56781 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/49 is applied, adding the last sentence to  
56782 the first non-shaded paragraph in the DESCRIPTION, and the following two paragraphs. The  
56783 RATIONALE is also updated. These changes are for alignment with the ISO C standard.

56784 **NAME**

56785       raise — send a signal to the executing process

56786 **SYNOPSIS**

56787       #include &lt;signal.h&gt;

56788       int raise(int sig);

56789 **DESCRIPTION**

56790 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 56791 conflict between the requirements described here and the ISO C standard is unintentional. This  
 56792 volume of POSIX.1-2008 defers to the ISO C standard.

56793 CX       The *raise()* function shall send the signal *sig* to the executing thread or process. If a signal  
 56794 handler is called, the *raise()* function shall not return until after the signal handler does.

56795 CX       The effect of the *raise()* function shall be equivalent to calling:

56796 pthread\_kill(pthread\_self(), sig);

56797 **RETURN VALUE**

56798 CX       Upon successful completion, 0 shall be returned. Otherwise, a non-zero value shall be returned  
 56799 and *errno* shall be set to indicate the error.

56800 **ERRORS**

56801       The *raise()* function shall fail if:

56802 CX       [EINVAL]       The value of the *sig* argument is an invalid signal number.

56803 **EXAMPLES**

56804       None.

56805 **APPLICATION USAGE**

56806       None.

56807 **RATIONALE**

56808       The term “thread” is an extension to the ISO C standard.

56809 **FUTURE DIRECTIONS**

56810       None.

56811 **SEE ALSO**

56812       *kill()*, *sigaction()*

56813       XBD <signal.h>, <sys/types.h>

56814 **CHANGE HISTORY**

56815       First released in Issue 4. Derived from the ANSI C standard.

56816 **Issue 5**

56817       The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

56818 **Issue 6**

56819       Extensions beyond the ISO C standard are marked.

56820       The following new requirements on POSIX implementations derive from alignment with the  
 56821 Single UNIX Specification:

- 56822       • In the RETURN VALUE section, the requirement to set *errno* on error is added.

- 56823
- 56824
- 56825
- Issue 7

Functionality relating to the Threads option is moved to the Base.
- The [EINVAL] error condition is added.

56826 **NAME**

56827 rand, rand\_r, srand — pseudo-random number generator

56828 **SYNOPSIS**

```
56829 #include <stdlib.h>
56830 int rand(void);
56831 OB CX int rand_r(unsigned *seed);
56832 void srand(unsigned seed);
```

56833 **DESCRIPTION**

56834 CX For *rand()* and *srand()*: The functionality described on this reference page is aligned with the  
 56835 ISO C standard. Any conflict between the requirements described here and the ISO C standard is  
 56836 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

56837 The *rand()* function shall compute a sequence of pseudo-random integers in the range  
 56838 XSI [0,{RAND\_MAX}] with a period of at least  $2^{32}$ .

56839 CX The *rand()* function need not be thread-safe.

56840 OB CX The *rand\_r()* function shall compute a sequence of pseudo-random integers in the range  
 56841 [0,{RAND\_MAX}]. (The value of the {RAND\_MAX} macro shall be at least 32767.)

56842 If *rand\_r()* is called with the same initial value for the object pointed to by *seed* and that object is  
 56843 not modified between successive returns and calls to *rand\_r()*, the same sequence shall be  
 56844 generated.

56845 The *srand()* function uses the argument as a seed for a new sequence of pseudo-random  
 56846 numbers to be returned by subsequent calls to *rand()*. If *srand()* is then called with the same  
 56847 seed value, the sequence of pseudo-random numbers shall be repeated. If *rand()* is called before  
 56848 any calls to *srand()* are made, the same sequence shall be generated as when *srand()* is first  
 56849 called with a seed value of 1.

56850 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
 56851 *rand()* or *srand()*.

56852 **RETURN VALUE**

56853 The *rand()* function shall return the next pseudo-random number in the sequence.

56854 OB CX The *rand\_r()* function shall return a pseudo-random integer.

56855 The *srand()* function shall not return a value.

56856 **ERRORS**

56857 No errors are defined.

56858 **EXAMPLES**56859 **Generating a Pseudo-Random Number Sequence**

56860 The following example demonstrates how to generate a sequence of pseudo-random numbers.

```
56861 #include <stdio.h>
56862 #include <stdlib.h>
56863 ...
56864     long count, i;
56865     char *keystr;
56866     int elementlen, len;
56867     char c;
56868     ...
```

```

56869      /* Initial random number generator. */
56870      srand(1);

56871      /* Create keys using only lowercase characters */
56872      len = 0;
56873      for (i=0; i<count; i++) {
56874          while (len < elementlen) {
56875              c = (char) (rand() % 128);
56876              if (islower(c))
56877                  keystr[len++] = c;
56878          }

56879          keystr[len] = '\0';
56880          printf("%s Element%0*ld\n", keystr, elementlen, i);
56881          len = 0;
56882      }

```

### Generating the Same Sequence on Different Machines

The following code defines a pair of functions that could be incorporated into applications wishing to ensure that the same sequence of numbers is generated across different machines.

```

56886      static unsigned long next = 1;
56887      int myrand(void) /* RAND_MAX assumed to be 32767. */
56888      {
56889          next = next * 1103515245 + 12345;
56890          return((unsigned)(next/65536) % 32768);
56891      }

56892      void mysrand(unsigned seed)
56893      {
56894          next = seed;
56895      }

```

### APPLICATION USAGE

The *drand48()* and *random()* functions provide much more elaborate pseudo-random number generators.

The limitations on the amount of state that can be carried between one function call and another mean the *rand\_r()* function can never be implemented in a way which satisfies all of the requirements on a pseudo-random number generator. These functions should be avoided whenever non-trivial requirements (including safety) have to be fulfilled.

### RATIONALE

The ISO C standard *rand()* and *srand()* functions allow per-process pseudo-random streams shared by all threads. Those two functions need not change, but there has to be mutual-exclusion that prevents interference between two threads concurrently accessing the random number generator.

With regard to *rand()*, there are two different behaviors that may be wanted in a multi-threaded program:

1. A single per-process sequence of pseudo-random numbers that is shared by all threads that call *rand()*

- 56912            2. A different sequence of pseudo-random numbers for each thread that calls *rand()*
- 56913            This is provided by the modified thread-safe function based on whether the seed value is global
- 56914            to the entire process or local to each thread.
- 56915            This does not address the known deficiencies of the *rand()* function implementations, which
- 56916            have been approached by maintaining more state. In effect, this specifies new thread-safe forms
- 56917            of a deficient function.
- 56918    **FUTURE DIRECTIONS**
- 56919            The *rand\_r()* function may be removed in a future version.
- 56920    **SEE ALSO**
- 56921            *drand48()*, *initstate()*
- 56922            XBD <stdlib.h>
- 56923    **CHANGE HISTORY**
- 56924            First released in Issue 1. Derived from Issue 1 of the SVID.
- 56925    **Issue 5**
- 56926            The *rand\_r()* function is included for alignment with the POSIX Threads Extension.
- 56927            A note indicating that the *rand()* function need not be reentrant is added to the DESCRIPTION.
- 56928    **Issue 6**
- 56929            Extensions beyond the ISO C standard are marked.
- 56930            The *rand\_r()* function is marked as part of the Thread-Safe Functions option.
- 56931    **Issue 7**
- 56932            Austin Group Interpretation 1003.1-2001 #156 is applied.
- 56933            The *rand\_r()* function is marked obsolescent.

56934 **NAME**

56935 random — generate pseudo-random number

56936 **SYNOPSIS**

```
56937 XSI      #include <stdlib.h>  
56938          long random(void);
```

56939 **DESCRIPTION**56940 Refer to *initstate()*.

**NAME**

pread, read — read from a file

**SYNOPSIS**

```
#include <unistd.h>
```

```
ssize_t pread(int fildes, void *buf, size_t nbyte, off_t offset);
```

```
ssize_t read(int fildes, void *buf, size_t nbyte);
```

**DESCRIPTION**

The *read()* function shall attempt to read *nbyte* bytes from the file associated with the open file descriptor, *fildes*, into the buffer pointed to by *buf*. The behavior of multiple concurrent reads on the same pipe, FIFO, or terminal device is unspecified.

Before any action described below is taken, and if *nbyte* is zero, the *read()* function may detect and return errors as described below. In the absence of errors, or if error detection is not performed, the *read()* function shall return zero and have no other results.

On files that support seeking (for example, a regular file), the *read()* shall start at a position in the file given by the file offset associated with *fildes*. The file offset shall be incremented by the number of bytes actually read.

Files that do not support seeking—for example, terminals—always read from the current position. The value of a file offset associated with such a file is undefined.

No data transfer shall occur past the current end-of-file. If the starting position is at or after the end-of-file, 0 shall be returned. If the file refers to a device special file, the result of subsequent *read()* requests is implementation-defined.

If the value of *nbyte* is greater than {SSIZE\_MAX}, the result is implementation-defined.

When attempting to read from an empty pipe or FIFO:

- If no process has the pipe open for writing, *read()* shall return 0 to indicate end-of-file.
- If some process has the pipe open for writing and O\_NONBLOCK is set, *read()* shall return -1 and set *errno* to [EAGAIN].
- If some process has the pipe open for writing and O\_NONBLOCK is clear, *read()* shall block the calling thread until some data is written or the pipe is closed by all processes that had the pipe open for writing.

When attempting to read a file (other than a pipe or FIFO) that supports non-blocking reads and has no data currently available:

- If O\_NONBLOCK is set, *read()* shall return -1 and set *errno* to [EAGAIN].
- If O\_NONBLOCK is clear, *read()* shall block the calling thread until some data becomes available.
- The use of the O\_NONBLOCK flag has no effect if there is some data available.

The *read()* function reads data previously written to a file. If any portion of a regular file prior to the end-of-file has not been written, *read()* shall return bytes with value 0. For example, *lseek()* allows the file offset to be set beyond the end of existing data in the file. If data is later written at this point, subsequent reads in the gap between the previous end of data and the newly written data shall return bytes with value 0 until data is written into the gap.

Upon successful completion, where *nbyte* is greater than 0, *read()* shall mark for update the last data access timestamp of the file, and shall return the number of bytes read. This number shall never be greater than *nbyte*. The value returned may be less than *nbyte* if the number of bytes

|       |        |                                                                                                                            |
|-------|--------|----------------------------------------------------------------------------------------------------------------------------|
| 56984 |        | left in the file is less than <i>nbyte</i> , if the <i>read()</i> request was interrupted by a signal, or if the file is a |
| 56985 |        | pipe or FIFO or special file and has fewer than <i>nbyte</i> bytes immediately available for reading.                      |
| 56986 |        | For example, a <i>read()</i> from a file associated with a terminal may return one typed line of data.                     |
| 56987 |        | If a <i>read()</i> is interrupted by a signal before it reads any data, it shall return $-1$ with <i>errno</i> set to      |
| 56988 |        | [EINTR].                                                                                                                   |
| 56989 |        | If a <i>read()</i> is interrupted by a signal after it has successfully read some data, it shall return the                |
| 56990 |        | number of bytes read.                                                                                                      |
| 56991 |        | For regular files, no data transfer shall occur past the offset maximum established in the open                            |
| 56992 |        | file description associated with <i>fildes</i> .                                                                           |
| 56993 |        | If <i>fildes</i> refers to a socket, <i>read()</i> shall be equivalent to <i>recv()</i> with no flags set.                 |
| 56994 | SIO    | If the O_DSYNC and O_RSYNC bits have been set, read I/O operations on the file descriptor                                  |
| 56995 |        | shall complete as defined by synchronized I/O data integrity completion. If the O_SYNC and                                 |
| 56996 |        | O_RSYNC bits have been set, read I/O operations on the file descriptor shall complete as                                   |
| 56997 |        | defined by synchronized I/O file integrity completion.                                                                     |
| 56998 | SHM    | If <i>fildes</i> refers to a shared memory object, the result of the <i>read()</i> function is unspecified.                |
| 56999 | TYM    | If <i>fildes</i> refers to a typed memory object, the result of the <i>read()</i> function is unspecified.                 |
| 57000 | OB XSR | A <i>read()</i> from a STREAMS file can read data in three different modes: <i>byte-stream</i> mode, <i>message-</i>       |
| 57001 |        | <i>nondiscard</i> mode, and <i>message-discard</i> mode. The default shall be byte-stream mode. This can be                |
| 57002 |        | changed using the I_SRDOPT <i>ioctl()</i> request, and can be tested with I_GRDOPT <i>ioctl()</i> . In byte-               |
| 57003 |        | stream mode, <i>read()</i> shall retrieve data from the STREAM until as many bytes as were requested                       |
| 57004 |        | are transferred, or until there is no more data to be retrieved. Byte-stream mode ignores                                  |
| 57005 |        | message boundaries.                                                                                                        |
| 57006 |        | In STREAMS message-nondiscard mode, <i>read()</i> shall retrieve data until as many bytes as were                          |
| 57007 |        | requested are transferred, or until a message boundary is reached. If <i>read()</i> does not retrieve all                  |
| 57008 |        | the data in a message, the remaining data shall be left on the STREAM, and can be retrieved by                             |
| 57009 |        | the next <i>read()</i> call. Message-discard mode also retrieves data until as many bytes as were                          |
| 57010 |        | requested are transferred, or a message boundary is reached. However, unread data remaining                                |
| 57011 |        | in a message after the <i>read()</i> returns shall be discarded, and shall not be available for a                          |
| 57012 |        | subsequent <i>read()</i> , <i>getmsg()</i> , or <i>getpmsg()</i> call.                                                     |
| 57013 |        | How <i>read()</i> handles zero-byte STREAMS messages is determined by the current read mode                                |
| 57014 |        | setting. In byte-stream mode, <i>read()</i> shall accept data until it has read <i>nbyte</i> bytes, or until there         |
| 57015 |        | is no more data to read, or until a zero-byte message block is encountered. The <i>read()</i> function                     |
| 57016 |        | shall then return the number of bytes read, and place the zero-byte message back on the                                    |
| 57017 |        | STREAM to be retrieved by the next <i>read()</i> , <i>getmsg()</i> , or <i>getpmsg()</i> . In message-nondiscard           |
| 57018 |        | mode or message-discard mode, a zero-byte message shall return 0 and the message shall be                                  |
| 57019 |        | removed from the STREAM. When a zero-byte message is read as the first message on a                                        |
| 57020 |        | STREAM, the message shall be removed from the STREAM and 0 shall be returned, regardless                                   |
| 57021 |        | of the read mode.                                                                                                          |
| 57022 |        | A <i>read()</i> from a STREAMS file shall return the data in the message at the front of the STREAM                        |
| 57023 |        | head read queue, regardless of the priority band of the message.                                                           |
| 57024 |        | By default, STREAMS are in control-normal mode, in which a <i>read()</i> from a STREAMS file can                           |
| 57025 |        | only process messages that contain a data part but do not contain a control part. The <i>read()</i> shall                  |
| 57026 |        | fail if a message containing a control part is encountered at the STREAM head. This default                                |
| 57027 |        | action can be changed by placing the STREAM in either control-data mode or control-discard                                 |
| 57028 |        | mode with the I_SRDOPT <i>ioctl()</i> command. In control-data mode, <i>read()</i> shall convert any                       |
| 57029 |        | control part to data and pass it to the application before passing any data part originally present                        |

57030 in the same message. In control-discard mode, *read()* shall discard message control parts but  
 57031 return to the process any data part in the message.

57032 In addition, *read()* shall fail if the STREAM head had processed an asynchronous error before  
 57033 the call. In this case, the value of *errno* shall not reflect the result of *read()*, but reflect the prior  
 57034 error. If a hangup occurs on the STREAM being read, *read()* shall continue to operate normally  
 57035 until the STREAM head read queue is empty. Thereafter, it shall return 0.

57036 The *pread()* function shall be equivalent to *read()*, except that it shall read from a given position  
 57037 in the file without changing the file offset. The first three arguments to *pread()* are the same as  
 57038 *read()* with the addition of a fourth argument *offset* for the desired position inside the file. An  
 57039 attempt to perform a *pread()* on a file that is incapable of seeking shall result in an error.

## 57040 RETURN VALUE

57041 Upon successful completion, these functions shall return a non-negative integer indicating the  
 57042 number of bytes actually read. Otherwise, the functions shall return -1 and set *errno* to indicate  
 57043 the error.

## 57044 ERRORS

57045 These functions shall fail if:

57046 [EAGAIN] The file is neither a pipe, nor a FIFO, nor a socket, the O\_NONBLOCK flag is  
 57047 set for the file descriptor, and the thread would be delayed in the read  
 57048 operation.

57049 [EBADF] The *fildev* argument is not a valid file descriptor open for reading.

57050 OB XSR [EBADMSG] The file is a STREAM file that is set to control-normal mode and the message  
 57051 waiting to be read includes a control part.

57052 [EINTR] The read operation was terminated due to the receipt of a signal, and no data  
 57053 was transferred.

57054 OB XSR [EINVAL] The STREAM or multiplexer referenced by *fildev* is linked (directly or  
 57055 indirectly) downstream from a multiplexer.

57056 [EIO] The process is a member of a background process group attempting to read  
 57057 from its controlling terminal, and either the calling thread is blocking  
 57058 SIGTTIN or the process is ignoring SIGTTIN or the process group of the  
 57059 process is orphaned. This error may also be generated for implementation-  
 57060 defined reasons.

57061 XSI [EISDIR] The *fildev* argument refers to a directory and the implementation does not  
 57062 allow the directory to be read using *read()* or *pread()*. The *readdir()* function  
 57063 should be used instead.

57064 [EOVERFLOW] The file is a regular file, *nbyte* is greater than 0, the starting position is before  
 57065 the end-of-file, and the starting position is greater than or equal to the offset  
 57066 maximum established in the open file description associated with *fildev*.

57067 The *pread()* function shall fail if:

57068 [EINVAL] The file is a regular file or block special file, and the *offset* argument is  
 57069 negative. The file offset shall remain unchanged.

57070 [ESPIPE] The file is incapable of seeking.

57071 The *read()* function shall fail if:

57072 [EAGAIN] The file is a pipe or FIFO, the O\_NONBLOCK flag is set for the file descriptor,  
57073 and the thread would be delayed in the read operation.

57074 [EAGAIN] or [EWOULDBLOCK]  
57075 The file is a socket, the O\_NONBLOCK flag is set for the file descriptor, and  
57076 the thread would be delayed in the read operation.

57077 [ECONNRESET] A read was attempted on a socket and the connection was forcibly closed by  
57078 its peer.

57079 [ENOTCONN] A read was attempted on a socket that is not connected.

57080 [ETIMEDOUT] A read was attempted on a socket and a transmission timeout occurred.

57081 These functions may fail if:

57082 [EIO] A physical I/O error has occurred.

57083 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

57084 [ENOMEM] Insufficient memory was available to fulfill the request.

57085 [ENXIO] A request was made of a nonexistent device, or the request was outside the  
57086 capabilities of the device.

## 57087 EXAMPLES

### 57088 Reading Data into a Buffer

57089 The following example reads data from the file associated with the file descriptor *fd* into the  
57090 buffer pointed to by *buf*.

```
57091 #include <sys/types.h>
57092 #include <unistd.h>
57093 ...
57094 char buf[20];
57095 size_t nbytes;
57096 ssize_t bytes_read;
57097 int fd;
57098 ...
57099 nbytes = sizeof(buf);
57100 bytes_read = read(fd, buf, nbytes);
57101 ...
```

## 57102 APPLICATION USAGE

57103 None.

## 57104 RATIONALE

57105 This volume of POSIX.1-2008 does not specify the value of the file offset after an error is  
57106 returned; there are too many cases. For programming errors, such as [EBADF], the concept is  
57107 meaningless since no file is involved. For errors that are detected immediately, such as  
57108 [EAGAIN], clearly the offset should not change. After an interrupt or hardware error, however,  
57109 an updated value would be very useful and is the behavior of many implementations.

57110 Note that a *read()* of zero bytes does not modify the last data access timestamp. A *read()* that  
57111 requests more than zero bytes, but returns zero, is required to modify the last data access  
57112 timestamp.

Implementations are allowed, but not required, to perform error checking for *read()* requests of zero bytes.

## Input and Output

The use of I/O with large byte counts has always presented problems. Ideas such as *lread()* and *lwrite()* (using and returning **longs**) were considered at one time. The current solution is to use abstract types on the ISO C standard function to *read()* and *write()*. The abstract types can be declared so that existing functions work, but can also be declared so that larger types can be represented in future implementations. It is presumed that whatever constraints limit the maximum range of **size\_t** also limit portable I/O requests to the same range. This volume of POSIX.1-2008 also limits the range further by requiring that the byte count be limited so that a signed return value remains meaningful. Since the return type is also a (signed) abstract type, the byte count can be defined by the implementation to be larger than an **int** can hold.

The standard developers considered adding atomicity requirements to a pipe or FIFO, but recognized that due to the nature of pipes and FIFOs there could be no guarantee of atomicity of reads of {PIPE\_BUF} or any other size that would be an aid to applications portability.

This volume of POSIX.1-2008 requires that no action be taken for *read()* or *write()* when *nbyte* is zero. This is not intended to take precedence over detection of errors (such as invalid buffer pointers or file descriptors). This is consistent with the rest of this volume of POSIX.1-2008, but the phrasing here could be misread to require detection of the zero case before any other errors. A value of zero is to be considered a correct value, for which the semantics are a no-op.

I/O is intended to be atomic to ordinary files and pipes and FIFOs. Atomic means that all the bytes from a single operation that started out together end up together, without interleaving from other I/O operations. It is a known attribute of terminals that this is not honored, and terminals are explicitly (and implicitly permanently) excepted, making the behavior unspecified. The behavior for other device types is also left unspecified, but the wording is intended to imply that future standards might choose to specify atomicity (or not).

There were recommendations to add format parameters to *read()* and *write()* in order to handle networked transfers among heterogeneous file system and base hardware types. Such a facility may be required for support by the OSI presentation of layer services. However, it was determined that this should correspond with similar C-language facilities, and that is beyond the scope of this volume of POSIX.1-2008. The concept was suggested to the developers of the ISO C standard for their consideration as a possible area for future work.

In 4.3 BSD, a *read()* or *write()* that is interrupted by a signal before transferring any data does not by default return an [EINTR] error, but is restarted. In 4.2 BSD, 4.3 BSD, and the Eighth Edition, there is an additional function, *select()*, whose purpose is to pause until specified activity (data to read, space to write, and so on) is detected on specified file descriptors. It is common in applications written for those systems for *select()* to be used before *read()* in situations (such as keyboard input) where interruption of I/O due to a signal is desired.

The issue of which files or file types are interruptible is considered an implementation design issue. This is often affected primarily by hardware and reliability issues.

There are no references to actions taken following an “unrecoverable error”. It is considered beyond the scope of this volume of POSIX.1-2008 to describe what happens in the case of hardware errors.

Earlier versions of this standard allowed two very different behaviors with regard to the handling of interrupts. In order to minimize the resulting confusion, it was decided that POSIX.1-2008 should support only one of these behaviors. Historical practice on AT&T-derived

systems was to have *read()* and *write()* return `-1` and set *errno* to `[EINTR]` when interrupted after some, but not all, of the data requested had been transferred. However, the US Department of Commerce FIPS 151-1 and FIPS 151-2 require the historical BSD behavior, in which *read()* and *write()* return the number of bytes actually transferred before the interrupt. If `-1` is returned when any data is transferred, it is difficult to recover from the error on a seekable device and impossible on a non-seekable device. Most new implementations support this behavior. The behavior required by POSIX.1-2008 is to return the number of bytes transferred.

POSIX.1-2008 does not specify when an implementation that buffers *read()*s actually moves the data into the user-supplied buffer, so an implementation may choose to do this at the latest possible moment. Therefore, an interrupt arriving earlier may not cause *read()* to return a partial byte count, but rather to return `-1` and set *errno* to `[EINTR]`.

Consideration was also given to combining the two previous options, and setting *errno* to `[EINTR]` while returning a short count. However, not only is there no existing practice that implements this, it is also contradictory to the idea that when *errno* is set, the function responsible shall return `-1`.

This volume of POSIX.1-2008 intentionally does not specify any *pread()* errors related to pipes, FIFOs, and sockets other than `[ESPIPE]`.

#### FUTURE DIRECTIONS

None.

#### CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

##### Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

The *pread()* function is added.

##### Issue 6

The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION now states that if *read()* is interrupted by a signal after it has successfully read some data, it returns the number of bytes read. In Issue 3, it was optional whether *read()* returned the number of bytes read, or whether it returned `-1` with *errno* set to `[EINTR]`. This is a FIPS requirement.
- In the DESCRIPTION, text is added to indicate that for regular files, no data transfer occurs past the offset maximum established in the open file description associated with *files*. This change is to support large files.
- The `[EOVERFLOW]` mandatory error condition is added.

- 57201           • The [ENXIO] optional error condition is added.
- 57202       Text referring to sockets is added to the DESCRIPTION.
- 57203       The following changes were made to align with the IEEE P1003.1a draft standard:
- 57204           • The effect of reading zero bytes is clarified.
- 57205       The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
- 57206       *read()* results are unspecified for typed memory objects.
- 57207       New RATIONALE is added to explain the atomicity requirements for input and output
- 57208       operations.
- 57209       The following error conditions are added for operations on sockets: [EAGAIN],
- 57210       [ECONNRESET], [ENOTCONN], and [ETIMEDOUT].
- 57211       The [EIO] error is made optional.
- 57212       The following error conditions are added for operations on sockets: [ENOBUFFS] and
- 57213       [ENOMEM].
- 57214       The *readv()* function is split out into a separate reference page.
- 57215       IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/108 is applied, updating the [EAGAIN]
- 57216       error in the ERRORS section from “the process would be delayed” to “the thread would be
- 57217       delayed”.
- 57218       IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/109 is applied, making an editorial
- 57219       correction in the RATIONALE section.
- 57220   **Issue 7**
- 57221       The *pread()* function is moved from the XSI option to the Base.
- 57222       Functionality relating to the XSI STREAMS option is marked obsolescent.
- 57223       Changes are made related to support for finegrained timestamps.
- 57224       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0480 [218], XSH/TC1-2008/0481 [79],
- 57225       XSH/TC1-2008/0482 [218], XSH/TC1-2008/0483 [218], XSH/TC1-2008/0484 [218], and
- 57226       XSH/TC1-2008/0485 [218,428] are applied.

## NAME

readdir, readdir\_r — read a directory

## SYNOPSIS

```
#include <dirent.h>

struct dirent *readdir(DIR *dirp);
int readdir_r(DIR *restrict dirp, struct dirent *restrict entry,
               struct dirent **restrict result);
```

## DESCRIPTION

The type **DIR**, which is defined in the **<dirent.h>** header, represents a *directory stream*, which is an ordered sequence of all the directory entries in a particular directory. Directory entries represent files; files may be removed from a directory or added to a directory asynchronously to the operation of *readdir()*.

The *readdir()* function shall return a pointer to a structure representing the directory entry at the current position in the directory stream specified by the argument *dirp*, and position the directory stream at the next entry. It shall return a null pointer upon reaching the end of the directory stream. The structure **dirent** defined in the **<dirent.h>** header describes a directory entry. The value of the structure's *d\_ino* member shall be set to the file serial number of the file named by the *d\_name* member. If the *d\_name* member names a symbolic link, the value of the *d\_ino* member shall be set to the file serial number of the symbolic link itself.

The *readdir()* function shall not return directory entries containing empty names. If entries for dot or dot-dot exist, one entry shall be returned for dot and one entry shall be returned for dot-dot; otherwise, they shall not be returned.

The application shall not modify the structure to which the return value of *readdir()* points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *readdir()* on the same directory stream. They shall not be affected by a call to *readdir()* on a different directory stream. The returned pointer, and pointers within the structure, might also be invalidated if the calling thread is terminated.

If a file is removed from or added to the directory after the most recent call to *opendir()* or *rewinddir()*, whether a subsequent call to *readdir()* returns an entry for that file is unspecified.

The *readdir()* function may buffer several directory entries per actual read operation; *readdir()* shall mark for update the last data access timestamp of the directory each time the directory is actually read.

After a call to *fork()*, either the parent or child (but not both) may continue processing the directory stream using *readdir()*, *rewinddir()*, or *seekdir()*. If both the parent and child processes use these functions, the result is undefined.

The *readdir()* function need not be thread-safe.

Applications wishing to check for error situations should set *errno* to 0 before calling *readdir()*. If *errno* is set to non-zero on return, an error occurred.

The *readdir\_r()* function shall initialize the **dirent** structure referenced by *entry* to represent the directory entry at the current position in the directory stream referred to by *dirp*, store a pointer to this structure at the location referenced by *result*, and position the directory stream at the next entry.

The storage pointed to by *entry* shall be large enough for a **dirent** with an array of **char** *d\_name* members containing at least {NAME\_MAX}+1 elements.

Upon successful return, the pointer returned at *\*result* shall have the same value as the argument *entry*. Upon reaching the end of the directory stream, this pointer shall have the value NULL.

The *readdir\_r()* function shall not return directory entries containing empty names.

If a file is removed from or added to the directory after the most recent call to *opendir()* or *rewinddir()*, whether a subsequent call to *readdir\_r()* returns an entry for that file is unspecified.

The *readdir\_r()* function may buffer several directory entries per actual read operation; *readdir\_r()* shall mark for update the last data access timestamp of the directory each time the directory is actually read.

## RETURN VALUE

Upon successful completion, *readdir()* shall return a pointer to an object of type **struct dirent**. When an error is encountered, a null pointer shall be returned and *errno* shall be set to indicate the error. When the end of the directory is encountered, a null pointer shall be returned and *errno* is not changed.

If successful, the *readdir\_r()* function shall return zero; otherwise, an error number shall be returned to indicate the error.

## ERRORS

These functions shall fail if:

[EOVERFLOW] One of the values in the structure to be returned cannot be represented correctly.

These functions may fail if:

[EBADF] The *dirp* argument does not refer to an open directory stream.

[ENOENT] The current position of the directory stream is invalid.

## EXAMPLES

The following sample program searches the current directory for each of the arguments supplied on the command line.

```
#include <dirent.h>
#include <errno.h>
#include <stdio.h>
#include <string.h>

static void lookup(const char *arg)
{
    DIR *dirp;
    struct dirent *dp;

    if ((dirp = opendir(".")) == NULL) {
        perror("couldn't open '.');
        return;
    }

    do {
        errno = 0;
        if ((dp = readdir(dirp)) != NULL) {
            if (strcmp(dp->d_name, arg) != 0)
                continue;

            (void) printf("found %s\n", arg);
            (void) closedir(dirp);
        }
    } while (1);
}
```

```

57316             return;
57317         }
57318     } while (dp != NULL);
57319     if (errno != 0)
57320         perror("error reading directory");
57321     else
57322         (void) printf("failed to find %s\n", arg);
57323     (void) closedir(dirp);
57324     return;
57325 }
57326 int main(int argc, char *argv[])
57327 {
57328     int i;
57329     for (i = 1; i < argc; i++)
57330         lookup(argv[i]);
57331     return (0);
57332 }

```

### APPLICATION USAGE

The `readdir()` function should be used in conjunction with `opendir()`, `closedir()`, and `rewinddir()` to examine the contents of the directory.

The `readdir_r()` function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

### RATIONALE

The returned value of `readdir()` merely *represents* a directory entry. No equivalence should be inferred.

Historical implementations of `readdir()` obtain multiple directory entries on a single read operation, which permits subsequent `readdir()` operations to operate from the buffered information. Any wording that required each successful `readdir()` operation to mark the directory last data access timestamp for update would disallow such historical performance-oriented implementations.

