term** edit option after the initial terminal information was loaded. This is permitted by POSIX.1-2008; however, implementations are encouraged to permit the user to modify their terminal type at any time.

### **terse**

Historically, the **terse** edit option optionally provided a shorter, less descriptive error message, for some error messages. This is permitted, but not required, by POSIX.1-2008. Historically, most common visual mode errors (for example, trying to move the cursor past the end of a line) did not result in an error message, but simply alerted the terminal. Implementations wishing to provide messages for novice users are urged to do so based on the **edit** option **verbose**, and not **terse**.

### **window**

In historical implementations, the default for the **window** edit option was based on the baud rate as follows:

1. If the baud rate was less than 1 200, the **edit** option **w300** set the window value; for example, the line:

```
set w300=12
```

would set the window option to 12 if the baud rate was less than 1 200.

2. If the baud rate was equal to 1 200, the **edit** option **w1200** set the window value.

3. If the baud rate was greater than 1 200, the **edit** option **w9600** set the window value.

The **w300**, **w1200**, and **w9600** options do not appear in POSIX.1-2008 because of their dependence on specific baud rates.

In historical implementations, the size of the window displayed by various commands was related to, but not necessarily the same as, the **window** edit option. For example, the size of the window was set by the *ex* command **visual 10**, but it did not change the value of the **window** edit option. However, changing the value of the **window** edit option did change the number of lines that were displayed when the screen was repainted. POSIX.1-2008 does not permit this behavior in the interests of consistency and simplicity of specification, and requires that all commands that change the number of lines that are displayed do it by setting the value of the **window** edit option.

#### **wrapmargin, wm**

Historically, the **wrapmargin** option did not affect maps inserting characters that also had associated *counts*; for example **:map K 5aABC DEF**. Unfortunately, there are widely used maps that depend on this behavior. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

Historically, **wrapmargin** was calculated using the column display width of all characters on the screen. For example, an implementation using "**^I**" to represent <tab> characters when the **list** edit option was set, where '**^**' and '**I**' each took up a single column on the screen, would calculate the **wrapmargin** based on a value of 2 for each <tab>. The **number** edit option similarly changed the effective length of the line as well. POSIX.1-2008 requires conformance to historical practice.

Earlier versions of this standard allowed for implementations with bytes other than eight bits, but this has been modified in this version.

#### **FUTURE DIRECTIONS**

None.

#### **CHANGE HISTORY**

First released in Issue 2.

##### **Issue 5**

The FUTURE DIRECTIONS section is added.

##### **Issue 6**

This utility is marked as part of the User Portability Utilities option.

The obsolescent SYNOPSIS is removed, removing the *+command* and *-* options.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the **map** command description, the sequence *#digit* is added.
- The **directory**, **edcompatible**, **redraw**, and **slowopen** edit options are added.

The *ex* utility is extensively changed for alignment with the IEEE P1003.2b draft standard. This includes changes as a result of the IEEE PASC Interpretations 1003.2 #31, #38, #49, #50, #51, #52, #55, #56, #57, #61, #62, #63, #64, #65, and #78.

The **-l** option is removed.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/23 is applied, correcting a URL.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/8 is applied, making an editorial correction in the EXTENDED DESCRIPTION.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/9 is applied, removing text describing behavior on systems with bytes consisting of more than eight bits.

#### Issue 7

Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if an operand is *'-'*.

Austin Group Interpretation 1003.1-2001 #036 is applied, clarifying the behavior for BREs.

Austin Group Interpretation 1003.1-2001 #121 is applied, clarifying the *ex* **write** command.

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

90524 **NAME**

90525       expand — convert tabs to spaces

90526 **SYNOPSIS**90527       expand [-t *tablist*] [*file...*]90528 **DESCRIPTION**

90529       The *expand* utility shall write files or the standard input to the standard output with <tab>  
 90530       characters replaced with one or more <space> characters needed to pad to the next tab stop. Any  
 90531       <backspace> characters shall be copied to the output and cause the column position count for  
 90532       tab stop calculations to be decremented; the column position count shall not be decremented  
 90533       below zero.

90534 **OPTIONS**90535       The *expand* utility shall conform to XBD [Section 12.2](#) (on page 216).

90536       The following option shall be supported:

90537       -t *tablist*   Specify the tab stops. The application shall ensure that the argument *tablist* consists  
 90538       of either a single positive decimal integer or a list of tabstops. If a single number is  
 90539       given, tabs shall be set that number of column positions apart instead of the  
 90540       default 8.

90541       If a list of tabstops is given, the application shall ensure that it consists of a list of  
 90542       two or more positive decimal integers, separated by <blank> or <comma>  
 90543       characters, in ascending order. The <tab> characters shall be set at those specific  
 90544       column positions. Each tab stop *N* shall be an integer value greater than zero, and  
 90545       the list is in strictly ascending order. This is taken to mean that, from the start of a  
 90546       line of output, tabbing to position *N* shall cause the next character output to be in  
 90547       the (*N*+1)th column position on that line.

90548       In the event of *expand* having to process a <tab> at a position beyond the last of  
 90549       those specified in a multiple tab-stop list, the <tab> shall be replaced by a single  
 90550       <space> in the output.

90551 **OPERANDS**

90552       The following operand shall be supported:

90553       *file*        The pathname of a text file to be used as input.

90554 **STDIN**

90555       See the INPUT FILES section.

90556 **INPUT FILES**

90557       Input files shall be text files.

90558 **ENVIRONMENT VARIABLES**90559       The following environment variables shall affect the execution of *expand*:

90560       LANG        Provide a default value for the internationalization variables that are unset or null.  
 90561       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 90562       variables used to determine the values of locale categories.)

90563       LC\_ALL      If set to a non-empty string value, override the values of all the other  
 90564       internationalization variables.

90565       LC\_CTYPE    Determine the locale for the interpretation of sequences of bytes of text data as  
 90566       characters (for example, single-byte as opposed to multi-byte characters in  
 90567       arguments and input files), the processing of <tab> and <space> characters, and  
 90568       for the determination of the width in column positions each character would

90569 occupy on an output device.

90570 *LC\_MESSAGES*

90571 Determine the locale that should be used to affect the format and contents of  
90572 diagnostic messages written to standard error.

90573 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

90574 **ASYNCHRONOUS EVENTS**

90575 Default.

90576 **STDOUT**

90577 The standard output shall be equivalent to the input files with <tab> characters converted into  
90578 the appropriate number of <space> characters.

90579 **STDERR**

90580 The standard error shall be used only for diagnostic messages.

90581 **OUTPUT FILES**

90582 None.

90583 **EXTENDED DESCRIPTION**

90584 None.

90585 **EXIT STATUS**

90586 The following exit values shall be returned:

90587 0 Successful completion

90588 >0 An error occurred.

90589 **CONSEQUENCES OF ERRORS**

90590 The *expand* utility shall terminate with an error message and non-zero exit status upon  
90591 encountering difficulties accessing one of the *file* operands.

90592 **APPLICATION USAGE**

90593 None.

90594 **EXAMPLES**

90595 None.

90596 **RATIONALE**

90597 The *expand* utility is useful for preprocessing text files (before sorting, looking at specific  
90598 columns, and so on) that contain <tab> characters.

90599 See XBD [Section 3.103](#) (on page 50).

90600 The *tablist* option-argument consists of integers in ascending order. Utility Syntax Guideline 8  
90601 mandates that *expand* shall accept the integers (within the single argument) separated using  
90602 either <comma> or <blank> characters.

90603 Earlier versions of this standard allowed the following form in the SYNOPSIS:

90604 `expand [-tabstop][-tab1,tab2,...,tabn][file ...]`

90605 This form is no longer specified by POSIX.1-2008 but may be present in some implementations.

90606 **FUTURE DIRECTIONS**

90607 None.

90608 **SEE ALSO**90609 *tabs, unexpand*90610 XBD [Section 3.103](#) (on page 50), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)90611 **CHANGE HISTORY**

90612 First released in Issue 4.

90613 **Issue 6**

90614 This utility is marked as part of the User Portability Utilities option.

90615 The APPLICATION USAGE section is added.

90616 The obsolescent SYNOPSIS is removed.

90617 The *LC\_CTYPE* environment variable description is updated to align with the IEEE P1003.2b  
90618 draft standard.

90619 The normative text is reworded to avoid use of the term “must” for application requirements.

90620 **Issue 7**

90621 Austin Group Interpretation 1003.1-2001 #027 is applied.

90622 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

90623 The *expand* utility is moved from the User Portability Utilities option to the Base. User  
90624 Portability Utilities is now an option for interactive utilities.

90625 **NAME**90626 `expr` — evaluate arguments as an expression90627 **SYNOPSIS**90628 `expr operand...`90629 **DESCRIPTION**90630 The *expr* utility shall evaluate an expression and write the result to standard output.90631 **OPTIONS**

90632 None.

90633 **OPERANDS**90634 The single expression evaluated by *expr* shall be formed from the *operand* operands, as described  
90635 in the EXTENDED DESCRIPTION section. The application shall ensure that each of the  
90636 expression operator symbols:90637 `( ) | & = > >= < <= != + - * / % :`90638 and the symbols *integer* and *string* in the table are provided as separate arguments to *expr*.90639 **STDIN**

90640 Not used.

90641 **INPUT FILES**

90642 None.

90643 **ENVIRONMENT VARIABLES**90644 The following environment variables shall affect the execution of *expr*:90645 **LANG** Provide a default value for the internationalization variables that are unset or null.  
90646 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
90647 variables used to determine the values of locale categories.)90648 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
90649 internationalization variables.90650 **LC\_COLLATE**90651 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
90652 character collating elements within regular expressions and by the string  
90653 comparison operators.90654 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
90655 characters (for example, single-byte as opposed to multi-byte characters in  
90656 arguments) and the behavior of character classes within regular expressions.90657 **LC\_MESSAGES**90658 Determine the locale that should be used to affect the format and contents of  
90659 diagnostic messages written to standard error.90660 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.90661 **ASYNCHRONOUS EVENTS**

90662 Default.

90663 **STDOUT**90664 The *expr* utility shall evaluate the expression and write the result, followed by a <newline>, to  
90665 standard output.

**STDERR**

The standard error shall be used only for diagnostic messages.

**OUTPUT FILES**

None.

**EXTENDED DESCRIPTION**

The formation of the expression to be evaluated is shown in the following table. The symbols *expr*, *expr1*, and *expr2* represent expressions formed from *integer* and *string* symbols and the expression operator symbols (all separate arguments) by recursive application of the constructs described in the table. The expressions are listed in order of decreasing precedence, with equal-precedence operators grouped between horizontal lines. All of the operators shall be left-associative.

| Expression                                                                                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>integer</i>                                                                                                                                                                            | An argument consisting only of an (optional) unary minus followed by digits.                                                                                                                                                                                                                                                                                                                               |
| <i>string</i>                                                                                                                                                                             | A string argument; see below.                                                                                                                                                                                                                                                                                                                                                                              |
| ( <i>expr</i> )                                                                                                                                                                           | Grouping symbols. Any expression can be placed within parentheses. Parentheses can be nested to a depth of {EXPR_NEST_MAX}.                                                                                                                                                                                                                                                                                |
| <i>expr1</i> : <i>expr2</i>                                                                                                                                                               | Matching expression; see below.                                                                                                                                                                                                                                                                                                                                                                            |
| <i>expr1</i> * <i>expr2</i><br><i>expr1</i> / <i>expr2</i>                                                                                                                                | Multiplication of decimal integer-valued arguments.<br>Integer division of decimal integer-valued arguments, producing an integer result.                                                                                                                                                                                                                                                                  |
| <i>expr1</i> % <i>expr2</i>                                                                                                                                                               | Remainder of integer division of decimal integer-valued arguments.                                                                                                                                                                                                                                                                                                                                         |

| <i>expr1</i>   <i>expr2</i>                                                                                                                                                               | Returns the evaluation of <i>expr1</i> if it is neither null nor zero; otherwise, returns the evaluation of <i>expr2</i> if it is not null; otherwise, zero.                                                                                                                                                                                                                                               |

## Matching Expression

The `' : '` matching operator shall compare the string resulting from the evaluation of *expr1* with the regular expression pattern resulting from the evaluation of *expr2*. Regular expression syntax shall be that defined in XBD [Section 9.3](#) (on page 183), except that all patterns are anchored to the beginning of the string (that is, only sequences starting at the first character of a string are matched by the regular expression) and, therefore, it is unspecified whether `'^'` is a special character in that context. Usually, the matching operator shall return a string representing the number of characters matched (`'0'` on failure). Alternatively, if the pattern contains at least one regular expression subexpression `"[\\(\\.\\.\\.\\)]"`, the string matched by the back-reference expression `"\1"` shall be returned. If the back-reference expression `"\1"` does not match, then the null string shall be returned.

## Identification as Integer or String

An argument or the value of a subexpression that consists only of an optional unary minus followed by digits is a candidate for treatment as an integer if it is used as the left argument to the `|` operator or as either argument to any of the following operators: `& = > >= < <= != + - * / %`. Otherwise, the argument or subexpression value shall be treated as a string.

The use of string arguments **length**, **substr**, **index**, or **match** produces unspecified results.

## EXIT STATUS

The following exit values shall be returned:

- 0 The *expression* evaluates to neither null nor zero.
- 1 The *expression* evaluates to null or zero.
- 2 Invalid *expression*.
- >2 An error occurred.

## CONSEQUENCES OF ERRORS

Default.

## APPLICATION USAGE

The *expr* utility has a rather difficult syntax:

- Many of the operators are also shell control operators or reserved words, so they have to be escaped on the command line.
- Each part of the expression is composed of separate arguments, so liberal usage of `<blank>` characters is required. For example:

| Invalid                   | Valid                          |
|---------------------------|--------------------------------|
| <i>expr</i> 1+2           | <i>expr</i> 1 + 2              |
| <i>expr</i> "1 + 2"       | <i>expr</i> 1 + 2              |
| <i>expr</i> 1 + ( 2 * 3 ) | <i>expr</i> 1 + \ ( 2 \* 3 \ ) |

In many cases, the arithmetic and string features provided as part of the shell command language are easier to use than their equivalents in *expr*. Newly written scripts should avoid *expr* in favor of the new features within the shell; see [Section 2.5](#) (on page 2339) and [Section 2.6.4](#) (on page 2348).

After argument processing by the shell, *expr* is not required to be able to tell the difference between an operator and an operand except by the value. If `"$a"` is `'='`, the command:

```
expr "$a" = '='
```

looks like:

```
expr = = =
```

as the arguments are passed to *expr* (and they all may be taken as the '=' operator). The following works reliably:

```
expr "X$a" = X=
```

Also note that this volume of POSIX.1-2008 permits implementations to extend utilities. The *expr* utility permits the integer arguments to be preceded with a unary minus. This means that an integer argument could look like an option. Therefore, the conforming application must employ the "--" construct of Guideline 10 of XBD [Section 12.2](#) (on page 216) to protect its operands if there is any chance the first operand might be a negative integer (or any string with a leading minus).

For testing string equality the *test* utility is preferred over *expr*, as it is usually implemented as a shell built-in. However, the functionality is not quite the same because the *expr* = and != operators check whether strings collate equally, whereas *test* checks whether they are identical. Therefore, they can produce different results in locales where the collation sequence does not have a total ordering of all characters (see XBD [Section 7.3.2](#), on page 147).

## EXAMPLES

The following command:

```
a=$(expr "$a" + 1)
```

adds 1 to the variable *a*.

The following command, for "\$a" equal to either */usr/abc/file* or just *file*:

```
expr $a : '.*\/(.*\)' \| $a
```

returns the last segment of a pathname (that is, *file*). Applications should avoid the character '/' used alone as an argument; *expr* may interpret it as the division operator.

The following command:

```
expr "//$a" : '.*\/(.*\)'
```

is a better representation of the previous example. The addition of the "/" characters eliminates any ambiguity about the division operator and simplifies the whole expression. Also note that pathnames may contain characters contained in the *IFS* variable and should be quoted to avoid having "\$a" expand into multiple arguments.

The following command:

```
expr "X$VAR" : '.*' - 1
```

returns the number of characters in *VAR*.

## RATIONALE

In an early proposal, EREs were used in the matching expression syntax. This was changed to BREs to avoid breaking historical applications.

The use of a leading <circumflex> in the BRE is unspecified because many historical implementations have treated it as a special character, despite their system documentation. For example:

```
expr foo : ^foo      expr ^foo : ^foo
```

return 3 and 0, respectively, on those systems; their documentation would imply the reverse.

90792 Thus, the anchoring condition is left unspecified to avoid breaking historical scripts relying on  
90793 this undocumented feature.

90794 **FUTURE DIRECTIONS**

90795 None.

90796 **SEE ALSO**

90797 [Section 2.5](#) (on page 2339), [Section 2.6.4](#) (on page 2348)

90800 **CHANGE HISTORY**

90801 First released in Issue 2.

90802 **Issue 5**

90803 The FUTURE DIRECTIONS section is added.

90804 **Issue 6**

90805 The *expr* utility is aligned with the IEEE P1003.2b draft standard, to include resolution of IEEE  
90806 PASC Interpretation 1003.2 #104.

90807 The normative text is reworded to avoid use of the term “must” for application requirements.

90808 **Issue 7**

90809 Austin Group Interpretation 1003.1-2001 #036 is applied, clarifying the behavior for BREs.

90810 The SYNOPSIS and OPERANDS sections are revised to explicitly state that the name of each of  
90811 the operands is *operand*.

**90812 NAME**

90813 false — return false value

**90814 SYNOPSIS**

90815 false

**90816 DESCRIPTION**

90817 The *false* utility shall return with a non-zero exit code.

**90818 OPTIONS**

90819 None.

**90820 OPERANDS**

90821 None.

**90822 STDIN**

90823 Not used.

90852 **CHANGE HISTORY**

90853 First released in Issue 2.

90854 **Issue 6**90855 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/24 is applied, changing the STDERR  
90856 section from “None.” to “Not used.” for alignment with [Section 1.4](#) (on page 2326).

90857 **NAME**90858 `fc` — process the command history list90859 **SYNOPSIS**

```
90860 UP fc [-r] [-e editor] [first [last]]
90861 fc -l [-nr] [first [last]]
90862 fc -s [old=new] [first]
```

90863 **DESCRIPTION**

90864 The `fc` utility shall list, or shall edit and re-execute, commands previously entered to an  
 90865 interactive `sh`.

90866 The command history list shall reference commands by number. The first number in the list is  
 90867 selected arbitrarily. The relationship of a number to its command shall not change except when  
 90868 the user logs in and no other process is accessing the list, at which time the system may reset the  
 90869 numbering to start the oldest retained command at another number (usually 1). When the  
 90870 number reaches an implementation-defined upper limit, which shall be no smaller than the  
 90871 value in `HISTSIZE` or 32767 (whichever is greater), the shell may wrap the numbers, starting the  
 90872 next command with a lower number (usually 1). However, despite this optional wrapping of  
 90873 numbers, `fc` shall maintain the time-ordering sequence of the commands. For example, if four  
 90874 commands in sequence are given the numbers 32766, 32767, 1 (wrapped), and 2 as they are  
 90875 executed, command 32767 is considered the command previous to 1, even though its number is  
 90876 higher.

90877 When commands are edited (when the `-l` option is not specified), the resulting lines shall be  
 90878 entered at the end of the history list and then re-executed by `sh`. The `fc` command that caused the  
 90879 editing shall not be entered into the history list. If the editor returns a non-zero exit status, this  
 90880 shall suppress the entry into the history list and the command re-execution. Any command line  
 90881 variable assignments or redirection operators used with `fc` shall affect both the `fc` command itself  
 90882 as well as the command that results; for example:

```
90883 fc -s -- -l 2>/dev/null
```

90884 reinvokes the previous command, suppressing standard error for both `fc` and the previous  
 90885 command.

90886 **OPTIONS**

90887 The `fc` utility shall conform to XBD [Section 12.2](#) (on page 216).

90888 The following options shall be supported:

- 90889 **-e editor** Use the editor named by *editor* to edit the commands. The *editor* string is a utility  
 90890 name, subject to search via the `PATH` variable (see XBD [Chapter 8](#), on page 173).  
 90891 The value in the `FCEDIT` variable shall be used as a default when `-e` is not  
 90892 specified. If `FCEDIT` is null or unset, `ed` shall be used as the editor.
- 90893 **-l** (The letter ell.) List the commands rather than invoking an editor on them. The  
 90894 commands shall be written in the sequence indicated by the *first* and *last* operands,  
 90895 as affected by `-r`, with each command preceded by the command number.
- 90896 **-n** Suppress command numbers when listing with `-l`.
- 90897 **-r** Reverse the order of the commands listed (with `-l`) or edited (with neither `-l` nor  
 90898 `-s`).

90939 **STDIN**

90940 Not used.

90941 **INPUT FILES**

90942 None.

90943 **ENVIRONMENT VARIABLES**90944 The following environment variables shall affect the execution of *fc*:

90945 *FCEDIT* This variable, when expanded by the shell, shall determine the default value for  
 90946 the *-e editor* option's *editor* option-argument. If *FCEDIT* is null or unset, *ed* shall be  
 90947 used as the editor.

90948 *HISTFILE* Determine a pathname naming a command history file. If the *HISTFILE* variable is  
 90949 not set, the shell may attempt to access or create a file *.sh\_history* in the directory  
 90950 referred to by the *HOME* environment variable. If the shell cannot obtain both read  
 90951 and write access to, or create, the history file, it shall use an unspecified  
 90952 mechanism that allows the history to operate properly. (References to history "file"  
 90953 in this section shall be understood to mean this unspecified mechanism in such  
 90954 cases.) An implementation may choose to access this variable only when  
 90955 initializing the history file; this initialization shall occur when *fc* or *sh* first attempt  
 90956 to retrieve entries from, or add entries to, the file, as the result of commands issued  
 90957 by the user, the file named by the *ENV* variable, or implementation-defined system  
 90958 start-up files. In some historical shells, the history file is initialized just after the  
 90959 *ENV* file has been processed. Therefore, it is implementation-defined whether  
 90960 changes made to *HISTFILE* after the history file has been initialized are effective.  
 90961 Implementations may choose to disable the history list mechanism for users with  
 90962 appropriate privileges who do not set *HISTFILE*; the specific circumstances under  
 90963 which this occurs are implementation-defined. If more than one instance of the  
 90964 shell is using the same history file, it is unspecified how updates to the history file  
 90965 from those shells interact. As entries are deleted from the history file, they shall be  
 90966 deleted oldest first. It is unspecified when history file entries are physically  
 90967 removed from the history file.

90968 *HISTSIZE* Determine a decimal number representing the limit to the number of previous  
 90969 commands that are accessible. If this variable is unset, an unspecified default  
 90970 greater than or equal to 128 shall be used. The maximum number of commands in  
 90971 the history list is unspecified, but shall be at least 128. An implementation may  
 90972 choose to access this variable only when initializing the history file, as described  
 90973 under *HISTFILE*. Therefore, it is unspecified whether changes made to *HISTSIZE*  
 90974 after the history file has been initialized are effective.

90975 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 90976 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 90977 variables used to determine the values of locale categories.)

90978 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 90979 internationalization variables.

90980 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 90981 characters (for example, single-byte as opposed to multi-byte characters in  
 90982 arguments and input files).

90983 *LC\_MESSAGES*

90984 Determine the locale that should be used to affect the format and contents of  
 90985 diagnostic messages written to standard error.

90986 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

90987 **ASYNCHRONOUS EVENTS**

90988 Default.

90989 **STDOUT**

90990 When the **-l** option is used to list commands, the format of each command in the list shall be as

90991 follows:

90992 "%d\t%s\n", <line number>, <command>

90993 If both the **-l** and **-n** options are specified, the format of each command shall be:

90994 "\t%s\n", <command>

90995 If the <command> consists of more than one line, the lines after the first shall be displayed as:

90996 "\t%s\n", <continued-command>

90997 **STDERR**

90998 The standard error shall be used only for diagnostic messages.

90999 **OUTPUT FILES**

91000 None.

91001 **EXTENDED DESCRIPTION**

91002 None.

91003 **EXIT STATUS**

91004 The following exit values shall be returned:

91005 0 Successful completion of the listing.

91006 >0 An error occurred.

91007 Otherwise, the exit status shall be that of the commands executed by *fc*.

91008 **CONSEQUENCES OF ERRORS**

91009 Default.

91010 **APPLICATION USAGE**

91011 Since editors sometimes use file descriptors as integral parts of their editing, redirecting their file

91012 descriptors as part of the *fc* command can produce unexpected results. For example, if *vi* is the

91013 *FCEDIT* editor, the command:

91014 *fc -s | more*

91015 does not work correctly on many systems.

91016 Users on windowing systems may want to have separate history files for each window by

91017 setting *HISTFILE* as follows:

91018 *HISTFILE=\$HOME/.sh\_hist\$\$*

91019 **EXAMPLES**

91020 None.

91021 **RATIONALE**

91022 This utility is based on the *fc* built-in of the KornShell.

91023 An early proposal specified the **-e** option as [**-e** *editor* [*old= new* ]], which is not historical

91024 practice. Historical practice in *fc* of either [**-e** *editor*] or [**-e** - [*old= new* ]] is acceptable, but not

91025 both together. To clarify this, a new option **-s** was introduced replacing the [**-e** -]. This resolves

the conflict and makes *fc* conform to the Utility Syntax Guidelines.

**HISTFILE** Some implementations of the KornShell check for the superuser and do not create a history file unless *HISTFILE* is set. This is done primarily to avoid creating unlinked files in the root file system when logging in during single-user mode. *HISTFILE* must be set for the superuser to have history.

**HISTSIZE** Needed to limit the size of history files. It is the intent of the standard developers that when two shells share the same history file, commands that are entered in one shell shall be accessible by the other shell. Because of the difficulties of synchronization over a network, the exact nature of the interaction is unspecified.

The initialization process for the history file can be dependent on the system start-up files, in that they may contain commands that effectively preempt the settings the user has for *HISTFILE* and *HISTSIZE*. For example, function definition commands are recorded in the history file. If the system administrator includes function definitions in some system start-up file called before the *ENV* file, the history file is initialized before the user can influence its characteristics. In some historical shells, the history file is initialized just after the *ENV* file has been processed. Because of these situations, the text requires the initialization process to be implementation-defined.

Consideration was given to omitting the *fc* utility in favor of the command line editing feature in *sh*. For example, in *vi* editing mode, typing "<ESC> v" is equivalent to:

```
EDITOR=vi fc
```

However, the *fc* utility allows the user the flexibility to edit multiple commands simultaneously (such as *fc 10 20*) and to use editors other than those supported by *sh* for command line editing.

In the KornShell, the alias *r* ("re-do") is preset to *fc -e -* (equivalent to the POSIX *fc -s*). This is probably an easier command name to remember than *fc* ("fix command"), but it does not meet the Utility Syntax Guidelines. Renaming *fc* to *hist* or *redo* was considered, but since this description closely matches historical KornShell practice already, such a renaming was seen as gratuitous. Users are free to create aliases whenever odd historical names such as *fc*, *awk*, *cat*, *grep*, or *yacc* are standardized by POSIX.

Command numbers have no ordering effects; they are like serial numbers. The *-r* option and *-number* operand address the sequence of command execution, regardless of serial numbers. So, for example, if the command number wrapped back to 1 at some arbitrary point, there would be no ambiguity associated with traversing the wrap point. For example, if the command history were:

```
32766: echo 1
32767: echo 2
1: echo 3
```

the number *-2* refers to command 32767 because it is the second previous command, regardless of serial number.

## FUTURE DIRECTIONS

None.

*sh*

XBD Chapter 8 (on page 173), Section 12.2 (on page 216)

**91068 CHANGE HISTORY**

91069 First released in Issue 4.

**91070 Issue 5**

91071 The FUTURE DIRECTIONS section is added.

**91072 Issue 6**

91073 This utility is marked as part of the User Portability Utilities option.

91074 In the ENVIRONMENT VARIABLES section, the text “user’s home directory” is updated to  
91075 “directory referred to by the *HOME* environment variable”.

**91076 Issue 7**

91077 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91078 **NAME**91079 `fg` — run jobs in the foreground91080 **SYNOPSIS**91081 UP `fg [job_id]`91082 **DESCRIPTION**

91083 If job control is enabled (see the description of `set -m`), the `fg` utility shall move a background job  
 91084 from the current environment (see [Section 2.12](#), on page 2371) into the foreground.

91085 Using `fg` to place a job into the foreground shall remove its process ID from the list of those  
 91086 “known in the current shell execution environment”; see [Section 2.9.3.1](#) (on page 2360).

91087 **OPTIONS**

91088 None.

91089 **OPERANDS**

91090 The following operand shall be supported:

91091 *job\_id* Specify the job to be run as a foreground job. If no *job\_id* operand is given, the  
 91092 *job\_id* for the job that was most recently suspended, placed in the background, or  
 91093 run as a background job shall be used. The format of *job\_id* is described in XBD  
 91094 [Section 3.204](#) (on page 66).

91095 **STDIN**

91096 Not used.

91097 **INPUT FILES**

91098 None.

91099 **ENVIRONMENT VARIABLES**91100 The following environment variables shall affect the execution of `fg`:

91101 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 91102 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 91103 variables used to determine the values of locale categories.)

91104 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 91105 internationalization variables.

91106 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 91107 characters (for example, single-byte as opposed to multi-byte characters in  
 91108 arguments).

91109 *LC\_MESSAGES*

91110 Determine the locale that should be used to affect the format and contents of  
 91111 diagnostic messages written to standard error.

91112 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.91113 **ASYNCHRONOUS EVENTS**

91114 Default.

91115 **STDOUT**91116 The `fg` utility shall write the command line of the job to standard output in the following format:91117 `"%s\n", <command>`

**91118 STDERR**

91119 The standard error shall be used only for diagnostic messages.

**91120 OUTPUT FILES**

91121 None.

**91122 EXTENDED DESCRIPTION**

91123 None.

**91124 EXIT STATUS**

91125 The following exit values shall be returned:

91126 0 Successful completion.

91127 >0 An error occurred.

**91128 CONSEQUENCES OF ERRORS**

91129 If job control is disabled, the *fg* utility shall exit with an error and no job shall be placed in the  
91130 foreground.

**91131 APPLICATION USAGE**

91132 The *fg* utility does not work as expected when it is operating in its own utility execution  
91133 environment because that environment has no applicable jobs to manipulate. See the  
91134 APPLICATION USAGE section for *bg*. For this reason, *fg* is generally implemented as a shell  
91135 regular built-in.

**91136 EXAMPLES**

91137 None.

**91138 RATIONALE**

91139 The extensions to the shell specified in this volume of POSIX.1-2008 have mostly been based on  
91140 features provided by the KornShell. The job control features provided by *bg*, *fg*, and *jobs* are also  
91141 based on the KornShell. The standard developers examined the characteristics of the C shell  
91142 versions of these utilities and found that differences exist. Despite widespread use of the C shell,  
91143 the KornShell versions were selected for this volume of POSIX.1-2008 to maintain a degree of  
91144 uniformity with the rest of the KornShell features selected (such as the very popular command  
91145 line editing features).

**91146 FUTURE DIRECTIONS**

91147 None.

**91148 SEE ALSO**

91149 [Section 2.9.3.1](#) (on page 2360), [Section 2.12](#) (on page 2371), *bg*, *kill*, *jobs*, *wait*

**91151 CHANGE HISTORY**

91152 First released in Issue 4.

**91153 Issue 6**

91154 This utility is marked as part of the User Portability Utilities option.

91155 The APPLICATION USAGE section is added.

91156 The JC marking is removed from the SYNOPSIS since job control is mandatory in this version.

**NAME**

file — determine file type

**SYNOPSIS**

file [-dh] [-M *file*] [-m *file*] *file*...

file -i [-h] *file*...

**DESCRIPTION**

The *file* utility shall perform a series of tests in sequence on each specified *file* in an attempt to classify it:

1. If *file* does not exist, cannot be read, or its file status could not be determined, the output shall indicate that the file was processed, but that its type could not be determined.
2. If the file is not a regular file, its file type shall be identified. The file types directory, FIFO, socket, block special, and character special shall be identified as such. Other implementation-defined file types may also be identified. If *file* is a symbolic link, by default the link shall be resolved and *file* shall test the type of file referenced by the symbolic link. (See the **-h** and **-i** options below.)
3. If the length of *file* is zero, it shall be identified as an empty file.
4. The *file* utility shall examine an initial segment of *file* and shall make a guess at identifying its contents based on position-sensitive tests. (The answer is not guaranteed to be correct; see the **-d**, **-M**, and **-m** options below.)
5. The *file* utility shall examine *file* and make a guess at identifying its contents based on context-sensitive default system tests. (The answer is not guaranteed to be correct.)
6. The file shall be identified as a data file.

If *file* does not exist, cannot be read, or its file status could not be determined, the output shall indicate that the file was processed, but that its type could not be determined.

If *file* is a symbolic link, by default the link shall be resolved and *file* shall test the type of file referenced by the symbolic link.

**OPTIONS**

The *file* utility shall conform to XBD [Section 12.2](#) (on page 216), except that the order of the **-m**, **-d**, and **-M** options shall be significant.

The following options shall be supported by the implementation:

- |                       |                                                                                                                                                                                                                                                                                                              |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-d</b>             | Apply any position-sensitive default system tests and context-sensitive default system tests to the file. This is the default if no <b>-M</b> or <b>-m</b> option is specified.                                                                                                                              |
| <b>-h</b>             | When a symbolic link is encountered, identify the file as a symbolic link. If <b>-h</b> is not specified and <i>file</i> is a symbolic link that refers to a nonexistent file, <i>file</i> shall identify the file as a symbolic link, as if <b>-h</b> had been specified.                                   |
| <b>-i</b>             | If a file is a regular file, do not attempt to classify the type of the file further, but identify the file as specified in the STDOUT section.                                                                                                                                                              |
| <b>-M <i>file</i></b> | Specify the name of a file containing position-sensitive tests that shall be applied to a file in order to classify it (see the EXTENDED DESCRIPTION). No position-sensitive default system tests nor context-sensitive default system tests shall be applied unless the <b>-d</b> option is also specified. |

91198        **-m file**        Specify the name of a file containing position-sensitive tests that shall be applied to  
 91199                        a file in order to classify it (see the EXTENDED DESCRIPTION).

91200        If the **-m** option is specified without specifying the **-d** option or the **-M** option, position-  
 91201        sensitive default system tests shall be applied after the position-sensitive tests specified by the  
 91202        **-m** option. If the **-M** option is specified with the **-d** option, the **-m** option, or both, or the **-m**  
 91203        option is specified with the **-d** option, the concatenation of the position-sensitive tests specified  
 91204        by these options shall be applied in the order specified by the appearance of these options. If a  
 91205        **-M** or **-m file** option-argument is **-**, the results are unspecified.

## 91206 OPERANDS

91207        The following operand shall be supported:

91208        *file*            A pathname of a file to be tested.

## 91209 STDIN

91210        The standard input shall be used if a *file* operand is **'-'** and the implementation treats the **'-'**  
 91211        as meaning standard input. Otherwise, the standard input shall not be used.

## 91212 INPUT FILES

91213        The *file* can be any file type.

## 91214 ENVIRONMENT VARIABLES

91215        The following environment variables shall affect the execution of *file*:

91216        *LANG*            Provide a default value for the internationalization variables that are unset or null.  
 91217                        (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 91218                        variables used to determine the values of locale categories.)

91219        *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
 91220                        internationalization variables.

91221        *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
 91222                        characters (for example, single-byte as opposed to multi-byte characters in  
 91223                        arguments and input files).

91224        *LC\_MESSAGES*

91225                        Determine the locale that should be used to affect the format and contents of  
 91226                        diagnostic messages written to standard error and informative messages written to  
 91227                        standard output.

91228        *XSI NLSPATH*    Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 91229 ASYNCHRONOUS EVENTS

91230        Default.

## 91231 STDOUT

91232        In the POSIX locale, the following format shall be used to identify each operand, *file* specified:

91233        "%s: %s\n", <file>, <type>

91234        The values for <type> are unspecified, except that in the POSIX locale, if *file* is identified as one  
 91235        of the types listed in the following table, <type> shall contain (but is not limited to) the  
 91236        corresponding string, unless the file is identified by a position-sensitive test specified by a **-M** or  
 91237        **-m** option. Each <space> shown in the strings shall be exactly one <space>.

91238

**Table 4-9** File Utility Output Strings

|       | <b>If <i>file</i> is:</b>                                    | <b>&lt;type&gt; shall contain the string:</b> | <b>Notes</b> |
|-------|--------------------------------------------------------------|-----------------------------------------------|--------------|
| 91239 | Nonexistent                                                  | cannot open                                   |              |
| 91240 |                                                              |                                               |              |
| 91241 | Block special                                                | block special                                 | 1            |
| 91242 | Character special                                            | character special                             | 1            |
| 91243 | Directory                                                    | directory                                     | 1            |
| 91244 | FIFO                                                         | fifo                                          | 1            |
| 91245 | Socket                                                       | socket                                        | 1            |
| 91246 | Symbolic link                                                | symbolic link to                              | 1            |
| 91247 | Regular file                                                 | regular file                                  | 1,2          |
| 91248 | Empty regular file                                           | empty                                         | 3            |
| 91249 | Regular file that cannot be read                             | cannot open                                   | 3            |
| 91250 | Executable binary                                            | executable                                    | 3,4,6        |
| 91251 | <i>ar</i> archive library (see <i>ar</i> )                   | archive                                       | 3,4,6        |
| 91252 | Extended <i>cpio</i> format (see <i>pax</i> )                | cpio archive                                  | 3,4,6        |
| 91253 | Extended <i>tar</i> format (see <b>ustar</b> in <i>pax</i> ) | tar archive                                   | 3,4,6        |
| 91254 | Shell script                                                 | commands text                                 | 3,5,6        |
| 91255 | C-language source                                            | c program text                                | 3,5,6        |
| 91256 | FORTRAN source                                               | fortran program text                          | 3,5,6        |
| 91257 | Regular file whose type cannot be determined                 | data                                          | 3            |

91258

**Notes:**

91259

1. This is a file type test.

91260

2. This test is applied only if the **-i** option is specified.

91261

3. This test is applied only if the **-i** option is not specified.

91262

4. This is a position-sensitive default system test.

91263

5. This is a context-sensitive default system test.

91264

6. Position-sensitive default system tests and context-sensitive default system tests are not applied if the **-M** option is specified unless the **-d** option is also specified.

91265

91266

In the POSIX locale, if *file* is identified as a symbolic link (see the **-h** option), the following alternative output format shall be used:

91267

91268

```
"%s: %s %s\n", <file>, <type>, <contents of link>"
```

91269

If the file named by the *file* operand does not exist, cannot be read, or the type of the file named by the *file* operand cannot be determined, this shall not be considered an error that affects the exit status.

91270

91271

91272

**STDERR**

91273

The standard error shall be used only for diagnostic messages.

91274

**OUTPUT FILES**

91275

None.

## EXTENDED DESCRIPTION

A file specified as an option-argument to the **-m** or **-M** options shall contain one position-sensitive test per line, which shall be applied to the file. If the test succeeds, the message field of the line shall be printed and no further tests shall be applied, with the exception that tests on immediately following lines beginning with a single '**>**' character shall be applied.

Each line shall be composed of the following four <tab>-separated fields. (Implementations may allow any combination of one or more white-space characters other than <newline> to act as field separators.)

*offset*      An unsigned number (optionally preceded by a single '**>**' character) specifying the *offset*, in bytes, of the value in the file that is to be compared against the *value* field of the line. If the file is shorter than the specified offset, the test shall fail.

If the *offset* begins with the character '**>**', the test contained in the line shall not be applied to the file unless the test on the last line for which the *offset* did not begin with a '**>**' was successful. By default, the *offset* shall be interpreted as an unsigned decimal number. With a leading 0x or 0X, the *offset* shall be interpreted as a hexadecimal number; otherwise, with a leading 0, the *offset* shall be interpreted as an octal number.

*type*      The type of the value in the file to be tested. The type shall consist of the type specification characters **d**, **s**, and **u**, specifying signed decimal, string, and unsigned decimal, respectively.

The *type* string shall be interpreted as the bytes from the file starting at the specified *offset* and including the same number of bytes specified by the *value* field. If insufficient bytes remain in the file past the *offset* to match the *value* field, the test shall fail.

The type specification characters **d** and **u** can be followed by an optional unsigned decimal integer that specifies the number of bytes represented by the type. The type specification characters **d** and **u** can be followed by an optional **C**, **S**, **I**, or **L**, indicating that the value is of type **char**, **short**, **int**, or **long**, respectively.

The default number of bytes represented by the type specifiers **d**, **f**, and **u** shall correspond to their respective C-language types as follows. If the system claims conformance to the C-Language Development Utilities option, those specifiers shall correspond to the default sizes used in the *c99* utility. Otherwise, the default sizes shall be implementation-defined.

For the type specifier characters **d** and **u**, the default number of bytes shall correspond to the size of a basic integer type of the implementation. For these specifier characters, the implementation shall support values of the optional number of bytes to be converted corresponding to the number of bytes in the C-language types **char**, **short**, **int**, or **long**. These numbers can also be specified by an application as the characters **C**, **S**, **I**, and **L**, respectively. The byte order used when interpreting numeric values is implementation-defined, but shall correspond to the order in which a constant of the corresponding type is stored in memory on the system.

All type specifiers, except for **s**, can be followed by a mask specifier of the form **&number**. The mask value shall be AND'ed with the value of the input file before the comparison with the *value* field of the line is made. By default, the mask shall be interpreted as an unsigned decimal number. With a leading 0x or 0X, the mask shall be interpreted as an unsigned hexadecimal number; otherwise, with a leading

|       |                   |                                                                                                                  |
|-------|-------------------|------------------------------------------------------------------------------------------------------------------|
| 91323 |                   | 0, the mask shall be interpreted as an unsigned octal number.                                                    |
| 91324 |                   | The strings <b>byte</b> , <b>short</b> , <b>long</b> , and <b>string</b> shall also be supported as type fields, |
| 91325 |                   | being interpreted as dC, dS, dL, and s, respectively.                                                            |
| 91326 | <i>value</i>      | The <i>value</i> to be compared with the value from the file.                                                    |
| 91327 |                   | If the specifier from the type field is s or <b>string</b> , then interpret the value as a string.               |
| 91328 |                   | Otherwise, interpret it as a number. If the value is a string, then the test shall                               |
| 91329 |                   | succeed only when a string value exactly matches the bytes from the file.                                        |
| 91330 |                   | If the <i>value</i> is a string, it can contain the following sequences:                                         |
| 91331 | <i>\character</i> | The <backslash>-escape sequences as specified in XBD Table 5-1                                                   |
| 91332 |                   | (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t',                                                         |
| 91333 |                   | '\v'). In addition, the escape sequence '\ ' (the <backslash>                                                    |
| 91334 |                   | character followed by a <space> character) shall be recognized to                                                |
| 91335 |                   | represent a <space> character. The results of using any other                                                    |
| 91336 |                   | character, other than an octal digit, following the <backslash>                                                  |
| 91337 |                   | are unspecified.                                                                                                 |
| 91338 | <i>\octal</i>     | Octal sequences that can be used to represent characters with                                                    |
| 91339 |                   | specific coded values. An octal sequence shall consist of a                                                      |
| 91340 |                   | <backslash> followed by the longest sequence of one, two, or                                                     |
| 91341 |                   | three octal-digit characters (01234567).                                                                         |
| 91342 |                   | By default, any value that is not a string shall be interpreted as a signed decimal                              |
| 91343 |                   | number. Any such value, with a leading 0x or 0X, shall be interpreted as an                                      |
| 91344 |                   | unsigned hexadecimal number; otherwise, with a leading zero, the value shall be                                  |
| 91345 |                   | interpreted as an unsigned octal number.                                                                         |
| 91346 |                   | If the value is not a string, it can be preceded by a character indicating the                                   |
| 91347 |                   | comparison to be performed. Permissible characters and the comparisons they                                      |
| 91348 |                   | specify are as follows:                                                                                          |
| 91349 | =                 | The test shall succeed if the value from the file equals the <i>value</i> field.                                 |
| 91350 | <                 | The test shall succeed if the value from the file is less than the <i>value</i> field.                           |
| 91351 | >                 | The test shall succeed if the value from the file is greater than the <i>value</i> field.                        |
| 91352 | &                 | The test shall succeed if all of the set bits in the <i>value</i> field are set in the value                     |
| 91353 |                   | from the file.                                                                                                   |
| 91354 | ^                 | The test shall succeed if at least one of the set bits in the <i>value</i> field is not set in                   |
| 91355 |                   | the value from the file.                                                                                         |
| 91356 | x                 | The test shall succeed if the file is large enough to contain a value of the type                                |
| 91357 |                   | specified starting at the offset specified.                                                                      |
| 91358 | <i>message</i>    | The <i>message</i> to be printed if the test succeeds. The <i>message</i> shall be interpreted                   |
| 91359 |                   | using the notation for the <i>printf</i> formatting specification; see <i>printf</i> . If the <i>value</i>       |
| 91360 |                   | field was a string, then the value from the file shall be the argument for the <i>printf</i>                     |
| 91361 |                   | formatting specification; otherwise, the value from the file shall be the argument.                              |

**EXIT STATUS**

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

The *file* utility can only be required to guess at many of the file types because only exhaustive testing can determine some types with certainty. For example, binary data on some implementations might match the initial segment of an executable or a *tar* archive.

Note that the table indicates that the output contains the stated string. Systems may add text before or after the string. For executables, as an example, the machine architecture and various facts about how the file was link-edited may be included. Note also that on systems that recognize shell script files starting with "#!" as executable files, these may be identified as executable binary files rather than as shell scripts.

**EXAMPLES**

Determine whether an argument is a binary executable file:

```
file -- "$1" | grep -q '.*executable' &&  
printf "%s is executable.\n" "$1"
```

**RATIONALE**

The *-f* option was omitted because the same effect can (and should) be obtained using the *xargs* utility.

Historical versions of the *file* utility attempt to identify the following types of files: symbolic link, directory, character special, block special, socket, *tar* archive, *cpio* archive, SCCS archive, archive library, empty, *compress* output, *pack* output, binary data, C source, FORTRAN source, assembler source, *nroff*/*troff*/*eqn*/*tbl* source *troff* output, shell script, C shell script, English text, ASCII text, various executables, APL workspace, compiled terminfo entries, and CURSES screen images. Only those types that are reasonably well specified in POSIX or are directly related to POSIX utilities are listed in the table.

Historical systems have used a "magic file" named */etc/magic* to help identify file types. Because it is generally useful for users and scripts to be able to identify special file types, the *-m* flag and a portable format for user-created magic files has been specified. No requirement is made that an implementation of *file* use this method of identifying files, only that users be permitted to add their own classifying tests.

In addition, three options have been added to historical practice. The *-d* flag has been added to permit users to cause their tests to follow any default system tests. The *-i* flag has been added to permit users to test portably for regular files in shell scripts. The *-M* flag has been added to permit users to ignore any default system tests.

The POSIX.1-2008 description of default system tests and the interaction between the *-d*, *-M*, and *-m* options did not clearly indicate that there were two types of "default system tests". The "position-sensitive tests" determine file types by looking for certain string or binary values at specific offsets in the file being examined. These position-sensitive tests were implemented in historical systems using the magic file described above. Some of these tests are now built into the *file* utility itself on some implementations so the output can provide more detail than can be provided by magic files. For example, a magic file can easily identify a **core** file on most implementations, but cannot name the program file that dropped the core. A magic file could

produce output such as:

```
/home/dwc/core: ELF 32-bit MSB core file SPARC Version 1
```

but by building the test into the *file* utility, you could get output such as:

```
/home/dwc/core: ELF 32-bit MSB core file SPARC Version 1, from 'testprog'
```

These extended built-in tests are still to be treated as position-sensitive default system tests even if they are not listed in */etc/magic* or any other magic file.

The context-sensitive default system tests were always built into the *file* utility. These tests looked for language constructs in text files trying to identify shell scripts, C, FORTRAN, and other computer language source files, and even plain text files. With the addition of the *-m* and *-M* options the distinction between position-sensitive and context-sensitive default system tests became important because the order of testing is important. The context-sensitive system default tests should never be applied before any position-sensitive tests even if the *-d* option is specified before a *-m* option or *-M* option due to the high probability that the context-sensitive system default tests will incorrectly identify arbitrary text files as text files before position-sensitive tests specified by the *-m* or *-M* option would be applied to give a more accurate identification.

Leaving the meaning of *-M* – and *-m* – unspecified allows an existing prototype of these options to continue to work in a backwards-compatible manner. (In that implementation, *-M* – was roughly equivalent to *-d* in POSIX.1-2008.)

The historical *-c* option was omitted as not particularly useful to users or portable shell scripts. In addition, a reasonable implementation of the *file* utility would report any errors found each time the magic file is read.

The historical format of the magic file was the same as that specified by the Rationale in the ISO POSIX-2:1993 standard for the *offset*, *value*, and *message* fields; however, it used less precise type fields than the format specified by the current normative text. The new type field values are a superset of the historical ones.

The following is an example magic file:

```
0 short      070707      cpio archive
0 short      0143561     Byte-swapped cpio archive
0 string     070707      ASCII cpio archive
0 long       0177555     Very old archive
0 short      0177545     Old archive
0 short      017437      Old packed data
0 string     \037\036     Packed data
0 string     \377\037     Compacted data
0 string     \037\235     Compressed data
>2 byte&0x80 >0         Block compressed
>2 byte&0x1f x          %d bits
0 string     \032\001     Compiled Terminfo Entry
0 short      0433         Curses screen image
0 short      0434         Curses screen image
0 string     <ar>         System V Release 1 archive
0 string     !<arch>\n___.SYMDEF Archive random library
0 string     !<arch>      Archive
0 string     ARF_BEGARF   PHIGS clear text archive
0 long       0x137A2950   Scalable OpenFont binary
0 long       0x137A2951   Encrypted scalable OpenFont binary
```

91454 The use of a basic integer data type is intended to allow the implementation to choose a word  
91455 size commonly used by applications on that architecture.

91456 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
91457 but this has been modified in this version.

#### 91458 **FUTURE DIRECTIONS**

91459 None.

#### 91460 **SEE ALSO**

91461 *ar, ls, pax, printf*

91462 XBD [Table 5-1](#) (on page 121), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

#### 91463 **CHANGE HISTORY**

91464 First released in Issue 4.

#### 91465 **Issue 6**

91466 This utility is marked as part of the User Portability Utilities option.

91467 Options and an EXTENDED DESCRIPTION are added as specified in the IEEE P1003.2b draft  
91468 standard.

91469 IEEE PASC Interpretations 1003.2 #192 and #178 are applied.

91470 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/25 is applied, making major changes to  
91471 address ambiguities raised in defect reports.

91472 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/26 is applied, making it clear in the  
91473 OPTIONS section that the **-m**, **-d**, and **-M** options do not comply with Guideline 11 of the  
91474 Utility Syntax Guidelines.

91475 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/10 is applied, clarifying the specification  
91476 characters.

91477 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/11 is applied, allowing application  
91478 developers to create portable magic files that can match characters in strings, and allowing  
91479 common extensions found in existing implementations.

91480 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/12 is applied, removing text describing  
91481 behavior on systems with bytes consisting of more than eight bits.

#### 91482 **Issue 7**

91483 Austin Group Interpretation 1003.1-2001 #092 is applied.

91484 SD5-XCU-ERN-4 is applied, adding further entries in the Notes column in [Table 4-9](#).

91485 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91486 The *file* utility is moved from the User Portability Utilities option to the Base. User Portability  
91487 Utilities is now an option for interactive utilities.

91488 The EXAMPLES section is revised to correct an error with the pathname "\$1".

91489 **NAME**

91490 find — find files

91491 **SYNOPSIS**91492 find [-H|-L] *path...* [*operand\_expression...*]91493 **DESCRIPTION**

91494 The *find* utility shall recursively descend the directory hierarchy from each file specified by *path*,  
 91495 evaluating a Boolean expression composed of the primaries described in the OPERANDS section  
 91496 for each file encountered. Each *path* operand shall be evaluated unaltered as it was provided,  
 91497 including all trailing <slash> characters; all pathnames for other files encountered in the  
 91498 hierarchy shall consist of the concatenation of the current *path* operand, a <slash> if the current  
 91499 *path* operand did not end in one, and the filename relative to the *path* operand. The relative  
 91500 portion shall contain no dot or dot-dot components, no trailing <slash> characters, and only  
 91501 single <slash> characters between pathname components.

91502 The *find* utility shall be able to descend to arbitrary depths in a file hierarchy and shall not fail  
 91503 due to path length limitations (unless a *path* operand specified by the application exceeds  
 91504 {PATH\_MAX} requirements).

91505 The *find* utility shall detect infinite loops; that is, entering a previously visited directory that is an  
 91506 ancestor of the last file encountered. When it detects an infinite loop, *find* shall write a  
 91507 diagnostic message to standard error and shall either recover its position in the hierarchy or  
 91508 terminate.

91509 If a file is removed from or added to the directory hierarchy being searched it is unspecified  
 91510 whether or not *find* includes that file in its search.

91511 **OPTIONS**91512 The *find* utility shall conform to XBD [Section 12.2](#) (on page 216).

91513 The following options shall be supported by the implementation:

91514 **-H** Cause the file information and file type evaluated for each symbolic link  
 91515 encountered as a *path* operand on the command line to be those of the file  
 91516 referenced by the link, and not the link itself. If the referenced file does not exist,  
 91517 the file information and type shall be for the link itself. File information and type  
 91518 for symbolic links encountered during the traversal of a file hierarchy shall be that  
 91519 of the link itself.

91520 **-L** Cause the file information and file type evaluated for each symbolic link  
 91521 encountered as a *path* operand on the command line or encountered during the  
 91522 traversal of a file hierarchy to be those of the file referenced by the link, and not the  
 91523 link itself. If the referenced file does not exist, the file information and type shall be  
 91524 for the link itself.

91525 Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered  
 91526 an error. The last option specified shall determine the behavior of the utility. If neither the **-H**  
 91527 nor the **-L** option is specified, then the file information and type for symbolic links encountered  
 91528 as a *path* operand on the command line or encountered during the traversal of a file hierarchy  
 91529 shall be that of the link itself.

91530 **OPERANDS**

91531 The following operands shall be supported:

91532 The first operand and subsequent operands up to but not including the first operand that starts  
 91533 with a '-', or is a '!' or a '(', shall be interpreted as *path* operands. If the first operand starts  
 91534 with a '-', or is a '!' or a '(', the behavior is unspecified. Each *path* operand is a pathname of

91535 a starting point in the file hierarchy.

91536 The first operand that starts with a `'-'`, or is a `'!'` or a `'('`, and all subsequent arguments shall  
 91537 be interpreted as an *expression* made up of the following primaries and operators. In the  
 91538 descriptions, wherever *n* is used as a primary argument, it shall be interpreted as a decimal  
 91539 integer optionally preceded by a <plus-sign> (`'+'`) or <hyphen-minus> (`'-'`), as follows:

91540 `+n` More than *n*.

91541 `n` Exactly *n*.

91542 `-n` Less than *n*.

91543 The following primaries shall be supported:

91544 `-name pattern`

91545 The primary shall evaluate as true if the basename of the current pathname  
 91546 matches *pattern* using the pattern matching notation described in [Section 2.13](#) (on  
 91547 page 2372). The additional rules in [Section 2.13.3](#) (on page 2373) do not apply as  
 91548 this is a matching operation, not an expansion.

91549 `-path pattern`

91550 The primary shall evaluate as true if the current pathname matches *pattern* using  
 91551 the pattern matching notation described in [Section 2.13](#) (on page 2372). The  
 91552 additional rules in [Section 2.13.3](#) (on page 2373) do not apply as this is a matching  
 91553 operation, not an expansion.

91554 `-nouser` The primary shall evaluate as true if the file belongs to a user ID for which the  
 91555 `getpwuid()` function defined in the System Interfaces volume of POSIX.1-2008 (or  
 91556 equivalent) returns NULL.

91557 `-nogroup` The primary shall evaluate as true if the file belongs to a group ID for which the  
 91558 `getgrgid()` function defined in the System Interfaces volume of POSIX.1-2008 (or  
 91559 equivalent) returns NULL.

91560 `-xdev` The primary shall always evaluate as true; it shall cause *find* not to continue  
 91561 descending past directories that have a different device ID (*st\_dev*, see the *stat()*  
 91562 function defined in the System Interfaces volume of POSIX.1-2008). If any `-xdev`  
 91563 primary is specified, it shall apply to the entire expression even if the `-xdev`  
 91564 primary would not normally be evaluated.

91565 `-prune` The primary shall always evaluate as true; it shall cause *find* not to descend the  
 91566 current pathname if it is a directory. If the `-depth` primary is specified, the `-prune`  
 91567 primary shall have no effect.

91568 `-perm [-]mode`

91569 The *mode* argument is used to represent file mode bits. It shall be identical in  
 91570 format to the *symbolic\_mode* operand described in *chmod*, and shall be interpreted  
 91571 as follows. To start, a template shall be assumed with all file mode bits cleared. An  
 91572 *op* symbol of `'+'` shall set the appropriate mode bits in the template; `'-'` shall  
 91573 clear the appropriate bits; `'='` shall set the appropriate mode bits, without regard  
 91574 to the contents of the file mode creation mask of the process. The *op* symbol of `'-'`  
 91575 cannot be the first character of *mode*; this avoids ambiguity with the optional  
 91576 leading <hyphen-minus>. Since the initial mode is all bits off, there are not any  
 91577 symbolic modes that need to use `'-'` as the first character.

91578 If the <hyphen-minus> is omitted, the primary shall evaluate as true when the file  
 91579 permission bits exactly match the value of the resulting template.

91580 Otherwise, if *mode* is prefixed by a <hyphen-minus>, the primary shall evaluate as  
 91581 true if at least all the bits in the resulting template are set in the file permission bits.

91582 **-perm** [-]*onum*  
 91583 If the <hyphen-minus> is omitted, the primary shall evaluate as true when the file  
 91584 mode bits exactly match the value of the octal number *onum* (see the description of  
 91585 the octal *mode* in *chmod*). Otherwise, if *onum* is prefixed by a <hyphen-minus>, the  
 91586 primary shall evaluate as true if at least all of the bits specified in *onum* are set. In  
 91587 both cases, the behavior is unspecified when *onum* exceeds 07777.

91588 **-type** *c* The primary shall evaluate as true if the type of the file is *c*, where *c* is 'b', 'c',  
 91589 'd', 'l', 'p', 'f', or 's' for block special file, character special file, directory,  
 91590 symbolic link, FIFO, regular file, or socket, respectively.

91591 **-links** *n* The primary shall evaluate as true if the file has *n* links.

91592 **-user** *uname* The primary shall evaluate as true if the file belongs to the user *uname*. If *uname* is  
 91593 a decimal integer and the *getpwnam()* (or equivalent) function does not return a  
 91594 valid user name, *uname* shall be interpreted as a user ID.

91595 **-group** *gname*  
 91596 The primary shall evaluate as true if the file belongs to the group *gname*. If *gname*  
 91597 is a decimal integer and the *getgrnam()* (or equivalent) function does not return a  
 91598 valid group name, *gname* shall be interpreted as a group ID.

91599 **-size** *n*[*c*] The primary shall evaluate as true if the file size in bytes, divided by 512 and  
 91600 rounded up to the next integer, is *n*. If *n* is followed by the character '*c*', the size  
 91601 shall be in bytes.

91602 **-atime** *n* The primary shall evaluate as true if the file access time subtracted from the  
 91603 initialization time, divided by 86 400 (with any remainder discarded), is *n*.

91604 **-ctime** *n* The primary shall evaluate as true if the time of last change of file status  
 91605 information subtracted from the initialization time, divided by 86 400 (with any  
 91606 remainder discarded), is *n*.

91607 **-mtime** *n* The primary shall evaluate as true if the file modification time subtracted from the  
 91608 initialization time, divided by 86 400 (with any remainder discarded), is *n*.

91609 **-exec** *utility\_name* [*argument* ...];  
 91610 **-exec** *utility\_name* [*argument* ...] {} +  
 91611 The end of the primary expression shall be punctuated by a <semicolon> or by a  
 91612 <plus-sign>. Only a <plus-sign> that immediately follows an argument  
 91613 containing only the two characters "{}" shall punctuate the end of the primary  
 91614 expression. Other uses of the <plus-sign> shall not be treated as special.

91615 If the primary expression is punctuated by a <semicolon>, the utility *utility\_name*  
 91616 shall be invoked once for each pathname and the primary shall evaluate as true if  
 91617 the utility returns a zero value as exit status. A *utility\_name* or *argument* containing  
 91618 only the two characters "{}" shall be replaced by the current pathname. If a  
 91619 *utility\_name* or *argument* string contains the two characters "{}", but not just the  
 91620 two characters "{}", it is implementation-defined whether *find* replaces those two  
 91621 characters or uses the string without change.

91622 If the primary expression is punctuated by a <plus-sign>, the primary shall always  
 91623 evaluate as true, and the pathnames for which the primary is evaluated shall be  
 91624 aggregated into sets. The utility *utility\_name* shall be invoked once for each set of  
 91625 aggregated pathnames. Each invocation shall begin after the last pathname in the

set is aggregated, and shall be completed before the *find* utility exits and before the first pathname in the next set (if any) is aggregated for this primary, but it is otherwise unspecified whether the invocation occurs before, during, or after the evaluations of other primaries. If any invocation returns a non-zero value as exit status, the *find* utility shall return a non-zero exit status. An argument containing only the two characters "{}" shall be replaced by the set of aggregated pathnames, with each pathname passed as a separate argument to the invoked utility in the same order that it was aggregated. The size of any set of two or more pathnames shall be limited such that execution of the utility does not cause the system's {ARG\_MAX} limit to be exceeded. If more than one argument containing the two characters "{}" is present, the behavior is unspecified.

The current directory for the invocation of *utility\_name* shall be the same as the current directory when the *find* utility was started. If the *utility\_name* names any of the special built-in utilities (see [Section 2.14](#), on page 2374), the results are undefined.

**-ok** *utility\_name* [*argument* ...];

The **-ok** primary shall be equivalent to **-exec**, except that the use of a <plus-sign> to punctuate the end of the primary expression need not be supported, and *find* shall request affirmation of the invocation of *utility\_name* using the current file as an argument by writing to standard error as described in the STDERR section. If the response on standard input is affirmative, the utility shall be invoked. Otherwise, the command shall not be invoked and the value of the **-ok** operand shall be false.

**-print** The primary shall always evaluate as true; it shall cause the current pathname to be written to standard output.

**-newer** *file* The primary shall evaluate as true if the modification time of the current file is more recent than the modification time of the file named by the pathname *file*.

**-depth** The primary shall always evaluate as true; it shall cause descent of the directory hierarchy to be done so that all entries in a directory are acted on before the directory itself. If a **-depth** primary is not specified, all entries in a directory shall be acted on after the directory itself. If any **-depth** primary is specified, it shall apply to the entire expression even if the **-depth** primary would not normally be evaluated.

The primaries can be combined using the following operators (in order of decreasing precedence):

( *expression* ) True if *expression* is true.

! *expression* Negation of a primary; the unary NOT operator.

*expression* [-a] *expression*

Conjunction of primaries; the AND operator is implied by the juxtaposition of two primaries or made explicit by the optional **-a** operator. The second expression shall not be evaluated if the first expression is false.

*expression* -o *expression*

Alternation of primaries; the OR operator. The second expression shall not be evaluated if the first expression is true.

If no *expression* is present, **-print** shall be used as the expression. Otherwise, if the given expression does not contain any of the primaries **-exec**, **-ok**, or **-print**, the given expression

91672 shall be effectively replaced by:  
 91673 ( *given\_expression* ) -print

91674 The **-user**, **-group**, and **-newer** primaries each shall evaluate their respective arguments only  
 91675 once.

91676 When the file type evaluated for the current file is a symbolic link, the results of evaluating the  
 91677 **-perm** primary are implementation-defined.

#### 91678 STDIN

91679 If the **-ok** primary is used, the response shall be read from the standard input. An entire line  
 91680 shall be read as the response. Otherwise, the standard input shall not be used.

#### 91681 INPUT FILES

91682 None.

#### 91683 ENVIRONMENT VARIABLES

91684 The following environment variables shall affect the execution of *find*:

91685 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 91686 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 91687 variables used to determine the values of locale categories.)

91688 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 91689 internationalization variables.

91690 **LC\_COLLATE**

91691 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 91692 character collating elements used in the pattern matching notation for the **-n**  
 91693 option and in the extended regular expression defined for the **yesexpr** locale  
 91694 keyword in the **LC\_MESSAGES** category.

91695 **LC\_CTYPE** This variable determines the locale for the interpretation of sequences of bytes of  
 91696 text data as characters (for example, single-byte as opposed to multi-byte  
 91697 characters in arguments), the behavior of character classes within the pattern  
 91698 matching notation used for the **-n** option, and the behavior of character classes  
 91699 within regular expressions used in the extended regular expression defined for the  
 91700 **yesexpr** locale keyword in the **LC\_MESSAGES** category.

91701 **LC\_MESSAGES**

91702 Determine the locale used to process affirmative responses, and the locale used to  
 91703 affect the format and contents of diagnostic messages and prompts written to  
 91704 standard error.

91705 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

91706 **PATH** Determine the location of the *utility\_name* for the **-exec** and **-ok** primaries, as  
 91707 described in XBD [Chapter 8](#) (on page 173).

#### 91708 ASYNCHRONOUS EVENTS

91709 Default.

#### 91710 STDOUT

91711 The **-print** primary shall cause the current pathnames to be written to standard output. The  
 91712 format shall be:

91713 "%s\n", <path>

91714 **STDERR**

91715 The **-ok** primary shall write a prompt to standard error containing at least the *utility\_name* to be  
 91716 invoked and the current pathname. In the POSIX locale, the last non-`<blank>` in the prompt shall  
 91717 be `' ? '`. The exact format used is unspecified.

91718 Otherwise, the standard error shall be used only for diagnostic messages.

91719 **OUTPUT FILES**

91720 None.

91721 **EXTENDED DESCRIPTION**

91722 None.

91723 **EXIT STATUS**

91724 The following exit values shall be returned:

91725 0 All *path* operands were traversed successfully.

91726 >0 An error occurred.

91727 **CONSEQUENCES OF ERRORS**

91728 Default.

91729 **APPLICATION USAGE**

91730 When used in operands, pattern matching notation, `<semicolon>`, `<left-parenthesis>`, and  
 91731 `<right-parenthesis>` characters are special to the shell and must be quoted (see [Section 2.2](#), on  
 91732 page 2336).

91733 The bit that is traditionally used for sticky (historically 01000) is specified in the **-perm** primary  
 91734 using the octal number argument form. Since this bit is not defined by this volume of  
 91735 POSIX.1-2008, applications must not assume that it actually refers to the traditional sticky bit.

91736 **EXAMPLES**

91737 1. The following commands are equivalent:

91738 `find .`  
 91739 `find . -print`

91740 They both write out the entire directory hierarchy from the current directory.

91741 2. The following command:

91742 `find / \( -name tmp -o -name '*.xx' \) -atime +7 -exec rm {} \;`

91743 removes all files named **tmp** or ending in **.xx** that have not been accessed for seven or  
 91744 more 24-hour periods.

91745 3. The following command:

91746 `find . -perm -o+w,+s`

91747 prints (**-print** is assumed) the names of all files in or below the current directory, with all  
 91748 of the file permission bits **S\_ISUID**, **S\_ISGID**, and **S\_IWOTH** set.

91749 4. The following command:

91750 `find . -name SCCS -prune -o -print`

91751 recursively prints pathnames of all files in the current directory and below, but skips  
 91752 directories named **SCCS** and files in them.

5. The following command:

```
find . -print -name SCCS -prune
```

behaves as in the previous example, but prints the names of the SCCS directories.

6. The following command is roughly equivalent to the **-nt** extension to *test*:

```
if [ -n "$(find file1 -prune -newer file2)" ]; then
    printf %s\\n "file1 is newer than file2"
fi
```

7. The descriptions of **-atime**, **-ctime**, and **-mtime** use the terminology *n* “86 400 second periods (days)”. For example, a file accessed at 23:59 is selected by:

```
find . -atime -1 -print
```

at 00:01 the next day (less than 24 hours later, not more than one day ago); the midnight boundary between days has no effect on the 24-hour calculation.

8. The following command:

```
find . ! -name . -prune -name '*.old' -exec \
    sh -c 'mv "$@" ../old/' sh {} +
```

performs the same task as:

```
mv /*.old ../old /*.old ../old/
```

while avoiding an “Argument list too long” error if there are a large number of files ending with **.old** and without running *mv* if there are no such files (and avoiding “No such file or directory” errors if **./old** does not exist or no files match **/\*.old** or **./.\*.old**).

The alternative:

```
find . ! -name . -prune -name '*.old' -exec mv {} ../old/ \;
```

is less efficient if there are many files to move because it executes one *mv* command per file.

9. On systems configured to mount removable media on directories under **/media**, the following command searches the file hierarchy for files larger than 100 000 KB without searching any mounted removable media:

```
find / -path /media -prune -o -size +200000 -print
```

10. Except for the root directory, and **"/"** on implementations where **"/"** does not refer to the root directory, no pattern given to **-name** will match a **<slash>**, because trailing **<slash>** characters are ignored when computing the basename of the file under evaluation. Given two empty directories named **foo** and **bar**, the following command:

```
find foo/// bar/// -name foo -o -name 'bar?*'
```

prints only the line **foo///**.

## RATIONALE

The **-a** operator was retained as an optional operator for compatibility with historical shell scripts, even though it is redundant with expression concatenation.

The descriptions of the **'-'** modifier on the *mode* and *onum* arguments to the **-perm** primary agree with historical practice on BSD and System V implementations. System V and BSD documentation both describe it in terms of checking additional bits; in fact, it uses the same bits, but checks for having at least all of the matching bits set instead of having exactly the matching

bits set.

The exact format of the interactive prompts is unspecified. Only the general nature of the contents of prompts are specified because:

- Implementations may desire more descriptive prompts than those used on historical implementations.
- Since the historical prompt strings do not terminate with <newline> characters, there is no portable way for another program to interact with the prompts of this utility via pipes.

Therefore, an application using this prompting option relies on the system to provide the most suitable dialog directly with the user, based on the general guidelines specified.

The **-name** *file* operand was changed to use the shell pattern matching notation so that *find* is consistent with other utilities using pattern matching.

The **-size** operand refers to the size of a file, rather than the number of blocks it may occupy in the file system. The intent is that the *st\_size* field defined in the System Interfaces volume of POSIX.1-2008 should be used, not the *st\_blocks* found in historical implementations. There are at least two reasons for this:

1. In both System V and BSD, *find* only uses *st\_size* in size calculations for the operands specified by this volume of POSIX.1-2008. (BSD uses *st\_blocks* only when processing the **-ls** primary.)
2. Users usually think of file size in terms of bytes, which is also the unit used by the *ls* utility for the output from the **-l** option. (In both System V and BSD, *ls* uses *st\_size* for the **-l** option size field and uses *st\_blocks* for the *ls -s* calculations. This volume of POSIX.1-2008 does not specify *ls -s*.)

The descriptions of **-atime**, **-ctime**, and **-mtime** were changed from the SVID description of *n* "days" to *n* being the result of the integer division of the time difference in seconds by 86 400. The description is also different in terms of the exact timeframe for the *n* case (*versus* the *+n* or *-n*), but it matches all known historical implementations. It refers to one 86 400 second period in the past, not any time from the beginning of that period to the current time. For example, **-atime 2** is true if the file was accessed any time in the period from 72 hours to 48 hours ago.

Historical implementations do not modify "{ }" when it appears as a substring of an **-exec** or **-ok** *utility\_name* or argument string. There have been numerous user requests for this extension, so this volume of POSIX.1-2008 allows the desired behavior. At least one recent implementation does support this feature, but encountered several problems in managing memory allocation and dealing with multiple occurrences of "{ }" in a string while it was being developed, so it is not yet required behavior.

Assuming the presence of **-print** was added to correct a historical pitfall that plagues novice users, it is entirely upwards-compatible from the historical System V *find* utility. In its simplest form (*find directory*), it could be confused with the historical BSD fast *find*. The BSD developers agreed that adding **-print** as a default expression was the correct decision and have added the fast *find* functionality within a new utility called *locate*.

Historically, the **-L** option was implemented using the primary **-follow**. The **-H** and **-L** options were added for two reasons. First, they offer a finer granularity of control and consistency with other programs that walk file hierarchies. Second, the **-follow** primary always evaluated to true. As they were historically really global variables that took effect before the traversal began, some valid expressions had unexpected results. An example is the expression **-print -o -follow**. Because **-print** always evaluates to true, the standard order of evaluation implies that **-follow** would never be evaluated. This was never the case. Historical practice for the **-follow** primary,

however, is not consistent. Some implementations always follow symbolic links on the command line whether **-follow** is specified or not. Others follow symbolic links on the command line only if **-follow** is specified. Both behaviors are provided by the **-H** and **-L** options, but scripts using the current **-follow** primary would be broken if the **-follow** option is specified to work either way.

Since the `-L` option resolves all symbolic links and the `-type l` primary is true for symbolic links that still exist after symbolic links have been resolved, the command:

```
find -L . -type l
```

prints a list of symbolic links reachable from the current directory that do not resolve to accessible files.

A feature of SVR4's *find* utility was the **-exec** primary's + terminator. This allowed filenames containing special characters (especially <newline> characters) to be grouped together without the problems that occur if such filenames are piped to *xargs*. Other implementations have added other ways to get around this problem, notably a **-print0** primary that wrote filenames with a null byte terminator. This was considered here, but not adopted. Using a null terminator meant that any utility that was going to process *find*'s **-print0** output had to add a new option to parse the null terminators it would now be reading.

The "-exec ... {} +" syntax adopted was a result of IEEE PASC Interpretation 1003.2 #210. It should be noted that this is an incompatible change to IEEE Std 1003.2-1992. For example, the following command printed all files with a '-' after their name if they are regular files, and a '+' otherwise:

```
find / -type f -exec echo {} - ';' -o -exec echo {} + ';' 2>/dev/null
```

The change invalidates usage like this. Even though the previous standard stated that this usage would work, in practice many did not support it and the standard developers felt it better to now state that this was not allowable.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 2.

## Issue 5

The FUTURE DIRECTIONS section is added.

## Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **-perm** [-]onum primary is supported.

The *find* utility is aligned with the IEEE P1003.2b draft standard, to include processing of symbolic links and changes to the description of the **atime**, **ctime**, and **mtime** operands.

IEEE PASC Interpretation 1003.2 #210 is applied, extending the `-exec` operand.

91883 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/13 is applied, updating the RATIONALE  
91884 section to be consistent with the normative text.

91885 **Issue 7**

91886 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
91887 *LC\_MESSAGES* environment variable.

91888 Austin Group Interpretation 1003.1-2001 #127 is applied, rephrasing the description of the **-exec**  
91889 primary to be “immediately follows”.

91890 Austin Group Interpretation 1003.1-2001 #185 is applied, clarifying the requirements for the **-H**  
91891 and **-L** options.

91892 Austin Group Interpretation 1003.1-2001 #186 is applied, clarifying the requirements for the  
91893 evaluation of *path* operands.

91894 Austin Group Interpretation 1003.1-2001 #195 is applied, clarifying the interpretation of the first  
91895 operand.

91896 SD5-XCU-ERN-48 is applied, clarifying the **-L** option in the case that the referenced file does not  
91897 exist.

91898 SD5-XCU-ERN-89 is applied, updating the OPERANDS section.

91899 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91900 SD5-XCU-ERN-117 is applied, clarifying the **-perm** operand.

91901 SD5-XCU-ERN-122 is applied, adding a new EXAMPLE.

91902 The description of the **-name** primary is revised and the **-path** primary is added (with a new  
91903 example).

91904 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0086 [365], XCU/TC1-2008/0087  
91905 [310], XCU/TC1-2008/0088 [309,310,430], XCU/TC1-2008/0089 [235], and XCU/TC1-2008/0090  
91906 [445] are applied.

91907 **NAME**

91908 fold — filter for folding lines

91909 **SYNOPSIS**91910 fold [-bs] [-w *width*] [*file...*]91911 **DESCRIPTION**

91912 The *fold* utility is a filter that shall fold lines from its input files, breaking the lines to have a  
 91913 maximum of *width* column positions (or bytes, if the **-b** option is specified). Lines shall be  
 91914 broken by the insertion of a <newline> such that each output line (referred to later in this section  
 91915 as a *segment*) is the maximum width possible that does not exceed the specified number of  
 91916 column positions (or bytes). A line shall not be broken in the middle of a character. The behavior  
 91917 is undefined if *width* is less than the number of columns any single character in the input would  
 91918 occupy.

91919 If the <carriage-return>, <backspace>, or <tab> characters are encountered in the input, and the  
 91920 **-b** option is not specified, they shall be treated specially:

91921 <backspace> The current count of line width shall be decremented by one, although the count  
 91922 never shall become negative. The *fold* utility shall not insert a <newline>  
 91923 immediately before or after any <backspace>, unless the following character has a  
 91924 width greater than 1 and would cause the line width to exceed *width*.

91925 <carriage-return>  
 91926 The current count of line width shall be set to zero. The *fold* utility shall not insert a  
 91927 <newline> immediately before or after any <carriage-return>.

91928 <tab> Each <tab> encountered shall advance the column position pointer to the next tab  
 91929 stop. Tab stops shall be at each column position *n* such that *n* modulo 8 equals 1.

91930 **OPTIONS**91931 The *fold* utility shall conform to XBD [Section 12.2](#) (on page 216).

91932 The following options shall be supported:

91933 **-b** Count *width* in bytes rather than column positions.

91934 **-s** If a segment of a line contains a <blank> within the first *width* column positions (or  
 91935 bytes), break the line after the last such <blank> meeting the width constraints. If  
 91936 there is no <blank> meeting the requirements, the **-s** option shall have no effect for  
 91937 that output segment of the input line.

91938 **-w *width*** Specify the maximum line length, in column positions (or bytes if **-b** is specified).  
 91939 The results are unspecified if *width* is not a positive decimal number. The default  
 91940 value shall be 80.

91941 **OPERANDS**

91942 The following operand shall be supported:

91943 *file* A pathname of a text file to be folded. If no *file* operands are specified, the standard  
 91944 input shall be used.

91945 **STDIN**

91946 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 91947 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 91948 the standard input shall not be used. See the INPUT FILES section.

91949 **INPUT FILES**

91950 If the **-b** option is specified, the input files shall be text files except that the lines are not limited  
 91951 to {LINE\_MAX} bytes in length. If the **-b** option is not specified, the input files shall be text files.

91952 **ENVIRONMENT VARIABLES**

91953 The following environment variables shall affect the execution of *fold*:

91954 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 91955 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 91956 variables used to determine the values of locale categories.)