When returning a directory entry for the root of a mounted file system, some historical implementations of `readdir()` returned the file serial number of the underlying mount point, rather than of the root of the mounted file system. This behavior is considered to be a bug, since the underlying file serial number has no significance to applications.

Since `readdir()` returns NULL when it detects an error and when the end of the directory is encountered, an application that needs to tell the difference must set `errno` to zero before the call and check it if NULL is returned. Since the function must not change `errno` in the second case and must set it to a non-zero value in the first case, a zero `errno` after a call returning NULL indicates end-of-directory; otherwise, an error.

Routines to deal with this problem more directly were proposed:

```

57356 int derror (dirp)
57357 DIR *dirp;
57358
57358 void clearerr (dirp)
57359 DIR *dirp;

```

The first would indicate whether an error had occurred, and the second would clear the error

indication. The simpler method involving *errno* was adopted instead by requiring that *readdir()* not change *errno* when end-of-directory is encountered.

An error or signal indicating that a directory has changed while open was considered but rejected.

The thread-safe version of the directory reading function returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call. Either the {NAME\_MAX} compile-time constant or the corresponding *pathconf()* option can be used to determine the maximum sizes of returned pathnames.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 2.

### Issue 5

Large File Summit extensions are added.

The *readdir\_r()* function is included for alignment with the POSIX Threads Extension.

A note indicating that the *readdir()* function need not be reentrant is added to the DESCRIPTION.

### Issue 6

The *readdir\_r()* function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir\_r()*.

The Open Group Corrigendum U026/8 is applied, clarifying the wording of the successful return for the *readdir\_r()* function.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- A statement is added to the DESCRIPTION indicating the disposition of certain fields in **struct dirent** when an entry refers to a symbolic link.
- The [EOVERFLOW] mandatory error condition is added. This change is to support large files.
- The [ENOENT] optional error condition is added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *readdir\_r()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/50 is applied, replacing the EXAMPLES section with a new example.

57402 **Issue 7**

57403 Austin Group Interpretation 1003.1-2001 #059 is applied, updating the ERRORS section.

57404 Austin Group Interpretation 1003.1-2001 #156 is applied.

57405 The *readdir\_r()* function is moved from the Thread-Safe Functions option to the Base.

57406 Changes are made related to support for finegrained timestamps.

57407 The value of the *d\_ino* member is no longer unspecified for symbolic links.

57408 SD5-XSH-ERN-193 is applied.

57409 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0486 [75] is applied.

57410 **NAME**

57411 readlink, readlinkat — read the contents of a symbolic link

57412 **SYNOPSIS**

57413 #include &lt;unistd.h&gt;

57414 ssize\_t readlink(const char \*restrict path, char \*restrict buf,  
57415 size\_t bufsiz);

57416 OH #include &lt;fcntl.h&gt;

57417

+  
+57418 ssize\_t readlinkat(int fd, const char \*restrict path,  
57419 char \*restrict buf, size\_t bufsiz);57420 **DESCRIPTION**57421 The *readlink()* function shall place the contents of the symbolic link referred to by *path* in the  
57422 buffer *buf* which has size *bufsiz*. If the number of bytes in the symbolic link is less than *bufsiz*,  
57423 the contents of the remainder of *buf* are unspecified. If the *buf* argument is not large enough to  
57424 contain the link content, the first *bufsiz* bytes shall be placed in *buf*.57425 If the value of *bufsiz* is greater than {SSIZE\_MAX}, the result is implementation-defined.57426 Upon successful completion, *readlink()* shall mark for update the last data access timestamp of  
57427 the symbolic link.57428 The *readlinkat()* function shall be equivalent to the *readlink()* function except in the case where  
57429 *path* specifies a relative path. In this case the symbolic link whose content is read is relative to the  
57430 directory associated with the file descriptor *fd* instead of the current working directory. If the  
57431 access mode of the open file description associated with the file descriptor is not O\_SEARCH, |  
57432 the function shall check whether directory searches are permitted using the current permissions |  
57433 of the directory underlying the file descriptor. If the access mode is O\_SEARCH, the function |  
57434 shall not perform the check.57435 If *readlinkat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
57436 directory shall be used and the behavior shall be identical to a call to *readlink()*.57437 **RETURN VALUE**57438 Upon successful completion, these functions shall return the count of bytes placed in the buffer.  
57439 Otherwise, these functions shall return a value of -1, leave the buffer unchanged, and set *errno* to  
57440 indicate the error.57441 **ERRORS**

57442 These functions shall fail if:

57443 [EACCES] Search permission is denied for a component of the path prefix of *path*.57444 [EINVAL] The *path* argument names a file that is not a symbolic link.

57445 [EIO] An I/O error occurred while reading from the file system.

57446 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
57447 argument.

57448 [ENAMETOOLONG]

57449 The length of a component of a pathname is longer than {NAME\_MAX}.

57450 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

57451 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
 57452 directory nor a symbolic link to a directory, or the *path* argument contains at  
 57453 least one non-`<slash>` character and ends with one or more trailing `<slash>`  
 57454 characters and the last pathname component names an existing file that is  
 57455 neither a directory nor a symbolic link to a directory.

57456 The *readlinkat*() function shall fail if:

57457 [EACCES] The access mode of the open file description associated with *fd* is not  
 57458 O\_SEARCH and the permissions of the directory underlying *fd* do not permit  
 57459 directory searches.

57460 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
 57461 neither AT\_FDCWD nor a valid file descriptor open for reading or searching.

57462 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated  
 57463 with a non-directory file.

57464 These functions may fail if:

57465 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 57466 resolution of the *path* argument.

57467 [ENAMETOOLONG]  
 57468 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 57469 symbolic link produced an intermediate result with a length that exceeds  
 57470 {PATH\_MAX}.

## 57471 EXAMPLES

### 57472 Reading the Name of a Symbolic Link

57473 The following example shows how to read the name of a symbolic link named `/modules/pass1`.

```
57474 #include <unistd.h>
57475 char buf[1024];
57476 ssize_t len;
57477 ...
57478 if ((len = readlink("/modules/pass1", buf, sizeof(buf)-1)) != -1)
57479     buf[len] = '\0';
```

## 57480 APPLICATION USAGE

57481 Conforming applications should not assume that the returned contents of the symbolic link are  
 57482 null-terminated.

## 57483 RATIONALE

57484 The type associated with *bufsiz* is a **size\_t** in order to be consistent with both the ISO C standard  
 57485 and the definition of *read()*. The behavior specified for *readlink()* when *bufsiz* is zero represents  
 57486 historical practice. For this case, the standard developers considered a change whereby *readlink()*  
 57487 would return the number of non-null bytes contained in the symbolic link with the buffer *buf*  
 57488 remaining unchanged; however, since the **stat** structure member *st\_size* value can be used to  
 57489 determine the size of buffer necessary to contain the contents of the symbolic link as returned by  
 57490 *readlink()*, this proposal was rejected, and the historical practice retained.

57491 The purpose of the *readlinkat()* function is to read the content of symbolic links in directories  
 57492 other than the current working directory without exposure to race conditions. Any part of the  
 57493 path of a file could be changed in parallel to a call to *readlink()*, resulting in unspecified behavior.  
 57494 By opening a file descriptor for the target directory and using the *readlinkat()* function it can be

57495 guaranteed that the symbolic link read is located relative to the desired directory.

## 57496 FUTURE DIRECTIONS

57497 None.

## 57501 CHANGE HISTORY

57502 First released in Issue 4, Version 2.

### 57503 Issue 5

57504 Moved from X/OPEN UNIX extension to BASE.

### 57505 Issue 6

57506 The return type is changed to **ssize\_t**, to align with the IEEE P1003.1a draft standard.

57507 The following new requirements on POSIX implementations derive from alignment with the  
57508 Single UNIX Specification:

- 57509 • This function is made mandatory.
- 57510 • In this function it is possible for the return value to exceed the range of the type **ssize\_t**  
57511 (since **size\_t** has a larger range of positive values than **ssize\_t**). A sentence restricting the  
57512 size of the **size\_t** object is added to the description to resolve this conflict.

57513 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 57514 • The FUTURE DIRECTIONS section is changed to None.

57515 The following changes were made to align with the IEEE P1003.1a draft standard:

- 57516 • The [ELOOP] optional error condition is added.

57517 The **restrict** keyword is added to the *readlink()* prototype for alignment with the  
57518 ISO/IEC 9899: 1999 standard.

### 57519 Issue 7

57520 Austin Group Interpretation 1003.1-2001 #143 is applied.

57521 SD5-XSH-ERN-189 is applied, updating the ERRORS section.

57522 The *readlinkat()* function is added from The Open Group Technical Standard, 2006, Extended  
57523 API Set Part 2.

57524 The [EACCES] error is removed from the “may fail” error conditions.

57525 Changes are made to allow a directory to be opened for searching.

57526 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
57527 pathname exists but is not a directory or a symbolic link to a directory.

57528 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0487 [120], XSH/TC1-2008/0488 [461],  
57529 XSH/TC1-2008/0489 [143], XSH/TC1-2008/0490 [324], XSH/TC1-2008/0491 [278],  
57530 XSH/TC1-2008/0492 [278], XSH/TC1-2008/0493 [455], and XSH/TC1-2008/0494 [151,231] are  
57531 applied.

**NAME**

readv — read a vector

**SYNOPSIS**

```
XSI    #include <sys/uio.h>
      ssize_t readv(int fildes, const struct iovec *iov, int iovcnt);
```

**DESCRIPTION**

The *readv()* function shall be equivalent to *read()*, except as described below. The *readv()* function shall place the input data into the *iovcnt* buffers specified by the members of the *iov* array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*−1]. The *iovcnt* argument is valid if greater than 0 and less than or equal to {IOV\_MAX}.

Each *iovec* entry specifies the base address and length of an area in memory where data should be placed. The *readv()* function shall always fill an area completely before proceeding to the next.

Upon successful completion, *readv()* shall mark for update the last data access timestamp of the file.

**RETURN VALUE**

Refer to *read()*.

**ERRORS**

Refer to *read()*.

In addition, the *readv()* function shall fail if:

[EINVAL]        The sum of the *iov\_len* values in the *iov* array overflowed an *ssize\_t*.

The *readv()* function may fail if:

[EINVAL]        The *iovcnt* argument was less than or equal to 0, or greater than {IOV\_MAX}.

**EXAMPLES****Reading Data into an Array**

The following example reads data from the file associated with the file descriptor *fd* into the buffers specified by members of the *iov* array.

```
#include <sys/types.h>
#include <sys/uio.h>
#include <unistd.h>
...
ssize_t bytes_read;
int fd;
char buf0[20];
char buf1[30];
char buf2[40];
int iovcnt;
struct iovec iov[3];

iov[0].iov_base = buf0;
iov[0].iov_len = sizeof(buf0);
iov[1].iov_base = buf1;
iov[1].iov_len = sizeof(buf1);
iov[2].iov_base = buf2;
```

```

57575         iov[2].iov_len = sizeof(buf2);
57576         ...
57577         iovcnt = sizeof(iov) / sizeof(struct iovec);
57578         bytes_read = readv(fd, iov, iovcnt);
57579         ...

```

#### 57580 APPLICATION USAGE

57581 None.

#### 57582 RATIONALE

#### 57589 CHANGE HISTORY

57590 First released in Issue 4, Version 2.

#### 57591 Issue 6

57592 Split out from the *read()* reference page.

#### 57593 Issue 7

57594 Changes are made related to support for finegrained timestamps.

57595 **NAME**

57596       realloc — memory reallocator

57597 **SYNOPSIS**

57598       #include &lt;stdlib.h&gt;

57599       void \*realloc(void \*ptr, size\_t size);

57600 **DESCRIPTION**

57601 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 57602 conflict between the requirements described here and the ISO C standard is unintentional. This  
 57603 volume of POSIX.1-2008 defers to the ISO C standard.

57604       The *realloc()* function shall deallocate the old object pointed to by *ptr* and return a pointer to a  
 57605 new object that has the size specified by *size*. The contents of the new object shall be the same as  
 57606 that of the old object prior to deallocation, up to the lesser of the new and old sizes. Any bytes in  
 57607 the new object beyond the size of the old object have indeterminate values. If the size of the  
 57608 space requested is zero, the behavior shall be implementation-defined: either a null pointer is  
 57609 returned, or the behavior shall be as if the size were some non-zero value, except that the  
 57610 behavior is undefined if the returned pointer is used to access an object. If the space cannot be  
 57611 allocated, the object shall remain unchanged.

57612       If *ptr* is a null pointer, *realloc()* shall be equivalent to *malloc()* for the specified size.

57613       If *ptr* does not match a pointer returned earlier by *calloc()*, *malloc()*, or *realloc()* or if the space has  
 57614 previously been deallocated by a call to *free()* or *realloc()*, the behavior is undefined.

57615       The order and contiguity of storage allocated by successive calls to *realloc()* is unspecified. The  
 57616 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to  
 57617 a pointer to any type of object and then used to access such an object in the space allocated (until  
 57618 the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object  
 57619 disjoint from any other object. The pointer returned shall point to the start (lowest byte address)  
 57620 of the allocated space. If the space cannot be allocated, a null pointer shall be returned.

57621 **RETURN VALUE**

57622       Upon successful completion, *realloc()* shall return a pointer to the (possibly moved) allocated  
 57623 space. If *size* is 0, either:

57624 CX       • A null pointer shall be returned and, if *ptr* is not a null pointer, *errno* shall be set to an  
 57625 implementation-defined value.

57626       • A pointer to the allocated space shall be returned, and the memory object pointed to by *ptr*  
 57627 shall be freed. The application shall ensure that the pointer is not used to access an object.

57628 CX       If there is not enough available memory, *realloc()* shall return a null pointer and set *errno* to  
 57629 CX       [ENOMEM]. If *realloc()* returns a null pointer and *errno* has been set to [ENOMEM], the  
 57630 memory referenced by *ptr* shall not be changed.

57631 **ERRORS**

57632       The *realloc()* function shall fail if:

57633 CX       [ENOMEM]       Insufficient memory is available.

**EXAMPLES**

None.

**APPLICATION USAGE**

The description of `realloc()` has been modified from previous versions of this standard to align with the ISO/IEC 9899:1999 standard. Previous versions explicitly permitted a call to `realloc(p, 0)` to free the space pointed to by `p` and return a null pointer. While this behavior could be interpreted as permitted by this version of the standard, the C language committee have indicated that this interpretation is incorrect. Applications should assume that if `realloc()` returns a null pointer, the space pointed to by `p` has not been freed. Since this could lead to double-frees, implementations should also set `errno` if a null pointer actually indicates a failure, and applications should only free the space if `errno` was changed.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

This standard defers to the ISO C standard. While that standard currently has language that might permit `realloc(p, 0)`, where `p` is not a null pointer, to free `p` while still returning a null pointer, the committee responsible for that standard is considering clarifying the language to explicitly prohibit that alternative.

**SEE ALSO**`calloc()`, `free()`, `malloc()`

XBD &lt;stdlib.h&gt;

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, if there is not enough available memory, the setting of `errno` to [ENOMEM] is added.
- The [ENOMEM] error condition is added.

**Issue 7**

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0495 [400], XSH/TC1-2008/0496 [400], XSH/TC1-2008/0497 [400], and XSH/TC1-2008/0498 [400] are applied.

**NAME**

realpath — resolve a pathname

**SYNOPSIS**

```
XSI    #include <stdlib.h>

char *realpath(const char *restrict file_name,
               char *restrict resolved_name);
```

**DESCRIPTION**

The *realpath()* function shall derive, from the pathname pointed to by *file\_name*, an absolute pathname that resolves to the same directory entry, whose resolution does not involve '.', '..', or symbolic links. If *resolved\_name* is a null pointer, the generated pathname shall be stored as a null-terminated string in a buffer allocated as if by a call to *malloc()*. Otherwise, if {PATH\_MAX} is defined as a constant in the <limits.h> header, then the generated pathname shall be stored as a null-terminated string, up to a maximum of {PATH\_MAX} bytes, in the buffer pointed to by *resolved\_name*.

If *resolved\_name* is not a null pointer and {PATH\_MAX} is not defined as a constant in the <limits.h> header, the behavior is undefined.

**RETURN VALUE**

Upon successful completion, *realpath()* shall return a pointer to the buffer containing the resolved name. Otherwise, *realpath()* shall return a null pointer and set *errno* to indicate the error.

If the *resolved\_name* argument is a null pointer, the pointer returned by *realpath()* can be passed to *free()*.

If the *resolved\_name* argument is not a null pointer and the *realpath()* function fails, the contents of the buffer pointed to by *resolved\_name* are undefined.

**ERRORS**

The *realpath()* function shall fail if:

- |                |                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [EACCES]       | Search permission was denied for a component of the path prefix of <i>file_name</i> .                                                                                                                                                                                                                                                                                                                      |
| [EINVAL]       | The <i>file_name</i> argument is a null pointer.                                                                                                                                                                                                                                                                                                                                                           |
| [EIO]          | An error occurred while reading from the file system.                                                                                                                                                                                                                                                                                                                                                      |
| [ELOOP]        | A loop exists in symbolic links encountered during resolution of the <i>file_name</i> argument.                                                                                                                                                                                                                                                                                                            |
| [ENAMETOOLONG] | The length of a component of a pathname is longer than {NAME_MAX}.                                                                                                                                                                                                                                                                                                                                         |
| [ENOENT]       | A component of <i>file_name</i> does not name an existing file or <i>file_name</i> points to an empty string.                                                                                                                                                                                                                                                                                              |
| [ENOTDIR]      | A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>file_name</i> argument contains at least one non- <i>&lt;slash&gt;</i> character and ends with one or more trailing <i>&lt;slash&gt;</i> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory. |

57706 The *realpath()* function may fail if:

- 57707 [EACCES] The *file\_name* argument does not begin with a <slash> and none of the
- 57708 symbolic links (if any) processed during pathname resolution of *file\_name* had
- 57709 contents that began with a <slash>, and either search permission was denied
- 57710 for the current directory or read or search permission was denied for a
- 57711 directory above the current directory in the file hierarchy.
- 57712 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during
- 57713 resolution of the *file\_name* argument.
- 57714 [ENAMETOOLONG]
- 57715 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a
- 57716 symbolic link produced an intermediate result with a length that exceeds
- 57717 {PATH\_MAX}.
- 57718 [ENOMEM] Insufficient storage space is available.

## 57719 EXAMPLES

### 57720 Generating an Absolute Pathname

57721 The following example generates an absolute pathname for the file identified by the *symlinkpath*

57722 argument. The generated pathname is stored in the buffer pointed to by *actualpath*.

```

57723 #include <stdlib.h>
57724 ...
57725 char *symlinkpath = "/tmp/symlink/file";
57726 char *actualpath;

57727 actualpath = realpath(symlinkpath, NULL);
57728 if (actualpath != NULL)
57729 {
57730     ... use actualpath ...
57731     free(actualpath);
57732 }
57733 else
57734 {
57735     ... handle error ...
57736 }
```

## 57737 APPLICATION USAGE

57738 For functions that allocate memory as if by *malloc()*, the application should release such memory

57739 when it is no longer required by a call to *free()*. For *realpath()*, this is the return value.

## 57740 RATIONALE

57741 Since *realpath()* has no *length* argument, if {PATH\_MAX} is not defined as a constant in

57742 <limits.h>, applications have no way of determining how large a buffer they need to allocate for

57743 it to be safe to pass to *realpath()*. A {PATH\_MAX} value obtained from a prior *pathconf()* call is

57744 out-of-date by the time *realpath()* is called. Hence the only reliable way to use *realpath()* when

57745 {PATH\_MAX} is not defined in <limits.h> is to pass a null pointer for *resolved\_name* so that

57746 *realpath()* will allocate a buffer of the necessary size.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*fpathconf()*, *free()*, *getcwd()*, *sysconf()*

XBD **<limits.h>**, **<stdlib.h>**

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

**Issue 6**

The **restrict** keyword is added to the *realpath()* prototype for alignment with the ISO/IEC 9899:1999 standard.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/51 is applied, adding new text to the DESCRIPTION for the case when *resolved\_name* is a null pointer, changing the [EINVAL] error text, adding text to the RATIONALE, and adding text to FUTURE DIRECTIONS.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/110 is applied, updating the ERRORS section to refer to the *file\_name* argument, rather than a nonexistent *path* argument.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #143 is applied.

This function is updated for passing a null pointer to *realpath()* for the *resolved\_name* argument.

The APPLICATION USAGE section is updated to clarify that memory is allocated as if by *malloc()*.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0499 [353], XSH/TC1-2008/0500 [324], and XSH/TC1-2008/0501 [353] are applied.

**NAME**

recv — receive a message from a connected socket

**SYNOPSIS**

```
#include <sys/socket.h>

ssize_t recv(int socket, void *buffer, size_t length, int flags);
```

**DESCRIPTION**

The *recv()* function shall receive a message from a connection-mode or connectionless-mode socket. It is normally used with connected sockets because it does not permit the application to retrieve the source address of received data.

The *recv()* function takes the following arguments:

|               |                                                                                                                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>socket</i> | Specifies the socket file descriptor.                                                                                                                                                                                                                                                                                                |
| <i>buffer</i> | Points to a buffer where the message should be stored.                                                                                                                                                                                                                                                                               |
| <i>length</i> | Specifies the length in bytes of the buffer pointed to by the <i>buffer</i> argument.                                                                                                                                                                                                                                                |
| <i>flags</i>  | Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:                                                                                                                                                                                                |
| MSG_PEEK      | Peeks at an incoming message. The data is treated as unread and the next <i>recv()</i> or similar function shall still return this data.                                                                                                                                                                                             |
| MSG_OOB       | Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.                                                                                                                                                                                                                                 |
| MSG_WAITALL   | On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket. |

The *recv()* function shall return the length of the message written to the buffer pointed to by the *buffer* argument. For message-based sockets, such as SOCK\_DGRAM and SOCK\_SEQPACKET, the entire message shall be read in a single operation. If a message is too long to fit in the supplied buffer, and MSG\_PEEK is not set in the *flags* argument, the excess bytes shall be discarded. For stream-based sockets, such as SOCK\_STREAM, message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes available, and no data shall be discarded.

If the MSG\_WAITALL flag is not set, data shall be returned only up to the end of the first message.

If no messages are available at the socket and O\_NONBLOCK is not set on the socket's file descriptor, *recv()* shall block until a message arrives. If no messages are available at the socket and O\_NONBLOCK is set on the socket's file descriptor, *recv()* shall fail and set *errno* to [EAGAIN] or [EWOULDBLOCK].

**RETURN VALUE**

Upon successful completion, *recv()* shall return the length of the message in bytes. If no messages are available to be received and the peer has performed an orderly shutdown, *recv()* shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

**ERRORS**

The *recv()* function shall fail if:

[EAGAIN] or [EWOULDBLOCK]

The socket's file descriptor is marked O\_NONBLOCK and no data is waiting to be received; or MSG\_OOB is set and no out-of-band data is available and either the socket's file descriptor is marked O\_NONBLOCK or the socket does not support blocking to await out-of-band data.

[EBADF] The *socket* argument is not a valid file descriptor.

[ECONNRESET] A connection was forcibly closed by a peer.

[EINTR] The *recv()* function was interrupted by a signal that was caught, before any data was available.

[EINVAL] The MSG\_OOB flag is set and no out-of-band data is available.

[ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EOPNOTSUPP] The specified flags are not supported for this socket type or protocol.

[ETIMEDOUT] The connection timed out during connection establishment, or due to a transmission timeout on active connection.

The *recv()* function may fail if:

[EIO] An I/O error occurred while reading from or writing to the file system.

[ENOBUFS] Insufficient resources were available in the system to perform the operation.

[ENOMEM] Insufficient memory was available to fulfill the request.

**EXAMPLES**

None.

**APPLICATION USAGE**

The *recv()* function is equivalent to *recvfrom()* with null pointer *address* and *address\_len* arguments, and to *read()* if the *socket* argument refers to a socket and the *flags* argument is 0.

The *select()* and *poll()* functions can be used to determine when data is available to be received.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0502 [462] is applied.

**NAME**

recvfrom — receive a message from a socket

**SYNOPSIS**

```
#include <sys/socket.h>

ssize_t recvfrom(int socket, void *restrict buffer, size_t length,
                 int flags, struct sockaddr *restrict address,
                 socklen_t *restrict address_len);
```

**DESCRIPTION**

The *recvfrom*() function shall receive a message from a connection-mode or connectionless-mode socket. It is normally used with connectionless-mode sockets because it permits the application to retrieve the source address of received data.

The *recvfrom*() function takes the following arguments:

|                    |                                                                                                                                                                                                                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>socket</i>      | Specifies the socket file descriptor.                                                                                                                                                                                                                                                                                                |
| <i>buffer</i>      | Points to the buffer where the message should be stored.                                                                                                                                                                                                                                                                             |
| <i>length</i>      | Specifies the length in bytes of the buffer pointed to by the <i>buffer</i> argument.                                                                                                                                                                                                                                                |
| <i>flags</i>       | Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:                                                                                                                                                                                                |
| MSG_PEEK           | Peeks at an incoming message. The data is treated as unread and the next <i>recvfrom</i> () or similar function shall still return this data.                                                                                                                                                                                        |
| MSG_OOB            | Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.                                                                                                                                                                                                                                 |
| MSG_WAITALL        | On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket. |
| <i>address</i>     | A null pointer, or points to a <b>sockaddr</b> structure in which the sending address is to be stored. The length and format of the address depend on the address family of the socket.                                                                                                                                              |
| <i>address_len</i> | Either a null pointer, if <i>address</i> is a null pointer, or a pointer to a <b>socklen_t</b> object which on input specifies the length of the supplied <b>sockaddr</b> structure, and on output specifies the length of the stored address.                                                                                       |

The *recvfrom*() function shall return the length of the message written to the buffer pointed to by the *buffer* argument. For message-based sockets, such as **SOCK\_RAW**, **SOCK\_DGRAM**, and **SOCK\_SEQPACKET**, the entire message shall be read in a single operation. If a message is too long to fit in the supplied buffer, and MSG\_PEEK is not set in the *flags* argument, the excess bytes shall be discarded. For stream-based sockets, such as **SOCK\_STREAM**, message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes available, and no data shall be discarded.

If the MSG\_WAITALL flag is not set, data shall be returned only up to the end of the first message.

Not all protocols provide the source address for messages. If the *address* argument is not a null

57898 pointer and the protocol provides the source address of messages, the source address of the  
 57899 received message shall be stored in the **sockaddr** structure pointed to by the *address* argument,  
 57900 and the length of this address shall be stored in the object pointed to by the *address\_len*  
 57901 argument.

57902 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,  
 57903 the stored address shall be truncated.

57904 If the *address* argument is not a null pointer and the protocol does not provide the source address  
 57905 of messages, the value stored in the object pointed to by *address* is unspecified.

57906 If no messages are available at the socket and O\_NONBLOCK is not set on the socket's file  
 57907 descriptor, *recvfrom()* shall block until a message arrives. If no messages are available at the  
 57908 socket and O\_NONBLOCK is set on the socket's file descriptor, *recvfrom()* shall fail and set *errno*  
 57909 to [EAGAIN] or [EWOULDBLOCK].

#### 57910 RETURN VALUE

57911 Upon successful completion, *recvfrom()* shall return the length of the message in bytes. If no  
 57912 messages are available to be received and the peer has performed an orderly shutdown,  
 57913 *recvfrom()* shall return 0. Otherwise, the function shall return -1 and set *errno* to indicate the  
 57914 error.

#### 57915 ERRORS

57916 The *recvfrom()* function shall fail if:

57917 [EAGAIN] or [EWOULDBLOCK]

57918 The socket's file descriptor is marked O\_NONBLOCK and no data is waiting  
 57919 to be received; or MSG\_OOB is set and no out-of-band data is available and  
 57920 either the socket's file descriptor is marked O\_NONBLOCK or the socket does  
 57921 not support blocking to await out-of-band data.

57922 [EBADF] The *socket* argument is not a valid file descriptor.

57923 [ECONNRESET] A connection was forcibly closed by a peer.

57924 [EINTR] A signal interrupted *recvfrom()* before any data was available.

57925 [EINVAL] The MSG\_OOB flag is set and no out-of-band data is available.

57926 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

57927 [ENOTSOCK] The *socket* argument does not refer to a socket.

57928 [EOPNOTSUPP] The specified flags are not supported for this socket type.

57929 [ETIMEDOUT] The connection timed out during connection establishment, or due to a  
 57930 transmission timeout on active connection.

57931 The *recvfrom()* function may fail if:

57932 [EIO] An I/O error occurred while reading from or writing to the file system.

57933 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

57934 [ENOMEM] Insufficient memory was available to fulfill the request.

57935 **EXAMPLES**

57936 None.

57937 **APPLICATION USAGE**57938 The *select()* and *poll()* functions can be used to determine when data is available to be received.57939 **RATIONALE**

57940 None.

57941 **FUTURE DIRECTIONS**

57942 None.

## 57950 NAME

57951 recvmsg — receive a message from a socket

## 57952 SYNOPSIS

57953 #include &lt;sys/socket.h&gt;

57954 ssize\_t recvmsg(int socket, struct msghdr \*message, int flags);

## 57955 DESCRIPTION

57956 The *recvmsg()* function shall receive a message from a connection-mode or connectionless-mode  
 57957 socket. It is normally used with connectionless-mode sockets because it permits the application  
 57958 to retrieve the source address of received data.

57959 The *recvmsg()* function takes the following arguments:

|       |                |                                                                                                                                                                                                                                                                                                                                      |
|-------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 57960 | <i>socket</i>  | Specifies the socket file descriptor.                                                                                                                                                                                                                                                                                                |
| 57961 | <i>message</i> | Points to a <b>msghdr</b> structure, containing both the buffer to store the source address and the buffers for the incoming message. The length and format of the address depend on the address family of the socket. The <i>msg_flags</i> member is ignored on input, but may contain meaningful values on output.                 |
| 57962 |                |                                                                                                                                                                                                                                                                                                                                      |
| 57963 |                |                                                                                                                                                                                                                                                                                                                                      |
| 57964 |                |                                                                                                                                                                                                                                                                                                                                      |
| 57965 | <i>flags</i>   | Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:                                                                                                                                                                                                |
| 57966 |                |                                                                                                                                                                                                                                                                                                                                      |
| 57967 | MSG_OOB        | Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.                                                                                                                                                                                                                                 |
| 57968 |                |                                                                                                                                                                                                                                                                                                                                      |
| 57969 | MSG_PEEK       | Peeks at the incoming message.                                                                                                                                                                                                                                                                                                       |
| 57970 | MSG_WAITALL    | On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket. |
| 57971 |                |                                                                                                                                                                                                                                                                                                                                      |
| 57972 |                |                                                                                                                                                                                                                                                                                                                                      |
| 57973 |                |                                                                                                                                                                                                                                                                                                                                      |
| 57974 |                |                                                                                                                                                                                                                                                                                                                                      |
| 57975 |                |                                                                                                                                                                                                                                                                                                                                      |

57976 The *recvmsg()* function shall receive messages from unconnected or connected sockets and shall  
 57977 return the length of the message.

57978 The *recvmsg()* function shall return the total length of the message. For message-based sockets,  
 57979 such as SOCK\_DGRAM and SOCK\_SEQPACKET, the entire message shall be read in a single  
 57980 operation. If a message is too long to fit in the supplied buffers, and MSG\_PEEK is not set in the  
 57981 *flags* argument, the excess bytes shall be discarded, and MSG\_TRUNC shall be set in the  
 57982 *msg\_flags* member of the **msghdr** structure. For stream-based sockets, such as SOCK\_STREAM,  
 57983 message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it  
 57984 becomes available, and no data shall be discarded.

57985 If the MSG\_WAITALL flag is not set, data shall be returned only up to the end of the first  
 57986 message.

57987 If no messages are available at the socket and O\_NONBLOCK is not set on the socket's file  
 57988 descriptor, *recvmsg()* shall block until a message arrives. If no messages are available at the  
 57989 socket and O\_NONBLOCK is set on the socket's file descriptor, the *recvmsg()* function shall fail  
 57990 and set *errno* to [EAGAIN] or [EWOULDBLOCK].

57991 In the **msghdr** structure, the *msg\_name* member may be a null pointer if the source address is not  
 57992 required. Otherwise, if the socket is unconnected, the *msg\_name* member points to a **sockaddr**  
 57993 structure in which the source address is to be stored, and the *msg\_namelen* member on input  
 57994 specifies the length of the supplied **sockaddr** structure and on output specifies the length of the

stored address. If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated. If the socket is connected, the *msg\_name* and *msg\_namelen* members shall be ignored. The *msg\_iov* and *msg\_iovlen* fields are used to specify where the received data shall be stored. The *msg\_iov* member points to an array of **iovec** structures; the *msg\_iovlen* member shall be set to the dimension of this array. In each **iovec** structure, the *iov\_base* field specifies a storage area and the *iov\_len* field gives its size in bytes. Each storage area indicated by *msg\_iov* is filled with received data in turn until all of the received data is stored or all of the areas have been filled.

Upon successful completion, the *msg\_flags* member of the message header shall be the bitwise-inclusive OR of all of the following flags that indicate conditions detected for the received message:

|            |                                                            |
|------------|------------------------------------------------------------|
| MSG_EOR    | End-of-record was received (if supported by the protocol). |
| MSG_OOB    | Out-of-band data was received.                             |
| MSG_TRUNC  | Normal data was truncated.                                 |
| MSG_CTRUNC | Control data was truncated.                                |

## RETURN VALUE

Upon successful completion, *recvmsg()* shall return the length of the message in bytes. If no messages are available to be received and the peer has performed an orderly shutdown, *recvmsg()* shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

## ERRORS

The *recvmsg()* function shall fail if:

[EAGAIN] or [EWOULDBLOCK]

The socket's file descriptor is marked O\_NONBLOCK and no data is waiting to be received; or MSG\_OOB is set and no out-of-band data is available and either the socket's file descriptor is marked O\_NONBLOCK or the socket does not support blocking to await out-of-band data.

[EBADF] The *socket* argument is not a valid open file descriptor.

[ECONNRESET] A connection was forcibly closed by a peer.

[EINTR] This function was interrupted by a signal before any data was available.

[EINVAL] The sum of the *iov\_len* values overflows a **ssize\_t**, or the MSG\_OOB flag is set and no out-of-band data is available.

[EMSGSIZE] The *msg\_iovlen* member of the **msghdr** structure pointed to by *message* is less than or equal to 0, or is greater than {IOV\_MAX}.

[ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EOPNOTSUPP] The specified flags are not supported for this socket type.

[ETIMEDOUT] The connection timed out during connection establishment, or due to a transmission timeout on active connection.

The *recvmsg()* function may fail if:

[EIO] An I/O error occurred while reading from or writing to the file system.

58035 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

58036 [ENOMEM] Insufficient memory was available to fulfill the request.

#### 58037 EXAMPLES

58038 None.

#### 58039 APPLICATION USAGE

58040 The *select()* and *poll()* functions can be used to determine when data is available to be received.

#### 58041 RATIONALE

58042 None.

#### 58043 FUTURE DIRECTIONS

58044 None.

#### 58045 SEE ALSO

58046 *poll()*, *pselect()*, *recv()*, *recvfrom()*, *send()*, *sendmsg()*, *sendto()*, *shutdown()*, *socket()*

#### 58048 CHANGE HISTORY

58049 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

#### 58050 Issue 7

58051 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0504 [464] is applied.

**NAME**

regcomp, regerror, regex, regfree — regular expression matching

**SYNOPSIS**

```
#include <regex.h>

int regcomp(regex_t *restrict preg, const char *restrict pattern,
            int cflags);
size_t regerror(int errcode, const regex_t *restrict preg,
                char *restrict errbuf, size_t errbuf_size);
int regex(const regex_t *restrict preg, const char *restrict string,
           size_t nmatch, regmatch_t pmatch[restrict], int eflags);
void regfree(regex_t *preg);
```

**DESCRIPTION**

These functions interpret *basic* and *extended* regular expressions as described in XBD [Chapter 9](#) (on page 181).

The **regex\_t** structure is defined in **<regex.h>** and contains at least the following member:

| Member Type   | Member Name    | Description                             |
|---------------|----------------|-----------------------------------------|
| <b>size_t</b> | <i>re_nsub</i> | Number of parenthesized subexpressions. |

The **regmatch\_t** structure is defined in **<regex.h>** and contains at least the following members:

| Member Type     | Member Name  | Description                                                                                |
|-----------------|--------------|--------------------------------------------------------------------------------------------|
| <b>regoff_t</b> | <i>rm_so</i> | Byte offset from start of <i>string</i> to start of substring.                             |
| <b>regoff_t</b> | <i>rm_eo</i> | Byte offset from start of <i>string</i> of the first character after the end of substring. |

The *regcomp()* function shall compile the regular expression contained in the string pointed to by the *pattern* argument and place the results in the structure pointed to by *preg*. The *cflags* argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in the **<regex.h>** header:

REG\_EXTENDED     Use Extended Regular Expressions.

REG\_ICASE        Ignore case in match (see XBD [Chapter 9](#), on page 181).

REG\_NOSUB        Report only success/fail in *regex()*.

REG\_NEWLINE      Change the handling of <newline> characters, as described in the text.

The default regular expression type for *pattern* is a Basic Regular Expression. The application can specify Extended Regular Expressions using the REG\_EXTENDED *cflags* flag.

If the REG\_NOSUB flag was not set in *cflags*, then *regcomp()* shall set *re\_nsub* to the number of parenthesized subexpressions (delimited by "*\( \)*" in basic regular expressions or "*( )*" in extended regular expressions) found in *pattern*.

The *regex()* function compares the null-terminated string specified by *string* with the compiled regular expression *preg* initialized by a previous call to *regcomp()*. If it finds a match, *regex()* shall return 0; otherwise, it shall return non-zero indicating either no match or an error. The *eflags* argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in the **<regex.h>** header:

58094 REG\_NOTBOL The first character of the string pointed to by *string* is not the beginning of  
 58095 the line. Therefore, the <circumflex> character ('^'), when taken as a  
 58096 special character, shall not match the beginning of *string*.

58097 REG\_NOTEOL The last character of the string pointed to by *string* is not the end of the  
 58098 line. Therefore, the <dollar-sign> ('\$'), when taken as a special character,  
 58099 shall not match the end of *string*.

58100 If *nmatch* is 0 or REG\_NOSUB was set in the *cflags* argument to *regcomp()*, then *regexexec()* shall  
 58101 ignore the *pmatch* argument. Otherwise, the application shall ensure that the *pmatch* argument  
 58102 points to an array with at least *nmatch* elements, and *regexexec()* shall fill in the elements of that  
 58103 array with offsets of the substrings of *string* that correspond to the parenthesized subexpressions  
 58104 of *pattern*: *pmatch[i].rm\_so* shall be the byte offset of the beginning and *pmatch[i].rm\_eo* shall be  
 58105 one greater than the byte offset of the end of substring *i*. (Subexpression *i* begins at the *i*th  
 58106 matched open parenthesis, counting from 1.) Offsets in *pmatch*[0] identify the substring that  
 58107 corresponds to the entire regular expression. Unused elements of *pmatch* up to *pmatch*[*nmatch*-1]  
 58108 shall be filled with -1. If there are more than *nmatch* subexpressions in *pattern* (*pattern* itself  
 58109 counts as a subexpression), then *regexexec()* shall still do the match, but shall record only the first  
 58110 *nmatch* substrings.

58111 When matching a basic or extended regular expression, any given parenthesized subexpression  
 58112 of *pattern* might participate in the match of several different substrings of *string*, or it might not  
 58113 match any substring even though the pattern as a whole did match. The following rules shall be  
 58114 used to determine which substrings to report in *pmatch* when matching regular expressions:

- 58115 1. If subexpression *i* in a regular expression is not contained within another subexpression,  
 58116 and it participated in the match several times, then the byte offsets in *pmatch*[*i*] shall  
 58117 delimit the last such match.
- 58118 2. If subexpression *i* is not contained within another subexpression, and it did not  
 58119 participate in an otherwise successful match, the byte offsets in *pmatch*[*i*] shall be -1. A  
 58120 subexpression does not participate in the match when:  
 58121 ' \* ' or "\{\}" appears immediately after the subexpression in a basic regular  
 58122 expression, or ' \* ', ' ? ', or " { } " appears immediately after the subexpression in  
 58123 an extended regular expression, and the subexpression did not match (matched 0  
 58124 times)

58125 or:

58126 ' | ' is used in an extended regular expression to select this subexpression or  
 58127 another, and the other subexpression matched.

- 58128 3. If subexpression *i* is contained within another subexpression *j*, and *i* is not contained  
 58129 within any other subexpression that is contained within *j*, and a match of subexpression *j*  
 58130 is reported in *pmatch*[*j*], then the match or non-match of subexpression *i* reported in  
 58131 *pmatch*[*i*] shall be as described in 1. and 2. above, but within the substring reported in  
 58132 *pmatch*[*j*] rather than the whole string. The offsets in *pmatch*[*i*] are still relative to the start  
 58133 of *string*.
- 58134 4. If subexpression *i* is contained in subexpression *j*, and the byte offsets in *pmatch*[*j*] are -1,  
 58135 then the pointers in *pmatch*[*i*] shall also be -1.
- 58136 5. If subexpression *i* matched a zero-length string, then both byte offsets in *pmatch*[*i*] shall be  
 58137 the byte offset of the character or null terminator immediately following the zero-length  
 58138 string.

58139 If, when *regexec()* is called, the locale is different from when the regular expression was  
58140 compiled, the result is undefined.

58141 If REG\_NEWLINE is not set in *cflags*, then a <newline> in *pattern* or *string* shall be treated as an  
58142 ordinary character. If REG\_NEWLINE is set, then <newline> shall be treated as an ordinary  
58143 character except as follows:

- 58144 1. A <newline> in *string* shall not be matched by a <period> outside a bracket expression or  
58145 by any form of a non-matching list (see XBD Chapter 9, on page 181).
- 58146 2. A <circumflex> ( ' ^ ' ) in *pattern*, when used to specify expression anchoring (see XBD  
58147 Section 9.3.8, on page 188), shall match the zero-length string immediately after a  
58148 <newline> in *string*, regardless of the setting of REG\_NOTBOL.
- 58149 3. A <dollar-sign> ( ' \$ ' ) in *pattern*, when used to specify expression anchoring, shall match  
58150 the zero-length string immediately before a <newline> in *string*, regardless of the setting  
58151 of REG\_NOTEOL.

58152 The *regfree()* function frees any memory allocated by *regcomp()* associated with *preg*.

58153 The following constants are defined as the minimum set of error return values, although other  
58154 errors listed as implementation extensions in <regex.h> are possible:

|       |              |                                                                      |
|-------|--------------|----------------------------------------------------------------------|
| 58155 | REG_BADBR    | Content of "\{\}" invalid: not a number, number too large, more than |
| 58156 |              | two numbers, first larger than second.                               |
| 58157 | REG_BADPAT   | Invalid regular expression.                                          |
| 58158 | REG_BADRPT   | '?', '*', or '+' not preceded by valid regular expression.           |
| 58159 | REG_EBRACE   | "\{\}" imbalance.                                                    |
| 58160 | REG_EBRACK   | "[" imbalance.                                                       |
| 58161 | REG_ECOLLATE | Invalid collating element referenced.                                |
| 58162 | REG_ECTYPE   | Invalid character class type referenced.                             |
| 58163 | REG_EESCAPE  | Trailing <backslash> character in pattern.                           |
| 58164 | REG_EPAREN   | "\(" or "(" imbalance.                                               |
| 58165 | REG_ERANGE   | Invalid endpoint in range expression.                                |
| 58166 | REG_ESPACE   | Out of memory.                                                       |
| 58167 | REG_ESUBREG  | Number in "\digit" invalid or in error.                              |
| 58168 | REG_NOMATCH  | <i>regexec()</i> failed to match.                                    |

58169 If more than one error occurs in processing a function call, any one of the possible constants may  
58170 be returned, as the order of detection is unspecified.

58171 The *regerror()* function provides a mapping from error codes returned by *regcomp()* and  
58172 *regexec()* to unspecified printable strings. It generates a string corresponding to the value of the  
58173 *errcode* argument, which the application shall ensure is the last non-zero value returned by  
58174 *regcomp()* or *regexec()* with the given value of *preg*. If *errcode* is not such a value, the content of  
58175 the generated string is unspecified.

58176 If *preg* is a null pointer, but *errcode* is a value returned by a previous call to *regexec()* or *regcomp()*,  
58177 the *regerror()* still generates an error string corresponding to the value of *errcode*, but it might not  
58178 be as detailed under some implementations.

If the *errbuf\_size* argument is not 0, *regerror()* shall place the generated string into the buffer of size *errbuf\_size* bytes pointed to by *errbuf*. If the string (including the terminating null) cannot fit in the buffer, *regerror()* shall truncate the string and null-terminate the result.

If *errbuf\_size* is 0, *regerror()* shall ignore the *errbuf* argument, and return the size of the buffer needed to hold the generated string.

If the *preg* argument to *regexexec()* or *regfree()* is not a compiled regular expression returned by *regcomp()*, the result is undefined. A *preg* is no longer treated as a compiled regular expression after it is given to *regfree()*.

## RETURN VALUE

Upon successful completion, the *regcomp()* function shall return 0. Otherwise, it shall return an integer value indicating an error as described in <regex.h>, and the content of *preg* is undefined. If a code is returned, the interpretation shall be as given in <regex.h>.

If *regcomp()* detects an invalid RE, it may return REG\_BADPAT, or it may return one of the error codes that more precisely describes the error.

Upon successful completion, the *regexexec()* function shall return 0. Otherwise, it shall return REG\_NOMATCH to indicate no match.

Upon successful completion, the *regerror()* function shall return the number of bytes needed to hold the entire generated string, including the null termination. If the return value is greater than *errbuf\_size*, the string returned in the buffer pointed to by *errbuf* has been truncated.

The *regfree()* function shall not return a value.

## ERRORS

No errors are defined.

## EXAMPLES

```
#include <regex.h>

/*
 * Match string against the extended regular expression in
 * pattern, treating errors as no match.
 *
 * Return 1 for match, 0 for no match.
 */

int
match(const char *string, char *pattern)
{
    int    status;
    regex_t re;

    if (regcomp(&re, pattern, REG_EXTENDED|REG_NOSUB) != 0) {
        return(0);      /* Report error. */
    }
    status = regexexec(&re, string, (size_t) 0, NULL, 0);
    regfree(&re);
    if (status != 0) {
        return(0);      /* Report error. */
    }
    return(1);
}
```

The following demonstrates how the REG\_NOTBOL flag could be used with *regexexec()* to find all substrings in a line that match a pattern supplied by a user. (For simplicity of the example, very little error checking is done.)

```
(void) regcomp (&re, pattern, 0);
/* This call to regexexec() finds the first match on the line. */
error = regexexec (&re, &buffer[0], 1, &pm, 0);
while (error == 0) { /* While matches found. */
    /* Substring found between pm.rm_so and pm.rm_eo. */
    /* This call to regexexec() finds the next match. */
    error = regexexec (&re, buffer + pm.rm_eo, 1, &pm, REG_NOTBOL);
}
```

## APPLICATION USAGE

An application could use:

```
regerror(code, preg, (char *)NULL, (size_t)0)
```

to find out how big a buffer is needed for the generated string, *malloc()* a buffer to hold the string, and then call *regerror()* again to get the string. Alternatively, it could allocate a fixed, static buffer that is big enough to hold most strings, and then use *malloc()* to allocate a larger buffer if it finds that this is too small.

To match a pattern as described in XCU [Section 2.13](#) (on page 2372), use the *fnmatch()* function.

## RATIONALE

The *regexexec()* function must fill in all *nmatch* elements of *pmatch*, where *nmatch* and *pmatch* are supplied by the application, even if some elements of *pmatch* do not correspond to subexpressions in *pattern*. The application developer should note that there is probably no reason for using a value of *nmatch* that is larger than *preg->re\_nsub*+1.

The REG\_NEWLINE flag supports a use of RE matching that is needed in some applications like text editors. In such applications, the user supplies an RE asking the application to find a line that matches the given expression. An anchor in such an RE anchors at the beginning or end of any line. Such an application can pass a sequence of <newline>-separated lines to *regexexec()* as a single long string and specify REG\_NEWLINE to *regcomp()* to get the desired behavior. The application must ensure that there are no explicit <newline> characters in *pattern* if it wants to ensure that any match occurs entirely within a single line.

The REG\_NEWLINE flag affects the behavior of *regexexec()*, but it is in the *cflags* parameter to *regcomp()* to allow flexibility of implementation. Some implementations will want to generate the same compiled RE in *regcomp()* regardless of the setting of REG\_NEWLINE and have *regexexec()* handle anchors differently based on the setting of the flag. Other implementations will generate different compiled REs based on the REG\_NEWLINE.

The REG\_ICASE flag supports the operations taken by the *grep -i* option and the historical implementations of *ex* and *vi*. Including this flag will make it easier for application code to be written that does the same thing as these utilities.

The substrings reported in *pmatch[]* are defined using offsets from the start of the string rather than pointers. This allows type-safe access to both constant and non-constant strings.

The type **regoff\_t** is used for the elements of *pmatch[]* to ensure that the application can represent large arrays in memory (important for an application conforming to the Shell and Utilities volume of POSIX.1-2008).

The 1992 edition of this standard required **regoff\_t** to be at least as wide as **off\_t**, to facilitate future extensions in which the string to be searched is taken from a file. However, these future

extensions have not appeared. The requirement rules out popular implementations with 32-bit **regoff\_t** and 64-bit **off\_t**, so it has been removed.

The standard developers rejected the inclusion of a *regsub()* function that would be used to do substitutions for a matched RE. While such a routine would be useful to some applications, its utility would be much more limited than the matching function described here. Both RE parsing and substitution are possible to implement without support other than that required by the ISO C standard, but matching is much more complex than substituting. The only difficult part of substitution, given the information supplied by *regexec()*, is finding the next character in a string when there can be multi-byte characters. That is a much larger issue, and one that needs a more general solution.

The *errno* variable has not been used for error returns to avoid filling the *errno* name space for this feature.

The interface is defined so that the matched substrings *rm\_sp* and *rm\_ep* are in a separate **regmatch\_t** structure instead of in **regex\_t**. This allows a single compiled RE to be used simultaneously in several contexts; in *main()* and a signal handler, perhaps, or in multiple threads of lightweight processes. (The *preg* argument to *regexec()* is declared with type **const**, so the implementation is not permitted to use the structure to store intermediate results.) It also allows an application to request an arbitrary number of substrings from an RE. The number of subexpressions in the RE is reported in *re\_nsub* in *preg*. With this change to *regexec()*, consideration was given to dropping the REG\_NOSUB flag since the user can now specify this with a zero *nmatch* argument to *regexec()*. However, keeping REG\_NOSUB allows an implementation to use a different (perhaps more efficient) algorithm if it knows in *regcomp()* that no subexpressions need be reported. The implementation is only required to fill in *pmatch* if *nmatch* is not zero and if REG\_NOSUB is not specified. Note that the **size\_t** type, as defined in the ISO C standard, is unsigned, so the description of *regexec()* does not need to address negative values of *nmatch*.

REG\_NOTBOL was added to allow an application to do repeated searches for the same pattern in a line. If the pattern contains a <circumflex> character that should match the beginning of a line, then the pattern should only match when matched against the beginning of the line. Without the REG\_NOTBOL flag, the application could rewrite the expression for subsequent matches, but in the general case this would require parsing the expression. The need for REG\_NOTEOL is not as clear; it was added for symmetry.

The addition of the *regerror()* function addresses the historical need for conforming application programs to have access to error information more than “Function failed to compile/match your RE for unknown reasons”.

This interface provides for two different methods of dealing with error conditions. The specific error codes (REG\_EBRACE, for example), defined in <regex.h>, allow an application to recover from an error if it is so able. Many applications, especially those that use patterns supplied by a user, will not try to deal with specific error cases, but will just use *regerror()* to obtain a human-readable error message to present to the user.

The *regerror()* function uses a scheme similar to *confstr()* to deal with the problem of allocating memory to hold the generated string. The scheme used by *strerror()* in the ISO C standard was considered unacceptable since it creates difficulties for multi-threaded applications.

The *preg* argument is provided to *regerror()* to allow an implementation to generate a more descriptive message than would be possible with *errcode* alone. An implementation might, for example, save the character offset of the offending character of the pattern in a field of *preg*, and then include that in the generated message string. The implementation may also ignore *preg*.

A REG\_FILENAME flag was considered, but omitted. This flag caused *regexexec()* to match patterns as described in XCU Section 2.13 (on page 2372) instead of REs. This service is now provided by the *fnmatch()* function.

Notice that there is a difference in philosophy between the ISO POSIX-2:1993 standard and POSIX.1-2008 in how to handle a “bad” regular expression. The ISO POSIX-2:1993 standard says that many bad constructs “produce undefined results”, or that “the interpretation is undefined”. POSIX.1-2008, however, says that the interpretation of such REs is unspecified. The term “undefined” means that the action by the application is an error, of similar severity to passing a bad pointer to a function.

The *regcomp()* and *regexexec()* functions are required to accept any null-terminated string as the *pattern* argument. If the meaning of the string is “undefined”, the behavior of the function is “unspecified”. POSIX.1-2008 does not specify how the functions will interpret the pattern; they might return error codes, or they might do pattern matching in some completely unexpected way, but they should not do something like abort the process.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

*fnmatch()*, *glob()*

XBD Chapter 9 (on page 181), *<regex.h>*, *<sys/types.h>*

XCUI Section 2.13 (on page 2372)

#### CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

##### Issue 5

Moved from POSIX2 C-language Binding to BASE.

##### Issue 6

In the SYNOPSIS, the optional include of the *<sys/types.h>* header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include *<sys/types.h>* has been removed. Although *<sys/types.h>* was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The normative text is updated to avoid use of the term “must” for application requirements.

The REG\_ENOSYS constant is removed.

The **restrict** keyword is added to the *regcomp()*, *regerror()*, and *regexexec()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

##### Issue 7

Austin Group Interpretation 1003.1-2001 #134 is applied, clarifying that if more than one error occurs in processing a function call, any one of the possible constants may be returned.

SD5-XBD-ERN-60 is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0505 [305] is applied.

58357 **NAME**

58358 remainder, remainderf, remainderl — remainder function

58359 **SYNOPSIS**

```
58360 #include <math.h>
58361 double remainder(double x, double y);
58362 float remainderf(float x, float y);
58363 long double remainderl(long double x, long double y);
```

58364 **DESCRIPTION**

58365 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 58366 conflict between the requirements described here and the ISO C standard is unintentional. This  
 58367 volume of POSIX.1-2008 defers to the ISO C standard.

58368 These functions shall return the floating-point remainder  $r = x - ny$  when  $y$  is non-zero. The value  
 58369  $n$  is the integral value nearest the exact value  $x/y$ . When  $|n - x/y| = 1/2$ , the value  $n$  is chosen to  
 58370 be even.

58371 The behavior of `remainder()` shall be independent of the rounding mode.

58372 **RETURN VALUE**

58373 Upon successful completion, these functions shall return the floating-point remainder  $r = x - ny$   
 58374 when  $y$  is non-zero.

58375 On systems that do not support the IEC 60559 Floating-Point option, if  $y$  is zero, it is  
 58376 implementation-defined whether a domain error occurs or zero is returned.

58377 MX If  $x$  or  $y$  is NaN, a NaN shall be returned.

58378 If  $x$  is infinite or  $y$  is 0 and the other is non-NaN, a domain error shall occur, and a NaN shall be  
 58379 returned.

58380 **ERRORS**

58381 These functions shall fail if:

58382 MX **Domain Error** The  $x$  argument is  $\pm\text{Inf}$ , or the  $y$  argument is  $\pm 0$  and the other argument is non-  
 58383 NaN.

58384 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,  
 58385 then `errno` shall be set to [EDOM]. If the integer expression `(math_errhandling`  
 58386 `& MATH_ERREXCEPT)` is non-zero, then the invalid floating-point exception  
 58387 shall be raised.

58388 These functions may fail if:

58389 **Domain Error** The  $y$  argument is zero.

58390 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,  
 58391 then `errno` shall be set to [EDOM]. If the integer expression `(math_errhandling`  
 58392 `& MATH_ERREXCEPT)` is non-zero, then the invalid floating-point exception  
 58393 shall be raised.

**EXAMPLES**

None.

**APPLICATION USAGE**

On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* & MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

**Issue 6**

The *remainder()* function is no longer marked as an extension.

The *remainderf()* and *remainderl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

**Issue 7**

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #55 (SD5-XSH-ERN-82) is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0506 [320] is applied.

58421 **NAME**

58422       remove — remove a file

58423 **SYNOPSIS**

58424       #include &lt;stdio.h&gt;

58425       int remove(const char \*path);

58426 **DESCRIPTION**

58427 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 58428       conflict between the requirements described here and the ISO C standard is unintentional. This  
 58429       volume of POSIX.1-2008 defers to the ISO C standard.

58430       The *remove()* function shall cause the file named by the pathname pointed to by *path* to be no  
 58431       longer accessible by that name. A subsequent attempt to open that file using that name shall fail,  
 58432       unless it is created anew.

58433 CX       If *path* does not name a directory, *remove(path)* shall be equivalent to *unlink(path)*.

58434       If *path* names a directory, *remove(path)* shall be equivalent to *rmdir(path)*.

58435 **RETURN VALUE**58436 CX       Refer to *rmdir()* or *unlink()*.58437 **ERRORS**58438 CX       Refer to *rmdir()* or *unlink()*.58439 **EXAMPLES**58440       **Removing Access to a File**58441       The following example shows how to remove access to a file named */home/cnd/old\_mods*.

58442       #include &lt;stdio.h&gt;

58443       int status;

58444       ...

58445       status = remove("/home/cnd/old\_mods");

58446 **APPLICATION USAGE**

58447       None.

58448 **RATIONALE**

58449       None.

58450 **FUTURE DIRECTIONS**

58451       None.

58452 **SEE ALSO**58453       *rmdir()*, *unlink()*

58454       XBD &lt;stdio.h&gt;

58455 **CHANGE HISTORY**

58456       First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ISO C  
 58457       standard.

58458 **Issue 6**

58459       Extensions beyond the ISO C standard are marked.

58460  
58461

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

58462  
58463  
58464

- The DESCRIPTION, RETURN VALUE, and ERRORS sections are updated so that if *path* is not a directory, *remove()* is equivalent to *unlink()*, and if it is a directory, it is equivalent to *rmdir()*.

58465 **NAME**

58466 remque — remove an element from a queue

58467 **SYNOPSIS**

```
58468 XSI      #include <search.h>
58469          void remque(void *element);
```

58470 **DESCRIPTION**58471 Refer to *insque()*.

58472 **NAME**

58473 remquo, remquof, remquol — remainder functions

58474 **SYNOPSIS**

```
58475 #include <math.h>
58476 double remquo(double x, double y, int *quo);
58477 float remquof(float x, float y, int *quo);
58478 long double remquol(long double x, long double y, int *quo);
```

58479 **DESCRIPTION**

58480 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 58481 conflict between the requirements described here and the ISO C standard is unintentional. This  
 58482 volume of POSIX.1-2008 defers to the ISO C standard.

58483 The *remquo()*, *remquof()*, and *remquol()* functions shall compute the same remainder as the  
 58484 *remainder()*, *remainderf()*, and *remainderl()* functions, respectively. In the object pointed to by *quo*,  
 58485 they store a value whose sign is the sign of  $x/y$  and whose magnitude is congruent modulo  $2^n$  to  
 58486 the magnitude of the integral quotient of  $x/y$ , where  $n$  is an implementation-defined integer  
 58487 greater than or equal to 3. If  $y$  is zero, the value stored in the object pointed to by *quo* is  
 58488 unspecified.

58489 An application wishing to check for error situations should set *errno* to zero and call  
 58490 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 58491 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 58492 zero, an error has occurred.

58493 **RETURN VALUE**58494 These functions shall return  $x \text{ REM } y$ .

58495 On systems that do not support the IEC 60559 Floating-Point option, if  $y$  is zero, it is  
 58496 implementation-defined whether a domain error occurs or zero is returned.

58497 MX If  $x$  or  $y$  is NaN, a NaN shall be returned.

58498 If  $x$  is  $\pm\text{Inf}$  or  $y$  is zero and the other argument is non-NaN, a domain error shall occur, and a  
 58499 NaN shall be returned.

58500 **ERRORS**

58501 These functions shall fail if:

58502 MX **Domain Error** The  $x$  argument is  $\pm\text{Inf}$ , or the  $y$  argument is  $\pm 0$  and the other argument is non-  
 58503 NaN.

58504 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 58505 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 58506 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 58507 shall be raised.

58508 These functions may fail if:

58509 **Domain Error** The  $y$  argument is zero.

58510 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 58511 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 58512 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 58513 shall be raised.

58514 **EXAMPLES**

58515 None.

58516 **APPLICATION USAGE**

58517 On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling &`  
58518 `MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

58519 **RATIONALE**

58520 These functions are intended for implementing argument reductions which can exploit a few  
58521 low-order bits of the quotient. Note that  $x$  may be so large in magnitude relative to  $y$  that an  
58522 exact representation of the quotient is not practical.

58523 **FUTURE DIRECTIONS**

58524 None.

## 58533 NAME

58534 rename, renameat — rename file |

## 58535 SYNOPSIS

58536 #include &lt;stdio.h&gt;

58537 int rename(const char \*old, const char \*new);

58538 OH CX #include &lt;fcntl.h&gt; +

58539 +

58540 CX int renameat(int oldfd, const char \*old, int newfd,  
58541 const char \*new);

## 58542 DESCRIPTION

58543 CX For *rename()*: The functionality described on this reference page is aligned with the ISO C  
 58544 standard. Any conflict between the requirements described here and the ISO C standard is  
 58545 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

58546 The *rename()* function shall change the name of a file. The *old* argument points to the pathname  
 58547 CX of the file to be renamed. The *new* argument points to the new pathname of the file. If the *new*  
 58548 argument does not resolve to an existing directory entry for a file of type directory and the *new*  
 58549 argument contains at least one non-*<slash>* character and ends with one or more trailing  
 58550 *<slash>* characters after all symbolic links have been processed, *rename()* shall fail.

58551 If either the *old* or *new* argument names a symbolic link, *rename()* shall operate on the symbolic  
 58552 link itself, and shall not resolve the last component of the argument. If the *old* argument and the  
 58553 *new* argument resolve to either the same existing directory entry or different directory entries for  
 58554 the same existing file, *rename()* shall return successfully and perform no other action.

58555 If the *old* argument points to the pathname of a file that is not a directory, the *new* argument shall  
 58556 not point to the pathname of a directory. If the link named by the *new* argument exists, it shall be  
 58557 removed and *old* renamed to *new*. In this case, a link named *new* shall remain visible to other  
 58558 threads throughout the renaming operation and refer either to the file referred to by *new* or *old*  
 58559 before the operation began. Write access permission is required for both the directory containing  
 58560 *old* and the directory containing *new*.