91957 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 91958 internationalization variables.

91959 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 91960 characters (for example, single-byte as opposed to multi-byte characters in  
 91961 arguments and input files), and for the determination of the width in column  
 91962 positions each character would occupy on a constant-width font output device.

91963 **LC\_MESSAGES**  
 91964 Determine the locale that should be used to affect the format and contents of  
 91965 diagnostic messages written to standard error.

91966 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

91967 **ASYNCHRONOUS EVENTS**

91968 Default.

91969 **STDOUT**

91970 The standard output shall be a file containing a sequence of characters whose order shall be  
 91971 preserved from the input files, possibly with inserted <newline> characters.

91972 **STDERR**

91973 The standard error shall be used only for diagnostic messages.

91974 **OUTPUT FILES**

91975 None.

91976 **EXTENDED DESCRIPTION**

91977 None.

91978 **EXIT STATUS**

91979 The following exit values shall be returned:

91980 0 All input files were processed successfully.

91981 >0 An error occurred.

91982 **CONSEQUENCES OF ERRORS**

91983 Default.

**APPLICATION USAGE**

The *cut* and *fold* utilities can be used to create text files out of files with arbitrary line lengths. The *cut* utility should be used when the number of lines (or records) needs to remain constant. The *fold* utility should be used when the contents of long lines need to be kept contiguous.

The *fold* utility is frequently used to send text files to printers that truncate, rather than fold, lines wider than the printer is able to print (usually 80 or 132 column positions).

**EXAMPLES**

An example invocation that submits a file of possibly long lines to the printer (under the assumption that the user knows the line width of the printer to be assigned by *lp*):

```
fold -w 132 bigfile | lp
```

**RATIONALE**

Although terminal input in canonical processing mode requires the erase character (frequently set to <backspace>) to erase the previous character (not byte or column position), terminal output is not buffered and is extremely difficult, if not impossible, to parse correctly; the interpretation depends entirely on the physical device that actually displays/prints/stores the output. In all known internationalized implementations, the utilities producing output for mixed column-width output assume that a <backspace> character backs up one column position and outputs enough <backspace> characters to return to the start of the character when <backspace> is used to provide local line motions to support underlining and emboldening operations. Since *fold* without the **-b** option is dealing with these same constraints, <backspace> is always treated as backing up one column position rather than backing up one character.

Historical versions of the *fold* utility assumed 1 byte was one character and occupied one column position when written out. This is no longer always true. Since the most common usage of *fold* is believed to be folding long lines for output to limited-length output devices, this capability was preserved as the default case. The **-b** option was added so that applications could *fold* files with arbitrary length lines into text files that could then be processed by the standard utilities. Note that although the width for the **-b** option is in bytes, a line is never split in the middle of a character. (It is unspecified what happens if a width is specified that is too small to hold a single character found in the input followed by a <newline>.)

The tab stops are hardcoded to be every eighth column to meet historical practice. No new method of specifying other tab stops was invented.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 4.

**Issue 6**

The normative text is reworded to avoid use of the term “must” for application requirements.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #092 is applied.

92026 Austin Group Interpretation 1003.1-2001 #204 is applied, updating the DESCRIPTION to clarify  
92027 when a <newline> can be inserted before or after a <backspace>.  
92028 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

92029 **NAME**92030 fort77 — FORTRAN compiler (**FORTRAN**)92031 **SYNOPSIS**

```
92032 OB FD fort77 [-c] [-g] [-L directory]... [-O optlevel] [-o outfile] [-s]
92033          [-w] operand...
```

92034 **DESCRIPTION**

92035 The *fort77* utility is the interface to the FORTRAN compilation system; it shall accept the full  
 92036 FORTRAN-77 language defined by the ANSI X3.9-1978 standard. The system conceptually  
 92037 consists of a compiler and link editor. The files referenced by *operands* are compiled and linked  
 92038 to produce an executable file. It is unspecified whether the linking occurs entirely within the  
 92039 operation of *fort77*; some implementations may produce objects that are not fully resolved until  
 92040 the file is executed.

92041 If the *-c* option is present, for all pathname operands of the form *file.f*, the files:

92042  $\$(\text{basename } \textit{pathname.f}) .o$

92043 shall be created or overwritten as the result of successful compilation. If the *-c* option is not  
 92044 specified, it is unspecified whether such *.o* files are created or deleted for the *file.f* operands.

92045 If there are no options that prevent link editing (such as *-c*) and all operands compile and link  
 92046 without error, the resulting executable file shall be written into the file named by the *-o* option  
 92047 (if present) or to the file **a.out**. The executable file shall be created as specified in the System  
 92048 Interfaces volume of POSIX.1-2008, except that the file permissions shall be set to:

92049  $S\_IRWXO \mid S\_IRWXG \mid S\_IRWXU$

92050 and that the bits specified by the *umask* of the process shall be cleared.

92051 **OPTIONS**

92052 The *fort77* utility shall conform to XBD [Section 12.2](#) (on page 216), except that:

- 92053 • The *-l library* operands have the format of options, but their position within a list of  
 92054 operands affects the order in which libraries are searched.
- 92055 • The order of specifying the multiple *-L* options is significant.
- 92056 • Conforming applications shall specify each option separately; that is, grouping option  
 92057 letters (for example, *-cg*) need not be recognized by all implementations.

92058 The following options shall be supported:

- 92059 *-c* Suppress the link-edit phase of the compilation, and do not remove any object files  
 92060 that are produced.
- 92061 *-g* Produce symbolic information in the object or executable files; the nature of this  
 92062 information is unspecified, and may be modified by implementation-defined  
 92063 interactions with other options.
- 92064 *-s* Produce object or executable files, or both, from which symbolic and other  
 92065 information not required for proper execution using the *exec* family of functions  
 92066 defined in the System Interfaces volume of POSIX.1-2008 has been removed  
 92067 (stripped). If both *-g* and *-s* options are present, the action taken is unspecified.
- 92068 *-o outfile* Use the pathname *outfile*, instead of the default **a.out**, for the executable file  
 92069 produced. If the *-o* option is present with *-c*, the result is unspecified.

92070        **-L *directory***    Change the algorithm of searching for the libraries named in **-I** operands to look in  
 92071                            the *directory* named by the *directory* pathname before looking in the usual places.  
 92072                            Directories named in **-L** options shall be searched in the specified order. At least  
 92073                            ten instances of this option shall be supported in a single *fort77* command  
 92074                            invocation. If a directory specified by a **-L** option contains a file named **libf.a**, the  
 92075                            results are unspecified.

92076        **-O *optlevel***    Specify the level of code optimization. If the *optlevel* option-argument is the digit  
 92077                            '0', all special code optimizations shall be disabled. If it is the digit '1', the  
 92078                            nature of the optimization is unspecified. If the **-O** option is omitted, the nature of  
 92079                            the system's default optimization is unspecified. It is unspecified whether code  
 92080                            generated in the presence of the **-O 0** option is the same as that generated when  
 92081                            **-O** is omitted. Other *optlevel* values may be supported.

92082        **-w**                Suppress warnings.

92083        Multiple instances of **-L** options can be specified.

## 92084 OPERANDS

92085        An *operand* is either in the form of a pathname or the form **-I *library***. At least one operand of the  
 92086        pathname form shall be specified. The following operands shall be supported:

92087        *file.f*              The pathname of a FORTRAN source file to be compiled and optionally passed to  
 92088                            the link editor. The filename operand shall be of this form if the **-c** option is used.

92089        *file.a*              A library of object files typically produced by *ar*, and passed directly to the link  
 92090                            editor. Implementations may recognize implementation-defined suffixes other  
 92091                            than **.a** as denoting object file libraries.

92092        *file.o*              An object file produced by *fort77 -c* and passed directly to the link editor.  
 92093                            Implementations may recognize implementation-defined suffixes other than **.o** as  
 92094                            denoting object files.

92095        The processing of other files is implementation-defined.

92096        **-I *library***        (The letter ell.) Search the library named:

92097                            *liblibrary.a*

92098                            A library is searched when its name is encountered, so the placement of a **-I**  
 92099                            operand is significant. Several standard libraries can be specified in this manner, as  
 92100                            described in the EXTENDED DESCRIPTION section. Implementations may  
 92101                            recognize implementation-defined suffixes other than **.a** as denoting libraries.

## 92102 STDIN

92103        Not used.

## 92104 INPUT FILES

92105        The input file shall be one of the following: a text file containing FORTRAN source code; an  
 92106        object file in the format produced by *fort77 -c*; or a library of object files, in the format produced  
 92107        by archiving zero or more object files, using *ar*. Implementations may supply additional utilities  
 92108        that produce files in these formats. Additional input files are implementation-defined.

92109        A <tab> encountered within the first six characters on a line of source code shall cause the  
 92110        compiler to interpret the following character as if it were the seventh character on the line (that  
 92111        is, in column 7).

92112 **ENVIRONMENT VARIABLES**92113 The following environment variables shall affect the execution of *fort77*:

92114 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 92115 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 92116 variables used to determine the values of locale categories.)

92117 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 92118 internationalization variables.

92119 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 92120 characters (for example, single-byte as opposed to multi-byte characters in  
 92121 arguments and input files).

92122 **LC\_MESSAGES**

92123 Determine the locale that should be used to affect the format and contents of  
 92124 diagnostic messages written to standard error.

92125 **XSI NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

92126 **TMPDIR** Determine the pathname that should override the default directory for temporary  
 92127 files, if any.

92128 **ASYNCHRONOUS EVENTS**

92129 Default.

92130 **STDOUT**

92131 Not used.

92132 **STDERR**

92133 The standard error shall be used only for diagnostic messages. If more than one *file* operand  
 92134 ending in *.f* (or possibly other unspecified suffixes) is given, for each such file:

92135 "%s:\n", *<file>*

92136 may be written to allow identification of the diagnostic message with the appropriate input file.

92137 This utility may produce warning messages about certain conditions that do not warrant  
 92138 returning an error (non-zero) exit value.

92139 **OUTPUT FILES**

92140 Object files, listing files, and executable files shall be produced in unspecified formats.

92141 **EXTENDED DESCRIPTION**92142 **Standard Libraries**92143 The *fort77* utility shall recognize the following **-l** operand for the standard library:

92144 **-l f** This library contains all functions referenced in the ANSI X3.9-1978 standard. This  
 92145 operand shall not be required to be present to cause a search of this library.

92146 In the absence of options that inhibit invocation of the link editor, such as **-c**, the *fort77* utility  
 92147 shall cause the equivalent of a **-l f** operand to be passed to the link editor as the last **-l** operand,  
 92148 causing it to be searched after all other object files and libraries are loaded.

92149 It is unspecified whether the library **libf.a** exists as a regular file. The implementation may  
 92150 accept as **-l** operands names of objects that do not exist as regular files.

## External Symbols

The FORTRAN compiler and link editor shall support the significance of external symbols up to a length of at least 31 bytes; case folding is permitted. The action taken upon encountering symbols exceeding the implementation-defined maximum symbol length is unspecified.

The compiler and link editor shall support a minimum of 511 external symbols per source or object file, and a minimum of 4095 external symbols total. A diagnostic message is written to standard output if the implementation-defined limit is exceeded; other actions are unspecified.

## EXIT STATUS

The following exit values shall be returned:

0 Successful compilation or link edit.

>0 An error occurred.

## CONSEQUENCES OF ERRORS

When *fort77* encounters a compilation error, it shall write a diagnostic to standard error and continue to compile other source code operands. It shall return a non-zero exit status, but it is implementation-defined whether an object module is created. If the link edit is unsuccessful, a diagnostic message shall be written to standard error, and *fort77* shall exit with a non-zero status.

## APPLICATION USAGE

None.

## EXAMPLES

The following usage example compiles **xyz.f** and creates the executable file **foo**:

```
fort77 -o foo xyz.f
```

The following example compiles **xyz.f** and creates the object file **xyz.o**:

```
fort77 -c xyz.f
```

The following example compiles **xyz.f** and creates the executable file **a.out**:

```
fort77 xyz.f
```

The following example compiles **xyz.f**, links it with **b.o**, and creates the executable **a.out**:

```
fort77 xyz.f b.o
```

## RATIONALE

The name of this utility was chosen as *fort77* to parallel the renaming of the C compiler. The name *f77* was not chosen to avoid problems with historical implementations. The ANSI X3.9-1978 standard was selected as a normative reference because the ISO/IEC version of FORTRAN-77 has been superseded by the ISO/IEC 1539:1991 standard.

The file inclusion and symbol definition **#define** mechanisms used by the *c99* utility were not included in this volume of POSIX.1-2008—even though they are commonly implemented—since there is no requirement that the FORTRAN compiler use the C preprocessor.

The **-onetrip** option was not included in this volume of POSIX.1-2008, even though many historical compilers support it, because it is derived from FORTRAN-66; it is an anachronism that should not be perpetuated.

Some implementations produce compilation listings. This aspect of FORTRAN has been left unspecified because there was controversy concerning the various methods proposed for implementing it: a **-V** option overlapped with historical vendor practice and a naming convention of creating files with **.l** suffixes collided with historical *lex* file naming practice.

There is no **-I** option in this version of this volume of POSIX.1-2008 to specify a directory for file inclusion. An **INCLUDE** directive has been a part of the Fortran-90 discussions, but an interface supporting that standard is not in the current scope.

It is noted that many FORTRAN compilers produce an object module even when compilation errors occur; during a subsequent compilation, the compiler may patch the object module rather than recompiling all the code. Consequently, it is left to the implementor whether or not an object file is created.

A reference to MIL-STD-1753 was removed from an early proposal in response to a request from the POSIX FORTRAN-binding standard developers. It was not the intention of the standard developers to require certification of the FORTRAN compiler, and IEEE Std 1003.9-1992 does not specify the military standard or any special preprocessing requirements. Furthermore, use of that document would have been inappropriate for an international standard.

The specification of optimization has been subject to changes through early proposals. At one time, **-O** and **-N** were Booleans: optimize and do not optimize (with an unspecified default). Some historical practice led this to be changed to:

**-O 0**        No optimization.

**-O 1**        Some level of optimization.

**-O n**        Other, unspecified levels of optimization.

It is not always clear whether “good code generation” is the same thing as optimization. Simple optimizations of local actions do not usually affect the semantics of a program. The **-O 0** option has been included to accommodate the very particular nature of scientific calculations in a highly optimized environment; compilers make errors. Some degree of optimization is expected, even if it is not documented here, and the ability to shut it off completely could be important when porting an application. An implementation may treat **-O 0** as “do less than normal” if it wishes, but this is only meaningful if any of the operations it performs can affect the semantics of a program. It is highly dependent on the implementation whether doing less than normal is logical. It is not the intent of the **-O 0** option to ask for inefficient code generation, but rather to assure that any semantically visible optimization is suppressed.

The specification of standard library access is consistent with the C compiler specification. Implementations are not required to have **/usr/lib/libf.a**, as many historical implementations do, but if not they are required to recognize **f** as a token.

External symbol size limits are in normative text; conforming applications need to know these limits. However, the minimum maximum symbol length should be taken as a constraint on a conforming application, not on an implementation, and consequently the action taken for a symbol exceeding the limit is unspecified. The minimum size for the external symbol table was added for similar reasons.

The CONSEQUENCES OF ERRORS section clearly specifies the behavior of the compiler when compilation or link-edit errors occur. The behavior of several historical implementations was examined, and the choice was made to be silent on the status of the executable, or **a.out**, file in the face of compiler or linker errors. If a linker writes the executable file, then links it on disk with *lseek()*s and *write()*s, the partially linked executable file can be left on disk and its execute bits turned off if the link edit fails. However, if the linker links the image in memory before writing the file to disk, it need not touch the executable file (if it already exists) because the link edit fails. Since both approaches are historical practice, a conforming application shall rely on the exit status of *fort77*, rather than on the existence or mode of the executable file.

The **-g** and **-s** options are not specified as mutually-exclusive. Historically, these two options

92239 have been mutually-exclusive, but because both are so loosely specified, it seemed appropriate  
92240 to leave their interaction unspecified.

92241 The requirement that conforming applications specify compiler options separately is to reserve  
92242 the multi-character option name space for vendor-specific compiler options, which are known to  
92243 exist in many historical implementations. Implementations are not required to recognize, for  
92244 example, `-gc` as if it were `-g -c`; nor are they forbidden from doing so. The SYNOPSIS shows all  
92245 of the options separately to highlight this requirement on applications.

92246 Echoing filenames to standard error is considered a diagnostic message because it would  
92247 otherwise be difficult to associate an error message with the erring file. They are described with  
92248 “may” to allow implementations to use other methods of identifying files and to parallel the  
92249 description in *c99*.

#### 92250 FUTURE DIRECTIONS

92251 Future versions of this standard may withdraw this utility. There are implementations of |  
92252 compilers that conform to much more recent versions of the FORTRAN programming language. |  
92253 Since there is no active FORTRAN binding to POSIX.1-2008, this standard does not need to |  
92254 specify any compiler.

#### 92259 CHANGE HISTORY

92260 First released in Issue 4.

#### 92261 Issue 6

92262 This utility is marked as part of the FORTRAN Development Utilities option.

92263 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 92264 Issue 7

92265 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

92266 **NAME**

92267 fuser — list process IDs of all processes that have one or more files open

92268 **SYNOPSIS**92269 XSI `fuser [-cfu] file...`92270 **DESCRIPTION**

92271 The *fuser* utility shall write to standard output the process IDs of processes running on the local  
 92272 system that have one or more named files open. For block special devices, all processes using  
 92273 any file on that device are listed.

92274 The *fuser* utility shall write to standard error additional information about the named files  
 92275 indicating how the file is being used.

92276 Any output for processes running on remote systems that have a named file open is unspecified.

92277 A user may need appropriate privileges to invoke the *fuser* utility.

92278 **OPTIONS**

92279 The *fuser* utility shall conform to XBD [Section 12.2](#) (on page 216).

92280 The following options shall be supported:

92281 **-c** The file is treated as a mount point and the utility shall report on any files open in  
 92282 the file system.

92283 **-f** The report shall be only for the named files.

92284 **-u** The user name, in parentheses, associated with each process ID written to standard  
 92285 output shall be written to standard error.

92286 **OPERANDS**

92287 The following operand shall be supported:

92288 *file* A pathname on which the file or file system is to be reported.

92289 **STDIN**

92290 Not used.

92291 **INPUT FILES**

92292 The user database.

92293 **ENVIRONMENT VARIABLES**

92294 The following environment variables shall affect the execution of *fuser*:

92295 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 92296 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 92297 variables used to determine the values of locale categories.)

92298 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 92299 internationalization variables.

92300 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 92301 characters (for example, single-byte as opposed to multi-byte characters in  
 92302 arguments).

92303 **LC\_MESSAGES**

92304 Determine the locale that should be used to affect the format and contents of  
 92305 diagnostic messages written to standard error.

92306 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

92307 **ASYNCHRONOUS EVENTS**

92308 Default.

92309 **STDOUT**

92310 The *fuser* utility shall write the process ID for each process using each file given as an operand to

92311 standard output in the following format:

92312 "%d", <*process\_id*>

92313 **STDERR**

92314 The *fuser* utility shall write diagnostic messages to standard error.

92315 The *fuser* utility also shall write the following to standard error:

92316

- The pathname of each named file is written followed immediately by a <colon>.
- For each process ID written to standard output, the character 'c' shall be written to standard error if the process is using the file as its current directory and the character 'r' shall be written to standard error if the process is using the file as its root directory. Implementations may write other alphabetic characters to indicate other uses of files.
- When the *-u* option is specified, characters indicating the use of the file shall be followed immediately by the user name, in parentheses, corresponding to the real user ID of the process. If the user name cannot be resolved from the real user ID of the process, the real user ID of the process shall be written instead of the user name.

92325 When standard output and standard error are directed to the same file, the output shall be

92326 interleaved so that the filename appears at the start of each line, followed by the process ID and

92327 characters indicating the use of the file. Then, if the *-u* option is specified, the user name or user

92328 ID for each process using that file shall be written.

92329 A <newline> shall be written to standard error after the last output described above for each *file*

92330 operand.

92331 **OUTPUT FILES**

92332 None.

92333 **EXTENDED DESCRIPTION**

92334 None.

92335 **EXIT STATUS**

92336 The following exit values shall be returned:

92337 0 Successful completion.

92338 >0 An error occurred.

92339 **CONSEQUENCES OF ERRORS**

92340 Default.

**92341 APPLICATION USAGE**

92342 None.

**92343 EXAMPLES**

92344 The command:

92345 `fuser -fu .`

92346 writes to standard output the process IDs of processes that are using the current directory and  
92347 writes to standard error an indication of how those processes are using the directory and the  
92348 user names associated with the processes that are using the current directory.

92349 `fuser -c <mount point>`

92350 writes to standard output the process IDs of processes that are using any file in the file system  
92351 which is mounted on <mount point> and writes to standard error an indication of how those  
92352 processes are using the files.

92353 `fuser <mount point>`

92354 writes to standard output the process IDs of processes that are using the file which is named by  
92355 <mount point> and writes to standard error an indication of how those processes are using the  
92356 file.

92357 `fuser <block device>`

92358 writes to standard output the process IDs of processes that are using any file which is on the  
92359 device named by <block device> and writes to standard error an indication of how those  
92360 processes are using the file.

92361 `fuser -f <block device>`

92362 writes to standard output the process IDs of processes that are using the file <block device> itself  
92363 and writes to standard error an indication of how those processes are using the file.

**92364 RATIONALE**

92365 The definition of the *fuser* utility follows existing practice.

**92366 FUTURE DIRECTIONS**

92367 None.

**92368 SEE ALSO**

92369 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

**92370 CHANGE HISTORY**

92371 First released in Issue 5.

**92372 Issue 7**

92373 SD5-XCU-ERN-90 is applied, updating the EXAMPLES section.

92374 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

92375 **NAME**

92376 gencat — generate a formatted message catalog

92377 **SYNOPSIS**92378 gencat *catfile* *msgfile*...92379 **DESCRIPTION**

92380 The *gencat* utility shall merge the message text source file *msgfile* into a formatted message  
 92381 catalog *catfile*. The file *catfile* shall be created if it does not already exist. If *catfile* does exist, its  
 92382 messages shall be included in the new *catfile*. If set and message numbers collide, the new  
 92383 message text defined in *msgfile* shall replace the old message text currently contained in *catfile*.

92384 **OPTIONS**

92385 None.

92386 **OPERANDS**

92387 The following operands shall be supported:

92388 *catfile* A pathname of the formatted message catalog. If '-' is specified, standard output  
 92389 shall be used. The format of the message catalog produced is unspecified.

92390 *msgfile* A pathname of a message text source file. If '-' is specified for an instance of  
 92391 *msgfile*, standard input shall be used. The format of message text source files is  
 92392 defined in the EXTENDED DESCRIPTION section.

92393 **STDIN**92394 The standard input shall not be used unless a *msgfile* operand is specified as '-'.92395 **INPUT FILES**

92396 The input files shall be text files.

92397 **ENVIRONMENT VARIABLES**92398 The following environment variables shall affect the execution of *gencat*:

92399 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 92400 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 92401 variables used to determine the values of locale categories.)

92402 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 92403 internationalization variables.

92404 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 92405 characters (for example, single-byte as opposed to multi-byte characters in  
 92406 arguments and input files).

92407 *LC\_MESSAGES*

92408 Determine the locale that should be used to affect the format and contents of  
 92409 diagnostic messages written to standard error.

92410 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

92411 **ASYNCHRONOUS EVENTS**

92412 Default.

92413 **STDOUT**92414 The standard output shall not be used unless the *catfile* operand is specified as '-'.

92415 **STDERR**

92416 The standard error shall be used only for diagnostic messages.

92417 **OUTPUT FILES**

92418 None.

92419 **EXTENDED DESCRIPTION**

92420 The content of a message text file shall be in the format defined as follows. Note that the fields of  
 92421 a message text source line are separated by a single <blank> character. Any other <blank>  
 92422 characters are considered to be part of the subsequent field.

92423 **\$set** *n comment*

92424 This line specifies the set identifier of the following messages until the next **\$set** or  
 92425 end-of-file appears. The *n* denotes the set identifier, which is defined as a number  
 92426 in the range [1, {NL\_SETMAX}] (see the <limits.h> header defined in the Base  
 92427 Definitions volume of POSIX.1-2008). The application shall ensure that set  
 92428 identifiers are presented in ascending order within a single source file, but need  
 92429 not be contiguous. Any string following the set identifier shall be treated as a  
 92430 comment. If no **\$set** directive is specified in a message text source file, all messages  
 92431 shall be located in an implementation-defined default message set NL\_SETD (see  
 92432 the <nl\_types.h> header defined in the Base Definitions volume of POSIX.1-2008).

92433 **\$delset** *n comment*

92434 This line deletes message set *n* from an existing message catalog. The *n* denotes the  
 92435 set number [1, {NL\_SETMAX}]. Any string following the set number shall be  
 92436 treated as a comment.

92437 **\$ comment** A line beginning with ' \$ ' followed by a <blank> shall be treated as a comment.

92438 *m message-text*

92439 The *m* denotes the message identifier, which is defined as a number in the range [1,  
 92440 {NL\_MSGMAX}] (see the <limits.h> header). The *message-text* shall be stored in the  
 92441 message catalog with the set identifier specified by the last **\$set** directive, and with  
 92442 message identifier *m*. If the *message-text* is empty, and a <blank> field separator is  
 92443 present, an empty string shall be stored in the message catalog. If a message source  
 92444 line has a message number, but neither a field separator nor *message-text*, the  
 92445 existing message with that number (if any) shall be deleted from the catalog. The  
 92446 application shall ensure that message identifiers are in ascending order within a  
 92447 single set, but need not be contiguous. The application shall ensure that the length  
 92448 of *message-text* is in the range [0, {NL\_TEXTMAX}] (see the <limits.h> header).

92449 **\$quote** *n* This line specifies an optional quote character *c*, which can be used to surround  
 92450 *message-text* so that trailing <space> characters or null (empty) messages are visible  
 92451 in a message source line. By default, or if an empty **\$quote** directive is supplied, no  
 92452 quoting of *message-text* shall be recognized.

92453 Empty lines in a message text source file shall be ignored. The effects of lines starting with any  
 92454 character other than those defined above are implementation-defined.

92455 Text strings can contain the special characters and escape sequences defined in the following  
 92456 table:

92457  
92458  
92459  
92460  
92461  
92462  
92463  
92464  
92465

| Description       | Symbol | Sequence |
|-------------------|--------|----------|
| <newline>         | NL(LF) | \n       |
| Horizontal-tab    | HT     | \t       |
| <vertical-tab>    | VT     | \v       |
| <backspace>       | BS     | \b       |
| <carriage-return> | CR     | \r       |
| <form-feed>       | FF     | \f       |
| Backslash         | \      | \\       |
| Bit pattern       | ddd    | \ddd     |

92466  
92467  
92468

The escape sequence "\ddd" consists of <backslash> followed by one, two, or three octal digits, which shall be taken to specify the value of the desired character. If the character following a <backslash> is not one of those specified, the <backslash> shall be ignored.

92469  
92470

A <backslash> followed by a <newline> is also used to continue a string on the following line. Thus, the following two lines describe a single message string:

92471  
92472

```
1 This line continues \
to the next line
```

92473

which shall be equivalent to:

92474

```
1 This line continues to the next line
```

## 92475 EXIT STATUS

92476

The following exit values shall be returned:

92477

0 Successful completion.

92478

>0 An error occurred.

## 92479 CONSEQUENCES OF ERRORS

92480

Default.

## 92481 APPLICATION USAGE

92482  
92483  
92484

Message catalogs produced by *gencat* are binary encoded, meaning that their portability cannot be guaranteed between different types of machine. Thus, just as C programs need to be recompiled for each type of machine, so message catalogs must be recreated via *gencat*.

## 92485 EXAMPLES

92486

None.

## 92487 RATIONALE

92488

## 92494 CHANGE HISTORY

92495

First released in Issue 3.

## 92496 Issue 6

92497

The normative text is reworded to avoid use of the term “must” for application requirements.

92498 **Issue 7**  
92499

The *gencat* utility is moved from the XSI option to the Base.

## 92500 NAME

92501 get — get a version of an SCCS file (**DEVELOPMENT**)

## 92502 SYNOPSIS

92503 XSI `get [-begkmnlLpst] [-c cutoff] [-i list] [-r SID] [-x list] file...`

## 92504 DESCRIPTION

92505 The *get* utility shall generate a text file from each named SCCS *file* according to the specifications  
92506 given by its options.92507 The generated text shall normally be written into a file called the **g-file** whose name is derived  
92508 from the SCCS filename by simply removing the leading "s.". 

## 92509 OPTIONS

92510 The *get* utility shall conform to XBD [Section 12.2](#) (on page 216).

92511 The following options shall be supported:

92512 **-r** *SID* Indicate the SCCS Identification String (SID) of the version (delta) of an SCCS file  
92513 to be retrieved. The table shows, for the most useful cases, what version of an  
92514 SCCS file is retrieved (as well as the SID of the version to be eventually created by  
92515 *delta* if the **-e** option is also used), as a function of the SID specified.92516 **-c** *cutoff* Indicate the *cutoff* date-time, in the form:92517 `YY[MM[DD[HH[MM[SS]]]]]`92518 For the YY component, values in the range [69,99] shall refer to years 1969 to 1999  
92519 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.92520 **Note:** It is expected that in a future version of this standard the default century inferred  
92521 from a 2-digit year will change. (This would apply to all commands accepting a  
92522 2-digit year as input.)92523 No changes (deltas) to the SCCS file that were created after the specified *cutoff*  
92524 date-time shall be included in the generated text file. Units omitted from the date-  
92525 time default to their maximum possible values; for example, **-c** 7502 is equivalent  
92526 to **-c** 750228235959.92527 Any number of non-numeric characters may separate the various 2-digit pieces of  
92528 the *cutoff* date-time. This feature allows the user to specify a *cutoff* date in the form:  
92529 **-c** "77/2/2 9:22:25".92530 **-e** Indicate that the *get* is for the purpose of editing or making a change (delta) to the  
92531 SCCS file via a subsequent use of *delta*. The **-e** option used in a *get* for a particular  
92532 version (SID) of the SCCS file shall prevent further *get* commands from editing on  
92533 the same SID until *delta* is executed or the **j** (joint edit) flag is set in the SCCS file.  
92534 Concurrent use of *get* **-e** for different SIDs is always allowed.92535 If the **g-file** generated by *get* with a **-e** option is accidentally ruined in the process  
92536 of editing, it may be regenerated by re-executing the *get* command with the **-k**  
92537 option in place of the **-e** option.92538 SCCS file protection specified via the ceiling, floor, and authorized user list stored  
92539 in the SCCS file shall be enforced when the **-e** option is used.92540 **-b** Use with the **-e** option to indicate that the new delta should have an SID in a new  
92541 branch as shown in the table below. This option shall be ignored if the **b** flag is not  
92542 present in the file or if the retrieved delta is not a leaf delta. (A leaf delta is one that  
92543 has no successors on the SCCS file tree.)

|       |                |                                                                                                                     |
|-------|----------------|---------------------------------------------------------------------------------------------------------------------|
| 92544 |                | <b>Note:</b> A branch delta may always be created from a non-leaf delta.                                            |
| 92545 | <b>-i list</b> | Indicate a <i>list</i> of deltas to be included (forced to be applied) in the creation of the                       |
| 92546 |                | generated file. The <i>list</i> has the following syntax:                                                           |
| 92547 |                | <code>&lt;list&gt; ::= &lt;range&gt;   &lt;list&gt; , &lt;range&gt;</code>                                          |
| 92548 |                | <code>&lt;range&gt; ::= SID   SID - SID</code>                                                                      |
| 92549 |                | SID, the SCCS Identification of a delta, may be in any form shown in the "SID                                       |
| 92550 |                | Specified" column of the table in the EXTENDED DESCRIPTION section, except                                          |
| 92551 |                | that the result of supplying a partial SID is unspecified. A diagnostic message shall                               |
| 92552 |                | be written if the first SID in the range is not an ancestor of the second SID in the                                |
| 92553 |                | range.                                                                                                              |
| 92554 | <b>-x list</b> | Indicate a <i>list</i> of deltas to be excluded (forced not to be applied) in the creation of                       |
| 92555 |                | the generated file. See the <b>-i</b> option for the <i>list</i> format.                                            |
| 92556 | <b>-k</b>      | Suppress replacement of identification keywords (see below) in the retrieved text                                   |
| 92557 |                | by their value. The <b>-k</b> option shall be implied by the <b>-e</b> option.                                      |
| 92558 | <b>-l</b>      | Write a delta summary into an <b>l-file</b> .                                                                       |
| 92559 | <b>-L</b>      | Write a delta summary to standard output. All informative output that normally is                                   |
| 92560 |                | written to standard output shall be written to standard error instead, unless the <b>-s</b>                         |
| 92561 |                | option is used, in which case it shall be suppressed.                                                               |
| 92562 | <b>-p</b>      | Write the text retrieved from the SCCS file to the standard output. No <b>g-file</b> shall                          |
| 92563 |                | be created. All informative output that normally goes to the standard output shall                                  |
| 92564 |                | go to standard error instead, unless the <b>-s</b> option is used, in which case it shall                           |
| 92565 |                | disappear.                                                                                                          |
| 92566 | <b>-s</b>      | Suppress all informative output normally written to standard output. However,                                       |
| 92567 |                | fatal error messages (which shall always be written to the standard error) shall                                    |
| 92568 |                | remain unaffected.                                                                                                  |
| 92569 | <b>-m</b>      | Precede each text line retrieved from the SCCS file by the SID of the delta that                                    |
| 92570 |                | inserted the text line in the SCCS file. The format shall be:                                                       |
| 92571 |                | <code>"%s\t%s", &lt;SID&gt;, &lt;text line&gt;</code>                                                               |
| 92572 | <b>-n</b>      | Precede each generated text line with the <b>%M%</b> identification keyword value (see                              |
| 92573 |                | below). The format shall be:                                                                                        |
| 92574 |                | <code>"%s\t%s", &lt;%M% value&gt;, &lt;text line&gt;</code>                                                         |
| 92575 |                | When both the <b>-m</b> and <b>-n</b> options are used, the <code>&lt;text line&gt;</code> shall be replaced by the |
| 92576 |                | <b>-m</b> option-generated format.                                                                                  |
| 92577 | <b>-g</b>      | Suppress the actual retrieval of text from the SCCS file. It is primarily used to                                   |
| 92578 |                | generate an <b>l-file</b> , or to verify the existence of a particular SID.                                         |
| 92579 | <b>-t</b>      | Use to access the most recently created (top) delta in a given release (for example,                                |
| 92580 |                | <b>-r 1</b> ), or release and level (for example, <b>-r 1.2</b> ).                                                  |

**OPERANDS**

The following operands shall be supported:

*file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *get* utility shall behave as though each file in the directory were specified as a named file, except that non-SCCS files (last component of the pathname does not begin with **s**.) and unreadable files shall be silently ignored.

If exactly one *file* operand appears, and it is **'-'**, the standard input shall be read; each line of the standard input is taken to be the name of an SCCS file to be processed. Non-SCCS files and unreadable files shall be silently ignored.

**STDIN**

The standard input shall be a text file used only if the *file* operand is specified as **'-'**. Each line of the text file shall be interpreted as an SCCS pathname.

**INPUT FILES**

The SCCS files shall be files of an unspecified format.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *get*:

**LANG** Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

**LC\_ALL** If set to a non-empty string value, override the values of all the other internationalization variables.

**LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).

**LC\_MESSAGES**

Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error, and informative messages written to standard output (or standard error, if the **-p** option is used).

**NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

**TZ** Determine the timezone in which the times and dates written in the SCCS file are evaluated. If the **TZ** variable is unset or NULL, an unspecified system default timezone is used.

**ASYNCHRONOUS EVENTS**

Default.

**STDOUT**

For each file processed, *get* shall write to standard output the SID being accessed and the number of lines retrieved from the SCCS file, in the following format:

**"%s\n%d lines\n", <SID>, <number of lines>**

If the **-e** option is used, the SID of the delta to be made shall appear after the SID accessed and before the number of lines generated, in the POSIX locale:

**"%s\nnew delta %s\n%d lines\n", <SID accessed>,  
<SID to be made>, <number of lines>**

If there is more than one named file or if a directory or standard input is named, each pathname

shall be written before each of the lines shown in one of the preceding formats:

```
"\n%s:\n", <pathname>
```

If the **-L** option is used, a delta summary shall be written following the format specified below for **l-files**.

If the **-i** option is used, included deltas shall be listed following the notation, in the POSIX locale:

```
"Included:\n"
```

If the **-x** option is used, excluded deltas shall be listed following the notation, in the POSIX locale:

```
"Excluded:\n"
```

If the **-p** or **-L** options are specified, the standard output shall consist of the text retrieved from the SCCS file.

## STDERR

The standard error shall be used only for diagnostic messages, except if the **-p** or **-L** options are specified, it shall include all informative messages normally sent to standard output.

## OUTPUT FILES

Several auxiliary files may be created by *get*. These files are known generically as the **g-file**, **l-file**, **p-file**, and **z-file**. The letter before the <hyphen-minus> is called the *tag*. An auxiliary filename shall be formed from the SCCS filename: the application shall ensure that the last component of all SCCS filenames is of the form *s.module-name*; the auxiliary files shall be named by replacing the leading *s* with the tag. The **g-file** shall be an exception to this scheme: the **g-file** is named by removing the *s*. prefix. For example, for *s.xyz.c*, the auxiliary filenames would be *xyz.c*, *l.xyz.c*, *p.xyz.c*, and *z.xyz.c*, respectively.

The **g-file**, which contains the generated text, shall be created in the current directory (unless the **-p** option is used). A **g-file** shall be created in all cases, whether or not any lines of text were generated by the *get*. It shall be owned by the real user. If the **-k** option is used or implied, the **g-file** shall be writable by the owner only (read-only for everyone else); otherwise, it shall be read-only. Only the real user need have write permission in the current directory.

The **l-file** shall contain a table showing which deltas were applied in generating the retrieved text. The **l-file** shall be created in the current directory if the **-l** option is used; it shall be read-only and it is owned by the real user. Only the real user need have write permission in the current directory.

Lines in the **l-file** shall have the following format:

```
"%c%c%Δ%s\t%sΔ%s\n", <code1>, <code2>, <code3>,
    <SID>, <date-time>, <login>
```

where the entries are:

**<code1>**      A <space> if the delta was applied; ' \* ' otherwise.

**<code2>**      A <space> if the delta was applied or was not applied and ignored; ' \* ' if the delta was not applied and was not ignored.

**<code3>**      A character indicating a special reason why the delta was or was not applied:

**I**      Included.

92665 X Excluded.

92666 C Cut off (by a `-c` option).

92667 `<date-time>` Date and time (using the format of the *date* utility's `%Y/%m/%d %T` conversion  
92668 specification format) of creation.

92669 `<login>` Login name of person who created *delta*.

92670 The comments and MR data shall follow on subsequent lines, indented one `<tab>`. A blank line  
92671 shall terminate each entry.

92672 The **p-file** shall be used to pass information resulting from a *get* with a `-e` option along to *delta*.  
92673 Its contents shall also be used to prevent a subsequent execution of *get* with a `-e` option for the  
92674 same SID until *delta* is executed or the joint edit flag, *j*, is set in the SCCS file. The **p-file** shall be  
92675 created in the directory containing the SCCS file and the application shall ensure that the  
92676 effective user has write permission in that directory. It shall be writable by owner only, and  
92677 owned by the effective user. Each line in the **p-file** shall have the following format:

92678 `"%sΔ%sΔ%sΔ%s%s\n", <g-file SID> ,`  
92679 `<SID of new delta> , <login-name of real user> ,`  
92680 `<date-time> , <i-value> , <x-value>`

92681 where `<i-value>` uses the format " " if no `-i` option was specified, and shall use the format:

92682 `"Δ-i%s", <-i option option-argument>`

92683 if a `-i` option was specified and `<x-value>` uses the format " " if no `-x` option was specified, and  
92684 shall use the format:

92685 `"Δ-x%s", <-x option option-argument>`

92686 if a `-x` option was specified. There can be an arbitrary number of lines in the **p-file** at any time;  
92687 no two lines shall have the same new delta SID.

92688 The **z-file** shall serve as a lock-out mechanism against simultaneous updates. Its contents shall  
92689 be the binary process ID of the command (that is, *get*) that created it. The **z-file** shall be created  
92690 in the directory containing the SCCS file for the duration of *get*. The same protection restrictions  
92691 as those for the **p-file** shall apply for the **z-file**. The **z-file** shall be created read-only.

## 92692 EXTENDED DESCRIPTION

| Determination of SCCS Identification String |                    |                                             |               |                            |
|---------------------------------------------|--------------------|---------------------------------------------|---------------|----------------------------|
| SID* Specified                              | –b Keyletter Used† | Other Conditions                            | SID Retrieved | SID of Delta to be Created |

| R.L                                         | yes                | No trunk successor                          | R.L           | R.L.(mB+1).1               |
| R.L                                         | –                  | Trunk successor in release ≥ R              | R.L           | R.L.(mB+1).1               |
| R.L.B                                       | no                 | No branch successor                         | R.L.B.mS      | R.L.B.(mS+1)               |
| R.L.B                                       | yes                | No branch successor                         | R.L.B.mS      | R.L.(mB+1).1               |
| R.L.B.S                                     | no                 | No branch successor                         | R.L.B.S       | R.L.B.(S+1)                |
| R.L.B.S                                     | yes                | No branch successor                         | R.L.B.S       | R.L.(mB+1).1               |
| R.L.B.S                                     | –                  | Branch successor                            | R.L.B.S       | R.L.(mB+1).1               |

92715 \* R, L, B, and S are the release, level, branch, and sequence components of the SID,  
 92716 respectively; m means maximum. Thus, for example, R.mL means “the maximum level  
 92717 number within release R”; R.L.(mB+1).1 means “the first sequence number on the new  
 92718 branch (that is, maximum branch number plus one) of level L within release R”. Note  
 92719 that if the SID specified is of the form R.L, R.L.B, or R.L.B.S, each of the specified  
 92720 components shall exist.

92721 \*\* hR is the highest existing release that is lower than the specified, nonexistent, release R.

92722 \*\*\* This is used to force creation of the first delta in a new release.

92723 † The –b option is effective only if the b flag is present in the file. An entry of ‘–’ means  
 92724 “irrelevant”.

92725 ‡ This case applies if the d (default SID) flag is not present in the file. If the d flag is  
 92726 present in the file, then the SID obtained from the d flag is interpreted as if it had been  
 92727 specified on the command line. Thus, one of the other cases in this table applies.

**System Date and Time**

When a **g-file** is generated, the creation time of deltas in the SCCS file may be taken into account. If any of these times are apparently in the future, the behavior is unspecified.

**Identification Keywords**

Identifying information shall be inserted into the text retrieved from the SCCS file by replacing identification keywords with their value wherever they occur. The following keywords may be used in the text stored in an SCCS file:

|     |                                                                                                                                                                                                                             |
|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| %M% | Module name: either the value of the <b>m</b> flag in the file, or if absent, the name of the SCCS file with the leading <b>s.</b> removed.                                                                                 |
| %I% | SCCS identification (SID) (%R%.%L% or %R%.%L%.%B%.%S%) of the retrieved text.                                                                                                                                               |
| %R% | Release.                                                                                                                                                                                                                    |
| %L% | Level.                                                                                                                                                                                                                      |
| %B% | Branch.                                                                                                                                                                                                                     |
| %S% | Sequence.                                                                                                                                                                                                                   |
| %D% | Current date (YY/MM/DD).                                                                                                                                                                                                    |
| %H% | Current date (MM/DD/YY).                                                                                                                                                                                                    |
| %T% | Current time (HH:MM:SS).                                                                                                                                                                                                    |
| %E% | Date newest applied delta was created (YY/MM/DD).                                                                                                                                                                           |
| %G% | Date newest applied delta was created (MM/DD/YY).                                                                                                                                                                           |
| %U% | Time newest applied delta was created (HH:MM:SS).                                                                                                                                                                           |
| %Y% | Module type: value of the <b>t</b> flag in the SCCS file.                                                                                                                                                                   |
| %F% | SCCS filename.                                                                                                                                                                                                              |
| %P% | SCCS absolute pathname.                                                                                                                                                                                                     |
| %Q% | The value of the <b>q</b> flag in the file.                                                                                                                                                                                 |
| %C% | Current line number. This keyword is intended for identifying messages output by the program, such as "this should not have happened" type errors. It is not intended to be used on every line to provide sequence numbers. |
| %Z% | The four-character string "@ ( # )" recognizable by <i>what</i> .                                                                                                                                                           |
| %W% | A shorthand notation for constructing <i>what</i> strings:<br>%W%=%Z%%M%<tab>%I%                                                                                                                                            |
| %A% | Another shorthand notation for constructing <i>what</i> strings:<br>%A%=%Z%%Y%%M%%I%%Z%                                                                                                                                     |

**EXIT STATUS**

The following exit values shall be returned:

0 Successful completion.

92764 >0 An error occurred.

## 92765 CONSEQUENCES OF ERRORS

92766 Default.

## 92767 APPLICATION USAGE

92768 Problems can arise if the system date and time have been modified (for example, put forward  
92769 and then back again, or unsynchronized clocks across a network) and can also arise when  
92770 different values of the *TZ* environment variable are used.

92771 Problems of a similar nature can also arise for the operation of the *delta* utility, which compares  
92772 the previous file body against the working file as part of its normal operation.

## 92773 EXAMPLES

92774 None.

## 92775 RATIONALE

92776 None.

## 92777 FUTURE DIRECTIONS

92778 None.

## 92779 SEE ALSO

92781 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

## 92782 CHANGE HISTORY

92783 First released in Issue 2.

### 92784 Issue 5

92785 A correction is made to the first format string in STDOUT.

92786 The interpretation of the *YY* component of the *-c cutoff* argument is noted.

### 92787 Issue 6

92788 The obsolescent SYNOPSIS is removed, removing the *-lp* option.

92789 The normative text is reworded to avoid use of the term “must” for application requirements.

92790 The Open Group Corrigendum U025/5 is applied, correcting text in the OPTIONS section.

92791 The Open Group Corrigendum U048/1 is applied.

92792 The Open Group Interpretation PIN4C.00014 is applied.

92793 The Open Group Base Resolution bwg2001-007 is applied as follows:

- 92794 • The EXTENDED DESCRIPTION section is updated to make partial SID handling
- 92795 unspecified, reflecting common usage, and to clarify SID ranges.
- 92796 • New text is added to the EXTENDED DESCRIPTION and APPLICATION USAGE sections
- 92797 regarding how the system date and time may be taken into account.
- 92798 • The *TZ* environment variable is added to the ENVIRONMENT VARIABLES section.

### 92799 Issue 7

92800 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

92801 **NAME**

92802       getconf — get configuration values

92803 **SYNOPSIS**92804       getconf [-v specification] *system\_var*92805       getconf [-v specification] *path\_var* *pathname*92806 **DESCRIPTION**92807       In the first synopsis form, the *getconf* utility shall write to the standard output the value of the  
92808       variable specified by the *system\_var* operand.92809       In the second synopsis form, the *getconf* utility shall write to the standard output the value of the  
92810       variable specified by the *path\_var* operand for the path specified by the *pathname* operand.92811       The value of each configuration variable shall be determined as if it were obtained by calling the  
92812       function from which it is defined to be available by this volume of POSIX.1-2008 or by the  
92813       System Interfaces volume of POSIX.1-2008 (see the OPERANDS section). The value shall reflect  
92814       conditions in the current operating environment.92815 **OPTIONS**92816       The *getconf* utility shall conform to XBD [Section 12.2](#) (on page 216).

92817       The following option shall be supported:

92818       -v *specification*92819               Indicate a specific specification and version for which configuration variables shall  
92820               be determined. If this option is not specified, the values returned correspond to an  
92821               implementation default conforming compilation environment.

92822               If the command:

92823               getconf \_POSIX\_V7\_ILP32\_OFF32

92824               does not write "-1\n" or "undefined\n" to standard output, then commands of  
92825               the form:

92826               getconf -v POSIX\_V7\_ILP32\_OFF32 ...

92827               determine values for configuration variables corresponding to the  
92828               POSIX\_V7\_ILP32\_OFF32 compilation environment specified in [c99](#), the  
92829               EXTENDED DESCRIPTION.

92830               If the command:

92831               getconf \_POSIX\_V7\_ILP32\_OFFBIG

92832               does not write "-1\n" or "undefined\n" to standard output, then commands of  
92833               the form:

92834               getconf -v POSIX\_V7\_ILP32\_OFFBIG ...

92835               determine values for configuration variables corresponding to the  
92836               POSIX\_V7\_ILP32\_OFFBIG compilation environment specified in [c99](#), the  
92837               EXTENDED DESCRIPTION.

92838               If the command:

92839               getconf \_POSIX\_V7\_LP64\_OFF64

92840               does not write "-1\n" or "undefined\n" to standard output, then commands of  
92841               the form:

92842 `getconf -v POSIX_V7_LP64_OFF64 ...`  
 92843 determine values for configuration variables corresponding to the  
 92844 POSIX\_V7\_LP64\_OFF64 compilation environment specified in [c99](#), the  
 92845 EXTENDED DESCRIPTION.

92846 If the command:

92847 `getconf _POSIX_V7_LPBIG_OFFBIG`

92848 does not write "-l\n" or "undefined\n" to standard output, then commands of  
 92849 the form:

92850 `getconf -v POSIX_V7_LPBIG_OFFBIG ...`

92851 determine values for configuration variables corresponding to the  
 92852 POSIX\_V7\_LPBIG\_OFFBIG compilation environment specified in [c99](#), the  
 92853 EXTENDED DESCRIPTION.

## 92854 OPERANDS

92855 The following operands shall be supported:

92856 *path\_var* A name of a configuration variable. All of the variables in the Variable column of  
 92857 the table in the DESCRIPTION of the *fpathconf()* function defined in the System  
 92858 Interfaces volume of POSIX.1-2008, without the enclosing braces, shall be  
 92859 supported. The implementation may add other local variables.

92860 *pathname* A pathname for which the variable specified by *path\_var* is to be determined.

92861 *system\_var* A name of a configuration variable. All of the following variables shall be  
 92862 supported:

- 92863 • The names in the Variable column of the table in the DESCRIPTION of the
- 92864 *sysconf()* function in the System Interfaces volume of POSIX.1-2008, except
- 92865 for the entries corresponding to `_SC_CLK_TCK`, `_SC_GETGR_R_SIZE_MAX`,
- 92866 and `_SC_GETPW_R_SIZE_MAX`, without the enclosing braces.

92867 For compatibility with earlier versions, the following variable names shall  
 92868 also be supported:

92869 `POSIX2_C_BIND`  
 92870 `POSIX2_C_DEV`  
 92871 `POSIX2_CHAR_TERM`  
 92872 `POSIX2_FORT_DEV`  
 92873 `POSIX2_FORT_RUN`  
 92874 `POSIX2_LOCALEDEF`  
 92875 `POSIX2_SW_DEV`  
 92876 `POSIX2_UPE`  
 92877 `POSIX2_VERSION`

92878 and shall be equivalent to the same name prefixed with an <underscore>.  
 92879 This requirement may be removed in a future version.

- 92880 • The names of the symbolic constants used as the *name* argument of the
- 92881 *confstr()* function in the System Interfaces volume of POSIX.1-2008, without
- 92882 the `_CS_` prefix.

92883 • The names of the symbolic constants listed under the headings “Maximum  
 92884 Values” and “Minimum Values” in the description of the `<limits.h>` header  
 92885 in the Base Definitions volume of POSIX.1-2008, without the enclosing  
 92886 braces.

92887 For compatibility with earlier versions, the following variable names shall  
 92888 also be supported:

92889 POSIX2\_BC\_BASE\_MAX  
 92890 POSIX2\_BC\_DIM\_MAX  
 92891 POSIX2\_BC\_SCALE\_MAX  
 92892 POSIX2\_BC\_STRING\_MAX  
 92893 POSIX2\_COLL\_WEIGHTS\_MAX  
 92894 POSIX2\_EXPR\_NEST\_MAX  
 92895 POSIX2\_LINE\_MAX  
 92896 POSIX2\_RE\_DUP\_MAX

92897 and shall be equivalent to the same name prefixed with an `<underscore>`.  
 92898 This requirement may be removed in a future version.

92899 The implementation may add other local values.

## 92900 STDIN

92901 Not used.

## 92902 INPUT FILES

92903 None.

## 92904 ENVIRONMENT VARIABLES

92905 The following environment variables shall affect the execution of *getconf*:

92906 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 92907 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 92908 variables used to determine the values of locale categories.)

92909 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 92910 internationalization variables.

92911 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 92912 characters (for example, single-byte as opposed to multi-byte characters in  
 92913 arguments).

92914 *LC\_MESSAGES*

92915 Determine the locale that should be used to affect the format and contents of  
 92916 diagnostic messages written to standard error.

92917 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 92918 ASYNCHRONOUS EVENTS

92919 Default.

## 92920 STDOUT

92921 If the specified variable is defined on the system and its value is described to be available from  
 92922 the *confstr()* function defined in the System Interfaces volume of POSIX.1-2008, its value shall be  
 92923 written in the following format:

92924 "%s\n", *<value>*

92925 Otherwise, if the specified variable is defined on the system, its value shall be written in the

92926 following format:

92927 "%d\n", <value>

92928 If the specified variable is valid, but is undefined on the system, *getconf* shall write using the

92929 following format:

92930 "undefined\n"

92931 If the variable name is invalid or an error occurs, nothing shall be written to standard output.

92932 **STDERR**

92933 The standard error shall be used only for diagnostic messages.

92934 **OUTPUT FILES**

92935 None.

92936 **EXTENDED DESCRIPTION**

92937 None.

92938 **EXIT STATUS**

92939 The following exit values shall be returned:

92940 0 The specified variable is valid and information about its current state was written

92941 successfully.

92942 >0 An error occurred.

92943 **CONSEQUENCES OF ERRORS**

92944 Default.

92945 **APPLICATION USAGE**

92946 None.

92947 **EXAMPLES**

92948 The following example illustrates the value of {NGROUPS\_MAX}:

92949 `getconf NGROUPS_MAX`

92950 The following example illustrates the value of {NAME\_MAX} for a specific directory:

92951 `getconf NAME_MAX /usr`

92952 The following example shows how to deal more carefully with results that might be unspecified:

92953 `if value=$(getconf PATH_MAX /usr); then`

92954 `if [ "$value" = "undefined" ]; then`

92955 `echo PATH_MAX in /usr is indeterminate.`

92956 `else`

92957 `echo PATH_MAX in /usr is $value.`

92958 `fi`

92959 `else`

92960 `echo Error in getconf.`

92961 `fi`

92962 **RATIONALE**

92963 The original need for this utility, and for the *confstr()* function, was to provide a way of finding

92964 the configuration-defined default value for the *PATH* environment variable. Since *PATH* can be

92965 modified by the user to include directories that could contain utilities replacing the standard

92966 utilities, shell scripts need a way to determine the system-supplied *PATH* environment variable

92967 value that contains the correct search path for the standard utilities. It was later suggested that

92968 access to the other variables described in this volume of POSIX.1-2008 could also be useful to  
92969 applications.

92970 This functionality of *getconf* would not be adequately subsumed by another command such as:

92971 `grep var /etc/conf`

92972 because such a strategy would provide correct values for neither those variables that can vary at  
92973 runtime, nor those that can vary depending on the path.

92974 Early proposal versions of *getconf* specified exit status 1 when the specified variable was valid,  
92975 but not defined on the system. The output string "undefined" is now used to specify this case  
92976 with exit code 0 because so many things depend on an exit code of zero when an invoked utility  
92977 is successful.

#### 92978 FUTURE DIRECTIONS

92979 None.

#### 92980 SEE ALSO

92981 *c99*

92982 XBD Chapter 8 (on page 173), Section 12.2 (on page 216), `<limits.h>`

#### 92984 CHANGE HISTORY

92985 First released in Issue 4.

#### 92986 Issue 5

92987 In the OPERANDS section:

- 92988 • {NL\_MAX} is changed to {NL\_NMAX}.
- 92989 • Entries beginning NL\_ are deleted from the list of standard configuration variables.
- 92990 • The list of variables previously marked UX is merged with the list marked EX.
- 92991 • Operands are added to support new Option Groups.
- 92992 • Operands are added so that *getconf* can determine supported programming environments.

#### 92993 Issue 6

92994 The Open Group Corrigendum U029/4 is applied, correcting the example command in the last  
92995 paragraph of the OPTIONS section.

92996 The following new requirements on POSIX implementations derive from alignment with the  
92997 Single UNIX Specification:

- 92998 • Operands are added to determine supported programming environments.

92999 This reference page is updated for alignment with the ISO/IEC 9899: 1999 standard. Specifically,  
93000 new macros for *c99* programming environments are introduced.

93001 XSI marked *system\_var* (XBS5\_\*) values are marked LEGACY.

93002 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/27 is applied, correcting the descriptions  
93003 of *path\_var* and *system\_var* in the OPERANDS section.

#### 93004 Issue 7

93005 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

93006 The EXAMPLES section is corrected.

 93007

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0091 [125] is applied.

93008 **NAME**

93009       getopts — parse utility options

93010 **SYNOPSIS**93011       getopts *optstring name* [*arg...*]93012 **DESCRIPTION**

93013       The *getopts* utility shall retrieve options and option-arguments from a list of parameters. It shall  
 93014       support the Utility Syntax Guidelines 3 to 10, inclusive, described in XBD [Section 12.2](#) (on page  
 93015       216).

93016       Each time it is invoked, the *getopts* utility shall place the value of the next option in the shell  
 93017       variable specified by the *name* operand and the index of the next argument to be processed in the  
 93018       shell variable *OPTIND*. Whenever the shell is invoked, *OPTIND* shall be initialized to 1.

93019       When the option requires an option-argument, the *getopts* utility shall place it in the shell  
 93020       variable *OPTARG*. If no option was found, or if the option that was found does not have an  
 93021       option-argument, *OPTARG* shall be unset.

93022       If an option character not contained in the *optstring* operand is found where an option character  
 93023       is expected, the shell variable specified by *name* shall be set to the <question-mark> ('?')  
 93024       character. In this case, if the first character in *optstring* is a <colon> (':'), the shell variable  
 93025       *OPTARG* shall be set to the option character found, but no output shall be written to standard  
 93026       error; otherwise, the shell variable *OPTARG* shall be unset and a diagnostic message shall be  
 93027       written to standard error. This condition shall be considered to be an error detected in the way  
 93028       arguments were presented to the invoking application, but shall not be an error in *getopts*  
 93029       processing.

93030       If an option-argument is missing:

- 93031       • If the first character of *optstring* is a <colon>, the shell variable specified by *name* shall be  
 93032       set to the <colon> character and the shell variable *OPTARG* shall be set to the option  
 93033       character found.
- 93034       • Otherwise, the shell variable specified by *name* shall be set to the <question-mark>  
 93035       character, the shell variable *OPTARG* shall be unset, and a diagnostic message shall be  
 93036       written to standard error. This condition shall be considered to be an error detected in the  
 93037       way arguments were presented to the invoking application, but shall not be an error in  
 93038       *getopts* processing; a diagnostic message shall be written as stated, but the exit status shall  
 93039       be zero.

93040       When the end of options is encountered, the *getopts* utility shall exit with a return value greater  
 93041       than zero; the shell variable *OPTIND* shall be set to the index of the first operand, or the value  
 93042       "\$#"+1 if there are no operands; the *name* variable shall be set to the <question-mark> character.  
 93043       Any of the following shall identify the end of options: the first "--" argument that is not an  
 93044       option-argument, finding an argument that is not an option-argument and does not begin with a  
 93045       '-' , or encountering an error.

93046       The shell variables *OPTIND* and *OPTARG* shall be local to the caller of *getopts* and shall not be  
 93047       exported by default.

93048       The shell variable specified by the *name* operand, *OPTIND*, and *OPTARG* shall affect the current  
 93049       shell execution environment; see [Section 2.12](#) (on page 2371).

93050       If the application sets *OPTIND* to the value 1, a new set of parameters can be used: either the  
 93051       current positional parameters or new *arg* values. Any other attempt to invoke *getopts* multiple  
 93052       times in a single shell execution environment with parameters (positional parameters or *arg*  
 93053       operands) that are not the same in all invocations, or with an *OPTIND* value modified to be a

93054 value other than 1, produces unspecified results.

#### 93055 OPTIONS

93056 None.

#### 93057 OPERANDS

93058 The following operands shall be supported:

93059 *optstring* A string containing the option characters recognized by the utility invoking *getopts*.  
 93060 If a character is followed by a <colon>, the option shall be expected to have an  
 93061 argument, which should be supplied as a separate argument. Applications should  
 93062 specify an option character and its option-argument as separate arguments, but  
 93063 *getopts* shall interpret the characters following an option character requiring  
 93064 arguments as an argument whether or not this is done. An explicit null option-  
 93065 argument need not be recognized if it is not supplied as a separate argument when  
 93066 *getopts* is invoked. (See also the *getopt()* function defined in the System Interfaces  
 93067 volume of POSIX.1-2008.) The characters <question-mark> and <colon> shall not  
 93068 be used as option characters by an application. The use of other option characters  
 93069 that are not alphanumeric produces unspecified results. If the option-argument is  
 93070 not supplied as a separate argument from the option character, the value in  
 93071 *OPTARG* shall be stripped of the option character and the '-'. The first character  
 93072 in *optstring* determines how *getopts* behaves if an option character is not known or  
 93073 an option-argument is missing.

93074 *name* The name of a shell variable that shall be set by the *getopts* utility to the option  
 93075 character that was found.

93076 The *getopts* utility by default shall parse positional parameters passed to the invoking shell  
 93077 procedure. If *args* are given, they shall be parsed instead of the positional parameters.

#### 93078 STDIN

93079 Not used.

#### 93080 INPUT FILES

93081 None.

#### 93082 ENVIRONMENT VARIABLES

93083 The following environment variables shall affect the execution of *getopts*:

93084 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 93085 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 93086 variables used to determine the values of locale categories.)

93087 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 93088 internationalization variables.

93089 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 93090 characters (for example, single-byte as opposed to multi-byte characters in  
 93091 arguments and input files).

93092 *LC\_MESSAGES*

93093 Determine the locale that should be used to affect the format and contents of  
 93094 diagnostic messages written to standard error.

93095 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

93096 *OPTIND* This variable shall be used by the *getopts* utility as the index of the next argument  
 93097 to be processed.

**93098 ASYNCHRONOUS EVENTS**

93099 Default.

**93100 STDOUT**

93101 Not used.

**93102 STDERR**

93103 Whenever an error is detected and the first character in the *optstring* operand is not a <colon>  
93104 (':'), a diagnostic message shall be written to standard error with the following information in  
93105 an unspecified format:

- 93106 • The invoking program name shall be identified in the message. The invoking program  
93107 name shall be the value of the shell special parameter 0 (see [Section 2.5.2](#), on page 2340) at  
93108 the time the *getopts* utility is invoked. A name equivalent to:

93109 `basename "$0"`

93110 may be used.

- 93111 • If an option is found that was not specified in *optstring*, this error is identified and the  
93112 invalid option character shall be identified in the message.

- 93113 • If an option requiring an option-argument is found, but an option-argument is not found,  
93114 this error shall be identified and the invalid option character shall be identified in the  
93115 message.

**93116 OUTPUT FILES**

93117 None.

**93118 EXTENDED DESCRIPTION**

93119 None.

**93120 EXIT STATUS**

93121 The following exit values shall be returned:

93122 0 An option, specified or unspecified by *optstring*, was found.

93123 >0 The end of options was encountered or an error occurred.

**93124 CONSEQUENCES OF ERRORS**

93125 Default.

**93126 APPLICATION USAGE**

93127 Since *getopts* affects the current shell execution environment, it is generally provided as a shell  
93128 regular built-in. If it is called in a subshell or separate utility execution environment, such as one  
93129 of the following:

93130 `(getopts abc value "$@")`

93131 `nohup getopts ...`

93132 `find . -exec getopts ... \;`

93133 it does not affect the shell variables in the caller's environment.

93134 Note that shell functions share *OPTIND* with the calling shell even though the positional  
93135 parameters are changed. If the calling shell and any of its functions uses *getopts* to parse  
93136 arguments, the results are unspecified.

**EXAMPLES**

The following example script parses and displays its arguments:

```
aflag=
bflag=
while getopts ab: name
do
    case $name in
        a)    aflag=1;;
        b)    bflag=1
              bval="$OPTARG";;
        ?)    printf "Usage: %s: [-a] [-b value] args\n" $0
              exit 2;;
    esac
done
if [ ! -z "$aflag" ]; then
    printf "Option -a specified\n"
fi
if [ ! -z "$bflag" ]; then
    printf 'Option -b "%s" specified\n' "$bval"
fi
shift $(( $OPTIND - 1 ))
printf "Remaining arguments are: %s\n" "$@"
```

**RATIONALE**

The *getopts* utility was chosen in preference to the System V *getopt* utility because *getopts* handles option-arguments containing <blank> characters.

The *OPTARG* variable is not mentioned in the ENVIRONMENT VARIABLES section because it does not affect the execution of *getopts*; it is one of the few “output-only” variables used by the standard utilities.

The <colon> is not allowed as an option character because that is not historical behavior, and it violates the Utility Syntax Guidelines. The <colon> is now specified to behave as in the KornShell version of the *getopts* utility; when used as the first character in the *optstring* operand, it disables diagnostics concerning missing option-arguments and unexpected option characters. This replaces the use of the *OPTERR* variable that was specified in an early proposal.

The formats of the diagnostic messages produced by the *getopts* utility and the *getopt()* function are not fully specified because implementations with superior (“friendlier”) formats objected to the formats used by some historical implementations. The standard developers considered it important that the information in the messages used be uniform between *getopts* and *getopt()*. Exact duplication of the messages might not be possible, particularly if a utility is built on another system that has a different *getopt()* function, but the messages must have specific information included so that the program name, invalid option character, and type of error can be distinguished by a user.

Only a rare application program intercepts a *getopts* standard error message and wants to parse it. Therefore, implementations are free to choose the most usable messages they can devise. The following formats are used by many historical implementations:

```
%s: illegal option -- %c\n", <program name>, <option character>

%s: option requires an argument -- %c\n", <program name>, \
    <option character>
```

93184 Historical shells with built-in versions of *getopt()* or *getopts* have used different formats,  
93185 frequently not even indicating the option character found in error.

93186 **FUTURE DIRECTIONS**

93187 None.

93192 **CHANGE HISTORY**

93193 First released in Issue 4.

93194 **Issue 6**

93195 The normative text is reworded to avoid use of the term “must” for application requirements.

93196 **Issue 7**

93197 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0092 [159] is applied.

**NAME**

grep — search a file for a pattern

**SYNOPSIS**

```
grep [-E|-F] [-c|-l|-q] [-insvx] -e pattern_list
    [-e pattern_list]... [-f pattern_file]... [file...]

grep [-E|-F] [-c|-l|-q] [-insvx] [-e pattern_list]...
    -f pattern_file [-f pattern_file]... [file...]

grep [-E|-F] [-c|-l|-q] [-insvx] pattern_list [file...]
```

**DESCRIPTION**

The *grep* utility shall search the input files, selecting lines matching one or more patterns; the types of patterns are controlled by the options specified. The patterns are specified by the *-e* option, *-f* option, or the *pattern\_list* operand. The *pattern\_list*'s value shall consist of one or more patterns separated by <newline> characters; the *pattern\_file*'s contents shall consist of one or more patterns terminated by a <newline> character. By default, an input line shall be selected if any pattern, treated as an entire basic regular expression (BRE) as described in XBD [Section 9.3](#) (on page 183), matches any part of the line excluding the terminating <newline>; a null BRE shall match every line. By default, each selected input line shall be written to the standard output.

Regular expression matching shall be based on text lines. Since a <newline> separates or terminates patterns (see the *-e* and *-f* options below), regular expressions cannot contain a <newline>. Similarly, since patterns are matched against individual lines (excluding the terminating <newline> characters) of the input, there is no way for a pattern to match a <newline> found in the input.

**OPTIONS**

The *grep* utility shall conform to XBD [Section 12.2](#) (on page 216).

The following options shall be supported:

**-E** Match using extended regular expressions. Treat each pattern specified as an ERE, as described in XBD [Section 9.4](#) (on page 188). If any entire ERE pattern matches some part of an input line excluding the terminating <newline>, the line shall be matched. A null ERE shall match every line.

**-F** Match using fixed strings. Treat each pattern specified as a string instead of a regular expression. If an input line contains any of the patterns as a contiguous sequence of bytes, the line shall be matched. A null string shall match every line.

**-c** Write only a count of selected lines to standard output.

**-e pattern\_list**

Specify one or more patterns to be used during the search for input. The application shall ensure that patterns in *pattern\_list* are separated by a <newline>. A null pattern can be specified by two adjacent <newline> characters in *pattern\_list*. Unless the *-E* or *-F* option is also specified, each pattern shall be treated as a BRE, as described in XBD [Section 9.3](#) (on page 183). Multiple *-e* and *-f* options shall be accepted by the *grep* utility. All of the specified patterns shall be used when matching lines, but the order of evaluation is unspecified.

**-f pattern\_file**

Read one or more patterns from the file named by the pathname *pattern\_file*. Patterns in *pattern\_file* shall be terminated by a <newline>. A null pattern can be specified by an empty line in *pattern\_file*. Unless the *-E* or *-F* option is also

- 93244 specified, each pattern shall be treated as a BRE, as described in XBD [Section 9.3](#)  
 93245 (on page 183).
- 93246 **-i** Perform pattern matching in searches without regard to case; see XBD [Section 9.2](#)  
 93247 (on page 182).
- 93248 **-l** (The letter ell.) Write only the names of files containing selected lines to standard  
 93249 output. Pathnames shall be written once per file searched. If the standard input is  
 93250 searched, a pathname of "(standard input)" shall be written, in the POSIX  
 93251 locale. In other locales, "standard input" may be replaced by something more  
 93252 appropriate in those locales.
- 93253 **-n** Precede each output line by its relative line number in the file, each file starting at  
 93254 line 1. The line number counter shall be reset for each file processed.
- 93255 **-q** Quiet. Nothing shall be written to the standard output, regardless of matching  
 93256 lines. Exit with zero status if an input line is selected.
- 93257 **-s** Suppress the error messages ordinarily written for nonexistent or unreadable files.  
 93258 Other error messages shall not be suppressed.
- 93259 **-v** Select lines not matching any of the specified patterns. If the **-v** option is not  
 93260 specified, selected lines shall be those that match any of the specified patterns.
- 93261 **-x** Consider only input lines that use all characters in the line excluding the  
 93262 terminating <newline> to match an entire fixed string or regular expression to be  
 93263 matching lines.

## 93264 OPERANDS

93265 The following operands shall be supported:

- 93266 *pattern\_list* Specify one or more patterns to be used during the search for input. This operand  
 93267 shall be treated as if it were specified as **-e pattern\_list**.
- 93268 *file* A pathname of a file to be searched for the patterns. If no *file* operands are  
 93269 specified, the standard input shall be used.

## 93270 STDIN

93271 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 93272 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 93273 the standard input shall not be used. See the INPUT FILES section.

## 93274 INPUT FILES

93275 The input files shall be text files.

## 93276 ENVIRONMENT VARIABLES

93277 The following environment variables shall affect the execution of *grep*:

- 93278 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 93279 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 93280 variables used to determine the values of locale categories.)
- 93281 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 93282 internationalization variables.
- 93283 *LC\_COLLATE*  
 93284 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 93285 character collating elements within regular expressions.

93286 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 93287 characters (for example, single-byte as opposed to multi-byte characters in  
 93288 arguments and input files) and the behavior of character classes within regular  
 93289 expressions.

93290 **LC\_MESSAGES**  
 93291 Determine the locale that should be used to affect the format and contents of  
 93292 diagnostic messages written to standard error.

93293 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

## 93294 **ASYNCHRONOUS EVENTS**

93295 Default.

## 93296 **STDOUT**

93297 If the **-l** option is in effect, the following shall be written for each file containing at least one  
 93298 selected input line:

93299 "%s\n", <file>

93300 Otherwise, if more than one *file* argument appears, and **-q** is not specified, the *grep* utility shall  
 93301 prefix each output line by:

93302 "%s: ", <file>

93303 The remainder of each output line shall depend on the other options specified:

- 93304 • If the **-c** option is in effect, the remainder of each output line shall contain:  
 93305 "%d\n", <count>
- 93306 • Otherwise, if **-c** is not in effect and the **-n** option is in effect, the following shall be written  
 93307 to standard output:  
 93308 "%d: ", <line number>
- 93309 • Finally, the following shall be written to standard output:  
 93310 "%s", <selected-line contents>

## 93311 **STDERR**

93312 The standard error shall be used only for diagnostic messages.

## 93313 **OUTPUT FILES**

93314 None.

## 93315 **EXTENDED DESCRIPTION**

93316 None.

## 93317 **EXIT STATUS**

93318 The following exit values shall be returned:

- 93319 0 One or more lines were selected.
- 93320 1 No lines were selected.
- 93321 >1 An error occurred.

## 93322 **CONSEQUENCES OF ERRORS**

93323 If the **-q** option is specified, the exit status shall be zero if an input line is selected, even if an  
 93324 error was detected. Otherwise, default actions shall be performed.

## APPLICATION USAGE

Care should be taken when using characters in *pattern\_list* that may also be meaningful to the command interpreter. It is safest to enclose the entire *pattern\_list* argument in single-quotes:

' . . . '

The **-e** *pattern\_list* option has the same effect as the *pattern\_list* operand, but is useful when *pattern\_list* begins with the <hyphen-minus> delimiter. It is also useful when it is more convenient to provide multiple patterns as separate arguments.

Multiple **-e** and **-f** options are accepted and *grep* uses all of the patterns it is given while matching input text lines. (Note that the order of evaluation is not specified. If an implementation finds a null string as a pattern, it is allowed to use that pattern first, matching every line, and effectively ignore any other patterns.)

The **-q** option provides a means of easily determining whether or not a pattern (or string) exists in a group of files. When searching several files, it provides a performance improvement (because it can quit as soon as it finds the first match) and requires less care by the user in choosing the set of files to supply as arguments (because it exits zero if it finds a match even if *grep* detected an access or read error on earlier *file* operands).

When using *grep* to process pathnames, it is recommended that LC\_ALL, or at least LC\_CTYPE and LC\_COLLATE, are set to POSIX or C in the environment, since pathnames can contain byte sequences that do not form valid characters in some locales, in which case the utility's behavior would be undefined. In the POSIX locale each byte is a valid single-byte character, and therefore this problem is avoided.

## EXAMPLES

1. To find all uses of the word "Posix" (in any case) in file **text.mm** and write with line numbers:

```
grep -i -n posix text.mm
```

2. To find all empty lines in the standard input:

```
grep ^$
```

or:

```
grep -v .
```

3. Both of the following commands print all lines containing strings "abc" or "def" or both:

```
grep -E 'abc|def'
```

```
grep -F 'abc
def'
```

4. Both of the following commands print all lines matching exactly "abc" or "def":

```
grep -E '^abc$|^def$'
```

```
grep -F -x 'abc
def'
```

**RATIONALE**

This *grep* has been enhanced in an upwards-compatible way to provide the exact functionality of the historical *egrep* and *fgrep* commands as well. It was the clear intention of the standard developers to consolidate the three *greps* into a single command.

The old *egrep* and *fgrep* commands are likely to be supported for many years to come as implementation extensions, allowing historical applications to operate unmodified.

Historical implementations usually silently ignored all but one of multiply-specified **-e** and **-f** options, but were not consistent as to which specification was actually used.

The **-b** option was omitted from the OPTIONS section because block numbers are implementation-defined.

The System V restriction on using **-** to mean standard input was omitted.

A definition of action taken when given a null BRE or ERE is specified. This is an error condition in some historical implementations.

The **-l** option previously indicated that its use was undefined when no files were explicitly named. This behavior was historical and placed an unnecessary restriction on future implementations. It has been removed.

The historical BSD *grep* **-s** option practice is easily duplicated by redirecting standard output to **/dev/null**. The **-s** option required here is from System V.

The **-x** option, historically available only with *fgrep*, is available here for all of the non-obsolete versions.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 2.

**Issue 6**

The Open Group Corrigendum U029/5 is applied, correcting the SYNOPSIS.

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/28 is applied, correcting the examples using the *grep* **-F** option which did not match the normative description of the **-F** option.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #092 is applied.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

SD5-XCU-ERN-98 is applied, updating the STDOUT section.

93399 **NAME**

93400 hash — remember or report utility locations

93401 **SYNOPSIS**93402 hash [*utility*...]

93403 hash -r

93404 **DESCRIPTION**

93405 The *hash* utility shall affect the way the current shell environment remembers the locations of  
 93406 utilities found as described in [Section 2.9.1.1](#) (on page 2357). Depending on the arguments  
 93407 specified, it shall add utility locations to its list of remembered locations or it shall purge the  
 93408 contents of the list. When no arguments are specified, it shall report on the contents of the list.

93409 Utilities provided as built-ins to the shell shall not be reported by *hash*.93410 **OPTIONS**93411 The *hash* utility shall conform to XBD [Section 12.2](#) (on page 216).

93412 The following option shall be supported:

93413 -r Forget all previously remembered utility locations.

93414 **OPERANDS**

93415 The following operand shall be supported:

93416 *utility* The name of a utility to be searched for and added to the list of remembered  
 93417 locations. If *utility* contains one or more <slash> characters, the results are  
 93418 unspecified.

93419 **STDIN**

93420 Not used.

93421 **INPUT FILES**

93422 None.

93423 **ENVIRONMENT VARIABLES**93424 The following environment variables shall affect the execution of *hash*:

93425 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 93426 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 93427 variables used to determine the values of locale categories.)

93428 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 93429 internationalization variables.

93430 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 93431 characters (for example, single-byte as opposed to multi-byte characters in  
 93432 arguments).

93433 *LC\_MESSAGES*

93434 Determine the locale that should be used to affect the format and contents of  
 93435 diagnostic messages written to standard error.

93436 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.93437 *PATH* Determine the location of *utility*, as described in XBD [Chapter 8](#) (on page 173).

**93438 ASYNCHRONOUS EVENTS**

93439 Default.

**93440 STDOUT**

93441 The standard output of *hash* shall be used when no arguments are specified. Its format is  
93442 unspecified, but includes the pathname of each utility in the list of remembered locations for the  
93443 current shell environment. This list shall consist of those utilities named in previous *hash*  
93444 invocations that have been invoked, and may contain those invoked and found through the  
93445 normal command search process.