58561 If the *old* argument points to the pathname of a directory, the *new* argument shall not point to the  
 58562 pathname of a file that is not a directory. If the directory named by the *new* argument exists, it  
 58563 shall be removed and *old* renamed to *new*. In this case, a link named *new* shall exist throughout  
 58564 the renaming operation and shall refer either to the directory referred to by *new* or *old* before the  
 58565 operation began. If *new* names an existing directory, it shall be required to be an empty directory.

58566 If either *pathname* argument refers to a path whose final component is either dot or dot-dot,  
 58567 *rename()* shall fail.

58568 If the *old* argument points to a pathname of a symbolic link, the symbolic link shall be renamed.  
 58569 If the *new* argument points to a pathname of a symbolic link, the symbolic link shall be removed.

58570 The *old* pathname shall not name an ancestor directory of the *new* pathname. Write access  
 58571 permission is required for the directory containing *old* and the directory containing *new*. If the  
 58572 *old* argument points to the pathname of a directory, write access permission may be required for  
 58573 the directory named by *old*, and, if it exists, the directory named by *new*.

58574 If the link named by the *new* argument exists and the file's link count becomes 0 when it is  
 58575 removed and no process has the file open, the space occupied by the file shall be freed and the  
 58576 file shall no longer be accessible. If one or more processes have the file open when the last link is  
 58577 removed, the link shall be removed before *rename()* returns, but the removal of the file contents

58578 shall be postponed until all references to the file are closed.

58579 Upon successful completion, *rename()* shall mark for update the last data modification and last  
58580 file status change timestamps of the parent directory of each file.

58581 If the *rename()* function fails for any reason other than [EIO], any file named by *new* shall be  
58582 unaffected.

58583 The *renameat()* function shall be equivalent to the *rename()* function except in the case where  
58584 either *old* or *new* specifies a relative path. If *old* is a relative path, the file to be renamed is located  
58585 relative to the directory associated with the file descriptor *oldfd* instead of the current working  
58586 directory. If *new* is a relative path, the same happens only relative to the directory associated  
58587 with *newfd*. If the access mode of the open file description associated with the file descriptor is  
58588 not O\_SEARCH, the function shall check whether directory searches are permitted using the  
58589 current permissions of the directory underlying the file descriptor. If the access mode is  
58590 O\_SEARCH, the function shall not perform the check.

58591 If *renameat()* is passed the special value AT\_FDCWD in the *oldfd* or *newfd* parameter, the current  
58592 working directory shall be used in the determination of the file for the respective *path* parameter.

## 58593 RETURN VALUE

58594 CX Upon successful completion, the *rename()* function shall return 0. Otherwise, it shall return -1,  
58595 *errno* shall be set to indicate the error, and neither the file named by *old* nor the file named by  
58596 *new* shall be changed or created.

58597 CX Upon successful completion, the *renameat()* function shall return 0. Otherwise, it shall return -1  
58598 and set *errno* to indicate the error.

## 58599 ERRORS

58600 CX The *rename()* and *renameat()* functions shall fail if:

58601 CX [EACCES] A component of either path prefix denies search permission; or one of the  
58602 directories containing *old* or *new* denies write permissions; or, write  
58603 permission is required and is denied for a directory pointed to by the *old* or  
58604 *new* arguments.

58605 CX [EBUSY] The directory named by *old* or *new* is currently in use by the system or another  
58606 process, and the implementation considers this an error.

58607 CX [EEXIST] or [ENOTEMPTY]  
58608 The link named by *new* is a directory that is not an empty directory.

58609 CX [EINVAL] The *old* pathname names an ancestor directory of the *new* pathname, or either  
58610 pathname argument contains a final component that is dot or dot-dot.

58611 CX [EIO] A physical I/O error has occurred.

58612 CX [EISDIR] The *new* argument points to a directory and the *old* argument points to a file  
58613 that is not a directory.

58614 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
58615 argument.

58616 CX [EMLINK] The file named by *old* is a directory, and the link count of the parent directory  
58617 of *new* would exceed {LINK\_MAX}.

58618 CX [ENAMETOOLONG]  
58619 The length of a component of a pathname is longer than {NAME\_MAX}.

|       |        |                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------|--------|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 58620 | CX     | [ENOENT]                                                         | The link named by <i>old</i> does not name an existing file, a component of the path prefix of <i>new</i> does not exist, or either <i>old</i> or <i>new</i> points to an empty string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 58621 |        |                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 58622 | CX     | [ENOSPC]                                                         | The directory that would contain <i>new</i> cannot be extended.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 58623 | CX     | [ENOTDIR]                                                        | A component of either path prefix names an existing file that is neither a directory nor a symbolic link to a directory; or the <i>old</i> argument names a directory and the <i>new</i> argument names a non-directory file; or the <i>old</i> argument contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory; or the <i>old</i> argument names an existing non-directory file and the <i>new</i> argument names a nonexistent file, contains at least one non- <code>&lt;slash&gt;</code> character, and ends with one or more trailing <code>&lt;slash&gt;</code> characters; or the <i>new</i> argument names an existing non-directory file, contains at least one non- <code>&lt;slash&gt;</code> character, and ends with one or more trailing <code>&lt;slash&gt;</code> characters. |

| 58660 |        |                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 58661 |        |                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 58662 |        |                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

58663 CX [ETXTBSY] The file named by *new* exists and is the last directory entry to a pure procedure  
 58664 (shared text) file that is being executed.

## 58665 EXAMPLES

### 58666 Renaming a File

58667 The following example shows how to rename a file named `/home/cnd/mod1` to  
 58668 `/home/cnd/mod2`.

```
58669 #include <stdio.h>
58670
58671 int status;
58672 ...
58673 status = rename("/home/cnd/mod1", "/home/cnd/mod2");
```

## 58673 APPLICATION USAGE

58674 Some implementations mark for update the last file status change timestamp of renamed files  
 58675 and some do not. Applications which make use of the last file status change timestamp may  
 58676 behave differently with respect to renamed files unless they are designed to allow for either  
 58677 behavior.

## 58678 RATIONALE

58679 This *rename()* function is equivalent for regular files to that defined by the ISO C standard. Its  
 58680 inclusion here expands that definition to include actions on directories and specifies behavior  
 58681 when the *new* parameter names a file that already exists. That specification requires that the  
 58682 action of the function be atomic.

58683 One of the reasons for introducing this function was to have a means of renaming directories  
 58684 while permitting implementations to prohibit the use of *link()* and *unlink()* with directories,  
 58685 thus constraining links to directories to those made by *mkdir()*.

58686 The specification that if *old* and *new* refer to the same file is intended to guarantee that:

```
58687 rename("x", "x");
```

58688 does not remove the file.

58689 Renaming dot or dot-dot is prohibited in order to prevent cyclical file system paths.

58690 See also the descriptions of [ENOTEMPTY] and [ENAMETOOLONG] in *rmdir()* and [EBUSY] in  
 58691 *unlink()*. For a discussion of [EXDEV], see *link()*.

58692 The purpose of the *renameat()* function is to rename files in directories other than the current  
 58693 working directory without exposure to race conditions. Any part of the path of a file could be  
 58694 changed in parallel to a call to *rename()*, resulting in unspecified behavior. By opening file  
 58695 descriptors for the source and target directories and using the *renameat()* function it can be  
 58696 guaranteed that that renamed file is located correctly and the resulting file is in the desired  
 58697 directory.

## 58698 FUTURE DIRECTIONS

58699 None.

## 58700 SEE ALSO

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 5**

The [EBUSY] error is added to the optional part of the ERRORS section.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] mandatory error condition is added.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Details are added regarding the treatment of symbolic links.
- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term “must” for application requirements.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #016 is applied, changing the definition of the [ENOTDIR] error.

Austin Group Interpretation 1003.1-2001 #076 is applied, clarifying the behavior if the final component of a path is either dot or dot-dot, and adding the associated [EINVAL] error case.

Austin Group Interpretation 1003.1-2001 #143 is applied.

Austin Group Interpretation 1003.1-2001 #145 is applied, clarifying that the [ENOENT] error condition also applies to the case in which a component of *new* does not exist.

Austin Group Interpretations 1003.1-2001 #174 and #181 are applied.

The *renameat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0508 [324], XSH/TC1-2008/0509 [147], XSH/TC1-2008/0510 [379], XSH/TC1-2008/0511 [278], and XSH/TC1-2008/0512 [278] are applied.

58735 **NAME**

58736       rewind — reset the file position indicator in a stream

58737 **SYNOPSIS**

58738       #include &lt;stdio.h&gt;

58739       void rewind(FILE \*stream);

58740 **DESCRIPTION**

58741 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 58742       conflict between the requirements described here and the ISO C standard is unintentional. This  
 58743       volume of POSIX.1-2008 defers to the ISO C standard.

58744       The call:

58745       rewind(stream)

58746       shall be equivalent to:

58747       (void) fseek(stream, 0L, SEEK\_SET)

58748       except that *rewind()* shall also clear the error indicator.

58749 CX       Since *rewind()* does not return a value, an application wishing to detect errors should clear *errno*,  
 58750       then call *rewind()*, and if *errno* is non-zero, assume an error has occurred.

58751 **RETURN VALUE**58752       The *rewind()* function shall not return a value.58753 **ERRORS**58754 CX       Refer to *fseek()* with the exception of [EINVAL] which does not apply.58755 **EXAMPLES**

58756       None.

58757 **APPLICATION USAGE**

58758       None.

58759 **RATIONALE**

58760       None.

58761 **FUTURE DIRECTIONS**

58762       None.

58763 **SEE ALSO**58764       Section 2.5 (on page 495), *fseek()*

58765       XBD &lt;stdio.h&gt;

58766 **CHANGE HISTORY**

58767       First released in Issue 1. Derived from Issue 1 of the SVID.

58768 **Issue 6**

58769       Extensions beyond the ISO C standard are marked.

58770 **Issue 7**

58771       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0513 [14] is applied.

58772 **NAME**

58773       rewinddir — reset the position of a directory stream to the beginning of a directory

58774 **SYNOPSIS**

58775       #include <dirent.h>

58776       void rewinddir(DIR \*dirp);

58777 **DESCRIPTION**

58778       The *rewinddir()* function shall reset the position of the directory stream to which *dirp* refers to the  
58779       beginning of the directory. It shall also cause the directory stream to refer to the current state of  
58780       the corresponding directory, as a call to *opendir()* would have done. If *dirp* does not refer to a  
58781       directory stream, the effect is undefined.

58782       After a call to the *fork()* function, either the parent or child (but not both) may continue  
58783       XSI       processing the directory stream using *readdir()*, *rewinddir()*, or *seekdir()*. If both the parent and  
58784       child processes use these functions, the result is undefined.

58785 **RETURN VALUE**

58786       The *rewinddir()* function shall not return a value.

58787 **ERRORS**

58788       No errors are defined.

58789 **EXAMPLES**

58790       None.

58791 **APPLICATION USAGE**

58792       The *rewinddir()* function should be used in conjunction with *opendir()*, *readdir()*, and *closedir()* to  
58793       examine the contents of the directory. This method is recommended for portability.

58794 **RATIONALE**

58795       None.

58796 **FUTURE DIRECTIONS**

58797       None.

58798 **SEE ALSO**

58799       *closedir()*, *fdopendir()*, *readdir()*

58800       XBD <dirent.h>, <sys/types.h>

58801 **CHANGE HISTORY**

58802       First released in Issue 2.

58803 **Issue 6**

58804       In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

58805       The following new requirements on POSIX implementations derive from alignment with the  
58806       Single UNIX Specification:

- 58807       • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
58808       required for conforming implementations of previous POSIX specifications, it was not  
58809       required for UNIX applications.

58810 **NAME**

58811 rint, rintf, rintl — round-to-nearest integral value

58812 **SYNOPSIS**

```
58813 #include <math.h>
58814 double rint(double x);
58815 float rintf(float x);
58816 long double rintl(long double x);
```

58817 **DESCRIPTION**

58818 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 58819 conflict between the requirements described here and the ISO C standard is unintentional. This  
 58820 volume of POSIX.1-2008 defers to the ISO C standard.

58821 These functions shall return the integral value (represented as a **double**) nearest  $x$  in the  
 58822 direction of the current rounding mode. The current rounding mode is implementation-defined.

58823 If the current rounding mode rounds toward negative infinity, then *rint()* shall be equivalent to  
 58824 *floor()*. If the current rounding mode rounds toward positive infinity, then *rint()* shall be  
 58825 equivalent to *ceil()*. If the current rounding mode rounds towards zero, then *rint()* shall be  
 58826 MX equivalent to *trunc()*. If the current rounding mode rounds towards nearest, then *rint()* differs  
 58827 from *round()* in that halfway cases are rounded to even rather than away from zero.

58828 These functions differ from the *nearbyint()*, *nearbyintf()*, and *nearbyintl()* functions only in that  
 58829 they may raise the inexact floating-point exception if the result differs in value from the  
 58830 argument.

58831 An application wishing to check for error situations should set *errno* to zero and call  
 58832 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 58833 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 58834 zero, an error has occurred.

58835 **RETURN VALUE**

58836 Upon successful completion, these functions shall return the integer (represented as a double  
 58837 MX precision number) nearest  $x$  in the direction of the current rounding mode. The result shall have  
 58838 the same sign as  $x$ .

58839 MX If  $x$  is NaN, a NaN shall be returned.

58840 If  $x$  is  $\pm 0$  or  $\pm \text{Inf}$ ,  $x$  shall be returned.

58841 **ERRORS**

58842 No errors are defined.

58843 **EXAMPLES**

58844 None.

58845 **APPLICATION USAGE**

58846 The integral value returned by these functions need not be expressible as an **intmax\_t**. The  
 58847 return value should be tested before assigning it to an integer type to avoid the undefined  
 58848 results of an integer overflow.

58849 **RATIONALE**

58850 None.

58851 **FUTURE DIRECTIONS**

58852 None.

58853 **SEE ALSO**58854 *abs()*, *ceil()*, *feclearexcept()*, *fetestexcept()*, *floor()*, *isnan()*, *nearbyint()*58855 XBD [Section 4.20](#) (on page 117), **<math.h>**58856 **CHANGE HISTORY**

58857 First released in Issue 4, Version 2.

58858 **Issue 5**

58859 Moved from X/OPEN UNIX extension to BASE.

58860 **Issue 6**

58861 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 58862 • The *rintf()* and *rintl()* functions are added.
- 58863 • The *rint()* function is no longer marked as an extension.
- 58864 • The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
- 58865 revised to align with the ISO/IEC 9899:1999 standard.
- 58866 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard
- 58867 are marked.

58868 **Issue 7**

58869 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0514 [346], XSH/TC1-2008/0515 [346],  
58870 XSH/TC1-2008/0516 [346], XSH/TC1-2008/0517 [346], and XSH/TC1-2008/0518 [346] are  
58871 applied.

58872 **NAME**

58873       rmdir — remove a directory

58874 **SYNOPSIS**

58875       #include &lt;unistd.h&gt;

58876       int rmdir(const char \*path);

58877 **DESCRIPTION**58878       The *rmdir()* function shall remove a directory whose name is given by *path*. The directory shall  
58879       be removed only if it is an empty directory.58880       If the directory is the root directory or the current working directory of any process, it is  
58881       unspecified whether the function succeeds, or whether it shall fail and set *errno* to [EBUSY].58882       If *path* names a symbolic link, then *rmdir()* shall fail and set *errno* to [ENOTDIR].58883       If the *path* argument refers to a path whose final component is either dot or dot-dot, *rmdir()* shall  
58884       fail.58885       If the directory's link count becomes 0 and no process has the directory open, the space occupied  
58886       by the directory shall be freed and the directory shall no longer be accessible. If one or more  
58887       processes have the directory open when the last link is removed, the dot and dot-dot entries, if  
58888       present, shall be removed before *rmdir()* returns and no new entries may be created in the  
58889       directory, but the directory shall not be removed until all references to the directory are closed.58890       If the directory is not an empty directory, *rmdir()* shall fail and set *errno* to [EEXIST] or  
58891       [ENOTEMPTY].58892       Upon successful completion, *rmdir()* shall mark for update the last data modification and last  
58893       file status change timestamps of the parent directory.58894 **RETURN VALUE**58895       Upon successful completion, the function *rmdir()* shall return 0. Otherwise, -1 shall be returned,  
58896       and *errno* set to indicate the error. If -1 is returned, the named directory shall not be changed.58897 **ERRORS**58898       The *rmdir()* function shall fail if:58899       [EACCES]       Search permission is denied on a component of the path prefix, or write  
58900       permission is denied on the parent directory of the directory to be removed.58901       [EBUSY]       The directory to be removed is currently in use by the system or some process  
58902       and the implementation considers this to be an error.58903       [EEXIST] or [ENOTEMPTY]       The *path* argument names a directory that is not an empty directory, or there  
58904       are hard links to the directory other than dot or a single entry in dot-dot.  
5890558906       [EINVAL]       The *path* argument contains a last component that is dot.

58907       [EIO]       A physical I/O error has occurred.

58908       [ELOOP]       A loop exists in symbolic links encountered during resolution of the *path*  
58909       argument.58910       [ENAMETOOLONG]       The length of a component of a pathname is longer than {NAME\_MAX}.  
5891158912       [ENOENT]       A component of *path* does not name an existing file, or the *path* argument  
58913       names a nonexistent directory or points to an empty string.

58914 [ENOTDIR] A component of *path* names an existing file that is neither a directory nor a  
 58915 symbolic link to a directory.

58916 XSI [EPERM] or [EACCES]  
 58917 The S\_ISVTX flag is set on the directory containing the file referred to by the  
 58918 *path* argument and the process does not satisfy the criteria specified in XBD  
 58919 Section 4.3 (on page 108).

58920 [EROFS] The directory entry to be removed resides on a read-only file system.

58921 The *rmdir()* function may fail if:

58922 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 58923 resolution of the *path* argument.

58924 [ENAMETOOLONG]  
 58925 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 58926 symbolic link produced an intermediate result with a length that exceeds  
 58927 {PATH\_MAX}.

## 58928 EXAMPLES

### 58929 Removing a Directory

58930 The following example shows how to remove a directory named `/home/cnd/mod1`.

```
58931 #include <unistd.h>
58932 int status;
58933 ...
58934 status = rmdir("/home/cnd/mod1");
```

## 58935 APPLICATION USAGE

58936 None.

## 58937 RATIONALE

58938 The *rmdir()* and *rename()* functions originated in 4.2 BSD, and they used [ENOTEMPTY] for the  
 58939 condition when the directory to be removed does not exist or *new* already exists. When the 1984  
 58940 /usr/group standard was published, it contained [EEXIST] instead. When these functions were  
 58941 adopted into System V, the 1984 /usr/group standard was used as a reference. Therefore,  
 58942 several existing applications and implementations support/use both forms, and no agreement  
 58943 could be reached on either value. All implementations are required to supply both [EEXIST] and  
 58944 [ENOTEMPTY] in `<errno.h>` with distinct values, so that applications can use both values in C-  
 58945 language **case** statements.

58946 The meaning of deleting *pathname/dot* is unclear, because the name of the file (directory) in the  
 58947 parent directory to be removed is not clear, particularly in the presence of multiple links to a  
 58948 directory.

58949 The POSIX.1-1990 standard was silent with regard to the behavior of *rmdir()* when there are  
 58950 multiple hard links to the directory being removed. The requirement to set *errno* to [EEXIST] or  
 58951 [ENOTEMPTY] clarifies the behavior in this case.

58952 If the current working directory of the process is being removed, that should be an allowed  
 58953 error.

58954 Virtually all existing implementations detect [ENOTEMPTY] or the case of dot-dot. The text in  
 58955 Section 2.3 (on page 481) about returning any one of the possible errors permits that behavior to  
 58956 continue. The [ELOOP] error may be returned if more than {SYMLOOP\_MAX} symbolic links

58957 are encountered during resolution of the *path* argument.

#### 58958 FUTURE DIRECTIONS

58959 None.

#### 58960 SEE ALSO

58961 [Section 2.3](#) (on page 481), *mkdir()*, *remove()*, *rename()*, *unlink()*

58962 [XBD Section 4.3](#) (on page 108), [<unistd.h>](#)

#### 58963 CHANGE HISTORY

58964 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 58965 Issue 6

58966 The following new requirements on POSIX implementations derive from alignment with the  
58967 Single UNIX Specification:

- 58968 • The DESCRIPTION is updated to indicate the results of naming a symbolic link in *path*.
- 58969 • The [EIO] mandatory error condition is added.
- 58970 • The [ELOOP] mandatory error condition is added.
- 58971 • A second [ENAMETOOLONG] is added as an optional error condition.

58972 The following changes were made to align with the IEEE P1003.1a draft standard:

- 58973 • The [ELOOP] optional error condition is added.

#### 58974 Issue 7

58975 Austin Group Interpretation 1003.1-2001 #143 is applied.

58976 Austin Group Interpretation 1003.1-2001 #181 is applied, updating the requirements for  
58977 operations when the S\_ISVTX bit is set.

58978 Changes are made related to support for finegrained timestamps.

58979 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0519 [324] is applied.

58980 **NAME**

58981 round, roundf, roundl — round to the nearest integer value in a floating-point format

58982 **SYNOPSIS**

58983 #include <math.h>  
58984 double round(double x);  
58985 float roundf(float x);  
58986 long double roundl(long double x);

58987 **DESCRIPTION**

58988 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
58989 conflict between the requirements described here and the ISO C standard is unintentional. This  
58990 volume of POSIX.1-2008 defers to the ISO C standard.

58991 These functions shall round their argument to the nearest integer value in floating-point format,  
58992 rounding halfway cases away from zero, regardless of the current rounding direction.

58993 **RETURN VALUE**

58994 MX Upon successful completion, these functions shall return the rounded integer value. The result  
58995 shall have the same sign as *x*.

58996 MX If *x* is NaN, a NaN shall be returned.

58997 If *x* is  $\pm 0$  or  $\pm \text{Inf}$ , *x* shall be returned.

58998 **ERRORS**

58999 No errors are defined.

59000 **EXAMPLES**

59001 None.

59002 **APPLICATION USAGE**

59003 The integral value returned by these functions need not be expressible as an **intmax\_t**. The  
59004 return value should be tested before assigning it to an integer type to avoid the undefined  
59005 results of an integer overflow.

59006 These functions may raise the inexact floating-point exception if the result differs in value from  
59007 the argument.

59008 **RATIONALE**

59009 None.

59010 **FUTURE DIRECTIONS**

59011 None.

59012 **SEE ALSO**

59013 *feclearexcept()*, *fetestexcept()*

59014 XBD Section 4.20 (on page 117), **<math.h>**

59015 **CHANGE HISTORY**

59016 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

59017 **Issue 7**

59018 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0520 [346] is applied.

59019 **NAME**

59020 scalbln, scalblnf, scalblnl, scalbn, scalbnf, scalbnl — compute exponent using FLT\_RADIX

59021 **SYNOPSIS**

```
59022 #include <math.h>
59023 double scalbln(double x, long n);
59024 float scalblnf(float x, long n);
59025 long double scalblnl(long double x, long n);
59026 double scalbn(double x, int n);
59027 float scalbnf(float x, int n);
59028 long double scalbnl(long double x, int n);
```

59029 **DESCRIPTION**

59030 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 59031 conflict between the requirements described here and the ISO C standard is unintentional. This  
 59032 volume of POSIX.1-2008 defers to the ISO C standard.

59033 These functions shall compute  $x * \text{FLT\_RADIX}^n$  efficiently, not normally by computing  
 59034  $\text{FLT\_RADIX}^n$  explicitly.

59035 An application wishing to check for error situations should set *errno* to zero and call  
 59036 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 59037 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 59038 zero, an error has occurred.

59039 **RETURN VALUE**

59040 Upon successful completion, these functions shall return  $x * \text{FLT\_RADIX}^n$ .

59041 If the result would cause overflow, a range error shall occur and these functions shall return  
 59042  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$  (according to the sign of *x*) as appropriate for  
 59043 the return type of the function.

59044 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 59045 MXX and *scalbln*(), *scalblnf*(), *scalblnl*(), *scalbn*(), *scalbnf*(), and *scalbnl*() shall return 0.0, or (if IEC  
 59046 60559 Floating-Point is not supported) an implementation-defined value no greater in  
 59047 magnitude than DBL\_MIN, FLT\_MIN, LDBL\_MIN, DBL\_MIN, FLT\_MIN, and LDBL\_MIN,  
 59048 respectively.

59049 MX If *x* is NaN, a NaN shall be returned.

59050 If *x* is  $\pm 0$  or  $\pm\text{Inf}$ , *x* shall be returned.

59051 If *n* is 0, *x* shall be returned.

59052 MXX If the correct value would cause underflow, and is representable, a range error may occur and  
 59053 the correct value shall be returned.

59054 **ERRORS**

59055 These functions shall fail if:

59056 Range Error The result overflows.

59057 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 59058 then *errno* shall be set to [ERANGE]. If the integer expression  
 59059 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 59060 floating-point exception shall be raised.

59061 These functions may fail if:

59062 Range Error The result underflows.

59063 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
59064 then *errno* shall be set to [ERANGE]. If the integer expression  
59065 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
59066 floating-point exception shall be raised.

#### 59067 EXAMPLES

59068 None.

#### 59069 APPLICATION USAGE

59070 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
59071 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

#### 59072 RATIONALE

59073 These functions are named so as to avoid conflicting with the historical definition of the *scalb()*  
59074 function from the Single UNIX Specification. The difference is that the *scalb()* function has a  
59075 second argument of **double** instead of **int**. The *scalb()* function is not part of the ISO C standard.  
59076 The three functions whose second type is **long** are provided because the factor required to scale  
59077 from the smallest positive floating-point value to the largest finite one, on many  
59078 implementations, is too large to represent in the minimum-width **int** format.

#### 59079 FUTURE DIRECTIONS

59080 None.

#### 59081 SEE ALSO

59082 *feclearexcept()*, *fetestexcept()*

59083 XBD Section 4.20 (on page 117), **<math.h>**

#### 59084 CHANGE HISTORY

59085 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

#### 59086 Issue 7

59087 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0521 [68] and XSH/TC1-2008/0522  
59088 [68] are applied.

59089 **NAME**

59090       scandir — scan a directory

59091 **SYNOPSIS**

59092       #include &lt;dirent.h&gt;

```
59093       int scandir(const char *dir, struct dirent ***namelist,  
59094                   int (*sel)(const struct dirent *),  
59095                   int (*compar)(const struct dirent **, const struct dirent **));
```

59096 **DESCRIPTION**59097       Refer to *alphasort()*.

59098 **NAME**

59099       scanf — convert formatted input

59100 **SYNOPSIS**

59101       #include &lt;stdio.h&gt;

59102       int scanf(const char \*restrict *format*, ...);59103 **DESCRIPTION**59104       Refer to *fscanf()*.

**59105 NAME**

59106 sched\_get\_priority\_max, sched\_get\_priority\_min — get priority limits (**REALTIME**)

**59107 SYNOPSIS**

```
59108 PS|TPS #include <sched.h>
59109 int sched_get_priority_max(int policy);
59110 int sched_get_priority_min(int policy);
```

**59111 DESCRIPTION**

59112 The *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions shall return the appropriate  
59113 maximum or minimum, respectively, for the scheduling policy specified by *policy*.

59114 The value of *policy* shall be one of the scheduling policy values defined in **<sched.h>**.

**59115 RETURN VALUE**

59116 If successful, the *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions shall return the  
59117 appropriate maximum or minimum values, respectively. If unsuccessful, they shall return a  
59118 value of  $-1$  and set *errno* to indicate the error.

**59119 ERRORS**

59120 The *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions shall fail if:

59121 [EINVAL] The value of the *policy* parameter does not represent a defined scheduling  
59122 policy.

**59123 EXAMPLES**

59124 None.

**59125 APPLICATION USAGE**

59126 None.

**59127 RATIONALE**

59133 *sched\_setscheduler()*

59134 XBD **<sched.h>**

**59135 CHANGE HISTORY**

59136 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**59137 Issue 6**

59138 These functions are marked as part of the Process Scheduling option.

59139 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
59140 implementation does not support the Process Scheduling option.

59141 The [ESRCH] error condition has been removed since these functions do not take a *pid*  
59142 argument.

59143 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/52 is applied, changing the PS margin  
59144 code in the SYNOPSIS to PS|TPS.

59145 **NAME**59146 sched\_getparam — get scheduling parameters (**REALTIME**)59147 **SYNOPSIS**

```
59148 PS      #include <sched.h>
59149      int sched_getparam(pid_t pid, struct sched_param *param);
```

59150 **DESCRIPTION**

59151 The *sched\_getparam()* function shall return the scheduling parameters of a process specified by  
 59152 *pid* in the **sched\_param** structure pointed to by *param*.

59153 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
 59154 parameters for the process whose process ID is equal to *pid* shall be returned.

59155 If *pid* is zero, the scheduling parameters for the calling process shall be returned. The behavior of  
 59156 the *sched\_getparam()* function is unspecified if the value of *pid* is negative.

59157 **RETURN VALUE**

59158 Upon successful completion, the *sched\_getparam()* function shall return zero. If the call to  
 59159 *sched\_getparam()* is unsuccessful, the function shall return a value of  $-1$  and set *errno* to indicate  
 59160 the error.

59161 **ERRORS**

59162 The *sched\_getparam()* function shall fail if:

59163 [EPERM] The requesting process does not have permission to obtain the scheduling  
 59164 parameters of the specified process.

59165 [ESRCH] No process can be found corresponding to that specified by *pid*.

59166 **EXAMPLES**

59167 None.

59168 **APPLICATION USAGE**

59169 None.

59170 **RATIONALE**

59171 None.

59172 **FUTURE DIRECTIONS**

59173 None.

59174 **SEE ALSO**

59175 *sched\_getscheduler()*, *sched\_setparam()*, *sched\_setscheduler()*

59176 XBD **<sched.h>**

59177 **CHANGE HISTORY**

59178 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

59179 **Issue 6**

59180 The *sched\_getparam()* function is marked as part of the Process Scheduling option.

59181 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 59182 implementation does not support the Process Scheduling option.

59183 **NAME**59184 sched\_getscheduler — get scheduling policy (**REALTIME**)59185 **SYNOPSIS**

```
59186 PS #include <sched.h>
59187 int sched_getscheduler(pid_t pid);
```

59188 **DESCRIPTION**

59189 The *sched\_getscheduler()* function shall return the scheduling policy of the process specified by  
59190 *pid*. If the value of *pid* is negative, the behavior of the *sched\_getscheduler()* function is  
59191 unspecified.

59192 The values that can be returned by *sched\_getscheduler()* are defined in the **<sched.h>** header.

59193 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
59194 policy shall be returned for the process whose process ID is equal to *pid*.

59195 If *pid* is zero, the scheduling policy shall be returned for the calling process.

59196 **RETURN VALUE**

59197 Upon successful completion, the *sched\_getscheduler()* function shall return the scheduling policy  
59198 of the specified process. If unsuccessful, the function shall return -1 and set *errno* to indicate the  
59199 error.

59200 **ERRORS**

59201 The *sched\_getscheduler()* function shall fail if:

59202 [EPERM] The requesting process does not have permission to determine the scheduling  
59203 policy of the specified process.

59204 [ESRCH] No process can be found corresponding to that specified by *pid*.

59205 **EXAMPLES**

59206 None.

59207 **APPLICATION USAGE**

59208 None.

59209 **RATIONALE**

59216 **CHANGE HISTORY**

59217 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

59218 **Issue 6**

59219 The *sched\_getscheduler()* function is marked as part of the Process Scheduling option.

59220 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
59221 implementation does not support the Process Scheduling option.

59222 **NAME**59223 sched\_rr\_get\_interval — get execution time limits (**REALTIME**)59224 **SYNOPSIS**

```
59225 PS|TPS #include <sched.h>
59226 int sched_rr_get_interval(pid_t pid, struct timespec *interval);
```

59227 **DESCRIPTION**

59228 The *sched\_rr\_get\_interval()* function shall update the **timespec** structure referenced by the  
 59229 *interval* argument to contain the current execution time limit (that is, time quantum) for the  
 59230 process specified by *pid*. If *pid* is zero, the current execution time limit for the calling process  
 59231 shall be returned.

59232 **RETURN VALUE**

59233 If successful, the *sched\_rr\_get\_interval()* function shall return zero. Otherwise, it shall return a  
 59234 value of -1 and set *errno* to indicate the error.

59235 **ERRORS**

59236 The *sched\_rr\_get\_interval()* function shall fail if:

59237 [ESRCH] No process can be found corresponding to that specified by *pid*.

59238 **EXAMPLES**

59239 None.

59240 **APPLICATION USAGE**

59241 None.

59250 **CHANGE HISTORY**

59251 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

59252 **Issue 6**

59253 The *sched\_rr\_get\_interval()* function is marked as part of the Process Scheduling option.

59254 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 59255 implementation does not support the Process Scheduling option.

59256 IEEE Std 1003.1-2001/Cor 1-2002, XSH/TC1/D6/53 is applied, changing the PS margin code in  
 59257 the SYNOPSIS to PS|TPS.

**NAME**

sched\_setparam — set scheduling parameters (**REALTIME**)

**SYNOPSIS**

```
#include <sched.h>

int sched_setparam(pid_t pid, const struct sched_param *param);
```

**DESCRIPTION**

The *sched\_setparam()* function shall set the scheduling parameters of the process specified by *pid* to the values specified by the **sched\_param** structure pointed to by *param*. The value of the *sched\_priority* member in the **sched\_param** structure shall be any integer within the inclusive priority range for the current scheduling policy of the process specified by *pid*. Higher numerical values for the priority represent higher priorities. If the value of *pid* is negative, the behavior of the *sched\_setparam()* function is unspecified.

If a process specified by *pid* exists, and if the calling process has permission, the scheduling parameters shall be set for the process whose process ID is equal to *pid*.

If *pid* is zero, the scheduling parameters shall be set for the calling process.

The conditions under which one process has permission to change the scheduling parameters of another process are implementation-defined.

Implementations may require the requesting process to have appropriate privileges to set its own scheduling parameters or those of another process.

See [Scheduling Policies](#) (on page 506) for a description on how this function affects the scheduling of the threads within the target process.

If the current scheduling policy for the target process is not **SCHED\_FIFO**, **SCHED\_RR**, or **SCHED\_SPORADIC**, the result is implementation-defined; this case includes the **SCHED\_OTHER** policy.

The specified *sched\_ss\_repl\_period* shall be greater than or equal to the specified *sched\_ss\_init\_budget* for the function to succeed; if it is not, then the function shall fail.

The value of *sched\_ss\_max\_repl* shall be within the inclusive range [1, {SS\_REPL\_MAX}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

This function is not atomic with respect to other threads in the process. Threads may continue to execute while this function call is in the process of changing the scheduling policy for the underlying kernel-scheduled entities used by the process contention scope threads.

**RETURN VALUE**

If successful, the *sched\_setparam()* function shall return zero.

If the call to *sched\_setparam()* is unsuccessful, the priority shall remain unchanged, and the function shall return a value of **-1** and set *errno* to indicate the error.

**ERRORS**

The *sched\_setparam()* function shall fail if:

[EINVAL] One or more of the requested scheduling parameters is outside the range defined for the scheduling policy of the specified *pid*.

59299 [EPERM] The requesting process does not have permission to set the scheduling  
 59300 parameters for the specified process, or does not have appropriate privileges  
 59301 to invoke *sched\_setparam()*.

59302 [ESRCH] No process can be found corresponding to that specified by *pid*.

#### 59314 CHANGE HISTORY

59315 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

#### 59316 Issue 6

59317 The *sched\_setparam()* function is marked as part of the Process Scheduling option.

59318 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 59319 implementation does not support the Process Scheduling option.

59320 The following new requirements on POSIX implementations derive from alignment with the  
 59321 Single UNIX Specification:

59322 • In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is  
 59323 added.

59324 • Sections describing two-level scheduling and atomicity of the function are added.

59325 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

59326 IEEE PASC Interpretation 1003.1 #100 is applied.

#### 59327 Issue 7

59328 Austin Group Interpretation 1003.1-2001 #061 is applied, updating the DESCRIPTION.

59329 Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements  
 59330 for the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values.

59331 **NAME**59332 sched\_setscheduler — set scheduling policy and parameters (**REALTIME**)59333 **SYNOPSIS**

```
59334 PS      #include <sched.h>
59335
59336      int sched_setscheduler(pid_t pid, int policy,
          const struct sched_param *param);
```

59337 **DESCRIPTION**

59338 The *sched\_setscheduler()* function shall set the scheduling policy and scheduling parameters of  
 59339 the process specified by *pid* to *policy* and the parameters specified in the **sched\_param** structure  
 59340 pointed to by *param*, respectively. The value of the *sched\_priority* member in the **sched\_param**  
 59341 structure shall be any integer within the inclusive priority range for the scheduling policy  
 59342 specified by *policy*. If the value of *pid* is negative, the behavior of the *sched\_setscheduler()*  
 59343 function is unspecified.

59344 The possible values for the *policy* parameter are defined in the **<sched.h>** header.

59345 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
 59346 policy and scheduling parameters shall be set for the process whose process ID is equal to *pid*.

59347 If *pid* is zero, the scheduling policy and scheduling parameters shall be set for the calling  
 59348 process.

59349 The conditions under which one process has appropriate privileges to change the scheduling  
 59350 parameters of another process are implementation-defined.

59351 Implementations may require that the requesting process have permission to set its own  
 59352 scheduling parameters or those of another process. Additionally, implementation-defined  
 59353 restrictions may apply as to the appropriate privileges required to set the scheduling policy of  
 59354 the process, or the scheduling policy of another process, to a particular value.

59355 The *sched\_setscheduler()* function shall be considered successful if it succeeds in setting the  
 59356 scheduling policy and scheduling parameters of the process specified by *pid* to the values  
 59357 specified by *policy* and the structure pointed to by *param*, respectively.

59358 See [Scheduling Policies](#) (on page 506) for a description on how this function affects the  
 59359 scheduling of the threads within the target process.

59360 SS If the current scheduling policy for the target process is not SCHED\_FIFO, SCHED\_RR, or  
 59361 SCHED\_SPORADIC, the result is implementation-defined; this case includes the  
 59362 SCHED\_OTHER policy.

59363 SS The specified *sched\_ss\_repl\_period* shall be greater than or equal to the specified  
 59364 *sched\_ss\_init\_budget* for the function to succeed; if it is not, then the function shall fail.

59365 The value of *sched\_ss\_max\_repl* shall be within the inclusive range [1,{SS\_REPL\_MAX}] for the  
 59366 function to succeed; if not, the function shall fail. It is unspecified whether the  
 59367 *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values are stored as provided by this function or are  
 59368 rounded to align with the resolution of the clock being used.

59369 This function is not atomic with respect to other threads in the process. Threads may continue to  
 59370 execute while this function call is in the process of changing the scheduling policy and  
 59371 associated scheduling parameters for the underlying kernel-scheduled entities used by the  
 59372 process contention scope threads.

**RETURN VALUE**

Upon successful completion, the function shall return the former scheduling policy of the specified process. If the *sched\_setscheduler()* function fails to complete successfully, the policy and scheduling parameters shall remain unchanged, and the function shall return a value of `-1` and set *errno* to indicate the error.

**ERRORS**

The *sched\_setscheduler()* function shall fail if:

[EINVAL] The value of the *policy* parameter is invalid, or one or more of the parameters contained in *param* is outside the valid range for the specified scheduling policy.

[EPERM] The requesting process does not have permission to set either or both of the scheduling parameters or the scheduling policy of the specified process.

[ESRCH] No process can be found corresponding to that specified by *pid*.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

The *sched\_setscheduler()* function is marked as part of the Process Scheduling option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Process Scheduling option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is added.
- Sections describing two-level scheduling and atomicity of the function are added.

The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #061 is applied, updating the DESCRIPTION.

Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements for the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values.

59413 **NAME**

59414 sched\_yield — yield the processor

59415 **SYNOPSIS**

59416 #include &lt;sched.h&gt;

59417 int sched\_yield(void);

59418 **DESCRIPTION**59419 The *sched\_yield()* function shall force the running thread to relinquish the processor until it again  
59420 becomes the head of its thread list. It takes no arguments.59421 **RETURN VALUE**59422 The *sched\_yield()* function shall return 0 if it completes successfully; otherwise, it shall return a  
59423 value of -1 and set *errno* to indicate the error.59424 **ERRORS**

59425 No errors are defined.

59426 **EXAMPLES**

59427 None.

59428 **APPLICATION USAGE**59429 The conceptual model for scheduling semantics in POSIX.1-2008 defines a set of thread lists. This  
59430 set of thread lists is always present regardless of the scheduling options supported by the  
59431 system. On a system where the Process Scheduling option is not supported, portable  
59432 applications should not make any assumptions regarding whether threads from other processes  
59433 will be on the same thread list.59434 **RATIONALE**

59435 None.

59436 **FUTURE DIRECTIONS**

59437 None.

59438 **SEE ALSO**59439 XBD [<sched.h>](#)59440 **CHANGE HISTORY**59441 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
59442 POSIX Threads Extension.59443 **Issue 6**59444 The *sched\_yield()* function is now marked as part of the Process Scheduling and Threads options.59445 **Issue 7**

59446 SD5-XSH-ERN-120 is applied, adding APPLICATION USAGE.

59447 The *sched\_yield()* function is moved to the Base.

59448 **NAME**

59449 seed48 — seed a uniformly distributed pseudo-random non-negative long integer generator

59450 **SYNOPSIS**59451 XSI `#include <stdlib.h>`59452 `unsigned short *seed48(unsigned short seed16v[3]);`59453 **DESCRIPTION**59454 Refer to *drand48()*.

**NAME**

seekdir — set the position of a directory stream

**SYNOPSIS**

```
XSI    #include <dirent.h>
void seekdir(DIR *dirp, long loc);
```

**DESCRIPTION**

The *seekdir()* function shall set the position of the next *readdir()* operation on the directory stream specified by *dirp* to the position specified by *loc*. The value of *loc* should have been returned from an earlier call to *telldir()* using the same directory stream. The new position reverts to the one associated with the directory stream when *telldir()* was performed.

If the value of *loc* was not obtained from an earlier call to *telldir()*, or if a call to *rewinddir()* occurred between the call to *telldir()* and the call to *seekdir()*, the results of subsequent calls to *readdir()* are unspecified.

**RETURN VALUE**

The *seekdir()* function shall not return a value.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

The original standard developers perceived that there were restrictions on the use of the *seekdir()* and *telldir()* functions related to implementation details, and for that reason these functions need not be supported on all POSIX-conforming systems. They are required on implementations supporting the XSI option.

One of the perceived problems of implementation is that returning to a given point in a directory is quite difficult to describe formally, in spite of its intuitive appeal, when systems that use B-trees, hashing functions, or other similar mechanisms to order their directories are considered. The definition of *seekdir()* and *telldir()* does not specify whether, when using these interfaces, a given directory entry will be seen at all, or more than once.

On systems not supporting these functions, their capability can sometimes be accomplished by saving a filename found by *readdir()* and later using *rewinddir()* and a loop on *readdir()* to relocate the position from which the filename was saved.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*fdopendir()*, *readdir()*, *telldir()*

XBD *<dirent.h>*, *<sys/types.h>*

**CHANGE HISTORY**

First released in Issue 2.

59496 **Issue 6**

59497 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

59498 **Issue 7**

59499 SD5-XSH-ERN-200 is applied, updating the DESCRIPTION to note that the value of *loc* should  
59500 have been returned from an earlier call to *telldir()* using the same directory stream.

59501 **NAME**

59502       select — synchronous I/O multiplexing

59503 **SYNOPSIS**

59504       #include &lt;sys/select.h&gt;

```
59505       int select(int nfds, fd_set *restrict readfds,  
59506                fd_set *restrict writefds, fd_set *restrict errorfds,  
59507                struct timeval *restrict timeout);
```

59508 **DESCRIPTION**59509       Refer to *pselect()*.

59510 **NAME**

59511 sem\_close — close a named semaphore

59512 **SYNOPSIS**

59513 #include &lt;semaphore.h&gt;

59514 int sem\_close(sem\_t \*sem);

59515 **DESCRIPTION**

59516 The *sem\_close()* function shall indicate that the calling process is finished using the named  
59517 semaphore indicated by *sem*. The effects of calling *sem\_close()* for an unnamed semaphore (one  
59518 created by *sem\_init()*) are undefined. The *sem\_close()* function shall deallocate (that is, make  
59519 available for reuse by a subsequent *sem\_open()* by this process) any system resources allocated  
59520 by the system for use by this process for this semaphore. The effect of subsequent use of the  
59521 semaphore indicated by *sem* by this process is undefined. If any threads in the calling process are  
59522 currently blocked on the semaphore, the behavior is undefined. If the semaphore has not been  
59523 removed with a successful call to *sem\_unlink()*, then *sem\_close()* has no effect on the state of the  
59524 semaphore. If the *sem\_unlink()* function has been successfully invoked for *name* after the most  
59525 recent call to *sem\_open()* with O\_CREAT for this semaphore, then when all processes that have  
59526 opened the semaphore close it, the semaphore is no longer accessible.

59527 **RETURN VALUE**

59528 Upon successful completion, a value of zero shall be returned. Otherwise, a value of -1 shall be  
59529 returned and *errno* set to indicate the error.

59530 **ERRORS**59531 The *sem\_close()* function may fail if:59532 [EINVAL] The *sem* argument is not a valid semaphore descriptor.59533 **EXAMPLES**

59534 None.

59535 **APPLICATION USAGE**

59536 None.

59537 **RATIONALE**

59538 None.

59539 **FUTURE DIRECTIONS**

59540 None.

59543 XBD &lt;semaphore.h&gt;

59544 **CHANGE HISTORY**

59545 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

59546 **Issue 6**59547 The *sem\_close()* function is marked as part of the Semaphores option.

59548 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
59549 implementation does not support the Semaphores option.

59550 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/113 is applied, updating the ERRORS  
59551 section so that the [EINVAL] error becomes optional.

59552 **Issue 7**

59553

The *sem\_close()* function is moved from the Semaphores option to the Base.

59554

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0523 [37] is applied.

59555 **NAME**

59556 sem\_destroy — destroy an unnamed semaphore

59557 **SYNOPSIS**

59558 #include <semaphore.h>

59559 int sem\_destroy(sem\_t \*sem);

59560 **DESCRIPTION**

59561 The *sem\_destroy()* function shall destroy the unnamed semaphore indicated by *sem*. Only a  
59562 semaphore that was created using *sem\_init()* may be destroyed using *sem\_destroy()*; the effect of  
59563 calling *sem\_destroy()* with a named semaphore is undefined. The effect of subsequent use of the  
59564 semaphore *sem* is undefined until *sem* is reinitialized by another call to *sem\_init()*.

59565 It is safe to destroy an initialized semaphore upon which no threads are currently blocked. The  
59566 effect of destroying a semaphore upon which other threads are currently blocked is undefined.

59567 **RETURN VALUE**

59568 Upon successful completion, a value of zero shall be returned. Otherwise, a value of -1 shall be  
59569 returned and *errno* set to indicate the error.

59570 **ERRORS**

59571 The *sem\_destroy()* function may fail if:

59572 [EINVAL] The *sem* argument is not a valid semaphore.

59573 [EBUSY] There are currently processes blocked on the semaphore.

59574 **EXAMPLES**

59575 None.

59585 **CHANGE HISTORY**

59586 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

59587 **Issue 6**

59588 The *sem\_destroy()* function is marked as part of the Semaphores option.

59589 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
59590 implementation does not support the Semaphores option.

59591 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/114 is applied, updating the ERRORS  
59592 section so that the [EINVAL] error becomes optional.

59593 **Issue 7**

59594 The *sem\_destroy()* function is moved from the Semaphores option to the Base.

59595 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0524 [37] is applied.

**59596 NAME**

59597 sem\_getvalue — get the value of a semaphore

**59598 SYNOPSIS**

59599 #include <semaphore.h>

59600 int sem\_getvalue(sem\_t \*restrict sem, int \*restrict sval);

**59601 DESCRIPTION**

59602 The *sem\_getvalue()* function shall update the location referenced by the *sval* argument to have  
59603 the value of the semaphore referenced by *sem* without affecting the state of the semaphore. The  
59604 updated value represents an actual semaphore value that occurred at some unspecified time  
59605 during the call, but it need not be the actual value of the semaphore when it is returned to the  
59606 calling process.

59607 If *sem* is locked, then the object to which *sval* points shall either be set to zero or to a negative  
59608 number whose absolute value represents the number of processes waiting for the semaphore at  
59609 some unspecified time during the call.

**59610 RETURN VALUE**

59611 Upon successful completion, the *sem\_getvalue()* function shall return a value of zero. Otherwise,  
59612 it shall return a value of -1 and set *errno* to indicate the error.

**59613 ERRORS**

59614 The *sem\_getvalue()* function may fail if:

59615 [EINVAL] The *sem* argument does not refer to a valid semaphore.

**59616 EXAMPLES**

59617 None.

**59618 APPLICATION USAGE**

59619 None.

**59620 RATIONALE**

59621 None.

**59622 FUTURE DIRECTIONS**

59623 None.

**59624 SEE ALSO**

59628 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**59629 Issue 6**

59630 The *sem\_getvalue()* function is marked as part of the Semaphores option.

59631 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
59632 implementation does not support the Semaphores option.

59633 The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std  
59634 1003.1d-1999.

59635 The **restrict** keyword is added to the *sem\_getvalue()* prototype for alignment with the  
59636 ISO/IEC 9899:1999 standard.

59637 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/54 is applied.

- 59638
- 59639
- 59640
- 59641
- 59642
- IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/115 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

**Issue 7**

The *sem\_getvalue()* function is moved from the Semaphores option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0525 [37] is applied.

59643 **NAME**

59644 sem\_init — initialize an unnamed semaphore

59645 **SYNOPSIS**

59646 #include &lt;semaphore.h&gt;

59647 int sem\_init(sem\_t \*sem, int pshared, unsigned value);

59648 **DESCRIPTION**

59649 The *sem\_init()* function shall initialize the unnamed semaphore referred to by *sem*. The value of  
 59650 the initialized semaphore shall be *value*. Following a successful call to *sem\_init()*, the semaphore  
 59651 may be used in subsequent calls to *sem\_wait()*, *sem\_timedwait()*, *sem\_trywait()*, *sem\_post()*, and  
 59652 *sem\_destroy()*. This semaphore shall remain usable until the semaphore is destroyed.

59653 If the *pshared* argument has a non-zero value, then the semaphore is shared between processes;  
 59654 in this case, any process that can access the semaphore *sem* can use *sem* for performing  
 59655 *sem\_wait()*, *sem\_timedwait()*, *sem\_trywait()*, *sem\_post()*, and *sem\_destroy()* operations.

59656 If the *pshared* argument is zero, then the semaphore is shared between threads of the process; any  
 59657 thread in this process can use *sem* for performing *sem\_wait()*, *sem\_timedwait()*, *sem\_trywait()*,  
 59658 *sem\_post()*, and *sem\_destroy()* operations.

59659 See [Section 2.9.9](#) (on page 523) for further requirements.

59660 Attempting to initialize an already initialized semaphore results in undefined behavior.

59661 **RETURN VALUE**

59662 Upon successful completion, the *sem\_init()* function shall initialize the semaphore in *sem* and  
 59663 return 0. Otherwise, it shall return -1 and set *errno* to indicate the error.

59664 **ERRORS**

59665 The *sem\_init()* function shall fail if:

- |       |          |                                                                            |
|-------|----------|----------------------------------------------------------------------------|
| 59666 | [EINVAL] | The <i>value</i> argument exceeds {SEM_VALUE_MAX}.                         |
| 59667 | [ENOSPC] | A resource required to initialize the semaphore has been exhausted, or the |
| 59668 |          | limit on semaphores ({SEM_NSEMS_MAX}) has been reached.                    |
| 59669 | [EPERM]  | The process lacks appropriate privileges to initialize the semaphore.      |

59681 **CHANGE HISTORY**

59682 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

59683 **Issue 6**

59684 The *sem\_init()* function is marked as part of the Semaphores option.

59685 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
59686 implementation does not support the Semaphores option.

59687 The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std  
59688 1003.1d-1999.

59689 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/116 is applied, updating the  
59690 DESCRIPTION to add the *sem\_timedwait()* function for alignment with IEEE Std 1003.1d-1999.

59691 **Issue 7**

59692 SD5-XSH-ERN-176 is applied.

59693 The *sem\_init()* function is moved from the Semaphores option to the Base.

59694 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0526 [37] is applied.

**NAME**

sem\_open — initialize and open a named semaphore

**SYNOPSIS**

```
#include <semaphore.h>
```

```
sem_t *sem_open(const char *name, int oflag, ...);
```

**DESCRIPTION**

The *sem\_open()* function shall establish a connection between a named semaphore and a process. Following a call to *sem\_open()* with semaphore name *name*, the process may reference the semaphore associated with *name* using the address returned from the call. This semaphore may be used in subsequent calls to *sem\_wait()*, *sem\_timedwait()*, *sem\_trywait()*, *sem\_post()*, and *sem\_close()*. The semaphore remains usable by this process until the semaphore is closed by a successful call to *sem\_close()*, *\_exit()*, or one of the *exec* functions.

The *oflag* argument controls whether the semaphore is created or merely accessed by the call to *sem\_open()*. The following flag bits may be set in *oflag*:

**O\_CREAT** This flag is used to create a semaphore if it does not already exist. If **O\_CREAT** is set and the semaphore already exists, then **O\_CREAT** has no effect, except as noted under **O\_EXCL**. Otherwise, *sem\_open()* creates a named semaphore. The **O\_CREAT** flag requires a third and a fourth argument: *mode*, which is of type **mode\_t**, and *value*, which is of type **unsigned**. The semaphore is created with an initial value of *value*. Valid initial values for semaphores are less than or equal to **{SEM\_VALUE\_MAX}**.

The user ID of the semaphore shall be set to the effective user ID of the process. The group ID of the semaphore shall be set to the effective group ID of the process; however, if the *name* argument is visible in the file system, the group ID may be set to the group ID of the containing directory. The permission bits of the semaphore are set to the value of the *mode* argument except those set in the file mode creation mask of the process. When bits in *mode* other than the file permission bits are specified, the effect is unspecified.

After the semaphore named *name* has been created by *sem\_open()* with the **O\_CREAT** flag, other processes can connect to the semaphore by calling *sem\_open()* with the same value of *name*.

**O\_EXCL** If **O\_EXCL** and **O\_CREAT** are set, *sem\_open()* fails if the semaphore *name* exists. The check for the existence of the semaphore and the creation of the semaphore if it does not exist are atomic with respect to other processes executing *sem\_open()* with **O\_EXCL** and **O\_CREAT** set. If **O\_EXCL** is set and **O\_CREAT** is not set, the effect is undefined.

If flags other than **O\_CREAT** and **O\_EXCL** are specified in the *oflag* parameter, the effect is unspecified.

The *name* argument points to a string naming a semaphore object. It is unspecified whether the name appears in the file system and is visible to functions that take pathnames as arguments. The *name* argument conforms to the construction rules for a pathname, except that the interpretation of *<slash>* characters other than the leading *<slash>* character in *name* is implementation-defined, and that the length limits for the *name* argument are implementation-defined and need not be the same as the pathname limits **{PATH\_MAX}** and **{NAME\_MAX}**. If *name* begins with the *<slash>* character, then processes calling *sem\_open()* with the same value of *name* shall refer to the same semaphore object, as long as that name has not been removed. If *name* does not begin with the *<slash>* character, the effect is implementation-defined.

59742 If a process makes multiple successful calls to *sem\_open()* with the same value for *name*, the same  
 59743 semaphore address shall be returned for each such successful call, provided that there have been  
 59744 no calls to *sem\_unlink()* for this semaphore, and at least one previous successful *sem\_open()* call  
 59745 for this semaphore has not been matched with a *sem\_close()* call.

59746 References to copies of the semaphore produce undefined results.

#### 59747 RETURN VALUE

59748 Upon successful completion, the *sem\_open()* function shall return the address of the semaphore.  
 59749 Otherwise, it shall return a value of SEM\_FAILED and set *errno* to indicate the error. The symbol  
 59750 SEM\_FAILED is defined in the <semaphore.h> header. No successful return from *sem\_open()*  
 59751 shall return the value SEM\_FAILED.

#### 59752 ERRORS

59753 If any of the following conditions occur, the *sem\_open()* function shall return SEM\_FAILED and  
 59754 set *errno* to the corresponding value:

59755 [EACCES] The named semaphore exists and the permissions specified by *oflag* are  
 59756 denied, or the named semaphore does not exist and permission to create the  
 59757 named semaphore is denied.

59758 [EEXIST] O\_CREAT and O\_EXCL are set and the named semaphore already exists.

59759 [EINTR] The *sem\_open()* operation was interrupted by a signal.

59760 [EINVAL] The *sem\_open()* operation is not supported for the given name, or O\_CREAT  
 59761 was specified in *oflag* and *value* was greater than {SEM\_VALUE\_MAX}.

59762 [EMFILE] Too many semaphore descriptors or file descriptors are currently in use by this  
 59763 process.

59764 [ENFILE] Too many semaphores are currently open in the system.

59765 [ENOENT] O\_CREAT is not set and the named semaphore does not exist.

59766 [ENOMEM] There is insufficient memory for the creation of the new named semaphore.

59767 [ENOSPC] There is insufficient space on a storage device for the creation of the new  
 59768 named semaphore.

59769 If any of the following conditions occur, the *sem\_open()* function may return SEM\_FAILED and  
 59770 set *errno* to the corresponding value:

59771 [ENAMETOOLONG]

59772 The length of the *name* argument exceeds {\_POSIX\_PATH\_MAX} on systems  
 59773 XSI that do not support the XSI option or exceeds {\_XOPEN\_PATH\_MAX} on XSI  
 59774 systems, or has a pathname component that is longer than  
 59775 XSI {\_POSIX\_NAME\_MAX} on systems that do not support the XSI option or  
 59776 longer than {\_XOPEN\_NAME\_MAX} on XSI systems.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

Early drafts required an error return value of -1 with the type `sem_t *` for the `sem_open()` function, which is not guaranteed to be portable across implementations. The revised text provides the symbolic error code `SEM_FAILED` to eliminate the type conflict.

**FUTURE DIRECTIONS**

A future version might require the `sem_open()` and `sem_unlink()` functions to have semantics similar to normal file system operations.

XBD `<semaphore.h>`

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

The `sem_open()` function is marked as part of the Semaphores option.

The `[ENOSYS]` error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The `sem_timedwait()` function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/117 is applied, updating the DESCRIPTION to add the `sem_timedwait()` function for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/118 is applied, updating the DESCRIPTION to describe the conditions to return the same semaphore address on a call to `sem_open()`. The words “and at least one previous successful `sem_open()` call for this semaphore has not been matched with a `sem_close()` call” are added.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #066 is applied, updating the `[ENOSPC]` error case and adding the `[ENOMEM]` error case.

Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the `name` argument and adding `[ENAMETOOLONG]` as a “may fail” error.

Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the user ID and group ID of the semaphore.

The `sem_open()` function is moved from the Semaphores option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0527 [37] is applied.

59815 **NAME**

59816 sem\_post — unlock a semaphore

59817 **SYNOPSIS**

59818 #include &lt;semaphore.h&gt;

59819 int sem\_post(sem\_t \*sem);

59820 **DESCRIPTION**59821 The *sem\_post()* function shall unlock the semaphore referenced by *sem* by performing a  
59822 semaphore unlock operation on that semaphore.59823 If the semaphore value resulting from this operation is positive, then no threads were blocked  
59824 waiting for the semaphore to become unlocked; the semaphore value is simply incremented.59825 If the value of the semaphore resulting from this operation is zero, then one of the threads  
59826 blocked waiting for the semaphore shall be allowed to return successfully from its call to  
59827 PS *sem\_wait()*. If the Process Scheduling option is supported, the thread to be unblocked shall be  
59828 chosen in a manner appropriate to the scheduling policies and parameters in effect for the  
59829 blocked threads. In the case of the schedulers SCHED\_FIFO and SCHED\_RR, the highest  
59830 priority waiting thread shall be unblocked, and if there is more than one highest priority thread  
59831 blocked waiting for the semaphore, then the highest priority thread that has been waiting the  
59832 longest shall be unblocked. If the Process Scheduling option is not defined, the choice of a thread  
59833 to unblock is unspecified.59834 SS If the Process Sporadic Server option is supported, and the scheduling policy is  
59835 SCHED\_SPORADIC, the semantics are as per SCHED\_FIFO above.59836 The *sem\_post()* function shall be async-signal-safe and may be invoked from a signal-catching  
59837 function.59838 **RETURN VALUE**59839 If successful, the *sem\_post()* function shall return zero; otherwise, the function shall return -1  
59840 and set *errno* to indicate the error.59841 **ERRORS**59842 The *sem\_post()* function may fail if:59843 [EINVAL] The *sem* argument does not refer to a valid semaphore.59844 **EXAMPLES**59845 See *sem\_timedwait()*.59846 **APPLICATION USAGE**

59847 None.

59848 **RATIONALE**

59849 None.

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

The `sem_post()` function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The `sem_timedwait()` function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

SCHED\_SPORADIC is added to the list of scheduling policies for which the thread that is to be unblocked is specified for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/119 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #156 is applied.

The `sem_post()` function is moved from the Semaphores option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0528 [37] is applied.

59871 **NAME**

59872 sem\_timedwait — lock a semaphore

59873 **SYNOPSIS**

```
59874 #include <semaphore.h>
59875 #include <time.h>
59876 int sem_timedwait(sem_t *restrict sem,
59877                  const struct timespec *restrict abstime);
```

59878 **DESCRIPTION**

59879 The *sem\_timedwait()* function shall lock the semaphore referenced by *sem* as in the *sem\_wait()*  
 59880 function. However, if the semaphore cannot be locked without waiting for another process or  
 59881 thread to unlock the semaphore by performing a *sem\_post()* function, this wait shall be  
 59882 terminated when the specified timeout expires.

59883 The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the  
 59884 clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
 59885 *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the  
 59886 call.

59887 The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall  
 59888 be the resolution of the clock on which it is based. The **timespec** data type is defined as a  
 59889 structure in the **<time.h>** header.

59890 Under no circumstance shall the function fail with a timeout if the semaphore can be locked  
 59891 immediately. The validity of the *abstime* need not be checked if the semaphore can be locked  
 59892 immediately.

59893 **RETURN VALUE**

59894 The *sem\_timedwait()* function shall return zero if the calling process successfully performed the  
 59895 semaphore lock operation on the semaphore designated by *sem*. If the call was unsuccessful, the  
 59896 state of the semaphore shall be unchanged, and the function shall return a value of -1 and set  
 59897 *errno* to indicate the error.

59898 **ERRORS**

59899 The *sem\_timedwait()* function shall fail if:

59900 [EINVAL] The process or thread would have blocked, and the *abstime* parameter  
 59901 specified a nanoseconds field value less than zero or greater than or equal to  
 59902 1 000 million.