**93446 STDERR**

93447 The standard error shall be used only for diagnostic messages.

**93448 OUTPUT FILES**

93449 None.

**93450 EXTENDED DESCRIPTION**

93451 None.

**93452 EXIT STATUS**

93453 The following exit values shall be returned:

93454 0 Successful completion.

93455 >0 An error occurred.

**93456 CONSEQUENCES OF ERRORS**

93457 Default.

**93458 APPLICATION USAGE**

93459 Since *hash* affects the current shell execution environment, it is always provided as a shell  
93460 regular built-in. If it is called in a separate utility execution environment, such as one of the  
93461 following:

93462 `nohup hash -r`  
93463 `find . -type f | xargs hash`

93464 it does not affect the command search process of the caller's environment.

93465 The *hash* utility may be implemented as an alias—for example, *alias -t -*, in which case utilities  
93466 found through normal command search are not listed by the *hash* command.

93467 The effects of *hash -r* can also be achieved portably by resetting the value of *PATH*; in the  
93468 simplest form, this can be:

93469 `PATH= "$PATH"`

93470 The use of *hash* with *utility* names is unnecessary for most applications, but may provide a  
93471 performance improvement on a few implementations; normally, the hashing process is included  
93472 by default.

**93473 EXAMPLES**

93474 None.

**93475 RATIONALE**

93476 None.

93477 **FUTURE DIRECTIONS**

93478 None.

93479 **SEE ALSO**93480 [Section 2.9.1.1](#) (on page 2357)93481 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)93482 **CHANGE HISTORY**

93483 First released in Issue 2.

93484 **Issue 7**93485 The *hash* utility is moved from the XSI option to the Base.

93486 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0093 [241] is applied.

93487 **NAME**

93488       head — copy the first part of files

93489 **SYNOPSIS**93490       head [-n *number*] [*file*...]93491 **DESCRIPTION**93492       The *head* utility shall copy its input files to the standard output, ending the output for each file at  
93493       a designated point.93494       Copying shall end at the point in each input file indicated by the **-n *number*** option. The option-  
93495       argument *number* shall be counted in units of lines.93496 **OPTIONS**93497       The *head* utility shall conform to XBD [Section 12.2](#) (on page 216).

93498       The following option shall be supported:

93499       **-n *number***   The first *number* lines of each input file shall be copied to standard output. The  
93500                      application shall ensure that the *number* option-argument is a positive decimal  
93501                      integer.93502       When a file contains less than *number* lines, it shall be copied to standard output in its entirety.  
93503       This shall not be an error.93504       If no options are specified, *head* shall act as if **-n 10** had been specified.93505 **OPERANDS**

93506       The following operand shall be supported:

93507       *file*           A pathname of an input file. If no *file* operands are specified, the standard input  
93508                      shall be used.93509 **STDIN**93510       The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
93511       operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
93512       the standard input shall not be used. See the INPUT FILES section.93513 **INPUT FILES**

93514       Input files shall be text files, but the line length is not restricted to {LINE\_MAX} bytes.

93515 **ENVIRONMENT VARIABLES**93516       The following environment variables shall affect the execution of *head*:93517       **LANG**           Provide a default value for the internationalization variables that are unset or null.  
93518                      (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
93519                      variables used to determine the values of locale categories.)93520       **LC\_ALL**          If set to a non-empty string value, override the values of all the other  
93521                      internationalization variables.93522       **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
93523                      characters (for example, single-byte as opposed to multi-byte characters in  
93524                      arguments and input files).93525       **LC\_MESSAGES**93526                      Determine the locale that should be used to affect the format and contents of  
93527                      diagnostic messages written to standard error.

93528 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 93529 ASYNCHRONOUS EVENTS

93530 Default.

## 93531 STDOUT

93532 The standard output shall contain designated portions of the input files.

93533 If multiple *file* operands are specified, *head* shall precede the output for each with the header:

93534 "*\n==> %s <==\n*", *<pathname>*

93535 except that the first header written shall not include the initial *<newline>*.

## 93536 STDERR

93537 The standard error shall be used only for diagnostic messages.

## 93538 OUTPUT FILES

93539 None.

## 93540 EXTENDED DESCRIPTION

93541 None.

## 93542 EXIT STATUS

93543 The following exit values shall be returned:

93544 0 Successful completion.

93545 >0 An error occurred.

## 93546 CONSEQUENCES OF ERRORS

93547 Default.

## 93548 APPLICATION USAGE

93549 When using *head* to process pathnames, it is recommended that *LC\_ALL*, or at least *LC\_CTYPE* |  
 93550 and *LC\_COLLATE*, are set to *POSIX* or *C* in the environment, since pathnames can contain byte |  
 93551 sequences that do not form valid characters in some locales, in which case the utility's behavior |  
 93552 would be undefined. In the *POSIX* locale each byte is a valid single-byte character, and therefore |  
 93553 this problem is avoided.

## 93554 EXAMPLES

93555 To write the first ten lines of all files (except those with a leading period) in the directory:

93556 *head -- \**

## 93557 RATIONALE

93558 Although it is possible to simulate *head* with *sed 10q* for a single file, the standard developers |  
 93559 decided that the popularity of *head* on historical BSD systems warranted its inclusion alongside |  
 93560 *tail*.

93561 *POSIX.1-2008* version of *head* follows the Utility Syntax Guidelines. The *-n* option was added to |  
 93562 this new interface so that *head* and *tail* would be more logically related. Earlier versions of this |  
 93563 standard allowed a *-number* option. This form is no longer specified by *POSIX.1-2008* but may |  
 93564 be present in some implementations.

93565 There is no *-c* option (as there is in *tail*) because it is not historical practice and because other |  
 93566 utilities in this volume of *POSIX.1-2008* provide similar functionality.

93567 **FUTURE DIRECTIONS**

93568 None.

93569 **SEE ALSO**93570 *sed, tail*93571 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)93572 **CHANGE HISTORY**

93573 First released in Issue 4.

93574 **Issue 6**93575 The obsolescent **–number** form is removed.

93576 The normative text is reworded to avoid use of the term “must” for application requirements.

93577 The DESCRIPTION is updated to clarify that when a file contains less than the number of lines  
93578 requested, the entire file is copied to standard output.93579 **Issue 7**

93580 Austin Group Interpretations 1003.1-2001 #027 and #092 are applied.

93581 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

93582 The APPLICATION USAGE section is removed and the EXAMPLES section is corrected.

**NAME**

iconv — codeset conversion

**SYNOPSIS**

```
iconv [-cs] -f frommap -t tomap [file...]
iconv -f fromcode [-cs] [-t tocode] [file...]
iconv -t tocode [-cs] [-f fromcode] [file...]
iconv -l
```

**DESCRIPTION**

The *iconv* utility shall convert the encoding of characters in *file* from one codeset to another and write the results to standard output.

When the options indicate that charmap files are used to specify the codesets (see **OPTIONS**), the codeset conversion shall be accomplished by performing a logical join on the symbolic character names in the two charmaps. The implementation need not support the use of charmap files for codeset conversion unless the POSIX2\_LOCALEDEF symbol is defined on the system.

**OPTIONS**

The *iconv* utility shall conform to XBD [Section 12.2](#) (on page 216).

The following options shall be supported:

**-c** Omit any characters that are invalid in the codeset of the input file from the output. When **-c** is not used, the results of encountering invalid characters in the input stream (either those that are not characters in the codeset of the input file or that have no corresponding character in the codeset of the output file) shall be specified in the system documentation. The presence or absence of **-c** shall not affect the exit status of *iconv*.

**-f** *fromcodeset*

Identify the codeset of the input file. The implementation shall recognize the following two forms of the *fromcodeset* option-argument:

*fromcode* The *fromcode* option-argument must not contain a <slash> character. It shall be interpreted as the name of one of the codeset descriptions provided by the implementation in an unspecified format. Valid values of *fromcode* are implementation-defined.

*frommap* The *frommap* option-argument must contain a <slash> character. It shall be interpreted as the pathname of a charmap file as defined in XBD [Section 6.4](#) (on page 129). If the pathname does not represent a valid, readable charmap file, the results are undefined.

If this option is omitted, the codeset of the current locale shall be used.

**-l** Write all supported *fromcode* and *tocode* values to standard output in an unspecified format.

**-s** Suppress any messages written to standard error concerning invalid characters. When **-s** is not used, the results of encountering invalid characters in the input stream (either those that are not valid characters in the codeset of the input file or that have no corresponding character in the codeset of the output file) shall be specified in the system documentation. The presence or absence of **-s** shall not affect the exit status of *iconv*.

**OUTPUT FILES**

None.

**EXTENDED DESCRIPTION**

None.

**EXIT STATUS**

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

The user must ensure that both charmap files use the same symbolic names for characters the two codesets have in common.

**EXAMPLES**

The following example converts the contents of file **mail.x400** from the ISO/IEC 6937:2001 standard codeset to the ISO/IEC 8859-1:1998 standard codeset, and stores the results in file **mail.local**:

```
iconv -f IS6937 -t IS8859 mail.x400 > mail.local
```

**RATIONALE**

The *iconv* utility can be used portably only when the user provides two charmap files as option-arguments. This is because a single charmap provided by the user cannot reliably be joined with the names in a system-provided character set description. The valid values for *fromcode* and *tocode* are implementation-defined and do not have to have any relation to the charmap mechanisms. As an aid to interactive users, the **-l** option was adopted from the Plan 9 operating system. It writes information concerning these implementation-defined values. The format is unspecified because there are many possible useful formats that could be chosen, such as a matrix of valid combinations of *fromcode* and *tocode*. The **-l** option is not intended for shell script usage; conforming applications will have to use charmaps.

The *iconv* utility may support the conversion between ASCII and EBCDIC-based encodings, but is not required to do so. In an XSI-compliant implementation, the *dd* utility is the only method guaranteed to support conversion between these two character sets.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 3.

**Issue 6**

This utility has been rewritten to align with the IEEE P1003.2b draft standard. Specifically, the ability to use charmap files for conversion has been added.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/29 is applied, making changes to address inconsistencies with the *iconv()* function in the System Interfaces volume of POSIX.1-2008.

93709 **Issue 7**

93710 Austin Group Interpretation 1003.1-2001 #206 is applied, correcting the *tomap* option.

93711 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

93712 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0094 [291] and XCU/TC1-2008/0095  
93713 [291] are applied.

93714 **NAME**93715 `id` — return user identity93716 **SYNOPSIS**93717 `id [user]`93718 `id -G [-n] [user]`93719 `id -g [-nr] [user]`93720 `id -u [-nr] [user]`93721 **DESCRIPTION**

93722 If no *user* operand is provided, the *id* utility shall write the user and group IDs and the  
 93723 corresponding user and group names of the invoking process to standard output. If the effective  
 93724 and real IDs do not match, both shall be written. If multiple groups are supported by the  
 93725 underlying system (see the description of {NGROUPS\_MAX} in the System Interfaces volume of  
 93726 POSIX.1-2008), the supplementary group affiliations of the invoking process shall also be  
 93727 written.

93728 If a *user* operand is provided and the process has appropriate privileges, the user and group IDs  
 93729 of the selected user shall be written. In this case, effective IDs shall be assumed to be identical to  
 93730 real IDs. If the selected user has more than one allowable group membership listed in the group  
 93731 database, these shall be written in the same manner as the supplementary groups described in  
 93732 the preceding paragraph.

93733 **OPTIONS**93734 The *id* utility shall conform to XBD [Section 12.2](#) (on page 216).

93735 The following options shall be supported:

93736 **-G** Output all different group IDs (effective, real, and supplementary) only, using the  
 93737 format "`%u\n`". If there is more than one distinct group affiliation, output each  
 93738 such affiliation, using the format " `%u`", before the <newline> is output.

93739 **-g** Output only the effective group ID, using the format "`%u\n`".

93740 **-n** Output the name in the format "`%s`" instead of the numeric ID using the format  
 93741 "`%u`".

93742 **-r** Output the real ID instead of the effective ID.

93743 **-u** Output only the effective user ID, using the format "`%u\n`".

93744 **OPERANDS**

93745 The following operand shall be supported:

93746 *user* The login name for which information is to be written.

93747 **STDIN**

93748 Not used.

93749 **INPUT FILES**

93750 None.

93751 **ENVIRONMENT VARIABLES**93752 The following environment variables shall affect the execution of *id*:

93753 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 93754 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 93755 variables used to determine the values of locale categories.)

|       |                            |                                                                                                                                                                                                                                                                                              |
|-------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 93756 | <i>LC_ALL</i>              | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                     |
| 93757 |                            |                                                                                                                                                                                                                                                                                              |
| 93758 | <i>LC_CTYPE</i>            | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).                                                                                                                    |
| 93759 |                            |                                                                                                                                                                                                                                                                                              |
| 93760 |                            |                                                                                                                                                                                                                                                                                              |
| 93761 | <i>LC_MESSAGES</i>         |                                                                                                                                                                                                                                                                                              |
| 93762 |                            | Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error and informative messages written to standard output.                                                                                                             |
| 93763 |                            |                                                                                                                                                                                                                                                                                              |

| 93791 |                            |                                                                                                                                                                                                                                                                                              |
| 93792 |                            | ", %u(%s)"                                                                                                                                                                                                                                                                                   |
| 93793 |                            | and the necessary number of the following arguments added at the end of the argument list:                                                                                                                                                                                                   |
| 93794 |                            | <supplementary group ID>, <supplementary group name>                                                                                                                                                                                                                                         |
| 93795 |                            | If any of the user ID, group ID, effective user ID, effective group ID, or supplementary/multiple                                                                                                                                                                                            |

93796 group IDs cannot be mapped by the system into printable user or group names, the  
93797 corresponding "(%s)" and *name* argument shall be omitted from the corresponding format  
93798 string.

93799 When any of the options are specified, the output format shall be as described in the OPTIONS  
93800 section.

#### 93801 **STDERR**

93802 The standard error shall be used only for diagnostic messages.

#### 93803 **OUTPUT FILES**

93804 None.

#### 93805 **EXTENDED DESCRIPTION**

93806 None.

#### 93807 **EXIT STATUS**

93808 The following exit values shall be returned:

93809 0 Successful completion.

93810 >0 An error occurred.

#### 93811 **CONSEQUENCES OF ERRORS**

93812 Default.

#### 93813 **APPLICATION USAGE**

93814 Output produced by the **-G** option and by the default case could potentially produce very long  
93815 lines on systems that support large numbers of supplementary groups. (On systems with user  
93816 and group IDs that are 32-bit integers and with group names with a maximum of 8 bytes per  
93817 name, 93 supplementary groups plus distinct effective and real group and user IDs could  
93818 theoretically overflow the 2048-byte {LINE\_MAX} text file line limit on the default output case.  
93819 It would take about 186 supplementary groups to overflow the 2048-byte barrier using *id -G*).  
93820 This is not expected to be a problem in practice, but in cases where it is a concern, applications  
93821 should consider using *fold -s* before post-processing the output of *id*.

#### 93822 **EXAMPLES**

93823 None.

#### 93824 **RATIONALE**

93825 The functionality provided by the 4 BSD *groups* utility can be simulated using:

93826 `id -Gn [ user ]`

93827 The 4 BSD command *groups* was considered, but it was not included because it did not provide  
93828 the functionality of the *id* utility of the SVID. Also, it was thought that it would be easier to  
93829 modify *id* to provide the additional functionality necessary to systems with multiple groups than  
93830 to invent another command.

93831 The options **-u**, **-g**, **-n**, and **-r** were added to ease the use of *id* with shell commands  
93832 substitution. Without these options it is necessary to use some preprocessor such as *sed* to select  
93833 the desired piece of information. Since output such as that produced by:

93834 `id -u -n`

93835 is frequently wanted, it seemed desirable to add the options.

93836 **FUTURE DIRECTIONS**

93837 None.

93838 **SEE ALSO**93839 *fold, logname, who*93840 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)93841 XSH *getgid()*, *getgroups()*, *getuid()*93842 **CHANGE HISTORY**

93843 First released in Issue 2.

93844 **Issue 7**

93845 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

93846 **NAME**

93847 ipcrm — remove an XSI message queue, semaphore set, or shared memory segment identifier

93848 **SYNOPSIS**93849 XSI `ipcrm [-q msgid|-Q msgkey|-s semid|-S semkey|-m shmid|-M shmkey]...`93850 **DESCRIPTION**93851 The *ipcrm* utility shall remove zero or more message queues, semaphore sets, or shared memory  
93852 segments. The interprocess communication facilities to be removed are specified by the options.93853 Only a user with appropriate privileges shall be allowed to remove an interprocess  
93854 communication facility that was not created by or owned by the user invoking *ipcrm*.93855 **OPTIONS**93856 The *ipcrm* utility shall conform to XBD [Section 12.2](#) (on page 216).

93857 The following options shall be supported:

93858 **-q msgid** Remove the message queue identifier *msgid* from the system and destroy the  
93859 message queue and data structure associated with it.93860 **-m shmid** Remove the shared memory identifier *shmid* from the system. The shared memory  
93861 segment and data structure associated with it shall be destroyed after the last  
93862 detach.93863 **-s semid** Remove the semaphore identifier *semid* from the system and destroy the set of  
93864 semaphores and data structure associated with it.93865 **-Q msgkey** Remove the message queue identifier, created with key *msgkey*, from the system  
93866 and destroy the message queue and data structure associated with it.93867 **-M shmkey** Remove the shared memory identifier, created with key *shmkey*, from the system.  
93868 The shared memory segment and data structure associated with it shall be  
93869 destroyed after the last detach.93870 **-S semkey** Remove the semaphore identifier, created with key *semkey*, from the system and  
93871 destroy the set of semaphores and data structure associated with it.93872 **OPERANDS**

93873 None.

93874 **STDIN**

93875 Not used.

93876 **INPUT FILES**

93877 None.

93878 **ENVIRONMENT VARIABLES**93879 The following environment variables shall affect the execution of *ipcrm*:93880 **LANG** Provide a default value for the internationalization variables that are unset or null.  
93881 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
93882 variables used to determine the values of locale categories.)93883 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
93884 internationalization variables.93885 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
93886 characters (for example, single-byte as opposed to multi-byte characters in  
93887 arguments).

93888 **LC\_MESSAGES**  
93889 Determine the locale that should be used to affect the format and contents of  
93890 diagnostic messages written to standard error.

93891 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

93892 **ASYNCHRONOUS EVENTS**  
93893 Default.

93894 **STDOUT**  
93895 Not used.

93896 **STDERR**  
93897 The standard error shall be used only for diagnostic messages.

93898 **OUTPUT FILES**  
93899 None.

93900 **EXTENDED DESCRIPTION**  
93901 None.

93902 **EXIT STATUS**  
93903 The following exit values shall be returned:  
93904 0 Successful completion.  
93905 >0 An error occurred.

93920 **CHANGE HISTORY**  
93921 First released in Issue 5.

93922 **Issue 7**  
93923 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

93924 **NAME**

93925 `ipcs` — report XSI interprocess communication facilities status

93926 **SYNOPSIS**

93927 XSI `ipcs [-qms] [-a|-bcopt]`

93928 **DESCRIPTION**

93929 The *ipcs* utility shall write information about active interprocess communication facilities.

93930 Without options, information shall be written in short format for message queues, shared  
93931 memory segments, and semaphore sets that are currently active in the system. Otherwise, the  
93932 information that is displayed is controlled by the options specified.

93933 **OPTIONS**

93934 The *ipcs* utility shall conform to XBD [Section 12.2](#) (on page 216).

93935 The *ipcs* utility accepts the following options:

93936 **-q** Write information about active message queues.

93937 **-m** Write information about active shared memory segments.

93938 **-s** Write information about active semaphore sets.

93939 If **-q**, **-m**, or **-s** are specified, only information about those facilities shall be written. If none of  
93940 these three are specified, information about all three shall be written subject to the following  
93941 options:

93942 **-a** Use all print options. (This is a shorthand notation for **-b**, **-c**, **-o**, **-p**, and **-t**.)

93943 **-b** Write information on maximum allowable size. (Maximum number of bytes in  
93944 messages on queue for message queues, size of segments for shared memory, and  
93945 number of semaphores in each set for semaphores.)

93946 **-c** Write creator's user name and group name; see below.

93947 **-o** Write information on outstanding usage. (Number of messages on queue and total  
93948 number of bytes in messages on queue for message queues, and number of  
93949 processes attached to shared memory segments.)

93950 **-p** Write process number information. (Process ID of the last process to send a  
93951 message and process ID of the last process to receive a message on message  
93952 queues, process ID of the creating process, and process ID of the last process to  
93953 attach or detach on shared memory segments.)

93954 **-t** Write time information. (Time of the last control operation that changed the access  
93955 permissions for all facilities, time of the last *msgsnd()* and *msgrcv()* operations on  
93956 message queues, time of the last *shmat()* and *shmdt()* operations on shared  
93957 memory, and time of the last *semop()* operation on semaphores.)

93958 **OPERANDS**

93959 None.

93960 **STDIN**

93961 Not used.

93962 **INPUT FILES**

- 93963 • The group database

- The user database

## ENVIRONMENT VARIABLES

The following environment variables shall affect the execution of *ipcs*:

**LANG** Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

**LC\_ALL** If set to a non-empty string value, override the values of all the other internationalization variables.

**LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).

### LC\_MESSAGES

Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

**NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**TZ** Determine the timezone for the date and time strings written by *ipcs*. If *TZ* is unset or null, an unspecified default timezone shall be used.

## ASYNCHRONOUS EVENTS

Default.

## STDOUT

An introductory line shall be written with the format:

```
"IPC status from %s as of %s\n", <source>, <date>
```

where *<source>* indicates the source used to gather the statistics and *<date>* is the information that would be produced by the *date* command when invoked in the POSIX locale.

The *ipcs* utility then shall create up to three reports depending upon the *-q*, *-m*, and *-s* options. The first report shall indicate the status of message queues, the second report shall indicate the status of shared memory segments, and the third report shall indicate the status of semaphore sets.

If the corresponding facility is not installed or has not been used since the last reboot, then the report shall be written out in the format:

```
"%s facility not in system.\n", <facility>
```

where *<facility>* is *Message Queue*, *Shared Memory*, or *Semaphore*, as appropriate. If the facility has been installed and has been used since the last reboot, column headings separated by one or more *<space>* characters and followed by a *<newline>* shall be written as indicated below followed by the facility name written out using the format:

```
"%s:\n", <facility>
```

where *<facility>* is *Message Queues*, *Shared Memory*, or *Semaphores*, as appropriate. On the second and third reports the column headings need not be written if the last column headings written already provide column headings for all information in that report.

The column headings provided in the first column below and the meaning of the information in those columns shall be given in order below; the letters in parentheses indicate the options that shall cause the corresponding column to appear; “all” means that the column shall always appear. Each column is separated by one or more *<space>* characters. Note that these options

|       |                                                                                          |                                                                                                     |
|-------|------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| 94007 | only determine what information is provided for each report; they do not determine which |                                                                                                     |
| 94008 | reports are written.                                                                     |                                                                                                     |
| 94009 | T (all)                                                                                  | Type of facility:                                                                                   |
| 94010 |                                                                                          | q Message queue.                                                                                    |
| 94011 |                                                                                          | m Shared memory segment.                                                                            |
| 94012 |                                                                                          | s Semaphore.                                                                                        |
| 94013 | This field is a single character written using the format %c.                            |                                                                                                     |
| 94014 | ID (all)                                                                                 | The identifier for the facility entry. This field shall be written using the format                 |
| 94015 |                                                                                          | %d.                                                                                                 |
| 94016 | KEY (all)                                                                                | The key used as an argument to <i>msgget()</i> , <i>semget()</i> , or <i>shmget()</i> to create the |
| 94017 |                                                                                          | facility entry.                                                                                     |
| 94018 |                                                                                          | <b>Note:</b> The key of a shared memory segment is changed to IPC_PRIVATE when the                  |
| 94019 |                                                                                          | segment has been removed until all processes attached to the segment                                |
| 94020 |                                                                                          | detach it.                                                                                          |
| 94021 | This field shall be written using the format 0x%x.                                       |                                                                                                     |
| 94022 | MODE (all)                                                                               | The facility access modes and flags. The mode shall consist of 11 characters                        |
| 94023 |                                                                                          | that are interpreted as follows.                                                                    |

| 94077 | LRPID (a,p)                                                              | The process ID of the last process to receive a message from the associated         |
| 94078 |                                                                          | queue. This field shall be written using the format:                                |
| 94079 |                                                                          | "%d", <pid>                                                                         |
| 94080 |                                                                          | where <pid> is 0 if no message has been received from the corresponding             |
| 94081 |                                                                          | message queue; otherwise, <pid> shall be the process ID of the last process to      |
| 94082 |                                                                          | receive a message from the queue.                                                   |
| 94083 | STIME (a,t)                                                              | The time the last message was sent to the associated queue. If a message has        |
| 94084 |                                                                          | been sent to the corresponding message queue, the hour, minute, and second          |
| 94085 |                                                                          | of the last time a message was sent to the queue shall be written using the         |
| 94086 |                                                                          | format %d:%2.2d:%2.2d. Otherwise, the format "no-entry" shall be                    |
| 94087 |                                                                          | written.                                                                            |
| 94088 | RTIME (a,t)                                                              | The time the last message was received from the associated queue. If a              |
| 94089 |                                                                          | message has been received from the corresponding message queue, the hour,           |
| 94090 |                                                                          | minute, and second of the last time a message was received from the queue           |

94091 shall be written using the format %d:%2.2d:%2.2d. Otherwise, the format  
 94092 " no-entry" shall be written.

94093 The following eight columns shall be only written out for shared memory segments.

94094 CREATOR (a,c) The user of the creator of the facility entry. If the user name of the creator is  
 94095 found in the user database, at least the first eight column positions of the  
 94096 name shall be written using the format %s. Otherwise, the user ID of the  
 94097 creator shall be written using the format %d.

94098 CGROUP (a,c) The group name of the creator of the facility entry. If the group name of the  
 94099 creator is found in the group database, at least the first eight column positions  
 94100 of the name shall be written using the format %s. Otherwise, the group ID of  
 94101 the creator shall be written using the format %d.

94102 NATTCH (a,o) The number of processes attached to the associated shared memory segment.  
 94103 This field shall be written using the format %d.

94104 SEGSZ (a,b) The size of the associated shared memory segment. This field shall be written  
 94105 using the format %d.

94106 CPID (a,p) The process ID of the creator of the shared memory entry. This field shall be  
 94107 written using the format %d.

94108 LPID (a,p) The process ID of the last process to attach or detach the shared memory  
 94109 segment. This field shall be written using the format:

94110 "%d", <pid>

94111 where <pid> is 0 if no process has attached the corresponding shared memory  
 94112 segment; otherwise, <pid> shall be the process ID of the last process to attach  
 94113 or detach the segment.

94114 ATIME (a,t) The time the last attach on the associated shared memory segment was  
 94115 completed. If the corresponding shared memory segment has ever been  
 94116 attached, the hour, minute, and second of the last time the segment was  
 94117 attached shall be written using the format %d:%2.2d:%2.2d. Otherwise, the  
 94118 format " no-entry" shall be written.

94119 DTIME (a,t) The time the last detach on the associated shared memory segment was  
 94120 completed. If the corresponding shared memory segment has ever been  
 94121 detached, the hour, minute, and second of the last time the segment was  
 94122 detached shall be written using the format %d:%2.2d:%2.2d. Otherwise, the  
 94123 format " no-entry" shall be written.

94124 The following four columns shall be only written out for semaphore sets:

94125 CREATOR (a,c) The user of the creator of the facility entry. If the user name of the creator is  
 94126 found in the user database, at least the first eight column positions of the  
 94127 name shall be written using the format %s. Otherwise, the user ID of the  
 94128 creator shall be written using the format %d.

94129 CGROUP (a,c) The group name of the creator of the facility entry. If the group name of the  
 94130 creator is found in the group database, at least the first eight column positions  
 94131 of the name shall be written using the format %s. Otherwise, the group ID of  
 94132 the creator shall be written using the format %d.

|       |                               |                                                                                                                                                                                                                                                                                                                                                                                  |
|-------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 94133 | NSEMS (a,b)                   | The number of semaphores in the set associated with the semaphore entry.                                                                                                                                                                                                                                                                                                         |
| 94134 |                               | This field shall be written using the format %d.                                                                                                                                                                                                                                                                                                                                 |
| 94135 | OTIME (a,t)                   | The time the last semaphore operation on the set associated with the semaphore entry was completed. If a semaphore operation has ever been performed on the corresponding semaphore set, the hour, minute, and second of the last semaphore operation on the semaphore set shall be written using the format %d:%2.2d:%2.2d. Otherwise, the format " no-entry" shall be written. |

| 94170 | <b>CHANGE HISTORY</b>         |                                                                                                                                                                                                                                                                                                                                                                                  |
| 94171 |                               | First released in Issue 5.                                                                                                                                                                                                                                                                                                                                                       |

94172 **Issue 6**

94173 The Open Group Corrigendum U020/1 is applied, correcting the SYNOPSIS.

94174 The Open Group Corrigenda U032/1 and U032/2 are applied, clarifying the output format.

94175 The Open Group Base Resolution bwg98-004 is applied.

94176 **Issue 7**

94177 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

94178 SD5-XCU-ERN-139 is applied, adding the *ipcrm* utility to the SEE ALSO section.

94179 **NAME**94180 `jobs` — display status of jobs in the current session94181 **SYNOPSIS**94182 UP `jobs [-l | -p] [job_id...]`94183 **DESCRIPTION**94184 The *jobs* utility shall display the status of jobs that were started in the current shell environment;  
94185 see [Section 2.12](#) (on page 2371).94186 When *jobs* reports the termination status of a job, the shell shall remove its process ID from the  
94187 list of those “known in the current shell execution environment”; see [Section 2.9.3.1](#) (on page  
94188 2360).94189 **OPTIONS**94190 The *jobs* utility shall conform to XBD [Section 12.2](#) (on page 216).

94191 The following options shall be supported:

94192 **-l** (The letter ell.) Provide more information about each job listed. This information  
94193 shall include the job number, current job, process group ID, state, and the  
94194 command that formed the job.94195 **-p** Display only the process IDs for the process group leaders of the selected jobs.94196 By default, the *jobs* utility shall display the status of all stopped jobs, running background jobs  
94197 and all jobs whose status has changed and have not been reported by the shell.94198 **OPERANDS**

94199 The following operand shall be supported:

94200 *job\_id* Specifies the jobs for which the status is to be displayed. If no *job\_id* is given, the  
94201 status information for all jobs shall be displayed. The format of *job\_id* is described  
94202 in XBD [Section 3.204](#) (on page 66).94203 **STDIN**

94204 Not used.

94205 **INPUT FILES**

94206 None.

94207 **ENVIRONMENT VARIABLES**94208 The following environment variables shall affect the execution of *jobs*:94209 **LANG** Provide a default value for the internationalization variables that are unset or null.  
94210 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
94211 variables used to determine the values of locale categories.)94212 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
94213 internationalization variables.94214 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
94215 characters (for example, single-byte as opposed to multi-byte characters in  
94216 arguments).94217 **LC\_MESSAGES**94218 Determine the locale that should be used to affect the format and contents of  
94219 diagnostic messages written to standard error and informative messages written to  
94220 standard output.

94221 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

94222 **ASYNCHRONOUS EVENTS**

94223 Default.

94224 **STDOUT**

94225 If the **-p** option is specified, the output shall consist of one line for each process ID:

94226 "%d\n", <process ID>

94227 Otherwise, if the **-l** option is not specified, the output shall be a series of lines of the form:

94228 "[%d] %c %s %s\n", <job-number>, <current>, <state>, <command>

94229 where the fields shall be as follows:

94230 <current> The character '+' identifies the job that would be used as a default for the *fg* or *bg* utilities; this job can also be specified using the *job\_id* %+ or "%%". The character '-' identifies the job that would become the default if the current default job were to exit; this job can also be specified using the *job\_id* %-. For other jobs, this field is a <space>. At most one job can be identified with '+' and at most one job can be identified with '-'. If there is any suspended job, then the current job shall be a suspended job. If there are at least two suspended jobs, then the previous job also shall be a suspended job.

94238 <job-number> A number that can be used to identify the process group to the *wait*, *fg*, *bg*, and *kill* utilities. Using these utilities, the job can be identified by prefixing the job number with '% '.

94241 <state> One of the following strings (in the POSIX locale):

94242 **Running** Indicates that the job has not been suspended by a signal and has not exited.

94243

94244 **Done** Indicates that the job completed and returned exit status zero.

94245 **Done(code)** Indicates that the job completed normally and that it exited with the specified non-zero exit status, *code*, expressed as a decimal number.

94246

94247 **Stopped** Indicates that the job was suspended by the SIGTSTP signal.

94248 **Stopped (SIGTSTP)**

94249 Indicates that the job was suspended by the SIGTSTP signal.

94250 **Stopped (SIGSTOP)**

94251 Indicates that the job was suspended by the SIGSTOP signal.

94252 **Stopped (SIGTTIN)**

94253 Indicates that the job was suspended by the SIGTTIN signal.

94254 **Stopped (SIGTTOU)**

94255 Indicates that the job was suspended by the SIGTTOU signal.

94256 The implementation may substitute the string **Suspended** in place of **Stopped**. If the job was terminated by a signal, the format of <state> is unspecified, but it shall be visibly distinct from all of the other <state> formats shown here and shall indicate the name or description of the signal causing the termination.

94257

94258

94259

94260 <command> The associated command that was given to the shell.

94261 If the **-l** option is specified, a field containing the process group ID shall be inserted before the <state> field. Also, more processes in a process group may be output on separate lines, using

94262

94263 only the process ID and *<command>* fields.

#### 94264 **STDERR**

94265 The standard error shall be used only for diagnostic messages.

#### 94266 **OUTPUT FILES**

94267 None.

#### 94268 **EXTENDED DESCRIPTION**

94269 None.

#### 94270 **EXIT STATUS**

94271 The following exit values shall be returned:

94272 0 Successful completion.

94273 >0 An error occurred.

#### 94274 **CONSEQUENCES OF ERRORS**

94275 Default.

#### 94276 **APPLICATION USAGE**

94277 The **-p** option is the only portable way to find out the process group of a job because different  
94278 implementations have different strategies for defining the process group of the job. Usage such  
94279 as *\$(jobs -p)* provides a way of referring to the process group of the job in an implementation-  
94280 independent way.

94281 The *jobs* utility does not work as expected when it is operating in its own utility execution  
94282 environment because that environment has no applicable jobs to manipulate. See the  
94283 APPLICATION USAGE section for *bg*. For this reason, *jobs* is generally implemented as a shell  
94284 regular built-in.

#### 94285 **EXAMPLES**

94286 None.

#### 94287 **RATIONALE**

94288 Both "*%%*" and "*%+*" are used to refer to the current job. Both forms are of equal validity—the  
94289 "*%%*" mirroring "*\$\$*" and "*%+*" mirroring the output of *jobs*. Both forms reflect historical  
94290 practice of the KornShell and the C shell with job control.

94291 The job control features provided by *bg*, *fg*, and *jobs* are based on the KornShell. The standard  
94292 developers examined the characteristics of the C shell versions of these utilities and found that  
94293 differences exist. Despite widespread use of the C shell, the KornShell versions were selected for  
94294 this volume of POSIX.1-2008 to maintain a degree of uniformity with the rest of the KornShell  
94295 features selected (such as the very popular command line editing features).

94296 The *jobs* utility is not dependent on the job control option, as are the seemingly related *bg* and *fg*  
94297 utilities because *jobs* is useful for examining background jobs, regardless of the condition of job  
94298 control. When the user has invoked a *set +m* command and job control has been turned off, *jobs*  
94299 can still be used to examine the background jobs associated with that current session. Similarly,  
94300 *kill* can then be used to kill background jobs with *kill %<background job number>*.

94301 The output for terminated jobs is left unspecified to accommodate various historical systems.  
94302 The following formats have been witnessed:

- 94303 1. **Killed**(*signal name*)
- 94304 2. *signal name*

94305 3. *signal name*(**coredump**)

94306 4. *signal description*– **core dumped**

94307 Most users should be able to understand these formats, although it means that applications have  
94308 trouble parsing them.

94309 The calculation of job IDs was not described since this would suggest an implementation, which  
94310 may impose unnecessary restrictions.

94311 In an early proposal, a **-n** option was included to “Display the status of jobs that have changed,  
94312 exited, or stopped since the last status report”. It was removed because the shell always writes  
94313 any changed status of jobs before each prompt.

#### 94314 **FUTURE DIRECTIONS**

94315 None.

#### 94316 **SEE ALSO**

94317 [Section 2.12](#) (on page 2371), *bg*, *fg*, *kill*, *wait*

#### 94319 **CHANGE HISTORY**

94320 First released in Issue 4.

#### 94321 **Issue 6**

94322 This utility is marked as part of the User Portability Utilities option.

94323 The JC shading is removed as job control is mandatory in this version.

#### 94324 **Issue 7**

94325 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**NAME**

join — relational database operator

**SYNOPSIS**

```
join [-a file_number|-v file_number] [-e string] [-o list] [-t char]
    [-1 field] [-2 field] file1 file2
```

**DESCRIPTION**

The *join* utility shall perform an equality join on the files *file1* and *file2*. The joined files shall be written to the standard output.

The join field is a field in each file on which the files are compared. The *join* utility shall write one line in the output for each pair of lines in *file1* and *file2* that have join fields that collate equally. The output line by default shall consist of the join field, then the remaining fields from *file1*, then the remaining fields from *file2*. This format can be changed by using the **-o** option (see below). The **-a** option can be used to add unmatched lines to the output. The **-v** option can be used to output only unmatched lines.

The files *file1* and *file2* shall be ordered in the collating sequence of *sort -b* on the fields on which they shall be joined, by default the first in each line. All selected output shall be written in the same collating sequence.

The default input field separators shall be <blank> characters. In this case, multiple separators shall count as one field separator, and leading separators shall be ignored. The default output field separator shall be a <space>.

The field separator and collating sequence can be changed by using the **-t** option (see below).

If the same key appears more than once in either file, all combinations of the set of remaining fields in *file1* and the set of remaining fields in *file2* are output in the order of the lines encountered.

If the input files are not in the appropriate collating sequence, the results are unspecified.

**OPTIONS**

The *join* utility shall conform to XBD [Section 12.2](#) (on page 216).

The following options shall be supported:

**-a file\_number**

Produce a line for each unpairable line in file *file\_number*, where *file\_number* is 1 or 2, in addition to the default output. If both **-a1** and **-a2** are specified, all unpairable lines shall be output.

**-e string**

Replace empty output fields in the list selected by **-o** with the string *string*.

**-o list**

Construct the output line to comprise the fields specified in *list*, each element of which shall have one of the following two forms:

1. *file\_number.field*, where *file\_number* is a file number and *field* is a decimal integer field number
2. 0 (zero), representing the join field

The elements of *list* shall be either <comma>-separated or <blank>-separated, as specified in Guideline 8 of XBD [Section 12.2](#) (on page 216). The fields specified by *list* shall be written for all selected output lines. Fields selected by *list* that do not appear in the input shall be treated as empty output fields. (See the **-e** option.) Only specifically requested fields shall be written. The application shall ensure that *list* is a single command line argument.

94370        **-t** *char*        Use character *char* as a separator, for both input and output. Every appearance of  
 94371        *char* in a line shall be significant. When this option is specified, the collating  
 94372        sequence shall be the same as *sort* without the **-b** option.

94373        **-v** *file\_number*        Instead of the default output, produce a line only for each unpairable line in  
 94374        *file\_number*, where *file\_number* is 1 or 2. If both **-v1** and **-v2** are specified, all  
 94375        unpairable lines shall be output.  
 94376

94377        **-1** *field*        Join on the *field*th field of file 1. Fields are decimal integers starting with 1.

94378        **-2** *field*        Join on the *field*th field of file 2. Fields are decimal integers starting with 1.

#### 94379 OPERANDS

94380        The following operands shall be supported:

94381        *file1, file2*        A pathname of a file to be joined. If either of the *file1* or *file2* operands is '-', the  
 94382        standard input shall be used in its place.

#### 94383 STDIN

94384        The standard input shall be used only if the *file1* or *file2* operand is '-'. See the INPUT FILES  
 94385        section.

#### 94386 INPUT FILES

94387        The input files shall be text files.

#### 94388 ENVIRONMENT VARIABLES

94389        The following environment variables shall affect the execution of *join*:

94390        *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 94391        (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 94392        variables used to determine the values of locale categories.)

94393        *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
 94394        internationalization variables.

94395        *LC\_COLLATE*

94396        Determine the locale of the collating sequence *join* expects to have been used when  
 94397        the input files were sorted.

94398        *LC\_CTYPE*        Determine the locale for the interpretation of sequences of bytes of text data as  
 94399        characters (for example, single-byte as opposed to multi-byte characters in  
 94400        arguments and input files).

94401        *LC\_MESSAGES*

94402        Determine the locale that should be used to affect the format and contents of  
 94403        diagnostic messages written to standard error.

94404 XSI        *NLSPATH*        Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 94405 ASYNCHRONOUS EVENTS

94406        Default.

#### 94407 STDOUT

94408        The *join* utility output shall be a concatenation of selected character fields. When the **-o** option  
 94409        is not specified, the output shall be:

94410        "%s%s%s\n", <*join field*>, <*other file1 fields*>,  
 94411        <*other file2 fields*>

94412        If the join field is not the first field in a file, the <*other file fields*> for that file shall be:

94413        *<fields preceding join field>, <fields following join field>*

94414        When the **-o** option is specified, the output format shall be:

94415        "*%s\n*", *<concatenation of fields>*

94416        where the concatenation of fields is described by the **-o** option, above.

94417        For either format, each field (except the last) shall be written with its trailing separator character.

94418        If the separator is the default (*<blank>* characters), a single *<space>* shall be written after each  
94419        field (except the last).

#### 94420        **STDERR**

94421        The standard error shall be used only for diagnostic messages.

#### 94422        **OUTPUT FILES**

94423        None.

#### 94424        **EXTENDED DESCRIPTION**

94425        None.

#### 94426        **EXIT STATUS**

94427        The following exit values shall be returned:

94428        0    All input files were output successfully.

94429        >0   An error occurred.

#### 94430        **CONSEQUENCES OF ERRORS**

94431        Default.

#### 94432        **APPLICATION USAGE**

94433        Pathnames consisting of numeric digits or of the form *string.string* should not be specified  
94434        directly following the **-o** list.

94435        If the collating sequence of the current locale does not have a total ordering of all characters (see +  
94436        XBD [Section 7.3.2](#), on page 147), *join* treats fields that collate equally but are not identical as +  
94437        being the same. If this behavior is not desired, it can be avoided by forcing the use of the POSIX +  
94438        locale (although this means re-sorting the input files into the POSIX locale collating sequence.) +

94439        When using *join* to process pathnames, it is recommended that LC\_ALL, or at least LC\_CTYPE +  
94440        and LC\_COLLATE, are set to POSIX or C in the environment, since pathnames can contain byte +  
94441        sequences that do not form valid characters in some locales, in which case the utility's behavior +  
94442        would be undefined. In the POSIX locale each byte is a valid single-byte character, and therefore +  
94443        this problem is avoided.

#### 94444        **EXAMPLES**

94445        The **-o 0** field essentially selects the union of the join fields. For example, given file **phone**:

```
94446        !Name                Phone Number
94447        Don                    +1 123-456-7890
94448        Hal                   +1 234-567-8901
94449        Yasushi               +2 345-678-9012
```

94450        and file **fax**:

```
94451        !Name                Fax Number
94452        Don                   +1 123-456-7899
94453        Keith                  +1 456-789-0122
94454        Yasushi               +2 345-678-9011
```

(where the large expanses of white space are meant to each represent a single <tab>), the command:

```
join -t "<tab>" -a 1 -a 2 -e '(unknown)' -o 0,1.2,2.2 phone fax
```

(where <tab> is a literal <tab> character) would produce:

| !Name   | Phone Number    | Fax Number      |
|---------|-----------------|-----------------|
| Don     | +1 123-456-7890 | +1 123-456-7899 |
| Hal     | +1 234-567-8901 | (unknown)       |
| Keith   | (unknown)       | +1 456-789-0122 |
| Yasushi | +2 345-678-9012 | +2 345-678-9011 |

Multiple instances of the same key will produce combinatorial results. The following:

```
fa:
  a x
  a y
  a z
fb:
  a p
```

will produce:

```
a x p
a y p
a z p
```

And the following:

```
fa:
  a b c
  a d e
fb:
  a w x
  a y z
  a o p
```

will produce:

```
a b c w x
a b c y z
a b c o p
a d e w x
a d e y z
a d e o p
```

## RATIONALE

The **-e** option is only effective when used with **-o** because, unless specific fields are identified using **-o**, *join* is not aware of what fields might be empty. The exception to this is the join field, but identifying an empty join field with the **-e** string is not historical practice and some scripts might break if this were changed.

The 0 field in the **-o** list was adopted from the Tenth Edition version of *join* to satisfy international objections that the *join* in the base documents for IEEE Std 1003.2-1992 did not support the “full join” or “outer join” described in relational database literature. Although it has been possible to include a join field in the output (by default, or by field number using **-o**), the join field could not be included for an unpaired line selected by **-a**. The **-o 0** field essentially

94500 selects the union of the join fields.

94501 This sort of outer join was not possible with the *join* commands in the base documents for  
94502 IEEE Std 1003.2-1992. The **-o 0** field was chosen because it is an upwards-compatible change for  
94503 applications. An alternative was considered: have the join field represent the union of the fields  
94504 in the files (where they are identical for matched lines, and one or both are null for unmatched  
94505 lines). This was not adopted because it would break some historical applications.

94506 The ability to specify *file2* as **-** is not historical practice; it was added for completeness.

94507 The **-v** option is not historical practice, but was considered necessary because it permitted the  
94508 writing of *only* those lines that do not match on the join field, as opposed to the **-a** option, which  
94509 prints both lines that do and do not match. This additional facility is parallel with the **-v** option  
94510 of *grep*.

94511 Some historical implementations have been encountered where a blank line in one of the input  
94512 files was considered to be the end of the file; the description in this volume of POSIX.1-2008 does  
94513 not cite this as an allowable case.

94514 Earlier versions of this standard allowed **-j**, **-j1**, **-j2** options, and a form of the **-o** option that  
94515 allowed the *list* option-argument to be multiple arguments. These forms are no longer specified  
94516 by POSIX.1-2008 but may be present in some implementations.

#### 94517 FUTURE DIRECTIONS

94518 None.

#### 94519 SEE ALSO

94520 *awk*, *comm*, *sort*, *uniq*

94521 XBD [Section 7.3.2](#) (on page 147), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

#### 94522 CHANGE HISTORY

94523 First released in Issue 2.

#### 94524 Issue 6

94525 The obsolescent **-j** options and the multi-argument **-o** option are removed in this version.

94526 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 94527 Issue 7

94528 Austin Group Interpretation 1003.1-2001 #027 is applied.

94529 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

## 94530 NAME

94531 kill — terminate or signal processes

## 94532 SYNOPSIS

94533 kill -s *signal\_name* *pid*...94534 kill -l [*exit\_status*]94535 XSI kill [-*signal\_name*] *pid*...94536 kill [-*signal\_number*] *pid*...

## 94537 DESCRIPTION

94538 The *kill* utility shall send a signal to the process or processes specified by each *pid* operand.94539 For each *pid* operand, the *kill* utility shall perform actions equivalent to the *kill()* function  
94540 defined in the System Interfaces volume of POSIX.1-2008 called with the following arguments:

- 94541 • The value of the *pid* operand shall be used as the *pid* argument.
- 94542 • The *sig* argument is the value specified by the *-s* option, *-signal\_number* option, or the
- 94543 *-signal\_name* option, or by SIGTERM, if none of these options is specified.

## 94544 OPTIONS

94545 XSI The *kill* utility shall conform to XBD [Section 12.2](#) (on page 216), except that in the last two  
 94546 SYNOPSIS forms, the *-signal\_number* and *-signal\_name* options are usually more than a single  
 94547 character.

94548 The following options shall be supported:

94549 **-l** (The letter ell.) Write all values of *signal\_name* supported by the implementation, if  
 94550 no operand is given. If an *exit\_status* operand is given and it is a value of the ' ? '   
 94551 shell special parameter (see [Section 2.5.2](#) (on page 2340) and *wait*) corresponding to  
 94552 a process that was terminated by a signal, the *signal\_name* corresponding to the  
 94553 signal that terminated the process shall be written. If an *exit\_status* operand is  
 94554 given and it is the unsigned decimal integer value of a signal number, the  
 94555 *signal\_name* (the symbolic constant name without the **SIG** prefix defined in the  
 94556 Base Definitions volume of POSIX.1-2008) corresponding to that signal shall be  
 94557 written. Otherwise, the results are unspecified.

94558 **-s *signal\_name***

94559 Specify the signal to send, using one of the symbolic names defined in the  
 94560 **<signal.h>** header. Values of *signal\_name* shall be recognized in a case-independent  
 94561 fashion, without the **SIG** prefix. In addition, the symbolic name 0 shall be  
 94562 recognized, representing the signal value zero. The corresponding signal shall be  
 94563 sent instead of SIGTERM.

94564 XSI **-*signal\_name***94565 Equivalent to *-s signal\_name*.94566 XSI **-*signal\_number***

94567 Specify a non-negative decimal integer, *signal\_number*, representing the signal to be  
 94568 used instead of SIGTERM, as the *sig* argument in the effective call to *kill()*. The  
 94569 correspondence between integer values and the *sig* value used is shown in the  
 94570 following list.

94571 The effects of specifying any *signal\_number* other than those listed below are  
 94572 undefined.

|       |                                                                                                 |         |
|-------|-------------------------------------------------------------------------------------------------|---------|
| 94573 | 0                                                                                               | 0       |
| 94574 | 1                                                                                               | SIGHUP  |
| 94575 | 2                                                                                               | SIGINT  |
| 94576 | 3                                                                                               | SIGQUIT |
| 94577 | 6                                                                                               | SIGABRT |
| 94578 | 9                                                                                               | SIGKILL |
| 94579 | 14                                                                                              | SIGALRM |
| 94580 | 15                                                                                              | SIGTERM |
| 94581 | If the first argument is a negative integer, it shall be interpreted as a <i>-signal_number</i> |         |
| 94582 | option, not as a negative <i>pid</i> operand specifying a process group.                        |         |

**OPERANDS**

The following operands shall be supported:

*pid* One of the following:

1. A decimal integer specifying a process or process group to be signaled. The process or processes selected by positive, negative, and zero values of the *pid* operand shall be as described for the *kill()* function. If process number 0 is specified, all processes in the current process group shall be signaled. For the effects of negative *pid* numbers, see the *kill()* function defined in the System Interfaces volume of POSIX.1-2008. If the first *pid* operand is negative, it should be preceded by "--" to keep it from being interpreted as an option.
2. A job control job ID (see XBD [Section 3.204](#), on page 66) that identifies a background process group to be signaled. The job control job ID notation is applicable only for invocations of *kill* in the current shell execution environment; see [Section 2.12](#) (on page 2371).

*exit\_status* A decimal integer specifying a signal number or the exit status of a process terminated by a signal.

**STDIN**

Not used.

**INPUT FILES**

None.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *kill*:

*LANG* Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

*LC\_ALL* If set to a non-empty string value, override the values of all the other internationalization variables.

*LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).

94614 **LC\_MESSAGES**  
 94615 Determine the locale that should be used to affect the format and contents of  
 94616 diagnostic messages written to standard error.

94617 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

94618 **ASYNCHRONOUS EVENTS**  
 94619 Default.

94620 **STDOUT**  
 94621 When the *-l* option is not specified, the standard output shall not be used.  
 94622 When the *-l* option is specified, the symbolic name of each signal shall be written in the  
 94623 following format:  
 94624 "%s%c", <signal\_name>, <separator>  
 94625 where the <signal\_name> is in uppercase, without the **SIG** prefix, and the <separator> shall be  
 94626 either a <newline> or a <space>. For the last signal written, <separator> shall be a <newline>.  
 94627 When both the *-l* option and *exit\_status* operand are specified, the symbolic name of the  
 94628 corresponding signal shall be written in the following format:  
 94629 "%s\n", <signal\_name>

94630 **STDERR**  
 94631 The standard error shall be used only for diagnostic messages.

94632 **OUTPUT FILES**  
 94633 None.

94634 **EXTENDED DESCRIPTION**  
 94635 None.

94636 **EXIT STATUS**  
 94637 The following exit values shall be returned:  
 94638 0 At least one matching process was found for each *pid* operand, and the specified signal was  
 94639 successfully processed for at least one matching process.  
 94640 >0 An error occurred.

94641 **CONSEQUENCES OF ERRORS**  
 94642 Default.

94643 **APPLICATION USAGE**  
 94644 Process numbers can be found by using *ps*.  
 94645 The job control job ID notation is not required to work as expected when *kill* is operating in its  
 94646 own utility execution environment. In either of the following examples:  
 94647 nohup kill %1 &  
 94648 system("kill %1");  
 94649 the *kill* operates in a different environment and does not share the shell's understanding of job  
 94650 numbers.

94651 **EXAMPLES**  
 94652 Any of the commands:  
 94653 kill -9 100 -165  
 94654 kill -s kill 100 -165

```
94655      kill -s KILL 100 -165
```

```
94656      sends the SIGKILL signal to the process whose process ID is 100 and to all processes whose
94657      process group ID is 165, assuming the sending process has permission to send that signal to the
94658      specified processes, and that they exist.
```

```
94659      The System Interfaces volume of POSIX.1-2008 and this volume of POSIX.1-2008 do not require
94660      specific signal numbers for any signal_names. Even the -signal_number option provides symbolic
94661      (although numeric) names for signals. If a process is terminated by a signal, its exit status
94662      indicates the signal that killed it, but the exact values are not specified. The kill -l option,
94663      however, can be used to map decimal signal numbers and exit status values into the name of a
94664      signal. The following example reports the status of a terminated job:
```

```
94665      job
94666      stat=$?
94667      if [ $stat -eq 0 ]
94668      then
94669          echo job completed successfully.
94670      elif [ $stat -gt 128 ]
94671      then
94672          echo job terminated by signal SIG$(kill -l $stat).
94673      else
94674          echo job terminated with error code $stat.
94675      fi
```

```
94676      To send the default signal to a process group (say 123), an application should use a command
94677      similar to one of the following:
```

```
94678      kill -TERM -123
94679      kill -- -123
```

#### 94680 RATIONALE

```
94681      The -l option originated from the C shell, and is also implemented in the KornShell. The C shell
94682      output can consist of multiple output lines because the signal names do not always fit on a
94683      single line on some terminal screens. The KornShell output also included the implementation-
94684      defined signal numbers and was considered by the standard developers to be too difficult for
94685      scripts to parse conveniently. The specified output format is intended not only to accommodate
94686      the historical C shell output, but also to permit an entirely vertical or entirely horizontal listing
94687      on systems for which this is appropriate.
```

```
94688      An early proposal invented the name SIGNULL as a signal_name for signal 0 (used by the System
94689      Interfaces volume of POSIX.1-2008 to test for the existence of a process without sending it a
94690      signal). Since the signal_name 0 can be used in this case unambiguously, SIGNULL has been
94691      removed.
```

```
94692      An early proposal also required symbolic signal_names to be recognized with or without the SIG
94693      prefix. Historical versions of kill have not written the SIG prefix for the -l option and have not
94694      recognized the SIG prefix on signal_names. Since neither applications portability nor ease-of-use
94695      would be improved by requiring this extension, it is no longer required.
```

```
94696      To avoid an ambiguity of an initial negative number argument specifying either a signal number
94697      or a process group, POSIX.1-2008 mandates that it is always considered the former by
94698      implementations that support the XSI option. It also requires that conforming applications
94699      always use the "--" options terminator argument when specifying a process group, unless an
94700      option is also specified.
```

```
94701      The -s option was added in response to international interest in providing some form of kill that
```

94702 meets the Utility Syntax Guidelines.

94703 The job control job ID notation is not required to work as expected when *kill* is operating in its  
94704 own utility execution environment. In either of the following examples:

94705 `nohup kill %1 &`  
94706 `system("kill %1");`

94707 the *kill* operates in a different environment and does not understand how the shell has managed  
94708 its job numbers.

#### 94709 FUTURE DIRECTIONS

#### 94715 CHANGE HISTORY

94716 First released in Issue 2.

#### 94717 Issue 6

94718 The obsolescent versions of the SYNOPSIS are turned into non-obsolescent features of the XSI  
94719 option, corresponding to a similar change in the *trap* special built-in.

#### 94720 Issue 7

94721 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

94722 **NAME**

94723 lex — generate programs for lexical tasks (DEVELOPMENT)

94724 **SYNOPSIS**94725 CD `lex [-t] [-n|-v] [file...]`94726 **DESCRIPTION**

94727 The *lex* utility shall generate C programs to be used in lexical processing of character input, and  
 94728 that can be used as an interface to *yacc*. The C programs shall be generated from *lex* source code  
 94729 and conform to the ISO C standard, without depending on any undefined, unspecified, or  
 94730 implementation-defined behavior, except in cases where the code is copied directly from the  
 94731 supplied source, or in cases that are documented by the implementation. Usually, the *lex* utility  
 94732 shall write the program it generates to the file **lex.yy.c**; the state of this file is unspecified if *lex*  
 94733 exits with a non-zero exit status. See the EXTENDED DESCRIPTION section for a complete  
 94734 description of the *lex* input language.

94735 **OPTIONS**94736 The *lex* utility shall conform to XBD [Section 12.2](#) (on page 216), except for Guideline 9.

94737 The following options shall be supported:

- 94738 **-n** Suppress the summary of statistics usually written with the **-v** option. If no table  
 94739 sizes are specified in the *lex* source code and the **-v** option is not specified, then **-n**  
 94740 is implied.
- 94741 **-t** Write the resulting program to standard output instead of **lex.yy.c**.
- 94742 **-v** Write a summary of *lex* statistics to the standard output. (See the discussion of *lex*  
 94743 table sizes in [Definitions in lex](#) (on page 2876).) If the **-t** option is specified and **-n**  
 94744 is not specified, this report shall be written to standard error. If table sizes are  
 94745 specified in the *lex* source code, and if the **-n** option is not specified, the **-v** option  
 94746 may be enabled.

94747 **OPERANDS**

94748 The following operand shall be supported:

- 94749 *file* A pathname of an input file. If more than one such *file* is specified, all files shall be  
 94750 concatenated to produce a single *lex* program. If no *file* operands are specified, or if  
 94751 a *file* operand is '-', the standard input shall be used.

94752 **STDIN**

94753 The standard input shall be used if no *file* operands are specified, or if a *file* operand is '-'. See  
 94754 INPUT FILES.

94755 **INPUT FILES**

94756 The input files shall be text files containing *lex* source code, as described in the EXTENDED  
 94757 DESCRIPTION section.

94758 **ENVIRONMENT VARIABLES**94759 The following environment variables shall affect the execution of *lex*:

- 94760 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 94761 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 94762 variables used to determine the values of locale categories.)
- 94763 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 94764 internationalization variables.

- 94765 **LC\_COLLATE**
- 94766 Determine the locale for the behavior of ranges, equivalence classes, and multi-
- 94767 character collating elements within regular expressions. If this variable is not set to
- 94768 the POSIX locale, the results are unspecified.
- 94769 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
- 94770 characters (for example, single-byte as opposed to multi-byte characters in
- 94771 arguments and input files), and the behavior of character classes within regular
- 94772 expressions. If this variable is not set to the POSIX locale, the results are
- 94773 unspecified.
- 94774 **LC\_MESSAGES**
- 94775 Determine the locale that should be used to affect the format and contents of
- 94776 diagnostic messages written to standard error.
- 94777 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.
- 94778 **ASYNCHRONOUS EVENTS**
- 94779 Default.
- 94780 **STDOUT**
- 94781 If the **-t** option is specified, the text file of C source code output of *lex* shall be written to
- 94782 standard output.
- 94783 If the **-t** option is not specified:
- 94784 • Implementation-defined informational, error, and warning messages concerning the
  - 94785 contents of *lex* source code input shall be written to either the standard output or standard
  - 94786 error.
  - 94787 • If the **-v** option is specified and the **-n** option is not specified, *lex* statistics shall also be
  - 94788 written to either the standard output or standard error, in an implementation-defined
  - 94789 format. These statistics may also be generated if table sizes are specified with a '%'
  - 94790 operator in the *Definitions* section, as long as the **-n** option is not specified.
- 94791 **STDERR**
- 94792 If the **-t** option is specified, implementation-defined informational, error, and warning messages
- 94793 concerning the contents of *lex* source code input shall be written to the standard error.
- 94794 If the **-t** option is not specified:
- 94795 1. Implementation-defined informational, error, and warning messages concerning the
  - 94796 contents of *lex* source code input shall be written to either the standard output or
  - 94797 standard error.
  - 94798 2. If the **-v** option is specified and the **-n** option is not specified, *lex* statistics shall also be
  - 94799 written to either the standard output or standard error, in an implementation-defined
  - 94800 format. These statistics may also be generated if table sizes are specified with a '%'
  - 94801 operator in the *Definitions* section, as long as the **-n** option is not specified.
- 94802 **OUTPUT FILES**
- 94803 A text file containing C source code shall be written to **lex.yy.c**, or to the standard output if the **-t**
- 94804 option is present.
- 94805 **EXTENDED DESCRIPTION**
- 94806 Each input file shall contain *lex* source code, which is a table of regular expressions with
- 94807 corresponding actions in the form of C program fragments.
- 94808 When **lex.yy.c** is compiled and linked with the *lex* library (using the **-ll** operand with *c99*), the

resulting program shall read character input from the standard input and shall partition it into strings that match the given expressions.

When an expression is matched, these actions shall occur:

- The input string that was matched shall be left in *yytext* as a null-terminated string; *yytext* shall either be an external character array or a pointer to a character string. As explained in [Definitions in lex](#) (on page 2876), the type can be explicitly selected using the **%array** or **%pointer** declarations, but the default is implementation-defined.
- The external **int** *yylen* shall be set to the length of the matching string.
- The expression's corresponding program fragment, or action, shall be executed.

During pattern matching, *lex* shall search the set of patterns for the single longest possible match. Among rules that match the same number of characters, the rule given first shall be chosen.

The general format of *lex* source shall be:

```

Definitions
%%
Rules
%%
UserSubroutines

```

The first "%%" is required to mark the beginning of the rules (regular expressions and actions); the second "%%" is required only if user subroutines follow.

Any line in the *Definitions* section beginning with a <blank> shall be assumed to be a C program fragment and shall be copied to the external definition area of the **lex.yy.c** file. Similarly, anything in the *Definitions* section included between delimiter lines containing only "%{" and "%}" shall also be copied unchanged to the external definition area of the **lex.yy.c** file.

Any such input (beginning with a <blank> or within "%{" and "%}" delimiter lines) appearing at the beginning of the *Rules* section before any rules are specified shall be written to **lex.yy.c** after the declarations of variables for the *yylex()* function and before the first line of code in *yylex()*. Thus, user variables local to *yylex()* can be declared here, as well as application code to execute upon entry to *yylex()*.

The action taken by *lex* when encountering any input beginning with a <blank> or within "%{" and "%}" delimiter lines appearing in the *Rules* section but coming after one or more rules is undefined. The presence of such input may result in an erroneous definition of the *yylex()* function.

C-language code in the input shall not contain C-language trigraphs. The C-language code within "%{" and "%}" delimiter lines shall not contain any lines consisting only of "%}", or only of "%%".

## Definitions in lex

*Definitions* appear before the first "%%" delimiter. Any line in this section not contained between "%{" and "%}" lines and not beginning with a <blank> shall be assumed to define a *lex* substitution string. The format of these lines shall be:

*name substitute*

If a *name* does not meet the requirements for identifiers in the ISO C standard, the result is undefined. The string *substitute* shall replace the string {*name*} when it is used in a rule. The *name* string shall be recognized in this context only when the braces are provided and when it does not appear within a bracket expression or within double-quotes.

In the *Definitions* section, any line beginning with a <percent-sign> ('%') character and followed by an alphanumeric word beginning with either 's' or 'S' shall define a set of start conditions. Any line beginning with a '%' followed by a word beginning with either 'x' or 'X' shall define a set of exclusive start conditions. When the generated scanner is in a %s state, patterns with no state specified shall be also active; in a %x state, such patterns shall not be active. The rest of the line, after the first word, shall be considered to be one or more <blank>-separated names of start conditions. Start condition names shall be constructed in the same way as definition names. Start conditions can be used to restrict the matching of regular expressions to one or more states as described in [Regular Expressions in lex](#) (on page 2877).

Implementations shall accept either of the following two mutually-exclusive declarations in the *Definitions* section:

**%array**      Declare the type of *yytext* to be a null-terminated character array.

**%pointer**    Declare the type of *yytext* to be a pointer to a null-terminated character string.

The default type of *yytext* is implementation-defined. If an application refers to *yytext* outside of the scanner source file (that is, via an **extern**), the application shall include the appropriate **%array** or **%pointer** declaration in the scanner source file.

Implementations shall accept declarations in the *Definitions* section for setting certain internal table sizes. The declarations are shown in the following table.

**Table 4-10** Table Size Declarations in *lex*

| Declaration        | Description                        | Minimum Value |
|--------------------|------------------------------------|---------------|
| <b>%p</b> <i>n</i> | Number of positions                | 2 500         |
| <b>%n</b> <i>n</i> | Number of states                   | 500           |
| <b>%a</b> <i>n</i> | Number of transitions              | 2 000         |
| <b>%e</b> <i>n</i> | Number of parse tree nodes         | 1 000         |
| <b>%k</b> <i>n</i> | Number of packed character classes | 1 000         |
| <b>%o</b> <i>n</i> | Size of the output array           | 3 000         |

In the table, *n* represents a positive decimal integer, preceded by one or more <blank> characters. The exact meaning of these table size numbers is implementation-defined. The implementation shall document how these numbers affect the *lex* utility and how they are related to any output that may be generated by the implementation should limitations be encountered during the execution of *lex*. It shall be possible to determine from this output which of the table size values needs to be modified to permit *lex* to successfully generate tables for the input language. The values in the column Minimum Value represent the lowest values conforming implementations shall provide.

**Rules in lex**

The rules in *lex* source files are a table in which the left column contains regular expressions and the right column contains actions (C program fragments) to be executed when the expressions are recognized.

*ERE action*

*ERE action*

...

The extended regular expression (ERE) portion of a row shall be separated from *action* by one or more <blank> characters. A regular expression containing <blank> characters shall be recognized under one of the following conditions:

- The entire expression appears within double-quotes.
- The <blank> characters appear within double-quotes or square brackets.
- Each <blank> is preceded by a <backslash> character.

**User Subroutines in lex**

Anything in the user subroutines section shall be copied to **lex.yy.c** following *yyllex()*.

**Regular Expressions in lex**

The *lex* utility shall support the set of extended regular expressions (see XBD [Section 9.4](#), on page 188), with the following additions and exceptions to the syntax:

"..." Any string enclosed in double-quotes shall represent the characters within the double-quotes as themselves, except that <backslash>-escapes (which appear in the following table) shall be recognized. Any <backslash>-escape sequence shall be terminated by the closing quote. For example, "\01"1" represents a single string: the octal value 1 followed by the character '1'.

<state>*r*, <state1, state2, ...>*r*

The regular expression *r* shall be matched only when the program is in one of the start conditions indicated by *state*, *state1*, and so on; see [Actions in lex](#) (on page 2879). (As an exception to the typographical conventions of the rest of this volume of POSIX.1-2008, in this case <state> does not represent a metavariable, but the literal angle-bracket characters surrounding a symbol.) The start condition shall be recognized as such only at the beginning of a regular expression.

*r/x*

The regular expression *r* shall be matched only if it is followed by an occurrence of regular expression *x* (*x* is the instance of trailing context, further defined below). The token returned in *yytext* shall only match *r*. If the trailing portion of *r* matches the beginning of *x*, the result is unspecified. The *r* expression cannot include further trailing context or the '\$' (match-end-of-line) operator; *x* cannot include the '^' (match-beginning-of-line) operator, nor trailing context, nor the '\$' operator. That is, only one occurrence of trailing context is allowed in a *lex* regular expression, and the '^' operator only can be used at the beginning of such an expression.

{*name*}

When *name* is one of the substitution symbols from the *Definitions* section, the string, including the enclosing braces, shall be replaced by the *substitute* value. The *substitute* value shall be treated in the extended regular expression as if it were enclosed in parentheses. No substitution shall occur if {*name*} occurs within a bracket expression or within double-quotes.

Within an ERE, a <backslash> character shall be considered to begin an escape sequence as specified in the table in XBD Chapter 5 (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v'). In addition, the escape sequences in the following table shall be recognized.

A literal <newline> cannot occur within an ERE; the escape sequence '\n' can be used to represent a <newline>. A <newline> shall not be matched by a period operator.

**Table 4-11** Escape Sequences in *lex*

| Escape Sequence | Description                                                                                                                                                                                                             | Meaning                                                                                                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \digits         | A <backslash> character followed by the longest sequence of one, two, or three octal-digit characters (01234567). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined. | The character whose encoding is represented by the one, two, or three-digit octal integer. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading <backslash> for each byte. |
| \xdigits        | A <backslash> character followed by the longest sequence of hexadecimal-digit characters (01234567abcdefABCDEF). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined.  | The character whose encoding is represented by the hexadecimal integer.                                                                                                                                                         |
| \c              | A <backslash> character followed by any character not described in this table or in the table in XBD Chapter 5 (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v').                                          | The character 'c', unchanged.                                                                                                                                                                                                   |

**Note:** If a '\x' sequence needs to be immediately followed by a hexadecimal digit character, a sequence such as "\x1" "1" can be used, which represents a character containing the value 1, followed by the character '1'.

The order of precedence given to extended regular expressions for *lex* differs from that specified in XBD Section 9.4 (on page 188). The order of precedence for *lex* shall be as shown in the following table, from high to low.

**Note:** The escaped characters entry is not meant to imply that these are operators, but they are included in the table to show their relationships to the true operators. The start condition, trailing context, and anchoring notations have been omitted from the table because of the placement restrictions described in this section; they can only appear at the beginning or ending of an ERE.

Table 4-12 ERE Precedence in *lex*

| Extended Regular Expression       | Precedence              |
|-----------------------------------|-------------------------|
| collation-related bracket symbols | [ = = ] [ : : ] [ . . ] |
| escaped characters                | \<special character>    |
| bracket expression                | [ ]                     |
| quoting                           | " . . . "               |
| grouping                          | ( )                     |
| definition                        | { name }                |
| single-character RE duplication   | * + ?                   |
| concatenation                     |                         |
| interval expression               | { m , n }               |
| alternation                       |                         |

The ERE anchoring operators '*^*' and '*\$*' do not appear in the table. With *lex* regular expressions, these operators are restricted in their use: the '*^*' operator can only be used at the beginning of an entire regular expression, and the '*\$*' operator only at the end. The operators apply to the entire regular expression. Thus, for example, the pattern "*(^abc)|(def\$)*" is undefined; it can instead be written as two separate rules, one with the regular expression "*^abc*" and one with "*def\$*", which share a common action via the special '*|*' action (see below). If the pattern were written "*^abc|def\$*", it would match either "*abc*" or "*def*" on a line by itself.

Unlike the general ERE rules, embedded anchoring is not allowed by most historical *lex* implementations. An example of embedded anchoring would be for patterns such as "*(^| )foo( |\$)*" to match "*foo*" when it exists as a complete word. This functionality can be obtained using existing *lex* features:

```

^foo/[ \n]      |
" foo"/[ \n]    /* Found foo as a separate word. */

```

Note also that '*\$*' is a form of trailing context (it is equivalent to "*/\n*") and as such cannot be used with regular expressions containing another instance of the operator (see the preceding discussion of trailing context).

The additional regular expressions trailing-context operator '*/'*' can be used as an ordinary character if presented within double-quotes, "*/"*"; preceded by a <backslash>, "*\"*"; or within a bracket expression, "*[ / ]*". The start-condition '*<*' and '*>*' operators shall be special only in a start condition at the beginning of a regular expression; elsewhere in the regular expression they shall be treated as ordinary characters.

### Actions in *lex*

The action to be taken when an ERE is matched can be a C program fragment or the special actions described below; the program fragment can contain one or more C statements, and can also include special actions. The empty C statement '*;*' shall be a valid action; any string in the *lex.yy.c* input that matches the pattern portion of such a rule is effectively ignored or skipped. However, the absence of an action shall not be valid, and the action *lex* takes in such a condition is undefined.

The specification for an action, including C statements and special actions, can extend across several lines if enclosed in braces:

```

ERE <one or more blanks> { program statement
                           program statement }

```

95015 The program statements shall not contain unbalanced curly brace preprocessing tokens.

95016 The default action when a string in the input to a **lex.yy.c** program is not matched by any  
 95017 expression shall be to copy the string to the output. Because the default behavior of a program  
 95018 generated by *lex* is to read the input and copy it to the output, a minimal *lex* source program that  
 95019 has just "%%" shall generate a C program that simply copies the input to the output unchanged.

95020 Four special actions shall be available:

95021 | ECHO; REJECT; BEGIN

95022 | The action ' | ' means that the action for the next rule is the action for this rule.  
 95023 Unlike the other three actions, ' | ' cannot be enclosed in braces or be  
 95024 <semicolon>-terminated; the application shall ensure that it is specified alone, with  
 95025 no other actions.

95026 **ECHO;** Write the contents of the string *yytext* on the output.

95027 **REJECT;** Usually only a single expression is matched by a given string in the input.  
 95028 **REJECT** means "continue to the next expression that matches the current input",  
 95029 and shall cause whatever rule was the second choice after the current rule to be  
 95030 executed for the same input. Thus, multiple rules can be matched and executed for  
 95031 one input string or overlapping input strings. For example, given the regular  
 95032 expressions "xyz" and "xy" and the input "xyz", usually only the regular  
 95033 expression "xyz" would match. The next attempted match would start after **z**. If  
 95034 the last action in the "xyz" rule is **REJECT**, both this rule and the "xy" rule  
 95035 would be executed. The **REJECT** action may be implemented in such a fashion that  
 95036 flow of control does not continue after it, as if it were equivalent to a **goto** to  
 95037 another part of *yylex()*. The use of **REJECT** may result in somewhat larger and  
 95038 slower scanners.

95039 **BEGIN** The action:

95040 BEGIN *newstate*;

95041 switches the state (start condition) to *newstate*. If the string *newstate* has not been  
 95042 declared previously as a start condition in the *Definitions* section, the results are  
 95043 unspecified. The initial state is indicated by the digit '0' or the token **INITIAL**.

95044 The functions or macros described below are accessible to user code included in the *lex* input. It  
 95045 is unspecified whether they appear in the C code output of *lex*, or are accessible only through the  
 95046 **-ll** operand to *c99* (the *lex* library).

95047 **int yylex(void)**  
 95048 Performs lexical analysis on the input; this is the primary function generated by the *lex*  
 95049 utility. The function shall return zero when the end of input is reached; otherwise, it shall  
 95050 return non-zero values (tokens) determined by the actions that are selected.

95051 **int yymore(void)**  
 95052 When called, indicates that when the next input string is recognized, it is to be appended to  
 95053 the current value of *yytext* rather than replacing it; the value in *yyleng* shall be adjusted  
 95054 accordingly.

95055 **int yyless(int n)**  
 95056 Retains *n* initial characters in *yytext*, NUL-terminated, and treats the remaining characters as  
 95057 if they had not been read; the value in *yyleng* shall be adjusted accordingly.

**int input(void)**

Returns the next character from the input, or zero on end-of-file. It shall obtain input from the stream pointer *yyin*, although possibly via an intermediate buffer. Thus, once scanning has begun, the effect of altering the value of *yyin* is undefined. The character read shall be removed from the input stream of the scanner without any processing by the scanner.

**int unput(int c)**

Returns the character 'c' to the input; *yytext* and *yylen* are undefined until the next expression is matched. The result of using *unput()* for more characters than have been input is unspecified.

The following functions shall appear only in the *lex* library accessible through the `-ll` operand; they can therefore be redefined by a conforming application:

**int yywrap(void)**

Called by *yylex()* at end-of-file; the default *yywrap()* shall always return 1. If the application requires *yylex()* to continue processing with another source of input, then the application can include a function *yywrap()*, which associates another file with the external variable **FILE \* yyin** and shall return a value of zero.

**int main(int argc, char \*argv[])**

Calls *yylex()* to perform lexical analysis, then exits. The user code can contain *main()* to perform application-specific operations, calling *yylex()* as applicable.

Except for *input()*, *unput()*, and *main()*, all external and static names generated by *lex* shall begin with the prefix **yy** or **YY**.

**EXIT STATUS**

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

Conforming applications are warned that in the *Rules* section, an ERE without an action is not acceptable, but need not be detected as erroneous by *lex*. This may result in compilation or runtime errors.

The purpose of *input()* is to take characters off the input stream and discard them as far as the lexical analysis is concerned. A common use is to discard the body of a comment once the beginning of a comment is recognized.

The *lex* utility is not fully internationalized in its treatment of regular expressions in the *lex* source code or generated lexical analyzer. It would seem desirable to have the lexical analyzer interpret the regular expressions given in the *lex* source according to the environment specified when the lexical analyzer is executed, but this is not possible with the current *lex* technology. Furthermore, the very nature of the lexical analyzers produced by *lex* must be closely tied to the lexical requirements of the input language being described, which is frequently locale-specific anyway. (For example, writing an analyzer that is used for French text is not automatically useful for processing other languages.)

**EXAMPLES**

The following is an example of a *lex* program that implements a rudimentary scanner for a Pascal-like syntax:

```
%{
/* Need this for the call to atof() below. */
#include <math.h>
/* Need this for printf(), fopen(), and stdin below. */
#include <stdio.h>
}%

DIGIT      [0-9]
ID         [a-z][a-z0-9]*

%%

{DIGIT}+ {
    printf("An integer: %s (%d)\n", yytext,
        atoi(yytext));
}

{DIGIT}+"."{DIGIT}* {
    printf("A float: %s (%g)\n", yytext,
        atof(yytext));
}

if|then|begin|end|procedure|function      {
    printf("A keyword: %s\n", yytext);
}

{ID}    printf("An identifier: %s\n", yytext);

"+"|"-"|"*"|"/"      printf("An operator: %s\n", yytext);

"{ "[^]\n}"          /* Eat up one-line comments. */

[ \t\n]+             /* Eat up white space. */

.    printf("Unrecognized character: %s\n", yytext);

%%

int main(int argc, char *argv[])
{
    ++argv, --argc; /* Skip over program name. */
    if (argc > 0)
        yyin = fopen(argv[0], "r");
    else
        yyin = stdin;

    yylex();
}
```

**RATIONALE**

Even though the `-c` option and references to the C language are retained in this description, *lex* may be generalized to other languages, as was done at one time for EFL, the Extended FORTRAN Language. Since the *lex* input specification is essentially language-independent, versions of this utility could be written to produce Ada, Modula-2, or Pascal code, and there are known historical implementations that do so.

The current description of *lex* bypasses the issue of dealing with internationalized EREs in the *lex* source code or generated lexical analyzer. If it follows the model used by *awk* (the source code is assumed to be presented in the POSIX locale, but input and output are in the locale specified by the environment variables), then the tables in the lexical analyzer produced by *lex* would interpret EREs specified in the *lex* source in terms of the environment variables specified when *lex* was executed. The desired effect would be to have the lexical analyzer interpret the EREs given in the *lex* source according to the environment specified when the lexical analyzer is executed, but this is not possible with the current *lex* technology.

The description of octal and hexadecimal-digit escape sequences agrees with the ISO C standard use of escape sequences.

Earlier versions of this standard allowed for implementations with bytes other than eight bits, but this has been modified in this version.

There is no detailed output format specification. The observed behavior of *lex* under four different historical implementations was that none of these implementations consistently reported the line numbers for error and warning messages. Furthermore, there was a desire that *lex* be allowed to output additional diagnostic messages. Leaving message formats unspecified avoids these formatting questions and problems with internationalization.

Although the `%x` specifier for *exclusive* start conditions is not historical practice, it is believed to be a minor change to historical implementations and greatly enhances the usability of *lex* programs since it permits an application to obtain the expected functionality with fewer statements.

The `%array` and `%pointer` declarations were added as a compromise between historical systems. The System V-based *lex* copies the matched text to a *yytext* array. The *flex* program, supported in BSD and GNU systems, uses a pointer. In the latter case, significant performance improvements are available for some scanners. Most historical programs should require no change in porting from one system to another because the string being referenced is null-terminated in both cases. (The method used by *flex* in its case is to null-terminate the token in place by remembering the character that used to come right after the token and replacing it before continuing on to the next scan.) Multi-file programs with external references to *yytext* outside the scanner source file should continue to operate on their historical systems, but would require one of the new declarations to be considered strictly portable.

The description of EREs avoids unnecessary duplication of ERE details because their meanings within a *lex* ERE are the same as that for the ERE in this volume of POSIX.1-2008.

The reason for the undefined condition associated with text beginning with a <blank> or within "`%{`" and "`%}`" delimiter lines appearing in the *Rules* section is historical practice. Both the BSD and System V *lex* copy the indented (or enclosed) input in the *Rules* section (except at the beginning) to unreachable areas of the *yylex()* function (the code is written directly after a *break* statement). In some cases, the System V *lex* generates an error message or a syntax error, depending on the form of indented input.

The intention in breaking the list of functions into those that may appear in `lex.yy.c` *versus* those that only appear in `libl.a` is that only those functions in `libl.a` can be reliably redefined by a conforming application.

The descriptions of standard output and standard error are somewhat complicated because historical *lex* implementations chose to issue diagnostic messages to standard output (unless `-t` was given). POSIX.1-2008 allows this behavior, but leaves an opening for the more expected behavior of using standard error for diagnostics. Also, the System V behavior of writing the statistics when any table sizes are given is allowed, while BSD-derived systems can avoid it. The

programmer can always precisely obtain the desired results by using either the `-t` or `-n` options.

The OPERANDS section does not mention the use of `-` as a synonym for standard input; not all historical implementations support such usage for any of the *file* operands.

A description of the *translation table* was deleted from early proposals because of its relatively low usage in historical applications.

The change to the definition of the *input()* function that allows buffering of input presents the opportunity for major performance gains in some applications.

The following examples clarify the differences between *lex* regular expressions and regular expressions appearing elsewhere in this volume of POSIX.1-2008. For regular expressions of the form `"r/x"`, the string matching *r* is always returned; confusion may arise when the beginning of *x* matches the trailing portion of *r*. For example, given the regular expression `"a*b/cc"` and the input `"aaabcc"`, *yytext* would contain the string `"aaab"` on this match. But given the regular expression `"x*/xy"` and the input `"xxxxy"`, the token `xxx`, not `xx`, is returned by some implementations because `xxx` matches `"x*"`.

In the rule `"ab*/bc"`, the `"b*"` at the end of *r* extends *r*'s match into the beginning of the trailing context, so the result is unspecified. If this rule were `"ab/bc"`, however, the rule matches the text `"ab"` when it is followed by the text `"bc"`. In this latter case, the matching of *r* cannot extend into the beginning of *x*, so the result is specified.

#### FUTURE DIRECTIONS

None.

#### CHANGE HISTORY

First released in Issue 2.

#### Issue 6

This utility is marked as part of the C-Language Development Utilities option.

The obsolescent `-c` option is removed.

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/14 is applied, removing text describing behavior on systems with bytes consisting of more than eight bits.

#### Issue 7

Austin Group Interpretation 1003.1-2001 #190 is applied, clarifying the requirements for generated code to conform to the ISO C standard.

Austin Group Interpretation 1003.1-2001 #191 is applied, clarifying the handling of C-language trigraphs and curly brace preprocessing tokens.

SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not apply.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

95231 **NAME**95232 link — call *link()* function95233 **SYNOPSIS**95234 XSI `link file1 file2`95235 **DESCRIPTION**95236 The *link* utility shall perform the function call:95237 `link(file1, file2);`95238 A user may need appropriate privileges to invoke the *link* utility.95239 **OPTIONS**

95240 None.

95241 **OPERANDS**

95242 The following operands shall be supported:

95243 *file1* The pathname of an existing file.95244 *file2* The pathname of the new directory entry to be created.95245 **STDIN**

95246 Not used.

95247 **INPUT FILES**

95248 Not used.

95249 **ENVIRONMENT VARIABLES**95250 The following environment variables shall affect the execution of *link*:95251 *LANG* Provide a default value for the internationalization variables that are unset or null.  
95252 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
95253 variables used to determine the values of locale categories.)95254 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
95255 internationalization variables.95256 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
95257 characters (for example, single-byte as opposed to multi-byte characters in  
95258 arguments).95259 *LC\_MESSAGES*  
95260 Determine the locale that should be used to affect the format and contents of  
95261 diagnostic messages written to standard error.95262 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.95263 **ASYNCHRONOUS EVENTS**

95264 Default.

95265 **STDOUT**

95266 None.

95267 **STDERR**

95268 The standard error shall be used only for diagnostic messages.

95269 **OUTPUT FILES**

95270 None.

95271 **EXTENDED DESCRIPTION**

95272 None.

95273 **EXIT STATUS**

95274 The following exit values shall be returned:

95275 0 Successful completion.

95276 &gt;0 An error occurred.

95287 **SEE ALSO**95288 *ln, unlink*95289 XBD *Chapter 8* (on page 173)95290 XSH *link()*95291 **CHANGE HISTORY**

95292 First released in Issue 5.

95293 **NAME**95294 `ln` — link files95295 **SYNOPSIS**95296 `ln [-fs] [-L|-P] source_file target_file`95297 `ln [-fs] [-L|-P] source_file... target_dir`95298 **DESCRIPTION**

95299 In the first synopsis form, the `ln` utility shall create a new directory entry (link) at the destination  
 95300 path specified by the `target_file` operand. If the `-s` option is specified, a symbolic link shall be  
 95301 created for the file specified by the `source_file` operand. This first synopsis form shall be assumed  
 95302 when the final operand does not name an existing directory; if more than two operands are  
 95303 specified and the final is not an existing directory, an error shall result.

95304 In the second synopsis form, the `ln` utility shall create a new directory entry (link), or if the `-s`  
 95305 option is specified a symbolic link, for each file specified by a `source_file` operand, at a  
 95306 destination path in the existing directory named by `target_dir`.

95307 If the last operand specifies an existing file of a type not specified by the System Interfaces  
 95308 volume of POSIX.1-2008, the behavior is implementation-defined.

95309 The corresponding destination path for each `source_file` shall be the concatenation of the target  
 95310 directory pathname, a `<slash>` character if the target directory pathname did not end in a  
 95311 `<slash>`, and the last pathname component of the `source_file`. The second synopsis form shall be  
 95312 assumed when the final operand names an existing directory.

95313 For each `source_file`:

95314 1. If the destination path exists and was created by a previous step, it is unspecified whether  
 95315 `ln` shall write a diagnostic message to standard error, do nothing more with the current  
 95316 `source_file`, and go on to any remaining `source_files`; or will continue processing the current  
 95317 `source_file`. If the destination path exists:

95318 a. If the `-f` option is not specified, `ln` shall write a diagnostic message to standard  
 95319 error, do nothing more with the current `source_file`, and go on to any remaining  
 95320 `source_files`.

95321 b. If the destination path names the same directory entry as the current `source_file` `ln` |  
 95322 shall write a diagnostic message to standard error, do nothing more with the  
 95323 current `source_file`, and go on to any remaining `source_files`.

95324 c. Actions shall be performed equivalent to the `unlink()` function defined in the |  
 95325 System Interfaces volume of POSIX.1-2008, called using the destination path as the  
 95326 `path` argument. If this fails for any reason, `ln` shall write a diagnostic message to  
 95327 standard error, do nothing more with the current `source_file`, and go on to any  
 95328 remaining `source_files`.

95329 2. If the `-s` option is specified, actions shall be performed equivalent to the `symlink()`  
 95330 function with `source_file` as the `path1` argument and the destination path as the `path2`  
 95331 argument. The `ln` utility shall do nothing more with `source_file` and shall go on to any  
 95332 remaining files.

95333 3. If `source_file` is a symbolic link:

95334 a. If the `-P` option is in effect, actions shall be performed equivalent to the `linkat()`  
 95335 function with `source_file` as the `path1` argument, the destination path as the `path2`  
 95336 argument, `AT_FDCWD` as the `fd1` and `fd2` arguments, and zero as the `flag`  
 95337 argument.

- b. If the `-L` option is in effect, actions shall be performed equivalent to the `linkat()` function with *source\_file* as the *path1* argument, the destination path as the *path2* argument, `AT_FDCWD` as the *fd1* and *fd2* arguments, and `AT_SYMLINK_FOLLOW` as the *flag* argument.

The *ln* utility shall do nothing more with *source\_file* and shall go on to any remaining files.

4. Actions shall be performed equivalent to the `link()` function defined in the System Interfaces volume of POSIX.1-2008 using *source\_file* as the *path1* argument, and the destination path as the *path2* argument.

## OPTIONS

The *ln* utility shall conform to XBD [Section 12.2](#) (on page 216).

The following options shall be supported:

- `-f` Force existing destination pathnames to be removed to allow the link.
- `-L` For each *source\_file* operand that names a file of type symbolic link, create a (hard) link to the file referenced by the symbolic link.
- `-P` For each *source\_file* operand that names a file of type symbolic link, create a (hard) link to the symbolic link itself.
- `-s` Create symbolic links instead of hard links. If the `-s` option is specified, the `-L` and `-P` options shall be silently ignored.

Specifying more than one of the mutually-exclusive options `-L` and `-P` shall not be considered an error. The last option specified shall determine the behavior of the utility (unless the `-s` option causes it to be ignored).

If the `-s` option is not specified and neither a `-L` nor a `-P` option is specified, it is implementation-defined which of the `-L` and `-P` options will be used as the default.

## OPERANDS

The following operands shall be supported:

- source\_file* A pathname of a file to be linked. If the `-s` option is specified, no restrictions on the type of file or on its existence shall be made. If the `-s` option is not specified, whether a directory can be linked is implementation-defined.
- target\_file* The pathname of the new directory entry to be created.
- target\_dir* A pathname of an existing directory in which the new directory entries are created.

## STDIN

Not used.

## INPUT FILES

None.

## ENVIRONMENT VARIABLES

The following environment variables shall affect the execution of *ln*:

- LANG* Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)
- LC\_ALL* If set to a non-empty string value, override the values of all the other internationalization variables.

|       |                               |                                                                                                                                                                                                                                                                                                                                                   |
|-------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 95379 | <b>LC_CTYPE</b>               | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).                                                                                                                                                                         |
| 95380 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 95381 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 95382 | <b>LC_MESSAGES</b>            |                                                                                                                                                                                                                                                                                                                                                   |
| 95383 |                               | Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.                                                                                                                                                                                                                      |

| 95405 |                               | None.                                                                                                                                                                                                                                                                                                                                             |
| 95406 | <b>RATIONALE</b>              |                                                                                                                                                                                                                                                                                                                                                   |
| 95407 |                               | The <b>CONSEQUENCES OF ERRORS</b> section does not require <i>ln -f a b</i> to remove <i>b</i> if a subsequent link operation would fail.                                                                                                                                                                                                         |
| 95408 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 95409 |                               | Some historic versions of <i>ln</i> (including the one specified by the SVID) unlink the destination file, if it exists, by default. If the mode does not permit writing, these versions prompt for confirmation before attempting the unlink. In these versions the <i>-f</i> option causes <i>ln</i> not to attempt to prompt for confirmation. |
| 95410 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 95411 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 95412 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 95413 |                               | This allows <i>ln</i> to succeed in creating links when the target file already exists, even if the file itself is not writable (although the directory must be). Early proposals specified this functionality.                                                                                                                                   |
| 95414 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 95415 |                               | This volume of POSIX.1-2008 does not allow the <i>ln</i> utility to unlink existing destination paths by default for the following reasons:                                                                                                                                                                                                       |
| 95416 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 95417 |                               | • The <i>ln</i> utility has historically been used to provide locking for shell applications, a usage that is incompatible with <i>ln</i> unlinking the destination path by default. There was no corresponding technical advantage to adding this functionality.                                                                                 |
| 95418 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 95419 |                               |                                                                                                                                                                                                                                                                                                                                                   |

- This functionality gave *ln* the ability to destroy the link structure of files, which changes the historical behavior of *ln*.
- This functionality is easily replicated with a combination of *rm* and *ln*.
- It is not historical practice in many systems; BSD and BSD-derived systems do not support this behavior. Unfortunately, whichever behavior is selected can cause scripts written expecting the other behavior to fail.
- It is preferable that *ln* perform in the same manner as the *link()* function, which does not permit the target to exist already.

This volume of POSIX.1-2008 retains the *-f* option to provide support for shell scripts depending on the SVID semantics. It seems likely that shell scripts would not be written to handle prompting by *ln* and would therefore have specified the *-f* option.

The *-f* option is an undocumented feature of many historical versions of the *ln* utility, allowing linking to directories. These versions require modification.

Early proposals of this volume of POSIX.1-2008 also required a *-i* option, which behaved like the *-i* options in *cp* and *mv*, prompting for confirmation before unlinking existing files. This was not historical practice for the *ln* utility and has been omitted.

The *-L* and *-P* options allow for implementing both common behaviors of the *ln* utility. Earlier versions of this standard did not specify these options and required the behavior now described for the *-L* option. Many systems by default or as an alternative provided a non-conforming *ln* utility with the behavior now described for the *-P* option. Since applications could not rely on *ln* following links in practice, the *-L* and *-P* options were added to specify the desired behavior for the application.

The *-L* and *-P* options are ignored when *-s* is specified in order to allow an alias to be created to alter the default behavior when creating hard links (for example, *alias ln='ln -L'*). They serve no purpose when *-s* is specified, since *source\_file* is then just a string to be used as the contents of the created symbolic link and need not exist as a file.

The specification ensures that *ln a a* with or without the *-f* option will not unlink the file *a*. Earlier versions of this standard were unclear in this case.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 2.

### Issue 6

The *ln* utility is updated to include symbolic link processing as defined in the IEEE P1003.2b draft standard.

### Issue 7

Austin Group Interpretations 1003.1-2001 #164, #168, and #169 are applied.

SD5-XCU-ERN-27 is applied, adding a new paragraph to the RATIONALE.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

95463  
95464  
95465

The **-L** and **-P** options are added to make it implementation-defined whether the *ln* utility follows symbolic links.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0096 [136] is applied.

95466 **NAME**

95467 locale — get locale-specific information

95468 **SYNOPSIS**

95469 locale [-a|-m]

95470 locale [-ck] name...

95471 **DESCRIPTION**

95472 The *locale* utility shall write information about the current locale environment, or all public  
 95473 locales, to the standard output. For the purposes of this section, a *public locale* is one provided by  
 95474 the implementation that is accessible to the application.

95475 When *locale* is invoked without any arguments, it shall summarize the current locale  
 95476 environment for each locale category as determined by the settings of the environment variables  
 95477 defined in XBD [Chapter 7](#) (on page 135).

95478 When invoked with operands, it shall write values that have been assigned to the keywords in  
 95479 the locale categories, as follows:

- 95480 • Specifying a keyword name shall select the named keyword and the category containing  
 95481 that keyword.
- 95482 • Specifying a category name shall select the named category and all keywords in that  
 95483 category.

95484 **OPTIONS**95485 The *locale* utility shall conform to XBD [Section 12.2](#) (on page 216).

95486 The following options shall be supported:

- 95487 **-a** Write information about all available public locales. The available locales shall  
 95488 include **POSIX**, representing the POSIX locale. The manner in which the  
 95489 implementation determines what other locales are available is implementation-  
 95490 defined.
- 95491 **-c** Write the names of selected locale categories; see the STDOUT section. The **-c**  
 95492 option increases readability when more than one category is selected (for example,  
 95493 via more than one keyword name or via a category name). It is valid both with  
 95494 and without the **-k** option.
- 95495 **-k** Write the names and values of selected keywords. The implementation may omit  
 95496 values for some keywords; see the OPERANDS section.
- 95497 **-m** Write names of available charmaps; see XBD [Section 6.1](#) (on page 125).

95498 **OPERANDS**

95499 The following operand shall be supported:

- 95500 **name** The name of a locale category as defined in XBD [Chapter 7](#) (on page 135), the name  
 95501 of a keyword in a locale category, or the reserved name **charmap**. The named  
 95502 category or keyword shall be selected for output. If a single *name* represents both a  
 95503 locale category name and a keyword name in the current locale, the results are  
 95504 unspecified. Otherwise, both category and keyword names can be specified as  
 95505 *name* operands, in any sequence. It is implementation-defined whether any  
 95506 keyword values are written for the categories *LC\_CTYPE* and *LC\_COLLATE*.

95507 **STDIN**

95508 Not used.

95509 **INPUT FILES**

95510 None.

95511 **ENVIRONMENT VARIABLES**95512 The following environment variables shall affect the execution of *locale*:

95513 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 95514 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 95515 variables used to determine the values of locale categories.)

95516 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 95517 internationalization variables.

95518 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 95519 characters (for example, single-byte as opposed to multi-byte characters in  
 95520 arguments and input files).

95521 *LC\_MESSAGES*

95522 Determine the locale that should be used to affect the format and contents of  
 95523 diagnostic messages written to standard error.

95524 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

95525 XSI The application shall ensure that the *LANG*, *LC\_\**, and *NLSPATH* environment variables specify  
 95526 the current locale environment to be written out; they shall be used if the *-a* option is not  
 95527 specified.

95528 **ASYNCHRONOUS EVENTS**

95529 Default.

95530 **STDOUT**95531 The *LANG* variable shall be written first using the format:

95532 "LANG=%s\n", &lt;value&gt;

95533 If *LANG* is not set or is an empty string, the value is the empty string.

95534 If *locale* is invoked without any options or operands, the names and values of the *LC\_\**  
 95535 environment variables described in this volume of POSIX.1-2008 shall be written to the standard  
 95536 output, one variable per line, and each line using the following format. Only those variables set  
 95537 in the environment and not overridden by *LC\_ALL* shall be written using this format:

95538 "%s=%s\n", &lt;variable\_name&gt;, &lt;value&gt;

95539 The names of those *LC\_\** variables associated with locale categories defined in this volume of  
 95540 POSIX.1-2008 that are not set in the environment or are overridden by *LC\_ALL* shall be written  
 95541 in the following format:

95542 "%s=\"%s\"\\n", &lt;variable\_name&gt;, &lt;implied value&gt;

95543 The <implied value> shall be the name of the locale that has been selected for that category by the  
 95544 implementation, based on the values in *LANG* and *LC\_ALL*, as described in XBD [Chapter 8](#) (on  
 95545 page 173).

95546 The <value> and <implied value> shown above shall be properly quoted for possible later reentry  
 95547 to the shell. The <value> shall not be quoted using double-quotes (so that it can be distinguished  
 95548 by the user from the <implied value> case, which always requires double-quotes).

The `LC_ALL` variable shall be written last, using the first format shown above. If it is not set, it shall be written as:

```
"LC_ALL=\n"
```

If any arguments are specified:

1. If the `-a` option is specified, the names of all the public locales shall be written, each in the following format:

```
"%s\n", <locale name>
```

2. If the `-c` option is specified, the names of all selected categories shall be written, each in the following format:

```
"%s\n", <category name>
```

If keywords are also selected for writing (see following items), the category name output shall precede the keyword output for that category.

If the `-c` option is not specified, the names of the categories shall not be written; only the keywords, as selected by the `<name>` operand, shall be written.

3. If the `-k` option is specified, the names and values of selected keywords shall be written. If a value is non-numeric and is not a compound keyword value, it shall be written in the following format:

```
"%s=\"%s\"\n", <keyword name>, <keyword value>
```

If a value is a non-numeric compound keyword value, it shall either be written in the format:

```
"%s=\"%s\"\n", <keyword name>, <keyword value>
```

where the `<keyword value>` is a single string of values separated by `<semicolon>` characters, or it shall be written in the format:

```
"%s=%s\n", <keyword name>, <keyword value>
```

where the `<keyword value>` is encoded as a set of strings, each enclosed in double-quotation-marks, separated by `<semicolon>` characters.

If the keyword was **charmap**, the name of the charmap (if any) that was specified via the `localedef -f` option when the locale was created shall be written, with the word **charmap** as `<keyword name>`.

If a value is numeric, it shall be written in one of the following formats:

```
"%s=%d\n", <keyword name>, <keyword value>
```

```
"%s=%c%o\n", <keyword name>, <escape character>, <keyword value>
```

```
"%s=%cx%x\n", <keyword name>, <escape character>, <keyword value>
```

where the `<escape character>` is that identified by the **escape\_char** keyword in the current locale; see XBD [Section 7.3](#) (on page 136).

Compound keyword values (list entries) shall be separated in the output by `<semicolon>` characters. When included in keyword values, the `<semicolon>`, `<backslash>`, double-quote, and any control character shall be preceded (escaped) with the escape character.

95587 4. If the **-k** option is not specified, selected keyword values shall be written, each in the  
 95588 following format:

95589 "%s\n", <keyword value>

95590 If the keyword was **charmap**, the name of the charmap (if any) that was specified via the  
 95591 *localedef* **-f** option when the locale was created shall be written.

95592 5. If the **-m** option is specified, then a list of all available charmaps shall be written, each in  
 95593 the format:

95594 "%s\n", <charmap>

95595 where <charmap> is in a format suitable for use as the option-argument to the *localedef* **-f**  
 95596 option.

#### 95597 **STDERR**

95598 The standard error shall be used only for diagnostic messages.

#### 95599 **OUTPUT FILES**

95600 None.

#### 95601 **EXTENDED DESCRIPTION**

95602 None.

#### 95603 **EXIT STATUS**

95604 The following exit values shall be returned:

95605 0 All the requested information was found and output successfully.

95606 >0 An error occurred.

#### 95607 **CONSEQUENCES OF ERRORS**

95608 Default.

#### 95609 **APPLICATION USAGE**

95610 If the *LANG* environment variable is not set or set to an empty value, or one of the *LC\_\**  
 95611 environment variables is set to an unrecognized value, the actual locales assumed (if any) are  
 95612 implementation-defined as described in XBD [Chapter 8](#) (on page 173).

95613 Implementations are not required to write out the actual values for keywords in the categories  
 95614 *LC\_CTYPE* and *LC\_COLLATE*; however, they must write out the categories (allowing an  
 95615 application to determine, for example, which character classes are available).

#### 95616 **EXAMPLES**

95617 In the following examples, the assumption is that locale environment variables are set as  
 95618 follows:

95619 *LANG*=locale\_x

95620 *LC\_COLLATE*=locale\_y

95621 The command *locale* would result in the following output:

95622 *LANG*=locale\_x

95623 *LC\_CTYPE*="locale\_x"

95624 *LC\_COLLATE*=locale\_y

95625 *LC\_TIME*="locale\_x"

95626 *LC\_NUMERIC*="locale\_x"

95627 *LC\_MONETARY*="locale\_x"

95628 *LC\_MESSAGES*="locale\_x"

95629 *LC\_ALL*=

The order of presentation of the categories is not specified by this volume of POSIX.1-2008.

The command:

```
LC_ALL=POSIX locale -ck decimal_point
```

would produce:

```
LC_NUMERIC
```

```
decimal_point="."
```

The following command shows an application of *locale* to determine whether a user-supplied response is affirmative:

```
printf 'Prompt for response: '
read response
if printf "%s\n" "$response" | grep -- -Eq "${locale yesexpr}"
then
    affirmative processing goes here
else
    non-affirmative processing goes here
fi
```

## RATIONALE

The output for categories *LC\_CTYPE* and *LC\_COLLATE* has been made implementation-defined because there is a questionable value in having a shell script receive an entire array of characters. It is also difficult to return a logical collation description, short of returning a complete *localedef* source.

The **-m** option was included to allow applications to query for the existence of charmaps. The output is a list of the charmaps (implementation-supplied and user-supplied, if any) on the system.

The **-c** option was included for readability when more than one category is selected (for example, via more than one keyword name or via a category name). It is valid both with and without the **-k** option.

The **charmap** keyword, which returns the name of the charmap (if any) that was used when the current locale was created, was included to allow applications needing the information to retrieve it.

According to XBD [Section 6.1](#) (on page 125), the standard requires that all supported locales must have the same encoding for <period> and <slash>, because these two characters are used within the locale-independent pathname resolution sequence. Therefore, it would be an error if *locale -a* listed both ASCII and EBCDIC-based locales, since those two encodings do not share the same representation for either <period> or <slash>. Any system that supports both environments would be expected to provide two POSIX locales, one in either codeset, where only the locales appropriate to the current environment can be visible at a time. In an XSI-compliant implementation, the *dd* utility is the only portable means for performing conversions between the two character sets.

## FUTURE DIRECTIONS

None.

## SEE ALSO

*localedef*

95675 **CHANGE HISTORY**

95676 First released in Issue 4.

95677 **Issue 5**

95678 The FUTURE DIRECTIONS section is added.

95679 **Issue 6**

95680 The normative text is reworded to avoid use of the term “must” for application requirements.

95681 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/30 is applied, correcting an editorial error  
95682 in the STDOUT section.95683 **Issue 7**95684 Austin Group Interpretations 1003.1-2001 #017, #021, and #088 are applied, clarifying the  
95685 standard output for the **-k** option when *LANG* is not set or is an empty string.

95686 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

95687 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0097 [291] is applied.

95688 **NAME**

95689 localedef — define locale environment

95690 **SYNOPSIS**95691 localedef [-c] [-f *charmap*] [-i *sourcefile*] [-u *code\_set\_name*] *name*95692 **DESCRIPTION**

95693 The *localedef* utility shall convert source definitions for locale categories into a format usable by  
 95694 the functions and utilities whose operational behavior is determined by the setting of the locale  
 95695 environment variables defined in XBD [Chapter 7](#) (on page 135). It is implementation-defined  
 95696 whether users have the capability to create new locales, in addition to those supplied by the  
 95697 implementation. If the symbolic constant POSIX2\_LOCALEDEF is defined, the system supports  
 95698 XSI the creation of new locales. On XSI-conformant systems, the symbolic constant  
 95699 POSIX2\_LOCALEDEF shall be defined.

95700 The utility shall read source definitions for one or more locale categories belonging to the same  
 95701 locale from the file named in the -i option (if specified) or from standard input.

95702 The *name* operand identifies the target locale. The utility shall support the creation of *public*, or  
 95703 generally accessible locales, as well as *private*, or restricted-access locales. Implementations may  
 95704 restrict the capability to create or modify public locales to users with appropriate privileges.

95705 Each category source definition shall be identified by the corresponding environment variable  
 95706 name and terminated by an **END** *category-name* statement. The following categories shall be  
 95707 supported. In addition, the input may contain source for implementation-defined categories.

95708 *LC\_CTYPE* Defines character classification and case conversion.

95709 *LC\_COLLATE*  
 95710 Defines collation rules.

95711 *LC\_MONETARY*  
 95712 Defines the format and symbols used in formatting of monetary information.

95713 *LC\_NUMERIC*  
 95714 Defines the decimal delimiter, grouping, and grouping symbol for non-monetary  
 95715 numeric editing.

95716 *LC\_TIME* Defines the format and content of date and time information.

95717 *LC\_MESSAGES*  
 95718 Defines the format and values of affirmative and negative responses.

95719 **OPTIONS**

95720 The *localedef* utility shall conform to XBD [Section 12.2](#) (on page 216).

95721 The following options shall be supported:

95722 **-c** Create permanent output even if warning messages have been issued.

95723 **-f *charmap*** Specify the pathname of a file containing a mapping of character symbols and  
 95724 collating element symbols to actual character encodings. The format of the  
 95725 *charmap* is described in XBD [Section 6.4](#) (on page 129). The application shall ensure  
 95726 that this option is specified if symbolic names (other than collating symbols  
 95727 defined in a **collating-symbol** keyword) are used. If the -f option is not present, an  
 95728 implementation-defined character mapping shall be used.

95729 **-i *inputfile*** The pathname of a file containing the source definitions. If this option is not  
 95730 present, source definitions shall be read from standard input. The format of the  
 95731 *inputfile* is described in XBD [Section 7.3](#) (on page 136).

95732            **-u** *code\_set\_name*  
 95733                    Specify the name of a codeset used as the target mapping of character symbols and  
 95734                    collating element symbols whose encoding values are defined in terms of the  
 95735                    ISO/IEC 10646-1:2000 standard position constant values.

## 95736 OPERANDS

95737            The following operand shall be supported:

95738            *name*            Identifies the locale; see XBD [Chapter 7](#) (on page 135) for a description of the use of  
 95739                    this name. If the name contains one or more <slash> characters, *name* shall be  
 95740                    interpreted as a pathname where the created locale definitions shall be stored. If  
 95741                    *name* does not contain any <slash> characters, the interpretation of the name is  
 95742                    implementation-defined and the locale shall be public. The ability to create public  
 95743                    locales in this way may be restricted to users with appropriate privileges. (As a  
 95744                    consequence of specifying one *name*, although several categories can be processed  
 95745                    in one execution, only categories belonging to the same locale can be processed.)

## 95746 STDIN

95747            Unless the **-i** option is specified, the standard input shall be a text file containing one or more  
 95748                    locale category source definitions, as described in XBD [Section 7.3](#) (on page 136). When lines are  
 95749                    continued using the escape character mechanism, there is no limit to the length of the  
 95750                    accumulated continued line.

## 95751 INPUT FILES

95752            The character set mapping file specified as the *charmap* option-argument is described in XBD  
 95753                    [Section 6.4](#) (on page 129). If a locale category source definition contains a **copy** statement, as  
 95754                    defined in XBD [Chapter 7](#) (on page 135), and the **copy** statement names a valid, existing locale,  
 95755                    then *localedef* shall behave as if the source definition had contained a valid category source  
 95756                    definition for the named locale.

## 95757 ENVIRONMENT VARIABLES

95758            The following environment variables shall affect the execution of *localedef*:

95759            *LANG*            Provide a default value for the internationalization variables that are unset or null.  
 95760                    (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 95761                    variables used to determine the values of locale categories.)

95762            *LC\_ALL*            If set to a non-empty string value, override the values of all the other  
 95763                    internationalization variables.

95764            *LC\_COLLATE*  
 95765                    (This variable has no affect on *localedef*; the POSIX locale is used for this category.)

95766            *LC\_CTYPE*           Determine the locale for the interpretation of sequences of bytes of text data as  
 95767                    characters (for example, single-byte as opposed to multi-byte characters in  
 95768                    arguments and input files). This variable has no affect on the processing of *localedef*  
 95769                    input data; the POSIX locale is used for this purpose, regardless of the value of this  
 95770                    variable.

95771            *LC\_MESSAGES*  
 95772                    Determine the locale that should be used to affect the format and contents of  
 95773                    diagnostic messages written to standard error.

95774    XSI            *NLSPATH*           Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

95775 **ASYNCHRONOUS EVENTS**

95776 Default.

95777 **STDOUT**

95778 The utility shall report all categories successfully processed, in an unspecified format.

95779 **STDERR**

95780 The standard error shall be used only for diagnostic messages.

95781 **OUTPUT FILES**95782 The format of the created output is unspecified. If the *name* operand does not contain a <slash>,  
95783 the existence of an output file for the locale is unspecified.95784 **EXTENDED DESCRIPTION**95785 When the **-u** option is used, the *code\_set\_name* option-argument shall be interpreted as an  
95786 implementation-defined name of a codeset to which the ISO/IEC 10646-1:2000 standard  
95787 position constant values shall be converted via an implementation-defined method. Both the  
95788 ISO/IEC 10646-1:2000 standard position constant values and other formats (decimal,  
95789 hexadecimal, or octal) shall be valid as encoding values within the *charmap* file. The codeset  
95790 represented by the implementation-defined name can be any codeset that is supported by the  
95791 implementation.95792 When conflicts occur between the *charmap* specification of <*code\_set\_name*>, <*mb\_cur\_max*>, or  
95793 <*mb\_cur\_min*> and the implementation-defined interpretation of these respective items for the  
95794 codeset represented by the **-u** option-argument *code\_set\_name*, the result is unspecified.95795 When conflicts occur between the *charmap* encoding values specified for symbolic names of  
95796 characters of the portable character set and the implementation-defined assignment of character  
95797 encoding values, the result is unspecified.95798 If a non-printable character in the *charmap* has a width specified that is not **-1**, the result will be  
95799 undefined.95800 **EXIT STATUS**

95801 The following exit values shall be returned:

- 95802 0 No errors occurred and the locales were successfully created.
- 
- 95803 1 Warnings occurred and the locales were successfully created.
- 
- 95804 2 The locale specification exceeded implementation limits or the coded character set or sets
- 
- 95805 used were not supported by the implementation, and no locale was created.
- 
- 95806 3 The capability to create new locales is not supported by the implementation.
- 
- 95807 >3 Warnings or errors occurred and no output was created.

95808 **CONSEQUENCES OF ERRORS**

95809 If an error is detected, no permanent output shall be created.

95810 If warnings occur, permanent output shall be created if the **-c** option was specified. The  
95811 following conditions shall cause warning messages to be issued:

- 95812 • If a symbolic name not found in the
- charmap*
- file is used for the descriptions of the
- 
- 95813
- LC\_CTYPE*
- or
- LC\_COLLATE*
- categories (for other categories, this shall be an error
- 
- 95814 condition).
- 
- 95815 • If the number of operands to the
- order**
- keyword exceeds the {
- COLL\_WEIGHTS\_MAX*
- }
- 
- 95816 limit.

- If optional keywords not supported by the implementation are present in the source.

Other implementation-defined conditions may also cause warnings.

## APPLICATION USAGE

The *charmap* definition is optional, and is contained outside the locale definition. This allows both completely self-defined source files, and generic sources (applicable to more than one codeset). To aid portability, all *charmap* definitions must use the same symbolic names for the portable character set. As explained in XBD [Section 6.4](#) (on page 129), it is implementation-defined whether or not users or applications can provide additional character set description files. Therefore, the `-f` option might be operable only when an implementation-defined *charmap* is named.

## EXAMPLES

None.

## RATIONALE

The output produced by the *localedef* utility is implementation-defined. The *name* operand is used to identify the specific locale. (As a consequence, although several categories can be processed in one execution, only categories belonging to the same locale can be processed.)

## FUTURE DIRECTIONS

None.

## SEE ALSO

[locale](#)

XBD [Section 6.4](#) (on page 129), [Chapter 7](#) (on page 135), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

## CHANGE HISTORY

First released in Issue 4.

### Issue 6

The `-u` option is added, as specified in the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/15 is applied, rewording text in the OPERANDS section describing the ability to create public locales.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/16 is applied, making the text consistent with the descriptions of **WIDTH** and **WIDTH\_DEFAULT** in the Base Definitions volume of POSIX.1-2008.

### Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

95851 **NAME**

95852       logger — log messages

95853 **SYNOPSIS**95854       logger *string*...95855 **DESCRIPTION**

95856       The *logger* utility saves a message, in an unspecified manner and format, containing the *string*  
 95857       operands provided by the user. The messages are expected to be evaluated later by personnel  
 95858       performing system administration tasks.

95859       It is implementation-defined whether messages written in locales other than the POSIX locale  
 95860       are effective.

95861 **OPTIONS**

95862       None.

95863 **OPERANDS**

95864       The following operand shall be supported:

95865       *string*       One of the string arguments whose contents are concatenated together, in the order  
 95866       specified, separated by single <space> characters.

95867 **STDIN**

95868       Not used.

95869 **INPUT FILES**

95870       None.

95871 **ENVIRONMENT VARIABLES**95872       The following environment variables shall affect the execution of *logger*:

95873       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 95874       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 95875       variables used to determine the values of locale categories.)

95876       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 95877       internationalization variables.

95878       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 95879       characters (for example, single-byte as opposed to multi-byte characters in  
 95880       arguments).

95881       *LC\_MESSAGES*

95882       Determine the locale that should be used to affect the format and contents of  
 95883       diagnostic messages written to standard error. (This means diagnostics from *logger*  
 95884       to the user or application, not diagnostic messages that the user is sending to the  
 95885       system administrator.)

95886       *XSI*       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

95887 **ASYNCHRONOUS EVENTS**

95888       Default.

95889 **STDOUT**

95890       Not used.

**95891 STDERR**

95892 The standard error shall be used only for diagnostic messages.

**95893 OUTPUT FILES**

95894 Unspecified.

**95895 EXTENDED DESCRIPTION**

95896 None.

**95897 EXIT STATUS**

95898 The following exit values shall be returned:

95899 0 Successful completion.

95900 >0 An error occurred.

**95901 CONSEQUENCES OF ERRORS**

95902 Default.

**95903 APPLICATION USAGE**

95904 This utility allows logging of information for later use by a system administrator or programmer  
95905 in determining why non-interactive utilities have failed. The locations of the saved messages,  
95906 their format, and retention period are all unspecified. There is no method for a conforming  
95907 application to read messages, once written.

**95908 EXAMPLES**

95909 A batch application, running non-interactively, tries to read a configuration file and fails; it may  
95910 attempt to notify the system administrator with:

95911 `logger myname: unable to read file foo. [timestamp]`

**95912 RATIONALE**

95913 The standard developers believed strongly that some method of alerting administrators to errors  
95914 was necessary. The obvious example is a batch utility, running non-interactively, that is unable to  
95915 read its configuration files or that is unable to create or write its results file. However, the  
95916 standard developers did not wish to define the format or delivery mechanisms as they have  
95917 historically been (and will probably continue to be) very system-specific, as well as involving  
95918 functionality clearly outside the scope of this volume of POSIX.1-2008.

95919 The text with *LC\_MESSAGES* about diagnostic messages means diagnostics from *logger* to the  
95920 user or application, not diagnostic messages that the user is sending to the system administrator.

95921 Multiple *string* arguments are allowed, similar to *echo*, for ease-of-use.

95922 Like the utilities *mailx* and *lp*, *logger* is admittedly difficult to test. This was not deemed sufficient  
95923 justification to exclude these utilities from this volume of POSIX.1-2008. It is also arguable that  
95924 they are, in fact, testable, but that the tests themselves are not portable.

**95925 FUTURE DIRECTIONS**

95926 None.

**95927 SEE ALSO**

95928 *lp*, *mailx*, *write*

95929 XBD Chapter 8 (on page 173)

95934 **NAME**

95935 logname — return the user's login name

95936 **SYNOPSIS**

95937 logname

95938 **DESCRIPTION**

95939 The *logname* utility shall write the user's login name to standard output. The login name shall be  
 95940 the string that would be returned by the *getlogin()* function defined in the System Interfaces  
 95941 volume of POSIX.1-2008. Under the conditions where the *getlogin()* function would fail, the  
 95942 *logname* utility shall write a diagnostic message to standard error and exit with a non-zero exit  
 95943 status.

95944 **OPTIONS**

95945 None.

95946 **OPERANDS**

95947 None.

95948 **STDIN**

95949 Not used.

95950 **INPUT FILES**

95951 None.

95952 **ENVIRONMENT VARIABLES**95953 The following environment variables shall affect the execution of *logname*:

95954 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 95955 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 95956 variables used to determine the values of locale categories.)

95957 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 95958 internationalization variables.

95959 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 95960 characters (for example, single-byte as opposed to multi-byte characters in  
 95961 arguments).

95962 *LC\_MESSAGES*

95963 Determine the locale that should be used to affect the format and contents of  
 95964 diagnostic messages written to standard error.

95965 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

95966 **ASYNCHRONOUS EVENTS**

95967 Default.

95968 **STDOUT**95969 The *logname* utility output shall be a single line consisting of the user's login name:

95970 "%s\n", &lt;login name&gt;

95971 **STDERR**

95972 The standard error shall be used only for diagnostic messages.

95973 **OUTPUT FILES**

95974 None.

95975 **EXTENDED DESCRIPTION**

95976 None.

95977 **EXIT STATUS**

95978 The following exit values shall be returned:

95979 0 Successful completion.

95980 &gt;0 An error occurred.

95981 **CONSEQUENCES OF ERRORS**

95982 Default.

95983 **APPLICATION USAGE**95984 The *logname* utility explicitly ignores the *LOGNAME* environment variable because environment  
95985 changes could produce erroneous results.95986 **EXAMPLES**

95987 None.

95988 **RATIONALE**95989 The **passwd** file is not listed as required because the implementation may have other means of  
95990 mapping login names.95991 **FUTURE DIRECTIONS**

95992 None.

95993 **SEE ALSO**95994 *id*, *who*

95995 XBD Chapter 8 (on page 173)

95996 XSH *getlogin()*95997 **CHANGE HISTORY**

95998 First released in Issue 2.

95999 **NAME**96000 `lp` — send files to a printer96001 **SYNOPSIS**96002 `lp [-c] [-d dest] [-n copies] [-msw] [-o option]... [-t title] [file...]`96003 **DESCRIPTION**

96004 The *lp* utility shall copy the input files to an output destination in an unspecified manner. The  
 96005 default output destination should be to a hardcopy device, such as a printer or microfilm  
 96006 recorder, that produces non-volatile, human-readable documents. If such a device is not  
 96007 available to the application, or if the system provides no such device, the *lp* utility shall exit with  
 96008 a non-zero exit status.

96009 The actual writing to the output device may occur some time after the *lp* utility successfully  
 96010 exits. During the portion of the writing that corresponds to each input file, the implementation  
 96011 shall guarantee exclusive access to the device.

96012 The *lp* utility shall associate a unique *request ID* with each request.

96013 Normally, a banner page is produced to separate and identify each print job. This page may be  
 96014 suppressed by implementation-defined conditions, such as an operator command or one of the  
 96015 `-o option` values.

96016 **OPTIONS**96017 The *lp* utility shall conform to XBD [Section 12.2](#) (on page 216).

96018 The following options shall be supported:

96019 **-c** Exit only after further access to any of the input files is no longer required. The  
 96020 application can then safely delete or modify the files without affecting the output  
 96021 operation. Normally, files are not copied, but are linked whenever possible. If the  
 96022 `-c` option is not given, then the user should be careful not to remove any of the  
 96023 files before the request has been printed in its entirety. It should also be noted that  
 96024 in the absence of the `-c` option, any changes made to the named files after the  
 96025 request is made but before it is printed may be reflected in the printed output. On  
 96026 some implementations, `-c` may be on by default.

96027 **-d *dest*** Specify a string that names the destination (*dest*). If *dest* is a printer, the request  
 96028 shall be printed only on that specific printer. If *dest* is a class of printers, the request  
 96029 shall be printed on the first available printer that is a member of the class. Under  
 96030 certain conditions (printer unavailability, file space limitation, and so on), requests  
 96031 for specific destinations need not be accepted. Destination names vary between  
 96032 systems.

96033 If `-d` is not specified, and neither the *LPDEST* nor *PRINTER* environment variable  
 96034 is set, an unspecified destination is used. The `-d dest` option shall take precedence  
 96035 over *LPDEST*, which in turn shall take precedence over *PRINTER*. Results are  
 96036 undefined when *dest* contains a value that is not a valid destination name.

96037 **-m** Send mail (see [mailx](#)) after the files have been printed. By default, no mail is sent  
 96038 upon normal completion of the print request.

96039 **-n *copies*** Write *copies* number of copies of the files, where *copies* is a positive decimal integer.  
 96040 The methods for producing multiple copies and for arranging the multiple copies  
 96041 when multiple *file* operands are used are unspecified, except that each file shall be  
 96042 output as an integral whole, not interleaved with portions of other files.

- 96043        **-o option**        Specify printer-dependent or class-dependent *options*. Several such *options* may be  
96044                                collected by specifying the **-o** option more than once.
- 96045        **-s**                Suppress messages from *lp*.
- 96046        **-t title**            Write *title* on the banner page of the output.
- 96047        **-w**                Write a message on the user's terminal after the files have been printed. If the user  
96048                                is not logged in, then mail shall be sent instead.

## 96049 OPERANDS

96050        The following operand shall be supported:

- 96051        *file*             A pathname of a file to be output. If no *file* operands are specified, or if a *file*  
96052                                operand is '-', the standard input shall be used. If a *file* operand is used, but the  
96053                                **-c** option is not specified, the process performing the writing to the output device  
96054                                may have user and group permissions that differ from that of the process invoking  
96055                                *lp*.

## 96056 STDIN

96057        The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
96058        See the INPUT FILES section.

## 96059 INPUT FILES

96060        The input files shall be text files.

## 96061 ENVIRONMENT VARIABLES

96062        The following environment variables shall affect the execution of *lp*:

- 96063        *LANG*             Provide a default value for the internationalization variables that are unset or null.  
96064                                (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
96065                                variables used to determine the values of locale categories.)
- 96066        *LC\_ALL*            If set to a non-empty string value, override the values of all the other  
96067                                internationalization variables.
- 96068        *LC\_CTYPE*        Determine the locale for the interpretation of sequences of bytes of text data as  
96069                                characters (for example, single-byte as opposed to multi-byte characters in  
96070                                arguments and input files).
- 96071        *LC\_MESSAGES*     Determine the locale that should be used to affect the format and contents of  
96072                                diagnostic messages written to standard error and informative messages written to  
96073                                standard output.
- 96075        *LC\_TIME*            Determine the format and contents of date and time strings displayed in the *lp*  
96076                                banner page, if any.
- 96077        *LPDEST*            Determine the destination. If the *LPDEST* environment variable is not set, the  
96078                                *PRINTER* environment variable shall be used. The **-d dest** option takes precedence  
96079                                over *LPDEST*. Results are undefined when **-d** is not specified and *LPDEST*  
96080                                contains a value that is not a valid destination name.
- 96081        XSI        *NLSPATH*            Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 96082        *PRINTER*           Determine the output device or destination. If the *LPDEST* and *PRINTER*  
96083                                environment variables are not set, an unspecified output device is used. The **-d**  
96084                                *dest* option and the *LPDEST* environment variable shall take precedence over  
96085                                *PRINTER*. Results are undefined when **-d** is not specified, *LPDEST* is unset, and  
96086                                *PRINTER* contains a value that is not a valid device or destination name.

96087           TZ           Determine the timezone used to calculate date and time strings displayed in the *lp*  
96088                           banner page, if any. If *TZ* is unset or null, an unspecified default timezone shall be  
96089                           used.

## 96090 ASYNCHRONOUS EVENTS

96091           Default.

## 96092 STDOUT

96093           The *lp* utility shall write a *request ID* to the standard output, unless *-s* is specified. The format of  
96094           the message is unspecified. The request ID can be used on systems supporting the historical  
96095           *cancel* and *lpstat* utilities.

## 96096 STDERR

96097           The standard error shall be used only for diagnostic messages.

## 96098 OUTPUT FILES

96099           None.

## 96100 EXTENDED DESCRIPTION

96101           None.

## 96102 EXIT STATUS

96103           The following exit values shall be returned:

96104           0   All input files were processed successfully.

96105           >0 No output device was available, or an error occurred.

## 96106 CONSEQUENCES OF ERRORS

96107           Default.

## 96108 APPLICATION USAGE

96109           The *pr* and *fold* utilities can be used to achieve reasonable formatting for the implementation's  
96110           default page size.

96111           A conforming application can use one of the *file* operands only with the *-c* option or if the file is  
96112           publicly readable and guaranteed to be available at the time of printing. This is because  
96113           POSIX.1-2008 gives the implementation the freedom to queue up the request for printing at  
96114           some later time by a different process that might not be able to access the file.

## 96115 EXAMPLES

96116           1. To print file *file*:

96117                 `lp -c file`

96118           2. To print multiple files with headers:

96119                 `pr file1 file2 | lp`

## 96120 RATIONALE

96121           The *lp* utility was designed to be a basic version of a utility that is already available in many  
96122           historical implementations. The standard developers considered that it should be implementable  
96123           simply as:

96124                 `cat "$@" > /dev/lp`

96125           after appropriate processing of options, if that is how the implementation chose to do it and if  
96126           exclusive access could be granted (so that two users did not write to the device simultaneously).  
96127           Although in the future the standard developers may add other options to this utility, it should  
96128           always be able to execute with no options or operands and send the standard input to an

unspecified output device.

This volume of POSIX.1-2008 makes no representations concerning the format of the printed output, except that it must be “human-readable” and “non-volatile”. Thus, writing by default to a disk or tape drive or a display terminal would not qualify. (Such destinations are not prohibited when `-d dest`, `LPDEST`, or `PRINTER` are used, however.)

This volume of POSIX.1-2008 is worded such that a “print job” consisting of multiple input files, possibly in multiple copies, is guaranteed to print so that any one file is not intermixed with another, but there is no statement that all the files or copies have to print out together.

The `-c` option may imply a spooling operation, but this is not required. The utility can be implemented to wait until the printer is ready and then wait until it is finished. Because of that, there is no attempt to define a queuing mechanism (priorities, classes of output, and so on).

On some historical systems, the request ID reported on the `STDOUT` can be used to later cancel or find the status of a request using utilities not defined in this volume of POSIX.1-2008.

Although the historical System V `lp` and BSD `lpr` utilities have provided similar functionality, they used different names for the environment variable specifying the destination printer. Since the name of the utility here is `lp`, `LPDEST` (used by the System V `lp` utility) was given precedence over `PRINTER` (used by the BSD `lpr` utility). Since environments of users frequently contain one or the other environment variable, the `lp` utility is required to recognize both. If this was not done, many applications would send output to unexpected output devices when users moved from system to system.

Some have commented that `lp` has far too little functionality to make it worthwhile. Requests have proposed additional options or operands or both that added functionality. The requests included:

- Wording *requiring* the output to be “hardcopy”
- A requirement for multiple printers
- Options for supporting various page-description languages

Given that a compliant system is not required to even have a printer, placing further restrictions upon the behavior of the printer is not useful. Since hardcopy format is so application-dependent, it is difficult, if not impossible, to select a reasonable subset of functionality that should be required on all compliant systems.

The term *unspecified* is used in this section in lieu of *implementation-defined* as most known implementations would not be able to make definitive statements in their conformance documents; the existence and usage of printers is very dependent on how the system administrator configures each individual system.

Since the default destination, device type, queuing mechanisms, and acceptable forms of input are all unspecified, usage guidelines for what a conforming application can do are as follows:

- Use the command in a pipeline, or with `-c`, so that there are no permission problems and the files can be safely deleted or modified.
- Limit output to text files of reasonable line lengths and printable characters and include no device-specific formatting information, such as a page description language. The meaning of “reasonable” in this context can only be answered as a quality-of-implementation issue, but it should be apparent from historical usage patterns in the industry and the locale. The `pr` and `fold` utilities can be used to achieve reasonable formatting for the default page size of the implementation.

Alternatively, the application can arrange its installation in such a way that it requires the system administrator or operator to provide the appropriate information on *lp* options and environment variable values.

At a minimum, having this utility in this volume of POSIX.1-2008 tells the industry that conforming applications require a means to print output and provides at least a command name and *LPDEST* routing mechanism that can be used for discussions between vendors, application developers, and users. The use of “should” in the DESCRIPTION of *lp* clearly shows the intent of the standard developers, even if they cannot mandate that all systems (such as laptops) have printers.

This volume of POSIX.1-2008 does not specify what the ownership of the process performing the writing to the output device may be. If *-c* is not used, it is unspecified whether the process performing the writing to the output device has permission to read *file* if there are any restrictions in place on who may read *file* until after it is printed. Also, if *-c* is not used, the results of deleting *file* before it is printed are unspecified.

## FUTURE DIRECTIONS

None.

## SEE ALSO

*mailx*

XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

## CHANGE HISTORY

First released in Issue 2.

### Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the requirement to associate a unique request ID, and the normal generation of a banner page is added.
- In the OPTIONS section:
  - The *-d dest* description is expanded, but references to *lpstat* are removed.
  - The *-m*, *-o*, *-s*, *-t*, and *-w* options are added.
- In the ENVIRONMENT VARIABLES section, *LC\_TIME* may now affect the execution.
- The STDOUT section is added.

The normative text is reworded to avoid use of the term “must” for application requirements.

The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

### Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**NAME**

ls — list directory contents

**SYNOPSIS**

```
ls [-ikqrs] [-g lno] [-A|-a] [-C|-m|-x|-l] \
  [-F|-p] [-H|-L] [-R|-d] [-S|-f|-t] [-c|-u] [file...]
```

**DESCRIPTION**

For each operand that names a file of a type other than directory or symbolic link to a directory, *ls* shall write the name of the file as well as any requested, associated information. For each operand that names a file of type directory, *ls* shall write the names of files contained within the directory as well as any requested, associated information. Filenames beginning with a <period> ( ' . ' ) and any associated information shall not be written out unless explicitly referenced, the *-A* or *-a* option is supplied, or an implementation-defined condition causes them to be written. If one or more of the *-d*, *-F*, or *-l* options are specified, and neither the *-H* nor the *-L* option is specified, for each operand that names a file of type symbolic link to a directory, *ls* shall write the name of the file as well as any requested, associated information. If none of the *-d*, *-F*, or *-l* options are specified, or the *-H* or *-L* options are specified, for each operand that names a file of type symbolic link to a directory, *ls* shall write the names of files contained within the directory as well as any requested, associated information. In each case where the names of files contained within a directory are written, if the directory contains any symbolic links then *ls* shall evaluate the file information and file type to be those of the symbolic link itself, unless the *-L* option is specified.

If no operands are specified, *ls* shall behave as if a single operand of dot ( ' . ' ) had been specified. If more than one operand is specified, *ls* shall write non-directory operands first; it shall sort directory and non-directory operands separately according to the collating sequence in the current locale.

Whenever *ls* sorts filenames or pathnames according to the collating sequence in the current locale, if this collating sequence does not have a total ordering of all characters (see XBD [Section 7.3.2](#), on page 147), then any filenames or pathnames that collate equally should be further compared byte-by-byte using the collating sequence for the POSIX locale.

The *ls* utility shall detect infinite loops; that is, entering a previously visited directory that is an ancestor of the last file encountered. When it detects an infinite loop, *ls* shall write a diagnostic message to standard error and shall either recover its position in the hierarchy or terminate.

**OPTIONS**

The *ls* utility shall conform to XBD [Section 12.2](#) (on page 216).

The following options shall be supported:

- A** Write out all directory entries, including those whose names begin with a <period> ( ' . ' ) but excluding the entries dot and dot-dot (if they exist).
- C** Write multi-text-column output with entries sorted down the columns, according to the collating sequence. The number of text columns and the column separator characters are unspecified, but should be adapted to the nature of the output device. This option disables long format output.
- F** Do not follow symbolic links named as operands unless the *-H* or *-L* options are specified. Write a <slash> ( ' / ' ) immediately after each pathname that is a directory, an <asterisk> ( ' \* ' ) after each that is executable, a <vertical-line> ( ' | ' ) after each that is a FIFO, and an at-sign ( ' @ ' ) after each that is a symbolic link. For other file types, other symbols may be written.

|       |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------|-----|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 96254 |     | <b>-H</b> | Evaluate the file information and file type for symbolic links specified on the command line to be those of the file referenced by the link, and not the link itself; however, <i>ls</i> shall write the name of the link itself and not the file referenced by the link.                                                                                                                                                                                                                                      |
| 96255 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 96286 |     | <b>-l</b> | (The letter ell.) Do not follow symbolic links named as operands unless the <b>-H</b> or <b>-L</b> options are specified. Write out in long format (see the STDOUT section). Disable the <b>-C</b> , <b>-m</b> , and <b>-x</b> options.                                                                                                                                                                                                                                                                        |
| 96287 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 96288 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 96289 |     | <b>-m</b> | Stream output format; list pathnames across the page, separated by a <comma> character followed by a <space> character. Use a <newline> character as the list terminator and after the separator sequence when there is not room on a line for the next list entry. This option disables long format output.                                                                                                                                                                                                   |
| 96290 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 96291 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 96292 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 96293 |     | <b>-n</b> | Turn on the <b>-l</b> (ell) option, but when writing the file's owner or group, write the file's numeric UID or GID rather than the user or group name, respectively. Disable the <b>-C</b> , <b>-m</b> , and <b>-x</b> options.                                                                                                                                                                                                                                                                               |
| 96294 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 96295 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 96296 | XSI | <b>-o</b> | Turn on the <b>-l</b> (ell) option, but disable writing the file's group name or number. Disable the <b>-C</b> , <b>-m</b> , and <b>-x</b> options.                                                                                                                                                                                                                                                                                                                                                            |
| 96297 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|       |           |                                                                                                                                      |
|-------|-----------|--------------------------------------------------------------------------------------------------------------------------------------|
| 96298 | <b>-p</b> | Write a <slash> ( ' / ' ) after each filename if that file is a directory.                                                           |
| 96299 | <b>-q</b> | Force each instance of non-printable filename characters and <tab> characters to be                                                  |
| 96300 |           | written as the <question-mark> ( ' ? ' ) character. Implementations may provide this                                                 |
| 96301 |           | option by default if the output is to a terminal device.                                                                             |
| 96302 | <b>-r</b> | Reverse the order of the sort to get reverse collating sequence oldest first, or                                                     |
| 96303 |           | smallest file size first depending on the other options given.                                                                       |
| 96304 | <b>-s</b> | Indicate the total number of file system blocks consumed by each file displayed. If                                                  |
| 96305 |           | the <b>-k</b> option is also specified, the block size shall be 1 024 bytes; otherwise, the                                          |
| 96306 |           | block size is implementation-defined.                                                                                                |
| 96307 | <b>-t</b> | Sort with the primary key being time modified (most recently modified first) and                                                     |
| 96308 |           | the secondary key being filename in the collating sequence. For a symbolic link,                                                     |
| 96309 |           | the time used as the sort key is that of the symbolic link itself, unless <i>ls</i> is                                               |
| 96310 |           | evaluating its file information to be that of the file referenced by the link (see the                                               |
| 96311 |           | <b>-H</b> and <b>-L</b> options).                                                                                                    |
| 96312 | <b>-u</b> | Use time of last access (see XBD <a href="#">&lt;sys/stat.h&gt;</a> ) instead of last modification of the file                       |
| 96313 |           | for sorting ( <b>-t</b> ) or writing ( <b>-l</b> ).                                                                                  |
| 96314 | <b>-x</b> | The same as <b>-C</b> , except that the multi-text-column output is produced with entries                                            |
| 96315 |           | sorted across, rather than down, the columns. This option disables long format                                                       |
| 96316 |           | output.                                                                                                                              |
| 96317 | <b>-1</b> | (The numeric digit one.) Force output to be one entry per line. This option does                                                     |
| 96318 | XSI       | not disable long format output. (Long format output is enabled by <b>-g</b> , <b>-l</b> (ell), <b>-n</b> ,                           |
| 96319 | XSI       | and <b>-o</b> ; and disabled by <b>-C</b> , <b>-m</b> , and <b>-x</b> .)                                                             |
| 96320 | XSI       | If an option that enables long format output ( <b>-g</b> , <b>-l</b> (ell), <b>-n</b> , and <b>-o</b> ) is given with an option that |
| 96321 |           | disables long format output ( <b>-C</b> , <b>-m</b> , and <b>-x</b> ), this shall not be considered an error. The last of            |
| 96322 |           | these options specified shall determine whether long format output is written.                                                       |
| 96323 |           | If <b>-R</b> , <b>-d</b> , or <b>-f</b> are specified, the results of specifying these mutually-exclusive options are                |
| 96324 |           | specified by the descriptions of these options above. If more than one of any of the other options                                   |
| 96325 |           | shown in the SYNOPSIS section in mutually-exclusive sets are given, this shall not be considered                                     |
| 96326 |           | an error; the last option specified in each set shall determine the output.                                                          |
| 96327 |           | Note that if <b>-t</b> is specified, <b>-c</b> and <b>-u</b> are not only mutually-exclusive with each other, they are               |
| 96328 |           | also mutually-exclusive with <b>-S</b> when determining sort order. But even if <b>-S</b> is specified after all                     |
| 96329 |           | occurrences of <b>-c</b> , <b>-t</b> , and <b>-u</b> , the last use of <b>-c</b> or <b>-u</b> determines the timestamp printed when  |
| 96330 |           | producing long format output.                                                                                                        |

## OPERANDS

The following operand shall be supported:

|             |                                                                                                                                 |
|-------------|---------------------------------------------------------------------------------------------------------------------------------|
| <i>file</i> | A pathname of a file to be written. If the file specified is not found, a diagnostic message shall be output on standard error. |
|-------------|---------------------------------------------------------------------------------------------------------------------------------|

## STDIN

Not used.

## INPUT FILES

None.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *ls*:

**COLUMNS** Determine the user's preferred column position width for writing multiple text-column output. If this variable contains a string representing a decimal integer, the *ls* utility shall calculate how many pathname text columns to write (see **-C**) based on the width provided. If **COLUMNS** is not set or invalid, an implementation-defined number of column positions shall be assumed, based on the implementation's knowledge of the output device. The column width chosen to write the names of files in any given directory shall be constant. Filenames shall not be truncated to fit into the multiple text-column output.

**LANG** Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

**LC\_ALL** If set to a non-empty string value, override the values of all the other internationalization variables.

**LC\_COLLATE** Determine the locale for character collation information in determining the pathname collation sequence.

**LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments) and which characters are defined as printable (character class **print**).

**LC\_MESSAGES** Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

**LC\_TIME** Determine the format and contents for date and time strings written by *ls*.

**NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

**TZ** Determine the timezone for date and time strings written by *ls*. If **TZ** is unset or null, an unspecified default timezone shall be used.

**ASYNCHRONOUS EVENTS**

Default.

**STDOUT**

The default format shall be to list one entry per line to standard output; the exceptions are to terminals or when one of the **-C**, **-m**, or **-x** options is specified. If the output is to a terminal, the format is implementation-defined.

When **-m** is specified, the format used for the last element of the list shall be:

"%s\n", <filename>

The format used for each other element of the list shall be:

"%s,%s", <filename>, <separator>

where, if there is not room for the next element of the list to fit within the current line length, <separator> is a string containing an optional <space> character and a mandatory <newline> character; otherwise it is a single <space> character.

If the **-i** option is specified, the file's file serial number (see XBD [<sys/stat.h>](#)) shall be written in the following format before any other output for the corresponding entry:

96382        %u ", <file serial number>

96383        If the **-l** option is specified, the following information shall be written for files other than  
96384        character special and block special files:

96385        "%s %u %s %s %u %s %s\n", <file mode>, <number of links>,  
96386        <owner name>, <group name>, <size>, <date and time>,  
96387        <pathname>

96388        If the **-l** option is specified, the following information shall be written for character special and  
96389        block special files:

96390        "%s %u %s %s %s %s %s\n", <file mode>, <number of links>,  
96391        <owner name>, <group name>, <device info>, <date and time>,  
96392        <pathname>

96393        In both cases if the file is a symbolic link and the **-L** option is also specified, this information  
96394        shall be for the file resolved from the symbolic link, except that the <pathname> field shall  
96395        contain the pathname of the symbolic link itself. If the file is a symbolic link and the **-L** option is  
96396        not specified, this information shall be about the link itself and the <pathname> field shall be of  
96397        the form:

96398        "%s -> %s", <pathname of link>, <contents of link>

96399        XSI        The **-n**, **-g**, and **-o** options use the same format as **-l**, but with omitted items and their  
96400        associated <blank> characters. See the OPTIONS section.

96401        In both the preceding **-l** forms, if <owner name> or <group name> cannot be determined, or if **-n**  
96402        is given, they shall be replaced with their associated numeric values using the format %u.

96403        The <size> field shall contain the value that would be returned for the file in the *st\_size* field of  
96404        **struct stat** (see XBD <sys/stat.h>). Note that for some file types this value is unspecified.

96405        The <device info> field shall contain implementation-defined information associated with the  
96406        device in question.

96407        The <date and time> field shall contain the appropriate date and timestamp of when the file was  
96408        last modified. In the POSIX locale, the field shall be the equivalent of the output of the following  
96409        *date* command:

96410        date "+%b %e %H:%M"

96411        if the file has been modified in the last six months, or:

96412        date "+%b %e %Y"

96413        (where two <space> characters are used between %e and %Y) if the file has not been modified in  
96414        the last six months or if the modification date is in the future, except that, in both cases, the final  
96415        <newline> produced by *date* shall not be included and the output shall be as if the *date*  
96416        command were executed at the time of the last modification date of the file rather than the  
96417        current time. When the *LC\_TIME* locale category is not set to the POSIX locale, a different format  
96418        and order of presentation of this field may be used.

96419        If the pathname was specified as a *file* operand, it shall be written as specified.

96420        XSI        The file mode written under the **-l**, **-n**, **-g**, and **-o** options shall consist of the following format:

96421        "%c%s%s%s", <entry type>, <owner permissions>,  
96422        <group permissions>, <other permissions>,  
96423        <optional alternate access method flag>

96424 The *<optional alternate access method flag>* shall be the empty string if there is no alternate or  
 96425 additional access control method associated with the file; otherwise, it shall be a string  
 96426 containing a single printable character that is not a <blank>.

96427 The *<entry type>* character shall describe the type of file, as follows:

- 96428 d Directory.
- 96429 b Block special file.
- 96430 c Character special file.
- 96431 l (ell) Symbolic link.
- 96432 p FIFO.
- 96433 – Regular file.

96434 Implementations may add other characters to this list to represent other implementation-defined  
 96435 file types.

96436 The next three fields shall be three characters each:

96437 *<owner permissions>*

96438 Permissions for the file owner class (see XBD [Section 4.5](#), on page 108).

96439 *<group permissions>*

96440 Permissions for the file group class.

96441 *<other permissions>*

96442 Permissions for the file other class.

96443 Each field shall have three character positions:

- 96444 1. If 'r', the file is readable; if '–', the file is not readable.
- 96445 2. If 'w', the file is writable; if '–', the file is not writable.
- 96446 3. The first of the following that applies:
  - 96447 S If in *<owner permissions>*, the file is not executable and set-user-ID mode is set. If in
  - 96448 *<group permissions>*, the file is not executable and set-group-ID mode is set.
  - 96449 s If in *<owner permissions>*, the file is executable and set-user-ID mode is set. If in
  - 96450 *<group permissions>*, the file is executable and set-group-ID mode is set.
  - 96451 XSI T If in *<other permissions>* and the file is a directory, search permission is not granted to
  - 96452 others, and the restricted deletion flag is set.
  - 96453 XSI t If in *<other permissions>* and the file is a directory, search permission is granted to
  - 96454 others, and the restricted deletion flag is set.
  - 96455 x The file is executable or the directory is searchable.
  - 96456 – None of the attributes of 'S', 's', 'T', 't', or 'x' applies.

96457 Implementations may add other characters to this list for the third character position.  
 96458 Such additions shall, however, be written in lowercase if the file is executable or  
 96459 searchable, and in uppercase if it is not.

96460 XSI If any of the **–l**, **–n**, **–s**, **–g**, or **–o** options is specified, each list of files within the directory shall be  
 96461 preceded by a status line indicating the number of file system blocks occupied by files in the  
 96462 directory in 512-byte units if the **–k** option is not specified, or 1024-byte units if the **–k** option is  
 96463 specified, rounded up to the next integral number of units, if necessary. In the POSIX locale, the

96464 format shall be:

96465 "total %u\n", <number of units in the directory>

96466 If more than one directory, or a combination of non-directory files and directories are written,  
96467 either as a result of specifying multiple operands, or the **-R** option, each list of files within a  
96468 directory shall be preceded by:

96469 "\n%s:\n", <directory name>

96470 If this string is the first thing to be written, the first <newline> shall not be written. This output  
96471 shall precede the number of units in the directory.

96472 If the **-s** option is given, each file shall be written with the number of blocks used by the file.  
96473 XSI Along with **-C**, **-l**, **-m**, or **-x**, the number and a <space> shall precede the filename; with **-l**, **-n**,  
96474 **-g**, or **-o**, they shall precede each line describing a file.

#### 96475 **STDERR**

96476 The standard error shall be used only for diagnostic messages.

#### 96477 **OUTPUT FILES**

96478 None.

#### 96479 **EXTENDED DESCRIPTION**

96480 None.

#### 96481 **EXIT STATUS**

96482 The following exit values shall be returned:

96483 0 Successful completion.

96484 >0 An error occurred.

#### 96485 **CONSEQUENCES OF ERRORS**

96486 Default.

#### 96487 **APPLICATION USAGE**

96488 Many implementations use the <equals-sign> (' = ') to denote sockets bound to the file system  
96489 for the **-F** option. Similarly, many historical implementations use the 's' character to denote  
96490 sockets as the entry type characters for the **-l** option.

96491 It is difficult for an application to use every part of the file modes field of *ls -l* in a portable  
96492 manner. Certain file types and executable bits are not guaranteed to be exactly as shown, as  
96493 implementations may have extensions. Applications can use this field to pass directly to a user  
96494 printout or prompt, but actions based on its contents should generally be deferred, instead, to  
96495 the *test* utility.

96496 The output of *ls* (with the **-l** and related options) contains information that logically could be  
96497 used by utilities such as *chmod* and *touch* to restore files to a known state. However, this  
96498 information is presented in a format that cannot be used directly by those utilities or be easily  
96499 translated into a format that can be used. A character has been added to the end of the  
96500 permissions string so that applications at least have an indication that they may be working in  
96501 an area they do not understand instead of assuming that they can translate the permissions  
96502 string into something that can be used. Future versions or related documents may define one or  
96503 more specific characters to be used based on different standard additional or alternative access  
96504 control mechanisms.

96505 As with many of the utilities that deal with filenames, the output of *ls* for multiple files or in one  
96506 of the long listing formats must be used carefully on systems where filenames can contain  
96507 embedded white space. Systems and system administrators should institute policies and user

training to limit the use of such filenames.

The number of disk blocks occupied by the file that it reports varies depending on underlying file system type, block size units reported, and the method of calculating the number of blocks. On some file system types, the number is the actual number of blocks occupied by the file (counting indirect blocks and ignoring holes in the file); on others it is calculated based on the file size (usually making an allowance for indirect blocks, but ignoring holes).

#### EXAMPLES

An example of a small directory tree being fully listed with *ls -laRF a* in the POSIX locale:

```
total 11
drwxr-xr-x  3 fox      prog          64 Jul  4 12:07 ./
drwxrwxrwx  4 fox      prog        3264 Jul  4 12:09 ../
drwxr-xr-x  2 fox      prog          48 Jul  4 12:07 b/
-rwxr--r--  1 fox      prog        572 Jul  4 12:07 foo*

a/b:
total 4
drwxr-xr-x  2 fox      prog          48 Jul  4 12:07 ./
drwxr-xr-x  3 fox      prog          64 Jul  4 12:07 ../
-rw-r--r--  1 fox      prog        700 Jul  4 12:07 bar
```

#### RATIONALE

Some historical implementations of the *ls* utility show all entries in a directory except dot and dot-dot when a superuser invokes *ls* without specifying the *-a* option. When “normal” users invoke *ls* without specifying *-a*, they should not see information about any files with names beginning with a <period> unless they were named as *file* operands.

Implementations are expected to traverse arbitrary depths when processing the *-R* option. The only limitation on depth should be based on running out of physical storage for keeping track of untraversed directories.

The *-1* (one) option was historically found in BSD and BSD-derived implementations only. It is required in this volume of POSIX.1-2008 so that conforming applications might ensure that output is one entry per line, even if the output is to a terminal.

The *-S* option was added in Issue 7, but had been provided by several implementations for many years. The description given in the standard documents historic practice, but does not match much of the documentation that described its behavior. Historical documentation typically described it as something like:

*-S*            Sort by size (largest size first) instead of by name. Special character devices (listed last) are sorted by name.

even though the file type was never considered when sorting the output. Character special files do typically sort close to the end of the list because their file size on most implementations is zero. But they are sorted alphabetically with any other files that happen to have the same file size (zero), not sorted separately and added to the end.

This volume of POSIX.1-2008 is frequently silent about what happens when mutually-exclusive options are specified. Except for *-R*, *-d*, and *-f*, the *ls* utility is required to accept multiple options from each mutually-exclusive option set without treating them as errors and to use the behavior specified by the last option given in each mutually-exclusive set. Since *ls* is one of the most aliased commands, it is important that the implementation perform intuitively. For example, if the alias were:

```
alias ls="ls -C"
```

and the user typed `ls -1` (one), single-text-column output should result, not an error.

The `-g`, `-l` (ell), `-n`, and `-o` options are not mutually-exclusive options. They all enable long format output. They work together to determine whether the file's owner is written (no if `-g` is present), file's group is written (no if `-o` is present), and if the file's group or owner is written whether it is written as the name (default) or a string representation of the UID or GID number (if `-n` is present). The `-C`, `-m`, `-x`, and `-1` (one) are mutually-exclusive options and the first three of these disable long format output. The `-1` (one) option does not directly change whether or not long format output is enabled, but by overriding `-C`, `-m`, and `-x`, it can re-enable long format output that had been disabled by one of these options.

Earlier versions of this standard did not describe the BSD `-A` option (like `-a`, but dot and dot-dot are not written out). It has been added due to widespread implementation.

Implementations may make `-q` the default for terminals to prevent trojan horse attacks on terminals with special escape sequences. This is not required because:

- Some control characters may be useful on some terminals; for example, a system might write them as `"\001"` or `"^A"`.
- Special behavior for terminals is not relevant to applications portability.

An early proposal specified that the *<optional alternate access method flag>* had to be `'+'` if there was an alternate access method used on the file or `<space>` if there was not. This was changed to be `<space>` if there is not and a single printable character if there is. This was done for three reasons:

1. There are historical implementations using characters other than `'+'`.
2. There are implementations that vary this character used in that position to distinguish between various alternate access methods in use.
3. The standard developers did not want to preclude future specifications that might need a way to specify more than one alternate access method.

Nonetheless, implementations providing a single alternate access method are encouraged to use `'+'`.

Earlier versions of this standard did not have the `-k` option, which meant that the `-s` option could not be used portably as its block size was implementation-defined, and the units used to specify the number of blocks occupied by files in a directory in an `ls -l` listing were fixed as 512-byte units. The `-k` option has been added to provide a way for the `-s` option to be used portably, and for consistency it also changes the aforementioned units from 512-byte to 1024-byte.

The *<date and time>* field in the `-l` format is specified only for the POSIX locale. As noted, the format can be different in other locales. No mechanism for defining this is present in this volume of POSIX.1-2008, as the appropriate vehicle is a messaging system; that is, the format should be specified as a "message".

## FUTURE DIRECTIONS

Allowing `-f` to ignore the `-A`, `-g`, `-l`, `-n`, `-o`, and `-s` options may be removed in a future version.

A future version of this standard may require that if the collating sequence for the current locale does not have a total ordering of all characters, any filenames or pathnames that collate equally are further compared byte-by-byte using the collating sequence for the POSIX locale.

XBD [Section 7.3.2](#) (on page 147), [Section 4.5](#) (on page 108), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216), [<sys/stat.h>](#)

XSH *fstatat()***CHANGE HISTORY**

First released in Issue 2.

**Issue 5**

A second FUTURE DIRECTION is added.

**Issue 6**

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the **-F** option, other symbols are allowed for other file types.

Treatment of symbolic links is added, as defined in the IEEE P1003.2b draft standard.

The Open Group Base Resolution bwg2001-010 is applied, adding the **T** and **t** fields as part of the **XSI** option.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #101 is applied, clarifying the optional alternate access method flag in the **STDOUT** section.

Austin Group Interpretation 1003.1-2001 #128 is applied, clarifying the **DESCRIPTION** and the definition of the **-R** option.

Austin Group Interpretation 1003.1-2001 #129 is applied, clarifying the behavior of *ls* when no operands are specified.

Austin Group Interpretation 1003.1-2001 #198 is applied, clarifying the requirements for the **-H** option.

SD5-XCU-ERN-50 is applied, adding the **-A** option.SD5-XCU-ERN-97 is applied, updating the **SYNOPSIS**.

The **-S** option is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

The **-f**, **-m**, **-n**, **-p**, **-s**, and **-x** options are moved from the **XSI** option to the **Base**.

The description of the **-f**, **-s**, and **-t** options are revised and the **-k** option is added.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0098 [424], XCU/TC1-2008/0099 [424], XCU/TC1-2008/0100 [424], XCU/TC1-2008/0101 [424], XCU/TC1-2008/0102 [424], XCU/TC1-2008/0103 [424], XCU/TC1-2008/0104 [424], XCU/TC1-2008/0105 [423,424], XCU/TC1-2008/0106 [424], XCU/TC1-2008/0107 [424], XCU/TC1-2008/0108 [424], XCU/TC1-2008/0109 [424], XCU/TC1-2008/0110 [424], XCU/TC1-2008/0111 [423], XCU/TC1-2008/0112 [117], XCU/TC1-2008/0113 [117], XCU/TC1-2008/0114 [117], XCU/TC1-2008/0115 [424], and XCU/TC1-2008/0116 [424] are applied.

96634 **NAME**

96635 m4 — macro processor

96636 **SYNOPSIS**96637 m4 [-s] [-D *name*[=*val*]]... [-U *name*]... *file*...96638 **DESCRIPTION**96639 The *m4* utility is a macro processor that shall read one or more text files, process them according  
96640 to their included macro statements, and write the results to standard output.96641 **OPTIONS**96642 The *m4* utility shall conform to XBD [Section 12.2](#) (on page 216), except that the order of the **-D**  
96643 and **-U** options shall be significant, and options can be interspersed with operands.