59903 [ETIMEDOUT] The semaphore could not be locked before the specified timeout expired.

59904 The *sem\_timedwait()* function may fail if:

59905 [EDEADLK] A deadlock condition was detected.

59906 [EINTR] A signal interrupted this function.

59907 [EINVAL] The *sem* argument does not refer to a valid semaphore.

**EXAMPLES**

The program shown below operates on an unnamed semaphore. The program expects two command-line arguments. The first argument specifies a seconds value that is used to set an alarm timer to generate a SIGALRM signal. This handler performs a *sem\_post*(3) to increment the semaphore that is being waited on in *main*() using *sem\_timedwait*(). The second command-line argument specifies the length of the timeout, in seconds, for *sem\_timedwait*().

```

#include <unistd.h>
#include <stdio.h>
#include <stdlib.h>
#include <semaphore.h>
#include <time.h>
#include <assert.h>
#include <errno.h>
#include <signal.h>

sem_t sem;

static void
handler(int sig)
{
    int sav_errno = errno;
    static const char info_msg[] = "sem_post() from handler\n";
    write(STDOUT_FILENO, info_msg, sizeof info_msg - 1);
    if (sem_post(&sem) == -1) {
        static const char err_msg[] = "sem_post() failed\n";
        write(STDERR_FILENO, err_msg, sizeof err_msg - 1);
        _exit(EXIT_FAILURE);
    }
    errno = sav_errno;
}

int
main(int argc, char *argv[])
{
    struct sigaction sa;
    struct timespec ts;
    int s;

    if (argc != 3) {
        fprintf(stderr, "Usage: %s <alarm-secs> <wait-secs>\n",
            argv[0]);
        exit(EXIT_FAILURE);
    }

    if (sem_init(&sem, 0, 0) == -1) {
        perror("sem_init");
        exit(EXIT_FAILURE);
    }

    /* Establish SIGALRM handler; set alarm timer using argv[1] */

    sa.sa_handler = handler;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = 0;
    if (sigaction(SIGALRM, &sa, NULL) == -1) {

```

```

59956         perror("sigaction");
59957         exit(EXIT_FAILURE);
59958     }
59959     alarm(atoi(argv[1]));
59960     /* Calculate relative interval as current time plus
59961        number of seconds given argv[2] */
59962     if (clock_gettime(CLOCK_REALTIME, &ts) == -1) {
59963         perror("clock_gettime");
59964         exit(EXIT_FAILURE);
59965     }
59966     ts.tv_sec += atoi(argv[2]);
59967     printf("main() about to call sem_timedwait()\n");
59968     while ((s = sem_timedwait(&sem, &ts)) == -1 && errno == EINTR)
59969         continue;          /* Restart if interrupted by handler */
59970     /* Check what happened */
59971     if (s == -1) {
59972         if (errno == ETIMEDOUT)
59973             printf("sem_timedwait() timed out\n");
59974         else
59975             perror("sem_timedwait");
59976     } else
59977         printf("sem_timedwait() succeeded\n");
59978     exit((s == 0) ? EXIT_SUCCESS : EXIT_FAILURE);
59979 }

```

## APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in XBD Section 3.291 (on page 80).

## RATIONALE

None.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/120 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

## Issue 7

The *sem\_timedwait()* function is moved from the Semaphores option to the Base.

Functionality relating to the Timers option is moved to the Base.

An example is added.

59998

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0529 [138] is applied.

59999 **NAME**

60000 `sem_trywait`, `sem_wait` — lock a semaphore

60001 **SYNOPSIS**

```
60002 #include <semaphore.h>
60003 int sem_trywait(sem_t *sem);
60004 int sem_wait(sem_t *sem);
```

60005 **DESCRIPTION**

60006 The `sem_trywait()` function shall lock the semaphore referenced by `sem` only if the semaphore is  
60007 currently not locked; that is, if the semaphore value is currently positive. Otherwise, it shall not  
60008 lock the semaphore.

60009 The `sem_wait()` function shall lock the semaphore referenced by `sem` by performing a semaphore  
60010 lock operation on that semaphore. If the semaphore value is currently zero, then the calling  
60011 thread shall not return from the call to `sem_wait()` until it either locks the semaphore or the call is  
60012 interrupted by a signal.

60013 Upon successful return, the state of the semaphore shall be locked and shall remain locked until  
60014 the `sem_post()` function is executed and returns successfully.

60015 The `sem_wait()` function is interruptible by the delivery of a signal.

60016 **RETURN VALUE**

60017 The `sem_trywait()` and `sem_wait()` functions shall return zero if the calling process successfully  
60018 performed the semaphore lock operation on the semaphore designated by `sem`. If the call was  
60019 unsuccessful, the state of the semaphore shall be unchanged, and the function shall return a  
60020 value of `-1` and set `errno` to indicate the error.

60021 **ERRORS**

60022 The `sem_trywait()` function shall fail if:

60023 [EAGAIN] The semaphore was already locked, so it cannot be immediately locked by the  
60024 `sem_trywait()` operation.

60025 The `sem_trywait()` and `sem_wait()` functions may fail if:

60026 [EDEADLK] A deadlock condition was detected.

60027 [EINTR] A signal interrupted this function.

60028 [EINVAL] The `sem` argument does not refer to a valid semaphore.

60029 **EXAMPLES**

60030 None.

60031 **APPLICATION USAGE**

60032 Applications using these functions may be subject to priority inversion, as discussed in XBD  
60033 [Section 3.291](#) (on page 80).

60034 **RATIONALE**

60035 None.

60036 **FUTURE DIRECTIONS**

60037 None.

60038 **SEE ALSO**

60039 [`semctl\(\)`](#), [`semget\(\)`](#), [`semop\(\)`](#), [`sem\_post\(\)`](#), [`sem\_timedwait\(\)`](#)

**CHANGE HISTORY**

60041 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

60043 The *sem\_trywait()* and *sem\_wait()* functions are marked as part of the Semaphores option.

60045 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
60046 implementation does not support the Semaphores option.

60047 The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std  
60048 1003.1d-1999.

60049 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/121 is applied, updating the ERRORS  
60050 section so that the [EINVAL] error becomes optional.

**Issue 7**

60051 SD5-XSH-ERN-54 is applied, removing the *sem\_wait()* function from the “shall fail” error cases.

60053 The *sem\_trywait()* and *sem\_wait()* functions are moved from the Semaphores option to the Base.  
60054 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0530 [37] is applied.

60055 **NAME**

60056 sem\_unlink — remove a named semaphore

60057 **SYNOPSIS**

60058 #include &lt;semaphore.h&gt;

60059 int sem\_unlink(const char \*name);

60060 **DESCRIPTION**

60061 The *sem\_unlink()* function shall remove the semaphore named by the string *name*. If the  
60062 semaphore named by *name* is currently referenced by other processes, then *sem\_unlink()* shall  
60063 have no effect on the state of the semaphore. If one or more processes have the semaphore open  
60064 when *sem\_unlink()* is called, destruction of the semaphore is postponed until all references to the  
60065 semaphore have been destroyed by calls to *sem\_close()*, *\_exit()*, or *exec*. Calls to *sem\_open()* to  
60066 recreate or reconnect to the semaphore refer to a new semaphore after *sem\_unlink()* is called. The  
60067 *sem\_unlink()* call shall not block until all references have been destroyed; it shall return  
60068 immediately.

60069 **RETURN VALUE**

60070 Upon successful completion, the *sem\_unlink()* function shall return a value of 0. Otherwise, the  
60071 semaphore shall not be changed and the function shall return a value of -1 and set *errno* to  
60072 indicate the error.

60073 **ERRORS**60074 The *sem\_unlink()* function shall fail if:

60075 [EACCES] Permission is denied to unlink the named semaphore.

60076 [ENOENT] The named semaphore does not exist.

60077 The *sem\_unlink()* function may fail if:

60078 [ENAMETOOLONG]

60079 The length of the *name* argument exceeds {\_POSIX\_PATH\_MAX} on systems  
60080 XSI that do not support the XSI option or exceeds {\_XOPEN\_PATH\_MAX} on XSI  
60081 systems, or has a pathname component that is longer than  
60082 XSI {\_POSIX\_NAME\_MAX} on systems that do not support the XSI option or  
60083 longer than {\_XOPEN\_NAME\_MAX} on XSI systems. A call to *sem\_unlink()*  
60084 with a *name* argument that contains the same semaphore name as was  
60085 previously used in a successful *sem\_open()* call shall not give an  
60086 [ENAMETOOLONG] error.

60087 **EXAMPLES**

60088 None.

60089 **APPLICATION USAGE**

60090 None.

60091 **RATIONALE**

60092 None.

60093 **FUTURE DIRECTIONS**

60094 A future version might require the *sem\_open()* and *sem\_unlink()* functions to have semantics  
60095 similar to normal file system operations.

60096 **SEE ALSO**60097 *semctl()*, *semget()*, *semop()*, *sem\_close()*, *sem\_open()*

60098 XBD &lt;semaphore.h&gt;

**CHANGE HISTORY**

60100 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

60102 The *sem\_unlink()* function is marked as part of the Semaphores option.

60103 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
60104 implementation does not support the Semaphores option.

**Issue 7**

60106 Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a  
60107 “shall fail” to a “may fail” error.

60108 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

60109 The *sem\_unlink()* function is moved from the Semaphores option to the Base.

60110 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0531 [37] is applied.

60111 **NAME**

60112       sem\_wait — lock a semaphore

60113 **SYNOPSIS**

60114       #include &lt;semaphore.h&gt;

60115       int sem\_wait(sem\_t \*sem);

60116 **DESCRIPTION**60117       Refer to *sem\_trywait()*.

**NAME**

semctl — XSI semaphore control operations

**SYNOPSIS**

```
XSI    #include <sys/sem.h>
      int semctl(int semid, int semnum, int cmd, ...);
```

**DESCRIPTION**

The *semctl()* function operates on XSI semaphores (see XBD [Section 4.17](#), on page 114). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in [Section 2.8](#) (on page 503).

The *semctl()* function provides a variety of semaphore control operations as specified by *cmd*. The fourth argument is optional and depends upon the operation requested. If required, it is of type **union semun**, which the application shall explicitly declare:

```
union semun {
    int val;
    struct semid_ds *buf;
    unsigned short *array;
} arg;
```

Each operation shall be performed atomically. +

The following semaphore control operations as specified by *cmd* are executed with respect to the semaphore specified by *semid* and *semnum*. The level of permission required for each operation is shown with each command; see [Section 2.7](#) (on page 501). The symbolic names for the values of *cmd* are defined in the `<sys/sem.h>` header:

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GETVAL  | Return the value of <i>semval</i> ; see <code>&lt;sys/sem.h&gt;</code> . Requires read permission.                                                                                                                                                                                                                                                                                                                                                                                   |
| SETVAL  | Set the value of <i>semval</i> to <i>arg.val</i> , where <i>arg</i> is the value of the fourth argument to <i>semctl()</i> . When this command is successfully executed, the <i>semadj</i> value corresponding to the specified semaphore in all processes is cleared. Also, the <i>sem_ctime</i> timestamp shall be set to the current time, as described in <a href="#">Section 2.7.1</a> (on page 502). Requires alter permission; see <a href="#">Section 2.7</a> (on page 501). |
| GETPID  | Return the value of <i>sempid</i> . Requires read permission.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| GETNCNT | Return the value of <i>semmcnt</i> . Requires read permission.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| GETZCNT | Return the value of <i>semzcnt</i> . Requires read permission.                                                                                                                                                                                                                                                                                                                                                                                                                       |

The following values of *cmd* operate on each *semval* in the set of semaphores:

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GETALL | Return the value of <i>semval</i> for each semaphore in the semaphore set and place into the array pointed to by <i>arg.array</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . Requires read permission.                                                                                                                                                                                                                                                                              |
| SETALL | Set the value of <i>semval</i> for each semaphore in the semaphore set according to the array pointed to by <i>arg.array</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . When this command is successfully executed, the <i>semadj</i> values corresponding to each specified semaphore in all processes are cleared. Also, the <i>sem_ctime</i> timestamp shall be set to the current time, as described in <a href="#">Section 2.7.1</a> (on page 502). Requires alter permission. |

|       |                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------|-----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 60159 | The following values of <i>cmd</i> are also available:                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 60160 | IPC_STAT                                                                                            | Place the current value of each member of the <b>semid_ds</b> data structure associated with <i>semid</i> into the structure pointed to by <i>arg.buf</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . The contents of this structure are defined in <b>&lt;sys/sem.h&gt;</b> . | 60201 |                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

60202 the data structure associated with *semid*.  
60203 [ERANGE] The argument *cmd* is equal to SETVAL or SETALL and the value to which  
60204 *semval* is to be set is greater than the system-imposed maximum.

#### 60205 EXAMPLES

60206 Refer to *semop()*.

#### 60207 APPLICATION USAGE

60208 The fourth parameter in the SYNOPSIS section is now specified as ". . ." in order to avoid a  
60209 clash with the ISO C standard when referring to the union *semun* (as defined in Issue 3) and for  
60210 backwards-compatibility.

60211 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
60212 Application developers who need to use IPC should design their applications so that modules  
60213 using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the  
60214 alternative interfaces.

#### 60215 RATIONALE

60216 None.

#### 60217 FUTURE DIRECTIONS

60218 None.

#### 60223 CHANGE HISTORY

60224 First released in Issue 2. Derived from Issue 2 of the SVID.

#### 60225 Issue 5

60226 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
60227 DIRECTIONS to the APPLICATION USAGE section.

#### 60228 Issue 7

60229 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0532 [345], XSH/TC1-2008/0533 [345],  
60230 XSH/TC1-2008/0534 [345], and XSH/TC1-2008/0535 [335] are applied.

**NAME**

semget — get set of XSI semaphores

**SYNOPSIS**

```
XSI    #include <sys/sem.h>
      int semget(key_t key, int nsems, int semflg);
```

**DESCRIPTION**

The *semget()* function operates on XSI semaphores (see XBD [Section 4.17](#), on page 114). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in [Section 2.8](#) (on page 503).

The *semget()* function shall return the semaphore identifier associated with *key*.

A semaphore identifier with its associated **semid\_ds** data structure and its associated set of *nsems* semaphores (see **<sys/sem.h>**) is created for *key* if one of the following is true:

- The argument *key* is equal to `IPC_PRIVATE`.
- The argument *key* does not already have a semaphore identifier associated with it and (*semflg* & `IPC_CREAT`) is non-zero.

Upon creation, the **semid\_ds** data structure associated with the new semaphore identifier is initialized as follows:

- In the operation permissions structure *sem\_perm.cuid*, *sem\_perm.uid*, *sem\_perm.cgid*, and *sem\_perm.gid* shall be set to the effective user ID and effective group ID, respectively, of the calling process.
- The low-order 9 bits of *sem\_perm.mode* shall be set to the low-order 9 bits of *semflg*.
- The variable *sem\_nsems* shall be set to the value of *nsems*.
- The variable *sem\_otime* shall be set to 0 and *sem\_ctime* shall be set to the current time, as described in [Section 2.7.1](#) (on page 502).
- The data structure associated with each semaphore in the set need not be initialized. The *semctl()* function with the command `SETVAL` or `SETALL` can be used to initialize each semaphore.

**RETURN VALUE**

Upon successful completion, *semget()* shall return a non-negative integer, namely a semaphore identifier; otherwise, it shall return `-1` and set *errno* to indicate the error.

**ERRORS**

The *semget()* function shall fail if:

- |          |                                                                                                                                                                                                                                                                                               |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [EACCES] | A semaphore identifier exists for <i>key</i> , but operation permission as specified by the low-order 9 bits of <i>semflg</i> would not be granted; see <a href="#">Section 2.7</a> (on page 501).                                                                                            |
| [EEXIST] | A semaphore identifier exists for the argument <i>key</i> but (( <i>semflg</i> & <code>IPC_CREAT</code> ) && ( <i>semflg</i> & <code>IPC_EXCL</code> )) is non-zero.                                                                                                                          |
| [EINVAL] | The value of <i>nsems</i> is either less than or equal to 0 or greater than the system-imposed limit, or a semaphore identifier exists for the argument <i>key</i> , but the number of semaphores in the set associated with it is less than <i>nsems</i> and <i>nsems</i> is not equal to 0. |

60272 [ENOENT] A semaphore identifier does not exist for the argument *key* and (*semflg*  
60273 &IPC\_CREAT) is equal to 0.

60274 [ENOSPC] A semaphore identifier is to be created but the system-imposed limit on the  
60275 maximum number of allowed semaphores system-wide would be exceeded.

#### 60276 EXAMPLES

60277 Refer to *semop()*.

#### 60278 APPLICATION USAGE

60279 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
60280 Application developers who need to use IPC should design their applications so that modules  
60281 using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the  
60282 alternative interfaces.

#### 60283 RATIONALE

60284 None.

#### 60285 FUTURE DIRECTIONS

60286 A future version may require that the value of the *semval*, *sempid*, *semncnt*, and *semzcnt* members  
60287 of all semaphores in a semaphore set be initialized to zero when a call to *semget()* creates a  
60288 semaphore set. Many semaphore implementations already do this and it greatly simplifies what  
60289 an application must do to initialize a semaphore set.

#### 60294 CHANGE HISTORY

60295 First released in Issue 2. Derived from Issue 2 of the SVID.

#### 60296 Issue 5

60297 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
60298 DIRECTIONS to a new APPLICATION USAGE section.

#### 60299 Issue 6

60300 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/122 is applied, updating the  
60301 DESCRIPTION from “each semaphore in the set shall not be initialized” to “each semaphore in  
60302 the set need not be initialized”.

#### 60303 Issue 7

60304 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0536 [335,439] and  
60305 XSH/TC1-2008/0537 [344] are applied.

**NAME**

semop — XSI semaphore operations

**SYNOPSIS**

```
XSI    #include <sys/sem.h>
int semop(int semid, struct sembuf *sops, size_t nsops);
```

**DESCRIPTION**

The *semop()* function operates on XSI semaphores (see XBD [Section 4.17](#), on page 114). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in [Section 2.8](#) (on page 503).

The *semop()* function shall perform atomically a user-defined array of semaphore operations in array order on the set of semaphores associated with the semaphore identifier specified by the argument *semid*.

The argument *sops* is a pointer to a user-defined array of semaphore operation structures. The implementation shall not modify elements of this array unless the application uses implementation-defined extensions.

The argument *nsops* is the number of such structures in the array.

Each structure, **sembuf**, includes the following members:

| Member Type    | Member Name    | Description          |
|----------------|----------------|----------------------|
| unsigned short | <i>sem_num</i> | Semaphore number.    |
| short          | <i>sem_op</i>  | Semaphore operation. |
| short          | <i>sem_flg</i> | Operation flags.     |

Each semaphore operation specified by *sem\_op* is performed on the corresponding semaphore specified by *semid* and *sem\_num*.

The variable *sem\_op* specifies one of three semaphore operations:

1. If *sem\_op* is a negative integer and the calling process has alter permission, one of the following shall occur:
  - If *semval* (see **<sys/sem.h>**) is greater than or equal to the absolute value of *sem\_op*, the absolute value of *sem\_op* is subtracted from *semval*. Also, if (*sem\_flg* & SEM\_UNDO) is non-zero, the absolute value of *sem\_op* shall be added to the *semadj* value of the calling process for the specified semaphore.
  - If *semval* is less than the absolute value of *sem\_op* and (*sem\_flg* & IPC\_NOWAIT) is non-zero, *semop()* shall return immediately.
  - If *semval* is less than the absolute value of *sem\_op* and (*sem\_flg* & IPC\_NOWAIT) is 0, *semop()* shall increment the *semncnt* associated with the specified semaphore and suspend execution of the calling thread until one of the following conditions occurs:
    - The value of *semval* becomes greater than or equal to the absolute value of *sem\_op*. When this occurs, the value of *semncnt* associated with the specified semaphore shall be decremented, the absolute value of *sem\_op* shall be subtracted from *semval* and, if (*sem\_flg* & SEM\_UNDO) is non-zero, the absolute value of *sem\_op* shall be added to the *semadj* value of the calling process for the specified semaphore.

- 60347 — The *semid* for which the calling thread is awaiting action is removed from the  
 60348 system. When this occurs, *errno* shall be set to [EIDRM] and -1 shall be  
 60349 returned.
- 60350 — The calling thread receives a signal that is to be caught. When this occurs, the  
 60351 value of *semncnt* associated with the specified semaphore shall be  
 60352 decremented, and the calling thread shall resume execution in the manner  
 60353 prescribed in [sigaction\(\)](#).
- 60354 2. If *sem\_op* is a positive integer and the calling process has alter permission, the value of  
 60355 *sem\_op* shall be added to *semval* and, if (*sem\_flg* & SEM\_UNDO) is non-zero, the value of  
 60356 *sem\_op* shall be subtracted from the *semadj* value of the calling process for the specified  
 60357 semaphore.
- 60358 3. If *sem\_op* is 0 and the calling process has read permission, one of the following shall occur:
- 60359 • If *semval* is 0, *semop()* shall return immediately.
- 60360 • If *semval* is non-zero and (*sem\_flg* & IPC\_NOWAIT) is non-zero, *semop()* shall return  
 60361 immediately.
- 60362 • If *semval* is non-zero and (*sem\_flg* & IPC\_NOWAIT) is 0, *semop()* shall increment the  
 60363 *semzcnt* associated with the specified semaphore and suspend execution of the  
 60364 calling thread until one of the following occurs:
- 60365 — The value of *semval* becomes 0, at which time the value of *semzcnt* associated  
 60366 with the specified semaphore shall be decremented.
- 60367 — The *semid* for which the calling thread is awaiting action is removed from the  
 60368 system. When this occurs, *errno* shall be set to [EIDRM] and -1 shall be  
 60369 returned.
- 60370 — The calling thread receives a signal that is to be caught. When this occurs, the  
 60371 value of *semzcnt* associated with the specified semaphore shall be  
 60372 decremented, and the calling thread shall resume execution in the manner  
 60373 prescribed in [sigaction\(\)](#).
- 60374 Upon successful completion, the value of *sempid* for each semaphore specified in the array  
 60375 pointed to by *sops* shall be set to the process ID of the calling process. Also, the *sem\_otime*  
 60376 timestamp shall be set to the current time, as described in [Section 2.7.1](#) (on page 502).

**60377 RETURN VALUE**

60378 Upon successful completion, *semop()* shall return 0; otherwise, it shall return -1 and set *errno* to  
 60379 indicate the error.

**60380 ERRORS**

60381 The *semop()* function shall fail if:

- 60382 [E2BIG] The value of *nsops* is greater than the system-imposed maximum.
- 60383 [EACCES] Operation permission is denied to the calling process; see [Section 2.7](#) (on page  
 60384 501).
- 60385 [EAGAIN] The operation would result in suspension of the calling process but (*sem\_flg*  
 60386 & IPC\_NOWAIT) is non-zero.
- 60387 [EFBIG] The value of *sem\_num* is greater than or equal to the number of semaphores in  
 60388 the set associated with *semid*.

|       |          |                                                                                                                                                                                                |
|-------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 60389 | [EIDRM]  | The semaphore identifier <i>semid</i> is removed from the system.                                                                                                                              |
| 60390 | [EINTR]  | The <i>semop()</i> function was interrupted by a signal.                                                                                                                                       |
| 60391 | [EINVAL] | The value of <i>semid</i> is not a valid semaphore identifier, or the number of individual semaphores for which the calling process requests a SEM_UNDO would exceed the system-imposed limit. |
| 60392 |          |                                                                                                                                                                                                |
| 60393 |          |                                                                                                                                                                                                |
| 60394 | [ENOSPC] | The limit on the number of individual processes requesting a SEM_UNDO would be exceeded.                                                                                                       |
| 60395 |          |                                                                                                                                                                                                |
| 60396 | [ERANGE] | An operation would cause a <i>semval</i> to overflow the system-imposed limit, or an operation would cause a <i>semadj</i> value to overflow the system-imposed limit.                         |
| 60397 |          |                                                                                                                                                                                                |
| 60398 |          |                                                                                                                                                                                                |

## 60399 EXAMPLES

### 60400 Setting Values in Semaphores

60401 The following example sets the values of the two semaphores associated with the *semid* identifier  
60402 to the values contained in the *sb* array.

```
60403 #include <sys/sem.h>
60404 ...
60405 int semid;
60406 struct sembuf sb[2];
60407 int nsops = 2;
60408 int result;

60409 /* Code to initialize semid. */
60410 ...

60411 /* Adjust value of semaphore in the semaphore array semid. */
60412 sb[0].sem_num = 0;
60413 sb[0].sem_op = -1;
60414 sb[0].sem_flg = SEM_UNDO | IPC_NOWAIT;
60415 sb[1].sem_num = 1;
60416 sb[1].sem_op = 1;
60417 sb[1].sem_flg = 0;

60418 result = semop(semid, sb, nsops);
```

### 60419 Creating a Semaphore Identifier

60420 The following example gets a unique semaphore key using the *ftok()* function, then gets a  
60421 semaphore ID associated with that key using the *semget()* function (the first call also tests to  
60422 make sure the semaphore exists). If the semaphore does not exist, the program creates it, as  
60423 shown by the second call to *semget()*. In creating the semaphore for the queuing process, the  
60424 program attempts to create one semaphore with read/write permission for all. It also uses the  
60425 IPC\_EXCL flag, which forces *semget()* to fail if the semaphore already exists.

60426 After creating the semaphore, the program uses calls to *semctl()* and *semop()* to initialize it to the  
60427 values in the *sbuf* array. The number of processes that can execute concurrently without queuing  
60428 is initially set to 2. The final call to *semget()* creates a semaphore identifier that can be used later  
60429 in the program.

60430 Processes that obtain *semid* without creating it check that *sem\_otime* is non-zero, to ensure that  
60431 the creating process has completed the *semop()* initialization.

The final call to *semop()* acquires the semaphore and waits until it is free; the SEM\_UNDO option releases the semaphore when the process exits, waiting until there are less than two processes running concurrently.

```

60432
60433
60434
60435 #include <stdio.h>
60436 #include <sys/sem.h>
60437 #include <sys/stat.h>
60438 #include <errno.h>
60439 #include <stdlib.h>
60440 ...
60441 key_t semkey;
60442 int semid;
60443 struct sembuf sbuf;
60444 union semun {
60445     int val;
60446     struct semid_ds *buf;
60447     unsigned short *array;
60448 } arg;
60449 struct semid_ds ds;
60450 ...
60451 /* Get unique key for semaphore. */
60452 if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
60453     perror("IPC error: ftok"); exit(1);
60454 }
60455
60456 /* Get semaphore ID associated with this key. */
60457 if ((semid = semget(semkey, 0, 0)) == -1) {
60458     /* Semaphore does not exist - Create. */
60459     if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
60460         S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1)
60461     {
60462         /* Initialize the semaphore. */
60463         arg.val = 0;
60464         sbuf.sem_num = 0;
60465         sbuf.sem_op = 2; /* This is the number of runs without queuing. */
60466         sbuf.sem_flg = 0;
60467         if (semctl(semid, 0, SETVAL, arg) == -1
60468             || semop(semid, &sbuf, 1) == -1) {
60469             perror("IPC error: semop"); exit(1);
60470         }
60471     }
60472     else if (errno == EEXIST) {
60473         if ((semid = semget(semkey, 0, 0)) == -1) {
60474             perror("IPC error 1: semget"); exit(1);
60475         }
60476         goto check_init;
60477     }
60478     else {
60479         perror("IPC error 2: semget"); exit(1);
60480     }
60481 }
else

```

```

60482     {
60483         /* Check that semid has completed initialization. */
60484         /* An application can use a retry loop at this point rather than
60485            exiting. */
60486         check_init:
60487         arg.buf = &ds;
60488         if (semctl(semid, 0, IPC_STAT, arg) < 0) {
60489             perror("IPC error 3: semctl"); exit(1);
60490         }
60491         if (ds.sem_otime == 0) {
60492             perror("IPC error 4: semctl"); exit(1);
60493         }
60494     }
60495     ...
60496     sbuf.sem_num = 0;
60497     sbuf.sem_op = -1;
60498     sbuf.sem_flg = SEM_UNDO;
60499     if (semop(semid, &sbuf, 1) == -1) {
60500         perror("IPC Error: semop"); exit(1);
60501     }

```

## APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the alternative interfaces.

## RATIONALE

None.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 2. Derived from Issue 2 of the SVID.

### Issue 5

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.

### Issue 7

SD5-XSH-ERN-171 is applied, updating the DESCRIPTION to clarify the order in which the operations in *sops* will be performed when there are multiple operations.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0538 [329,429], XSH/TC1-2008/0539 [345,428], XSH/TC1-2008/0540 [329,429], XSH/TC1-2008/0541 [335], and XSH/TC1-2008/0542 [291,429] are applied.

**NAME**

send — send a message on a socket

**SYNOPSIS**

```
#include <sys/socket.h>
```

```
ssize_t send(int socket, const void *buffer, size_t length, int flags);
```

**DESCRIPTION**

The *send()* function shall initiate transmission of a message from the specified socket to its peer. The *send()* function shall send a message only when the socket is connected. If the socket is a connectionless-mode socket, the message shall be sent to the pre-specified peer address.

The *send()* function takes the following arguments:

*socket* Specifies the socket file descriptor.

*buffer* Points to the buffer containing the message to send.

*length* Specifies the length of the message in bytes.

*flags* Specifies the type of message transmission. Values of this argument are formed by logically OR'ing zero or more of the following flags:

MSG\_EOR Terminates a record (if supported by the protocol).

MSG\_OOB Sends out-of-band data on sockets that support out-of-band communications. The significance and semantics of out-of-band data are protocol-specific.

MSG\_NOSIGNAL Requests not to send the SIGPIPE signal if an attempt to send is made on a stream-oriented socket that is no longer connected. The [EPIPE] error shall still be returned.

The length of the message to be sent is specified by the *length* argument. If the message is too long to pass through the underlying protocol, *send()* shall fail and no data shall be transmitted.

Successful completion of a call to *send()* does not guarantee delivery of the message. A return value of -1 indicates only locally-detected errors.

If space is not available at the sending socket to hold the message to be transmitted, and the socket file descriptor does not have O\_NONBLOCK set, *send()* shall block until space is available. If space is not available at the sending socket to hold the message to be transmitted, and the socket file descriptor does have O\_NONBLOCK set, *send()* shall fail. The *select()* and *poll()* functions can be used to determine when it is possible to send more data.

The socket in use may require the process to have appropriate privileges to use the *send()* function.

**RETURN VALUE**

Upon successful completion, *send()* shall return the number of bytes sent. Otherwise, -1 shall be returned and *errno* set to indicate the error.