96644 The following options shall be supported:

96645 **-s** Enable line synchronization output for the *c99* preprocessor phase (that is, **#line**  
96646 directives).96647 **-D *name*[=*val*]**96648 Define *name* to *val* or to null if *=val* is omitted.96649 **-U *name*** Undefine *name*.96650 **OPERANDS**

96651 The following operand shall be supported:

96652 *file* A pathname of a text file to be processed. If no *file* is given, or if it is '-', the  
96653 standard input shall be read.96654 **STDIN**96655 The standard input shall be a text file that is used if no *file* operand is given, or if it is '-'.96656 **INPUT FILES**96657 The input file named by the *file* operand shall be a text file.96658 **ENVIRONMENT VARIABLES**96659 The following environment variables shall affect the execution of *m4*:96660 **LANG** Provide a default value for the internationalization variables that are unset or null.  
96661 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
96662 variables used to determine the values of locale categories.)96663 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
96664 internationalization variables.96665 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
96666 characters (for example, single-byte as opposed to multi-byte characters in  
96667 arguments and input files).96668 **LC\_MESSAGES**96669 Determine the locale that should be used to affect the format and contents of  
96670 diagnostic messages written to standard error.96671 **XSI NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.96672 **ASYNCHRONOUS EVENTS**

96673 Default.

**STDOUT**

The standard output shall be the same as the input files, after being processed for macro expansion.

**STDERR**

The standard error shall be used to display strings with the **errprint** macro, macro tracing enabled by the **traceon** macro, the defined text for macros written by the **dumpdef** macro, or for diagnostic messages.

**OUTPUT FILES**

None.

**EXTENDED DESCRIPTION**

The *m4* utility shall compare each token from the input against the set of built-in and user-defined macros. If the token matches the name of a macro, then the token shall be replaced by the macro's defining text, if any, and rescanned for matching macro names. Once no portion of the token matches the name of a macro, it shall be written to standard output. Macros may have arguments, in which case the arguments shall be substituted into the defining text before it is rescanned.

Macro calls have the form:

```
name(arg1, arg2, ..., argn)
```

Macro names shall consist of letters, digits, and underscores, where the first character is not a digit. Tokens not of this form shall not be treated as macros.

The application shall ensure that the <left-parenthesis> immediately follows the name of the macro. If a token matching the name of a macro is not followed by a <left-parenthesis>, it is handled as a use of that macro without arguments.

If a macro name is followed by a <left-parenthesis>, its arguments are the <comma>-separated tokens between the <left-parenthesis> and the matching <right-parenthesis>. Unquoted white-space characters preceding each argument shall be ignored. All other characters, including trailing white-space characters, are retained. <comma> characters enclosed between <left-parenthesis> and <right-parenthesis> characters do not delimit arguments.

Arguments are positionally defined and referenced. The string "\$1" in the defining text shall be replaced by the first argument. Systems shall support at least nine arguments; only the first nine can be referenced, using the strings "\$1" to "\$9", inclusive. The string "\$0" is replaced with the name of the macro. The string "\$#" is replaced by the number of arguments as a string. The string "\$\*" is replaced by a list of all of the arguments, separated by <comma> characters. The string "\$@" is replaced by a list of all of the arguments separated by <comma> characters, and each argument is quoted using the current left and right quoting strings. The string "\${" produces unspecified behavior.

If fewer arguments are supplied than are in the macro definition, the omitted arguments are taken to be null. It is not an error if more arguments are supplied than are in the macro definition.

No special meaning is given to any characters enclosed between matching left and right quoting strings, but the quoting strings are themselves discarded. By default, the left quoting string consists of a grave accent (backquote) and the right quoting string consists of an acute accent (single-quote); see also the **changequote** macro.

Comments are written but not scanned for matching macro names; by default, the begin-comment string consists of the <number-sign> character and the end-comment string consists of a <newline>. See also the **changecom** and **dnl** macros.

96720 The *m4* utility shall make available the following built-in macros. They can be redefined, but  
 96721 once this is done the original meaning is lost. Their values shall be null unless otherwise stated.  
 96722 In the descriptions below, the term *defining text* refers to the value of the macro: the second  
 96723 argument to the **define** macro, among other things. Except for the first argument to the **eval**  
 96724 macro, all numeric arguments to built-in macros shall be interpreted as decimal values. The  
 96725 string values produced as the defining text of the **decr**, **divnum**, **incr**, **index**, **len**, and **sysval**  
 96726 built-in macros shall be in the form of a decimal-constant as defined in the C language.

96727 **changecom** The **changecom** macro shall set the begin-comment and end-comment strings.  
 96728 With no arguments, the comment mechanism shall be disabled. With a single non-  
 96729 null argument, that argument shall become the begin-comment and the <newline>  
 96730 shall become the end-comment string. With two non-null arguments, the first  
 96731 argument shall become the begin-comment string and the second argument shall  
 96732 become the end-comment string. The behavior is unspecified if either argument is  
 96733 provided but null. Systems shall support comment strings of at least five  
 96734 characters.

96735 **changequote** The **changequote** macro shall set the begin-quote and end-quote strings. With no  
 96736 arguments, the quote strings shall be set to the default values (that is, ' '). The  
 96737 behavior is unspecified if there is a single argument or either argument is null.  
 96738 With two non-null arguments, the first argument shall become the begin-quote  
 96739 string and the second argument shall become the end-quote string. Systems shall  
 96740 support quote strings of at least five characters.

96741 **decr** The defining text of the **decr** macro shall be its first argument decremented by 1. It  
 96742 shall be an error to specify an argument containing any non-numeric characters.  
 96743 The behavior is unspecified if **decr** is not immediately followed by a <left-  
 96744 parenthesis>.

96745 **define** The second argument shall become the defining text of the macro whose name is  
 96746 the first argument. It is unspecified whether the **define** macro deletes all prior  
 96747 definitions of the macro named by its first argument or preserves all but the  
 96748 current definition of the macro. The behavior is unspecified if **define** is not  
 96749 immediately followed by a <left-parenthesis>.

96750 **defn** The defining text of the **defn** macro shall be the quoted definition (using the  
 96751 current quoting strings) of its arguments. The behavior is unspecified if **defn** is not  
 96752 immediately followed by a <left-parenthesis>.

96753 **divert** The *m4* utility maintains nine temporary buffers, numbered 1 to 9, inclusive.  
 96754 When the last of the input has been processed, any output that has been placed in  
 96755 these buffers shall be written to standard output in buffer-numerical order. The  
 96756 **divert** macro shall divert future output to the buffer specified by its argument.  
 96757 Specifying no argument or an argument of 0 shall resume the normal output  
 96758 process. Output diverted to a stream with a negative number shall be discarded.  
 96759 Behavior is implementation-defined if a stream number larger than 9 is specified. It  
 96760 shall be an error to specify an argument containing any non-numeric characters.

96761 **divnum** The defining text of the **divnum** macro shall be the number of the current output  
 96762 stream as a string.

96763 **dnl** The **dnl** macro shall cause *m4* to discard all input characters up to and including  
 96764 the next <newline>.

|       |                 |                                                                                                                                                                                                                                                                                                                                   |
|-------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 96765 | <b>dumpdef</b>  | The <b>dumpdef</b> macro shall write the defined text to standard error for each of the macros specified as arguments, or, if no arguments are specified, for all macros.                                                                                                                                                         |
| 96766 |                 |                                                                                                                                                                                                                                                                                                                                   |
| 96767 | <b>errprint</b> | The <b>errprint</b> macro shall write its arguments to standard error. The behavior is unspecified if <b>errprint</b> is not immediately followed by a <left-parenthesis>.                                                                                                                                                        |
| 96768 |                 |                                                                                                                                                                                                                                                                                                                                   |
| 96769 | <b>eval</b>     | The <b>eval</b> macro shall evaluate its first argument as an arithmetic expression, using signed integer arithmetic with at least 32-bit precision. At least the following C-language operators shall be supported, with precedence, associativity, and behavior as described in <a href="#">Section 1.1.2.1</a> (on page 2321): |
| 96770 |                 |                                                                                                                                                                                                                                                                                                                                   |
| 96771 |                 |                                                                                                                                                                                                                                                                                                                                   |
| 96772 |                 |                                                                                                                                                                                                                                                                                                                                   |
| 96773 |                 | ( )                                                                                                                                                                                                                                                                                                                               |
| 96774 |                 | unary +                                                                                                                                                                                                                                                                                                                           |
| 96775 |                 | unary -                                                                                                                                                                                                                                                                                                                           |
| 96776 |                 | ~                                                                                                                                                                                                                                                                                                                                 |
| 96777 |                 | !                                                                                                                                                                                                                                                                                                                                 |
| 96778 |                 | binary *                                                                                                                                                                                                                                                                                                                          |

| 96804 | <b>ifdef</b>    | If the first argument to the <b>ifdef</b> macro is defined, the defining text shall be the                                                                                                                                                                                                                                        |
| 96805 |                 | second argument. Otherwise, the defining text shall be the third argument, if                                                                                                                                                                                                                                                     |
| 96806 |                 | specified, or the null string, if not. The behavior is unspecified if <b>ifdef</b> is not                                                                                                                                                                                                                                         |
| 96807 |                 | immediately followed by a <left-parenthesis>.                                                                                                                                                                                                                                                                                     |
| 96808 | <b>ifelse</b>   | The <b>ifelse</b> macro takes three or more arguments. If the first two arguments                                                                                                                                                                                                                                                 |
| 96809 |                 | compare as equal strings (after macro expansion of both arguments), the defining                                                                                                                                                                                                                                                  |
| 96810 |                 | text shall be the third argument. If the first two arguments do not compare as equal                                                                                                                                                                                                                                              |
| 96811 |                 | strings and there are three arguments, the defining text shall be null. If the first two                                                                                                                                                                                                                                          |
| 96812 |                 | arguments do not compare as equal strings and there are four or five arguments,                                                                                                                                                                                                                                                   |

|       |                    |                                                                                                    |
|-------|--------------------|----------------------------------------------------------------------------------------------------|
| 96813 |                    | the defining text shall be the fourth argument. If the first two arguments do not                  |
| 96814 |                    | compare as equal strings and there are six or more arguments, the first three                      |
| 96815 |                    | arguments shall be discarded and processing shall restart with the remaining                       |
| 96816 |                    | arguments. The behavior is unspecified if <b>ifelse</b> is not immediately followed by a           |
| 96817 |                    | <left-parenthesis>.                                                                                |
| 96818 | <b>include</b>     | The defining text for the <b>include</b> macro shall be the contents of the file named by          |
| 96819 |                    | the first argument. It shall be an error if the file cannot be read. The behavior is               |
| 96820 |                    | unspecified if <b>include</b> is not immediately followed by a <left-parenthesis>.                 |
| 96821 | <b>incr</b>        | The defining text of the <b>incr</b> macro shall be its first argument incremented by 1. It        |
| 96822 |                    | shall be an error to specify an argument containing any non-numeric characters.                    |
| 96823 |                    | The behavior is unspecified if <b>incr</b> is not immediately followed by a <left-                 |
| 96824 |                    | parenthesis>.                                                                                      |
| 96825 | <b>index</b>       | The defining text of the <b>index</b> macro shall be the first character position (as a            |
| 96826 |                    | string) in the first argument where a string matching the second argument begins                   |
| 96827 |                    | (zero origin), or -1 if the second argument does not occur. The behavior is                        |
| 96828 |                    | unspecified if <b>index</b> is not immediately followed by a <left-parenthesis>.                   |
| 96829 | <b>len</b>         | The defining text of the <b>len</b> macro shall be the length (as a string) of the first           |
| 96830 |                    | argument. The behavior is unspecified if <b>len</b> is not immediately followed by a               |
| 96831 |                    | <left-parenthesis>.                                                                                |
| 96832 | <b>m4exit</b>      | Exit from the <i>m4</i> utility. If the first argument is specified, it shall be the exit code. If |
| 96833 |                    | no argument is specified, the exit code shall be zero. It shall be an error to specify             |
| 96834 |                    | an argument containing any non-numeric characters. If the first argument is zero                   |
| 96835 |                    | or no argument is specified, and an error has previously occurred (for example, a                  |
| 96836 |                    | <i>file</i> operand that could not be opened), it is unspecified whether the exit status is        |
| 96837 |                    | zero or non-zero.                                                                                  |
| 96838 | <b>m4wrap</b>      | The first argument shall be processed when EOF is reached. If the <b>m4wrap</b> macro              |
| 96839 |                    | is used multiple times, the arguments specified shall be processed in the order in                 |
| 96840 |                    | which the <b>m4wrap</b> macros were processed. The behavior is unspecified if <b>m4wrap</b>        |
| 96841 |                    | is not immediately followed by a <left-parenthesis>.                                               |
| 96842 | OB <b>maketemp</b> | The defining text shall be the first argument, with any trailing 'X' characters                    |
| 96843 |                    | replaced with the current process ID as a string. The behavior is unspecified if                   |
| 96844 |                    | <b>maketemp</b> is not immediately followed by a <left-parenthesis>.                               |
| 96845 | <b>mkstemp</b>     | The defining text shall be as if it were the resulting pathname after a successful call            |
| 96846 |                    | to the <i>mkstemp</i> () function defined in the System Interfaces volume of POSIX.1-2008          |
| 96847 |                    | called with the first argument to the macro invocation. If a file is created, that file            |
| 96848 |                    | shall be closed. If a file could not be created, the <i>m4</i> utility shall write a diagnostic    |
| 96849 |                    | message to standard error and shall continue processing input but its final exit                   |
| 96850 |                    | status shall be non-zero; the defining text of the macro shall be the empty string.                |
| 96851 |                    | The behavior is unspecified if <b>mkstemp</b> is not immediately followed by a <left-              |
| 96852 |                    | parenthesis>.                                                                                      |
| 96853 | <b>popdef</b>      | The <b>popdef</b> macro shall delete the current definition of its arguments, replacing            |
| 96854 |                    | that definition with the previous one. If there is no previous definition, the macro               |
| 96855 |                    | is undefined. The behavior is unspecified if <b>popdef</b> is not immediately followed by          |
| 96856 |                    | a <left-parenthesis>.                                                                              |
| 96857 | <b>pushdef</b>     | The <b>pushdef</b> macro shall be equivalent to the <b>define</b> macro with the exception that    |
| 96858 |                    | it shall preserve any current definition for future retrieval using the <b>popdef</b> macro.       |
| 96859 |                    | The behavior is unspecified if <b>pushdef</b> is not immediately followed by a <left-              |

|       |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 96860 |                 | parenthesis>.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 96861 | <b>shift</b>    | The defining text for the <b>shift</b> macro shall be a comma-separated list of its arguments except the first one. Each argument shall be quoted using the current quoting strings. The behavior is unspecified if <b>shift</b> is not immediately followed by a <left-parenthesis>.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 96868 | <b>substr</b>   | The defining text for the <b>substr</b> macro shall be the substring of the first argument beginning at the zero-offset character position specified by the second argument. The third argument, if specified, shall be the number of characters to select; if not specified, the characters from the starting point to the end of the first argument shall become the defining text. It shall not be an error to specify a starting point beyond the end of the first argument and the defining text shall be null. It shall be an error to specify an argument containing any non-numeric characters. The behavior is unspecified if <b>substr</b> is not immediately followed by a <left-parenthesis>.                                                                            |

| 96877 | <b>syscmd</b>   | The <b>syscmd</b> macro shall interpret its first argument as a shell command line. The defining text shall be the string result of that command. The string result shall not be rescanned for macros while setting the defining text. No output redirection shall be performed by the <i>m4</i> utility. The exit status value from the command can be retrieved using the <b>sysval</b> macro. The behavior is unspecified if <b>syscmd</b> is not immediately followed by a <left-parenthesis>.                                                                                                                                                                                                                                                                                   |

| 96888 | <b>traceoff</b> | The <b>traceoff</b> macro shall disable tracing for the macros specified as arguments, or, if no arguments are specified, for all macros.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 96889 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 96890 | <b>translit</b> | The defining text of the <b>translit</b> macro shall be the first argument with every character that occurs in the second argument replaced with the corresponding character from the third argument. If no replacement character is specified for some source character because the second argument is longer than the third argument, that character shall be deleted from the first argument in <b>translit</b> 's defining text. The behavior is unspecified if the '-' character appears within the second or third argument anywhere besides the first or last character. The behavior is unspecified if the same character appears more than once in the second argument. The behavior is unspecified if <b>translit</b> is not immediately followed by a <left-parenthesis>. |

| 96903 | <b>undivert</b> | The <b>undivert</b> macro shall cause immediate output of any text in temporary buffers named as arguments, or all temporary buffers if no arguments are specified. Buffers can be undiverted into other temporary buffers. Undiverting shall discard the contents of the temporary buffer. The behavior is unspecified if an argument                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 96904 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 96905 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 96906 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

96907 contains any non-numeric characters.

## 96908 EXIT STATUS

96909 The following exit values shall be returned:

96910 0 Successful completion.

96911 >0 An error occurred

96912 If the **m4exit** macro is used, the exit value can be specified by the input file.

## 96913 CONSEQUENCES OF ERRORS

96914 Default.

## 96915 APPLICATION USAGE

96916 The **defn** macro is useful for renaming macros, especially built-ins.

96917 Since **eval** defers to the ISO C standard, some operations have undefined behavior. In some  
 96918 implementations, division or remainder by zero cause a fatal signal, even if the division occurs  
 96919 on the short-circuited branch of "&&" or "||". Any operation that overflows in signed  
 96920 arithmetic produces undefined behavior. Likewise, using the **shift** operators with a shift amount  
 96921 that is not positive and smaller than the precision is undefined, as is shifting a negative number  
 96922 to the right. Historically, not all implementations obeyed C-language precedence rules: '~' and  
 96923 '!' were lower than '=='; '==' and '!=' were not lower than '<'; and '|' was not lower  
 96924 than '^'; the liberal use of "(" can force the desired precedence even with these non-  
 96925 compliant implementations. Furthermore, some traditional implementations treated '^' as an  
 96926 exponentiation operator, although most implementations now use "\*\*\*" as an extension for this  
 96927 purpose.

96928 When a macro has been multiply defined via the **pushdef** macro, it is unspecified whether the  
 96929 **define** macro will alter only the most recent definition (as though by **popdef** and **pushdef**), or  
 96930 replace the entire stack of definitions with a single definition (as though by **undefine** and  
 96931 **pushdef**). An application desiring particular behavior for the **define** macro in this case can  
 96932 redefine it accordingly.

96933 Applications should use the **mkstemp** macro instead of the obsolescent **maketemp** macro for  
 96934 creating temporary files.

## 96935 EXAMPLES

96936 If the file **m4src** contains the lines:

```
96937 The value of 'VER' is "VER".
96938 ifdef('VER', ``VER'' is defined to be VER., VER is not defined.)
96939 ifelse(VER, 1, ``VER'' is 'VER'.)
96940 ifelse(VER, 2, ``VER'' is 'VER'., ``VER'' is not 2.)
96941 end
```

96942 then the command

96943 m4 m4src

96944 or the command:

96945 m4 -U VER m4src

96946 produces the output:

```
96947 The value of VER is "VER".
96948 VER is not defined.
96949 VER is not 2.
```

96950           end  
96951           The command:  
96952           m4 -D VER m4src  
96953           produces the output:  
96954           The value of VER is "".  
96955           VER is defined to be .  
96956           VER is not 2.  
96957           end  
96958           The command:  
96959           m4 -D VER=1 m4src  
96960           produces the output:  
96961           The value of VER is "1".  
96962           VER is defined to be 1.  
96963           VER is 1.  
96964           VER is not 2.  
96965           end  
96966           The command:  
96967           m4 -D VER=2 m4src  
96968           produces the output:  
96969           The value of VER is "2".  
96970           VER is defined to be 2.  
96971           VER is 2.  
96972           end

#### 96973 **RATIONALE**

96974           Historic System V-based behavior treated "\${" in a macro definition as two literal characters.  
96975           However, this sequence is left unspecified so that implementations may offer extensions such as  
96976           "\${11}" meaning the eleventh positional parameter. Macros can still be defined with  
96977           appropriate uses of nested quoting to result in a literal "\${" in the output after rescanning  
96978           removes the nested quotes.

96979           In the **translit** built-in, historic System V-based behavior treated '–' as a literal; GNU behavior  
96980           treats it as a range. This version of the standard allows either behavior.

#### 96981 **FUTURE DIRECTIONS**

96982           None.

#### 96983 **SEE ALSO**

96984           c99

96985           XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

#### 96986 **CHANGE HISTORY**

96987           First released in Issue 2.

**Issue 5**

The phrase “the defined text for macros written by the **dumpdef** macro” is added to the description of **STDERR**, and the description of **dumpdef** is updated to indicate that output is written to standard error. The description of **eval** is updated to indicate that the list of excluded C operators excludes unary **'&'** and **'.'**. In the description of **ifdef**, the phrase “and it is not defined to be zero” is deleted.

**Issue 6**

In the EXTENDED DESCRIPTION, the **eval** text is updated to include a **'&'** character in the excepted list.

The EXTENDED DESCRIPTION of **divert** is updated to clarify that there are only nine diversion buffers.

The normative text is reworded to avoid use of the term “must” for application requirements.

The Open Group Base Resolution bwg2000-006 is applied.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/31 is applied, replacing the EXAMPLES section.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #117 is applied, marking the **maketemp** macro obsolescent and adding a new **mkstemp** macro.

Austin Group Interpretation 1003.1-2001 #207 is applied, clarifying the handling of white-space characters that precede or trail any macro arguments.

SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not apply (options can be interspersed with operands).

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

SD5-XCU-ERN-99 is applied, clarifying the definition of the **divert** macro in the EXTENDED DESCRIPTION.

SD5-XCU-ERN-100 is applied, clarifying the definition of the **syscmd** macro in the EXTENDED DESCRIPTION.

SD5-XCU-ERN-101 is applied, clarifying the definition of the **undivert** macro in the EXTENDED DESCRIPTION.

SD5-XCU-ERN-111 is applied to the EXTENDED DESCRIPTION, clarifying that the string **"\${"** produces unspecified behavior.

SD5-XCU-ERN-112 is applied, updating the **changequote** macro.

SD5-XCU-ERN-118 is applied, clarifying the definition of the **define** macro in the EXTENDED DESCRIPTION and APPLICATION USAGE sections.

SD5-XCU-ERN-119 is applied, clarifying the definition of the **translit** macro in the EXTENDED DESCRIPTION and RATIONALE sections.

SD5-XCU-ERN-130, SD5-XCU-ERN-131, and SD5-XCU-ERN-137 are applied.

The **m4** utility is moved from the XSI option to the Base.

97026  
97027

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0117 [241], XCU/TC1-2008/0118 [242,431], XCU/TC1-2008/0119 [242,431], and XCU/TC1-2008/0120 [325,430] are applied.

97028 **NAME**

97029 mailx — process messages

97030 **SYNOPSIS**97031 **Send Mode**97032 mailx [-s *subject*] *address*...97033 **Receive Mode**

97034 UP mailx -e

97035 mailx [-HiNn] [-F] [-u *user*]97036 mailx -f [-HiNn] [-F] [*file*]97037 **DESCRIPTION**

97038 The *mailx* utility provides a message sending and receiving facility. It has two major modes,  
97039 selected by the options used: Send Mode and Receive Mode.

97040 On systems that do not support the User Portability Utilities option, an application using *mailx*  
97041 shall have the ability to send messages in an unspecified manner (Send Mode). Unless the first  
97042 character of one or more lines is <tilde> ( '~ '), all characters in the input message shall appear in  
97043 the delivered message, but additional characters may be inserted in the message before it is  
97044 retrieved.

97045 UP On systems supporting the User Portability Utilities option, mail-receiving capabilities and other  
97046 interactive features, Receive Mode, described below, also shall be enabled.

97047 **Send Mode**

97048 Send Mode can be used by applications or users to send messages from the text in standard  
97049 input.

97050 UP **Receive Mode**

97051 Receive Mode is more oriented towards interactive users. Mail can be read and sent in this  
97052 interactive mode.

97053 When reading mail, *mailx* provides commands to facilitate saving, deleting, and responding to  
97054 messages. When sending mail, *mailx* allows editing, reviewing, and other modification of the  
97055 message as it is entered.

97056 Incoming mail shall be stored in one or more unspecified locations for each user, collectively  
97057 called the system *mailbox* for that user. When *mailx* is invoked in Receive Mode, the system  
97058 mailbox shall be the default place to find new mail. As messages are read, they shall be marked  
97059 to be moved to a secondary file for storage, unless specific action is taken. This secondary file is  
97060 called the **mbox** and is normally located in the directory referred to by the *HOME* environment  
97061 variable (see *MBOX* in the ENVIRONMENT VARIABLES section for a description of this file).  
97062 Messages shall remain in this file until explicitly removed. When the -f option is used to read  
97063 mail messages from secondary files, messages shall be retained in those files unless specifically  
97064 removed. All three of these locations—system mailbox, **mbox**, and secondary file—are referred  
97065 to in this section as simply “mailboxes”, unless more specific identification is required.

## OPTIONS

The *mailx* utility shall conform to XBD [Section 12.2](#) (on page 216).

The following options shall be supported. (Only the `-s subject` option shall be required on all systems. The other options are required only on systems supporting the User Portability Utilities option.)

**-e** Test for the presence of mail in the system mailbox. The *mailx* utility shall write nothing and exit with a successful return code if there is mail to read.

**-f** Read messages from the file named by the *file* operand instead of the system mailbox. (See also **folder**.) If no *file* operand is specified, read messages from **mbox** instead of the system mailbox.

**-F** Record the message in a file named after the first recipient. The name is the login-name portion of the address found first on the **To:** line in the mail header. Overrides the **record** variable, if set (see [Internal Variables in mailx](#), on page 2939).

**-H** Write a header summary only.

**-i** Ignore interrupts. (See also **ignore**.)

**-n** Do not initialize from the system default start-up file. See the EXTENDED DESCRIPTION section.

**-N** Do not write an initial header summary.

**-s subject** Set the **Subject** header field to *subject*. All characters in the *subject* string shall appear in the delivered message. The results are unspecified if *subject* is longer than {LINE\_MAX} – 10 bytes or contains a <newline>.

**-u user** Read the system mailbox of the login name *user*. This shall only be successful if the invoking user has appropriate privileges to read the system mailbox of that user.

## OPERANDS

The following operands shall be supported:

*address* Addressee of message. When **-n** is specified and no user start-up files are accessed (see the EXTENDED DESCRIPTION section), the user or application shall ensure this is an address to pass to the mail delivery system. Any system or user start-up files may enable aliases (see **alias** under [Commands in mailx](#), on page 2942) that may modify the form of *address* before it is passed to the mail delivery system.

*file* A pathname of a file to be read instead of the system mailbox when **-f** is specified. The meaning of the *file* option-argument shall be affected by the contents of the **folder** internal variable; see [Internal Variables in mailx](#) (on page 2939).

## STDIN

When *mailx* is invoked in Send Mode (the first synopsis line), standard input shall be the message to be delivered to the specified addresses. When in Receive Mode, user commands shall be accepted from *stdin*. If the User Portability Utilities option is not supported, standard input lines beginning with a <tilde> ('~') character produce unspecified results.

If the User Portability Utilities option is supported, then in both Send and Receive Modes, standard input lines beginning with the escape character (usually <tilde> ('~')) shall affect processing as described in [Command Escapes in mailx](#) (on page 2951).

## 97108 INPUT FILES

97109 When *mailx* is used as described by this volume of POSIX.1-2008, the *file* option-argument (see  
 97110 the **-f** option) and the **mbox** shall be text files containing mail messages, formatted as described  
 97111 in the OUTPUT FILES section. The nature of the system mailbox is unspecified; it need not be a  
 97112 file.

## 97113 ENVIRONMENT VARIABLES

97114 UP Some of the functionality described in this section shall be provided on implementations that  
 97115 support the User Portability Utilities option as described in the text, and is not further shaded  
 97116 for this option.

97117 The following environment variables shall affect the execution of *mailx*:

97118 **DEAD** Determine the pathname of the file in which to save partial messages in case of  
 97119 interrupts or delivery errors. The default shall be **dead.letter** in the directory  
 97120 named by the *HOME* variable. The behavior of *mailx* in saving partial messages is  
 97121 unspecified if the User Portability Utilities option is not supported and *DEAD* is  
 97122 not defined with the value **/dev/null**.

97123 **EDITOR** Determine the name of a utility to invoke when the **edit** (see [Commands in mailx](#),  
 97124 on page 2942) or **~e** (see [Command Escapes in mailx](#), on page 2951) command is  
 97125 XSI used. The default editor is unspecified. [On XSI-conformant systems it is \*ed\*.](#) The  
 97126 effects of this variable are unspecified if the User Portability Utilities option is not  
 97127 supported.

97128 **HOME** Determine the pathname of the user's home directory.

97129 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 97130 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 97131 variables used to determine the values of locale categories.)

97132 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 97133 internationalization variables.

97134 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 97135 characters (for example, single-byte as opposed to multi-byte characters in  
 97136 arguments and input files) and the handling of case-insensitive address and  
 97137 header-field comparisons.

97138 **LC\_TIME** This variable may determine the format and contents of the date and time strings  
 97139 written by *mailx*. This volume of POSIX.1-2008 specifies the effects of this variable  
 97140 only for systems supporting the User Portability Utilities option.

## 97141 LC\_MESSAGES

97142 Determine the locale that should be used to affect the format and contents of  
 97143 diagnostic messages written to standard error and informative messages written to  
 97144 standard output.

97145 **LISTER** Determine a string representing the command for writing the contents of the  
 97146 **folder** directory to standard output when the **folders** command is given (see  
 97147 **folders** in [Commands in mailx](#), on page 2942). Any string acceptable as a  
 97148 *command\_string* operand to the *sh -c* command shall be valid. If this variable is null  
 97149 or not set, the output command shall be *ls*. The effects of this variable are  
 97150 unspecified if the User Portability Utilities option is not supported.

97151 **MAILRC** Determine the pathname of the user start-up file. The default shall be **.mailrc** in the  
 97152 directory referred to by the *HOME* environment variable. The behavior of *mailx* is  
 97153 unspecified if the User Portability Utilities option is not supported and *MAILRC* is

| 97160 | XSI                        | <i>NLSPATH</i> Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 97161 | <i>PAGER</i>               | Determine a string representing an output filtering or pagination command for writing the output to the terminal. Any string acceptable as a <i>command_string</i> operand to the <i>sh -c</i> command shall be valid. When standard output is a terminal device, the message output shall be piped through the command if the <i>mailx</i> internal variable <b>cr</b> t is set to a value less the number of lines in the message; see <a href="#">Internal Variables in mailx</a> (on page 2939). If the <i>PAGER</i> variable is null or not set, the paginator shall be either <i>more</i> or another paginator utility documented in the system documentation. The effects of this variable are unspecified if the User Portability Utilities option is not supported. |

| 97191 | UP                         | 1. If in command mode, the current command, if there is one, shall be aborted, and a command-mode prompt shall be written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 97192 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 97193 |                            | 2. If in input mode:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 97194 | UP                         | a. If <b>ignore</b> is set, <i>mailx</i> shall write "@\n", discard the current input line, and continue processing, bypassing the message-abort mechanism described in item 2b.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 97195 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 97196 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

- 97197 UP                   b. If the interrupt was received while sending mail, either when in **Receive Mode** or  
 97198 **in Send Mode**, a message shall be written, and another subsequent interrupt, with  
 97199 no other intervening characters typed, shall be required to abort the mail message.  
 97200 UP                   If in **Receive Mode** and another interrupt is received, a command-mode prompt  
 97201 shall be written. If in **Send Mode** and another interrupt is received, *mailx* shall  
 97202 terminate with a non-zero status.

97203                   In both cases listed in item b, if the message is not empty:

- 97204 UP                   i. If **save** is enabled and the file named by *DEAD* can be created, the message  
 97205 shall be written to the file named by *DEAD*. If the file exists, the message  
 97206 shall be written to replace the contents of the file.
- 97207 UP                   ii. If **save** is not enabled, or the file named by *DEAD* cannot be created, the  
 97208 message shall not be saved.

97209                   The *mailx* utility shall take the standard action for all other signals.

## 97210 **STDOUT**

97211                   In command and input modes, all output, including prompts and messages, shall be written to  
 97212 standard output.

## 97213 **STDERR**

97214                   The standard error shall be used only for diagnostic messages.

## 97215 **OUTPUT FILES**

97216                   Various *mailx* commands and command escapes can create or add to files, including the **mbox**,  
 97217 the dead-letter file, and secondary mailboxes. When *mailx* is used as described in this volume of  
 97218 POSIX.1-2008, these files shall be text files, formatted as follows:

97219                   line beginning with **From<space>**  
 97220                   [one or more *header-lines*; see [Commands in mailx](#) (on page 2942)]  
 97221                   empty line  
 97222                   [zero or more *body lines*  
 97223                   empty line]  
 97224                   [line beginning with **From<space>...**]

97225                   where each message begins with the **From <space>** line shown, preceded by the beginning of  
 97226 the file or an empty line. (The **From <space>** line is considered to be part of the message header,  
 97227 but not one of the header-lines referred to in [Commands in mailx](#) (on page 2942); thus, it shall  
 97228 not be affected by the **discard**, **ignore**, or **retain** commands.) The formats of the remainder of the  
 97229 **From <space>** line and any additional header lines are unspecified, except that none shall be  
 97230 empty. The format of a message body line is also unspecified, except that no line following an  
 97231 empty line shall start with **From <space>**; *mailx* shall modify any such user-entered message  
 97232 body lines (following an empty line and beginning with **From <space>**) by adding one or more  
 97233 characters to precede the 'F'; it may add these characters to **From <space>** lines that are not  
 97234 preceded by an empty line.

97235                   When a message from the system mailbox or entered by the user is not a text file, it is  
 97236 implementation-defined how such a message is stored in files written by *mailx*.

## 97237 **EXTENDED DESCRIPTION**

97238 UP                   The functionality in the entire EXTENDED DESCRIPTION section shall be provided on  
 97239 implementations supporting the User Portability Utilities option. The functionality described in  
 97240 this section shall be provided on implementations that support the User Portability Utilities  
 97241 option (and the rest of this section is not further shaded for this option).

The *mailx* utility need not support for all character encodings in all circumstances. For example, inter-system mail may be restricted to 7-bit data by the underlying network, 8-bit data need not be portable to non-internationalized systems, and so on. Under these circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991 standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used.

When *mailx* is invoked using one of the Receive Mode synopsis forms, it shall write a page of header-summary lines (if `-N` was not specified and there are messages, see below), followed by a prompt indicating that *mailx* can accept regular commands (see [Commands in mailx](#), on page 2942); this is termed *command mode*. The page of header-summary lines shall contain the first new message if there are new messages, or the first unread message if there are unread messages, or the first message. When *mailx* is invoked using the Send Mode synopsis and standard input is a terminal, if no subject is specified on the command line and the **asksub** variable is set, a prompt for the subject shall be written. At this point, *mailx* shall be in input mode. This input mode shall also be entered when using one of the Receive Mode synopsis forms and a reply or new message is composed using the **reply**, **Reply**, **followup**, **Followup**, or **mail** commands and standard input is a terminal. When the message is typed and the end of the message is encountered, the message shall be passed to the mail delivery software. Commands can be entered by beginning a line with the escape character (by default, `<tilde>` (`'~'`)) followed by a single command letter and optional arguments. See [Commands in mailx](#) (on page 2942) for a summary of these commands. It is unspecified what effect these commands will have if standard input is not a terminal when a message is entered using either the Send Mode synopsis, or the Read Mode commands **reply**, **Reply**, **followup**, **Followup**, or **mail**.

**Note:** For notational convenience, this section uses the default escape character, `<tilde>`, in all references and examples.

At any time, the behavior of *mailx* shall be governed by a set of environmental and internal variables. These are flags and valued parameters that can be set and cleared via the *mailx* **set** and **unset** commands.

Regular commands are of the form:

`[command] [msglist] [argument ...]`

If no *command* is specified in command mode, **next** shall be assumed. In input mode, commands shall be recognized by the escape character, and lines not treated as commands shall be taken as input for the message.

In command mode, each message shall be assigned a sequential number, starting with 1.

All messages have a state that shall affect how they are displayed in the header summary and how they are retained or deleted upon termination of *mailx*. There is at any time the notion of a *current* message, which shall be marked by a `'>'` at the beginning of a line in the header summary. When *mailx* is invoked using one of the Receive Mode synopsis forms, the current message shall be the first new message, if there is a new message, or the first unread message if there is an unread message, or the first message if there are any messages, or unspecified if there are no messages in the mailbox. Each command that takes an optional list of messages (*msglist*) or an optional single message (*message*) on which to operate shall leave the current message set to the highest-numbered message of the messages specified, unless the command deletes messages, in which case the current message shall be set to the first undeleted message (that is, a message not in the deleted state) after the highest-numbered message deleted by the command, if one exists, or the first undeleted message before the highest-numbered message deleted by the command, if one exists, or to an unspecified value if there are no remaining undeleted messages. All messages shall be in one of the following states:

|       |                  |                                                                                                         |
|-------|------------------|---------------------------------------------------------------------------------------------------------|
| 97289 | <i>new</i>       | The message is present in the system mailbox and has not been viewed by the user                        |
| 97290 |                  | or moved to any other state. Messages in state <i>new</i> when <i>mailx</i> quits shall be              |
| 97291 |                  | retained in the system mailbox.                                                                         |
| 97292 | <i>unread</i>    | The message has been present in the system mailbox for more than one invocation                         |
| 97293 |                  | of <i>mailx</i> and has not been viewed by the user or moved to any other state.                        |
| 97294 |                  | Messages in state <i>unread</i> when <i>mailx</i> quits shall be retained in the system mailbox.        |
| 97295 | <i>read</i>      | The message has been processed by one of the following commands: <b>~f, ~m, ~F, ~M,</b>                 |
| 97296 |                  | <b>copy, mbox, next, pipe, print, Print, top, type, Type, undelete.</b> The <b>delete, dp,</b>          |
| 97297 |                  | and <b>dt</b> commands may also cause the next message to be marked as <i>read</i> ,                    |
| 97298 |                  | depending on the value of the <b>autoprint</b> variable. Messages that are in the system                |
| 97299 |                  | mailbox and in state <i>read</i> when <i>mailx</i> quits shall be saved in the <b>mbox</b> , unless the |
| 97300 |                  | internal variable <b>hold</b> was set. Messages that are in the <b>mbox</b> or in a secondary           |
| 97301 |                  | mailbox and in state <i>read</i> when <i>mailx</i> quits shall be retained in their current             |
| 97302 |                  | location.                                                                                               |
| 97303 | <i>deleted</i>   | The message has been processed by one of the following commands: <b>delete, dp, dt.</b>                 |
| 97304 |                  | Messages in state <i>deleted</i> when <i>mailx</i> quits shall be deleted. Deleted messages shall       |
| 97305 |                  | be ignored until <i>mailx</i> quits or changes mailboxes or they are specified to the                   |
| 97306 |                  | undelete command; for example, the message specification <i>/string</i> shall only                      |
| 97307 |                  | search the subject lines of messages that have not yet been deleted, unless the                         |
| 97308 |                  | command operating on the list of messages is <b>undelete</b> . No deleted message or                    |
| 97309 |                  | deleted message header shall be displayed by any <i>mailx</i> command other than                        |
| 97310 |                  | <b>undelete</b> .                                                                                       |
| 97311 | <i>preserved</i> | The message has been processed by a <b>preserve</b> command. When <i>mailx</i> quits, the               |
| 97312 |                  | message shall be retained in its current location.                                                      |
| 97313 | <i>saved</i>     | The message has been processed by one of the following commands: <b>save</b> or <b>write</b> .          |
| 97314 |                  | If the current mailbox is the system mailbox, and the internal variable <b>keepsave</b> is              |
| 97315 |                  | set, messages in the state <i>saved</i> shall be saved to the file designated by the <i>MBOX</i>        |
| 97316 |                  | variable (see the ENVIRONMENT VARIABLES section). If the current mailbox is                             |
| 97317 |                  | the system mailbox, messages in the state <i>saved</i> shall be deleted from the current                |
| 97318 |                  | mailbox, when the <b>quit</b> or <b>file</b> command is used to exit the current mailbox.               |
| 97319 |                  | The header-summary line for each message shall indicate the state of the message.                       |
| 97320 |                  | Many commands take an optional list of messages ( <i>msglist</i> ) on which to operate, which defaults  |
| 97321 |                  | to the current message. A <i>msglist</i> is a list of message specifications separated by <blank>       |
| 97322 |                  | characters, which can include:                                                                          |
| 97323 | <i>n</i>         | Message number <i>n</i> .                                                                               |
| 97324 | <b>+</b>         | The next undeleted message, or the next deleted message for the <b>undelete</b> command.                |
| 97325 | <b>–</b>         | The next previous undeleted message, or the next previous deleted message for the                       |
| 97326 |                  | <b>undelete</b> command.                                                                                |
| 97327 | <b>.</b>         | The current message.                                                                                    |
| 97328 | <b>^</b>         | The first undeleted message, or the first deleted message for the <b>undelete</b> command.              |
| 97329 | <b>\$</b>        | The last message.                                                                                       |
| 97330 | <b>*</b>         | All messages.                                                                                           |

|       |         |                                                                                      |
|-------|---------|--------------------------------------------------------------------------------------|
| 97331 | n-m     | An inclusive range of message numbers.                                               |
| 97332 | address | All messages from <i>address</i> ; any address as shown in a header summary shall be |
| 97333 |         | matchable in this form.                                                              |
| 97334 | /string | All messages with <i>string</i> in the subject line (case ignored).                  |
| 97335 | :c      | All messages of type <i>c</i> , where <i>c</i> shall be one of:                      |
| 97336 | d       | Deleted messages.                                                                    |
| 97337 | n       | New messages.                                                                        |
| 97338 | o       | Old messages (any not in state <i>read</i> or <i>new</i> ).                          |
| 97339 | r       | Read messages.                                                                       |
| 97340 | u       | Unread messages.                                                                     |

97341 Other commands take an optional message (*message*) on which to operate, which defaults to the  
97342 current message. All of the forms allowed for *msglist* are also allowed for *message*, but if more  
97343 than one message is specified, only the first shall be operated on.

97344 Other arguments are usually arbitrary strings whose usage depends on the command involved.

97345 **Start-Up in mailx**

97346 At start-up time, *mailx* shall take the following steps in sequence:

1. Establish all variables at their stated default values.
2. Process command line options, overriding corresponding default values.
3. Import any of the *DEAD*, *EDITOR*, *MBOX*, *LISTER*, *PAGER*, *SHELL*, or *VISUAL* variables that are present in the environment, overriding the corresponding default values.
4. Read *mailx* commands from an unspecified system start-up file, unless the **-n** option is given, to initialize any internal *mailx* variables and aliases.
5. Process the user start-up file of *mailx* commands named in the user *MAILRC* variable.

97354 Most regular *mailx* commands are valid inside start-up files, the most common use being to set  
97355 up initial display options and alias lists. The following commands shall be invalid in a start-up  
97356 file: **!**, **edit**, **hold**, **mail**, **preserve**, **reply**, **Reply**, **shell**, **visual**, **Copy**, **followup**, and **Followup**.  
97357 Any errors in a start-up file shall either cause *mailx* to terminate with a diagnostic message and a  
97358 non-zero status or to continue after writing a diagnostic message, ignoring the remainder of the  
97359 lines in the file.

97360 A blank line in a start-up file shall be ignored.

## 97361 Internal Variables in mailx

97362 The following variables are internal *mailx* variables. Each internal variable can be set via the  
97363 *mailx* **set** command at any time. The **unset** and **set no name** commands can be used to erase  
97364 variables.

97365 In the following list, variables shown as:

```
97366      variable
```

97367 represent Boolean values. Variables shown as:

```
97368      variable=value
```

|       |                         |                                                                                                               |
|-------|-------------------------|---------------------------------------------------------------------------------------------------------------|
| 97369 |                         | shall be assigned string or numeric values. For string values, the rules in <a href="#">Commands in mailx</a> |
| 97370 |                         | (on page 2942) concerning filenames and quoting shall also apply.                                             |
| 97371 |                         | The defaults specified here may be changed by the unspecified system start-up file unless the                 |
| 97372 |                         | user specifies the <b>-n</b> option.                                                                          |
| 97373 | <b>allnet</b>           | All network names whose login name components match shall be treated as                                       |
| 97374 |                         | identical. This shall cause the <i>msglist</i> message specifications to behave similarly.                    |
| 97375 |                         | The default shall be <b>noallnet</b> . See also the <b>alternates</b> command and the <b>metoo</b>            |
| 97376 |                         | variable.                                                                                                     |
| 97377 | <b>append</b>           | Append messages to the end of the <b>mbox</b> file upon termination instead of placing                        |
| 97378 |                         | them at the beginning. The default shall be <b>noappend</b> . This variable shall not                         |
| 97379 |                         | affect the <b>save</b> command when saving to <b>mbox</b> .                                                   |
| 97380 | <b>ask, asksub</b>      | Prompt for a subject line on outgoing mail if one is not specified on the command                             |
| 97381 |                         | line with the <b>-s</b> option. The <b>ask</b> and <b>asksub</b> forms are synonyms; the system shall         |
| 97382 |                         | refer to <b>asksub</b> and <b>noasksub</b> in its messages, but shall accept <b>ask</b> and <b>noask</b> as   |
| 97383 |                         | user input to mean <b>asksub</b> and <b>noasksub</b> . It shall not be possible to set both <b>ask</b>        |
| 97384 |                         | and <b>noasksub</b> , or <b>noask</b> and <b>asksub</b> . The default shall be <b>asksub</b> , but no         |
| 97385 |                         | prompting shall be done if standard input is not a terminal.                                                  |
| 97386 | <b>askbcc</b>           | Prompt for the blind copy list. The default shall be <b>noaskbcc</b> .                                        |
| 97387 | <b>askcc</b>            | Prompt for the copy list. The default shall be <b>noaskcc</b> .                                               |
| 97388 | <b>autoprint</b>        | Enable automatic writing of messages after <b>delete</b> and <b>undelete</b> commands. The                    |
| 97389 |                         | default shall be <b>noautoprint</b> .                                                                         |
| 97390 | <b>bang</b>             | Enable the special-case treatment of <exclamation-mark> characters ('!') in                                   |
| 97391 |                         | escape command lines; see the <b>escape</b> command and <a href="#">Command Escapes in mailx</a>              |
| 97392 |                         | (on page 2951). The default shall be <b>nobang</b> , disabling the expansion of '!' in the                    |
| 97393 |                         | <i>command</i> argument to the <b>~!</b> command and the <b>~!command</b> escape.                             |
| 97394 | <b>cmd=command</b>      |                                                                                                               |
| 97395 |                         | Set the default command to be invoked by the <b>pipe</b> command. The default shall be                        |
| 97396 |                         | <b>nocmd</b> .                                                                                                |
| 97397 | <b>crt=number</b>       | Pipe messages having more than <i>number</i> lines through the command specified by                           |
| 97398 |                         | the value of the <i>PAGER</i> variable. The default shall be <b>nocrt</b> . If it is set to null, the         |
| 97399 |                         | value used is implementation-defined.                                                                         |
| 97400 | XSI <b>debug</b>        | Enable verbose diagnostics for debugging. Messages are not delivered. The                                     |
| 97401 |                         | default shall be <b>nodebug</b> .                                                                             |
| 97402 | <b>dot</b>              | When <b>dot</b> is set, a <period> on a line by itself during message input from a                            |
| 97403 |                         | terminal shall also signify end-of-file (in addition to normal end-of-file). The                              |
| 97404 |                         | default shall be <b>nodot</b> . If <b>ignoreeof</b> is set (see below), a setting of <b>nodot</b> shall be    |
| 97405 |                         | ignored and the <period> is the only method to terminate input mode.                                          |
| 97406 | <b>escape=c</b>         | Set the command escape character to be the character 'c'. By default, the                                     |
| 97407 |                         | command escape character shall be <tilde>. If <b>escape</b> is unset, <tilde> shall be                        |
| 97408 |                         | used; if it is set to null, command escaping shall be disabled.                                               |
| 97409 | <b>flipr</b>            | Reverse the meanings of the <b>R</b> and <b>r</b> commands. The default shall be <b>noflipr</b> .             |
| 97410 | <b>folder=directory</b> |                                                                                                               |
| 97411 |                         | The default directory for saving mail files. User-specified filenames beginning with                          |
| 97412 |                         | a <plus-sign> ('+') shall be expanded by preceding the filename with this                                     |

|       |                            |                                                                                                          |
|-------|----------------------------|----------------------------------------------------------------------------------------------------------|
| 97413 |                            | directory name to obtain the real pathname. If <i>directory</i> does not start with a                    |
| 97414 |                            | <slash> ( ' / ' ), the contents of <i>HOME</i> shall be prefixed to it. The default shall be             |
| 97415 |                            | <b>nofolder</b> . If <b>folder</b> is unset or set to null, user-specified filenames beginning with      |
| 97416 |                            | '+' shall refer to files in the current directory that begin with the literal '+'                        |
| 97417 |                            | character. See also <b>outfolder</b> below. The <b>folder</b> value need not affect the processing       |
| 97418 |                            | of the files named in <i>MBOX</i> and <i>DEAD</i> .                                                      |
| 97419 | <b>header</b>              | Enable writing of the header summary when entering <i>mailx</i> in Receive Mode. The                     |
| 97420 |                            | default shall be <b>header</b> .                                                                         |
| 97421 | <b>hold</b>                | Preserve all messages that are read in the system mailbox instead of putting them                        |
| 97422 |                            | in the <b>mbox</b> save file. The default shall be <b>nohold</b> .                                       |
| 97423 | <b>ignore</b>              | Ignore interrupts while entering messages. The default shall be <b>noignore</b> .                        |
| 97424 | <b>ignoreeof</b>           | Ignore normal end-of-file during message input. Input can be terminated only by                          |
| 97425 |                            | entering a <period> ( ' . ' ) on a line by itself or by the ~. command escape. The                       |
| 97426 |                            | default shall be <b>noignoreeof</b> . See also <b>dot</b> above.                                         |
| 97427 | <b>indentprefix=string</b> |                                                                                                          |
| 97428 |                            | A string that shall be added as a prefix to each line that is inserted into the message                  |
| 97429 |                            | by the ~m command escape. This variable shall default to one <tab>.                                      |
| 97430 | <b>keep</b>                | When a system mailbox, secondary mailbox, or <b>mbox</b> is empty, truncate it to zero                   |
| 97431 |                            | length instead of removing it. The default shall be <b>nokeep</b> .                                      |
| 97432 | <b>keepsave</b>            | Keep the messages that have been saved from the system mailbox into other files                          |
| 97433 |                            | in the file designated by the variable <i>MBOX</i> , instead of deleting them. The default               |
| 97434 |                            | shall be <b>nokeepsave</b> .                                                                             |
| 97435 | <b>metoo</b>               | Suppress the deletion of the login name of the user from the recipient list when                         |
| 97436 |                            | replying to a message or sending to a group. The default shall be <b>nometoo</b> .                       |
| 97437 | XSI <b>onehop</b>          | When responding to a message that was originally sent to several recipients, the                         |
| 97438 |                            | other recipient addresses are normally forced to be relative to the originating                          |
| 97439 |                            | author's machine for the response. This flag disables alteration of the recipients'                      |
| 97440 |                            | addresses, improving efficiency in a network where all machines can send directly                        |
| 97441 |                            | to all other machines (that is, one hop away). The default shall be <b>noonehop</b> .                    |
| 97442 | <b>outfolder</b>           | Cause the files used to record outgoing messages to be located in the directory                          |
| 97443 |                            | specified by the <b>folder</b> variable unless the pathname is absolute. The default shall               |
| 97444 |                            | be <b>nooutfolder</b> . See the <b>record</b> variable.                                                  |
| 97445 | <b>page</b>                | Insert a <form-feed> after each message sent through the pipe created by the <b>pipe</b>                 |
| 97446 |                            | command. The default shall be <b>nopage</b> .                                                            |
| 97447 | <b>prompt=string</b>       |                                                                                                          |
| 97448 |                            | Set the command-mode prompt to <i>string</i> . If <i>string</i> is null or if <b>noprompt</b> is set, no |
| 97449 |                            | prompting shall occur. The default shall be to prompt with the string " ? ".                             |
| 97450 | <b>quiet</b>               | Refrain from writing the opening message and version when entering <i>mailx</i> . The                    |
| 97451 |                            | default shall be <b>noquiet</b> .                                                                        |
| 97452 | <b>record=file</b>         | Record all outgoing mail in the file with the pathname <i>file</i> . The default shall be                |
| 97453 |                            | <b>norecord</b> . See also <b>outfolder</b> above.                                                       |
| 97454 | <b>save</b>                | Enable saving of messages in the dead-letter file on interrupt or delivery error. See                    |
| 97455 |                            | the variable <i>DEAD</i> for the location of the dead-letter file. The default shall be <b>save</b> .    |

**screen=number**

Set the number of lines in a screenful of headers for the **headers** and **z** commands. If **screen** is not specified, a value based on the terminal type identified by the *TERM* environment variable, the window size, the baud rate, or some combination of these shall be used.

**sendwait**

Wait for the background mailer to finish before returning. The default shall be **nosendwait**.

**showto**

When the sender of the message was the user who is invoking *mailx*, write the information from the **To:** line instead of the **From:** line in the header summary. The default shall be **noshowto**.

**sign=string**

Set the variable inserted into the text of a message when the **~a** command escape is given. The default shall be **nosign**. The character sequences '**\t**' and '**\n**' shall be recognized in the variable as <tab> and <newline> characters, respectively. (See also **~i** in [Command Escapes in mailx](#) (on page 2951).)

**Sign=string**

Set the variable inserted into the text of a message when the **~A** command escape is given. The default shall be **noSign**. The character sequences '**\t**' and '**\n**' shall be recognized in the variable as <tab> and <newline> characters, respectively.

**toplines=number**

Set the number of lines of the message to write with the **top** command. The default shall be 5.

**Commands in mailx**

The following *mailx* commands shall be provided. In the following list, header refers to lines from the message header, as shown in the OUTPUT FILES section. Header-line refers to lines within the header that begin with one or more non-white-space characters, immediately followed by a <colon> and white space and continuing until the next line beginning with a non-white-space character or an empty line. Header-field refers to the portion of a header line prior to the first <colon> in that line.

For each of the commands listed below, the command can be entered as the abbreviation (those characters in the Synopsis command word preceding the '**[ ]**'), the full command (all characters shown for the command word, omitting the '**[ ]**' and '**'**'), or any truncation of the full command down to the abbreviation. For example, the **exit** command (shown as **ex[it]** in the Synopsis) can be entered as **ex**, **exi**, or **exit**.

The arguments to commands can be quoted, using the following methods:

- An argument can be enclosed between paired double-quotes ("**"**") or single-quotes ("**'**"); any white space, shell word expansion, or <backslash> characters within the quotes shall be treated literally as part of the argument. A double-quote shall be treated literally within single-quotes and *vice versa*. These special properties of the <quotation-mark> characters shall occur only when they are paired at the beginning and end of the argument.
- A <backslash> outside of the enclosing quotes shall be discarded and the following character treated literally as part of the argument.
- An unquoted <backslash> at the end of a command line shall be discarded and the next line shall continue the command.

97498 Filenames, where expected, shall be subjected to the following transformations, in sequence:

- 97499 • If the filename begins with an unquoted <plus-sign>, and the **folder** variable is defined  
97500 (see the **folder** variable), the <plus-sign> shall be replaced by the value of the **folder**  
97501 variable followed by a <slash>. If the **folder** variable is unset or is set to null, the filename  
97502 shall be unchanged.
- 97503 • Shell word expansions shall be applied to the filename (see [Section 2.6](#), on page 2343). If  
97504 more than a single pathname results from this expansion and the command is expecting  
97505 one file, the effects are unspecified.

## 97506 Declare Aliases

97507 *Synopsis:*     a[lias] [alias [address...]]  
97508               g[roup] [alias [address...]]

97509 Add the given addresses to the alias specified by *alias*. The names shall be substituted when  
97510 *alias* is used as a recipient address specified by the user in an outgoing message (that is, other  
97511 recipients addressed indirectly through the **reply** command shall not be substituted in this  
97512 manner). Mail address alias substitution shall apply only when the alias string is used as a full  
97513 address; for example, when **hlj** is an alias, *hlj@posix.com* does not trigger the alias substitution. If  
97514 no arguments are given, write a listing of the current aliases to standard output. If only an *alias*  
97515 argument is given, write a listing of the specified alias to standard output. These listings need  
97516 not reflect the same order of addresses that were entered.

## 97517 Declare Alternatives

97518 *Synopsis:*     alt[ernates] name...

97519 (See also the **metoo** variable.) Declare a list of alternative names for the user's login. When  
97520 responding to a message, these names shall be removed from the list of recipients for the  
97521 response. The comparison of names shall be in a case-insensitive manner. With no arguments,  
97522 **alternates** shall write the current list of alternative names.

## 97523 Change Current Directory

97524 *Synopsis:*     cd [directory]  
97525               ch[dir] [directory]

97526 Change directory. If *directory* is not specified, the contents of *HOME* shall be used.

## 97527 Copy Messages

97528 *Synopsis:*     c[opy] [file]  
97529               c[opy] [msglist] file  
97530               C[opy] [msglist]

97531 Copy messages to the file named by the pathname *file* without marking the messages as saved.  
97532 Otherwise, it shall be equivalent to the **save** command.

97533 In the capitalized form, save the specified messages in a file whose name is derived from the  
97534 author of the message to be saved, without marking the messages as saved. Otherwise, it shall  
97535 be equivalent to the **Save** command.

## Delete Messages

*Synopsis:*     d[delete] [msglist]

Mark messages for deletion from the mailbox. The deletions shall not occur until *mailx* quits (see the **quit** command) or changes mailboxes (see the **folder** command). If **autoprint** is set and there are messages remaining after the **delete** command, the current message shall be written as described for the **print** command (see the **print** command); otherwise, the *mailx* prompt shall be written.

## Discard Header Fields

*Synopsis:*     di[scard] [header-field...]  
              ig[nore] [header-field...]

Suppress the specified header fields when writing messages. Specified *header-fields* shall be added to the list of suppressed header fields. Examples of header fields to ignore are **status** and **cc**. The fields shall be included when the message is saved. The **Print** and **Type** commands shall override this command. The comparison of header fields shall be in a case-insensitive manner. If no arguments are specified, write a list of the currently suppressed header fields to standard output; the listing need not reflect the same order of header fields that were entered.

If both **retain** and **discard** commands are given, **discard** commands shall be ignored.

## Delete Messages and Display

*Synopsis:*     dp [msglist]  
              dt [msglist]

Delete the specified messages as described for the **delete** command, except that the **autoprint** variable shall have no effect, and the current message shall be written only if it was set to a message after the last message deleted by the command. Otherwise, an informational message to the effect that there are no further messages in the mailbox shall be written, followed by the *mailx* prompt.

## Echo a String

*Synopsis:*     ec[ho] string ...

Echo the given strings, equivalent to the shell *echo* utility.

## Edit Messages

*Synopsis:*     e[dit] [msglist]

Edit the given messages. The messages shall be placed in a temporary file and the utility named by the *EDITOR* variable is invoked to edit each file in sequence. The default *EDITOR* is unspecified.

The **edit** command does not modify the contents of those messages in the mailbox.

**Exit**

*Synopsis:*     ex[it]  
              x[it]

Exit from *mailx* without changing the mailbox. No messages shall be saved in the **mbox** (see also **quit**).

**Change Folder**

*Synopsis:*     fi[le] [*file*]  
              fold[er] [*file*]

Quit (see the **quit** command) from the current file of messages and read in the file named by the pathname *file*. If no argument is given, the name and status of the current mailbox shall be written.

Several unquoted special characters shall be recognized when used as *file* names, with the following substitutions:

- %       The system mailbox for the invoking user.
  - %*user*   The system mailbox for *user*.
  - #       The previous file.
  - &       The current **mbox**.
  - +*file*   The named file in the **folder** directory. (See the **folder** variable.)
- The default file shall be the current mailbox.

**Display List of Folders**

*Synopsis:*     folders

Write the names of the files in the directory set by the **folder** variable. The command specified by the *LISTER* environment variable shall be used (see the ENVIRONMENT VARIABLES section).

**Follow Up Specified Messages**

*Synopsis:*     fo[llowup] [*message*]  
              F[ollowup] [*msglist*]

In the lowercase form, respond to a message, recording the response in a file whose name is derived from the author of the message. See also the **save** and **copy** commands and **outfolder**.

In the capitalized form, respond to the first message in the *msglist*, sending the message to the author of each message in the *msglist*. The subject line shall be taken from the first message and the response shall be recorded in a file whose name is derived from the author of the first message. See also the **Save** and **Copy** commands and **outfolder**.

Both forms shall override the **record** variable, if set.

**Display Header Summary for Specified Messages**

*Synopsis:*    f[rom] [msglist]

Write the header summary for the specified messages.

**Display Header Summary**

*Synopsis:*    h[eaders] [message]

Write the page of headers that includes the message specified. If the *message* argument is not specified, the current message shall not change. However, if the *message* argument is specified, the current message shall become the message that appears at the top of the page of headers that includes the message specified. The **screen** variable sets the number of headers per page. See also the **z** command.

**Help**

*Synopsis:*    hel[p]  
              ?

Write a summary of commands.

**Hold Messages**

*Synopsis:*    ho[ld] [msglist]  
              pre[serve] [msglist]

Mark the messages in *msglist* to be retained in the mailbox when *mailx* terminates. This shall override any commands that might previously have marked the messages to be deleted. During the current invocation of *mailx*, only the **delete**, **dp**, or **dt** commands shall remove the *preserve* marking of a message.

**Execute Commands Conditionally**

*Synopsis:*    i[f] s|r  
              mail-commands  
              el[se]  
              mail-commands  
              en[dif]

Execute commands conditionally, where **if s** executes the following *mail-commands*, up to an **else** or **endif**, if the program is in Send Mode, and **if r** shall cause the *mail-commands* to be executed only in Receive Mode.

**List Available Commands**

*Synopsis:*    l[ist]

Write a list of all commands available. No explanation shall be given.

**Mail a Message**

*Synopsis:*    m[ail] address...

Mail a message to the specified addresses or aliases.

**Direct Messages to mbox**

*Synopsis:*    mb[ox] [msglist]

Arrange for the given messages to end up in the **mbox** save file when *mailx* terminates normally. See **MBOX**. See also the **exit** and **quit** commands.

**Process Next Specified Message**

*Synopsis:*    n[ext] [message]

If the current message has not been written (for example, by the **print** command) since *mailx* started or since any other message was the current message, behave as if the **print** command was entered. Otherwise, if there is an undeleted message after the current message, make it the current message and behave as if the **print** command was entered. Otherwise, an informational message to the effect that there are no further messages in the mailbox shall be written, followed by the *mailx* prompt. Should the current message location be the result of an immediately preceding **hold**, **mbox**, **preserve**, or **touch** command, **next** will act as if the current message has already been written.

**Pipe Message**

*Synopsis:*    pi[pe] [[msglist] command]  
              | [[msglist] command]

Pipe the messages through the given *command* by invoking the command interpreter specified by *SHELL* with two arguments: **-c** and *command*. (See also *sh -c*.) The application shall ensure that the command is given as a single argument. Quoting, described previously, can be used to accomplish this. If no arguments are given, the current message shall be piped through the command specified by the value of the **cmd** variable. If the **page** variable is set, a <form-feed> shall be inserted after each message.

**Display Message with Headers**

*Synopsis:*    P[rint] [msglist]  
              T[ype] [msglist]

Write the specified messages, including all header lines, to standard output. Override suppression of lines by the **discard**, **ignore**, and **retain** commands. If **crt** is set, the messages longer than the number of lines specified by the **crt** variable shall be paged through the command specified by the *PAGER* environment variable.

**Display Message**

*Synopsis:*    p[rint] [msglist]  
              t[ype] [msglist]

Write the specified messages to standard output. If **crt** is set, the messages longer than the number of lines specified by the **crt** variable shall be paged through the command specified by the *PAGER* environment variable.

## Quit

*Synopsis:*     q[uit]  
              end-of-file

Terminate *mailx*, storing messages that were read in **mbox** (if the current mailbox is the system mailbox and unless **hold** is set), deleting messages that have been explicitly saved (unless **keepsave** is set), discarding messages that have been deleted, and saving all remaining messages in the mailbox.

## Reply to a Message List

*Synopsis:*     R[eply] [msglist]  
              R[espond] [msglist]

Mail a reply message to the sender of each message in the *msglist*. The subject line shall be formed by concatenating **Re:**<space> (unless it already begins with that string) and the subject from the first message. If **record** is set to a filename, the response shall be saved at the end of that file.

See also the **flipr** variable.

## Reply to a Message

*Synopsis:*     r[eply] [message]  
              r[espond] [message]

Mail a reply message to all recipients included in the header of the message. The subject line shall be formed by concatenating **Re:**<space> (unless it already begins with that string) and the subject from the message. If **record** is set to a filename, the response shall be saved at the end of that file.

See also the **flipr** variable.

## Retain Header Fields

*Synopsis:*     ret[ain] [header-field...]

Retain the specified header fields when writing messages. This command shall override all **discard** and **ignore** commands. The comparison of header fields shall be in a case-insensitive manner. If no arguments are specified, write a list of the currently retained header fields to standard output; the listing need not reflect the same order of header fields that were entered.

## Save Messages

*Synopsis:*     s[ave] [file]  
              s[ave] [msglist] file  
              S[ave] [msglist]

Save the specified messages in the file named by the pathname *file*, or the **mbox** if the *file* argument is omitted. The file shall be created if it does not exist; otherwise, the messages shall be appended to the file. The message shall be put in the state *saved*, and shall behave as specified in the description of the *saved* state when the current mailbox is exited by the **quit** or **file** command.

In the capitalized form, save the specified messages in a file whose name is derived from the author of the first message. The name of the file shall be taken to be the author's name with all network addressing stripped off. See also the **Copy**, **followup**, and **Followup** commands and

97717 **outfolder** variable.

## 97718 **Set Variables**

97719 *Synopsis:*    **se**[t] [**name**=[*string*] ...] [**name**=*number* ...] [**no**name ...]

97720 Define one or more variables called *name*. The variable can be given a null, string, or numeric  
97721 value. Quoting and <backslash>-escapes can occur anywhere in *string*, as described previously,  
97722 as if the *string* portion of the argument were the entire argument. The forms *name* and *name*=  
97723 shall be equivalent to *name*="" for variables that take string values. The **set** command without  
97724 arguments shall write a list of all defined variables and their values. The **no** *name* form shall be  
97725 equivalent to **unset** *name*.

## 97726 **Invoke a Shell**

97727 *Synopsis:*    **sh**[ell]

97728 Invoke an interactive command interpreter (see also *SHELL*).

## 97729 **Display Message Size**

97730 *Synopsis:*    **si**[ze] [*msglist*]

97731 Write the size in bytes of each of the specified messages.

## 97732 **Read mailx Commands From a File**

97733 *Synopsis:*    **so**[urce] *file*

97734 Read and execute commands from the file named by the pathname *file* and return to command  
97735 mode.

## 97736 **Display Beginning of Messages**

97737 *Synopsis:*    **to**[p] [*msglist*]

97738 Write the top few lines of each of the specified messages. If the **toplines** variable is set, it is taken  
97739 as the number of lines to write. The default shall be 5.

## 97740 **Touch Messages**

97741 *Synopsis:*    **tou**[ch] [*msglist*]

97742 Touch the specified messages. If any message in *msglist* is not specifically deleted nor saved in a  
97743 file, it shall be placed in the **mbox** upon normal termination. See **exit** and **quit**.

## 97744 **Delete Aliases**

97745 *Synopsis:*    **una**[lias] [*alias*]...

97746 Delete the specified alias names. If a specified alias does not exist, the results are unspecified.

## Undelete Messages

*Synopsis:*     u[ndelete] [msglist]

Change the state of the specified messages from deleted to read. If **autoprint** is set, the last message of those restored shall be written. If *msglist* is not specified, the message shall be selected as follows:

- If there are any deleted messages that follow the current message, the first of these shall be chosen.
- Otherwise, the last deleted message that also precedes the current message shall be chosen.

## Unset Variables

*Synopsis:*     uns[et] name...

Cause the specified variables to be erased.

## Edit Message with Full-Screen Editor

*Synopsis:*     v[isual] [msglist]

Edit the given messages with a screen editor. Each message shall be placed in a temporary file, and the utility named by the *VISUAL* variable shall be invoked to edit each file in sequence. The default editor shall be *vi*.

The **visual** command does not modify the contents of those messages in the mailbox.

## Write Messages to a File

*Synopsis:*     w[rite] [msglist] file

Write the given messages to the file specified by the pathname *file*, minus the message header. Otherwise, it shall be equivalent to the **save** command.

## Scroll Header Display

*Synopsis:*     z[+|-]

Scroll the header display forward (if '+' is specified or if no option is specified) or backward (if '-' is specified) one screenful. The number of headers written shall be set by the **screen** variable.

## Invoke Shell Command

*Synopsis:*     !command

Invoke the command interpreter specified by *SHELL* with two arguments: **-c** and *command*. (See also *sh -c*.) If the **bang** variable is set, each unescaped occurrence of '!' in *command* shall be replaced with the command executed by the previous ! command or ~! command escape.

**Null Command**

*Synopsis:*    # *comment*

This null command (comment) shall be ignored by *mailx*.

**Display Current Message Number**

*Synopsis:*       =

Write the current message number.

**Command Escapes in mailx**

The following commands can be entered only from input mode, by beginning a line with the escape character (by default, <tilde> ('~')). See the **escape** variable description for changing this special character. The format for the commands shall be:

<escape-character><command-char><separator>[<arguments>]

where the <separator> can be zero or more <blank> characters.

In the following descriptions, the application shall ensure that the argument *command* (but not *mailx-command*) is a shell command string. Any string acceptable to the command interpreter specified by the *SHELL* variable when it is invoked as *SHELL -c command\_string* shall be valid. The command can be presented as multiple arguments (that is, quoting is not required).

Command escapes that are listed with *msglist* or *mailx-command* arguments are invalid in Send Mode and produce unspecified results.

**~! *command*** Invoke the command interpreter specified by *SHELL* with two arguments: **-c** and *command*; and then return to input mode. If the **bang** variable is set, each unescaped occurrence of '!' in *command* shall be replaced with the command executed by the previous ! command or ~! command escape.

**~.** Simulate end-of-file (terminate message input).

**~: *mailx-command*, ~\_ *mailx-command***  
Perform the command-level request.

**~?** Write a summary of command escapes.

**~A** This shall be equivalent to **~i Sign**.

**~a** This shall be equivalent to **~i sign**.

**~b *name...*** Add the *names* to the blind carbon copy (**Bcc**) list.

**~c *name...*** Add the *names* to the carbon copy (**Cc**) list.

**~d** Read in the dead-letter file. See *DEAD* for a description of this file.

**~e** Invoke the editor, as specified by the *EDITOR* environment variable, on the partial message.

**~f [*msglist*]** Forward the specified messages. The specified messages shall be inserted into the current message without alteration. This command escape also shall insert message headers into the message with field selection affected by the **discard**, **ignore**, and **retain** commands.

|       |                                                                             |                                                                                                                  |
|-------|-----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| 97815 | ~F [ <i>msglist</i> ]                                                       | This shall be the equivalent of the ~f command escape, except that all headers shall                             |
| 97816 |                                                                             | be included in the message, regardless of previous <b>discard</b> , <b>ignore</b> , and <b>retain</b>            |
| 97817 |                                                                             | commands.                                                                                                        |
| 97818 | ~h                                                                          | If standard input is a terminal, prompt for a <b>Subject</b> line and the <b>To</b> , <b>Cc</b> , and <b>Bcc</b> |
| 97819 |                                                                             | lists. Other implementation-defined headers may also be presented for editing. If                                |
| 97820 |                                                                             | the field is written with an initial value, it can be edited as if it had just been typed.                       |
| 97821 | ~i <i>string</i>                                                            | Insert the value of the named variable, followed by a <newline>, into the text of                                |
| 97822 |                                                                             | the message. If the string is unset or null, the message shall not be changed.                                   |
| 97823 | ~m [ <i>msglist</i> ]                                                       | Insert the specified messages into the message, prefixing non-empty lines with the                               |
| 97824 |                                                                             | string in the <b>indentprefix</b> variable. This command escape also shall insert message                        |
| 97825 |                                                                             | headers into the message, with field selection affected by the <b>discard</b> , <b>ignore</b> , and              |
| 97826 |                                                                             | <b>retain</b> commands.                                                                                          |
| 97827 | ~M [ <i>msglist</i> ]                                                       | This shall be the equivalent of the ~m command escape, except that all headers                                   |
| 97828 |                                                                             | shall be included in the message, regardless of previous <b>discard</b> , <b>ignore</b> , and <b>retain</b>      |
| 97829 |                                                                             | commands.                                                                                                        |
| 97830 | ~p                                                                          | Write the message being entered. If the message is longer than <b>crt</b> lines (see                             |
| 97831 |                                                                             | <a href="#">Internal Variables in mailx</a> , on page 2939), the output shall be paginated as                    |
| 97832 |                                                                             | described for the <b>PAGER</b> variable.                                                                         |
| 97833 | ~q                                                                          | Quit (see the <b>quit</b> command) from input mode by simulating an interrupt. If the                            |
| 97834 |                                                                             | body of the message is not empty, the partial message shall be saved in the dead-                                |
| 97835 |                                                                             | letter file. See <i>DEAD</i> for a description of this file.                                                     |
| 97836 | ~r <i>file</i> , ~< <i>file</i> , ~r ! <i>command</i> , ~< ! <i>command</i> |                                                                                                                  |
| 97837 |                                                                             | Read in the file specified by the pathname <i>file</i> . If the argument begins with an                          |
| 97838 |                                                                             | <exclamation-mark> ('!'), the rest of the string shall be taken as an arbitrary                                  |
| 97839 |                                                                             | system command; the command interpreter specified by <i>SHELL</i> shall be invoked                               |
| 97840 |                                                                             | with two arguments: -c and <i>command</i> . The standard output of <i>command</i> shall be                       |
| 97841 |                                                                             | inserted into the message.                                                                                       |
| 97842 | ~s <i>string</i>                                                            | Set the subject line to <i>string</i> .                                                                          |
| 97843 | ~t <i>name...</i>                                                           | Add the given <i>names</i> to the <b>To</b> list.                                                                |
| 97844 | ~v                                                                          | Invoke the full-screen editor, as specified by the <i>VISUAL</i> environment variable, on                        |
| 97845 |                                                                             | the partial message.                                                                                             |
| 97846 | ~w <i>file</i>                                                              | Write the partial message, without the header, onto the file named by the                                        |
| 97847 |                                                                             | pathname <i>file</i> . The file shall be created or the message shall be appended to it if                       |
| 97848 |                                                                             | the file exists.                                                                                                 |
| 97849 | ~x                                                                          | Exit as with ~q, except the message shall not be saved in the dead-letter file.                                  |
| 97850 | ~l <i>command</i>                                                           | Pipe the body of the message through the given <i>command</i> by invoking the                                    |
| 97851 |                                                                             | command interpreter specified by <i>SHELL</i> with two arguments: -c and <i>command</i> . If                     |
| 97852 |                                                                             | the <i>command</i> returns a successful exit status, the standard output of the command                          |
| 97853 |                                                                             | shall replace the message. Otherwise, the message shall remain unchanged. If the                                 |
| 97854 |                                                                             | <i>command</i> fails, an error message giving the exit status shall be written.                                  |

97855 **EXIT STATUS**97856 UP When the **-e** option is specified, the following exit values are returned:

97857 0 Mail was found.

97858 &gt;0 Mail was not found or an error occurred.

97859 Otherwise, the following exit values are returned:

97860 0 Successful completion; note that this status implies that all messages were *sent*, but it gives  
97861 no assurances that any of them were actually *delivered*.

97862 &gt;0 An error occurred.

97863 **CONSEQUENCES OF ERRORS**97864 UP When in **input mode (Receive Mode)** or Send Mode:97865 • If an error is encountered processing an input line beginning with a <tilde> ('~')  
97866 UP character, (see [Command Escapes in mailx](#), on page 2951), a diagnostic message shall be  
97867 written to standard error, and the message being composed may be modified, but this  
97868 condition shall not prevent the message from being sent.

97869 • Other errors shall prevent the sending of the message.

97870 UP When in command mode:

97871 • Default.

97872 **APPLICATION USAGE**97873 Delivery of messages to remote systems requires the existence of communication paths to such  
97874 systems. These need not exist.97875 Input lines are limited to {LINE\_MAX} bytes, but mailers between systems may impose more  
97876 severe line-length restrictions. This volume of POSIX.1-2008 does not place any restrictions on  
97877 the length of messages handled by *mailx*, and for delivery of local messages the only limitations  
97878 should be the normal problems of available disk space for the target mail file. When sending  
97879 messages to external machines, applications are advised to limit messages to less than 100 000  
97880 bytes because some mail gateways impose message-length restrictions.97881 The format of the system mailbox is intentionally unspecified. Not all systems implement  
97882 system mailboxes as flat files, particularly with the advent of multimedia mail messages. Some  
97883 system mailboxes may be multiple files, others records in a database. The internal format of the  
97884 messages themselves is specified with the historical format from Version 7, but only after the  
97885 messages have been saved in some file other than the system mailbox. This was done so that  
97886 many historical applications expecting text-file mailboxes are not broken.97887 Some new formats for messages can be expected in the future, probably including binary data,  
97888 bit maps, and various multimedia objects. As described here, *mailx* is not prohibited from  
97889 handling such messages, but it must store them as text files in secondary mailboxes (unless some  
97890 extension, such as a variable or command line option, is used to change the stored format). Its  
97891 method of doing so is implementation-defined and might include translating the data into text  
97892 file-compatible or readable form or omitting certain portions of the message from the stored  
97893 output.97894 The **discard** and **ignore** commands are not inverses of the **retain** command. The **retain**  
97895 command discards all header-fields except those explicitly retained. The **discard** command  
97896 keeps all header-fields except those explicitly discarded. If headers exist on the retained header

list, **discard** and **ignore** commands are ignored.

## EXAMPLES

None.

## RATIONALE

The standard developers felt strongly that a method for applications to send messages to specific users was necessary. The obvious example is a batch utility, running non-interactively, that wishes to communicate errors or results to a user. However, the actual format, delivery mechanism, and method of reading the message are clearly beyond the scope of this volume of POSIX.1-2008.

The intent of this command is to provide a simple, portable interface for sending messages non-interactively. It merely defines a “front-end” to the historical mail system. It is suggested that implementations explicitly denote the sender and recipient in the body of the delivered message. Further specification of formats for either the message envelope or the message itself were deliberately not made, as the industry is in the midst of changing from the current standards to a more internationalized standard and it is probably incorrect, at this time, to require either one.

Implementations are encouraged to conform to the various delivery mechanisms described in the CCITT X.400 standards or to the equivalent Internet standards, described in Internet Request for Comment (RFC) documents RFC 819, RFC 920, RFC 921, RFC 1123, and RFC 5322 (which succeeded RFC 822).

Many historical systems modified each body line that started with **From** by prefixing the ‘F’ with ‘>’. It is unnecessary, but allowed, to do that when the string does not follow a blank line because it cannot be confused with the next header.

The **edit** and **visual** commands merely edit the specified messages in a temporary file. They do not modify the contents of those messages in the mailbox; such a capability could be added as an extension, such as by using different command names.

The restriction on a subject line being {LINE\_MAX}–10 bytes is based on the historical format that consumes 10 bytes for **Subject:** and the trailing <newline>. Many historical mailers that a message may encounter on other systems are not able to handle lines that long, however.

Like the utilities *logger* and *lp*, *mailx* admittedly is difficult to test. This was not deemed sufficient justification to exclude this utility from this volume of POSIX.1-2008. It is also arguable that it is, in fact, testable, but that the tests themselves are not portable.

When *mailx* is being used by an application that wishes to receive the results as if none of the User Portability Utilities option features were supported, the *DEAD* environment variable must be set to **/dev/null**. Otherwise, it may be subject to the file creations described in *mailx* ASYNCHRONOUS EVENTS. Similarly, if the *MAILRC* environment variable is not set to **/dev/null**, historical versions of *mailx* and *Mail* read initialization commands from a file before processing begins. Since the initialization that a user specifies could alter the contents of messages an application is trying to send, such applications must set *MAILRC* to **/dev/null**.

The description of *LC\_TIME* uses “may affect” because many historical implementations do not or cannot manipulate the date and time strings in the incoming mail headers. Some headers found in incoming mail do not have enough information to determine the timezone in which the mail originated, and, therefore, *mailx* cannot convert the date and time strings into the internal form that then is parsed by routines like *strftime()* that can take *LC\_TIME* settings into account. Changing all these times to a user-specified format is allowed, but not required.

The paginator selected when *PAGER* is null or unset is partially unspecified to allow the System V historical practice of using *pg* as the default. Bypassing the pagination function, such as by

declaring that *cat* is the paginator, would not meet with the intended meaning of this description. However, any “portable user” would have to set *PAGER* explicitly to get his or her preferred paginator on all systems. The paginator choice was made partially unspecified, unlike the *VISUAL* editor choice (mandated to be *vi*) because most historical pagers follow a common theme of user input, whereas editors differ dramatically.

Options to specify addresses as **cc** (carbon copy) or **bcc** (blind carbon copy) were considered to be format details and were omitted.

A zero exit status implies that all messages were *sent*, but it gives no assurances that any of them were actually *delivered*. The reliability of the delivery mechanism is unspecified and is an appropriate marketing distinction between systems.

In order to conform to the Utility Syntax Guidelines, a solution was required to the optional *file* option-argument to **-f**. By making *file* an operand, the guidelines are satisfied and users remain portable. However, it does force implementations to support usage such as:

```
mailx -fin mymail.box
```

The **no name** method of unsetting variables is not present in all historical systems, but it is in System V and provides a logical set of commands corresponding to the format of the display of options from the *mailx set* command without arguments.

The **ask** and **asksub** variables are the names selected by BSD and System V, respectively, for the same feature. They are synonyms in this volume of POSIX.1-2008.

The *mailx echo* command was not documented in the BSD version and has been omitted here because it is not obviously useful for interactive users.

The default prompt on the System V *mailx* is a <question-mark>, on BSD *Mail* an <ampersand>. Since this volume of POSIX.1-2008 chose the *mailx* name, it kept the System V default, assuming that BSD users would not have difficulty with this minor incompatibility (that they can override).

The meanings of **r** and **R** are reversed between System V *mailx* and SunOS *Mail*. Once again, since this volume of POSIX.1-2008 chose the *mailx* name, it kept the System V default, but allows the SunOS user to achieve the desired results using **flpr**, an internal variable in System V *mailx*, although it has not been documented in the SVID.

The **indentprefix** variable, the **retain** and **unalias** commands, and the **~F** and **~M** command escapes were adopted from 4.3 BSD *Mail*.

The **version** command was not included because no sufficiently general specification of the version information could be devised that would still be useful to a portable user. This command name should be used by suppliers who wish to provide version information about the *mailx* command.

The “implementation-specific (unspecified) system start-up file” historically has been named */etc/mailx.rc*, but this specific name and location are not required.

The intent of the wording for the **next** command is that if any command has already displayed the current message it should display a following message, but, otherwise, it should display the current message. Consider the command sequence:

```
next 3
delete 3
next
```

where the **autoprint** option was not set. The normative text specifies that the second **next**

command should display a message following the third message, because even though the current message has not been displayed since it was set by the **delete** command, it has been displayed since the current message was anything other than message number 3. This does not always match historical practice in some implementations, where the command file address followed by **next** (or the default command) would skip the message for which the user had searched.

## FUTURE DIRECTIONS

None.

XBD Chapter 8 (on page 173), Section 12.2 (on page 216)

## CHANGE HISTORY

First released in Issue 2.

### Issue 5

The description of the *EDITOR* environment variable is changed to indicate that *ed* is the default editor if this variable is not set. In previous issues, this default was not stated explicitly at this point but was implied further down in the text.

The FUTURE DIRECTIONS section is added.

### Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **-F** option is added.
- The **allnet**, **debug**, and **sendwait** internal variables are added.
- The **C**, **ec**, **fo**, **F**, and **S** *mailx* commands are added.

In the DESCRIPTION and ENVIRONMENT VARIABLES sections, text stating “*HOME* directory” is replaced by “directory referred to by the *HOME* environment variable”.

The *mailx* utility is aligned with the IEEE P1003.2b draft standard, which includes various clarifications to resolve IEEE PASC Interpretations submitted for the ISO POSIX-2:1993 standard. In particular, the changes here address IEEE PASC Interpretations 1003.2 #10, #11, #103, #106, #108, #114, #115, #122, and #129.

The normative text is reworded to avoid use of the term “must” for application requirements.

The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/32 is applied, applying a change to the EXTENDED DESCRIPTION, raised by IEEE PASC Interpretation 1003.2 #122, which was overlooked in the first version of this standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/17 is applied, updating the EXTENDED DESCRIPTION (Internal Variables in *mailx*). The system start-up file is changed from “implementation-defined” to “unspecified” for consistency with other text in the EXTENDED DESCRIPTION.

### Issue 7

Austin Group Interpretation 1003.1-2001 #089 is applied, clarifying the effect of the *LC\_TIME* environment variable.

Austin Group Interpretation 1003.1-2001 #090 is applied, updating the description of the **next**

- 98030 command.
- 98031 SD5-XCU-ERN-69 is applied.
- 98032 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 98033 Shading to indicate support for the User Portability Utilities option is added.

98034 **NAME**98035 `make` — maintain, update, and regenerate groups of programs (**DEVELOPMENT**)98036 **SYNOPSIS**

```
98037 SD  make [-einpqrst] [-f makefile]... [-k|-S] [macro=value...]
98038      [target_name...]
```

98039 **DESCRIPTION**

98040 The *make* utility shall update files that are derived from other files. A typical case is one where  
 98041 object files are derived from the corresponding source files. The *make* utility examines time  
 98042 relationships and shall update those derived files (called targets) that have modified times  
 98043 earlier than the modified times of the files (called prerequisites) from which they are derived. A  
 98044 description file (makefile) contains a description of the relationships between files, and the  
 98045 commands that need to be executed to update the targets to reflect changes in their  
 98046 prerequisites. Each specification, or rule, shall consist of a target, optional prerequisites, and  
 98047 optional commands to be executed when a prerequisite is newer than the target. There are two  
 98048 types of rule:

- 98049 1. *Inference rules*, which have one target name with at least one <period> ('.') and no  
 98050 <slash> ('/')
- 98051 2. *Target rules*, which can have more than one target name

98052 In addition, *make* shall have a collection of built-in macros and inference rules that infer  
 98053 prerequisite relationships to simplify maintenance of programs.

98054 To receive exactly the behavior described in this section, the user shall ensure that a portable  
 98055 makefile shall:

- 98056 • Include the special target **.POSIX**
- 98057 • Omit any special target reserved for implementations (a leading period followed by  
 98058 uppercase letters) that has not been specified by this section

98059 The behavior of *make* is unspecified if either or both of these conditions are not met.

98060 **OPTIONS**

98061 The *make* utility shall conform to XBD [Section 12.2](#) (on page 216), except for Guideline 9.

98062 The following options shall be supported:

- |       |                    |                                                                                                                                                                                                                                                                                                                                                                                            |
|-------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 98063 | <b>-e</b>          | Cause environment variables, including those with null values, to override macro assignments within makefiles.                                                                                                                                                                                                                                                                             |
| 98064 |                    |                                                                                                                                                                                                                                                                                                                                                                                            |
| 98065 | <b>-f makefile</b> | Specify a different makefile. The argument <i>makefile</i> is a pathname of a description file, which is also referred to as the <i>makefile</i> . A pathname of '-' shall denote the standard input. There can be multiple instances of this option, and they shall be processed in the order specified. The effect of specifying the same option-argument more than once is unspecified. |
| 98066 |                    |                                                                                                                                                                                                                                                                                                                                                                                            |
| 98067 |                    |                                                                                                                                                                                                                                                                                                                                                                                            |
| 98068 |                    |                                                                                                                                                                                                                                                                                                                                                                                            |
| 98069 |                    |                                                                                                                                                                                                                                                                                                                                                                                            |
| 98070 | <b>-i</b>          | Ignore error codes returned by invoked commands. This mode is the same as if the special target <b>.IGNORE</b> were specified without prerequisites.                                                                                                                                                                                                                                       |
| 98071 |                    |                                                                                                                                                                                                                                                                                                                                                                                            |
| 98072 | <b>-k</b>          | Continue to update other targets that do not depend on the current target if a non-ignored error occurs while executing the commands to bring a target up-to-date.                                                                                                                                                                                                                         |
| 98073 |                    |                                                                                                                                                                                                                                                                                                                                                                                            |
| 98074 | <b>-n</b>          | Write commands that would be executed on standard output, but do not execute them. However, lines with a <plus-sign> ('+') prefix shall be executed. In this mode, lines with an at-sign ('@') character prefix shall be written to standard                                                                                                                                               |
| 98075 |                    |                                                                                                                                                                                                                                                                                                                                                                                            |
| 98076 |                    |                                                                                                                                                                                                                                                                                                                                                                                            |

- 98077 output.
- 98078 **-p** Write to standard output the complete set of macro definitions and target  
98079 descriptions. The output format is unspecified.
- 98080 **-q** Return a zero exit value if the target file is up-to-date; otherwise, return an exit  
98081 value of 1. Targets shall not be updated if this option is specified. However, a  
98082 makefile command line (associated with the targets) with a <plus-sign> ('+')  
98083 prefix shall be executed.
- 98084 **-r** Clear the suffix list and do not use the built-in rules.
- 98085 **-S** Terminate *make* if an error occurs while executing the commands to bring a target  
98086 up-to-date. This shall be the default and the opposite of **-k**.
- 98087 **-s** Do not write makefile command lines or touch messages (see **-t**) to standard  
98088 output before executing. This mode shall be the same as if the special target  
98089 **.SILENT** were specified without prerequisites.
- 98090 **-t** Update the modification time of each target as though a *touch target* had been  
98091 executed. Targets that have prerequisites but no commands (see [Target Rules](#), on  
98092 page 2963), or that are already up-to-date, shall not be touched in this manner.  
98093 Write messages to standard output for each target file indicating the name of the  
98094 file and that it was touched. Normally, the *makefile* command lines associated with  
98095 each target are not executed. However, a command line with a <plus-sign> ('+')  
98096 prefix shall be executed.

98097 Any options specified in the *MAKEFLAGS* environment variable shall be evaluated before any  
98098 options specified on the *make* utility command line. If the **-k** and **-S** options are both specified  
98099 on the *make* utility command line or by the *MAKEFLAGS* environment variable, the last option  
98100 specified shall take precedence. If the **-f** or **-p** options appear in the *MAKEFLAGS* environment  
98101 variable, the result is undefined.

## 98102 OPERANDS

98103 The following operands shall be supported:

98104 *target\_name* Target names, as defined in the EXTENDED DESCRIPTION section. If no target is  
98105 specified, while *make* is processing the makefiles, the first target that *make*  
98106 encounters that is not a special target or an inference rule shall be used.

98107 *macro=value* Macro definitions, as defined in [Macros](#) (on page 2965).

98108 If the *target\_name* and *macro=value* operands are intermixed on the *make* utility command line,  
98109 the results are unspecified.

## 98110 STDIN

98111 The standard input shall be used only if the *makefile* option-argument is '-'. See the INPUT  
98112 FILES section.

## 98113 INPUT FILES

98114 The input file, otherwise known as the makefile, is a text file containing rules, macro definitions, |  
98115 include lines, and comments. See the EXTENDED DESCRIPTION section.

## 98116 ENVIRONMENT VARIABLES

98117 The following environment variables shall affect the execution of *make*:

98118 *LANG* Provide a default value for the internationalization variables that are unset or null.  
98119 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
98120 variables used to determine the values of locale categories.)

|-------|-----|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 98121 |     | <b>LC_ALL</b>              | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 98122 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 98123 |     | <b>LC_CTYPE</b>            | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 98124 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 98125 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 98126 |     | <b>LC_MESSAGES</b>         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 98127 |     |                            | Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 98128 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 98129 |     | <b>MAKEFLAGS</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 98130 |     |                            | This variable shall be interpreted as a character string representing a series of option characters to be used as the default options. The implementation shall accept both of the following formats (but need not accept them when intermixed):                                                                                                                                                                                                                                                                                                                                                                   |
| 98131 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 98132 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 98133 |     |                            | • The characters are option letters without the leading <hyphen> characters or <blank> separation used on a <i>make</i> utility command line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 98134 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 98135 |     |                            | • The characters are formatted in a manner similar to a portion of the <i>make</i> utility command line: options are preceded by <hyphen-minus> characters and <blank>-separated as described in XBD <a href="#">Section 12.2</a> (on page 216). The <i>macro=value</i> macro definition operands can also be included. The difference between the contents of <b>MAKEFLAGS</b> and the <i>make</i> utility command line is that the contents of the variable shall not be subjected to the word expansions (see <a href="#">Section 2.6</a> , on page 2343) associated with parsing the command line values.      |

| 98145 |     |                            | Provide a directory to be used to search for SCCS files not found in the current directory. In all of the following cases, the search for SCCS files is made in the directory <b>SCCS</b> in the identified directory. If the value of <b>PROJECTDIR</b> begins with a <slash>, it shall be considered an absolute pathname; otherwise, the value of <b>PROJECTDIR</b> is treated as a user name and that user's initial working directory shall be examined for a subdirectory <b>src</b> or <b>source</b> . If such a directory is found, it shall be used. Otherwise, the value is used as a relative pathname. |

| 98166 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**STDOUT**

The *make* utility shall write all commands to be executed to standard output unless the `-s` option was specified, the command is prefixed with an at-sign, or the special target **.SILENT** has either the current target as a prerequisite or has no prerequisites. If *make* is invoked without any work needing to be done, it shall write a message to standard output indicating that no action was taken. If the `-t` option is present and a file is touched, *make* shall write to standard output a message of unspecified format indicating that the file was touched, including the filename of the file.

**STDERR**

The standard error shall be used only for diagnostic messages.

**OUTPUT FILES**

Files can be created when the `-t` option is present. Additional files can also be created by the utilities invoked by *make*.

**EXTENDED DESCRIPTION**

The *make* utility attempts to perform the actions required to ensure that the specified targets are up-to-date. A target shall be considered up-to-date if it exists and is newer than all of its dependencies, or if it has already been made up-to-date by the current invocation of *make* (regardless of the target's existence or age). A target may also be considered up-to-date if it exists, is the same age as one or more of its prerequisites, and is newer than the remaining prerequisites (if any). The *make* utility shall treat all prerequisites as targets themselves and recursively ensure that they are up-to-date, processing them in the order in which they appear in the rule. The *make* utility shall use the modification times of files to determine whether the corresponding targets are out-of-date.

To ensure that a target is up-to-date, *make* shall ensure that all of the prerequisites of a target are up-to-date, then check to see if the target itself is up-to-date. If the target is not up-to-date, the target shall be made up-to-date by executing the rule's commands (if any). If the target does not exist after the target has been successfully made up-to-date, the target shall be treated as being newer than any target for which it is a prerequisite.

If a target exists and there is neither a target rule nor an inference rule for the target, the target shall be considered up-to-date. It shall be an error if *make* attempts to ensure that a target is up-to-date but the target does not exist and there is neither a target rule nor an inference rule for the target.

**Makefile Syntax**

A makefile can contain rules, macro definitions (see [Macros](#), on page 2965), include lines, and comments. There are two kinds of rules: *inference rules* and *target rules*. The *make* utility shall contain a set of built-in inference rules. If the `-r` option is present, the built-in rules shall not be used and the suffix list shall be cleared. Additional rules of both types can be specified in a makefile. If a rule is defined more than once, the value of the rule shall be that of the last one specified. Macros can also be defined more than once, and the value of the macro is specified in [Macros](#) (on page 2965). There are three kinds of comments: blank lines, empty lines, and a `<number-sign> (' #')` and all following characters up to the first unescaped `<newline>` character. Blank lines, empty lines, and lines with `<number-sign> (' #')` as the first character on the line are also known as comment lines.

By default, the following files shall be tried in sequence: **./makefile** and **./Makefile**. If neither **./makefile** or **./Makefile** are found, other implementation-defined files may also be tried. On XSI-conformant systems, the additional files **./s.makefile**, **SCCS/s.makefile**, **./s.Makefile**, and **SCCS/s.Makefile** shall also be tried.

The `-f` option shall direct *make* to ignore any of these default files and use the specified argument as a makefile instead. If the `'-'` argument is specified, standard input shall be used.

The term *makefile* is used to refer to any rules provided by the user, whether in `./makefile` or its variants, or specified by the `-f` option.

The rules in makefiles shall consist of the following types of lines: target rules, including special targets (see [Target Rules](#), on page 2963), inference rules (see [Inference Rules](#), on page 2966), macro definitions (see [Macros](#), on page 2965), and comments.

Target and Inference Rules may contain *command lines*. Command lines can have a prefix that shall be removed before execution (see [Makefile Execution](#), on page 2963).

When an escaped `<newline>` (one preceded by a `<backslash>`) is found anywhere in the makefile except in a command line, an include line, or a line immediately preceding an include line, it shall be replaced, along with any leading white space on the following line, with a single `<space>`. When an escaped `<newline>` is found in a command line in a makefile, the command line shall contain the `<backslash>`, the `<newline>`, and the next line, except that the first character of the next line shall not be included if it is a `<tab>`. When an escaped `<newline>` is found in an include line or in a line immediately preceding an include line, the behavior is unspecified.

### Include Lines

If the word **include** appears at the beginning of a line and is followed by one or more `<blank>` characters, the string formed by the remainder of the line shall be processed as follows to produce a pathname:

- The trailing `<newline>`, any `<blank>` characters immediately preceding a comment, and any comment shall be discarded. If the resulting string contains any double-quote characters (`' ' ' '`) the behavior is unspecified.
- The resulting string shall be processed for macro expansion (see [Macros](#) (on page 2965)).
- Any `<blank>` characters that appear after the first non-`<blank>` shall be used as separators to divide the macro-expanded string into fields. It is unspecified whether any other white-space characters are also used as separators. It is unspecified whether pathname expansion (see [Section 2.13](#), on page 2372) is also performed.
- If the processing of separators and optional pathname expansion results in either zero or two or more non-empty fields, the behavior is unspecified. If it results in one non-empty field, that field is taken as the pathname.

If the pathname does not begin with a `' / '` it shall be treated as relative to the current working directory of the process, not relative to the directory containing the makefile. If the file does not exist in this location, it is unspecified whether additional directories are searched.

The contents of the file specified by the pathname shall be read and processed as if they appeared in the makefile in place of the include line. If the file ends with an escaped `<newline>` the behavior is unspecified.

The file may itself contain further include lines. Implementations shall support nesting of include files up to a depth of at least 16.

## Makefile Execution

Makefile command lines shall be processed one at a time.

Makefile command lines can have one or more of the following prefixes: a <hyphen-minus> ('-'), an at-sign ('@'), or a <plus-sign> ('+'). These shall modify the way in which *make* processes the command.

- If the command prefix contains a <hyphen-minus>, or the `-i` option is present, or the special target **.IGNORE** has either the current target as a prerequisite or has no prerequisites, any error found while executing the command shall be ignored.
- @ If the command prefix contains an at-sign and the *make* utility command line `-n` option is not specified, or the `-s` option is present, or the special target **.SILENT** has either the current target as a prerequisite or has no prerequisites, the command shall not be written to standard output before it is executed.
- + If the command prefix contains a <plus-sign>, this indicates a makefile command line that shall be executed even if `-n`, `-q`, or `-t` is specified.

An *execution line* is built from the command line by removing any prefix characters. Except as described under the at-sign prefix, the execution line shall be written to the standard output, optionally preceded by a <tab>. The execution line shall then be executed by a shell as if it were passed as the argument to the *system()* interface, except that if errors are not being ignored then the shell `-e` option shall also be in effect. If errors are being ignored for the command (as a result of the `-i` option, a '-' command prefix, or a **.IGNORE** special target), the shell `-e` option shall not be in effect. The environment for the command being executed shall contain all of the variables in the environment of *make*.

By default, when *make* receives a non-zero status from the execution of a command, it shall terminate with an error message to standard error.

## Target Rules

Target rules are formatted as follows:

```
target [target...]: [prerequisite...][;command]
[<tab>command
<tab>command
...]
```

*line that does not begin with <tab>*

Target entries are specified by a <blank>-separated, non-null list of targets, then a <colon>, then a <blank>-separated, possibly empty list of prerequisites. Text following a <semicolon>, if any, and all following lines that begin with a <tab>, are makefile command lines to be executed to update the target. The first non-empty line that does not begin with a <tab> or '#' shall begin a new entry. Any comment line may begin a new entry.

Applications shall select target names from the set of characters consisting solely of periods, underscores, digits, and alphabets from the portable character set (see XBD Section 6.1, on page 125). Implementations may allow other characters in target names as extensions. The interpretation of targets containing the characters '%' and '"' is implementation-defined.

A target that has prerequisites, but does not have any commands, can be used to add to the prerequisite list for that target. Only one target rule for any given target can contain commands.

Lines that begin with one of the following are called *special targets* and control the operation of *make*:

- 98298 **.DEFAULT** If the makefile uses this special target, the application shall ensure that it is  
 98299 specified with commands, but without prerequisites. The commands shall be used  
 98300 by *make* if there are no other rules available to build a target.
- 98301 **.IGNORE** Prerequisites of this special target are targets themselves; this shall cause errors  
 98302 from commands associated with them to be ignored in the same manner as  
 98303 specified by the `-i` option. Subsequent occurrences of **.IGNORE** shall add to the  
 98304 list of targets ignoring command errors. If no prerequisites are specified, *make* shall  
 98305 behave as if the `-i` option had been specified and errors from all commands  
 98306 associated with all targets shall be ignored.
- 98307 **.POSIX** The application shall ensure that this special target is specified without  
 98308 prerequisites or commands. If it appears as the first non-comment line in the  
 98309 makefile, *make* shall process the makefile as specified by this section; otherwise, the  
 98310 behavior of *make* is unspecified.
- 98311 **.PRECIOUS** Prerequisites of this special target shall not be removed if *make* receives one of the  
 98312 asynchronous events explicitly described in the ASYNCHRONOUS EVENTS  
 98313 section. Subsequent occurrences of **.PRECIOUS** shall add to the list of precious  
 98314 files. If no prerequisites are specified, all targets in the makefile shall be treated as  
 98315 if specified with **.PRECIOUS**.
- 98316 XSI **.SCCS\_GET** The application shall ensure that this special target is specified without  
 98317 prerequisites. If this special target is included in a makefile, the commands  
 98318 specified with this target shall replace the default commands associated with this  
 98319 special target (see [Default Rules](#), on page 2969). The commands specified with this  
 98320 target are used to get all SCCS files that are not found in the current directory.
- 98321 When source files are named in a dependency list, *make* shall treat them just like  
 98322 any other target. Because the source file is presumed to be present in the directory,  
 98323 there is no need to add an entry for it to the makefile. When a target has no  
 98324 dependencies, but is present in the directory, *make* shall assume that that file is up-  
 98325 to-date. If, however, an SCCS file named **SCCS/s.source\_file** is found for a target  
 98326 *source\_file*, *make* compares the timestamp of the target file with that of the  
 98327 **SCCS/s.source\_file** to ensure the target is up-to-date. If the target is missing, or if  
 98328 the SCCS file is newer, *make* shall automatically issue the commands specified for  
 98329 the **.SCCS\_GET** special target to retrieve the most recent version. However, if the  
 98330 target is writable by anyone, *make* shall not retrieve a new version.
- 98331 **.SILENT** Prerequisites of this special target are targets themselves; this shall cause  
 98332 commands associated with them not to be written to the standard output before  
 98333 they are executed. Subsequent occurrences of **.SILENT** shall add to the list of  
 98334 targets with silent commands. If no prerequisites are specified, *make* shall behave  
 98335 as if the `-s` option had been specified and no commands or touch messages  
 98336 associated with any target shall be written to standard output.
- 98337 **.SUFFIXES** Prerequisites of **.SUFFIXES** shall be appended to the list of known suffixes and are  
 98338 used in conjunction with the inference rules (see [Inference Rules](#), on page 2966). If  
 98339 **.SUFFIXES** does not have any prerequisites, the list of known suffixes shall be  
 98340 cleared.
- 98341 The special targets **.IGNORE**, **.POSIX**, **.PRECIOUS**, **.SILENT**, and **.SUFFIXES** shall be specified  
 98342 without commands.
- 98343 Targets with names consisting of a leading <period> followed by the uppercase letters "POSIX"  
 98344 and then any other characters are reserved for future standardization. Targets with names

consisting of a leading <period> followed by one or more uppercase letters are reserved for implementation extensions.

## Macros

Macro definitions are in the form:

```
string1 = [string2]
```

The macro named *string1* is defined as having the value of *string2*, where *string2* is defined as all characters, if any, after the <equals-sign>, up to a comment character ('#') or an unescaped <newline>. Any <blank> characters immediately before or after the <equals-sign> shall be ignored.

Applications shall select macro names from the set of characters consisting solely of periods, underscores, digits, and alphabets from the portable character set (see XBD Section 6.1, on page 125). A macro name shall not contain an <equals-sign>. Implementations may allow other characters in macro names as extensions.

Macros can appear anywhere in the makefile. Macro expansions using the forms  $\$(string1)$  or  $\${string1}$  shall be replaced by *string2*, as follows:

- Macros in target lines shall be evaluated when the target line is read.
- Macros in makefile command lines shall be evaluated when the command is executed.
- Macros in the string before the <equals-sign> in a macro definition shall be evaluated when the macro assignment is made.
- Macros after the <equals-sign> in a macro definition shall not be evaluated until the defined macro is used in a rule or command, or before the <equals-sign> in a macro definition.

The parentheses or braces are optional if *string1* is a single character. The macro  $\$\$$  shall be replaced by the single character '\$'. If *string1* in a macro expansion contains a macro expansion, the results are unspecified.

Macro expansions using the forms  $\$(string1[:subst1=[subst2]])$  or  $\${string1[:subst1=[subst2]]}$  can be used to replace all occurrences of *subst1* with *subst2* when the macro substitution is performed. The *subst1* to be replaced shall be recognized when it is a suffix at the end of a word in *string1* (where a *word*, in this context, is defined to be a string delimited by the beginning of the line, a <blank>, or a <newline>). If *string1* in a macro expansion contains a macro expansion, the results are unspecified. If a <percent-sign> character appears as part of *subst1* or *subst2* after any macros have been recursively expanded, the results are unspecified. +

Macro expansions in *string1* of macro definition lines shall be evaluated when read. Macro expansions in *string2* of macro definition lines shall be performed when the macro identified by *string1* is expanded in a rule or command.

Macro definitions shall be taken from the following sources, in the following logical order, before the makefile(s) are read.

1. Macros specified on the *make* utility command line, in the order specified on the command line. It is unspecified whether the internal macros defined in **Internal Macros** (on page 2968) are accepted from this source.
2. Macros defined by the *MAKEFLAGS* environment variable, in the order specified in the environment variable. It is unspecified whether the internal macros defined in **Internal Macros** (on page 2968) are accepted from this source.

3. The contents of the environment, excluding the *MAKEFLAGS* and *SHELL* variables and including the variables with null values.

4. Macros defined in the inference rules built into *make*.

Macro definitions from these sources shall not override macro definitions from a lower-numbered source. Macro definitions from a single source (for example, the *make* utility command line, the *MAKEFLAGS* environment variable, or the other environment variables) shall override previous macro definitions from the same source.

Macros defined in the makefile(s) shall override macro definitions that occur before them in the makefile(s) and macro definitions from source 4. If the *-e* option is not specified, macros defined in the makefile(s) shall override macro definitions from source 3. Macros defined in the makefile(s) shall not override macro definitions from source 1 or source 2.

Before the makefile(s) are read, all of the *make* utility command line options (except *-f* and *-p*) and *make* utility command line macro definitions (except any for the *MAKEFLAGS* macro), not already included in the *MAKEFLAGS* macro, shall be added to the *MAKEFLAGS* macro, quoted in an implementation-defined manner such that when *MAKEFLAGS* is read by another instance of the *make* command, the original macro's value is recovered. Other implementation-defined options and macros may also be added to the *MAKEFLAGS* macro. If this modifies the value of the *MAKEFLAGS* macro, or, if the *MAKEFLAGS* macro is modified at any subsequent time, the *MAKEFLAGS* environment variable shall be modified to match the new value of the *MAKEFLAGS* macro. The result of setting *MAKEFLAGS* in the Makefile is unspecified.

Before the makefile(s) are read, all of the *make* utility command line macro definitions (except the *MAKEFLAGS* macro or the *SHELL* macro) shall be added to the environment of *make*. Other implementation-defined variables may also be added to the environment of *make*. Macros defined by the *MAKEFLAGS* environment variable and macros defined in the makefile(s) shall not be added to the environment of *make* if they are not already in its environment. With the exception of *SHELL* (see below), it is unspecified whether macros defined in these ways update the value of an environment variable that already exists in the environment of *make*.

The **SHELL** macro shall be treated specially. It shall be provided by *make* and set to the pathname of the shell command language interpreter (see *sh*). The *SHELL* environment variable shall not affect the value of the **SHELL** macro. If **SHELL** is defined in the makefile or is specified on the command line, it shall replace the original value of the **SHELL** macro, but shall not affect the *SHELL* environment variable. Other effects of defining **SHELL** in the makefile or on the command line are implementation-defined.

## Inference Rules

Inference rules are formatted as follows:

```
target:
<tab>command
[<tab>command]
...

line that does not begin with <tab> or #
```

The application shall ensure that the *target* portion is a valid target name (see [Target Rules](#), on page 2963) of the form *.s2* or *.s1.s2* (where *.s1* and *.s2* are suffixes that have been given as prerequisites of the **SUFFIXES** special target and *s1* and *s2* do not contain any *<slash>* or *<period>* characters.) If there is only one *<period>* in the target, it is a single-suffix inference rule. Targets with two periods are double-suffix inference rules. Inference rules can have only one target before the *<colon>*.

The application shall ensure that the makefile does not specify prerequisites for inference rules; no characters other than white space shall follow the <colon> in the first line, except when creating the *empty rule*, described below. Prerequisites are inferred, as described below.

Inference rules can be redefined. A target that matches an existing inference rule shall overwrite the old inference rule. An empty rule can be created with a command consisting of simply a <semicolon> (that is, the rule still exists and is found during inference rule search, but since it is empty, execution has no effect). The empty rule can also be formatted as follows:

```
rule: ;
```

where zero or more <blank> characters separate the <colon> and <semicolon>.

The *make* utility uses the suffixes of targets and their prerequisites to infer how a target can be made up-to-date. A list of inference rules defines the commands to be executed. By default, *make* contains a built-in set of inference rules. Additional rules can be specified in the makefile.

The special target **.SUFFIXES** contains as its prerequisites a list of suffixes that shall be used by the inference rules. The order in which the suffixes are specified defines the order in which the inference rules for the suffixes are used. New suffixes shall be appended to the current list by specifying a **.SUFFIXES** special target in the makefile. A **.SUFFIXES** target with no prerequisites shall clear the list of suffixes. An empty **.SUFFIXES** target followed by a new **.SUFFIXES** list is required to change the order of the suffixes.

Normally, the user would provide an inference rule for each suffix. The inference rule to update a target with a suffix **.s1** from a prerequisite with a suffix **.s2** is specified as a target **.s2.s1**. The internal macros provide the means to specify general inference rules (see [Internal Macros](#), on page 2968).

When no target rule is found to update a target, the inference rules shall be checked. The suffix of the target (**.s1**) to be built is compared to the list of suffixes specified by the **.SUFFIXES** special targets. If the **.s1** suffix is found in **.SUFFIXES**, the inference rules shall be searched in the order defined for the first **.s2.s1** rule whose prerequisite file (**\$.s2**) exists. If the target is out-of-date with respect to this prerequisite, the commands for that inference rule shall be executed.

If the target to be built does not contain a suffix and there is no rule for the target, the single suffix inference rules shall be checked. The single-suffix inference rules define how to build a target if a file is found with a name that matches the target name with one of the single suffixes appended. A rule with one suffix **.s2** is the definition of how to build *target* from **target.s2**. The other suffix (**.s1**) is treated as null.

A <tilde> ('~') in the above rules refers to an SCCS file in the current directory. Thus, the rule **.c~.o** would transform an SCCS C-language source file into an object file (**.o**). Because the **s.** of the SCCS files is a prefix, it is incompatible with *make's* suffix point of view. Hence, the '~' is a way of changing any file reference into an SCCS file reference.

## Libraries

If a target or prerequisite contains parentheses, it shall be treated as a member of an archive library. For the *lib(member.o)* expression *lib* refers to the name of the archive library and *member.o* to the member name. The application shall ensure that the member is an object file with the **.o** suffix. The modification time of the expression is the modification time for the member as kept in the archive library; see [ar](#). The **.a** suffix shall refer to an archive library. The **.s2.a** rule shall be used to update a member in the library from a file with a suffix **.s2**.

## Internal Macros

The *make* utility shall maintain five internal macros that can be used in target and inference rules. In order to clearly define the meaning of these macros, some clarification of the terms *target rule*, *inference rule*, *target*, and *prerequisite* is necessary.

Target rules are specified by the user in a makefile for a particular target. Inference rules are user-specified or *make*-specified rules for a particular class of target name. Explicit prerequisites are those prerequisites specified in a makefile on target lines. Implicit prerequisites are those prerequisites that are generated when inference rules are used. Inference rules are applied to implicit prerequisites or to explicit prerequisites that do not have target rules defined for them in the makefile. Target rules are applied to targets specified in the makefile.

Before any target in the makefile is updated, each of its prerequisites (both explicit and implicit) shall be updated. This shall be accomplished by recursively processing each prerequisite. Upon recursion, each prerequisite shall become a target itself. Its prerequisites in turn shall be processed recursively until a target is found that has no prerequisites, or further recursion would require applying two inference rules one immediately after the other, at which point the recursion shall stop. As an extension, implementations may continue recursion when two or more successive inference rules need to be applied; however, if there are multiple different chains of such rules that could be used to create the target, it is unspecified which chain is used. The recursion shall then back up, updating each target as it goes.

In the definitions that follow, the word *target* refers to one of:

- A target specified in the makefile
- An explicit prerequisite specified in the makefile that becomes the target when *make* processes it during recursion
- An implicit prerequisite that becomes a target when *make* processes it during recursion

In the definitions that follow, the word *prerequisite* refers to one of the following:

- An explicit prerequisite specified in the makefile for a particular target
- An implicit prerequisite generated as a result of locating an appropriate inference rule and corresponding file that matches the suffix of the target

The five internal macros are:

**\$@** The **\$@** shall evaluate to the full target name of the current target, or the archive filename part of a library archive target. It shall be evaluated for both target and inference rules.

For example, in the **.c.a** inference rule, **\$@** represents the out-of-date **.a** file to be built. Similarly, in a makefile target rule to build **lib.a** from **file.c**, **\$@** represents the out-of-date **lib.a**.

**\$\$** The **\$\$** macro shall be evaluated only when the current target is an archive library member of the form *libname(member.o)*. In these cases, **\$@** shall evaluate to *libname* and **\$\$** shall evaluate to *member.o*. The **\$\$** macro shall be evaluated for both target and inference rules.

For example, in a makefile target rule to build **lib.a(file.o)**, **\$\$** represents **file.o**, as opposed to **\$@**, which represents **lib.a**.

**\$?** The **\$?** macro shall evaluate to the list of prerequisites that are newer than the current target. It shall be evaluated for both target and inference rules.

98520 For example, in a makefile target rule to build *prog* from **file1.o**, **file2.o**, and **file3.o**, and  
 98521 where *prog* is not out-of-date with respect to **file1.o**, but is out-of-date with respect to  
 98522 **file2.o** and **file3.o**, **\$?** represents **file2.o** and **file3.o**.

98523 **\$<** In an inference rule, the **\$<** macro shall evaluate to the filename whose existence  
 98524 allowed the inference rule to be chosen for the target. In the **.DEFAULT** rule, the **\$<**  
 98525 macro shall evaluate to the current target name. The meaning of the **\$<** macro shall be  
 98526 otherwise unspecified.

98527 For example, in the **.c.a** inference rule, **\$<** represents the prerequisite **.c** file.

98528 **\$\*** The **\$\*** macro shall evaluate to the current target name with its suffix deleted. It shall be  
 98529 evaluated at least for inference rules.

98530 For example, in the **.c.a** inference rule, **\$\*.o** represents the out-of-date **.o** file that  
 98531 corresponds to the prerequisite **.c** file.

98532 Each of the internal macros has an alternative form. When an uppercase '**D**' or '**F**' is appended  
 98533 to any of the macros, the meaning shall be changed to the *directory part* for '**D**' and *filename part*  
 98534 for '**F**'. The directory part is the path prefix of the file without a trailing **<slash>**; for the current  
 98535 directory, the directory part is '**. .**'. When the **\$?** macro contains more than one prerequisite  
 98536 filename, the **\$(?D)** and **\$(?F)** (or **\${?D}** and **\${?F}**) macros expand to a list of directory name parts  
 98537 and filename parts respectively.

98538 For the target *lib(member.o)* and the **s2.a** rule, the internal macros shall be defined as:

98539 **\$<** *member.s2*

98540 **\$\*** *member*

98541 **\$@** *lib*

98542 **\$?** *member.s2*

98543 **\$%** *member.o*

## 98544 Default Rules

98545 The default rules for *make* shall achieve results that are the same as if the following were used.  
 98546 Implementations that do not support the C-Language Development Utilities option may omit  
 98547 **CC**, **CFLAGS**, **YACC**, **YFLAGS**, **LEX**, **LFLAGS**, **LDFLAGS**, and the **.c**, **.y**, and **.l** inference rules.  
 98548 Implementations that do not support FORTRAN may omit **FC**, **FFLAGS**, and the **.f** inference  
 98549 rules. Implementations may provide additional macros and rules.

## 98550 SPECIAL TARGETS

98551 XSI **.SCCS\_GET:** *sccs \$(SCCSFLAGS) get \$(SCCSGETFLAGS) \$@*

98552 XSI **.SUFFIXES:** *.o .c .y .l .a .sh .f .c~ .y~ .l~ .sh~ .f~*

## 98553 MACROS

98554 **MAKE=***make*

98555 **AR=***ar*

98556 **ARFLAGS=***--rv*

98557 **YACC=***yacc*

98558 **YFLAGS=**

98559 **LEX=***lex*

98560 **LFLAGS=**

```

98561      LDFLAGS=
98562      CC=c99
98563      CFLAGS=-O 1
98564      FC=fort77
98565      FFLAGS=-O 1
98566 XSI    GET=get
98567      GFLAGS=
98568      SCCSFLAGS=
98569      SCCSGETFLAGS=-s

```

#### 98570 SINGLE SUFFIX RULES

```

98571      .c:
98572          $(CC) $(CFLAGS) $(LDFLAGS) -o $@ $<
98573      .f:
98574          $(FC) $(FFLAGS) $(LDFLAGS) -o $@ $<
98575      .sh:
98576          cp $< $@
98577          chmod a+x $@
98578 XSI    .c~:
98579          $(GET) $(GFLAGS) -p $< > $*.c
98580          $(CC) $(CFLAGS) $(LDFLAGS) -o $@ $*.c
98581      .f~:
98582          $(GET) $(GFLAGS) -p $< > $*.f
98583          $(FC) $(FFLAGS) $(LDFLAGS) -o $@ $*.f
98584      .sh~:
98585          $(GET) $(GFLAGS) -p $< > $*.sh
98586          cp $*.sh $@
98587          chmod a+x $@

```

#### 98588 DOUBLE SUFFIX RULES

```

98589      .c.o:
98590          $(CC) $(CFLAGS) -c $<
98591      .f.o:
98592          $(FC) $(FFLAGS) -c $<
98593      .y.o:
98594          $(YACC) $(YFLAGS) $<
98595          $(CC) $(CFLAGS) -c y.tab.c
98596          rm -f y.tab.c
98597          mv y.tab.o $@
98598      .l.o:
98599          $(LEX) $(LFLAGS) $<
98600          $(CC) $(CFLAGS) -c lex.yy.c
98601          rm -f lex.yy.c
98602          mv lex.yy.o $@
98603      .y.c:

```

```

98604         $(YACC) $(YFLAGS) $<
98605         mv y.tab.c $@

98606     .l.c:
98607         $(LEX) $(LFLAGS) $<
98608         mv lex.yy.c $@

98609 XSI     .c~.o:
98610         $(GET) $(GFLAGS) -p $< > $*.c
98611         $(CC) $(CFLAGS) -c $*.c

98612     .f~.o:
98613         $(GET) $(GFLAGS) -p $< > $*.f
98614         $(FC) $(FFLAGS) -c $*.f

98615     .y~.o:
98616         $(GET) $(GFLAGS) -p $< > $*.y
98617         $(YACC) $(YFLAGS) $*.y
98618         $(CC) $(CFLAGS) -c y.tab.c
98619         rm -f y.tab.c
98620         mv y.tab.o $@

98621     .l~.o:
98622         $(GET) $(GFLAGS) -p $< > $*.l
98623         $(LEX) $(LFLAGS) $*.l
98624         $(CC) $(CFLAGS) -c lex.yy.c
98625         rm -f lex.yy.c
98626         mv lex.yy.o $@

98627     .y~.c:
98628         $(GET) $(GFLAGS) -p $< > $*.y
98629         $(YACC) $(YFLAGS) $*.y
98630         mv y.tab.c $@

98631     .l~.c:
98632         $(GET) $(GFLAGS) -p $< > $*.l
98633         $(LEX) $(LFLAGS) $*.l
98634         mv lex.yy.c $@

98635     .c.a:
98636         $(CC) -c $(CFLAGS) $<
98637         $(AR) $(ARFLAGS) $@ $*.o
98638         rm -f $*.o

98639     .f.a:
98640         $(FC) -c $(FFLAGS) $<
98641         $(AR) $(ARFLAGS) $@ $*.o
98642         rm -f $*.o

```

## EXIT STATUS

When the **-q** option is specified, the *make* utility shall exit with one of the following values:

- 0 Successful completion.
- 1 The target was not up-to-date.

98647 >1 An error occurred.

98648 When the **-q** option is not specified, the *make* utility shall exit with one of the following values:

98649 0 Successful completion.

98650 >0 An error occurred.

## 98651 CONSEQUENCES OF ERRORS

98652 Default.

## 98653 APPLICATION USAGE

98654 If there is a source file (such as *./source.c*) and there are two SCCS files corresponding to it  
 98655 (*./s.source.c* and *./SCCS/s.source.c*), on XSI-conformant systems *make* uses the SCCS file in the  
 98656 current directory. However, users are advised to use the underlying SCCS utilities (*admin*, *delta*,  
 98657 *get*, and so on) or the *scs* utility for all source files in a given directory. If both forms are used for  
 98658 a given source file, future developers are very likely to be confused.

98659 It is incumbent upon portable makefiles to specify the **.POSIX** special target in order to  
 98660 guarantee that they are not affected by local extensions.

98661 The **-k** and **-S** options are both present so that the relationship between the command line, the  
 98662 *MAKEFLAGS* variable, and the makefile can be controlled precisely. If the **k** flag is passed in  
 98663 *MAKEFLAGS* and a command is of the form:

98664 `$(MAKE) -S foo`

98665 then the default behavior is restored for the child *make*.

98666 When the **-n** option is specified, it is always added to *MAKEFLAGS*. This allows a recursive  
 98667 *make -n target* to be used to see all of the action that would be taken to update *target*.

98668 Because of widespread historical practice, interpreting a <number-sign> ('#') inside a variable  
 98669 as the start of a comment has the unfortunate side-effect of making it impossible to place a  
 98670 <number-sign> in a variable, thus forbidding something like:

98671 `CFLAGS = "-D COMMENT_CHAR='#'"`

98672 Many historical *make* utilities stop chaining together inference rules when an intermediate target  
 98673 is nonexistent. For example, it might be possible for a *make* to determine that both *.y.c* and *.c.o*  
 98674 could be used to convert a *.y* to a *.o*. Instead, in this case, *make* requires the use of a *.y.o* rule.

98675 The best way to provide portable makefiles is to include all of the rules needed in the makefile  
 98676 itself. The rules provided use only features provided by other parts of this volume of  
 98677 POSIX.1-2008. The default rules include rules for optional commands in this volume of  
 98678 POSIX.1-2008. Only rules pertaining to commands that are provided are needed in an  
 98679 implementation's default set.

98680 Macros used within other macros are evaluated when the new macro is used rather than when  
 98681 the new macro is defined. Therefore:

98682 `MACRO = value1`  
 98683 `NEW = $(MACRO)`  
 98684 `MACRO = value2`

98685 `target:`  
 98686 `echo $(NEW)`

98687 would produce *value2* and not *value1* since **NEW** was not expanded until it was needed in the  
 98688 *echo* command line.

Some historical applications have been known to intermix *target\_name* and *macro=name* operands on the command line, expecting that all of the macros are processed before any of the targets are dealt with. Conforming applications do not do this, although some backwards-compatibility support may be included in some implementations.

The following characters in filenames may give trouble: `'=`, `':`, `'\``, single-quote, and `'@`. In include filenames, pattern matching characters and `'"` should also be avoided, as they may be treated as special by some implementations.

For inference rules, the description of `$<` and `$?` seem similar. However, an example shows the minor difference. In a makefile containing:

```
foo.o: foo.h
```

if **foo.h** is newer than **foo.o**, yet **foo.c** is older than **foo.o**, the built-in rule to make **foo.o** from **foo.c** is used, with `$<` equal to **foo.c** and `$?` equal to **foo.h**. If **foo.c** is also newer than **foo.o**, `$<` is equal to **foo.c** and `$?` is equal to **foo.h foo.c**.

As a consequence of the general rules for target updating, a useful special case is that if a target has no prerequisites and no commands, and the target of the rule is a nonexistent file, then *make* acts as if this target has been updated whenever its rule is run.

**Note:** This implies that all targets depending on this one will always have their commands run.

Shell command sequences like `make; cp original copy; make` may have problems on filesystems where the timestamp resolution is the minimum (1 second) required by the standard and where *make* considers identical timestamps to be up-to-date. Conversely, rules like `copy: original; cp -p original copy` will result in redundant work on *make* implementations that consider identical timestamps to be out-of-date.

This standard does not specify precedence between macro definition and include directives. Thus, the behavior of:

```
include =foo.mk
```

is unspecified. To define a variable named `include`, either the white space before the `<equal-sign>` should be removed, or another macro should be used, as in:

```
INCLUDE_NAME = include
$(INCLUDE_NAME) =foo.mk
```

On the other hand, if the intent is to include a file which starts with an `<equal-sign>`, either the filename should be changed to `./=foo.mk`, or the makefile should be written as:

```
INCLUDE_FILE = =foo.mk
include $(INCLUDE_FILE)
```

## EXAMPLES

1. The following command:

```
make
```

makes the first target found in the makefile.

2. The following command:

```
make junk
```

makes the target **junk**.

3. The following makefile says that **pgm** depends on two files, **a.o** and **b.o**, and that they in turn depend on their corresponding source files (**a.c** and **b.c**), and a common file **incl.h**:

```
.POSIX:
pgm: a.o b.o
    c99 a.o b.o -o pgm
a.o: incl.h a.c
    c99 -c a.c
b.o: incl.h b.c
    c99 -c b.c
```

4. An example for making optimized **.o** files from **.c** files is:

```
.c.o:
    c99 -c -O 1 $*.c

or:

.c.o:
    c99 -c -O 1 $<
```

5. The most common use of the archive interface follows. Here, it is assumed that the source files are all C-language source:

```
lib: lib(file1.o) lib(file2.o) lib(file3.o)
    @echo lib is now up-to-date
```

The **.c.a** rule is used to make **file1.o**, **file2.o**, and **file3.o** and insert them into **lib**.

The treatment of escaped <newline> characters throughout the makefile is historical practice. For example, the inference rule:

```
.c.o\
:

works, and the macro:

f= bar baz\
    biz
a:
    echo ==$f==

echoes "==bar baz biz==".
```

If **\$\$?** were:

```
/usr/include/stdio.h /usr/include/unistd.h foo.h

then $(?D) would be:

/usr/include /usr/include .

and $(?F) would be:

stdio.h unistd.h foo.h
```

6. The contents of the built-in rules can be viewed by running:

```
make -p -f /dev/null 2>/dev/null
```

## RATIONALE

The *make* utility described in this volume of POSIX.1-2008 is intended to provide the means for changing portable source code into executables that can be run on an POSIX.1-2008-conforming system. It reflects the most common features present in System V and BSD *makes*.

Historically, the *make* utility has been an especially fertile ground for vendor and research organization-specific syntax modifications and extensions. Examples include:

- Syntax supporting parallel execution (such as from various multi-processor vendors, GNU, and others)
- Additional “operators” separating targets and their prerequisites (System V, BSD, and others)
- Specifying that command lines containing the strings “`${MAKE}`” and “`$(MAKE)`” are executed when the `-n` option is specified (GNU and System V)
- Modifications of the meaning of internal macros when referencing libraries (BSD and others)
- Using a single instance of the shell for all of the command lines of the target (BSD and others)
- Allowing <space> characters as well as <tab> characters to delimit command lines (BSD)
- Adding C preprocessor-style “include” and “ifdef” constructs (System V, GNU, BSD, and others)
- Remote execution of command lines (Sprite and others)
- Specifying additional special targets (BSD, System V, and most others)
- Specifying an alternate shell to use to process commands.

+

Additionally, many vendors and research organizations have rethought the basic concepts of *make*, creating vastly extended, as well as completely new, syntaxes. Each of these versions of *make* fulfills the needs of a different community of users; it is unreasonable for this volume of POSIX.1-2008 to require behavior that would be incompatible (and probably inferior) to historical practice for such a community.

In similar circumstances, when the industry has enough sufficiently incompatible formats as to make them irreconcilable, this volume of POSIX.1-2008 has followed one or both of two courses of action. Commands have been renamed (*cksum*, *echo*, and *pax*) and/or command line options have been provided to select the desired behavior (*grep*, *od*, and *pax*).

Because the syntax specified for the *make* utility is, by and large, a subset of the syntaxes accepted by almost all versions of *make*, it was decided that it would be counter-productive to change the name. And since the makefile itself is a basic unit of portability, it would not be completely effective to reserve a new option letter, such as *make -P*, to achieve the portable behavior. Therefore, the special target **.POSIX** was added to the makefile, allowing users to specify “standard” behavior. This special target does not preclude extensions in the *make* utility, nor does it preclude such extensions being used by the makefile specifying the target; it does, however, preclude any extensions from being applied that could alter the behavior of previously valid syntax; such extensions must be controlled via command line options or new special targets. It is incumbent upon portable makefiles to specify the **.POSIX** special target in order to guarantee that they are not affected by local extensions.

The portable version of *make* described in this reference page is not intended to be the state-of-the-art software generation tool and, as such, some newer and more leading-edge features have

not been included. An attempt has been made to describe the portable makefile in a manner that does not preclude such extensions as long as they do not disturb the portable behavior described here.

When the `-n` option is specified, it is always added to `MAKEFLAGS`. This allows a recursive `make -n target` to be used to see all of the action that would be taken to update `target`.

The definition of `MAKEFLAGS` allows both the System V letter string and the BSD command line formats. The two formats are sufficiently different to allow implementations to support both without ambiguity.

Early proposals stated that an “unquoted” `<number-sign>` was treated as the start of a comment. The `make` utility does not pay any attention to quotes. A `<number-sign>` starts a comment regardless of its surroundings.

The text about “other implementation-defined pathnames may also be tried” in addition to `./makefile` and `./Makefile` is to allow such extensions as `SCCS/s.Makefile` and other variations. It was made an implementation-defined requirement (as opposed to unspecified behavior) to highlight surprising implementations that might select something unexpected like `/etc/Makefile`. XSI-conformant systems also try `./s.makefile`, `SCCS/s.makefile`, `./s.Makefile`, and `SCCS/s.Makefile`.

Early proposals contained the macro `NPROC` as a means of specifying that `make` should use `n` processes to do the work required. While this feature is a valuable extension for many systems, it is not common usage and could require other non-trivial extensions to makefile syntax. This extension is not required by this volume of POSIX.1-2008, but could be provided as a compatible extension. The macro `PARALLEL` is used by some historical systems with essentially the same meaning (but without using a name that is a common system limit value). It is suggested that implementors recognize the existing use of `NPROC` and/or `PARALLEL` as extensions to `make`.

The default rules are based on System V. The default `CC=` value is `c99` instead of `cc` because this volume of POSIX.1-2008 does not standardize the utility named `cc`. Thus, every conforming application would be required to define `CC=c99` to expect to run. There is no advantage conferred by the hope that the makefile might hit the “preferred” compiler because this cannot be guaranteed to work. Also, since the portable makescript can only use the `c99` options, no advantage is conferred in terms of what the script can do. It is a quality-of-implementation issue as to whether `c99` is as valuable as `cc`.

The `-d` option to `make` is frequently used to produce debugging information, but is too implementation-defined to add to this volume of POSIX.1-2008.

The `-p` option is not passed in `MAKEFLAGS` on most historical implementations and to change this would cause many implementations to break without sufficiently increased portability.

Commands that begin with a `<plus-sign>` (`'+'`) are executed even if the `-n` option is present. Based on the GNU version of `make`, the behavior of `-n` when the `<plus-sign>` prefix is encountered has been extended to apply to `-q` and `-t` as well. However, the System V convention of forcing command execution with `-n` when the command line of a target contains either of the strings `"$(MAKE)"` or `"${MAKE}"` has not been adopted. This functionality appeared in early proposals, but the danger of this approach was pointed out with the following example of a portion of a makefile:

```
subdir:
    cd subdir; rm all_the_files; $(MAKE)
```

The loss of the System V behavior in this case is well-balanced by the safety afforded to other makefiles that were not aware of this situation. In any event, the command line `<plus-sign>`

prefix can provide the desired functionality.

The double <colon> in the target rule format is supported in BSD systems to allow more than one target line containing the same target name to have commands associated with it. Since this is not functionality described in the SVID or XPG3 it has been allowed as an extension, but not mandated.

The default rules are provided with text specifying that the built-in rules shall be the same as if the listed set were used. The intent is that implementations should be able to use the rules without change, but will be allowed to alter them in ways that do not affect the primary behavior.

One point of discussion was whether to drop the default rules list from this volume of POSIX.1-2008. They provide convenience, but do not enhance portability of applications. The prime benefit is in portability of users who wish to type *make command* and have the command build from a **command.c** file.

The historical *MAKESHELL* feature, and related features provided by other *make* implementations, were omitted. In some implementations it is used to let a user override the shell to be used to run *make* commands. This was confusing; for a portable *make*, the shell should be chosen by the makefile writer. Further, a makefile writer cannot require an alternate shell to be used and still consider the makefile portable. While it would be possible to standardize a mechanism for specifying an alternate shell, existing implementations do not agree on such a mechanism, and makefile writers can already invoke an alternate shell by specifying the shell name in the rule for a target; for example:

```
python -c "foo"
```

The *make* utilities in most historical implementations process the prerequisites of a target in left-to-right order, and the makefile format requires this. It supports the standard idiom used in many makefiles that produce *yacc* programs; for example:

```
foo: y.tab.o lex.o main.o
    $(CC) $(CFLAGS) -o $@ t.tab.o lex.o main.o
```

In this example, if *make* chose any arbitrary order, the **lex.o** might not be made with the correct **y.tab.h**. Although there may be better ways to express this relationship, it is widely used historically. Implementations that desire to update prerequisites in parallel should require an explicit extension to *make* or the makefile format to accomplish it, as described previously.

The algorithm for determining a new entry for target rules is partially unspecified. Some historical *makes* allow comment lines (including blank and empty lines) within the collection of commands marked by leading <tab> characters. A conforming makefile must ensure that each command starts with a <tab>, but implementations are free to ignore comments without triggering the start of a new entry.

The ASYNCHRONOUS EVENTS section includes having SIGTERM and SIGHUP, along with the more traditional SIGINT and SIGQUIT, remove the current target unless directed not to do so. SIGTERM and SIGHUP were added to parallel other utilities that have historically cleaned up their work as a result of these signals. When *make* receives any signal other than SIGQUIT, it is required to resend itself the signal it received so that it exits with a status that reflects the signal. The results from SIGQUIT are partially unspecified because, on systems that create **core** files upon receipt of SIGQUIT, the **core** from *make* would conflict with a **core** file from the command that was running when the SIGQUIT arrived. The main concern was to prevent damaged files from appearing up-to-date when *make* is rerun.

The **.PRECIOUS** special target was extended to affect all targets globally (by specifying no

prerequisites). The **.IGNORE** and **.SILENT** special targets were extended to allow prerequisites; it was judged to be more useful in some cases to be able to turn off errors or echoing for a list of targets than for the entire makefile. These extensions to *make* in System V were made to match historical practice from the BSD *make*.

Macros are not exported to the environment of commands to be run. This was never the case in any historical *make* and would have serious consequences. The environment is the same as the environment to *make* except that **MAKEFLAGS** and macros defined on the *make* command line are added, and except that macros defined by the **MAKEFLAGS** environment variable and macros defined in the makefile(s) may update the value of an existing environment variable (other than **SHELL**).

Some implementations do not use *system()* for all command lines, as required by the portable makefile format; as a performance enhancement, they select lines without shell metacharacters for direct execution by *execve()*. There is no requirement that *system()* be used specifically, but merely that the same results be achieved. The metacharacters typically used to bypass the direct *execve()* execution have been any of:

```
= | ^ ( ) ; & < > * ? [ ] : $ ` ' " \ \n
```

The default in some advanced versions of *make* is to group all the command lines for a target and execute them using a single shell invocation; the System V method is to pass each line individually to a separate shell. The single-shell method has the advantages in performance and the lack of a requirement for many continued lines. However, converting to this newer method has caused portability problems with many historical makefiles, so the behavior with the POSIX makefile is specified to be the same as that of System V. It is suggested that the special target **.ONESHELL** be used as an implementation extension to achieve the single-shell grouping for a target or group of targets.

Novice users of *make* have had difficulty with the historical need to start commands with a <tab>. Since it is often difficult to discern differences between <tab> and <space> characters on terminals or printed listings, confusing bugs can arise. In early proposals, an attempt was made to correct this problem by allowing leading <blank> characters instead of <tab> characters. However, implementors reported many makefiles that failed in subtle ways following this change, and it is difficult to implement a *make* that unambiguously can differentiate between macro and command lines. There is extensive historical practice of allowing leading <space> characters before macro definitions. Forcing macro lines into column 1 would be a significant backwards-compatibility problem for some makefiles. Therefore, historical practice was restored.

There is substantial variation in the handling of include lines by different implementations. However, there is enough commonality for the standard to be able to specify a minimum set of requirements that allow the feature to be used portably. Known variations have been explicitly called out as unspecified behavior in the description.

The System V dynamic dependency feature was not included. It would support:

```
cat: $$@.c
```

that would expand to;

```
cat: cat.c
```

This feature exists only in the new version of System V *make* and, while useful, is not in wide usage. This means that macros are expanded twice for prerequisites: once at makefile parse time and once at target update time.

Consideration was given to adding metarules to the POSIX *make*. This would make **%.o: %.c** the

same as **.c.o.**. This is quite useful and available from some vendors, but it would cause too many changes to this *make* to support. It would have introduced rule chaining and new substitution rules. However, the rules for target names have been set to reserve the '%' and '"' characters. These are traditionally used to implement metarules and quoting of target names, respectively. Implementors are strongly encouraged to use these characters only for these purposes.

A request was made to extend the suffix delimiter character from a <period> to any character. The metarules feature in newer *makes* solves this problem in a more general way. This volume of POSIX.1-2008 is staying with the more conservative historical definition.

The standard output format for the **-p** option is not described because it is primarily a debugging option and because the format is not generally useful to programs. In historical implementations the output is not suitable for use in generating makefiles. The **-p** format has been variable across historical implementations. Therefore, the definition of **-p** was only to provide a consistently named option for obtaining *make* script debugging information.

Some historical implementations have not cleared the suffix list with **-r**.

Implementations should be aware that some historical applications have intermixed *target\_name* and *macro=value* operands on the command line, expecting that all of the macros are processed before any of the targets are dealt with. Conforming applications do not do this, but some backwards-compatibility support may be warranted.

Empty inference rules are specified with a <semicolon> command rather than omitting all commands, as described in an early proposal. The latter case has no traditional meaning and is reserved for implementation extensions, such as in GNU *make*.

Earlier versions of this standard defined comment lines only as lines with '#' as the first character. Many places then talked about comments, blank lines, and empty lines; but some places inadvertently only mentioned comments when blank lines and empty lines had also been accepted in all known implementations. The standard now defines comment lines to be blank lines, empty lines, and lines starting with a '#' character and explicitly lists cases where blank lines and empty lines are not acceptable.

On most historic systems, the *make* utility considered a target with a prerequisite that had an identical timestamp as up-to-date. The HP-UX implementation of *make* treated it as out-of-date. The standard now allows either behavior, but implementations are encouraged to follow the example set by HP-UX. This is especially important on file systems where the timestamp resolution is the minimum (1 second) required by the standard. All implementations of *make* should make full use of the finest timestamp resolution available on the file systems holding targets and prerequisites to ensure that targets are up-to-date even for prerequisite files with timestamps that were updated within the same second. However, if the timestamp resolutions of the file systems containing a target and a prerequisite are different, the timestamp with the more precise resolution should be rounded down to the resolution of the less precise timestamp for the comparison.

## FUTURE DIRECTIONS

Some implementations of *make* include an *export* directive to add specified *make* variables to the environment. This may be considered for standardization in a future version.

A future version of this standard may require that macro expansions using the forms  $\$(string1:[op]\%[os]=[np][\%][ns])$  or  $\${string1:[op]\%[os]=[np][\%][ns]}$  are treated as pattern macro expansions.

98998 First released in Issue 2.

98999 **Issue 5**

99000 The FUTURE DIRECTIONS section is added.

99001 **Issue 6**

99002 This utility is marked as part of the Software Development Utilities option.

99003 The Open Group Corrigendum U029/1 is applied, correcting a typographical error in the  
99004 SPECIAL TARGETS section.99005 In the ENVIRONMENT VARIABLES section, the *PROJECTDIR* description is updated from  
99006 “otherwise, the home directory of a user of that name is examined” to “otherwise, the value of  
99007 *PROJECTDIR* is treated as a user name and that user’s initial working directory is examined”.99008 It is specified whether the command line is related to the makefile or to the *make* command, and  
99009 the macro processing rules are updated to align with the IEEE P1003.2b draft standard.

99010 The normative text is reworded to avoid use of the term “must” for application requirements.

99011 PASC Interpretation 1003.2 #193 is applied.

99012 **Issue 7**99013 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
99014 apply.

99015 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

99016 Include lines in makefiles are introduced.

99017 Austin Group Interpretation 1003.1-2001 #131 is applied, changing the **Makefile Execution**  
99018 section.

99019 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0121 [257] is applied.

99020 **NAME**

99021       man — display system documentation

99022 **SYNOPSIS**99023       man [-k] *name* . . .99024 **DESCRIPTION**

99025       The *man* utility shall write information about each of the *name* operands. If *name* is the name of a  
 99026       standard utility, *man* at a minimum shall write a message describing the syntax used by the  
 99027       standard utility, its options, and operands. If more information is available, the *man* utility shall  
 99028       provide it in an implementation-defined manner.

99029       An implementation may provide information for values of *name* other than the standard utilities.  
 99030       Standard utilities that are listed as optional and that are not supported by the implementation  
 99031       either shall cause a brief message indicating that fact to be displayed or shall cause a full display  
 99032       of information as described previously.

99033 **OPTIONS**99034       The *man* utility shall conform to XBD [Section 12.2](#) (on page 216).

99035       The following option shall be supported:

99036       **-k**       Interpret *name* operands as keywords to be used in searching a utilities summary  
 99037       database that contains a brief purpose entry for each standard utility and write lines  
 99038       from the summary database that match any of the keywords. The keyword search shall  
 99039       produce results that are the equivalent of the output of the following command:

```
99040       grep -Ei '
99041        name
99042        name
99043        . . .
99044        ' summary-database
```

99045       This assumes that the *summary-database* is a text file with a single entry per line; this  
 99046       organization is not required and the example using *grep -Ei* is merely illustrative of the  
 99047       type of search intended. The purpose entry to be included in the database shall consist  
 99048       of a terse description of the purpose of the utility.

99049 **OPERANDS**

99050       The following operand shall be supported:

99051       *name*       A keyword or the name of a standard utility. When **-k** is not specified and *name*  
 99052       does not represent one of the standard utilities, the results are unspecified.

99053 **STDIN**

99054       Not used.

99055 **INPUT FILES**

99056       None.

99057 **ENVIRONMENT VARIABLES**99058       The following environment variables shall affect the execution of *man*:

99059       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 99060       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 99061       variables used to determine the values of locale categories.)

99062       **LC\_ALL**      If set to a non-empty string value, override the values of all the other  
 99063       internationalization variables.

99064 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 99065 characters (for example, single-byte as opposed to multi-byte characters in  
 99066 arguments and in the summary database). The value of *LC\_CTYPE* need not affect  
 99067 the format of the information written about the *name* operands.

99068 **LC\_MESSAGES**  
 99069 Determine the locale that should be used to affect the format and contents of  
 99070 diagnostic messages written to standard error and informative messages written to  
 99071 standard output.

99072 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

99073 **PAGER** Determine an output filtering command for writing the output to a terminal. Any  
 99074 string acceptable as a *command\_string* operand to the *sh -c* command shall be valid.  
 99075 When standard output is a terminal device, the reference page output shall be  
 99076 piped through the command. If the *PAGER* variable is null or not set, the command  
 99077 shall be either *more* or another paginator utility documented in the system  
 99078 documentation.

## 99079 **ASYNCHRONOUS EVENTS**

99080 Default.

## 99081 **STDOUT**

99082 The *man* utility shall write text describing the syntax of the utility *name*, its options and its  
 99083 operands, or, when *-k* is specified, lines from the summary database. The format of this text is  
 99084 implementation-defined.

## 99085 **STDERR**

99086 The standard error shall be used for diagnostic messages, and may also be used for  
 99087 informational messages of unspecified format.

## 99088 **OUTPUT FILES**

99089 None.

## 99090 **EXTENDED DESCRIPTION**

99091 None.

## 99092 **EXIT STATUS**

99093 The following exit values shall be returned:

99094 0 Successful completion.

99095 >0 An error occurred.

## 99096 **CONSEQUENCES OF ERRORS**

99097 Default.

## 99098 **APPLICATION USAGE**

99099 None.

## 99100 **EXAMPLES**

99101 None.

## 99102 **RATIONALE**

99103 It is recognized that the *man* utility is only of minimal usefulness as specified. The opinion of the  
 99104 standard developers was strongly divided as to how much or how little information *man* should  
 99105 be required to provide. They considered, however, that the provision of some portable way of  
 99106 accessing documentation would aid user portability. The arguments against a fuller specification  
 99107 were:

- Large quantities of documentation should not be required on a system that does not have excess disk space.
- The current manual system does not present information in a manner that greatly aids user portability.
- A “better help system” is currently an area in which vendors feel that they can add value to their POSIX implementations.

The `-f` option was considered, but due to implementation differences, it was not included in this volume of POSIX.1-2008.

The description was changed to be more specific about what has to be displayed for a utility. The standard developers considered it insufficient to allow a display of only the synopsis without giving a short description of what each option and operand does.

The “purpose” entry to be included in the database can be similar to the section title (less the numeric prefix) from this volume of POSIX.1-2008 for each utility. These titles are similar to those used in historical systems for this purpose.

See *mailx* for rationale concerning the default paginator.

The caveat in the *LC\_CTYPE* description was added because it is not a requirement that an implementation provide reference pages for all of its supported locales on each system; changing *LC\_CTYPE* does not necessarily translate the reference page into another language. This is equivalent to the current state of *LC\_MESSAGES* in POSIX.1-2008—locale-specific messages are not yet a requirement.

The historical *MANPATH* variable is not included in POSIX because no attempt is made to specify naming conventions for reference page files, nor even to mandate that they are files at all. On some implementations they could be a true database, a hypertext file, or even fixed strings within the *man* executable. The standard developers considered the portability of reference pages to be outside their scope of work. However, users should be aware that *MANPATH* is implemented on a number of historical systems and that it can be used to tailor the search pattern for reference pages from the various categories (utilities, functions, file formats, and so on) when the system administrator reveals the location and conventions for reference pages on the system.

The keyword search can rely on at least the text of the section titles from these utility descriptions, and the implementation may add more keywords. The term “section titles” refers to the strings such as:

```
man - Display system documentation
ps - Report process status
```

## FUTURE DIRECTIONS

None.

## SEE ALSO

XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

## CHANGE HISTORY

First released in Issue 4.

99149 **Issue 5**

99150 The FUTURE DIRECTIONS section is added.

99151 **Issue 7**99152 Austin Group Interpretation 1003.1-2001 #108 is applied, clarifying that informational messages  
99153 may appear on standard error.

99154 **NAME**

99155       mesg — permit or deny messages

99156 **SYNOPSIS**99157       mesg [*y*|*n*]99158 **DESCRIPTION**

99159       The *mesg* utility shall control whether other users are allowed to send messages via *write*, *talk*, or  
 99160       other utilities to a terminal device. The terminal device affected shall be determined by searching  
 99161       for the first terminal in the sequence of devices associated with standard input, standard output,  
 99162       and standard error, respectively. With no arguments, *mesg* shall report the current state without  
 99163       changing it. Processes with appropriate privileges may be able to send messages to the terminal  
 99164       independent of the current state.

99165 **OPTIONS**

99166       None.

99167 **OPERANDS**

99168       The following operands shall be supported in the POSIX locale:

99169       *y*               Grant permission to other users to send messages to the terminal device.99170       *n*               Deny permission to other users to send messages to the terminal device.99171 **STDIN**

99172       Not used.

99173 **INPUT FILES**

99174       None.

99175 **ENVIRONMENT VARIABLES**99176       The following environment variables shall affect the execution of *mesg*:

99177       *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 99178       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 99179       variables used to determine the values of locale categories.)

99180       *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
 99181       internationalization variables.

99182       *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
 99183       characters (for example, single-byte as opposed to multi-byte characters in  
 99184       arguments).

99185       *LC\_MESSAGES*

99186                       Determine the locale that should be used to affect the format and contents of  
 99187       diagnostic messages written (by *mesg*) to standard error.

99188       XSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.99189 **ASYNCHRONOUS EVENTS**

99190       Default.

99191 **STDOUT**99192       If no operand is specified, *mesg* shall display the current terminal state in an unspecified format.99193 **STDERR**

99194       The standard error shall be used only for diagnostic messages.

**OUTPUT FILES**

None.

**EXTENDED DESCRIPTION**

None.

**EXIT STATUS**

The following exit values shall be returned:

0 Receiving messages is allowed.

1 Receiving messages is not allowed.

&gt;1 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

The mechanism by which the message status of the terminal is changed is unspecified. Therefore, unspecified actions may cause the status of the terminal to change after *mesg* has successfully completed. These actions may include, but are not limited to: another invocation of the *mesg* utility, login procedures; invocation of the *stty* utility, invocation of the *chmod* utility or *chmod()* function, and so on.

**EXAMPLES**

None.

**RATIONALE**

The terminal changed by *mesg* is that associated with the standard input, output, or error, rather than the controlling terminal for the session. This is because users logged in more than once should be able to change any of their login terminals without having to stop the job running in those sessions. This is not a security problem involving the terminals of other users because appropriate privileges would be required to affect the terminal of another user.

The method of checking each of the first three file descriptors in sequence until a terminal is found was adopted from System V.

The file */dev/tty* is not specified for the terminal device because it was thought to be too restrictive. Typical environment changes for the *n* operand are that write permissions are removed for *others* and *group* from the appropriate device. It was decided to leave the actual description of what is done as unspecified because of potential differences between implementations.

The format for standard output is unspecified because of differences between historical implementations. This output is generally not useful to shell scripts (they can use the exit status), so exact parsing of the output is unnecessary.

**FUTURE DIRECTIONS**

None.

**SEE ALSO***talk*, *write*

XBD Chapter 8 (on page 173)

99235 **CHANGE HISTORY**

99236 First released in Issue 2.

99237 **Issue 6**

99238 This utility is marked as part of the User Portability Utilities option.

99239 **Issue 7**99240 The *mesg* utility is moved from the User Portability Utilities option to the Base. User Portability  
99241 Utilities is now an option for interactive utilities.

**NAME**

mkdir — make directories

**SYNOPSIS**

mkdir [-p] [-m *mode*] *dir*...

**DESCRIPTION**

The *mkdir* utility shall create the directories specified by the operands, in the order specified.

For each *dir* operand, the *mkdir* utility shall perform actions equivalent to the *mkdir()* function defined in the System Interfaces volume of POSIX.1-2008, called with the following arguments:

1. The *dir* operand is used as the *path* argument.
2. The value of the bitwise-inclusive OR of S\_IRWXU, S\_IRWXG, and S\_IRWXO is used as the *mode* argument. (If the **-m** option is specified, the value of the *mkdir()* *mode* argument is unspecified, but the directory shall at no time have permissions less restrictive than the **-m mode** option-argument.)

**OPTIONS**

The *mkdir* utility shall conform to XBD [Section 12.2](#) (on page 216).

The following options shall be supported:

**-m mode** Set the file permission bits of the newly-created directory to the specified *mode* value. The *mode* option-argument shall be the same as the *mode* operand defined for the *chmod* utility. In the *symbolic\_mode* strings, the *op* characters '+' and '-' shall be interpreted relative to an assumed initial mode of *a=rwx*; '+' shall add permissions to the default mode, '-' shall delete permissions from the default mode.

**-p** Create any missing intermediate pathname components.

For each *dir* operand that does not name an existing directory, before performing the actions described in the DESCRIPTION above, the *mkdir* utility shall create any pathname components of the path prefix of *dir* that do not name an existing directory by performing actions equivalent to first calling the *mkdir()* function with the following arguments:

1. A pathname naming the missing pathname component, ending with a trailing <slash> character, as the *path* argument
2. The value zero as the *mode* argument

and then calling the *chmod()* function with the following arguments:

1. The same *path* argument as in the *mkdir()* call
2. The value (S\_IWUSR|S\_IXUSR|~*filemask*)&0777 as the *mode* argument, where *filemask* is the file mode creation mask of the process (see XSH [umask\(\)](#))

Each *dir* operand that names an existing directory shall be ignored without error.

**OPERANDS**

The following operand shall be supported:

*dir* A pathname of a directory to be created.

99282 **STDIN**

99283 Not used.

99284 **INPUT FILES**

99285 None.

99286 **ENVIRONMENT VARIABLES**99287 The following environment variables shall affect the execution of *mkdir*:

99288 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 99289 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 99290 variables used to determine the values of locale categories.)

99291 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 99292 internationalization variables.

99293 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 99294 characters (for example, single-byte as opposed to multi-byte characters in  
 99295 arguments).

99296 *LC\_MESSAGES*

99297 Determine the locale that should be used to affect the format and contents of  
 99298 diagnostic messages written to standard error.

99299 *XSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

99300 **ASYNCHRONOUS EVENTS**

99301 Default.

99302 **STDOUT**

99303 Not used.

99304 **STDERR**

99305 The standard error shall be used only for diagnostic messages.

99306 **OUTPUT FILES**

99307 None.

99308 **EXTENDED DESCRIPTION**

99309 None.

99310 **EXIT STATUS**

99311 The following exit values shall be returned:

99312 0 All the specified directories were created successfully, or the *-p* option was specified and all  
 99313 the specified directories either already existed or were created successfully.

99314 &gt;0 An error occurred.

99315 **CONSEQUENCES OF ERRORS**

99316 Default.

**APPLICATION USAGE**

The default file mode for directories is *a=rwx* (777 on most systems) with selected permissions removed in accordance with the file mode creation mask. For intermediate pathname components created by *mkdir*, the mode is the default modified by *u+wx* so that the subdirectories can always be created regardless of the file mode creation mask; if different ultimate permissions are desired for the intermediate directories, they can be changed afterwards with *chmod*.

Note that some of the requested directories may have been created even if an error occurs.

**EXAMPLES**

None.

**RATIONALE**

The System V *-m* option was included to control the file mode.

The System V *-p* option was included to create any needed intermediate directories and to complement the functionality provided by *rmdir* for removing directories in the path prefix as they become empty. Because no error is produced if any path component already exists, the *-p* option is also useful to ensure that a particular directory exists.

The functionality of *mkdir* is described substantially through a reference to the *mkdir()* function in the System Interfaces volume of POSIX.1-2008. For example, by default, the mode of the directory is affected by the file mode creation mask in accordance with the specified behavior of the *mkdir()* function. In this way, there is less duplication of effort required for describing details of the directory creation.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*chmod*, *rm*, *rmdir*, *umask*

XSH *mkdir()*, *umask()*

**CHANGE HISTORY**

First released in Issue 2.

**Issue 5**

The FUTURE DIRECTIONS section is added.

**Issue 7**

SD5-XCU-ERN-56 is applied, aligning the *-m* option with the IEEE P1003.2b draft standard to clarify an ambiguity.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0122 [161] is applied.

**NAME**

mkfifo — make FIFO special files

**SYNOPSIS**

mkfifo [-m *mode*] *file*...

**DESCRIPTION**

The *mkfifo* utility shall create the FIFO special files specified by the operands, in the order specified.