**ERRORS**

The *send()* function shall fail if:

[EAGAIN] or [EWOULDBLOCK]

The socket's file descriptor is marked O\_NONBLOCK and the requested operation would block.

|       |                |                                                                                                                                                                                                                                                                               |
|-------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 60569 | [EBADF]        | The <i>socket</i> argument is not a valid file descriptor.                                                                                                                                                                                                                    |
| 60570 | [ECONNRESET]   | A connection was forcibly closed by a peer.                                                                                                                                                                                                                                   |
| 60571 | [EDESTADDRREQ] |                                                                                                                                                                                                                                                                               |
| 60572 |                | The socket is not connection-mode and no peer address is set.                                                                                                                                                                                                                 |
| 60573 | [EINTR]        | A signal interrupted <i>send()</i> before any data was transmitted.                                                                                                                                                                                                           |
| 60574 | [EMSGSIZE]     | The message is too large to be sent all at once, as the socket requires.                                                                                                                                                                                                      |
| 60575 | [ENOTCONN]     | The socket is not connected.                                                                                                                                                                                                                                                  |
| 60576 | [ENOTSOCK]     | The <i>socket</i> argument does not refer to a socket.                                                                                                                                                                                                                        |
| 60577 | [EOPNOTSUPP]   | The <i>socket</i> argument is associated with a socket that does not support one or more of the values set in <i>flags</i> .                                                                                                                                                  |
| 60578 |                |                                                                                                                                                                                                                                                                               |
| 60579 | [EPIPE]        | The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type SOCK_STREAM or SOCK_SEQPACKET and the MSG_NOSIGNAL flag is not set, the SIGPIPE signal is generated to the calling thread. |
| 60580 |                |                                                                                                                                                                                                                                                                               |
| 60581 |                |                                                                                                                                                                                                                                                                               |
| 60582 |                |                                                                                                                                                                                                                                                                               |
| 60583 |                | The <i>send()</i> function may fail if:                                                                                                                                                                                                                                       |
| 60584 | [EACCES]       | The calling process does not have appropriate privileges.                                                                                                                                                                                                                     |
| 60585 | [EIO]          | An I/O error occurred while reading from or writing to the file system.                                                                                                                                                                                                       |
| 60586 | [ENETDOWN]     | The local network interface used to reach the destination is down.                                                                                                                                                                                                            |
| 60587 | [ENETUNREACH]  |                                                                                                                                                                                                                                                                               |
| 60588 |                | No route to the network is present.                                                                                                                                                                                                                                           |
| 60589 | [ENOBUFS]      | Insufficient resources were available in the system to perform the operation.                                                                                                                                                                                                 |

**EXAMPLES**

None.

**APPLICATION USAGE**

If the *socket* argument refers to a connection-mode socket, the *send()* function is equivalent to *sendto()* (with any value for the *dest\_addr* and *dest\_len* arguments, as they are ignored in this case). If the *socket* argument refers to a socket and the *flags* argument is 0, the *send()* function is equivalent to *write()*.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*connect()*, *getsockopt()*, *poll()*, *pselect()*, *recv()*, *recvfrom()*, *recvmsg()*, *sendmsg()*, *sendto()*, *setsockopt()*, *shutdown()*, *socket()*, *write()*

XBD &lt;sys/socket.h&gt;

**CHANGE HISTORY**

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

60607 **Issue 7**

60608 Austin Group Interpretation 1003.1-2001 #035 is applied, updating the DESCRIPTION to clarify  
60609 the behavior when the socket is a connectionless-mode socket.

60610 The MSG\_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended  
60611 API Set Part 2.

60612 The [EPIPE] error is modified.

60613 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0543 [463] is applied.

## NAME

sendmsg — send a message on a socket using a message structure

## SYNOPSIS

```
#include <sys/socket.h>
```

```
ssize_t sendmsg(int socket, const struct msghdr *message, int flags);
```

## DESCRIPTION

The *sendmsg()* function shall send a message through a connection-mode or connectionless-mode socket. If the socket is a connectionless-mode socket, the message shall be sent to the address specified by **msghdr** if no pre-specified peer address has been set. If a peer address has been pre-specified, either the message shall be sent to the address specified in **msghdr** (overriding the pre-specified peer address), or the function shall return `-1` and set *errno* to `[EISCONN]`. If the socket is connection-mode, the destination address in **msghdr** shall be ignored.

The *sendmsg()* function takes the following arguments:

|                |                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>socket</i>  | Specifies the socket file descriptor.                                                                                                                                                                                                           |
| <i>message</i> | Points to a <b>msghdr</b> structure, containing both the destination address and the buffers for the outgoing message. The length and format of the address depend on the address family of the socket. The <i>msg_flags</i> member is ignored. |
| <i>flags</i>   | Specifies the type of message transmission. The application may specify 0 or the following flag:                                                                                                                                                |
| MSG_EOR        | Terminates a record (if supported by the protocol).                                                                                                                                                                                             |
| MSG_OOB        | Sends out-of-band data on sockets that support out-of-band data. The significance and semantics of out-of-band data are protocol-specific.                                                                                                      |
| MSG_NOSIGNAL   | Requests not to send the SIGPIPE signal if an attempt to send is made on a stream-oriented socket that is no longer connected. The <code>[EPIPE]</code> error shall still be returned.                                                          |

The *msg\_iov* and *msg\_iovlen* fields of *message* specify zero or more buffers containing the data to be sent. *msg\_iov* points to an array of **iovec** structures; *msg\_iovlen* shall be set to the dimension of this array. In each **iovec** structure, the *iov\_base* field specifies a storage area and the *iov\_len* field gives its size in bytes. Some of these sizes can be zero. The data from each storage area indicated by *msg\_iov* is sent in turn.

Successful completion of a call to *sendmsg()* does not guarantee delivery of the message. A return value of `-1` indicates only locally-detected errors.

If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does not have `O_NONBLOCK` set, the *sendmsg()* function shall block until space is available. If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does have `O_NONBLOCK` set, the *sendmsg()* function shall fail.

If the socket protocol supports broadcast and the specified address is a broadcast address for the socket protocol, *sendmsg()* shall fail if the `SO_BROADCAST` option is not set for the socket.

The socket in use may require the process to have appropriate privileges to use the *sendmsg()* function.

**RETURN VALUE**

Upon successful completion, *sendmsg()* shall return the number of bytes sent. Otherwise, *-1* shall be returned and *errno* set to indicate the error.

**ERRORS**

The *sendmsg()* function shall fail if:

[EAGAIN] or [EWOULDBLOCK]

The socket's file descriptor is marked *O\_NONBLOCK* and the requested operation would block.

[EAFNOSUPPORT]

Addresses in the specified address family cannot be used with this socket.

[EBADF]

The *socket* argument is not a valid file descriptor.

[ECONNRESET] A connection was forcibly closed by a peer.

[EINTR]

A signal interrupted *sendmsg()* before any data was transmitted.

[EINVAL]

The sum of the *iov\_len* values overflows an *ssize\_t*.

[EMSGSIZE]

The message is too large to be sent all at once (as the socket requires), or the *msg\_iovlen* member of the **msghdr** structure pointed to by *message* is less than or equal to 0 or is greater than {*IOV\_MAX*}.

[ENOTCONN]

The socket is connection-mode but is not connected.

[ENOTSOCK]

The *socket* argument does not refer to a socket.

[EOPNOTSUPP]

The *socket* argument is associated with a socket that does not support one or more of the values set in *flags*.

[EPIPE]

The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type *SOCK\_STREAM* or *SOCK\_SEQPACKET* and the *MSG\_NOSIGNAL* flag is not set, the *SIGPIPE* signal is generated to the calling thread.

If the address family of the socket is *AF\_UNIX*, then *sendmsg()* shall fail if:

[EIO]

An I/O error occurred while reading from or writing to the file system.

[ELOOP]

A loop exists in symbolic links encountered during resolution of the pathname in the socket address.

[ENAMETOOLONG]

The length of a component of a pathname is longer than {*NAME\_MAX*}.

[ENOENT]

A component of the pathname does not name an existing file or the path name is an empty string.

[ENOTDIR]

A component of the path prefix of the pathname in the socket address names an existing file that is neither a directory nor a symbolic link to a directory, or the pathname in the socket address contains at least one non-*<slash>* character and ends with one or more trailing *<slash>* characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

60697 The *sendmsg()* function may fail if:

60698 [EACCES] Search permission is denied for a component of the path prefix; or write access  
60699 to the named socket is denied.

60700 [EDESTADDRREQ]  
60701 The socket is not connection-mode and does not have its peer address set, and  
60702 no destination address was specified.

60703 [EHOSTUNREACH]  
60704 The destination host cannot be reached (probably because the host is down or  
60705 a remote router cannot reach it).

60706 [EIO] An I/O error occurred while reading from or writing to the file system.

60707 [EISCONN] A destination address was specified and the socket is already connected.

60708 [ENETDOWN] The local network interface used to reach the destination is down.

60709 [ENETUNREACH]  
60710 No route to the network is present.

60711 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

60712 [ENOMEM] Insufficient memory was available to fulfill the request.

60713 If the address family of the socket is AF\_UNIX, then *sendmsg()* may fail if:

60714 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
60715 resolution of the pathname in the socket address.

60716 [ENAMETOOLONG]  
60717 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
60718 symbolic link produced an intermediate result with a length that exceeds  
60719 {PATH\_MAX}.

## 60720 EXAMPLES

60721 Done.

## 60722 APPLICATION USAGE

60723 The *select()* and *poll()* functions can be used to determine when it is possible to send more data.

## 60724 RATIONALE

60725 None.

## 60726 FUTURE DIRECTIONS

60727 None.

## 60732 CHANGE HISTORY

60733 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

60734 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
60735 [ELOOP] error condition is added.

60736 **Issue 7**

60737 Austin Group Interpretation 1003.1-2001 #073 is applied, updating the DESCRIPTION.

60738 Austin Group Interpretation 1003.1-2001 #143 is applied.

60739 The MSG\_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended  
60740 API Set Part 2.

60741 The [EPIPE] error is modified.

60742 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0544 [324] is applied.

**NAME**

sendto — send a message on a socket

**SYNOPSIS**

```
#include <sys/socket.h>

ssize_t sendto(int socket, const void *message, size_t length,
               int flags, const struct sockaddr *dest_addr,
               socklen_t dest_len);
```

**DESCRIPTION**

The *sendto()* function shall send a message through a connection-mode or connectionless-mode socket.

If the socket is a connectionless-mode socket, the message shall be sent to the address specified by *dest\_addr* if no pre-specified peer address has been set. If a peer address has been pre-specified, either the message shall be sent to the address specified by *dest\_addr* (overriding the pre-specified peer address), or the function shall return  $-1$  and set *errno* to [EISCONN].

If the socket is connection-mode, *dest\_addr* shall be ignored.

The *sendto()* function takes the following arguments:

|                  |                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>socket</i>    | Specifies the socket file descriptor.                                                                                                                                     |
| <i>message</i>   | Points to a buffer containing the message to be sent.                                                                                                                     |
| <i>length</i>    | Specifies the size of the message in bytes.                                                                                                                               |
| <i>flags</i>     | Specifies the type of message transmission. Values of this argument are formed by logically OR'ing zero or more of the following flags:                                   |
| MSG_EOR          | Terminates a record (if supported by the protocol).                                                                                                                       |
| MSG_OOB          | Sends out-of-band data on sockets that support out-of-band data. The significance and semantics of out-of-band data are protocol-specific.                                |
| MSG_NOSIGNAL     | Requests not to send the SIGPIPE signal if an attempt to send is made on a stream-oriented socket that is no longer connected. The [EPIPE] error shall still be returned. |
| <i>dest_addr</i> | Points to a <b>sockaddr</b> structure containing the destination address. The length and format of the address depend on the address family of the socket.                |
| <i>dest_len</i>  | Specifies the length of the <b>sockaddr</b> structure pointed to by the <i>dest_addr</i> argument.                                                                        |

If the socket protocol supports broadcast and the specified address is a broadcast address for the socket protocol, *sendto()* shall fail if the SO\_BROADCAST option is not set for the socket.

The *dest\_addr* argument specifies the address of the target.

The *length* argument specifies the length of the message.

Successful completion of a call to *sendto()* does not guarantee delivery of the message. A return value of  $-1$  indicates only locally-detected errors.

If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does not have O\_NONBLOCK set, *sendto()* shall block until space is available. If space is not available at the sending socket to hold the message to be transmitted

60785 and the socket file descriptor does have O\_NONBLOCK set, *sendto()* shall fail.

60786 The socket in use may require the process to have appropriate privileges to use the *sendto()*

60787 function.

60788 **RETURN VALUE**

60789 Upon successful completion, *sendto()* shall return the number of bytes sent. Otherwise, -1 shall

60790 be returned and *errno* set to indicate the error.

60791 **ERRORS**

60792 The *sendto()* function shall fail if:

60793 [EAFNOSUPPORT]

60794 Addresses in the specified address family cannot be used with this socket.

60795 [EAGAIN] or [EWOULDBLOCK]

60796 The socket's file descriptor is marked O\_NONBLOCK and the requested

60797 operation would block.

60798 [EBADF] The *socket* argument is not a valid file descriptor.

60799 [ECONNRESET] A connection was forcibly closed by a peer.

60800 [EINTR] A signal interrupted *sendto()* before any data was transmitted.

60801 [EMSGSIZE] The message is too large to be sent all at once, as the socket requires.

60802 [ENOTCONN] The socket is connection-mode but is not connected.

60803 [ENOTSOCK] The *socket* argument does not refer to a socket.

60804 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or

60805 more of the values set in *flags*.

60806 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is

60807 no longer connected. In the latter case, and if the socket is of type

60808 SOCK\_STREAM or SOCK\_SEQPACKET and the MSG\_NOSIGNAL flag is not

60809 set, the SIGPIPE signal is generated to the calling thread.

60810 If the address family of the socket is AF\_UNIX, then *sendto()* shall fail if:

60811 [EIO] An I/O error occurred while reading from or writing to the file system.

60812 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname

60813 in the socket address.

60814 [ENAMETOOLONG]

60815 The length of a component of a pathname is longer than {NAME\_MAX}.

60816 [ENOENT] A component of the pathname does not name an existing file or the pathname

60817 is an empty string.

60818 [ENOTDIR] A component of the path prefix of the pathname in the socket address names

60819 an existing file that is neither a directory nor a symbolic link to a directory, or

60820 the pathname in the socket address contains at least one non-*<slash>* character

60821 and ends with one or more trailing *<slash>* characters and the last pathname

60822 component names an existing file that is neither a directory nor a symbolic

60823 link to a directory.

60824 The *sendto()* function may fail if:

60825 [EACCES] Search permission is denied for a component of the path prefix; or write access  
60826 to the named socket is denied.

60827 [EDESTADDRREQ]  
60828 The socket is not connection-mode and does not have its peer address set, and  
60829 no destination address was specified.

60830 [EHOSTUNREACH]  
60831 The destination host cannot be reached (probably because the host is down or  
60832 a remote router cannot reach it).

60833 [EINVAL] The *dest\_len* argument is not a valid length for the address family.

60834 [EIO] An I/O error occurred while reading from or writing to the file system.

60835 [EISCONN] A destination address was specified and the socket is already connected.

60836 [ENETDOWN] The local network interface used to reach the destination is down.

60837 [ENETUNREACH]  
60838 No route to the network is present.

60839 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

60840 [ENOMEM] Insufficient memory was available to fulfill the request.

60841 If the address family of the socket is AF\_UNIX, then *sendto()* may fail if:

60842 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
60843 resolution of the pathname in the socket address.

60844 [ENAMETOOLONG]  
60845 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
60846 symbolic link produced an intermediate result with a length that exceeds  
60847 {PATH\_MAX}.

## 60848 EXAMPLES

60849 None.

## 60850 APPLICATION USAGE

60851 The *select()* and *poll()* functions can be used to determine when it is possible to send more data.

## 60852 RATIONALE

60853 None.

## 60854 FUTURE DIRECTIONS

60855 None.

60859 XBD <sys/socket.h>

## 60860 CHANGE HISTORY

60861 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

60862 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
60863 [ELOOP] error condition is added.

60864 **Issue 7**

60865 Austin Group Interpretations 1003.1-2001 #035 and #073 are applied, updating the [EISCONN]  
60866 error and the DESCRIPTION.

60867 Austin Group Interpretation 1003.1-2001 #143 is applied, clarifying the [ENAMETOOLONG]  
60868 error condition.

60869 The MSG\_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended  
60870 API Set Part 2.

60871 The [EPIPE] error is modified.

60872 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0545 [324] is applied.

60873 **NAME**

60874       setbuf — assign buffering to a stream

60875 **SYNOPSIS**

60876       #include &lt;stdio.h&gt;

60877       void setbuf(FILE \*restrict stream, char \*restrict buf);

60878 **DESCRIPTION**

60879 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
60880 conflict between the requirements described here and the ISO C standard is unintentional. This  
60881 volume of POSIX.1-2008 defers to the ISO C standard.

60882       Except that it returns no value, the function call:

60883       setbuf(stream, buf)

60884       shall be equivalent to:

60885       setvbuf(stream, buf, \_IOFBF, BUFSIZ)

60886       if *buf* is not a null pointer, or to:

60887       setvbuf(stream, buf, \_IONBF, BUFSIZ)

60888       if *buf* is a null pointer.60889 **RETURN VALUE**60890       The *setbuf()* function shall not return a value.60891 **ERRORS**

60892       Although the *setvbuf()* interface may set *errno* in defined ways, the value of *errno* after a call to  
60893 *setbuf()* is unspecified.

60894 **EXAMPLES**

60895       None.

60896 **APPLICATION USAGE**

60897       A common source of error is allocating buffer space as an “automatic” variable in a code block,  
60898 and then failing to close the stream in the same block.

60899       With *setbuf()*, allocating a buffer of BUFSIZ bytes does not necessarily imply that all of BUFSIZ  
60900 bytes are used for the buffer area.

60901       Since *errno* is not required to be unchanged on success, in order to correctly detect and possibly  
60902 recover from errors, applications should use *setvbuf()* instead of *setbuf()*.

60903 **RATIONALE**

60904       None.

60905 **FUTURE DIRECTIONS**

60906       None.

60907 **SEE ALSO**60908       Section 2.5 (on page 495), *fopen()*, *setvbuf()*

60909       XBD &lt;stdio.h&gt;

60910 **CHANGE HISTORY**

60911       First released in Issue 1. Derived from Issue 1 of the SVID.

60912 **Issue 6**

60913 The prototype for *setbuf()* is updated for alignment with the ISO/IEC 9899:1999 standard.

60914 **Issue 7**

60915 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0546 [397], XSH/TC1-2008/0547 [397],  
60916 and XSH/TC1-2008/0548 [14] are applied.

**NAME**

setegid — set the effective group ID

**SYNOPSIS**

```
#include <unistd.h>
```

```
int setegid(gid_t gid);
```

**DESCRIPTION**

If *gid* is equal to the real group ID or the saved set-group-ID, or if the process has appropriate privileges, *setegid()* shall set the effective group ID of the calling process to *gid*; the real group ID, saved set-group-ID, and any supplementary group IDs shall remain unchanged.

The *setegid()* function shall not affect the supplementary group list in any way.

**RETURN VALUE**

Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to indicate the error.

**ERRORS**

The *setegid()* function shall fail if:

[EINVAL] The value of the *gid* argument is invalid and is not supported by the implementation.

[EPERM] The process does not have appropriate privileges and *gid* does not match the real group ID or the saved set-group-ID.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

Refer to the RATIONALE section in *setuid()*.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*exec*, *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *seteuid()*, *setgid()*, *setregid()*, *setreuid()*, *setuid()*

XBD *<sys/types.h>*, *<unistd.h>*

**CHANGE HISTORY**

First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

**NAME**

setenv — add or change environment variable

**SYNOPSIS**

```
CX      #include <stdlib.h>
        int setenv(const char *envname, const char *envval, int overwrite);
```

**DESCRIPTION**

The *setenv()* function shall update or add a variable in the environment of the calling process. The *envname* argument points to a string containing the name of an environment variable to be added or altered. The environment variable shall be set to the value to which *envval* points. The function shall fail if *envname* points to a string which contains an '=' character. If the environment variable named by *envname* already exists and the value of *overwrite* is non-zero, the function shall return success and the environment shall be updated. If the environment variable named by *envname* already exists and the value of *overwrite* is zero, the function shall return success and the environment shall remain unchanged.

The *setenv()* function shall update the list of pointers to which *environ* points.

The strings described by *envname* and *envval* are copied by this function.

The *setenv()* function need not be thread-safe.

**RETURN VALUE**

Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to indicate the error, and the environment shall be unchanged.

**ERRORS**

The *setenv()* function shall fail if:

- |          |                                                                                                          |
|----------|----------------------------------------------------------------------------------------------------------|
| [EINVAL] | The <i>envname</i> argument points to an empty string or points to a string containing an '=' character. |
| [ENOMEM] | Insufficient memory was available to add a variable or its value to the environment.                     |

**EXAMPLES**

None.

**APPLICATION USAGE**

See *exec()* for restrictions on changing the environment in multi-threaded applications.

**RATIONALE**

Unanticipated results may occur if *setenv()* changes the external variable *environ*. In particular, if the optional *envp* argument to *main()* is present, it is not changed, and thus may point to an obsolete copy of the environment (as may any other copy of *environ*). However, other than the aforementioned restriction, the standard developers intended that the traditional method of walking through the environment by way of the *environ* pointer must be supported.

It was decided that *setenv()* should be required by this version because it addresses a piece of missing functionality, and does not impose a significant burden on the implementor.

There was considerable debate as to whether the System V *putenv()* function or the BSD *setenv()* function should be required as a mandatory function. The *setenv()* function was chosen because it permitted the implementation of the *unsetenv()* function to delete environmental variables, without specifying an additional interface. The *putenv()* function is available as part of the XSI option.

60992 The standard developers considered requiring that *setenv()* indicate an error when a call to it  
60993 would result in exceeding {ARG\_MAX}. The requirement was rejected since the condition might  
60994 be temporary, with the application eventually reducing the environment size. The ultimate  
60995 success or failure depends on the size at the time of a call to *exec*, which returns an indication of  
60996 this error condition.

60997 See also the RATIONALE section in *getenv()*.

#### 60998 FUTURE DIRECTIONS

60999 None.

#### 61003 CHANGE HISTORY

61004 First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

61005 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/55 is applied, adding references to *exec* in  
61006 the APPLICATION USAGE and SEE ALSO sections.

#### 61007 Issue 7

61008 Austin Group Interpretation 1003.1-2001 #156 is applied.

61009 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0549 [167], XSH/TC1-2008/0550 [185],  
61010 XSH/TC1-2008/0551 [167], and XSH/TC1-2008/0552 [38] are applied.

61011 **NAME**

61012        seteuid — set effective user ID

61013 **SYNOPSIS**

61014        #include &lt;unistd.h&gt;

61015        int seteuid(uid\_t uid);

61016 **DESCRIPTION**

61017        If *uid* is equal to the real user ID or the saved set-user-ID, or if the process has appropriate  
 61018        privileges, *seteuid()* shall set the effective user ID of the calling process to *uid*; the real user ID  
 61019        and saved set-user-ID shall remain unchanged.

61020        The *seteuid()* function shall not affect the supplementary group list in any way.

61021 **RETURN VALUE**

61022        Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
 61023        indicate the error.

61024 **ERRORS**

61025        The *seteuid()* function shall fail if:

61026        [EINVAL]        The value of the *uid* argument is invalid and is not supported by the  
 61027        implementation.

61028        [EPERM]        The process does not have appropriate privileges and *uid* does not match the  
 61029        real user ID or the saved set-user-ID.

61030 **EXAMPLES**

61031        None.

61032 **APPLICATION USAGE**

61033        None.

61034 **RATIONALE**61035        Refer to the RATIONALE section in *setuid()*.61036 **FUTURE DIRECTIONS**

61037        None.

61038 **SEE ALSO**61039        *exec*, *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *setgid()*, *setregid()*, *setreuid()*, *setuid()*

61041 **CHANGE HISTORY**

61042        First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

61043        IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/123 is applied, making an editorial  
 61044        correction to the [EPERM] error in the ERRORS section.

61045 **NAME**

61046       setgid — set-group-ID

61047 **SYNOPSIS**

61048       #include &lt;unistd.h&gt;

61049       int setgid(gid\_t gid);

61050 **DESCRIPTION**61051       If the process has appropriate privileges, *setgid()* shall set the real group ID, effective group ID,  
61052       and the saved set-group-ID of the calling process to *gid*.61053       If the process does not have appropriate privileges, but *gid* is equal to the real group ID or the  
61054       saved set-group-ID, *setgid()* shall set the effective group ID to *gid*; the real group ID and saved  
61055       set-group-ID shall remain unchanged.61056       The *setgid()* function shall not affect the supplementary group list in any way.

61057       Any supplementary group IDs of the calling process shall remain unchanged.

61058 **RETURN VALUE**61059       Upon successful completion, 0 is returned. Otherwise, -1 shall be returned and *errno* set to  
61060       indicate the error.61061 **ERRORS**61062       The *setgid()* function shall fail if:61063       [EINVAL]       The value of the *gid* argument is invalid and is not supported by the  
61064       implementation.61065       [EPERM]       The process does not have appropriate privileges and *gid* does not match the  
61066       real group ID or the saved set-group-ID.61067 **EXAMPLES**

61068       None.

61069 **APPLICATION USAGE**

61070       None.

61071 **RATIONALE**61072       Refer to the RATIONALE section in *setuid()*.61073 **FUTURE DIRECTIONS**

61077       XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

61078 **CHANGE HISTORY**

61079       First released in Issue 1. Derived from Issue 1 of the SVID.

61080 **Issue 6**

61081       In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

61082       The following new requirements on POSIX implementations derive from alignment with the  
61083       Single UNIX Specification:

- 61084
- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
61085       required for conforming implementations of previous POSIX specifications, it was not  
61086       required for UNIX applications.

- 61087
- 61088
- Functionality associated with `_POSIX_SAVED_IDS` is now mandated. This is a FIPS requirement.
- 61089
- The following changes were made to align with the IEEE P1003.1a draft standard:
- 61090
- The effects of `setgid()` in processes without appropriate privileges are changed.
- 61091
- A requirement that the supplementary group list is not affected is added.

61092 **NAME**

61093       setgrent — reset the group database to the first entry

61094 **SYNOPSIS**

```
61095 XSI      #include <grp.h>  
61096          void setgrent(void);
```

61097 **DESCRIPTION**61098       Refer to *endgrent()*.

61099 **NAME**

61100 sethostent — network host database functions

61101 **SYNOPSIS**

61102 #include &lt;netdb.h&gt;

61103 void sethostent(int *stayopen*);61104 **DESCRIPTION**61105 Refer to *endhostent()*.

**61106 NAME**

61107       setitimer — set the value of an interval timer

**61108 SYNOPSIS**

61109 OB XSI   #include <sys/time.h>

```
61110       int setitimer(int which, const struct itimerval *restrict value,  
61111                    struct itimerval *restrict ovalue);
```

**61112 DESCRIPTION**

61113       Refer to *getitimer()*.

61114 **NAME**

61115       setjmp — set jump point for a non-local goto

61116 **SYNOPSIS**

61117       #include &lt;setjmp.h&gt;

61118       int setjmp(jmp\_buf env);

61119 **DESCRIPTION**

61120 CX     The functionality described on this reference page is aligned with the ISO C standard. Any  
 61121     conflict between the requirements described here and the ISO C standard is unintentional. This  
 61122     volume of POSIX.1-2008 defers to the ISO C standard.

61123     A call to *setjmp()* shall save the calling environment in its *env* argument for later use by  
 61124     *longjmp()*.

61125     It is unspecified whether *setjmp()* is a macro or a function. If a macro definition is suppressed in  
 61126     order to access an actual function, or a program defines an external identifier with the name  
 61127     *setjmp*, the behavior is undefined.

61128     An application shall ensure that an invocation of *setjmp()* appears in one of the following  
 61129     contexts only:

- 61130       • The entire controlling expression of a selection or iteration statement
- 61131       • One operand of a relational or equality operator with the other operand an integral  
 61132       constant expression, with the resulting expression being the entire controlling expression  
 61133       of a selection or iteration statement
- 61134       • The operand of a unary '!' operator with the resulting expression being the entire  
 61135       controlling expression of a selection or iteration
- 61136       • The entire expression of an expression statement (possibly cast to **void**)

61137     If the invocation appears in any other context, the behavior is undefined.

61138 **RETURN VALUE**

61139     If the return is from a direct invocation, *setjmp()* shall return 0. If the return is from a call to  
 61140     *longjmp()*, *setjmp()* shall return a non-zero value.

61141 **ERRORS**

61142     No errors are defined.

61143 **EXAMPLES**

61144     None.

61145 **APPLICATION USAGE**

61146     In general, *sigsetjmp()* is more useful in dealing with errors and interrupts encountered in a low-  
 61147     level subroutine of a program.

61148 **RATIONALE**

61149     None.

61150 **FUTURE DIRECTIONS**

61151     None.

61152 **SEE ALSO**

61153     *longjmp()*, *sigsetjmp()*

61154     XBD <setjmp.h>

**CHANGE HISTORY**

61155  
61156 First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

61157  
61158 The normative text is updated to avoid use of the term “must” for application requirements.

61159 **NAME**61160 setkey — set encoding key (**CRYPT**)61161 **SYNOPSIS**

```
61162 XSI      #include <stdlib.h>
61163         void setkey(const char *key);
```

61164 **DESCRIPTION**

61165 The *setkey()* function provides access to an implementation-defined encoding algorithm. The  
 61166 argument of *setkey()* is an array of length 64 bytes containing only the bytes with numerical  
 61167 value of 0 and 1. If this string is divided into groups of 8, the low-order bit in each group is  
 61168 ignored; this gives a 56-bit key which is used by the algorithm. This is the key that shall be used  
 61169 with the algorithm to encode a string *block* passed to *encrypt()*.

61170 The *setkey()* function shall not change the setting of *errno* if successful. An application wishing to  
 61171 check for error situations should set *errno* to 0 before calling *setkey()*. If *errno* is non-zero on  
 61172 return, an error has occurred.

61173 The *setkey()* function need not be thread-safe.

61174 **RETURN VALUE**

61175 No values are returned.

61176 **ERRORS**

61177 The *setkey()* function shall fail if:

61178 [ENOSYS] The functionality is not supported on this implementation.

61179 **EXAMPLES**

61180 None.

61181 **APPLICATION USAGE**

61182 Decoding need not be implemented in all environments. This is related to government  
 61183 restrictions in some countries on encryption and decryption routines. Historical practice has  
 61184 been to ship a different version of the encryption library without the decryption feature in the  
 61185 routines supplied. Thus the exported version of *encrypt()* does encoding but not decoding.

61186 **RATIONALE**

61187 None.

61188 **FUTURE DIRECTIONS**

61189 A future version of the standard may mark this interface as obsolete or remove it altogether.

61190 **SEE ALSO**

61191 *crypt()*, *encrypt()*

61192 XBD <stdlib.h>

61193 **CHANGE HISTORY**

61194 First released in Issue 1. Derived from Issue 1 of the SVID.

61195 **Issue 5**

61196 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

61197 **Issue 7**

61198 Austin Group Interpretation 1003.1-2001 #156 is applied.

61199 **NAME**

61200       setlocale — set program locale

61201 **SYNOPSIS**

61202       #include &lt;locale.h&gt;

61203       char \*setlocale(int category, const char \*locale);

61204 **DESCRIPTION**

61205 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 61206 conflict between the requirements described here and the ISO C standard is unintentional. This  
 61207 volume of POSIX.1-2008 defers to the ISO C standard.

61208       The *setlocale()* function selects the appropriate piece of the global locale, as specified by the  
 61209 *category* and *locale* arguments, and can be used to change or query the entire global locale or  
 61210 portions thereof. The value LC\_ALL for *category* names the entire global locale; other values for  
 61211 *category* name only a part of the global locale:

61212       LC\_COLLATE       Affects the behavior of regular expressions and the collation functions.

61213       LC\_CTYPE         Affects the behavior of regular expressions, character classification, character  
 61214 conversion functions, and wide-character functions.

61215 CX       LC\_MESSAGES   Affects the affirmative and negative response expressions returned by  
 61216 *nl\_langinfo()* and the way message catalogs are located. It may also affect the  
 61217 behavior of functions that return or write message strings.