For each *file* operand, the *mkfifo* utility shall perform actions equivalent to the *mkfifo*() function defined in the System Interfaces volume of POSIX.1-2008, called with the following arguments:

1. The *file* operand is used as the *path* argument.
2. The value of the bitwise-inclusive OR of S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH is used as the *mode* argument. (If the -m option is specified, the value of the *mkfifo*() *mode* argument is unspecified, but the FIFO shall at no time have permissions less restrictive than the -m *mode* option-argument.)

**OPTIONS**

The *mkfifo* utility shall conform to XBD [Section 12.2](#) (on page 216).

The following option shall be supported:

-m *mode* Set the file permission bits of the newly-created FIFO to the specified *mode* value. The *mode* option-argument shall be the same as the *mode* operand defined for the *chmod* utility. In the *symbolic\_mode* strings, the *op* characters '+' and '-' shall be interpreted relative to an assumed initial mode of *a=rw*.

**OPERANDS**

The following operand shall be supported:

*file* A pathname of the FIFO special file to be created.

**STDIN**

Not used.

**INPUT FILES**

None.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *mkfifo*:

LANG Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

LC\_ALL If set to a non-empty string value, override the values of all the other internationalization variables.

LC\_CTYPE Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).

LC\_MESSAGES

Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

99394 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

99395 **ASYNCHRONOUS EVENTS**

99396 Default.

99397 **STDOUT**

99398 Not used.

99399 **STDERR**

99400 The standard error shall be used only for diagnostic messages.

99401 **OUTPUT FILES**

99402 None.

99403 **EXTENDED DESCRIPTION**

99404 None.

99405 **EXIT STATUS**

99406 The following exit values shall be returned:

99407 0 All the specified FIFO special files were created successfully.

99408 >0 An error occurred.

99409 **CONSEQUENCES OF ERRORS**

99410 Default.

99411 **APPLICATION USAGE**

99412 None.

99413 **EXAMPLES**

99414 None.

99415 **RATIONALE**

99416 This utility was added to permit shell applications to create FIFO special files.

99417 The **-m** option was added to control the file mode, for consistency with the similar functionality

99418 provided by the *mkdir* utility.

99419 Early proposals included a **-p** option similar to the *mkdir -p* option that created intermediate

99420 directories leading up to the FIFO specified by the final component. This was removed because

99421 it is not commonly needed and is not common practice with similar utilities.

99422 The functionality of *mkfifo* is described substantially through a reference to the *mkfifo()* function

99423 in the System Interfaces volume of POSIX.1-2008. For example, by default, the mode of the FIFO

99424 file is affected by the file mode creation mask in accordance with the specified behavior of the

99425 *mkfifo()* function. In this way, there is less duplication of effort required for describing details of

99426 the file creation.

99427 **FUTURE DIRECTIONS**

99428 None.

99429 **SEE ALSO**

99430 *chmod*, *umask*

99433 **CHANGE HISTORY**

99434 First released in Issue 3.

99435 **Issue 6**99436 The **-m** option is aligned with the IEEE P1003.2b draft standard to clarify an ambiguity.

99437 **NAME**99438 `more` — display files on a page-by-page basis99439 **SYNOPSIS**99440 UP `more [-ceisu] [-n number] [-p command] [-t tagstring] [file...]`99441 **DESCRIPTION**

99442 The *more* utility shall read files and either write them to the terminal on a page-by-page basis or  
 99443 filter them to standard output. If standard output is not a terminal device, all input files shall be  
 99444 copied to standard output in their entirety, without modification, except as specified for the `-s`  
 99445 option. If standard output is a terminal device, the files shall be written a number of lines (one  
 99446 screenful) at a time under the control of user commands. See the EXTENDED DESCRIPTION  
 99447 section.

99448 Certain block-mode terminals do not have all the capabilities necessary to support the complete  
 99449 *more* definition; they are incapable of accepting commands that are not terminated with a  
 99450 <newline>. Implementations that support such terminals shall provide an operating mode to  
 99451 *more* in which all commands can be terminated with a <newline> on those terminals. This mode:

- 99452 • Shall be documented in the system documentation
- 99453 • Shall, at invocation, inform the user of the terminal deficiency that requires the <newline>  
 99454 usage and provide instructions on how this warning can be suppressed in future  
 99455 invocations
- 99456 • Shall not be required for implementations supporting only fully capable terminals
- 99457 • Shall not affect commands already requiring <newline> characters
- 99458 • Shall not affect users on the capable terminals from using *more* as described in this volume  
 99459 of POSIX.1-2008

99460 **OPTIONS**

99461 The *more* utility shall conform to XBD [Section 12.2](#) (on page 216), except that '+' may be  
 99462 recognized as an option delimiter as well as '-'.

99463 The following options shall be supported:

- 99464 **-c** If a screen is to be written that has no lines in common with the current screen, or  
 99465 *more* is writing its first screen, *more* shall not scroll the screen, but instead shall  
 99466 redraw each line of the screen in turn, from the top of the screen to the bottom. In  
 99467 addition, if *more* is writing its first screen, the screen shall be cleared. This option  
 99468 may be silently ignored on devices with insufficient terminal capabilities.
- 99469 **-e** Exit immediately after writing the last line of the last file in the argument list; see  
 99470 the EXTENDED DESCRIPTION section.
- 99471 **-i** Perform pattern matching in searches without regard to case; see XBD [Section 9.2](#)  
 99472 (on page 182).
- 99473 **-n *number*** Specify the number of lines per screenful. The *number* argument is a positive  
 99474 decimal integer. The `-n` option shall override any values obtained from any other  
 99475 source.
- 99476 **-p *command*** Each time a screen from a new file is displayed or redisplayed (including as a  
 99477 result of *more* commands; for example, `:p`), execute the *more* command(s) in the  
 99478 command arguments in the order specified, as if entered by the user after the first  
 99479 screen has been displayed. No intermediate results shall be displayed (that is, if the  
 99480 command is a movement to a screen different from the normal first screen, only the

- 99481 screen resulting from the command shall be displayed.) If any of the commands  
 99482 fail for any reason, an informational message to this effect shall be written, and no  
 99483 further commands specified using the **-p** option shall be executed for this file.
- 99484 **-s** Behave as if consecutive empty lines were a single empty line.
- 99485 **-t tagstring** Write the screenful of the file containing the tag named by the *tagstring* argument.  
 99486 See the *ctags* utility. The tags feature represented by **-t tagstring** and the **:t**  
 99487 command is optional. It shall be provided on any system that also provides a  
 99488 conforming implementation of *ctags*; otherwise, the use of **-t** produces undefined  
 99489 results.
- 99490 The filename resulting from the **-t** option shall be logically added as a prefix to the  
 99491 list of command line files, as if specified by the user. If the tag named by the  
 99492 *tagstring* argument is not found, it shall be an error, and *more* shall take no further  
 99493 action.
- 99494 If the tag specifies a line number, the first line of the display shall contain the  
 99495 beginning of that line. If the tag specifies a pattern, the first line of the display shall  
 99496 contain the beginning of the matching text from the first line of the file that  
 99497 contains that pattern. If the line does not exist in the file or matching text is not  
 99498 found, an informational message to this effect shall be displayed, and *more* shall  
 99499 display the default screen as if **-t** had not been specified.
- 99500 If both the **-t tagstring** and **-p command** options are given, the **-t tagstring** shall be  
 99501 processed first; that is, the file and starting line for the display shall be as specified  
 99502 by **-t**, and then the **-p more** command shall be executed. If the line (matching text)  
 99503 specified by the **-t** command does not exist (is not found), no **-p more** command  
 99504 shall be executed for this file at any time.
- 99505 **-u** Treat a <backspace> as a printable control character, displayed as an  
 99506 implementation-defined character sequence (see the EXTENDED DESCRIPTION  
 99507 section), suppressing backspacing and the special handling that produces  
 99508 underlined or standout mode text on some terminal types. Also, do not ignore a  
 99509 <carriage-return> at the end of a line.

## 99510 OPERANDS

- 99511 The following operand shall be supported:

- 99512 *file* A pathname of an input file. If no *file* operands are specified, the standard input  
 99513 shall be used. If a *file* is '-', the standard input shall be read at that point in the  
 99514 sequence.

## 99515 STDIN

- 99516 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.

## 99517 INPUT FILES

- 99518 The input files being examined shall be text files. If standard output is a terminal, standard error  
 99519 shall be used to read commands from the user. If standard output is a terminal, standard error is  
 99520 not readable, and command input is needed, *more* may attempt to obtain user commands from  
 99521 the controlling terminal (for example, */dev/tty*); otherwise, *more* shall terminate with an error  
 99522 indicating that it was unable to read user commands. If standard output is not a terminal, no  
 99523 error shall result if standard error cannot be opened for reading.

99524 **ENVIRONMENT VARIABLES**99525 The following environment variables shall affect the execution of *more*:

99526 *COLUMNS* Override the system-selected horizontal display line size. See XBD [Chapter 8](#) (on  
99527 page 173) for valid values and results when it is unset or null.

99528 *EDITOR* Used by the *v* command to select an editor. See the EXTENDED DESCRIPTION  
99529 section.

99530 *LANG* Provide a default value for the internationalization variables that are unset or null.  
99531 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
99532 variables used to determine the values of locale categories.)

99533 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
99534 internationalization variables.

99535 *LC\_COLLATE*  
99536 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
99537 character collating elements within regular expressions.

99538 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
99539 characters (for example, single-byte as opposed to multi-byte characters in  
99540 arguments and input files) and the behavior of character classes within regular  
99541 expressions.

99542 *LC\_MESSAGES*  
99543 Determine the locale that should be used to affect the format and contents of  
99544 diagnostic messages written to standard error and informative messages written to  
99545 standard output.

99546 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

99547 *LINES* Override the system-selected vertical screen size, used as the number of lines in a  
99548 screenful. See XBD [Chapter 8](#) (on page 173) for valid values and results when it is  
99549 unset or null. The *-n* option shall take precedence over the *LINES* variable for  
99550 determining the number of lines in a screenful.

99551 *MORE* Determine a string containing options described in the OPTIONS section preceded  
99552 with <hyphen-minus> characters and <blank>-separated as on the command line.  
99553 Any command line options shall be processed after those in the *MORE* variable, as  
99554 if the command line were:

99555 *more \$MORE options operands*

99556 The *MORE* variable shall take precedence over the *TERM* and *LINES* variables for  
99557 determining the number of lines in a screenful.

99558 *TERM* Determine the name of the terminal type. If this variable is unset or null, an  
99559 unspecified default terminal type is used.

99560 **ASYNCHRONOUS EVENTS**

99561 Default.

99562 **STDOUT**

99563 The standard output shall be used to write the contents of the input files.

**STDERR**

The standard error shall be used for diagnostic messages and user commands (see the INPUT FILES section), and, if standard output is a terminal device, to write a prompting string. The prompting string shall appear on the screen line below the last line of the file displayed in the current screenful. The prompt shall contain the name of the file currently being examined and shall contain an end-of-file indication and the name of the next file, if any, when prompting at the end-of-file. If an error or informational message is displayed, it is unspecified whether it is contained in the prompt. If it is not contained in the prompt, it shall be displayed and then the user shall be prompted for a continuation character, at which point another message or the user prompt may be displayed. The prompt is otherwise unspecified. It is unspecified whether informational messages are written for other user commands.

**OUTPUT FILES**

None.

**EXTENDED DESCRIPTION**

The following section describes the behavior of *more* when the standard output is a terminal device. If the standard output is not a terminal device, no options other than *-s* shall have any effect, and all input files shall be copied to standard output otherwise unmodified, at which time *more* shall exit without further action.

The number of lines available per screen shall be determined by the *-n* option, if present, or by examining values in the environment (see the ENVIRONMENT VARIABLES section). If neither method yields a number, an unspecified number of lines shall be used.

The maximum number of lines written shall be one less than this number, because the screen line after the last line written shall be used to write a user prompt and user input. If the number of lines in the screen is less than two, the results are undefined. It is unspecified whether user input is permitted to be longer than the remainder of the single line where the prompt has been written.

The number of columns available per line shall be determined by examining values in the environment (see the ENVIRONMENT VARIABLES section), with a default value as described in XBD Chapter 8 (on page 173).

Lines that are longer than the display shall be folded; the length at which folding occurs is unspecified, but should be appropriate for the output device. Folding may occur between glyphs of single characters that take up multiple display columns.

When standard output is a terminal and *-u* is not specified, *more* shall treat <backspace> and <carriage-return> characters specially:

- A character, followed first by a sequence of *n* <backspace> characters (where *n* is the same as the number of column positions that the character occupies), then by *n* <underscore> characters ( ' \_ ' ), shall cause that character to be written as underlined text, if the terminal type supports that. The *n* <underscore> characters, followed first by *n* <backspace> characters, then any character with *n* column positions, shall also cause that character to be written as underlined text, if the terminal type supports that.
- A sequence of *n* <backspace> characters (where *n* is the same as the number of column positions that the previous character occupies) that appears between two identical printable characters shall cause the first of those two characters to be written as emboldened text (that is, visually brighter, standout mode, or inverse-video mode), if the terminal type supports that, and the second to be discarded. Immediately subsequent occurrences of <backspace>/character pairs for that same character shall also be discarded. (For example, the sequence "a\ba\ba\ba" is interpreted as a single

emboldened 'a'.)

- The *more* utility shall logically discard all other <backspace> characters from the line as well as the character which precedes them, if any.
- A <carriage-return> at the end of a line shall be ignored, rather than being written as a non-printable character, as described in the next paragraph.

It is implementation-defined how other non-printable characters are written. Implementations should use the same format that they use for the *ex* **print** command; see the OPTIONS section within the *ed* utility. It is unspecified whether a multi-column character shall be separated if it crosses a display line boundary; it shall not be discarded. The behavior is unspecified if the number of columns on the display is less than the number of columns any single character in the line being displayed would occupy.

When each new file is displayed (or redisplayed), *more* shall write the first screen of the file. Once the initial screen has been written, *more* shall prompt for a user command. If the execution of the user command results in a screen that has lines in common with the current screen, and the device has sufficient terminal capabilities, *more* shall scroll the screen; otherwise, it is unspecified whether the screen is scrolled or redrawn.

For all files but the last (including standard input if no file was specified, and for the last file as well, if the **-e** option was not specified), when *more* has written the last line in the file, *more* shall prompt for a user command. This prompt shall contain the name of the next file as well as an indication that *more* has reached end-of-file. If the user command is **f**, <control>-F, <space>, **j**, <newline>, **d**, <control>-D, or **s**, *more* shall display the next file. Otherwise, if displaying the last file, *more* shall exit. Otherwise, *more* shall execute the user command specified.

Several of the commands described in this section display a previous screen from the input stream. In the case that text is being taken from a non-rewindable stream, such as a pipe, it is implementation-defined how much backwards motion is supported. If a command cannot be executed because of a limitation on backwards motion, an error message to this effect shall be displayed, the current screen shall not change, and the user shall be prompted for another command.

If a command cannot be performed because there are insufficient lines to display, *more* shall alert the terminal. If a command cannot be performed because there are insufficient lines to display or a **/** command fails: if the input is the standard input, the last screen in the file may be displayed; otherwise, the current file and screen shall not change, and the user shall be prompted for another command.

The interactive commands in the following sections shall be supported. Some commands can be preceded by a decimal integer, called *count* in the following descriptions. If not specified with the command, *count* shall default to 1. In the following descriptions, *pattern* is a basic regular expression, as described in XBD [Section 9.3](#) (on page 183). The term “examine” is historical usage meaning “open the file for viewing”; for example, *more* **foo** would be expressed as examining file **foo**.

In the following descriptions, unless otherwise specified, *line* is a line in the *more* display, not a line from the file being examined.

In the following descriptions, the *current position* refers to two things:

1. The position of the current line on the screen
2. The line number (in the file) of the current line on the screen

Usually, the line on the screen corresponding to the current position is the third line on the

screen. If this is not possible (there are fewer than three lines to display or this is the first page of the file, or it is the last page of the file), then the current position is either the first or last line on the screen as described later.

## Help

*Synopsis:*     **h**

Write a summary of these commands and other implementation-defined commands. The behavior shall be as if the *more* utility were executed with the **-e** option on a file that contained the summary information. The user shall be prompted as described earlier in this section when end-of-file is reached. If the user command is one of those specified to continue to the next file, *more* shall return to the file and screen state from which the **h** command was executed.

## Scroll Forward One Screenful

*Synopsis:*     **[count]f**  
                 **[count]<control>-F**

Scroll forward *count* lines, with a default of one screenful. If *count* is more than the screen size, only the final screenful shall be written.

## Scroll Backward One Screenful

*Synopsis:*     **[count]b**  
                 **[count]<control>-B**

Scroll backward *count* lines, with a default of one screenful (see the **-n** option). If *count* is more than the screen size, only the final screenful shall be written.

## Scroll Forward One Line

*Synopsis:*     **[count]<space>**  
                 **[count]j**  
                 **[count]<newline>**

Scroll forward *count* lines. The default *count* for the **<space>** shall be one screenful; for **j** and **<newline>**, one line. The entire *count* lines shall be written, even if *count* is more than the screen size.

## Scroll Backward One Line

*Synopsis:*     **[count]k**

Scroll backward *count* lines. The entire *count* lines shall be written, even if *count* is more than the screen size.

## Scroll Forward One Half Screenful

*Synopsis:*     **[count]d**  
                 **[count]<control>-D**

Scroll forward *count* lines, with a default of one half of the screen size. If *count* is specified, it shall become the new default for subsequent **d**, **<control>-D**, and **u** commands.

**Skip Forward One Line**

*Synopsis:*     [*count*]**s**

Display the screenful beginning with the line *count* lines after the last line on the current screen. If *count* would cause the current position to be such that less than one screenful would be written, the last screenful in the file shall be written.

**Scroll Backward One Half Screenful**

*Synopsis:*     [*count*]**u**  
                  [*count*]**<control>-U**

Scroll backward *count* lines, with a default of one half of the screen size. If *count* is specified, it shall become the new default for subsequent **d**, **<control>-D**, **u**, and **<control>-U** commands. The entire *count* lines shall be written, even if *count* is more than the screen size.

**Go to Beginning of File**

*Synopsis:*     [*count*]**g**

Display the screenful beginning with line *count*.

**Go to End-of-File**

*Synopsis:*     [*count*]**G**

If *count* is specified, display the screenful beginning with the line *count*. Otherwise, display the last screenful of the file.

**Refresh the Screen**

*Synopsis:*     **r**  
                  **<control>-L**

Refresh the screen.

**Discard and Refresh**

*Synopsis:*     **R**

Refresh the screen, discarding any buffered input. If the current file is non-seekable, buffered input shall not be discarded and the **R** command shall be equivalent to the **r** command.

**Mark Position**

*Synopsis:*     **m***letter*

Mark the current position with the letter named by *letter*, where *letter* represents the name of one of the lowercase letters of the portable character set. When a new file is examined, all marks may be lost.

**Return to Mark**

*Synopsis:*     ' *letter*

Return to the position that was previously marked with the letter named by *letter*, making that line the current position.

**Return to Previous Position**

*Synopsis:*     ' '

Return to the position from which the last large movement command was executed (where a "large movement" is defined as any movement of more than a screenful of lines). If no such movements have been made, return to the beginning of the file.

**Search Forward for Pattern**

*Synopsis:*     [*count*]/[!]*pattern*<newline>

Display the screenful beginning with the *count*th line containing the pattern. The search shall start after the first line currently displayed. The null regular expression ('/' followed by a <newline>) shall repeat the search using the previous regular expression, with a default *count*. If the character '!' is included, the matching lines shall be those that do not contain the *pattern*. If no match is found for the *pattern*, a message to that effect shall be displayed.

**Search Backward for Pattern**

*Synopsis:*     [*count*?][!]*pattern*<newline>

Display the screenful beginning with the *count*th previous line containing the pattern. The search shall start on the last line before the first line currently displayed. The null regular expression ('?' followed by a <newline>) shall repeat the search using the previous regular expression, with a default *count*. If the character '!' is included, matching lines shall be those that do not contain the *pattern*. If no match is found for the *pattern*, a message to that effect shall be displayed.

**Repeat Search**

*Synopsis:*     [*count*]n

Repeat the previous search for *count*th line containing the last *pattern* (or not containing the last *pattern*, if the previous search was "/" or "?").

**Repeat Search in Reverse**

*Synopsis:*     [*count*]N

Repeat the search in the opposite direction of the previous search for the *count*th line containing the last *pattern* (or not containing the last *pattern*, if the previous search was "/" or "?").

**Examine New File**

*Synopsis:*        :e [*filename*]  
<newline>

Examine a new file. If the *filename* argument is not specified, the current file (see the :n and :p commands below) shall be re-examined. The *filename* shall be subjected to the process of shell word expansions (see [Section 2.6](#), on page 2343); if more than a single pathname results, the effects are unspecified. If *filename* is a <number-sign> ('#'), the previously examined file shall be re-examined. If *filename* is not accessible for any reason (including that it is a non-seekable file), an error message to this effect shall be displayed and the current file and screen shall not change.

**Examine Next File**

*Synopsis:*        [count]:n

Examine the next file. If a number *count* is specified, the *count*th next file shall be examined. If *filename* refers to a non-seekable file, the results are unspecified.

**Examine Previous File**

*Synopsis:*        [count]:p

Examine the previous file. If a number *count* is specified, the *count*th previous file shall be examined. If *filename* refers to a non-seekable file, the results are unspecified.

**Go to Tag**

*Synopsis:*        :t *tagstring*  
<newline>

If the file containing the tag named by the *tagstring* argument is not the current file, examine the file, as if the :e command was executed with that file as the argument. Otherwise, or in addition, display the screenful beginning with the tag, as described for the -t option (see the OPTIONS section). If the *ctags* utility is not supported by the system, the use of :t produces undefined results.

**Invoke Editor**

*Synopsis:*        v

Invoke an editor to edit the current file being examined. If standard input is being examined, the results are unspecified. The name of the editor shall be taken from the environment variable *EDITOR*, or shall default to *vi*. If the last pathname component in *EDITOR* is either *vi* or *ex*, the editor shall be invoked with a -c *linenumber* command line argument, where *linenumber* is the line number of the file line containing the display line currently displayed as the first line of the screen. It is implementation-defined whether line-setting options are passed to editors other than *vi* and *ex*.

When the editor exits, *more* shall resume with the same file and screen as when the editor was invoked.

**Display Position**

*Synopsis:*       =

                  <control>-G

Write a message for which the information references the first byte of the line after the last line of the file on the screen. This message shall include the name of the file currently being examined, its number relative to the total number of files there are to examine, the line number in the file, the byte number and the total bytes in the file, and what percentage of the file precedes the current position. If *more* is reading from standard input, or the file is shorter than a single screen, the line number, the byte number, the total bytes, and the percentage need not be written.

**Quit**

*Synopsis:*       q

                  :q

                  ZZ

Exit *more*.

**EXIT STATUS**

The following exit values shall be returned:

- 0   Successful completion.
- >0   An error occurred.

**CONSEQUENCES OF ERRORS**

If an error is encountered accessing a file when using the **:n** command, *more* shall attempt to examine the next file in the argument list, but the final exit status shall be affected. If an error is encountered accessing a file via the **:p** command, *more* shall attempt to examine the previous file in the argument list, but the final exit status shall be affected. If an error is encountered accessing a file via the **:e** command, *more* shall remain in the current file and the final exit status shall not be affected.

**APPLICATION USAGE**

When the standard output is not a terminal, only the **-s** filter-modification option is effective. This is based on historical practice. For example, a typical implementation of *man* pipes its output through *more -s* to squeeze excess white space for terminal users. When *man* is piped to *lp*, however, it is undesirable for this squeezing to happen.

**EXAMPLES**

The **-p** allows arbitrary commands to be executed at the start of each file. Examples are:

*more -p G file1 file2*  
Examine each file starting with its last screenful.

*more -p 100 file1 file2*  
Examine each file starting with line 100 in the current position (usually the third line, so line 98 would be the first line written).

*more -p /100 file1 file2*  
Examine each file starting with the first line containing the string "100" in the current position

## RATIONALE

The *more* utility, available in BSD and BSD-derived systems, was chosen as the prototype for the POSIX file display program since it is more widely available than either the public-domain program *less* or than *pg*, a pager provided in System V. The 4.4 BSD *more* is the model for the features selected; it is almost fully upwards-compatible from the 4.3 BSD version in wide use and has become more amenable for *vi* users. Several features originally derived from various file editors, found in both *less* and *pg*, have been added to this volume of POSIX.1-2008 as they have proved extremely popular with users.

There are inconsistencies between *more* and *vi* that result from historical practice. For example, the single-character commands **h**, **f**, **b**, and **<space>** are screen movers in *more*, but cursor movers in *vi*. These inconsistencies were maintained because the cursor movements are not applicable to *more* and the powerful functionality achieved without the use of the control key justifies the differences.

The tags interface has been included in a program that is not a text editor because it promotes another degree of consistent operation with *vi*. It is conceivable that the paging environment of *more* would be superior for browsing source code files in some circumstances.

The operating mode referred to for block-mode terminals effectively adds a **<newline>** to each Synopsis line that currently has none. So, for example, **d<newline>** would page one screenful. The mode could be triggered by a command line option, environment variable, or some other method. The details are not imposed by this volume of POSIX.1-2008 because there are so few systems known to support such terminals. Nevertheless, it was considered that all systems should be able to support *more* given the exception cited for this small community of terminals because, in comparison to *vi*, the cursor movements are few and the command set relatively amenable to the optional **<newline>** characters.

Some versions of *more* provide a shell escaping mechanism similar to the *ex* **!** command. The standard developers did not consider that this was necessary in a paginator, particularly given the wide acceptance of multiple window terminals and job control features. (They chose to retain such features in the editors and *mailx* because the shell interaction also gives an opportunity to modify the editing buffer, which is not applicable to *more*.)

The **-p** (position) option replaces the **+** command because of the Utility Syntax Guidelines. The **+command** option is no longer specified by POSIX.1-2008 but may be present in some implementations. In early proposals, it took a *pattern* argument, but historical *less* provided the *more* general facility of a command. It would have been desirable to use the same **-c** as *ex* and *vi*, but the letter was already in use.

The text stating “from a non-rewindable stream ... implementations may limit the amount of backwards motion supported” would allow an implementation that permitted no backwards motion beyond text already on the screen. It was not possible to require a minimum amount of backwards motion that would be effective for all conceivable device types. The implementation should allow the user to back up as far as possible, within device and reasonable memory allocation constraints.

Historically, non-printable characters were displayed using the ARPA standard mappings, which are as follows:

1. Printable characters are left alone.
2. Control characters less than **\177** are represented as followed by the character offset from the **'@'** character in the ASCII map; for example, **\007** is represented as **'G'**.

3. \177 is represented as followed by ' ? '.

The display of characters having their eighth bit set was less standard. Existing implementations use hex (0x00), octal (\000), and a meta-bit display. (The latter displayed characters with their eighth bit set as the two characters "M-", followed by the seven-bit display as described previously.) The latter probably has the best claim to historical practice because it was used with the -v option of 4 BSD and 4 BSD-derived versions of the *cat* utility since 1980.

No specific display format is required by POSIX.1-2008. Implementations are encouraged to conform to historic practice in the absence of any strong reason to diverge.

#### FUTURE DIRECTIONS

None.

Chapter 2 (on page 2335), *ctags*, *ed*, *ex*, *vi*

XBD Chapter 8 (on page 173), Section 9.2 (on page 182), Section 9.3 (on page 183), Section 12.2 (on page 216)

#### CHANGE HISTORY

First released in Issue 4.

##### Issue 5

The FUTURE DIRECTIONS section is added.

##### Issue 6

This utility is marked as part of the User Portability Utilities option.

The obsolescent SYNOPSIS is removed.

The utility has been extensively reworked for alignment with the IEEE P1003.2b draft standard:

- Changes have been made as a result of IEEE PASC Interpretations 1003.2 #37 and #109.
- The *more* utility should be able to handle underlined and emboldened displays of characters that are wider than a single column position.

##### Issue 7

Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that '+' may be recognized as an option delimiter in the OPTIONS section.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0123 [265] is applied.

99905 **NAME**

99906 mv — move files

99907 **SYNOPSIS**99908 mv [-if] *source\_file target\_file*99909 mv [-if] *source\_file... target\_dir*99910 **DESCRIPTION**

99911 In the first synopsis form, the *mv* utility shall move the file named by the *source\_file* operand to the destination specified by the *target\_file*. This first synopsis form is assumed when the final operand does not name an existing directory and is not a symbolic link referring to an existing directory. In this case, if *source\_file* names a non-directory file and *target\_file* ends with a trailing <slash> character, *mv* shall treat this as an error and no *source\_file* operands will be processed.

99916 In the second synopsis form, *mv* shall move each file named by a *source\_file* operand to a destination file in the existing directory named by the *target\_dir* operand, or referenced if *target\_dir* is a symbolic link referring to an existing directory. The destination path for each *source\_file* shall be the concatenation of the target directory, a single <slash> character if the target did not end in a <slash>, and the last pathname component of the *source\_file*. This second form is assumed when the final operand names an existing directory.

99922 If any operand specifies an existing file of a type not specified by the System Interfaces volume of POSIX.1-2008, the behavior is implementation-defined.

99924 For each *source\_file* the following steps shall be taken:

- 99925 1. If the destination path exists, the *-f* option is not specified, and either of the following conditions is true:

- 99926 a. The permissions of the destination path do not permit writing and the standard input is a terminal.
- 99927 b. The *-i* option is specified.

99930 the *mv* utility shall write a prompt to standard error and read a line from standard input. If the response is not affirmative, *mv* shall do nothing more with the current *source\_file* and go on to any remaining *source\_files*.

- 99933 2. If the *source\_file* operand and destination path resolve to either the same existing directory entry or different directory entries for the same existing file, then the destination path shall not be removed, and one of the following shall occur:

- 99936 a. No change is made to *source\_file*, no error occurs, and no diagnostic is issued.
- 99937 b. No change is made to *source\_file*, a diagnostic is issued to standard error identifying the two names, and the exit status is affected.
- 99939 c. If the *source\_file* operand and destination path name distinct directory entries, then the *source\_file* operand is removed, no error occurs, and no diagnostic is issued.

99941 The *mv* utility shall do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.

- 99943 3. The *mv* utility shall perform actions equivalent to the *rename()* function defined in the System Interfaces volume of POSIX.1-2008, called with the following arguments:

- 99945 a. The *source\_file* operand is used as the *old* argument.

- b. The destination path is used as the *new* argument.

If this succeeds, *mv* shall do nothing more with the current *source\_file* and go on to any remaining *source\_files*. If this fails for any reasons other than those described for the *errno* [EXDEV] in the System Interfaces volume of POSIX.1-2008, *mv* shall write a diagnostic message to standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.

4. If the destination path exists, and it is a file of type directory and *source\_file* is not a file of type directory, or it is a file not of type directory and *source\_file* is a file of type directory, *mv* shall write a diagnostic message to standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*. If the destination path exists and was created by a previous step, it is unspecified whether this will be treated as an error or the destination path will be overwritten.
5. If the destination path exists, *mv* shall attempt to remove it. If this fails for any reason, *mv* shall write a diagnostic message to standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.
6. The file hierarchy rooted in *source\_file* shall be duplicated as a file hierarchy rooted in the destination path. If *source\_file* or any of the files below it in the hierarchy are symbolic links, the links themselves shall be duplicated, including their contents, rather than any files to which they refer. The following characteristics of each file in the file hierarchy shall be duplicated:

- The time of last data modification and time of last access
- The user ID and group ID
- The file mode

If the user ID, group ID, or file mode of a regular file cannot be duplicated, the file mode bits S\_ISUID and S\_ISGID shall not be duplicated.

When files are duplicated to another file system, the implementation may require that the process invoking *mv* has read access to each file being duplicated.

If files being duplicated to another file system have hard links to other files, it is unspecified whether the files copied to the new file system have the hard links preserved or separate copies are created for the linked files.

If the duplication of the file hierarchy fails for any reason, *mv* shall write a diagnostic message to standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.

If the duplication of the file characteristics fails for any reason, *mv* shall write a diagnostic message to standard error, but this failure shall not cause *mv* to modify its exit status.

7. The file hierarchy rooted in *source\_file* shall be removed. If this fails for any reason, *mv* shall write a diagnostic message to the standard error, do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.

## OPTIONS

The *mv* utility shall conform to XBD [Section 12.2](#) (on page 216).

The following options shall be supported:

- f** Do not prompt for confirmation if the destination path exists. Any previous occurrence of the **-i** option is ignored.

99989            **-i**            Prompt for confirmation if the destination path exists. Any previous occurrence of  
 99990                            the **-f** option is ignored.

99991            Specifying more than one of the **-f** or **-i** options shall not be considered an error. The last option  
 99992            specified shall determine the behavior of *mv*.

#### 99993 **OPERANDS**

99994            The following operands shall be supported:

99995            *source\_file*    A pathname of a file or directory to be moved.

99996            *target\_file*    A new pathname for the file or directory being moved.

99997            *target\_dir*     A pathname of an existing directory into which to move the input files.

#### 99998 **STDIN**

99999            The standard input shall be used to read an input line in response to each prompt specified in  
 100000            the **STDERR** section. Otherwise, the standard input shall not be used.

#### 100001 **INPUT FILES**

100002            The input files specified by each *source\_file* operand can be of any file type.

#### 100003 **ENVIRONMENT VARIABLES**

100004            The following environment variables shall affect the execution of *mv*:

100005            *LANG*            Provide a default value for the internationalization variables that are unset or null.  
 100006                            (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 100007                            variables used to determine the values of locale categories.)

100008            *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
 100009                            internationalization variables.

100010            *LC\_COLLATE*

100011                            Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 100012                            character collating elements used in the extended regular expression defined for  
 100013                            the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

100014            *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
 100015                            characters (for example, single-byte as opposed to multi-byte characters in  
 100016                            arguments and input files), the behavior of character classes used in the extended  
 100017                            regular expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES*  
 100018                            category.

100019            *LC\_MESSAGES*

100020                            Determine the locale used to process affirmative responses, and the locale used to  
 100021                            affect the format and contents of diagnostic messages and prompts written to  
 100022                            standard error.

100023 **XSI**            *NLSPATH*       Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 100024 **ASYNCHRONOUS EVENTS**

100025            Default.

#### 100026 **STDOUT**

100027            Not used.

#### 100028 **STDERR**

100029            Prompts shall be written to the standard error under the conditions specified in the  
 100030            **DESCRIPTION** section. The prompts shall contain the destination pathname, but their format is  
 100031            otherwise unspecified. Otherwise, the standard error shall be used only for diagnostic

100032 messages.

#### 100033 OUTPUT FILES

100034 The output files may be of any file type.

#### 100035 EXTENDED DESCRIPTION

100036 None.

#### 100037 EXIT STATUS

100038 The following exit values shall be returned:

100039 0 All input files were moved successfully.

100040 >0 An error occurred.

#### 100041 CONSEQUENCES OF ERRORS

100042 If the copying or removal of *source\_file* is prematurely terminated by a signal or error, *mv* may  
 100043 leave a partial copy of *source\_file* at the source or destination. The *mv* utility shall not modify  
 100044 both *source\_file* and the destination path simultaneously; termination at any point shall leave  
 100045 either *source\_file* or the destination path complete.

#### 100046 APPLICATION USAGE

100047 Some implementations mark for update the last file status change timestamp of renamed files  
 100048 and some do not. Applications which make use of the last file status change timestamp may  
 100049 behave differently with respect to renamed files unless they are designed to allow for either  
 100050 behavior.

100051 The specification ensures that *mv a a* will not alter the contents of file **a**, and allows the  
 100052 implementation to issue an error that a file cannot be moved onto itself. Likewise, when **a** and **b**  
 100053 are hard links to the same file, *mv a b* will not alter **b**, but if a diagnostic is not issued, then it is  
 100054 unspecified whether **a** is left untouched (as it would be by the *rename()* function) or unlinked  
 100055 (reducing the link count of **b**).

#### 100056 EXAMPLES

100057 If the current directory contains only files **a** (of any type defined by the System Interfaces  
 100058 volume of POSIX.1-2008), **b** (also of any type), and a directory **c**:

100059 `mv a b c`

100060 `mv c d`

100061 results with the original files **a** and **b** residing in the directory **d** in the current directory.

#### 100062 RATIONALE

100063 Early proposals diverged from the SVID and BSD historical practice in that they required that  
 100064 when the destination path exists, the `-f` option is not specified, and input is not a terminal, *mv*  
 100065 fails. This was done for compatibility with *cp*. The current text returns to historical practice. It  
 100066 should be noted that this is consistent with the *rename()* function defined in the System  
 100067 Interfaces volume of POSIX.1-2008, which does not require write permission on the target.

100068 For absolute clarity, paragraph (1), describing the behavior of *mv* when prompting for  
 100069 confirmation, should be interpreted in the following manner:

100070 `if (exists AND (NOT f_option) AND`  
 100071 `((not_writable AND input_is_terminal) OR i_option))`

100072 The `-i` option exists on BSD systems, giving applications and users a way to avoid accidentally  
 100073 unlinking files when moving others. When the standard input is not a terminal, the 4.3 BSD *mv*  
 100074 deletes all existing destination paths without prompting, even when `-i` is specified; this is  
 100075 inconsistent with the behavior of the 4.3 BSD *cp* utility, which always generates an error when

the file is unwritable and the standard input is not a terminal. The standard developers decided that use of `-i` is a request for interaction, so when the destination path exists, the utility takes instructions from whatever responds to standard input.

The `rename()` function is able to move directories within the same file system. Some historical versions of `mv` have been able to move directories, but not to a different file system. The standard developers considered that this was an annoying inconsistency, so this volume of POSIX.1-2008 requires directories to be able to be moved even across file systems. There is no `-R` option to confirm that moving a directory is actually intended, since such an option was not required for moving directories in historical practice. Requiring the application to specify it sometimes, depending on the destination, seemed just as inconsistent. The semantics of the `rename()` function were preserved as much as possible. For example, `mv` is not permitted to “rename” files to or from directories, even though they might be empty and removable.

Historic implementations of `mv` did not exit with a non-zero exit status if they were unable to duplicate any file characteristics when moving a file across file systems, nor did they write a diagnostic message for the user. The former behavior has been preserved to prevent scripts from breaking; a diagnostic message is now required, however, so that users are alerted that the file characteristics have changed.

The exact format of the interactive prompts is unspecified. Only the general nature of the contents of prompts are specified because implementations may desire more descriptive prompts than those used on historical implementations. Therefore, an application not using the `-f` option or using the `-i` option relies on the system to provide the most suitable dialog directly with the user, based on the behavior specified.

When `mv` is dealing with a single file system and `source_file` is a symbolic link, the link itself is moved as a consequence of the dependence on the `rename()` functionality, per the DESCRIPTION. Across file systems, this has to be made explicit.

## FUTURE DIRECTIONS

None.

## SEE ALSO

`cp`, `ln`

XBD Chapter 8 (on page 173), Section 12.2 (on page 216)

XSH `rename()`

## CHANGE HISTORY

First released in Issue 2.

### Issue 6

The `mv` utility is changed to describe processing of symbolic links as specified in the IEEE P1003.2b draft standard.

The APPLICATION USAGE section is added.

### Issue 7

Austin Group Interpretation 1003.1-2001 #016 is applied.

Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the `LC_MESSAGES` environment variable.

Austin Group Interpretations 1003.1-2001 #164, #168, and #169 are applied.

SD5-XCU-ERN-13 is applied, making an editorial correction to the SYNOPSIS.

SD5-XCU-ERN-51 is applied to the DESCRIPTION, defining the behavior for when files are

- 100120 being duplicated to another file system while having hard links.
- 100121 Changes are made related to support for finegrained timestamps.
- 100122 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0124 [48] is applied.

100123 **NAME**

100124       newgrp — change to a new group

100125 **SYNOPSIS**

100126       newgrp [-l] [group]

100127 **DESCRIPTION**

100128       The *newgrp* utility shall create a new shell execution environment with a new real and effective  
 100129       group identification. Of the attributes listed in [Section 2.12](#) (on page 2371), the new shell  
 100130       execution environment shall retain the working directory, file creation mask, and exported  
 100131       variables from the previous environment (that is, open files, traps, unexported variables, alias  
 100132       definitions, shell functions, and *set* options may be lost). All other aspects of the process  
 100133       environment that are preserved by the *exec* family of functions defined in the System Interfaces  
 100134       volume of POSIX.1-2008 shall also be preserved by *newgrp*; whether other aspects are preserved  
 100135       is unspecified.

100136       A failure to assign the new group identifications (for example, for security or password-related  
 100137       reasons) shall not prevent the new shell execution environment from being created.

100138       The *newgrp* utility shall affect the supplemental groups for the process as follows:

- 100139       • On systems where the effective group ID is normally in the supplementary group list (or  
 100140       whenever the old effective group ID actually is in the supplementary group list):
  - 100141           — If the new effective group ID is also in the supplementary group list, *newgrp* shall  
 100142           change the effective group ID.
  - 100143           — If the new effective group ID is not in the supplementary group list, *newgrp* shall add  
 100144           the new effective group ID to the list, if there is room to add it.
- 100145       • On systems where the effective group ID is not normally in the supplementary group list  
 100146       (or whenever the old effective group ID is not in the supplementary group list):
  - 100147           — If the new effective group ID is in the supplementary group list, *newgrp* shall delete  
 100148           it.
  - 100149           — If the old effective group ID is not in the supplementary list, *newgrp* shall add it if  
 100150           there is room.

100151       **Note:**     The System Interfaces volume of POSIX.1-2008 does not specify whether the effective group ID  
 100152       of a process is included in its supplementary group list.

100153       With no operands, *newgrp* shall change the effective group back to the groups identified in the  
 100154       user's user entry, and shall set the list of supplementary groups to that set in the user's group  
 100155       database entries.

100156       If the first argument is *'-'*, the results are unspecified.

100157       If a password is required for the specified group, and the user is not listed as a member of that  
 100158       group in the group database, the user shall be prompted to enter the correct password for that  
 100159       group. If the user is listed as a member of that group, no password shall be requested. If no  
 100160       password is required for the specified group, it is implementation-defined whether users not  
 100161       listed as members of that group can change to that group. Whether or not a password is  
 100162       required, implementation-defined system accounting or security mechanisms may impose  
 100163       additional authorization restrictions that may cause *newgrp* to write a diagnostic message and  
 100164       suppress the changing of the group identification.

100165 **OPTIONS**

100166 The *newgrp* utility shall conform to XBD [Section 12.2](#) (on page 216), except for the unspecified  
 100167 usage of `'-'`.

100168 The following option shall be supported:

100169 `-l` (The letter ell.) Change the environment to what would be expected if the user  
 100170 actually logged in again.

100171 **OPERANDS**

100172 The following operand shall be supported:

100173 *group* A group name from the group database or a non-negative numeric group ID.  
 100174 Specifies the group ID to which the real and effective group IDs shall be set. If  
 100175 *group* is a non-negative numeric string and exists in the group database as a group  
 100176 name (see *getgrnam()*), the numeric group ID associated with that group name  
 100177 shall be used as the group ID.

100178 **STDIN**

100179 Not used.

100180 **INPUT FILES**

100181 The file `/dev/tty` shall be used to read a single line of text for password checking, when one is  
 100182 required.

100183 **ENVIRONMENT VARIABLES**

100184 The following environment variables shall affect the execution of *newgrp*:

100185 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 100186 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 100187 variables used to determine the values of locale categories.)

100188 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 100189 internationalization variables.

100190 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 100191 characters (for example, single-byte as opposed to multi-byte characters in  
 100192 arguments).

100193 *LC\_MESSAGES*

100194 Determine the locale that should be used to affect the format and contents of  
 100195 diagnostic messages written to standard error.

100196 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

100197 **ASYNCHRONOUS EVENTS**

100198 Default.

100199 **STDOUT**

100200 Not used.

100201 **STDERR**

100202 The standard error shall be used for diagnostic messages and a prompt string for a password, if  
 100203 one is required. Diagnostic messages may be written in cases where the exit status is not  
 100204 available. See the EXIT STATUS section.

**100205 OUTPUT FILES**

100206 None.

**100207 EXTENDED DESCRIPTION**

100208 None.

**100209 EXIT STATUS**

100210 If *newgrp* succeeds in creating a new shell execution environment, whether or not the group  
100211 identification was changed successfully, the exit status shall be the exit status of the shell.  
100212 Otherwise, the following exit value shall be returned:

100213 >0 An error occurred.

**100214 CONSEQUENCES OF ERRORS**

100215 The invoking shell may terminate.

**100216 APPLICATION USAGE**

100217 There is no convenient way to enter a password into the group database. Use of group  
100218 passwords is not encouraged, because by their very nature they encourage poor security  
100219 practices. Group passwords may disappear in the future.

100220 A common implementation of *newgrp* is that the current shell uses *exec* to overlay itself with  
100221 *newgrp*, which in turn overlays itself with a new shell after changing group. On some  
100222 implementations, however, this may not occur and *newgrp* may be invoked as a subprocess.

100223 The *newgrp* command is intended only for use from an interactive terminal. It does not offer a  
100224 useful interface for the support of applications.

100225 The exit status of *newgrp* is generally inapplicable. If *newgrp* is used in a script, in most cases it  
100226 successfully invokes a new shell and the rest of the original shell script is bypassed when the  
100227 new shell exits. Used interactively, *newgrp* displays diagnostic messages to indicate problems.  
100228 But usage such as:

100229 *newgrp* foo  
100230 *echo* \$?

100231 is not useful because the new shell might not have access to any status *newgrp* may have  
100232 generated (and most historical systems do not provide this status). A zero status echoed here  
100233 does not necessarily indicate that the user has changed to the new group successfully. Following  
100234 *newgrp* with the *id* command provides a portable means of determining whether the group  
100235 change was successful or not.

**100236 EXAMPLES**

100237 None.

**100238 RATIONALE**

100239 Most historical implementations use one of the *exec* functions to implement the behavior of  
100240 *newgrp*. Errors detected before the *exec* leave the environment unchanged, while errors detected  
100241 after the *exec* leave the user in a changed environment. While it would be useful to have *newgrp*  
100242 issue a diagnostic message to tell the user that the environment changed, it would be  
100243 inappropriate to require this change to some historical implementations.

100244 The password mechanism is allowed in the group database, but how this would be  
100245 implemented is not specified.

100246 The *newgrp* utility was retained in this volume of POSIX.1-2008, even given the existence of the  
100247 multiple group permissions feature in the System Interfaces volume of POSIX.1-2008, for several  
100248 reasons. First, in some implementations, the group ownership of a newly created file is  
100249 determined by the group of the directory in which the file is created, as allowed by the System

100250 Interfaces volume of POSIX.1-2008; on other implementations, the group ownership of a newly  
100251 created file is determined by the effective group ID. On implementations of the latter type,  
100252 *newgrp* allows files to be created with a specific group ownership. Finally, many  
100253 implementations use the real group ID in accounting, and on such systems, *newgrp* allows the  
100254 accounting identity of the user to be changed.

#### 100255 **FUTURE DIRECTIONS**

100256 None.

#### 100257 **SEE ALSO**

100260 XSH *exec*, *getgrnam()*

#### 100261 **CHANGE HISTORY**

100262 First released in Issue 2.

#### 100263 **Issue 6**

100264 This utility is marked as part of the User Portability Utilities option.

100265 The obsolescent SYNOPSIS is removed.

100266 The text describing supplemental groups is no longer conditional on {NGROUPS\_MAX} being  
100267 greater than 1. This is because {NGROUPS\_MAX} now has a minimum value of 8. This is a FIPS  
100268 requirement.

#### 100269 **Issue 7**

100270 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first  
100271 argument is '- '.

100272 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100273 The *newgrp* utility is moved from the User Portability Utilities option to the Base. User  
100274 Portability Utilities is now an option for interactive utilities.

100275 **NAME**

100276        *nice* — invoke a utility with an altered nice value

100277 **SYNOPSIS**

100278        *nice* [*-n increment*] *utility* [*argument...*]

100279 **DESCRIPTION**

100280        The *nice* utility shall invoke a utility, requesting that it be run with a different nice value (see  
100281        XBD [Section 3.244](#), on page 72). With no options, the executed utility shall be run with a nice  
100282        value that is some implementation-defined quantity greater than or equal to the nice value of the  
100283        current process. If the user lacks appropriate privileges to affect the nice value in the requested  
100284        manner, the *nice* utility shall not affect the nice value; in this case, a warning message may be  
100285        written to standard error, but this shall not prevent the invocation of *utility* or affect the exit  
100286        status.

100287 **OPTIONS**

100288        The *nice* utility shall conform to XBD [Section 12.2](#) (on page 216).

100289        The following option is supported:

100290        *-n increment* A positive or negative decimal integer which shall have the same effect on the  
100291        execution of the utility as if the utility had called the *nice()* function with the  
100292        numeric value of the *increment* option-argument.

100293 **OPERANDS**

100294        The following operands shall be supported:

100295        *utility*        The name of a utility that is to be invoked. If the *utility* operand names any of the  
100296        special built-in utilities in [Section 2.14](#) (on page 2374), the results are undefined.

100297        *argument*      Any string to be supplied as an argument when invoking the utility named by the  
100298        *utility* operand.

100299 **STDIN**

100300        Not used.

100301 **INPUT FILES**

100302        None.

100303 **ENVIRONMENT VARIABLES**

100304        The following environment variables shall affect the execution of *nice*:

100305        *LANG*        Provide a default value for the internationalization variables that are unset or null.  
100306        (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
100307        variables used to determine the values of locale categories.)

100308        *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
100309        internationalization variables.

100310        *LC\_CTYPE*      Determine the locale for the interpretation of sequences of bytes of text data as  
100311        characters (for example, single-byte as opposed to multi-byte characters in  
100312        arguments).

100313        *LC\_MESSAGES*

100314        Determine the locale that should be used to affect the format and contents of  
100315        diagnostic messages written to standard error.

100316 XSI        *NLSPATH*        Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

| 100320 | Default.                                                                                                                                            |                                                                             |
| 100321 | <b>STDOUT</b>                                                                                                                                       |                                                                             |
| 100322 | Not used.                                                                                                                                           |                                                                             |
| 100323 | <b>STDERR</b>                                                                                                                                       |                                                                             |
| 100324 | The standard error shall be used only for diagnostic messages.                                                                                      |                                                                             |
| 100325 | <b>OUTPUT FILES</b>                                                                                                                                 |                                                                             |
| 100326 | None.                                                                                                                                               |                                                                             |
| 100327 | <b>EXTENDED DESCRIPTION</b>                                                                                                                         |                                                                             |
| 100328 | None.                                                                                                                                               |                                                                             |
| 100329 | <b>EXIT STATUS</b>                                                                                                                                  |                                                                             |
| 100330 | If <i>utility</i> is invoked, the exit status of <i>nice</i> shall be the exit status of <i>utility</i> ; otherwise, the <i>nice</i>                |                                                                             |
| 100331 | utility shall exit with one of the following values:                                                                                                |                                                                             |
| 100332 | 1-125                                                                                                                                               | An error occurred in the <i>nice</i> utility.                               |
| 100333 | 126                                                                                                                                                 | The utility specified by <i>utility</i> was found but could not be invoked. |
| 100334 | 127                                                                                                                                                 | The utility specified by <i>utility</i> could not be found.                 |
| 100335 | <b>CONSEQUENCES OF ERRORS</b>                                                                                                                       |                                                                             |
| 100336 | Default.                                                                                                                                            |                                                                             |
| 100337 | <b>APPLICATION USAGE</b>                                                                                                                            |                                                                             |
| 100338 | The only guaranteed portable uses of this utility are:                                                                                              |                                                                             |
| 100339 | <i>nice utility</i>                                                                                                                                 |                                                                             |
| 100340 | Run <i>utility</i> with the default higher or equal nice value.                                                                                     |                                                                             |
| 100341 | <i>nice -n &lt;positive integer&gt; utility</i>                                                                                                     |                                                                             |
| 100342 | Run <i>utility</i> with a higher nice value.                                                                                                        |                                                                             |
| 100343 | On some implementations they have no discernible effect on the invoked utility and on some                                                          |                                                                             |
| 100344 | others they are exactly equivalent.                                                                                                                 |                                                                             |
| 100345 | Historical systems have frequently supported the <i>&lt;positive integer&gt;</i> up to 20. Since there is no                                        |                                                                             |
| 100346 | error penalty associated with guessing a number that is too high, users without access to the                                                       |                                                                             |
| 100347 | system conformance document (to see what limits are actually in place) could use the historical 1                                                   |                                                                             |
| 100348 | to 20 range or attempt to use very large numbers if the job should be truly low priority.                                                           |                                                                             |
| 100349 | The nice value of a process can be displayed using the command:                                                                                     |                                                                             |
| 100350 | ps -o nice                                                                                                                                          |                                                                             |
| 100351 | The <i>command</i> , <i>env</i> , <i>nice</i> , <i>nohup</i> , <i>time</i> , and <i>xargs</i> utilities have been specified to use exit code 127 if |                                                                             |
| 100352 | an error occurs so that applications can distinguish “failure to find a utility” from “invoked                                                      |                                                                             |
| 100353 | utility exited with an error indication”. The value 127 was chosen because it is not commonly                                                       |                                                                             |
| 100354 | used for other meanings; most utilities use small values for “normal error conditions” and the                                                      |                                                                             |
| 100355 | values above 128 can be confused with termination due to receipt of a signal. The value 126 was                                                     |                                                                             |
| 100356 | chosen in a similar manner to indicate that the utility could be found, but not invoked. Some                                                       |                                                                             |
| 100357 | scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction                                                    |                                                                             |
| 100358 | between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to                                                    |                                                                             |
| 100359 | exec the utility fail with [ENOENT], and uses 126 when any attempt to exec the utility fails for                                                    |                                                                             |

100360 any other reason.

#### 100361 EXAMPLES

100362 None.

#### 100363 RATIONALE

100364 The 4.3 BSD version of *nice* does not check whether *increment* is a valid decimal integer. The  
100365 command *nice -x utility*, for example, would be treated the same as the command *nice --1*  
100366 *utility*. If the user does not have appropriate privileges, this results in a “permission denied”  
100367 error. This is considered a bug.

100368 When a user without appropriate privileges gives a negative *increment*, System V treats it like  
100369 the command *nice -0 utility*, while 4.3 BSD writes a “permission denied” message and does not  
100370 run the utility. The standard specifies the System V behavior together with an optional BSD-style  
100371 “permission denied” message.

100372 The C shell has a built-in version of *nice* that has a different interface from the one described in  
100373 this volume of POSIX.1-2008.

100374 The term “utility” is used, rather than “command”, to highlight the fact that shell compound  
100375 commands, pipelines, and so on, cannot be used. Special built-ins also cannot be used.  
100376 However, “utility” includes user application programs and shell scripts, not just utilities defined  
100377 in this volume of POSIX.1-2008.

100378 Historical implementations of *nice* provide a nice value range of 40 or 41 discrete steps, with the  
100379 default nice value being the midpoint of that range. By default, they raise the nice value of the  
100380 executed utility by 10.

100381 Some historical documentation states that the *increment* value must be within a fixed range. This  
100382 is misleading; the valid *increment* values on any invocation are determined by the current  
100383 process nice value, which is not always the default.

100384 The definition of nice value is not intended to suggest that all processes in a system have  
100385 priorities that are comparable. Scheduling policy extensions such as the realtime priorities in the  
100386 System Interfaces volume of POSIX.1-2008 make the notion of a single underlying priority for all  
100387 scheduling policies problematic. Some implementations may implement the *nice*-related features  
100388 to affect all processes on the system, others to affect just the general time-sharing activities  
100389 implied by this volume of POSIX.1-2008, and others may have no effect at all. Because of the use  
100390 of “implementation-defined” in *nice* and *renice*, a wide range of implementation strategies are  
100391 possible.

100392 Earlier versions of this standard allowed a *-increment* option. This form is no longer specified by  
100393 POSIX.1-2008 but may be present in some implementations.

#### 100394 FUTURE DIRECTIONS

100395 None.

#### 100400 CHANGE HISTORY

100401 First released in Issue 4.

100402 **Issue 6**

100403 This utility is marked as part of the User Portability Utilities option.

100404 The obsolescent SYNOPSIS is removed.

100405 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/18 is applied, deleting a paragraph of  
100406 RATIONALE that referred to text no longer in the standard.

100407 **Issue 7**

100408 Austin Group Interpretation 1003.1-2001 #027 is applied.

100409 SD5-XCU-ERN-32 and SD5-XCU-ERN-33 are applied, updating the DESCRIPTION,  
100410 APPLICATION USAGE, and RATIONALE sections.

100411 The *nice* utility is moved from the User Portability Utilities option to the Base. User Portability  
100412 Utilities is now an option for interactive utilities.

100413 **NAME**

100414 nl — line numbering filter

100415 **SYNOPSIS**

```
100416 XSI nl [-p] [-b type] [-d delim] [-f type] [-h type] [-i incr] [-l num]
100417          [-n format] [-s sep] [-v startnum] [-w width] [file]
```

100418 **DESCRIPTION**

100419 The *nl* utility shall read lines from the named *file* or the standard input if no *file* is named and  
 100420 shall reproduce the lines to standard output. Lines shall be numbered on the left. Additional  
 100421 functionality may be provided in accordance with the command options in effect.

100422 The *nl* utility views the text it reads in terms of logical pages. Line numbering shall be reset at  
 100423 the start of each logical page. A logical page consists of a header, a body, and a footer section.  
 100424 Empty sections are valid. Different line numbering options are independently available for  
 100425 header, body, and footer (for example, no numbering of header and footer lines while  
 100426 numbering blank lines only in the body).

100427 The starts of logical page sections shall be signaled by input lines containing nothing but the  
 100428 following delimiter characters:

| Line     | Start of |
|----------|----------|
| \: \: \: | Header   |
| \: \:    | Body     |
| \:       | Footer   |

100433 Unless otherwise specified, *nl* shall assume the text being read is in a single logical page body.

100434 **OPTIONS**

100435 The *nl* utility shall conform to XBD [Section 12.2](#) (on page 216). Only one file can be named.

100436 The following options shall be supported:

100437 **-b type** Specify which logical page body lines shall be numbered. Recognized *types* and  
 100438 their meaning are:

100439 **a** Number all lines.

100440 **t** Number only non-empty lines.

100441 **n** No line numbering.

100442 **pstring** Number only lines that contain the basic regular expression specified in  
 100443 *string*.

100444 The default *type* for logical page body shall be **t** (text lines numbered).

100445 **-d delim** Specify the delimiter characters that indicate the start of a logical page section.  
 100446 These can be changed from the default characters "\: " to two user-specified  
 100447 characters. If only one character is entered, the second character shall remain the  
 100448 default character ' : '.

100449 **-f type** Specify the same as **b type** except for footer. The default for logical page footer shall  
 100450 be **n** (no lines numbered).

100451 **-h type** Specify the same as **b type** except for header. The default *type* for logical page  
 100452 header shall be **n** (no lines numbered).

|        |                           |                                                                                                                                                                                                                                                                                         |
|--------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 100453 | <b>-i</b> <i>incr</i>     | Specify the increment value used to number logical page lines. The default shall be 1.                                                                                                                                                                                                  |
| 100454 |                           |                                                                                                                                                                                                                                                                                         |
| 100455 | <b>-l</b> <i>num</i>      | Specify the number of blank lines to be considered as one. For example, <b>-l 2</b> results in only the second adjacent blank line being numbered (if the appropriate <b>-h a</b> , <b>-b a</b> , or <b>-f a</b> option is set). The default shall be 1.                                |
| 100456 |                           |                                                                                                                                                                                                                                                                                         |
| 100457 |                           |                                                                                                                                                                                                                                                                                         |
| 100458 | <b>-n</b> <i>format</i>   | Specify the line numbering format. Recognized values are: <b>ln</b> , left justified, leading zeros suppressed; <b>rn</b> , right justified, leading zeros suppressed; <b>rz</b> , right justified, leading zeros kept. The default <i>format</i> shall be <b>rn</b> (right justified). |
| 100459 |                           |                                                                                                                                                                                                                                                                                         |
| 100460 |                           |                                                                                                                                                                                                                                                                                         |
| 100461 | <b>-p</b>                 | Specify that numbering should not be restarted at logical page delimiters.                                                                                                                                                                                                              |
| 100462 | <b>-s</b> <i>sep</i>      | Specify the characters used in separating the line number and the corresponding text line. The default <i>sep</i> shall be a <tab>.                                                                                                                                                     |
| 100463 |                           |                                                                                                                                                                                                                                                                                         |
| 100464 | <b>-v</b> <i>startnum</i> | Specify the initial value used to number logical page lines. The default shall be 1.                                                                                                                                                                                                    |
| 100465 | <b>-w</b> <i>width</i>    | Specify the number of characters to be used for the line number. The default <i>width</i> shall be 6.                                                                                                                                                                                   |
| 100466 |                           |                                                                                                                                                                                                                                                                                         |

#### 100467 OPERANDS

100468 The following operand shall be supported:

100469 *file* A pathname of a text file to be line-numbered.

#### 100470 STDIN

100471 The standard input shall be used if no *file* operand is specified, and shall be used if the *file*  
 100472 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 100473 the standard input shall not be used. See the INPUT FILES section.

#### 100474 INPUT FILES

100475 The input file shall be a text file.

#### 100476 ENVIRONMENT VARIABLES

100477 The following environment variables shall affect the execution of *nl*:

100478 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 100479 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 100480 variables used to determine the values of locale categories.)

100481 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 100482 internationalization variables.

100483 *LC\_COLLATE*

100484 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 100485 character collating elements within regular expressions.

100486 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 100487 characters (for example, single-byte as opposed to multi-byte characters in  
 100488 arguments and input files), the behavior of character classes within regular  
 100489 expressions, and for deciding which characters are in character class **graph** (for the  
 100490 **-b t**, **-f t**, and **-h t** options).

100491 *LC\_MESSAGES*

100492 Determine the locale that should be used to affect the format and contents of  
 100493 diagnostic messages written to standard error.

100494 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

100495 **ASYNCHRONOUS EVENTS**

100496 Default.

100497 **STDOUT**

100498 The standard output shall be a text file in the following format:

100499 "%s%s%s", *<line number>*, *<separator>*, *<input line>*

100500 where *<line number>* is one of the following numeric formats:

100501 %6d When the **rn** format is used (the default; see **-n**).

100502 %06d When the **rz** format is used.

100503 %-6d When the **ln** format is used.

100504 *<empty>* When line numbers are suppressed for a portion of the page; the *<separator>* is also suppressed.

100505

100506 In the preceding list, the number 6 is the default width; the **-w** option can change this value.

100507 **STDERR**

100508 The standard error shall be used only for diagnostic messages.

100509 **OUTPUT FILES**

100510 None.

100511 **EXTENDED DESCRIPTION**

100512 None.

100513 **EXIT STATUS**

100514 The following exit values shall be returned:

100515 0 Successful completion.

100516 >0 An error occurred.

100517 **CONSEQUENCES OF ERRORS**

100518 Default.

100519 **APPLICATION USAGE**

100520 In using the **-d delim** option, care should be taken to escape characters that have special meaning to the command interpreter.

100521

100522 **EXAMPLES**

100523 The command:

100524 `nl -v 10 -i 10 -d \!+ file1`

100525 numbers *file1* starting at line number 10 with an increment of 10. The logical page delimiter is

100526 "**!+**". Note that the **'!'** has to be escaped when using *cs**h* as a command interpreter because of

100527 its history substitution syntax. For *ks**h* and *sh* the escape is not necessary, but does not do any

100528 harm.

100529 **RATIONALE**

100530 None.

100531 **FUTURE DIRECTIONS**

100532 None.

100533 **SEE ALSO**100534 *pr*100535 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)100536 **CHANGE HISTORY**

100537 First released in Issue 2.

100538 **Issue 5**100539 The option `[-f type]` is added to the SYNOPSIS. The option descriptions are presented in  
100540 alphabetic order. The description of `-bt` is changed to “Number only non-empty lines”.100541 **Issue 6**100542 The obsolescent behavior allowing the options to be intermingled with the optional *file* operand  
100543 is removed.100544 **Issue 7**

100545 Austin Group Interpretation 1003.1-2001 #092 is applied.

100546 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100547 **NAME**100548 nm — write the name list of an object file (**DEVELOPMENT**)100549 **SYNOPSIS**100550 SD nm [-APv] [-g|-u] [-t *format*] *file*...100551 XSI nm [-APv] [-efox] [-g|-u] [-t *format*] *file*...100552 **DESCRIPTION**

100553 The *nm* utility shall display symbolic information appearing in the object file, executable file, or  
 100554 object-file library named by *file*. If no symbolic information is available for a valid input file, the  
 100555 *nm* utility shall report that fact, but not consider it an error condition.

100556 XSI The default base used when numeric values are written is unspecified. On XSI-conformant  
 100557 systems, it shall be decimal if the **-P** option is not specified.

100558 **OPTIONS**100559 The *nm* utility shall conform to XBD [Section 12.2](#) (on page 216).

100560 The following options shall be supported:

100561 **-A** Write the full pathname or library name of an object on each line.100562 XSI **-e** Write only external (global) and static symbol information.

100563 XSI **-f** Produce full output. Write redundant symbols (**.text**, **.data**, and **.bss**), normally  
 100564 suppressed.

100565 **-g** Write only external (global) symbol information.100566 XSI **-o** Write numeric values in octal (equivalent to **-t o**).100567 **-P** Write information in a portable output format, as specified in the STDOUT section.

100568 **-t *format*** Write each numeric value in the specified format. The format shall be dependent  
 100569 on the single character used as the *format* option-argument:

100570 XSI d decimal (default if **-P** is not specified).

100571 o octal.

100572 x hexadecimal (default if **-P** is specified).100573 **-u** Write only undefined symbols.100574 **-v** Sort output by value instead of by symbol name.100575 XSI **-x** Write numeric values in hexadecimal (equivalent to **-t x**).100576 **OPERANDS**

100577 The following operand shall be supported:

100578 *file* A pathname of an object file, executable file, or object-file library.100579 **STDIN**

100580 See the INPUT FILES section.

100581 **INPUT FILES**

100582 The input file shall be an object file, an object-file library whose format is the same as those  
 100583 produced by the *ar* utility for link editing, or an executable file. The *nm* utility may accept  
 100584 additional implementation-defined object library formats for the input file.

100585 **ENVIRONMENT VARIABLES**

100586 The following environment variables shall affect the execution of *nm*:

100587 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 100588 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 100589 variables used to determine the values of locale categories.)

100590 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 100591 internationalization variables.

100592 *LC\_COLLATE*  
 100593 Determine the locale for character collation information for the symbol-name and  
 100594 symbol-value collation sequences.

100595 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 100596 characters (for example, single-byte as opposed to multi-byte characters in  
 100597 arguments).

100598 *LC\_MESSAGES*  
 100599 Determine the locale that should be used to affect the format and contents of  
 100600 diagnostic messages written to standard error.

100601 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

100602 **ASYNCHRONOUS EVENTS**

100603 Default.

100604 **STDOUT**

100605 If symbolic information is present in the input files, then for each file or for each member of an  
 100606 archive, the *nm* utility shall write the following information to standard output. By default, the  
 100607 format is unspecified, but the output shall be sorted by symbol name according to the collation  
 100608 sequence in the current locale.

- 100609 • Library or object name, if *-A* is specified
- 100610 • Symbol name
- 100611 • Symbol type, which shall either be one of the following single characters or an  
 100612 implementation-defined type represented by a single character:
  - 100613 A Global absolute symbol.
  - 100614 a Local absolute symbol.
  - 100615 B Global “bss” (that is, uninitialized data space) symbol.
  - 100616 b Local bss symbol.
  - 100617 D Global data symbol.
  - 100618 d Local data symbol.
  - 100619 T Global text symbol.
  - 100620 t Local text symbol.
  - 100621 U Undefined symbol.
- 100622 • Value of the symbol
- 100623 • The size associated with the symbol, if applicable

100624 This information may be supplemented by additional information specific to the

100625 implementation.

100626 If the **-P** option is specified, the previous information shall be displayed using the following  
 100627 portable format. The three versions differ depending on whether **-t d**, **-t o**, or **-t x** was specified,  
 100628 respectively:

100629 "%s%s %s %d %d\n", <library/object name>, <name>, <type>,  
 100630 <value>, <size>

100631 "%s%s %s %o %o\n", <library/object name>, <name>, <type>,  
 100632 <value>, <size>

100633 "%s%s %s %x %x\n", <library/object name>, <name>, <type>,  
 100634 <value>, <size>

100635 where <library/object name> shall be formatted as follows:

- 100636 • If **-A** is not specified, <library/object name> shall be an empty string.
- 100637 • If **-A** is specified and the corresponding *file* operand does not name a library:  
 100638 "%s: ", <file>
- 100639 • If **-A** is specified and the corresponding *file* operand names a library. In this case,  
 100640 <object file> shall name the object file in the library containing the symbol being described:  
 100641 "%s[%s]: ", <file>, <object file>

100642 If **-A** is not specified, then if more than one *file* operand is specified or if only one *file* operand is  
 100643 specified and it names a library, *nm* shall write a line identifying the object containing the  
 100644 following symbols before the lines containing those symbols, in the form:

- 100645 • If the corresponding *file* operand does not name a library:  
 100646 "%s:\n", <file>
- 100647 • If the corresponding *file* operand names a library; in this case, <object file> shall be the  
 100648 name of the file in the library containing the following symbols:  
 100649 "%s[%s]:\n", <file>, <object file>

100650 If **-P** is specified, but **-t** is not, the format shall be as if **-t x** had been specified.

100651 **STDERR**

100652 The standard error shall be used only for diagnostic messages.

100653 **OUTPUT FILES**

100654 None.

100655 **EXTENDED DESCRIPTION**

100656 None.

100657 **EXIT STATUS**

100658 The following exit values shall be returned:

100659 0 Successful completion.

100660 >0 An error occurred.

100661 **CONSEQUENCES OF ERRORS**

100662 Default.

**100663 APPLICATION USAGE**

100664 Mechanisms for dynamic linking make this utility less meaningful when applied to an  
100665 executable file because a dynamically linked executable may omit numerous library routines  
100666 that would be found in a statically linked executable.

**100667 EXAMPLES**

100668 None.

**100669 RATIONALE**

100670 Historical implementations of *nm* have used different bases for numeric output and supplied  
100671 different default types of symbols that were reported. The *-t format* option, similar to that used  
100672 in *od* and *strings*, can be used to specify the numeric base; *-g* and *-u* can be used to restrict the  
100673 amount of output or the types of symbols included in the output.

100674 The compromise of using *-t format* versus using *-d*, *-o*, and other similar options was necessary  
100675 because of differences in the meaning of *-o* between implementations. The *-o* option from BSD  
100676 has been provided here as *-A* to avoid confusion with the *-o* from System V (which has been  
100677 provided here as *-t* and as *-o* on XSI-conformant systems).

100678 The option list was significantly reduced from that provided by historical implementations.

100679 The *nm* description is a subset of both the System V and BSD *nm* utilities with no specified  
100680 default output.

100681 It was recognized that mechanisms for dynamic linking make this utility less meaningful when  
100682 applied to an executable file (because a dynamically linked executable file may omit numerous  
100683 library routines that would be found in a statically linked executable file), but the value of *nm*  
100684 during software development was judged to outweigh other limitations.

100685 The default output format of *nm* is not specified because of differences in historical  
100686 implementations. The *-P* option was added to allow some type of portable output format. After  
100687 a comparison of the different formats used in SunOS, BSD, SVR3, and SVR4, it was decided to  
100688 create one that did not match the current format of any of these four systems. The format  
100689 devised is easy to parse by humans, easy to parse in shell scripts, and does not need to vary  
100690 depending on locale (because no English descriptions are included). All of the systems currently  
100691 have the information available to use this format.

100692 The format given in *nm* STDOUT uses <space> characters between the fields, which may be any  
100693 number of <blank> characters required to align the columns. The single-character types were  
100694 selected to match historical practice, and the requirement that implementation additions also be  
100695 single characters made parsing the information easier for shell scripts.

**100696 FUTURE DIRECTIONS**

100697 None.

**100698 SEE ALSO**

100699 *ar*, *c99*

100700 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

**100701 CHANGE HISTORY**

100702 First released in Issue 2.

**100703 Issue 6**

100704 This utility is marked as supported when both the User Portability Utilities option and the  
100705 Software Development Utilities option are supported.

100706 **Issue 7**

100707 The *nm* utility is removed from the User Portability Utilities option. User Portability Utilities is  
100708 now an option for interactive utilities.

100709 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100710 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0125 [263] and XCU/TC1-2008/0126  
100711 [263] are applied.

100712 **NAME**

100713       nohup — invoke a utility immune to hangups

100714 **SYNOPSIS**100715       nohup *utility* [*argument...*]100716 **DESCRIPTION**

100717       The *nohup* utility shall invoke the utility named by the *utility* operand with arguments supplied  
 100718       as the *argument* operands. At the time the named *utility* is invoked, the SIGHUP signal shall be  
 100719       set to be ignored.

100720       If standard input is associated with a terminal, the *nohup* utility may redirect standard input  
 100721       from an unspecified file.

100722       If the standard output is a terminal, all output written by the named *utility* to its standard output  
 100723       shall be appended to the end of the file **nohup.out** in the current directory. If **nohup.out** cannot  
 100724       be created or opened for appending, the output shall be appended to the end of the file  
 100725       **nohup.out** in the directory specified by the *HOME* environment variable. If neither file can be  
 100726       created or opened for appending, *utility* shall not be invoked. If a file is created, the file's  
 100727       permission bits shall be set to S\_IRUSR | S\_IWUSR.

100728       If standard error is a terminal and standard output is open but is not a terminal, all output  
 100729       written by the named utility to its standard error shall be redirected to the same open file  
 100730       description as the standard output. If standard error is a terminal and standard output either is a  
 100731       terminal or is closed, the same output shall instead be appended to the end of the **nohup.out** file  
 100732       as described above.

100733 **OPTIONS**

100734       None.

100735 **OPERANDS**

100736       The following operands shall be supported:

100737       *utility*       The name of a utility that is to be invoked. If the *utility* operand names any of the  
 100738       special built-in utilities in [Section 2.14](#) (on page 2374), the results are undefined.

100739       *argument*   Any string to be supplied as an argument when invoking the utility named by the  
 100740       *utility* operand.

100741 **STDIN**

100742       Not used.

100743 **INPUT FILES**

100744       None.

100745 **ENVIRONMENT VARIABLES**100746       The following environment variables shall affect the execution of *nohup*:

100747       *HOME*       Determine the pathname of the user's home directory: if the output file **nohup.out**  
 100748       cannot be created in the current directory, the *nohup* utility shall use the directory  
 100749       named by *HOME* to create the file.

100750       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 100751       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 100752       variables used to determine the values of locale categories.)

100753       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 100754       internationalization variables.

| 100789 |                               | The <i>command</i> , <i>env</i> , <i>nice</i> , <i>nohup</i> , <i>time</i> , and <i>xargs</i> utilities have been specified to use exit code 127 if an error occurs so that applications can distinguish “failure to find a utility” from “invoked utility exited with an error indication”. The value 127 was chosen because it is not commonly used for other meanings; most utilities use small values for “normal error conditions” and the values above 128 can be confused with termination due to receipt of a signal. The value 126 was chosen in a similar manner to indicate that the utility could be found, but not invoked. Some scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to <i>exec</i> the utility fail with [ENOENT], and uses 126 when any attempt to <i>exec</i> the utility fails for any other reason. |

| 100796 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 100797 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 100798 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**100799 EXAMPLES**

100800 It is frequently desirable to apply *nohup* to pipelines or lists of commands. This can be done by  
100801 placing pipelines and command lists in a single file; this file can then be invoked as a utility, and  
100802 the *nohup* applies to everything in the file.

100803 Alternatively, the following command can be used to apply *nohup* to a complex command:

100804 `nohup sh -c 'complex-command-line' </dev/null`

**100805 RATIONALE**

100806 The 4.3 BSD version ignores SIGTERM and SIGHUP, and if *./nohup.out* cannot be used, it fails  
100807 instead of trying to use *\$HOME/nohup.out*.

100808 The *cs*h utility has a built-in version of *nohup* that acts differently from the *nohup* defined in this  
100809 volume of POSIX.1-2008.

100810 The term *utility* is used, rather than *command*, to highlight the fact that shell compound  
100811 commands, pipelines, special built-ins, and so on, cannot be used directly. However, *utility*  
100812 includes user application programs and shell scripts, not just the standard utilities.

100813 Historical versions of the *nohup* utility use default file creation semantics. Some more recent  
100814 versions use the permissions specified here as an added security precaution.

100815 Some historical implementations ignore SIGQUIT in addition to SIGHUP; others ignore  
100816 SIGTERM. An early proposal allowed, but did not require, SIGQUIT to be ignored. Several  
100817 reviewers objected that *nohup* should only modify the handling of SIGHUP as required by this  
100818 volume of POSIX.1-2008.

100819 Historical versions of *nohup* did not affect standard input, but that causes problems in the  
100820 common scenario where the user logs into a system, types the command:

100821 `nohup make &`

100822 at the prompt, and then logs out. If standard input is not affected by *nohup*, the login session  
100823 may not terminate for quite some time, since standard input remains open until *make* exits. To  
100824 avoid this problem, POSIX.1-2008 allows implementations to redirect standard input if it is a  
100825 terminal. Since the behavior is implementation-defined, portable applications that may run into  
100826 the problem should redirect standard input themselves. For example, instead of:

100827 `nohup make &`

100828 an application can invoke:

100829 `nohup make </dev/null &`

**100830 FUTURE DIRECTIONS**

100831 None.

**100836 CHANGE HISTORY**

100837 First released in Issue 2.

100838 **Issue 7**  
100839

Austin Group Interpretations 1003.1-2001 #104, #105, and #106 are applied.

100840 **NAME**100841 `od` — dump files in various formats100842 **SYNOPSIS**

100843 `od [-v] [-A address_base] [-j skip] [-N count] [-t type_string]...`  
 100844 `[file...]`

100845 XSI `od [-bcdosx] [file] [[+]offset[.][b]]`100846 **DESCRIPTION**

100847 The *od* utility shall write the contents of its input files to standard output in a user-specified  
 100848 format.

100849 **OPTIONS**

100850 The *od* utility shall conform to XBD [Section 12.2](#) (on page 216), except that the order of  
 100851 XSI presentation of the `-t` options and the `-bcdosx` options is significant.

100852 The following options shall be supported:

100853 `-A address_base`

100854 Specify the input offset base. See the EXTENDED DESCRIPTION section. The  
 100855 application shall ensure that the *address\_base* option-argument is a character. The  
 100856 characters 'd', 'o', and 'x' specify that the offset base shall be written in  
 100857 decimal, octal, or hexadecimal, respectively. The character 'n' specifies that the  
 100858 offset shall not be written.

100859 XSI `-b` Interpret bytes in octal. This shall be equivalent to `-t o1`.

100860 XSI `-c` Interpret bytes as characters specified by the current setting of the *LC\_CTYPE*  
 100861 category. Certain non-graphic characters appear as C escapes: "NUL=\0",  
 100862 "BS=\b", "FF=\f", "NL=\n", "CR=\r", "HT=\t"; others appear as 3-digit octal  
 100863 numbers.

100864 XSI `-d` Interpret *words* (two-byte units) in unsigned decimal. This shall be equivalent to  
 100865 `-t u2`.

100866 `-j skip` Jump over *skip* bytes from the beginning of the input. The *od* utility shall read or  
 100867 seek past the first *skip* bytes in the concatenated input files. If the combined input is  
 100868 not at least *skip* bytes long, the *od* utility shall write a diagnostic message to  
 100869 standard error and exit with a non-zero exit status.

100870 By default, the *skip* option-argument shall be interpreted as a decimal number.  
 100871 With a leading 0x or 0X, the offset shall be interpreted as a hexadecimal number;  
 100872 otherwise, with a leading '0', the offset shall be interpreted as an octal number.  
 100873 Appending the character 'b', 'k', or 'm' to offset shall cause it to be interpreted  
 100874 as a multiple of 512, 1024, or 1048576 bytes, respectively. If the *skip* number is  
 100875 hexadecimal, any appended 'b' shall be considered to be the final hexadecimal  
 100876 digit.

100877 `-N count` Format no more than *count* bytes of input. By default, *count* shall be interpreted as  
 100878 a decimal number. With a leading 0x or 0X, *count* shall be interpreted as a  
 100879 hexadecimal number; otherwise, with a leading '0', it shall be interpreted as an  
 100880 octal number. If *count* bytes of input (after successfully skipping, if `-j skip` is  
 100881 specified) are not available, it shall not be considered an error; the *od* utility shall  
 100882 format the input that is available.

|        |                 |                                      |                                                                                                                             |
|--------|-----------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| 100883 | XSI             | <b>-o</b>                            | Interpret <i>words</i> (two-byte units) in octal. This shall be equivalent to <b>-t o2</b> .                                |
| 100884 | XSI             | <b>-s</b>                            | Interpret <i>words</i> (two-byte units) in signed decimal. This shall be equivalent to                                      |
| 100885 |                 | <b>-t d2</b> .                       |                                                                                                                             |

| 100887 |                 |                                      | Specify one or more output types. See the EXTENDED DESCRIPTION section. The                                                 |
| 100888 |                 |                                      | application shall ensure that the <i>type_string</i> option-argument is a string specifying                                 |
| 100889 |                 |                                      | the types to be used when writing the input data. The string shall consist of the                                           |
| 100890 |                 |                                      | type specification characters a, c, d, f, o, u, and x, specifying named character,                                          |
| 100891 |                 |                                      | character, signed decimal, floating point, octal, unsigned decimal, and                                                     |
| 100892 |                 |                                      | hexadecimal, respectively. The type specification characters d, f, o, u, and x can be                                       |
| 100893 |                 |                                      | followed by an optional unsigned decimal integer that specifies the number of                                               |
| 100894 |                 |                                      | bytes to be transformed by each instance of the output type. The type specification                                         |
| 100895 |                 |                                      | character f can be followed by an optional F, D, or L indicating that the conversion                                        |
| 100896 |                 |                                      | should be applied to an item of type <b>float</b> , <b>double</b> , or <b>long double</b> , respectively.                   |
| 100897 |                 |                                      | The type specification characters d, o, u, and x can be followed by an optional C, S,                                       |
| 100898 |                 |                                      | I, or L indicating that the conversion should be applied to an item of type <b>char</b> ,                                   |
| 100899 |                 |                                      | <b>short</b> , <b>int</b> , or <b>long</b> , respectively. Multiple types can be concatenated within the                    |
| 100900 |                 |                                      | same <i>type_string</i> and multiple <b>-t</b> options can be specified. Output lines shall be                              |
| 100901 |                 |                                      | written for each type specified in the order in which the type specification                                                |
| 100902 |                 |                                      | characters are specified.                                                                                                   |
| 100903 |                 | <b>-v</b>                            | Write all input data. Without the <b>-v</b> option, any number of groups of output lines,                                   |
| 100904 |                 |                                      | which would be identical to the immediately preceding group of output lines                                                 |
| 100905 |                 |                                      | (except for the byte offsets), shall be replaced with a line containing only an                                             |
| 100906 |                 |                                      | <asterisk> ( ' * ' ).                                                                                                       |
| 100907 | XSI             | <b>-x</b>                            | Interpret <i>words</i> (two-byte units) in hexadecimal. This shall be equivalent to <b>-t x2</b> .                          |
| 100908 | XSI             |                                      | Multiple types can be specified by using multiple <b>-bcdostx</b> options. Output lines are written for                     |
| 100909 |                 |                                      | each type specified in the order in which the types are specified.                                                          |
| 100910 | <b>OPERANDS</b> |                                      |                                                                                                                             |
| 100911 |                 |                                      | The following operands shall be supported:                                                                                  |
| 100912 | <i>file</i>     |                                      | A pathname of a file to be read. If no <i>file</i> operands are specified, the standard input                               |
| 100913 |                 |                                      | shall be used.                                                                                                              |
| 100914 |                 |                                      | If there are no more than two operands, none of the <b>-A</b> , <b>-j</b> , <b>-N</b> , <b>-t</b> , or <b>-v</b> options is |
| 100915 |                 |                                      | specified, and either of the following is true: the first character of the last operand                                     |
| 100916 |                 |                                      | is a <plus-sign> ( ' + ' ), or there are two operands and the first character of the last                                   |
| 100917 | XSI             |                                      | operand is numeric; the last operand shall be interpreted as an offset operand on                                           |
| 100918 |                 |                                      | XSI-conformant systems. Under these conditions, the results are unspecified on                                              |
| 100919 |                 |                                      | systems that are not XSI-conformant systems.                                                                                |
| 100920 | XSI             | <b>[+]<i>offset</i>[.][<i>b</i>]</b> | The <i>offset</i> operand specifies the offset in the file where dumping is to commence.                                    |
| 100921 |                 |                                      | This operand is normally interpreted as octal bytes. If ' . ' is appended, the offset                                       |
| 100922 |                 |                                      | shall be interpreted in decimal. If ' b ' is appended, the offset shall be interpreted                                      |
| 100923 |                 |                                      | in units of 512 bytes.                                                                                                      |
| 100924 | <b>STDIN</b>    |                                      |                                                                                                                             |
| 100925 |                 |                                      | The standard input shall be used if no <i>file</i> operands are specified, and shall be used if a <i>file</i>               |
| 100926 |                 |                                      | operand is ' - ' and the implementation treats the ' - ' as meaning standard input. Otherwise,                              |
| 100927 |                 |                                      | the standard input shall not be used. See the INPUT FILES section.                                                          |

100928 **INPUT FILES**

100929 The input files can be any file type.

100930 **ENVIRONMENT VARIABLES**100931 The following environment variables shall affect the execution of *od*:

100932 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 100933 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 100934 variables used to determine the values of locale categories.)

100935 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 100936 internationalization variables.

100937 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 100938 characters (for example, single-byte as opposed to multi-byte characters in  
 100939 arguments and input files).

100940 **LC\_MESSAGES**

100941 Determine the locale that should be used to affect the format and contents of  
 100942 diagnostic messages written to standard error.

100943 **LC\_NUMERIC**

100944 Determine the locale for selecting the radix character used when writing floating-  
 100945 point formatted output.

100946 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

100947 **ASYNCHRONOUS EVENTS**

100948 Default.

100949 **STDOUT**

100950 See the EXTENDED DESCRIPTION section.

100951 **STDERR**

100952 The standard error shall be used only for diagnostic messages.

100953 **OUTPUT FILES**

100954 None.

100955 **EXTENDED DESCRIPTION**

100956 The *od* utility shall copy sequentially each input file to standard output, transforming the input  
 100957 XSI data according to the output types specified by the **-t** option or the **-bcdosx** options. If no  
 100958 output type is specified, the default output shall be as if **-t oS** had been specified.

100959 The number of bytes transformed by the output type specifier *c* may be variable depending on  
 100960 the **LC\_CTYPE** category.

100961 The default number of bytes transformed by output type specifiers *d*, *f*, *o*, *u*, and *x* corresponds  
 100962 to the various C-language types as follows. If the *c99* compiler is present on the system, these  
 100963 specifiers shall correspond to the sizes used by default in that compiler. Otherwise, these sizes  
 100964 may vary among systems that conform to POSIX.1-2008.

- 100965 • For the type specifier characters *d*, *o*, *u*, and *x*, the default number of bytes shall
- 100966 correspond to the size of the underlying implementation's basic integer type. For these
- 100967 specifier characters, the implementation shall support values of the optional number of
- 100968 bytes to be converted corresponding to the number of bytes in the C-language types **char**,
- 100969 **short**, **int**, and **long**. These numbers can also be specified by an application as the
- 100970 characters '**C**', '**S**', '**I**', and '**L**', respectively. The implementation shall also support
- 100971 the values 1, 2, 4, and 8, even if it provides no C-Language types of those sizes. The

implementation shall support the decimal value corresponding to the C-language type **long long**. The byte order used when interpreting numeric values is implementation-defined, but shall correspond to the order in which a constant of the corresponding type is stored in memory on the system.

- For the type specifier character *f*, the default number of bytes shall correspond to the number of bytes in the underlying implementation's basic double precision floating-point data type. The implementation shall support values of the optional number of bytes to be converted corresponding to the number of bytes in the C-language types **float**, **double**, and **long double**. These numbers can also be specified by an application as the characters 'F', 'D', and 'L', respectively.

The type specifier character *a* specifies that bytes shall be interpreted as named characters from the International Reference Version (IRV) of the ISO/IEC 646:1991 standard. Only the least significant seven bits of each byte shall be used for this type specification. Bytes with the values listed in the following table shall be written using the corresponding names for those characters.

**Table 4-13** Named Characters in *od*

| Value | Name | Value | Name | Value | Name      | Value | Name |
|-------|------|-------|------|-------|-----------|-------|------|
| \000  | nul  | \001  | soh  | \002  | stx       | \003  | etx  |
| \004  | eot  | \005  | enq  | \006  | ack       | \007  | bel  |
| \010  | bs   | \011  | ht   | \012  | lf or nl* | \013  | vt   |
| \014  | ff   | \015  | cr   | \016  | so        | \017  | si   |
| \020  | dle  | \021  | dc1  | \022  | dc2       | \023  | dc3  |
| \024  | dc4  | \025  | nak  | \026  | syn       | \027  | etb  |
| \030  | can  | \031  | em   | \032  | sub       | \033  | esc  |
| \034  | fs   | \035  | gs   | \036  | rs        | \037  | us   |
| \040  | sp   | \177  | del  |       |           |       |      |

**Note:** The "\012" value may be written either as **lf** or **nl**.

The type specifier character *c* specifies that bytes shall be interpreted as characters specified by the current setting of the *LC\_CTYPE* locale category. Characters listed in the table in XBD Chapter 5 (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v') shall be written as the corresponding escape sequences, except that <backslash> shall be written as a single <backslash> and a NUL shall be written as '\0'. Other non-printable characters shall be written as one three-digit octal number for each byte in the character. Printable multi-byte characters shall be written in the area corresponding to the first byte of the character; the two-character sequence "\*\*\*" shall be written in the area corresponding to each remaining byte in the character, as an indication that the character is continued. When either the **-j skip** or **-N count** option is specified along with the *c* type specifier, and this results in an attempt to start or finish in the middle of a multi-byte character, the result is implementation-defined.

The input data shall be manipulated in blocks, where a block is defined as a multiple of the least common multiple of the number of bytes transformed by the specified output types. If the least common multiple is greater than 16, the results are unspecified. Each input block shall be written as transformed by each output type, one per written line, in the order that the output types were specified. If the input block size is larger than the number of bytes transformed by the output type, the output type shall sequentially transform the parts of the input block, and the output from each of the transformations shall be separated by one or more <blank> characters.

If, as a result of the specification of the **-N** option or end-of-file being reached on the last input file, input data only partially satisfies an output type, the input shall be extended sufficiently

101019 with null bytes to write the last byte of the input.

101020 Unless **-A n** is specified, the first output line produced for each input block shall be preceded by  
 101021 the input offset, cumulative across input files, of the next byte to be written. The format of the  
 101022 input offset is unspecified; however, it shall not contain any <blank> characters, shall start at the  
 101023 first character of the output line, and shall be followed by one or more <blank> characters. In  
 101024 addition, the offset of the byte following the last byte written shall be written after all the input  
 101025 data has been processed, but shall not be followed by any <blank> characters.

101026 If no **-A** option is specified, the input offset base is unspecified.

## 101027 EXIT STATUS

101028 The following exit values shall be returned:

101029 0 All input files were processed successfully.

101030 >0 An error occurred.

## 101031 CONSEQUENCES OF ERRORS

101032 Default.

## 101033 APPLICATION USAGE

101034 XSI-conformant applications are warned not to use filenames starting with '+' or a first  
 101035 operand starting with a numeric character so that the old functionality can be maintained by  
 101036 implementations, unless they specify one of the **-A**, **-j**, or **-N** options. To guarantee that one of  
 101037 these filenames is always interpreted as a filename, an application could always specify the  
 101038 address base format with the **-A** option.

## 101039 EXAMPLES

101040 If a file containing 128 bytes with decimal values zero to 127, in increasing order, is supplied as  
 101041 standard input to the command:

101042 `od -A d -t a`

101043 on an implementation using an input block size of 16 bytes, the standard output, independent of  
 101044 the current locale setting, would be similar to:

```

101045 0000000 nul soh stx etx eot enq ack bel bs ht nl vt ff cr so si
101046 0000016 dle dc1 dc2 dc3 dc4 nak syn etb can em sub esc fs gs rs us
101047 0000032 sp ! " # $ % & ' ( ) * + , - . /
101048 0000048 0 1 2 3 4 5 6 7 8 9 : ; < = > ?
101049 0000064 @ A B C D E F G H I J K L M N O
101050 0000080 P Q R S T U V W X Y Z [ \ ] ^ _
101051 0000096 ` a b c d e f g h i j k l m n o
101052 0000112 p q r s t u v w x y z { | } ~ del
101053 0000128
  
```

101054 Note that this volume of POSIX.1-2008 allows **nl** or **lf** to be used as the name for the  
 101055 ISO/IEC 646:1991 standard IRV character with decimal value 10. The IRV names this character  
 101056 **lf** (line feed), but traditional implementations have referred to this character as newline (**nl**) and  
 101057 the POSIX locale character set symbolic name for the corresponding character is a <newline>.

101058 The command:

101059 `od -A o -t o2x2x -N 18`

101060 on a system with 32-bit words and an implementation using an input block size of 16 bytes  
 101061 could write 18 bytes in approximately the following format:

101062 `0000000 032056 031440 041123 042040 052516 044530 020043 031464`

```

101063          342e   3320   4253   4420   554e   4958   2023   3334
101064          342e3320          42534420          554e4958          20233334
101065 0000020 032472
101066          353a
101067          353a0000
101068 0000022

```

The command:

```
od -A d -t f -t o4 -t x4 -N 24 -j 0x15
```

on a system with 64-bit doubles (for example, IEEE Std 754-1985 double precision floating-point format) would skip 21 bytes of input data and then write 24 bytes in approximately the following format:

```

101074 0000000 1.000000000000000e+00 1.573500000000000e+01
101075 07774000000 00000000000 10013674121 35341217270
101076 3ff00000 00000000 402f3851 eb851eb8
101077 0000016 1.406682300000000e+02
101078 10030312542 04370303230
101079 40619562 23e18698
101080 0000024

```

## RATIONALE

The *od* utility went through several names in early proposals, including *hd*, *xd*, and most recently *hexdump*. There were several objections to all of these based on the following reasons:

- The *hd* and *xd* names conflicted with historical utilities that behaved differently.
- The *hexdump* description was much more complex than needed for a simple dump utility.
- The *od* utility has been available on all historical implementations and there was no need to create a new name for a utility so similar to the historical *od* utility.

The original reasons for not standardizing historical *od* were also fairly widespread. Those reasons are given below along with rationale explaining why the standard developers believe that this version does not suffer from the indicated problem:

- The BSD and System V versions of *od* have diverged, and the intersection of features provided by both does not meet the needs of the user community. In fact, the System V version only provides a mechanism for dumping octal bytes and **shorts**, signed and unsigned decimal **shorts**, hexadecimal **shorts**, and ASCII characters. BSD added the ability to dump **floats**, **doubles**, named ASCII characters, and octal, signed decimal, unsigned decimal, and hexadecimal **longs**. The version presented here provides more normalized forms for dumping bytes, **shorts**, **ints**, and **longs** in octal, signed decimal, unsigned decimal, and hexadecimal; **float**, **double**, and **long double**; and named ASCII as well as current locale characters.
- It would not be possible to come up with a compatible superset of the BSD and System V flags that met the requirements of the standard developers. The historical default *od* output is the specified default output of this utility. None of the option letters chosen for this version of *od* conflict with any of the options to historical versions of *od*.
- On systems with different sizes for **short**, **int**, and **long**, there was no way to ask for dumps of **ints**, even in the BSD version. Because of the way options are named, the name space could not be extended to solve these problems. This is why the **-t** option was added (with type specifiers more closely matched to the *printf()* formats used in the rest of this volume of POSIX.1-2008) and the optional field sizes were added to the **d**, **f**, **o**, **u**, and **x** type

specifiers. It is also one of the reasons why the historical practice was not mandated as a required obsolescent form of *od*. (Although the old versions of *od* are not listed as an obsolescent form, implementations are urged to continue to recognize the older forms for several more years.) The *a*, *c*, *f*, *o*, and *x* types match the meaning of the corresponding format characters in the historical implementations of *od* except for the default sizes of the fields converted. The *d* format is signed in this volume of POSIX.1-2008 to match the *printf()* notation. (Historical versions of *od* used *d* as a synonym for *u* in this version. The System V implementation uses *s* for signed decimal; BSD uses *i* for signed decimal and *s* for null-terminated strings.) Other than *d* and *u*, all of the type specifiers match format characters in the historical BSD version of *od*.

The sizes of the C-language types **char**, **short**, **int**, **long**, **float**, **double**, and **long double** are used even though it is recognized that there may be zero or more than one compiler for the C language on an implementation and that they may use different sizes for some of these types. (For example, one compiler might use 2 bytes **shorts**, 2 bytes **ints**, and 4 bytes **longs**, while another compiler (or an option to the same compiler) uses 2 bytes **shorts**, 4 bytes **ints**, and 4 bytes **longs**.) Nonetheless, there has to be a basic size known by the implementation for these types, corresponding to the values reported by invocations of the *getconf* utility when called with *system\_var* operands {UCHAR\_MAX}, {USHORT\_MAX}, {UINT\_MAX}, and {ULONG\_MAX} for the types **char**, **short**, **int**, and **long**, respectively. There are similar constants required by the ISO C standard, but not required by the System Interfaces volume of POSIX.1-2008 or this volume of POSIX.1-2008. They are {FLT\_MANT\_DIG}, {DBL\_MANT\_DIG}, and {LDBL\_MANT\_DIG} for the types **float**, **double**, and **long double**, respectively. If the optional *c99* utility is provided by the implementation and used as specified by this volume of POSIX.1-2008, these are the sizes that would be provided. If an option is used that specifies different sizes for these types, there is no guarantee that the *od* utility is able to interpret binary data output by such a program correctly.

This volume of POSIX.1-2008 requires that the numeric values of these lengths be recognized by the *od* utility and that symbolic forms also be recognized. Thus, a conforming application can always look at an array of **unsigned long** data elements using *od -t uL*.

- The method of specifying the format for the address field based on specifying a starting offset in a file unnecessarily tied the two together. The **-A** option now specifies the address base and the **-S** option specifies a starting offset.
- It would be difficult to break the dependence on US ASCII to achieve an internationalized utility. It does not seem to be any harder for *od* to dump characters in the current locale than it is for the *ed* or *sed* **l** commands. The *c* type specifier does this without difficulty and is completely compatible with the historical implementations of the *c* format character when the current locale uses a superset of the ISO/IEC 646:1991 standard as a codeset. The *a* type specifier (from the BSD *a* format character) was left as a portable means to dump ASCII (or more correctly ISO/IEC 646:1991 standard (IRV)) so that headers produced by *pax* could be deciphered even on systems that do not use the ISO/IEC 646:1991 standard as a subset of their base codeset.

The use of **"\*\*"** as an indication of continuation of a multi-byte character in *c* specifier output was chosen based on seeing an implementation that uses this method. The continuation bytes have to be marked in a way that is not ambiguous with another single-byte or multi-byte character.

An early proposal used **-S** and **-n**, respectively, for the **-j** and **-N** options eventually selected. These were changed to avoid conflicts with historical implementations.

101158 The original standard specified **-t o2** as the default when no output type was given. This was  
101159 changed to **-t oS** (the length of a **short**) to accommodate a supercomputer implementation that  
101160 historically used 64 bits as its default (and that defined shorts as 64 bits). This change should not  
101161 affect conforming applications. The requirement to support lengths of 1, 2, and 4 was added at  
101162 the same time to address an historical implementation that had no two-byte data types in its C  
101163 compiler.

101164 The use of a basic integer data type is intended to allow the implementation to choose a word  
101165 size commonly used by applications on that architecture.

101166 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
101167 but this has been modified in this version.

#### 101168 **FUTURE DIRECTIONS**

101169 All option and operand interfaces marked XSI may be removed in a future version.

#### 101170 **SEE ALSO**

101171 *c99, sed*

101172 XBD [Chapter 5](#) (on page 121), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

#### 101173 **CHANGE HISTORY**

101174 First released in Issue 2.

#### 101175 **Issue 5**

101176 In the description of the **-c** option, the phrase “This is equivalent to **-t c.**” is deleted.

101177 The FUTURE DIRECTIONS section is modified.

#### 101178 **Issue 6**

101179 The *od* utility is changed to remove the assumption that **short** was a two-byte entity, as per the  
101180 revisions in the IEEE P1003.2b draft standard.

101181 The normative text is reworded to avoid use of the term “must” for application requirements.

101182 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/33 is applied, correcting the examples  
101183 which used an undefined **-n** option, which should have been **-N**.

101184 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/19 is applied, removing text describing  
101185 behavior on systems with bytes consisting of more than eight bits.

#### 101186 **Issue 7**

101187 Austin Group Interpretation 1003.1-2001 #092 is applied.

101188 SD5-XCU-ERN-37 is applied, updating the OPERANDS section.

101189 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

101190 **NAME**101191 `paste` — merge corresponding or subsequent lines of files101192 **SYNOPSIS**101193 `paste [-s] [-d list] file...`101194 **DESCRIPTION**101195 The *paste* utility shall concatenate the corresponding lines of the given input files, and write the  
101196 resulting lines to standard output.101197 The default operation of *paste* shall concatenate the corresponding lines of the input files. The  
101198 <newline> of every line except the line from the last input file shall be replaced with a <tab>.101199 If an end-of-file condition is detected on one or more input files, but not all input files, *paste* shall  
101200 behave as though empty lines were read from the files on which end-of-file was detected, unless  
101201 the `-s` option is specified.101202 **OPTIONS**101203 The *paste* utility shall conform to XBD [Section 12.2](#) (on page 216).

101204 The following options shall be supported:

101205 `-d list` Unless a <backslash> character appears in *list*, each character in *list* is an element  
101206 specifying a delimiter character. If a <backslash> character appears in *list*, the  
101207 <backslash> character and one or more characters following it are an element  
101208 specifying a delimiter character as described below. These elements specify one or  
101209 more delimiters to use, instead of the default <tab>, to replace the <newline> of  
101210 the input lines. The elements in *list* shall be used circularly; that is, when the list is  
101211 exhausted the first element from the list is reused. When the `-s` option is specified:

- 101212
- The last <newline> in a file shall not be modified.
  - The delimiter shall be reset to the first element of *list* after each *file* operand is  
101213 processed.

101214 When the `-s` option is not specified:

- 101215
- The <newline> characters in the file specified by the last *file* operand shall  
101216 not be modified.
  - The delimiter shall be reset to the first element of *list* each time a line is  
101217 processed from each file.

101218 If a <backslash> character appears in *list*, it and the character following it shall be  
101219 used to represent the following delimiter characters:101220 `\n` <newline>.101221 `\t` <tab>.101222 `\\` <backslash> character.101223 `\0` Empty string (not a null character). If '`\0`' is immediately followed by the  
101224 character '`x`', the character '`X`', or any character defined by the *LC\_CTYPE*  
101225 **digit** keyword (see XBD [Chapter 7](#), on page 135), the results are unspecified.

101226 If any other characters follow the &lt;backslash&gt;, the results are unspecified.

101227 `-s` Concatenate all of the lines from each input file into one line of output per file, in  
101228 command line order. The <newline> of every line except the last line in each input  
101229 file shall be replaced with a <tab>, unless otherwise specified by the `-d` option. If  
101230 an input file is empty, the output line corresponding to that file shall consist of  
101231 |  
101232 |

101233 only a <newline> character.

#### 101234 OPERANDS

101235 The following operand shall be supported:

101236 *file* A pathname of an input file. If '-' is specified for one or more of the *files*, the  
 101237 standard input shall be used; the standard input shall be read one line at a time,  
 101238 circularly, for each instance of '-'. Implementations shall support pasting of at  
 101239 least 12 *file* operands.

#### 101240 STDIN

101241 The standard input shall be used only if one or more *file* operands is '-'. See the INPUT FILES  
 101242 section.

#### 101243 INPUT FILES

101244 The input files shall be text files, except that line lengths shall be unlimited.

#### 101245 ENVIRONMENT VARIABLES

101246 The following environment variables shall affect the execution of *paste*:

101247 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 101248 (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
 101249 used to determine the values of locale categories.)

101250 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 101251 internationalization variables.

101252 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 101253 characters (for example, single-byte as opposed to multi-byte characters in  
 101254 arguments and input files).

101255 *LC\_MESSAGES*  
 101256 Determine the locale that should be used to affect the format and contents of  
 101257 diagnostic messages written to standard error.

101258 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 101259 ASYNCHRONOUS EVENTS

101260 Default.

#### 101261 STDOUT

101262 Concatenated lines of input files shall be separated by the <tab> (or other characters under the  
 101263 control of the -d option) and terminated by a <newline>.

#### 101264 STDERR

101265 The standard error shall be used only for diagnostic messages.

#### 101266 OUTPUT FILES

101267 None.

#### 101268 EXTENDED DESCRIPTION

101269 None.

#### 101270 EXIT STATUS

101271 The following exit values shall be returned:

101272 0 Successful completion.

101273 >0 An error occurred.

101274 **CONSEQUENCES OF ERRORS**

101275 If one or more input files cannot be opened when the `-s` option is not specified, a diagnostic  
 101276 message shall be written to standard error, but no output is written to standard output. If the `-s`  
 101277 option is specified, the *paste* utility shall provide the default behavior described in [Section 1.4](#) (on  
 101278 page 2326).

101279 **APPLICATION USAGE**

101280 When the escape sequences of the *list* option-argument are used in a shell script, they must be  
 101281 quoted; otherwise, the shell treats the `<backslash>` as a special character.

101282 Conforming applications should only use the specific `<backslash>`-escaped delimiters presented  
 101283 in this volume of POSIX.1-2008. Historical implementations treat `'\x'`, where `'x'` is not in this  
 101284 list, as `'x'`, but future implementations are free to expand this list to recognize other common  
 101285 escapes similar to those accepted by *printf* and other standard utilities.

101286 Most of the standard utilities work on text files. The *cut* utility can be used to turn files with  
 101287 arbitrary line lengths into a set of text files containing the same data. The *paste* utility can be used  
 101288 to create (or recreate) files with arbitrary line lengths. For example, if *file* contains long lines:

```
101289 cut -b 1-500 -n file > file1
101290 cut -b 501- -n file > file2
```

101291 creates **file1** (a text file) with lines no longer than 500 bytes (plus the `<newline>`) and **file2** that  
 101292 contains the remainder of the data from *file*. Note that **file2** is not a text file if there are lines in  
 101293 *file* that are longer than 500 + `{LINE_MAX}` bytes. The original file can be recreated from **file1**  
 101294 and **file2** using the command:

```
101295 paste -d "\0" file1 file2 > file
```

101296 The commands:

```
101297 paste -d "\0" ...
101298 paste -d " " ...
```

101299 are not necessarily equivalent; the latter is not specified by this volume of POSIX.1-2008 and  
 101300 may result in an error. The construct `'\0'` is used to mean “no separator” because historical  
 101301 versions of *paste* did not follow the syntax guidelines, and the command:

```
101302 paste -d " " ...
```

101303 could not be handled properly by *getopt()*.

101304 **EXAMPLES**

101305 1. Write out a directory in four columns:

```
101306 ls | paste - - - -
```

101307 2. Combine pairs of lines from a file into single lines:

```
101308 paste -s -d "\t\n" file
```

101309 **RATIONALE**

101310 None.

101311 **FUTURE DIRECTIONS**

101312 None.

101313 **SEE ALSO**101314 [Section 1.4](#) (on page 2326), *cut*, *grep*, *pr*101315 XBD [Chapter 7](#) (on page 135), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)101316 **CHANGE HISTORY**

101317 First released in Issue 2.

101318 **Issue 6**

101319 The normative text is reworded to avoid use of the term “must” for application requirements.

101320 **Issue 7**

101321 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

101322 **NAME**

101323 patch — apply changes to files

101324 **SYNOPSIS**

101325 patch [-blNR] [-c|-e|-n|-u] [-d *dir*] [-D *define*] [-i *patchfile*]  
 101326 [-o *outfile*] [-p *num*] [-r *rejectfile*] [*file*]

101327 **DESCRIPTION**

101328 The *patch* utility shall read a source (patch) file containing any of four forms of difference (diff)  
 101329 listings produced by the *diff* utility (normal, copied context, unified context, or in the style of *ed*)  
 101330 and apply those differences to a file. By default, *patch* shall read from the standard input.

101331 The *patch* utility shall attempt to determine the type of the *diff* listing, unless overruled by a *-c*,  
 101332 *-e*, *-n*, or *-u* option.

101333 If the patch file contains more than one patch, *patch* shall attempt to apply each of them as if they  
 101334 came from separate patch files. (In this case, the application shall ensure that the name of the  
 101335 patch file is determinable for each *diff* listing.)

101336 **OPTIONS**

101337 The *patch* utility shall conform to XBD [Section 12.2](#) (on page 216).

101338 The following options shall be supported:

101339 **-b** Save a copy of the original contents of each modified file, before the differences are  
 101340 applied, in a file of the same name with the suffix **.orig** appended to it. If the file  
 101341 already exists, it shall be overwritten; if multiple patches are applied to the same  
 101342 file, the **.orig** file shall be written only for the first patch. When the *-o outfile* option  
 101343 is also specified, *file.orig* shall not be created but, if *outfile* already exists, *outfile.orig*  
 101344 shall be created.

101345 **-c** Interpret the patch file as a copied context difference (the output of the utility *diff*  
 101346 when the *-c* or *-C* options are specified).

101347 **-d dir** Change the current directory to *dir* before processing as described in the  
 101348 EXTENDED DESCRIPTION section.

101349 **-D define** Mark changes with one of the following C preprocessor constructs:

```
101350 #ifdef define
101351 ...
101352 #endif

101353 #ifndef define
101354 ...
101355 #endif
```

101356 optionally combined with the C preprocessor construct **#else**. If the patched file is  
 101357 processed with the C preprocessor, where the macro *define* is defined, the output  
 101358 shall contain the changes from the patch file; otherwise, the output shall not  
 101359 contain the patches specified in the patch file.

101360 **-e** Interpret the patch file as an *ed* script, rather than a *diff* script.

101361 **-i patchfile** Read the patch information from the file named by the pathname *patchfile*, rather  
 101362 than the standard input.

101363 **-l** (The letter ell.) Cause any sequence of <blank> characters in the difference script to  
 101364 match any sequence of <blank> characters in the input file. Other characters shall  
 101365 be matched exactly.

|        |                      |                                                                                                      |
|--------|----------------------|------------------------------------------------------------------------------------------------------|
| 101366 | <b>-n</b>            | Interpret the script as a normal difference.                                                         |
| 101367 | <b>-N</b>            | Ignore patches where the differences have already been applied to the file; by                       |
| 101368 |                      | default, already-applied patches shall be rejected.                                                  |
| 101369 | <b>-o outfile</b>    | Instead of modifying the files (specified by the <i>file</i> operand or the difference               |
| 101370 |                      | listings) directly, write a copy of the file referenced by each patch, with the                      |
| 101371 |                      | appropriate differences applied, to <i>outfile</i> . Multiple patches for a single file shall be     |
| 101372 |                      | applied to the intermediate versions of the file created by any previous patches,                    |
| 101373 |                      | and shall result in multiple, concatenated versions of the file being written to                     |
| 101374 |                      | <i>outfile</i> .                                                                                     |
| 101375 | <b>-p num</b>        | For all pathnames in the patch file that indicate the names of files to be patched,                  |
| 101376 |                      | delete <i>num</i> pathname components from the beginning of each pathname. If the                    |
| 101377 |                      | pathname in the patch file is absolute, any leading <slash> characters shall be                      |
| 101378 |                      | considered the first component (that is, <b>-p 1</b> shall remove the leading <slash>                |
| 101379 |                      | characters). Specifying <b>-p 0</b> shall cause the full pathname to be used. If <b>-p</b> is not    |
| 101380 |                      | specified, only the basename (the final pathname component) shall be used.                           |
| 101381 | <b>-R</b>            | Reverse the sense of the patch script; that is, assume that the difference script was                |
| 101382 |                      | created from the new version to the old version. The <b>-R</b> option cannot be used                 |
| 101383 |                      | with <i>ed</i> scripts. The <i>patch</i> utility shall attempt to reverse each portion of the script |
| 101384 |                      | before applying it. Rejected differences shall be saved in swapped format. If this                   |
| 101385 |                      | option is not specified, and until a portion of the patch file is successfully applied,              |
| 101386 |                      | <i>patch</i> attempts to apply each portion in its reversed sense as well as in its normal           |
| 101387 |                      | sense. If the attempt is successful, the user shall be prompted to determine whether                 |
| 101388 |                      | the <b>-R</b> option should be set.                                                                  |
| 101389 | <b>-r rejectfile</b> | Override the default reject filename. In the default case, the reject file shall have the            |
| 101390 |                      | same name as the output file, with the suffix <b>.rej</b> appended to it; see <a href="#">Patch</a>  |
| 101391 |                      | <a href="#">Application</a> (on page 3048).                                                          |
| 101392 | <b>-u</b>            | Interpret the patch file as a unified context difference (the output of the <i>diff</i> utility      |
| 101393 |                      | when the <b>-u</b> or <b>-U</b> options are specified).                                              |

#### 101394 OPERANDS

101395 The following operand shall be supported:

101396 *file* A pathname of a file to patch.

#### 101397 STDIN

101398 See the INPUT FILES section.

#### 101399 INPUT FILES

101400 Input files shall be text files.

#### 101401 ENVIRONMENT VARIABLES

101402 The following environment variables shall affect the execution of *patch*:

101403 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 101404 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 101405 used to determine the values of locale categories.)

101406 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 101407 internationalization variables.

101408 *LC\_COLLATE*  
 101409 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 101410 character collating elements used in the extended regular expression defined for

|        |                                                                                                                                                  |                                                                                       |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| 101411 |                                                                                                                                                  | the <b>yesexpr</b> locale keyword in the <i>LC_MESSAGES</i> category.                 |
| 101412 | <i>LC_CTYPE</i>                                                                                                                                  | Determine the locale for the interpretation of sequences of bytes of text data as     |
| 101413 |                                                                                                                                                  | characters (for example, single-byte as opposed to multi-byte characters in           |
| 101414 |                                                                                                                                                  | arguments and input files), and the behavior of character classes used in the         |
| 101415 |                                                                                                                                                  | extended regular expression defined for the <b>yesexpr</b> locale keyword in the      |
| 101416 |                                                                                                                                                  | <i>LC_MESSAGES</i> category.                                                          |
| 101417 | <i>LC_MESSAGES</i>                                                                                                                               |                                                                                       |
| 101418 |                                                                                                                                                  | Determine the locale used to process affirmative responses, and the locale used to    |
| 101419 |                                                                                                                                                  | affect the format and contents of diagnostic messages and prompts written to          |
| 101420 |                                                                                                                                                  | standard error.                                                                       |
| 101421 | XSI <i>NLSPATH</i>                                                                                                                               | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> . |
| 101422 | <i>LC_TIME</i>                                                                                                                                   | Determine the locale for recognizing the format of file timestamps written by the     |
| 101423 |                                                                                                                                                  | <i>diff</i> utility in a context-difference input file.                               |
| 101424 | <b>ASYNCHRONOUS EVENTS</b>                                                                                                                       |                                                                                       |
| 101425 | Default.                                                                                                                                         |                                                                                       |
| 101426 | <b>STDOUT</b>                                                                                                                                    |                                                                                       |
| 101427 | Not used.                                                                                                                                        |                                                                                       |
| 101428 | <b>STDERR</b>                                                                                                                                    |                                                                                       |
| 101429 | The standard error shall be used for diagnostic and informational messages.                                                                      |                                                                                       |
| 101430 | <b>OUTPUT FILES</b>                                                                                                                              |                                                                                       |
| 101431 | The output of the <i>patch</i> utility, the save files ( <b>.orig</b> suffixes), and the reject files ( <b>.rej</b> suffixes) shall              |                                                                                       |
| 101432 | be text files.                                                                                                                                   |                                                                                       |
| 101433 | <b>EXTENDED DESCRIPTION</b>                                                                                                                      |                                                                                       |
| 101434 | A patch file may contain patching instructions for more than one file; filenames shall be                                                        |                                                                                       |
| 101435 | determined as specified in <a href="#">Filename Determination</a> (on page 3048). When the <b>-b</b> option is                                   |                                                                                       |
| 101436 | specified, for each patched file, the original shall be saved in a file of the same name with the                                                |                                                                                       |
| 101437 | suffix <b>.orig</b> appended to it.                                                                                                              |                                                                                       |
| 101438 | For each patched file, a reject file may also be created as noted in <a href="#">Patch Application</a> (on page                                  |                                                                                       |
| 101439 | 3048). In the absence of a <b>-r</b> option, the name of this file shall be formed by appending the suffix                                       |                                                                                       |
| 101440 | <b>.rej</b> to the original filename.                                                                                                            |                                                                                       |
| 101441 | <b>Patch File Format</b>                                                                                                                         |                                                                                       |
| 101442 | The patch file shall contain zero or more lines of header information followed by one or more                                                    |                                                                                       |
| 101443 | patches. Each patch shall contain zero or more lines of filename identification in the format                                                    |                                                                                       |
| 101444 | produced by the <b>-c</b> , <b>-C</b> , <b>-u</b> , or <b>-U</b> options of the <i>diff</i> utility, and one or more sets of <i>diff</i> output, |                                                                                       |
| 101445 | which are customarily called <i>hunks</i> .                                                                                                      |                                                                                       |
| 101446 | The <i>patch</i> utility shall recognize the following expression in the header information:                                                     |                                                                                       |
| 101447 | <b>Index:</b> <i>pathname</i>                                                                                                                    |                                                                                       |
| 101448 | The file to be patched is named <i>pathname</i> .                                                                                                |                                                                                       |
| 101449 | If all lines (including headers) within a patch begin with the same leading sequence of <blank>                                                  |                                                                                       |
| 101450 | characters, the <i>patch</i> utility shall remove this sequence before proceeding. Within each patch, if                                         |                                                                                       |
| 101451 | the type of difference is common context, the <i>patch</i> utility shall recognize the following                                                 |                                                                                       |
| 101452 | expressions:                                                                                                                                     |                                                                                       |

101453 \*\*\* *filename timestamp*  
 101454 The patches arose from *filename*.

101455 --- *filename timestamp*  
 101456 The patches should be applied to *filename*.

101457 If the type of difference is unified context, the *patch* utility shall recognize the following  
 101458 expressions:

101459 --- *filename timestamp*  
 101460 The patches arose from *filename*.

101461 + + + *filename timestamp*  
 101462 The patches should be applied to *filename*.

101463 Each hunk within a patch shall be the *diff* output to change a line range within the original file.  
 101464 The line numbers for successive hunks within a patch shall occur in ascending order.

### 101465 Filename Determination

101466 If no *file* operand is specified, *patch* shall perform the following steps to determine the filename  
 101467 to use:

- 101468 1. If the type of *diff* is context, the *patch* utility shall delete pathname components (as  
 101469 specified by the **-p** option) from the filename on the line beginning with "\*\*\*\*" (if copied  
 101470 context) or "---" (if unified context), then test for the existence of this file relative to the  
 101471 current directory (or the directory specified with the **-d** option). If the file exists, the *patch*  
 101472 utility shall use this filename.
- 101473 2. If the type of *diff* is context, the *patch* utility shall delete the pathname components (as  
 101474 specified by the **-p** option) from the filename on the line beginning with "---" (if copied  
 101475 context) or "+ + +" (if unified context), then test for the existence of this file relative to the  
 101476 current directory (or the directory specified with the **-d** option). If the file exists, the *patch*  
 101477 utility shall use this filename.
- 101478 3. If the header information contains a line beginning with the string **Index:**, the *patch* utility  
 101479 shall delete pathname components (as specified by the **-p** option) from this line, then test  
 101480 for the existence of this file relative to the current directory (or the directory specified  
 101481 with the **-d** option). If the file exists, the *patch* utility shall use this filename.
- 101482 XSI 4. If an **SCCS** directory exists in the current directory, *patch* shall attempt to perform a **get -e**  
 101483 **SCCS/s.filename** command to retrieve an editable version of the file. If the file exists, the  
 101484 *patch* utility shall use this filename.
- 101485 5. The *patch* utility shall write a prompt to standard output and request a filename  
 101486 interactively from the controlling terminal (for example, **/dev/tty**).

### 101487 Patch Application

101488 If the **-c**, **-e**, **-n**, or **-u** option is present, the *patch* utility shall interpret information within each  
 101489 hunk as a copied context difference, an *ed* difference, a normal difference, or a unified context  
 101490 difference, respectively. In the absence of any of these options, the *patch* utility shall determine  
 101491 the type of difference based on the format of information within the hunk.

101492 For each hunk, the *patch* utility shall begin to search for the place to apply the patch at the line  
 101493 number at the beginning of the hunk, plus or minus any offset used in applying the previous  
 101494 hunk. If lines matching the hunk context are not found, *patch* shall scan both forwards and  
 101495 backwards at least 1 000 bytes for a set of lines that match the hunk context.

101496 If no such place is found and it is a context difference, then another scan shall take place,  
101497 ignoring the first and last line of context. If that fails, the first two and last two lines of context  
101498 shall be ignored and another scan shall be made. Implementations may search more extensively  
101499 for installation locations.

101500 If no location can be found, the *patch* utility shall append the hunk to the reject file. A rejected  
101501 hunk that is a copied context difference, an *ed* difference, or a normal difference shall be written  
101502 in copied-context-difference format regardless of the format of the patch file. It is  
101503 implementation-defined whether a rejected hunk that is a unified context difference is written in  
101504 copied-context-difference format or in unified-context-difference format. If the input was a  
101505 normal or *ed*-style difference, the reject file may contain differences with zero lines of context.  
101506 The line numbers on the hunks in the reject file may be different from the line numbers in the  
101507 patch file since they shall reflect the approximate locations for the failed hunks in the new file  
101508 rather than the old one.

101509 If the type of patch is an *ed* diff, the implementation may accomplish the patching by invoking  
101510 the *ed* utility.

#### 101511 EXIT STATUS

101512 The following exit values shall be returned:

- 101513 0 Successful completion.
- 101514 1 One or more lines were written to a reject file.
- 101515 >1 An error occurred.

#### 101516 CONSEQUENCES OF ERRORS

101517 Patches that cannot be correctly placed in the file shall be written to a reject file.

#### 101518 APPLICATION USAGE

101519 The **-R** option does not work with *ed* scripts because there is too little information to reconstruct  
101520 the reverse operation.

101521 The **-p** option makes it possible to customize a patch file to local user directory structures  
101522 without manually editing the patch file. For example, if the filename in the patch file was:

101523 `/curds/whey/src/blurfl/blurfl.c`

101524 Setting **-p 0** gives the entire pathname unmodified; **-p 1** gives:

101525 `curds/whey/src/blurfl/blurfl.c`

101526 without the leading <slash>, **-p 4** gives:

101527 `blurfl/blurfl.c`

101528 and not specifying **-p** at all gives:

101529 `blurfl.c` .

#### 101530 EXAMPLES

101531 None.

#### 101532 RATIONALE

101533 Some of the functionality in historical *patch* implementations was not specified. The following  
101534 documents those features present in historical implementations that have not been specified.

101535 A deleted piece of functionality was the '+' pseudo-option allowing an additional set of options  
101536 and a patch file operand to be given. This was seen as being insufficiently useful to standardize.

101537 In historical implementations, if the string "Prereq:" appeared in the header, the *patch* utility

would search for the corresponding version information (the string specified in the header, delimited by <blank> characters or the beginning or end of a line or the file) anywhere in the original file. This was deleted as too simplistic and insufficiently trustworthy a mechanism to standardize. For example, if:

Prereq: 1.2

were in the header, the presence of a delimited 1.2 anywhere in the file would satisfy the prerequisite.

The following options were dropped from historical implementations of *patch* as insufficiently useful to standardize:

**-b** The **-b** option historically provided a method for changing the name extension of the backup file from the default **.orig**. This option has been modified and retained in this volume of POSIX.1-2008.

**-F** The **-F** option specified the number of lines of a context diff to ignore when searching for a place to install a patch.

**-f** The **-f** option historically caused *patch* not to request additional information from the user.

**-r** The **-r** option historically provided a method of overriding the extension of the reject file from the default **.rej**.

**-s** The **-s** option historically caused *patch* to work silently unless an error occurred.

**-x** The **-x** option historically set internal debugging flags.

In some file system implementations, the saving of a **.orig** file may produce unwanted results. In the case of 12, 13, or 14-character filenames (on file systems supporting 14-character maximum filenames), the **.orig** file overwrites the new file. The reject file may also exceed this filename limit. It was suggested, due to some historical practice, that a <tilde> ('~') suffix be used instead of **.orig** and some other character instead of the **.rej** suffix. This was rejected because it is not obvious to the user which file is which. The suffixes **.orig** and **.rej** are clearer and more understandable.

The **-b** option has the opposite sense in some historical implementations—do not save the **.orig** file. The default case here is not to save the files, making *patch* behave more consistently with the other standard utilities.

The **-w** option in early proposals was changed to **-l** to match historical practice.

The **-N** option was included because without it, a non-interactive application cannot reject previously applied patches. For example, if a user is piping the output of *diff* into the *patch* utility, and the user only wants to patch a file to a newer version non-interactively, the **-N** option is required.

Changes to the **-l** option description were proposed to allow matching across <newline> characters in addition to just <blank> characters. Since this is not historical practice, and since some ambiguities could result, it is suggested that future developments in this area utilize another option letter, such as **-L**.

The **-u** option of GNU *patch* has been added, along with support for unified context formats.

101578 **FUTURE DIRECTIONS**

101579 None.

101580 **SEE ALSO**101581 *diff, ed*101582 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)101583 **CHANGE HISTORY**

101584 First released in Issue 4.

101585 **Issue 5**

101586 The FUTURE DIRECTIONS section is added.

101587 **Issue 6**

101588 This utility is marked as part of the User Portability Utilities option.

101589 The description of the **-D** option and the steps in [Filename Determination](#) (on page 3048) are  
101590 changed to match historical practice as defined in the IEEE P1003.2b draft standard.

101591 The normative text is reworded to avoid use of the term “must” for application requirements.

101592 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/34 is applied, clarifying the way that the  
101593 *patch* utility performs **ifdef** selection for the **-D** option.101594 **Issue 7**101595 The *patch* utility is moved from the User Portability Utilities option to the Base. User Portability  
101596 Utilities is now an option for interactive utilities.

101597 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

101598 SD5-XCU-ERN-103 and SD5-XCU-ERN-120 are applied, adding the **-u** option.101599 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
101600 *LC\_MESSAGES* and *LC\_CTYPE* environment variables and adding the *LC\_COLLATE*  
101601 environment variable.

101602 **NAME**

101603 pathchk — check pathnames

101604 **SYNOPSIS**101605 pathchk [-p] [-P] *pathname*...101606 **DESCRIPTION**

101607 The *pathchk* utility shall check that one or more pathnames are valid (that is, they could be used  
 101608 to access or create a file without causing syntax errors) and portable (that is, no filename  
 101609 truncation results). More extensive portability checks are provided by the **-p** and **-P** options.

101610 By default, the *pathchk* utility shall check each component of each *pathname* operand based on the  
 101611 underlying file system. A diagnostic shall be written for each *pathname* operand that:

- 101612 • Is longer than {PATH\_MAX} bytes (see **Pathname Variable Values** in XBD [<limits.h>](#))
- 101613 • Contains any component longer than {NAME\_MAX} bytes in its containing directory
- 101614 • Contains any component in a directory that is not searchable
- 101615 • Contains any byte sequence that is not valid in its containing directory

101616 The format of the diagnostic message is not specified, but shall indicate the error detected and  
 101617 the corresponding *pathname* operand.

101618 It shall not be considered an error if one or more components of a *pathname* operand do not exist  
 101619 as long as a file matching the pathname specified by the missing components could be created  
 101620 that does not violate any of the checks specified above.

101621 **OPTIONS**101622 The *pathchk* utility shall conform to XBD [Section 12.2](#) (on page 216).

101623 The following option shall be supported:

101624 **-p** Instead of performing checks based on the underlying file system, write a  
 101625 diagnostic for each *pathname* operand that:

- 101626 • Is longer than {\_POSIX\_PATH\_MAX} bytes (see **Minimum Values** in XBD  
 101627 [<limits.h>](#))
- 101628 • Contains any component longer than {\_POSIX\_NAME\_MAX} bytes
- 101629 • Contains any character in any component that is not in the portable filename  
 101630 character set

101631 **-P** Write a diagnostic for each *pathname* operand that:

- 101632 • Contains a component whose first character is the <hyphen-minus>  
 101633 character
- 101634 • Is empty

101635 **OPERANDS**

101636 The following operand shall be supported:

101637 *pathname* A pathname to be checked.101638 **STDIN**

101639 Not used.

101640 **INPUT FILES**

101641 None.

101642 **ENVIRONMENT VARIABLES**101643 The following environment variables shall affect the execution of *pathchk*:

101644 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 101645 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 101646 used to determine the values of locale categories.)

101647 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 101648 internationalization variables.

101649 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 101650 characters (for example, single-byte as opposed to multi-byte characters in  
 101651 arguments).

101652 *LC\_MESSAGES*

101653 Determine the locale that should be used to affect the format and contents of  
 101654 diagnostic messages written to standard error.

101655 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

101656 **ASYNCHRONOUS EVENTS**

101657 Default.

101658 **STDOUT**

101659 Not used.

101660 **STDERR**

101661 The standard error shall be used only for diagnostic messages.

101662 **OUTPUT FILES**

101663 None.

101664 **EXTENDED DESCRIPTION**

101665 None.

101666 **EXIT STATUS**

101667 The following exit values shall be returned:

101668 0 All *pathname* operands passed all of the checks.

101669 &gt;0 An error occurred.

101670 **CONSEQUENCES OF ERRORS**

101671 Default.

101672 **APPLICATION USAGE**

101673 The *test* utility can be used to determine whether a given pathname names an existing file; it  
 101674 does not, however, give any indication of whether or not any component of the pathname was  
 101675 truncated in a directory where the `_POSIX_NO_TRUNC` feature is not in effect. The *pathchk*  
 101676 utility does not check for file existence; it performs checks to determine whether a pathname  
 101677 does exist or could be created with no pathname component truncation.

101678 The *noclobber* option in the shell (see the *set* special built-in) can be used to atomically create a  
 101679 file. As with all file creation semantics in the System Interfaces volume of POSIX.1-2008, it  
 101680 guarantees atomic creation, but still depends on applications to agree on conventions and  
 101681 cooperate on the use of files after they have been created.

101682 To verify that a pathname meets the requirements of filename portability, applications should

use both the `-p` and `-P` options together.

#### EXAMPLES

To verify that all pathnames in an imported data interchange archive are legitimate and unambiguous on the current system:

```
# This example assumes that no pathnames in the archive
# contain <newline> characters.
pax -f archive | sed -e 's/^[[:alnum:]]/\\&/g' | xargs pathchk --
if [ $? -eq 0 ]
then
    pax -r -f archive
else
    echo Investigate problems before importing files.
    exit 1
fi
```

To verify that all files in the current directory hierarchy could be moved to any system conforming to the System Interfaces volume of POSIX.1-2008 that also supports the *pax* utility:

```
find . -exec pathchk -p -P {} +
if [ $? -eq 0 ]
then
    pax -w -f ../archive .
else
    echo Portable archive cannot be created.
    exit 1
fi
```

To verify that a user-supplied pathname names a readable file and that the application can create a file extending the given path without truncation and without overwriting any existing file:

```
case $- in
    *(*)    reset="";;
    *)      reset="set +C"
            set -C;;
esac
test -r "$path" && pathchk "$path.out" &&
rm "$path.out" > "$path.out"
if [ $? -ne 0 ]; then
    printf "%s: %s not found or %s.out fails \
creation checks.\n" $0 "$path" "$path"
    $reset      # Reset the noclobber option in case a trap
                # on EXIT depends on it.
    exit 1
fi
$reset
PROCESSING < "$path" > "$path.out"
```

The following assumptions are made in this example:

1. **PROCESSING** represents the code that is used by the application to use **\$path** once it is verified that **\$path.out** works as intended.

2. The state of the *noclobber* option is unknown when this code is invoked and should be set on exit to the state it was in when this code was invoked. (The **reset** variable is used in this example to restore the initial state.)

3. Note the usage of:

```
rm "$path.out" > "$path.out"
```

- a. The *pathchk* command has already verified, at this point, that **\$path.out** is not truncated.
- b. With the *noclobber* option set, the shell verifies that **\$path.out** does not already exist before invoking *rm*.
- c. If the shell succeeded in creating **\$path.out**, *rm* removes it so that the application can create the file again in the **PROCESSING** step.
- d. If the **PROCESSING** step wants the file to exist already when it is invoked, the:

```
rm "$path.out" > "$path.out"
```

should be replaced with:

```
> "$path.out"
```

which verifies that the file did not already exist, but leaves **\$path.out** in place for use by **PROCESSING**.

#### RATIONALE

The *pathchk* utility was new for the ISO POSIX-2:1993 standard. It, along with the *set -C(noclobber)* option added to the shell, replaces the *mktemp*, *validfnam*, and *create* utilities that appeared in early proposals. All of these utilities were attempts to solve several common problems:

- Verify the validity (for several different definitions of “valid”) of a pathname supplied by a user, generated by an application, or imported from an external source.
- Atomically create a file.
- Perform various string handling functions to generate a temporary filename.

The *create* utility, included in an early proposal, provided checking and atomic creation in a single invocation of the utility; these are orthogonal issues and need not be grouped into a single utility. Note that the *noclobber* option also provides a way of creating a lock for process synchronization; since it provides an atomic *create*, there is no race between a test for existence and the following creation if it did not exist.

Having a function like *tmpnam()* in the ISO C standard is important in many high-level languages. The shell programming language, however, has built-in string manipulation facilities, making it very easy to construct temporary filenames. The names needed obviously depend on the application, but are frequently of a form similar to:

```
$TMPDIR/application_abbreviation$$suffix
```

In cases where there is likely to be contention for a given suffix, a simple shell **for** or **while** loop can be used with the shell *noclobber* option to create a file without risk of collisions, as long as applications trying to use the same filename name space are cooperating on the use of files after they have been created.

For historical purposes, **-p** does not check for the use of the <hyphen-minus> character as the first character in a component of the pathname, or for an empty *pathname* operand.

101777 **Issue 7**

101778 Austin Group Interpretations 1003.1-2001 #039, #040, and #094 are applied.

101779 SD5-XCU-ERN-121 is applied, updating the EXAMPLES section.

101780 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0127 [291] is applied.

101781 **NAME**

101782       pax — portable archive interchange

101783 **SYNOPSIS**101784       pax [-dv] [-c|-n] [-H|-L] [-o options] [-f archive] [-s replstr]...  
101785       [*pattern*...]101786       pax -r[-c|-n] [-dikuv] [-H|-L] [-f archive] [-o options]... [-p string]...  
101787       [-s replstr]... [*pattern*...]101788       pax -w [-dituvX] [-H|-L] [-b blocksize] [[-a] [-f archive]] [-o options]...  
101789       [-s replstr]... [-x format] [*file*...]101790       pax -r -w [-diklntuvX] [-H|-L] [-o options]... [-p string]...  
101791       [-s replstr]... [*file*...] *directory*101792 **DESCRIPTION**101793       The *pax* utility shall read, write, and write lists of the members of archive files and copy  
101794       directory hierarchies. A variety of archive formats shall be supported; see the **-x format** option.101795       The action to be taken depends on the presence of the **-r** and **-w** options. The four combinations  
101796       of **-r** and **-w** are referred to as the four modes of operation: **list**, **read**, **write**, and **copy** modes,  
101797       corresponding respectively to the four forms shown in the SYNOPSIS section.101798       **list**       In **list** mode (when neither **-r** nor **-w** are specified), *pax* shall write the names of  
101799       the members of the archive file read from the standard input, with pathnames  
101800       matching the specified patterns, to standard output. If a named file is of type  
101801       directory, the file hierarchy rooted at that file shall be listed as well.101802       **read**       In **read** mode (when **-r** is specified, but **-w** is not), *pax* shall extract the members of  
101803       the archive file read from the standard input, with pathnames matching the  
101804       specified patterns. If an extracted file is of type directory, the file hierarchy rooted  
101805       at that file shall be extracted as well. The extracted files shall be created performing  
101806       pathname resolution with the directory in which *pax* was invoked as the current  
101807       working directory.101808       If an attempt is made to extract a directory when the directory already exists, this  
101809       shall not be considered an error. If an attempt is made to extract a FIFO when the  
101810       FIFO already exists, this shall not be considered an error.101811       The ownership, access, and modification times, and file mode of the restored files  
101812       are discussed under the **-p** option.101813       **write**       In **write** mode (when **-w** is specified, but **-r** is not), *pax* shall write the contents of  
101814       the *file* operands to the standard output in an archive format. If no *file* operands are  
101815       specified, a list of files to copy, one per line, shall be read from the standard input  
101816       and each entry in this list shall be processed as if it had been a *file* operand on the  
101817       command line. A file of type directory shall include all of the files in the file  
101818       hierarchy rooted at the file.101819       **copy**       In **copy** mode (when both **-r** and **-w** are specified), *pax* shall copy the *file* operands  
101820       to the destination directory.101821       If no *file* operands are specified, a list of files to copy, one per line, shall be read  
101822       from the standard input. A file of type directory shall include all of the files in the  
101823       file hierarchy rooted at the file.101824       The effect of the **copy** shall be as if the copied files were written to a *pax* format |  
101825       archive file and then subsequently extracted, except that copying of sockets may be |

supported even if archiving them in write mode is not supported, and that there may be hard links between the original and the copied files. If the destination directory is a subdirectory of one of the files to be copied, the results are unspecified. If the destination directory is a file of a type not defined by the System Interfaces volume of POSIX.1-2008, the results are implementation-defined; otherwise, it shall be an error for the file named by the *directory* operand not to exist, not be writable by the user, or not be a file of type directory.

In **read** or **copy** modes, if intermediate directories are necessary to extract an archive member, *pax* shall perform actions equivalent to the *mkdir()* function defined in the System Interfaces volume of POSIX.1-2008, called with the following arguments:

- The intermediate directory used as the *path* argument
- The value of the bitwise-inclusive OR of S\_IRWXU, S\_IRWXG, and S\_IRWXO as the *mode* argument

If any specified *pattern* or *file* operands are not matched by at least one file or archive member, *pax* shall write a diagnostic message to standard error for each one that did not match and exit with a non-zero exit status.

The archive formats described in the EXTENDED DESCRIPTION section shall be automatically detected on input. The default output archive format shall be implementation-defined.

A single archive can span multiple files. The *pax* utility shall determine, in an implementation-defined manner, what file to read or write as the next file.

If the selected archive format supports the specification of linked files, it shall be an error if these files cannot be linked when the archive is extracted. For archive formats that do not store file contents with each name that causes a hard link, if the file that contains the data is not extracted during this *pax* session, either the data shall be restored from the original file, or a diagnostic message shall be displayed with the name of a file that can be used to extract the data. In traversing directories, *pax* shall detect infinite loops; that is, entering a previously visited directory that is an ancestor of the last file visited. When it detects an infinite loop, *pax* shall write a diagnostic message to standard error and shall terminate.

## OPTIONS

The *pax* utility shall conform to XBD [Section 12.2](#) (on page 216), except that the order of presentation of the **-o**, **-p**, and **-s** options is significant.

The following options shall be supported:

- r** Read an archive file from standard input.
- w** Write files to the standard output in the specified archive format.
- a** Append files to the end of the archive. It is implementation-defined which devices on the system support appending. Additional file formats unspecified by this volume of POSIX.1-2008 may impose restrictions on appending.
- b *blocksize*** Block the output at a positive decimal integer number of bytes per write to the archive file. Devices and archive formats may impose restrictions on blocking. Blocking shall be automatically determined on input. Conforming applications shall not specify a *blocksize* value larger than 32 256. Default blocking when creating archives depends on the archive format. (See the **-x** option below.)
- c** Match all file or archive members except those specified by the *pattern* or *file* operands.

|        |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 101870 | <b>-d</b>         | Cause files of type directory being copied or archived or archive members of type directory being extracted or listed to match only the file or archive member itself and not the file hierarchy rooted at the file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 101871 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 101872 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 101875 | <b>-H</b>         | If a symbolic link referencing a file of type directory is specified on the command line, <i>pax</i> shall archive the file hierarchy rooted in the file referenced by the link, using the name of the link as the root of the file hierarchy. Otherwise, if a symbolic link referencing a file of any other file type which <i>pax</i> can normally archive is specified on the command line, then <i>pax</i> shall archive the file referenced by the link, using the name of the link. The default behavior, when neither <b>-H</b> or <b>-L</b> are specified, shall be to archive the symbolic link itself.                                                                                                                                                                                                                       |

| 101882 | <b>-i</b>         | Interactively rename files or archive members. For each archive member matching a <i>pattern</i> operand or file matching a <i>file</i> operand, a prompt shall be written to the file <b>/dev/tty</b> . The prompt shall contain the name of the file or archive member, but the format is otherwise unspecified. A line shall then be read from <b>/dev/tty</b> . If this line is blank, the file or archive member shall be skipped. If this line consists of a single period, the file or archive member shall be processed with no modification to its name. Otherwise, its name shall be replaced with the contents of the line. The <i>pax</i> utility shall immediately exit with a non-zero exit status if end-of-file is encountered when reading a response or if <b>/dev/tty</b> cannot be opened for reading and writing. |

| 101902 | <b>-L</b>         | If a symbolic link referencing a file of type directory is specified on the command line or encountered during the traversal of a file hierarchy, <i>pax</i> shall archive the file hierarchy rooted in the file referenced by the link, using the name of the link as the root of the file hierarchy. Otherwise, if a symbolic link referencing a file of any other file type which <i>pax</i> can normally archive is specified on the command line or encountered during the traversal of a file hierarchy, <i>pax</i> shall archive the file referenced by the link, using the name of the link. The default behavior, when neither <b>-H</b> or <b>-L</b> are specified, shall be to archive the symbolic link itself.                                                                                                            |

| 101912 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 101913 | <b>-o options</b> | Provide information to the implementation to modify the algorithm for extracting or writing files. The value of <i>options</i> shall consist of one or more <comma>-separated keywords of the form:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 101914 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 101915 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 101916 |                   | <i>keyword</i> [[:]=value][,keyword[[:]=value], ...]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Some keywords apply only to certain file formats, as indicated with each description. Use of keywords that are inapplicable to the file format being processed produces undefined results.

Keywords in the *options* argument shall be a string that would be a valid portable filename as described in XBD [Section 3.282](#) (on page 79).

**Note:** Keywords are not expected to be filenames, merely to follow the same character composition rules as portable filenames.

Keywords can be preceded with white space. The *value* field shall consist of zero or more characters; within *value*, the application shall precede any literal <comma> with a <backslash>, which shall be ignored, but preserves the <comma> as part of *value*. A <comma> as the final character, or a <comma> followed solely by white space as the final characters, in *options* shall be ignored. Multiple **-o** options can be specified; if keywords given to these multiple **-o** options conflict, the keywords and values appearing later in command line sequence shall take precedence and the earlier shall be silently ignored. The following keyword values of *options* shall be supported for the file formats as indicated:

**delete=pattern**

(Applicable only to the **-x pax** format.) When used in **write** or **copy** mode, *pax* shall omit from extended header records that it produces any keywords matching the string pattern. When used in **read** or **list** mode, *pax* shall ignore any keywords matching the string pattern in the extended header records. In both cases, matching shall be performed using the pattern matching notation described in [Section 2.13.1](#) (on page 2372) and [Section 2.13.2](#) (on page 2373). For example:

**-o delete=security.\***

would suppress security-related information. See [pax Extended Header](#) (on page 3071) for extended header record keyword usage.

When multiple **-odelete=pattern** options are specified, the patterns shall be additive; all keywords matching the specified string patterns shall be omitted from extended header records that *pax* produces.

**exthdr.name=string**

(Applicable only to the **-x pax** format.) This keyword allows user control over the name that is written into the **ustar** header blocks for the extended header produced under the circumstances described in [pax Header Block](#) (on page 3070). The name shall be the contents of *string*, after the following character substitutions have been made:

| <i>string</i><br>Includes: | Replaced by:                                                                                                       |
|----------------------------|--------------------------------------------------------------------------------------------------------------------|
| %d                         | The directory name of the file, equivalent to the result of the <i>dirname</i> utility on the translated pathname. |
| %f                         | The filename of the file, equivalent to the result of the <i>basename</i> utility on the translated pathname.      |
| %p                         | The process ID of the <i>pax</i> process.                                                                          |
| %%                         | A ' % ' character.                                                                                                 |

Any other ' % ' characters in *string* produce undefined results.

If no **-o exthdr.name=string** is specified, *pax* shall use the following default

value:  
`%d/PaxHeaders.%p/%f`

#### **globexthdr.name=string**

(Applicable only to the **-x pax** format.) When used in **write** or **copy** mode with the appropriate options, *pax* shall create global extended header records with **ustar** header blocks that will be treated as regular files by previous versions of *pax*. This keyword allows user control over the name that is written into the **ustar** header blocks for global extended header records. The name shall be the contents of *string*, after the following character substitutions have been made:

| <i>string</i><br>Includes: | Replaced by:                                                                                                       |
|----------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>%n</code>            | An integer that represents the sequence number of the global extended header record in the archive, starting at 1. |
| <code>%p</code>            | The process ID of the <i>pax</i> process.                                                                          |
| <code>%%</code>            | A <code>'%'</code> character.                                                                                      |

Any other `'%'` characters in *string* produce undefined results.

If no **-o globexthdr.name=string** is specified, *pax* shall use the following default value:

`$TMPDIR/GlobalHead.%p.%n`

where *\$TMPDIR* represents the value of the *TMPDIR* environment variable. If *TMPDIR* is not set, *pax* shall use **/tmp**.

#### **invalid=action**

(Applicable only to the **-x pax** format.) This keyword allows user control over the action *pax* takes upon encountering values in an extended header record that, in **read** or **copy** mode, are invalid in the destination hierarchy or, in **list** mode, cannot be written in the codeset and current locale of the implementation. The following are invalid values that shall be recognized by *pax*:

- In **read** or **copy** mode, a filename or link name that contains character encodings invalid in the destination hierarchy. (For example, the name may contain embedded NULs.)
- In **read** or **copy** mode, a filename or link name that is longer than the maximum allowed in the destination hierarchy (for either a pathname component or the entire pathname).
- In **list** mode, any character string value (filename, link name, user name, and so on) that cannot be written in the codeset and current locale of the implementation.

The following mutually-exclusive values of the *action* argument are supported:

**binary** In **write** mode, *pax* shall generate a **hdrcharset=BINARY** extended header record for each file with a filename, link name, group name, owner name, or any other field in an extended header record that cannot be translated to the UTF-8 codeset, allowing the archive to contain the files with unencoded extended header record values. In **read** or **copy** mode, *pax* shall

|        |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 102008 |                       | use the values specified in the header without translation, regardless of whether this may overwrite an existing file with a valid name. In <b>list</b> mode, <i>pax</i> shall behave identically to the <b>bypass</b> action.                                                                                                                                                                                                                                                                                                                                                                                          |
| 102009 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 102010 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 102042 |                       | This keyword specifies the output format of the table of contents produced when the <b>-v</b> option is specified in <b>list</b> mode. See <a href="#">List Mode Format Specifications</a> (on page 3065). To avoid ambiguity, the <b>listopt=format</b> shall be the only or final <b>keyword=value</b> pair in a <b>-o</b> option-argument; all characters in the remainder of the option-argument shall be considered part of the format string. When multiple <b>-olistopt=format</b> options are specified, the format strings shall be considered a single, concatenated string, evaluated in command line order. |

| 102051 |                       | (Applicable only to the <b>-x pax</b> format.) When used in <b>write</b> or <b>copy</b> mode, <i>pax</i> shall include <b>atime</b> and <b>mtime</b> extended header records for each file. See <a href="#">pax Extended Header File Times</a> (on page 3074).                                                                                                                                                                                                                                                                                                                                                          |
| 102052 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 102053 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 102054 |                       | In addition to these keywords, if the <b>-x pax</b> format is specified, any of the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

keywords and values defined in [pax Extended Header](#) (on page 3071), including implementation extensions, can be used in **-o** option-arguments, in either of two modes:

**keyword=value**

When used in **write** or **copy** mode, these keyword/value pairs shall be included at the beginning of the archive as **typeflag g** global extended header records. When used in **read** or **list** mode, these keyword/value pairs shall act as if they had been at the beginning of the archive as **typeflag g** global extended header records.

**keyword:=value**

When used in **write** or **copy** mode, these keyword/value pairs shall be included as records at the beginning of a **typeflag x** extended header for each file. (This shall be equivalent to the `<equals-sign>` form except that it creates no **typeflag g** global extended header records.) When used in **read** or **list** mode, these keyword/value pairs shall act as if they were included as records at the end of each extended header; thus, they shall override any global or file-specific extended header record keywords of the same names. For example, in the command:

```
pax -r -o "
  gname:=mygroup,
  " <archive
```

the group name will be forced to a new value for all files read from the archive.

The precedence of **-o** keywords over various fields in the archive is described in [pax Extended Header Keyword Precedence](#) (on page 3074). If the **-o delete=pattern**, **-o keyword=value**, or **-o keyword:=value** options are used to override or remove any extended header data needed to find files in an archive (e.g., **-o delete=size** for a file whose size cannot be represented in a **ustar** header or **-o size=100** for a file whose size is not 100 bytes), the behavior is undefined.

**-p string**

Specify one or more file characteristic options (privileges). The *string* option-argument shall be a string specifying file characteristics to be retained or discarded on extraction. The string shall consist of the specification characters **a**, **e**, **m**, **o**, and **p**. Other implementation-defined characters can be included. Multiple characteristics can be concatenated within the same string and multiple **-p** options can be specified. The meaning of the specification characters are as follows:

- a** Do not preserve file access times.
- e** Preserve the user ID, group ID, file mode bits (see [XBD Section 3.169](#), on page 60), access time, modification time, and any other implementation-defined file characteristics.
- m** Do not preserve file modification times.
- o** Preserve the user ID and group ID.
- p** Preserve the file mode bits. Other implementation-defined file mode attributes may be preserved.

In the preceding list, “preserve” indicates that an attribute stored in the archive shall be given to the extracted file, subject to the permissions of the invoking

process. The access and modification times of the file shall be preserved unless otherwise specified with the `-p` option or not stored in the archive. All attributes that are not preserved shall be determined as part of the normal file creation action (see [Section 1.1.1.4](#), on page 2318).

If neither the `e` nor the `o` specification character is specified, or the user ID and group ID are not preserved for any reason, *pax* shall not set the `S_ISUID` and `S_ISGID` bits of the file mode.

If the preservation of any of these items fails for any reason, *pax* shall write a diagnostic message to standard error. Failure to preserve these items shall affect the final exit status, but shall not cause the extracted file to be deleted.

If file characteristic letters in any of the *string* option-arguments are duplicated or conflict with each other, the ones given last shall take precedence. For example, if `-p eme` is specified, file modification times are preserved.

`-s replstr` Modify file or archive member names named by *pattern* or *file* operands according to the substitution expression *replstr*, using the syntax of the *ed* utility. The concepts of “address” and “line” are meaningless in the context of the *pax* utility, and shall not be supplied. The format shall be:

```
-s /old/new/[gp]
```

where as in *ed*, *old* is a basic regular expression and *new* can contain an `<ampersand>`, `'\n'` (where *n* is a digit) back-references, or subexpression matching. The *old* string shall also be permitted to contain `<newline>` characters.

Any non-null character can be used as a delimiter (`'/'` shown here). Multiple `-s` expressions can be specified; the expressions shall be applied in the order specified, terminating with the first successful substitution. The optional trailing `'g'` is as defined in the *ed* utility. The optional trailing `'p'` shall cause successful substitutions to be written to standard error. File or archive member names that substitute to the empty string shall be ignored when reading and writing archives.

`-t` When reading files from the file system, and if the user has the permissions required by *utime()* to do so, set the access time of each file read to the access time that it had before being read by *pax*.

`-u` Ignore files that are older (having a less recent file modification time) than a pre-existing file or archive member with the same name. In **read** mode, an archive member with the same name as a file in the file system shall be extracted if the archive member is newer than the file. In **write** mode, an archive file member with the same name as a file in the file system shall be superseded if the file is newer than the archive member. If `-a` is also specified, this is accomplished by appending to the archive; otherwise, it is unspecified whether this is accomplished by actual replacement in the archive or by appending to the archive. In **copy** mode, the file in the destination hierarchy shall be replaced by the file in the source hierarchy or by a link to the file in the source hierarchy if the file in the source hierarchy is newer.

`-v` In **list** mode, produce a verbose table of contents (see the **STDOUT** section). Otherwise, write archive member pathnames to standard error (see the **STDERR** section).

|        |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 102173 |                  | In <b>write</b> mode, the files shall be selected based on the user-specified pathnames as modified by the <b>-n</b> and <b>-u</b> options. Then, any <b>-s</b> and <b>-i</b> options shall modify, in that order, the names of these selected files. The <b>-v</b> option shall write names resulting from these modifications.                                                                                                                                                                                                               |
| 102174 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 102175 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 102176 |                  | If both the <b>-u</b> and <b>-n</b> options are specified, <i>pax</i> shall not consider a file selected unless it is newer than the file to which it is compared.                                                                                                                                                                                                                                                                                                                                                                             |
| 102177 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 102178 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 102179 |                  | <b>List Mode Format Specifications</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 102180 |                  | In <b>list</b> mode with the <b>-o listopt=format</b> option, the <i>format</i> argument shall be applied for each selected file. The <i>pax</i> utility shall append a <newline> to the <b>listopt</b> output for each selected file.                                                                                                                                                                                                                                                                                                         |
| 102181 |                  | The <i>format</i> argument shall be used as the <i>format</i> string described in XBD Chapter 5 (on page 121), with the exceptions 1. through 6. defined in the EXTENDED DESCRIPTION section of <i>printf</i> , plus the following exceptions:                                                                                                                                                                                                                                                                                                 |
| 102182 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 102183 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 102184 |                  | 7. The sequence ( <i>keyword</i> ) can occur before a format conversion specifier. The conversion argument is defined by the value of <i>keyword</i> . The implementation shall support the following keywords:                                                                                                                                                                                                                                                                                                                                |
| 102185 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 102186 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

- 102187 — Any of the Field Name entries in Table 4-14 (on page 3075) and Table 4-16 (on page  
102188 3078). The implementation may support the *cpio* keywords without the leading *c\_* in  
102189 addition to the form required by Table 4-16 (on page 3078).
- 102190 — Any keyword defined for the extended header in pax Extended Header (on page  
102191 3071).
- 102192 — Any keyword provided as an implementation-defined extension within the extended  
102193 header defined in pax Extended Header (on page 3071).

102194 For example, the sequence "%(charset)s" is the string value of the name of the character  
102195 set in the extended header.

102196 The result of the keyword conversion argument shall be the value from the applicable  
102197 header field or extended header, without any trailing NULs.

102198 All keyword values used as conversion arguments shall be translated from the UTF-8  
102199 encoding (or alternative encoding specified by any **hdrcharset** extended header record) to  
102200 the character set appropriate for the local file system, user database, and so on, as  
102201 applicable.

- 102202 8. An additional conversion specifier character, T, shall be used to specify time formats. The T  
102203 conversion specifier character can be preceded by the sequence (*keyword=subformat*), where  
102204 *subformat* is a date format as defined by *date* operands. The default *keyword* shall be **mtime**  
102205 and the default subformat shall be:

102206 %b %e %H:%M %Y

- 102207 9. An additional conversion specifier character, M, shall be used to specify the file mode string  
102208 as defined in *ls* Standard Output. If (*keyword*) is omitted, the **mode** keyword shall be used.  
102209 For example, %.1M writes the single character corresponding to the <entry type> field of the  
102210 *ls -l* command.

- 102211 10. An additional conversion specifier character, D, shall be used to specify the device for block  
102212 or special files, if applicable, in an implementation-defined format. If not applicable, and  
102213 (*keyword*) is specified, then this conversion shall be equivalent to %(*keyword*)u. If not  
102214 applicable, and (*keyword*) is omitted, then this conversion shall be equivalent to <space>.

- 102215 11. An additional conversion specifier character, F, shall be used to specify a pathname. The F  
102216 conversion character can be preceded by a sequence of <comma>-separated keywords:

102217 (*keyword*[,*keyword*] ... )

102218 The values for all the keywords that are non-null shall be concatenated together, each  
102219 separated by a ' / '. The default shall be (**path**) if the keyword **path** is defined; otherwise,  
102220 the default shall be (**prefix,name**).

- 102221 12. An additional conversion specifier character, L, shall be used to specify a symbolic link  
102222 expansion. If the current file is a symbolic link, then %L shall expand to:

102223 "%s -> %s", <value of keyword>, <contents of link>

102224 Otherwise, the %L conversion specification shall be the equivalent of %F.

## 102225 OPERANDS

102226 The following operands shall be supported:

102227 *directory* The destination directory pathname for **copy** mode.

|        |                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                         |