61218       LC\_MONETARY   Affects the behavior of functions that handle monetary values.

61219       LC\_NUMERIC     Affects the behavior of functions that handle numeric values.

61220       LC\_TIME         Affects the behavior of the time conversion functions.

61221       The *locale* argument is a pointer to a character string containing the required setting of *category*.  
 61222 The contents of this string are implementation-defined. In addition, the following preset values  
 61223 of *locale* are defined for all settings of *category*:

61224 CX       "POSIX"       Specifies the minimal environment for C-language translation called the  
 61225 POSIX locale. The POSIX locale is the default global locale at entry to *main()*.

61226       "C"             Equivalent to "POSIX".

61227 CX       ""            Specifies an implementation-defined native environment. The determination  
 61228 of the name of the new locale for the specified category depends on the value  
 61229 of the associated environment variables, *LC\_\** and *LANG*; see XBD Chapter 7  
 61230 (on page 135) and Chapter 8 (on page 173).

61231       A null pointer   Directs *setlocale()* to query the current global locale setting and return the  
 61232 name of the locale if *category* is not LC\_ALL, or a string which encodes the  
 61233 locale name(s) for all of the individual categories if *category* is LC\_ALL.

61234 CX       Setting all of the categories of the global locale is similar to successively setting each individual  
 61235 category of the global locale, except that all error checking is done before any actions are  
 61236 performed. To set all the categories of the global locale, *setlocale()* can be invoked as:

61237       setlocale(LC\_ALL, "");

61238       In this case, *setlocale()* shall first verify that the values of all the environment variables it needs  
 61239 according to the precedence rules (described in XBD Chapter 8, on page 173) indicate supported  
 61240 locales. If the value of any of these environment variable searches yields a locale that is not  
 61241 supported (and non-null), *setlocale()* shall return a null pointer and the global locale shall not be

changed. If all environment variables name supported locales, *setlocale()* shall proceed as if it had been called for each category, using the appropriate value from the associated environment variable or from the implementation-defined default if there is no such value.

The global locale established using *setlocale()* shall only be used in threads for which no current locale has been set using *uselocale()* or whose current locale has been set to the global locale using *uselocale(LC\_GLOBAL\_LOCALE)*.

The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls *setlocale()*.

61250 CX The *setlocale()* function need not be thread-safe. +

## 61251 RETURN VALUE

Upon successful completion, *setlocale()* shall return the string associated with the specified category for the new locale. Otherwise, *setlocale()* shall return a null pointer and the global locale shall not be changed.

A null pointer for *locale* shall cause *setlocale()* to return a pointer to the string associated with the specified *category* for the current global locale. The global locale shall not be changed.

The string returned by *setlocale()* is such that a subsequent call with that string and its associated *category* shall restore that part of the global locale. The application shall not modify the string returned. The returned string pointer might be invalidated or the string content might be overwritten by a subsequent call to *setlocale()*. The returned pointer might also be invalidated if the calling thread is terminated. +

## 61262 ERRORS

61263 No errors are defined.

## 61264 EXAMPLES

61265 None.

## 61266 APPLICATION USAGE

The following code illustrates how a program can initialize the international environment for one language, while selectively modifying the global locale such that regular expressions and string operations can be applied to text recorded in a different language:

```
61270 setlocale(LC_ALL, "De");
61271 setlocale(LC_COLLATE, "Fr@dict");
```

Internationalized programs can initiate language operation according to environment variable settings (see XBD Section 8.2, on page 174) by calling *setlocale()* as follows:

```
61274 setlocale(LC_ALL, "");
```

Changing the setting of *LC\_MESSAGES* has no effect on catalogs that have already been opened by calls to *catopen()*.

In order to make use of different locale settings while multiple threads are running, applications should use *uselocale()* in preference to *setlocale()*.

## 61279 RATIONALE

References to the international environment or locale in the following text relate to the global locale for the process. This can be overridden for individual threads using *uselocale()*.

The ISO C standard defines a collection of functions to support internationalization. One of the most significant aspects of these functions is a facility to set and query the *international environment*. The international environment is a repository of information that affects the behavior of certain functionality, namely:

1. Character handling
2. Collating
3. Date/time formatting
4. Numeric editing
5. Monetary formatting
6. Messaging

The `setlocale()` function provides the application developer with the ability to set all or portions, called *categories*, of the international environment. These categories correspond to the areas of functionality mentioned above. The syntax for `setlocale()` is as follows:

```
char *setlocale(int category, const char *locale);
```

where *category* is the name of one of following categories, namely:

```
LC_COLLATE
LC_CTYPE
LC_MESSAGES
LC_MONETARY
LC_NUMERIC
LC_TIME
```

In addition, a special value called `LC_ALL` directs `setlocale()` to set all categories.

There are two primary uses of `setlocale()`:

1. Querying the international environment to find out what it is set to
2. Setting the international environment, or *locale*, to a specific value

The behavior of `setlocale()` in these two areas is described below. Since it is difficult to describe the behavior in words, examples are used to illustrate the behavior of specific uses.

To query the international environment, `setlocale()` is invoked with a specific category and the null pointer as the locale. The null pointer is a special directive to `setlocale()` that tells it to query rather than set the international environment. The following syntax is used to query the name of the international environment:

```
setlocale({LC_ALL, LC_COLLATE, LC_CTYPE, LC_MESSAGES, LC_MONETARY, \
          LC_NUMERIC, LC_TIME}, (char *) NULL);
```

The `setlocale()` function shall return the string corresponding to the current international environment. This value may be used by a subsequent call to `setlocale()` to reset the international environment to this value. However, it should be noted that the return value from `setlocale()` may be a pointer to a static area within the function and is not guaranteed to remain unchanged (that is, it may be modified by a subsequent call to `setlocale()`). Therefore, if the purpose of calling `setlocale()` is to save the value of the current international environment so it can be changed and reset later, the return value should be copied to an array of `char` in the calling program.

There are three ways to set the international environment with `setlocale()`:

`setlocale(category, string)`

This usage sets a specific *category* in the international environment to a specific value corresponding to the value of the *string*. A specific example is provided below:

61327            `setlocale(LC_ALL, "fr_FR.ISO-8859-1");`

61328            In this example, all categories of the international environment are set to the locale  
61329            corresponding to the string "fr\_FR.ISO-8859-1", or to the French language as spoken in  
61330            France using the ISO/IEC 8859-1:1998 standard codeset.

61331            If the string does not correspond to a valid locale, *setlocale()* shall return a null pointer and  
61332            the international environment is not changed. Otherwise, *setlocale()* shall return the name of  
61333            the locale just set.

61334            *setlocale(category, "C")*

61335            The ISO C standard states that one locale must exist on all conforming implementations.  
61336            The name of the locale is C and corresponds to a minimal international environment needed  
61337            to support the C programming language.

61338            *setlocale(category, "")*

61339            This sets a specific category to an implementation-defined default. This corresponds to the  
61340            value of the environment variables.

## 61341 FUTURE DIRECTIONS

61342            None.

## 61351 CHANGE HISTORY

61352            First released in Issue 3.

### 61353 Issue 5

61354            The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

### 61355 Issue 6

61356            Extensions beyond the ISO C standard are marked.

61357            The normative text is updated to avoid use of the term “must” for application requirements.

61358            IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/124 is applied, updating the  
61359            DESCRIPTION to clarify the behavior of:

61360            `setlocale(LC_ALL, "");`

### 61361 Issue 7

61362            Functionality relating to the Threads option is moved to the Base.

61363            POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0553 [302], XSH/TC1-2008/0554 [303],  
61364            XSH/TC1-2008/0555 [302], XSH/TC1-2008/0556 [302], XSH/TC1-2008/0557 [302],  
61365            XSH/TC1-2008/0558 [302], XSH/TC1-2008/0559 [302], XSH/TC1-2008/0560 [288],  
61366            XSH/TC1-2008/0561 [302], XSH/TC1-2008/0562 [302], XSH/TC1-2008/0563 [302],  
61367            XSH/TC1-2008/0564 [302], XSH/TC1-2008/0565 [302], XSH/TC1-2008/0566 [302],  
61368            XSH/TC1-2008/0567 [288], XSH/TC1-2008/0568 [288], and XSH/TC1-2008/0569 [303] are  
61369            applied.

61370 **NAME**

61371 setlogmask — set the log priority mask

61372 **SYNOPSIS**

```
61373 XSI    #include <syslog.h>
61374      int setlogmask(int maskpri);
```

61375 **DESCRIPTION**61376 Refer to *closelog()*.

61377 **NAME**

61378       setnetent — network database function

61379 **SYNOPSIS**

61380       #include &lt;netdb.h&gt;

61381       void setnetent(int *stayopen*);61382 **DESCRIPTION**61383       Refer to *endnetent()*.

61384 **NAME**

61385       setpgid — set process group ID for job control

61386 **SYNOPSIS**

61387       #include &lt;unistd.h&gt;

61388       int setpgid(pid\_t pid, pid\_t pgid);

61389 **DESCRIPTION**61390       The *setpgid()* function shall either join an existing process group or create a new process group within the session of the calling process.

61392       The process group ID of a session leader shall not change.

61393       Upon successful completion, the process group ID of the process with a process ID that matches *pid* shall be set to *pgid*.61395       As a special case, if *pid* is 0, the process ID of the calling process shall be used. Also, if *pgid* is 0, the process ID of the indicated process shall be used.61397 **RETURN VALUE**61398       Upon successful completion, *setpgid()* shall return 0; otherwise, -1 shall be returned and *errno* shall be set to indicate the error.61400 **ERRORS**61401       The *setpgid()* function shall fail if:61402       [EACCES]       The value of the *pid* argument matches the process ID of a child process of the calling process and the child process has successfully executed one of the *exec* functions.61405       [EINVAL]       The value of the *pgid* argument is less than 0, or is not a value supported by the implementation.61407       [EPERM]       The process indicated by the *pid* argument is a session leader.61408       [EPERM]       The value of the *pid* argument matches the process ID of a child process of the calling process and the child process is not in the same session as the calling process.61411       [EPERM]       The value of the *pgid* argument is valid but does not match the process ID of the process indicated by the *pid* argument and there is no process with a process group ID that matches the value of the *pgid* argument in the same session as the calling process.61415       [ESRCH]       The value of the *pid* argument does not match the process ID of the calling process or of a child process of the calling process.61417 **EXAMPLES**

61418       None.

61419 **APPLICATION USAGE**

61420       None.

61421 **RATIONALE**61422       The *setpgid()* function shall group processes together for the purpose of signaling, placement in foreground or background, and other job control actions.61424       The *setpgid()* function is similar to the *setpgrp()* function of 4.2 BSD, except that 4.2 BSD allowed the specified new process group to assume any value. This presents certain security problems and is more flexible than necessary to support job control.

To provide tighter security, *setpgid()* only allows the calling process to join a process group already in use inside its session or create a new process group whose process group ID was equal to its process ID.

When a job control shell spawns a new job, the processes in the job must be placed into a new process group via *setpgid()*. There are two timing constraints involved in this action:

1. The new process must be placed in the new process group before the appropriate program is launched via one of the *exec* functions.
2. The new process must be placed in the new process group before the shell can correctly send signals to the new process group.

To address these constraints, the following actions are performed. The new processes call *setpgid()* to alter their own process groups after *fork()* but before *exec*. This satisfies the first constraint. Under 4.3 BSD, the second constraint is satisfied by the synchronization property of *vfork()*; that is, the shell is suspended until the child has completed the *exec*, thus ensuring that the child has completed the *setpgid()*. A new version of *fork()* with this same synchronization property was considered, but it was decided instead to merely allow the parent shell process to adjust the process group of its child processes via *setpgid()*. Both timing constraints are now satisfied by having both the parent shell and the child attempt to adjust the process group of the child process; it does not matter which succeeds first.

Since it would be confusing to an application to have its process group change after it began executing (that is, after *exec*), and because the child process would already have adjusted its process group before this, the [EACCES] error was added to disallow this.

One non-obvious use of *setpgid()* is to allow a job control shell to return itself to its original process group (the one in effect when the job control shell was executed). A job control shell does this before returning control back to its parent when it is terminating or suspending itself as a way of restoring its job control “state” back to what its parent would expect. (Note that the original process group of the job control shell typically matches the process group of its parent, but this is not necessarily always the case.)

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

### Issue 6

In the SYNOPSIS, the optional include of the [`<sys/types.h>`](#) header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include [`<sys/types.h>`](#) has been removed. Although [`<sys/types.h>`](#) was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The *setpgid()* function is mandatory since `_POSIX_JOB_CONTROL` is required to be defined in this version. This is a FIPS requirement.

61470  
61471  
61472  
61473

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/56 is applied, changing the wording in the DESCRIPTION from “the process group ID of the indicated process shall be used” to “the process ID of the indicated process shall be used”. This change reverts the wording to as in the ISO POSIX-1: 1996 standard; it appeared to be an unintentional change.

61474 **NAME**

61475       setpgrp — set the process group ID

61476 **SYNOPSIS**

```
61477 OB XSI  #include <unistd.h>
61478         pid_t setpgrp(void);
```

61479 **DESCRIPTION**

61480       If the calling process is not already a session leader, *setpgrp()* sets the process group ID of the  
 61481       calling process to the process ID of the calling process. If *setpgrp()* creates a new session, then the  
 61482       new session has no controlling terminal.

61483       The *setpgrp()* function has no effect when the calling process is a session leader.

61484 **RETURN VALUE**

61485       Upon completion, *setpgrp()* shall return the process group ID.

61486 **ERRORS**

61487       No errors are defined.

61488 **EXAMPLES**

61489       None.

61490 **APPLICATION USAGE**

61491       It is unspecified whether this function behaves as *setpgid(0,0)* or *setsid()* unless the process is  
 61492       already a session leader. Therefore, applications are encouraged to use *setpgid()* or *setsid()* as  
 61493       appropriate.

61494 **RATIONALE**

61495       None.

61496 **FUTURE DIRECTIONS**

61497       The *setpgrp()* function may be removed in a future version.

61498 **SEE ALSO**

61499       *exec*, *fork()*, *getpid()*, *getsid()*, *kill()*, *setpgid()*, *setsid()*

61501 **CHANGE HISTORY**

61502       First released in Issue 4, Version 2.

61503 **Issue 5**

61504       Moved from X/OPEN UNIX extension to BASE.

61505 **Issue 7**

61506       The *setpgrp()* function is marked obsolescent.

61507 **NAME**

61508       setpriority — set the nice value

61509 **SYNOPSIS**

```
61510 XSI      #include <sys/resource.h>
61511          int setpriority(int which, id_t who, int nice);
```

61512 **DESCRIPTION**61513       Refer to *getpriority()*.

61514 **NAME**

61515       setprotoent — network protocol database functions

61516 **SYNOPSIS**

61517       #include &lt;netdb.h&gt;

61518       void setprotoent(int *stayopen*);61519 **DESCRIPTION**61520       Refer to *endprotoent()*.

61521 **NAME**

61522        setpwent — user database function

61523 **SYNOPSIS**61524 XSI        `#include <pwd.h>`61525        `void setpwent(void);`61526 **DESCRIPTION**61527        Refer to *endpwent()*.

**NAME**

setregid — set real and effective group IDs

**SYNOPSIS**

```
#include <unistd.h>

int setregid(gid_t rgid, gid_t egid);
```

**DESCRIPTION**

The *setregid()* function shall set the real and effective group IDs of the calling process.

If *rgid* is  $-1$ , the real group ID shall not be changed; if *egid* is  $-1$ , the effective group ID shall not be changed.

The real and effective group IDs may be set to different values in the same call.

Only a process with appropriate privileges can set the real group ID and the effective group ID to any valid value.

A non-privileged process can set either the real group ID to the saved set-group-ID from one of the *exec* family of functions, or the effective group ID to the saved set-group-ID or the real group ID.

If the real group ID is being set (*rgid* is not  $-1$ ), or the effective group ID is being set to a value not equal to the real group ID, then the saved set-group-ID of the current process shall be set equal to the new effective group ID.

Any supplementary group IDs of the calling process remain unchanged.

**RETURN VALUE**

Upon successful completion, 0 shall be returned. Otherwise,  $-1$  shall be returned and *errno* set to indicate the error, and neither of the group IDs are changed.

**ERRORS**

The *setregid()* function shall fail if:

- |          |                                                                                                                                                                                                                                  |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [EINVAL] | The value of the <i>rgid</i> or <i>egid</i> argument is invalid or out-of-range.                                                                                                                                                 |
| [EPERM]  | The process does not have appropriate privileges and a change other than changing the real group ID to the saved set-group-ID, or changing the effective group ID to the real group ID or the saved set-group-ID, was requested. |

**EXAMPLES**

None.

**APPLICATION USAGE**

If a non-privileged set-group-ID process sets its effective group ID to its real group ID, it can only set its effective group ID back to the previous value if *rgid* was  $-1$  in the *setregid()* call, since the saved-group-ID is not changed in that case. If *rgid* was equal to the real group ID in the *setregid()* call, then the saved set-group-ID will also have been changed to the real user ID.

**RATIONALE**

Earlier versions of this standard did not specify whether the saved set-group-ID was affected by *setregid()* calls. This version specifies common existing practice that constitutes an important security feature. The ability to set both the effective group ID and saved set-group-ID to be the same as the real group ID means that any security weakness in code that is executed after that point cannot result in malicious code being executed with the previous effective group ID. Privileged applications could already do this using just *setgid()*, but for non-privileged

61571 applications the only standard method available is to use this feature of *setregid()*.

61572 **FUTURE DIRECTIONS**

61573 None.

61574 **SEE ALSO**

61575 *exec*, *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setreuid()*, *setuid()*

61576 XBD <unistd.h>

61577 **CHANGE HISTORY**

61578 First released in Issue 4, Version 2.

61579 **Issue 5**

61580 Moved from X/OPEN UNIX extension to BASE.

61581 The DESCRIPTION is updated to indicate that the saved set-group-ID can be set by any of the  
61582 *exec* family of functions, not just *execve()*.

61583 **Issue 7**

61584 SD5-XSH-ERN-177 is applied, adding the ability to set both the effective group ID and saved set-  
61585 group-ID to be the same as the real group ID.

**NAME**

setreuid — set real and effective user IDs

**SYNOPSIS**

```
XSI    #include <unistd.h>
      int setreuid(uid_t ruid, uid_t euid);
```

**DESCRIPTION**

The *setreuid()* function shall set the real and effective user IDs of the current process to the values specified by the *ruid* and *euid* arguments. If *ruid* or *euid* is *-1*, the corresponding effective or real user ID of the current process shall be left unchanged.

A process with appropriate privileges can set either ID to any value. An unprivileged process can only set the effective user ID if the *euid* argument is equal to either the real, effective, or saved user ID of the process.

If the real user ID is being set (*ruid* is not *-1*), or the effective user ID is being set to a value not equal to the real user ID, then the saved set-user-ID of the current process shall be set equal to the new effective user ID.

It is unspecified whether a process without appropriate privileges is permitted to change the real user ID to match the current effective user ID or saved set-user-ID of the process.

**RETURN VALUE**

Upon successful completion, 0 shall be returned. Otherwise, *-1* shall be returned and *errno* set to indicate the error.

**ERRORS**

The *setreuid()* function shall fail if:

- |          |                                                                                                                                                                                                                                                                                            |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [EINVAL] | The value of the <i>ruid</i> or <i>euid</i> argument is invalid or out-of-range.                                                                                                                                                                                                           |
| [EPERM]  | The current process does not have appropriate privileges, and either an attempt was made to change the effective user ID to a value other than the real user ID or the saved set-user-ID or an attempt was made to change the real user ID to a value not permitted by the implementation. |

**EXAMPLES****Setting the Effective User ID to the Real User ID**

The following example sets the effective user ID of the calling process to the real user ID, so that files created later will be owned by the current user. It also sets the saved set-user-ID to the real user ID, so any future attempt to set the effective user ID back to its previous value will fail.

```
#include <unistd.h>
#include <sys/types.h>
...
setreuid(getuid(), getuid());
...
```

**APPLICATION USAGE**

None.

**RATIONALE**

Earlier versions of this standard did not specify whether the saved set-user-ID was affected by *setreuid()* calls. This version specifies common existing practice that constitutes an important security feature. The ability to set both the effective user ID and saved set-user-ID to be the same as the real user ID means that any security weakness in code that is executed after that point cannot result in malicious code being executed with the previous effective user ID. Privileged applications could already do this using just *setuid()*, but for non-privileged applications the only standard method available is to use this feature of *setreuid()*.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

**Issue 7**

SD5-XSH-ERN-177 is applied, adding the ability to set both the effective user ID and the saved set-user-ID to be the same as the real user ID.

61645 **NAME**

61646 setrlimit — control maximum resource consumption

61647 **SYNOPSIS**61648 XSI `#include <sys/resource.h>`61649 `int setrlimit(int resource, const struct rlimit *rlp);`61650 **DESCRIPTION**61651 Refer to *getrlimit()*.

61652 **NAME**

61653       setservent — network services database functions

61654 **SYNOPSIS**

61655       #include &lt;netdb.h&gt;

61656       void setservent(int *stayopen*);61657 **DESCRIPTION**61658       Refer to *endservent()*.

61659 **NAME**

61660 setsid — create session and set process group ID

61661 **SYNOPSIS**

61662 #include &lt;unistd.h&gt;

61663 pid\_t setsid(void);

61664 **DESCRIPTION**

61665 The *setsid()* function shall create a new session, if the calling process is not a process group  
 61666 leader. Upon return the calling process shall be the session leader of this new session, shall be  
 61667 the process group leader of a new process group, and shall have no controlling terminal. The  
 61668 process group ID of the calling process shall be set equal to the process ID of the calling process.  
 61669 The calling process shall be the only process in the new process group and the only process in  
 61670 the new session.

61671 **RETURN VALUE**

61672 Upon successful completion, *setsid()* shall return the value of the new process group ID of the  
 61673 calling process. Otherwise, it shall return -1 and set *errno* to indicate the error.

61674 **ERRORS**61675 The *setsid()* function shall fail if:

61676 [EPERM] The calling process is already a process group leader, or the process group ID  
 61677 of a process other than the calling process matches the process ID of the  
 61678 calling process.

61679 **EXAMPLES**

61680 None.

61681 **APPLICATION USAGE**

61682 None.

61683 **RATIONALE**

61684 The *setsid()* function is similar to the *setpgid()* function of System V. System V, without job  
 61685 control, groups processes into process groups and creates new process groups via *setpgid()*; only  
 61686 one process group may be part of a login session.

61687 Job control allows multiple process groups within a login session. In order to limit job control  
 61688 actions so that they can only affect processes in the same login session, this volume of  
 61689 POSIX.1-2008 adds the concept of a session that is created via *setsid()*. The *setsid()* function also  
 61690 creates the initial process group contained in the session. Additional process groups can be  
 61691 created via the *setpgid()* function. A System V process group would correspond to a POSIX  
 61692 System Interfaces session containing a single POSIX process group. Note that this function  
 61693 requires that the calling process not be a process group leader. The usual way to ensure this is  
 61694 true is to create a new process with *fork()* and have it call *setsid()*. The *fork()* function  
 61695 guarantees that the process ID of the new process does not match any existing process group ID.

61696 **FUTURE DIRECTIONS**

61697 None.

61698 **SEE ALSO**61699 *getsid()*, *setpgid()*, *setpgid()*

61700 XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

61701 **CHANGE HISTORY**

61702 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

61703 **Issue 6**

61704 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

61705 The following new requirements on POSIX implementations derive from alignment with the  
61706 Single UNIX Specification:

- 61707 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
61708 required for conforming implementations of previous POSIX specifications, it was not  
61709 required for UNIX applications.

61710 **Issue 7**

61711 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0570 [421] is applied.

61712 **NAME**

61713       setsockopt — set the socket options

61714 **SYNOPSIS**

```
61715       #include <sys/socket.h>
61716       int setsockopt(int socket, int level, int option_name,
61717                      const void *option_value, socklen_t option_len);
```

61718 **DESCRIPTION**

61719       The *setsockopt()* function shall set the option specified by the *option\_name* argument, at the  
 61720       protocol level specified by the *level* argument, to the value pointed to by the *option\_value*  
 61721       argument for the socket associated with the file descriptor specified by the *socket* argument.

61722       The *level* argument specifies the protocol level at which the option resides. To set options at the  
 61723       socket level, specify the *level* argument as SOL\_SOCKET. To set options at other levels, supply  
 61724       the appropriate *level* identifier for the protocol controlling the option. For example, to indicate  
 61725       that an option is interpreted by the TCP (Transport Control Protocol), set *level* to IPPROTO\_TCP  
 61726       as defined in the **<netinet/in.h>** header.

61727       The *option\_name* argument specifies a single option to set. It can be one of the socket-level  
 61728       options defined in **<sys/socket.h>** and described in [Section 2.10.16](#) (on page 528). If *option\_name*  
 61729       is equal to SO\_RCVTIMEO or SO\_SNDTIMEO and the implementation supports setting the  
 61730       option, it is unspecified whether the **struct timeval** pointed to by *option\_value* is stored as  
 61731       provided by this function or is rounded up to align with the resolution of the clock being used. If  
 61732       *setsockopt()* is called with *option\_name* equal to SO\_ACCEPTCONN, SO\_ERROR, or SO\_TYPE,  
 61733       the behavior is unspecified.

61734 **RETURN VALUE**

61735       Upon successful completion, *setsockopt()* shall return 0. Otherwise, -1 shall be returned and  
 61736       *errno* set to indicate the error.

61737 **ERRORS**

61738       The *setsockopt()* function shall fail if:

- |       |               |                                                                                                         |
|-------|---------------|---------------------------------------------------------------------------------------------------------|
| 61739 | [EBADF]       | The <i>socket</i> argument is not a valid file descriptor.                                              |
| 61740 | [EDOM]        | The send and receive timeout values are too big to fit into the timeout fields in the socket structure. |
| 61742 | [EINVAL]      | The specified option is invalid at the specified socket level or the socket has been shut down.         |
| 61744 | [EISCONN]     | The socket is already connected, and a specified option cannot be set while the socket is connected.    |
| 61746 | [ENOPROTOOPT] | The option is not supported by the protocol.                                                            |
| 61748 | [ENOTSOCK]    | The <i>socket</i> argument does not refer to a socket.                                                  |

61749       The *setsockopt()* function may fail if:

- |       |           |                                                                          |
|-------|-----------|--------------------------------------------------------------------------|
| 61750 | [ENOMEM]  | There was insufficient memory available for the operation to complete.   |
| 61751 | [ENOBUFS] | Insufficient resources are available in the system to complete the call. |

**EXAMPLES**

None.

**APPLICATION USAGE**

The *setsockopt()* function provides an application program with the means to control socket behavior. An application program can use *setsockopt()* to allocate buffer space, control timeouts, or permit socket data broadcasts. The `<sys/socket.h>` header defines the socket-level options available to *setsockopt()*.

Options may exist at multiple protocol levels. The `SO_` options are always present at the uppermost socket level.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/125 is applied, updating the `SO_LINGER` option in the DESCRIPTION to refer to the calling thread rather than the process.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #158 is applied, removing text relating to socket options that is now in Section 2.10.16 (on page 528).

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0571 [369] is applied.

61776 **NAME**

61777        setstate — switch pseudo-random number generator state arrays

61778 **SYNOPSIS**

```
61779 XSI      #include <stdlib.h>
61780          char *setstate(char *state);
```

61781 **DESCRIPTION**61782        Refer to *initstate()*.

61783 **NAME**

61784       setuid — set user ID

61785 **SYNOPSIS**

```
61786       #include <unistd.h>
61787       int setuid(uid_t uid);
```

61788 **DESCRIPTION**

61789       If the process has appropriate privileges, *setuid()* shall set the real user ID, effective user ID, and  
61790       the saved set-user-ID of the calling process to *uid*.

61791       If the process does not have appropriate privileges, but *uid* is equal to the real user ID or the  
61792       saved set-user-ID, *setuid()* shall set the effective user ID to *uid*; the real user ID and saved set-  
61793       user-ID shall remain unchanged.

61794       The *setuid()* function shall not affect the supplementary group list in any way.

61795 **RETURN VALUE**

61796       Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
61797       indicate the error.

61798 **ERRORS**

61799       The *setuid()* function shall fail, return -1, and set *errno* to the corresponding value if one or more  
61800       of the following are true:

61801       [EINVAL]       The value of the *uid* argument is invalid and not supported by the  
61802       implementation.

61803       [EPERM]        The process does not have appropriate privileges and *uid* does not match the  
61804       real user ID or the saved set-user-ID.

61805 **EXAMPLES**

61806       None.

61807 **APPLICATION USAGE**

61808       None.

61809 **RATIONALE**

61810       The various behaviors of the *setuid()* and *setgid()* functions when called by non-privileged  
61811       processes reflect the behavior of different historical implementations. For portability, it is  
61812       recommended that new non-privileged applications use the *seteuid()* and *setegid()* functions  
61813       instead.

61814       The saved set-user-ID capability allows a program to regain the effective user ID established at  
61815       the last *exec* call. Similarly, the saved set-group-ID capability allows a program to regain the  
61816       effective group ID established at the last *exec* call. These capabilities are derived from System V.  
61817       Without them, a program might have to run as superuser in order to perform the same  
61818       functions, because superuser can write on the user's files. This is a problem because such a  
61819       program can write on any user's files, and so must be carefully written to emulate the  
61820       permissions of the calling process properly. In System V, these capabilities have traditionally  
61821       been implemented only via the *setuid()* and *setgid()* functions for non-privileged processes. The  
61822       fact that the behavior of those functions was different for privileged processes made them  
61823       difficult to use. The POSIX.1-1990 standard defined the *setuid()* function to behave differently  
61824       for privileged and unprivileged users. When the caller had appropriate privileges, the function  
61825       set the real user ID, effective user ID, and saved set-user ID of the calling process on  
61826       implementations that supported it. When the caller did not have appropriate privileges, the  
61827       function set only the effective user ID, subject to permission checks. The former use is generally  
61828       needed for utilities like *login* and *su*, which are not conforming applications and thus outside the

scope of POSIX.1-2008. These utilities wish to change the user ID irrevocably to a new value, generally that of an unprivileged user. The latter use is needed for conforming applications that are installed with the set-user-ID bit and need to perform operations using the real user ID.

POSIX.1-2008 augments the latter functionality with a mandatory feature named `_POSIX_SAVED_IDS`. This feature permits a set-user-ID application to switch its effective user ID back and forth between the values of its *exec*-time real user ID and effective user ID. Unfortunately, the POSIX.1-1990 standard did not permit a conforming application using this feature to work properly when it happened to be executed with (implementation-defined) appropriate privileges. Furthermore, the application did not even have a means to tell whether it had this privilege. Since the saved set-user-ID feature is quite desirable for applications, as evidenced by the fact that NIST required it in FIPS 151-2, it has been mandated by POSIX.1-2008. However, there are implementors who have been reluctant to support it given the limitation described above.

The 4.3BSD system handles the problem by supporting separate functions: *setuid()* (which always sets both the real and effective user IDs, like *setuid()* in POSIX.1-2008 for privileged users), and *seteuid()* (which always sets just the effective user ID, like *setuid()* in POSIX.1-2008 for non-privileged users). This separation of functionality into distinct functions seems desirable. 4.3BSD does not support the saved set-user-ID feature. It supports similar functionality of switching the effective user ID back and forth via *setreuid()*, which permits reversing the real and effective user IDs. This model seems less desirable than the saved set-user-ID because the real user ID changes as a side-effect. The current 4.4BSD includes saved effective IDs and uses them for *seteuid()* and *setegid()* as described above. The *setreuid()* and *setregid()* functions will be deprecated or removed.

The solution here is:

- Require that all implementations support the functionality of the saved set-user-ID, which is set by the *exec* functions and by privileged calls to *setuid()*.
- Add the *seteuid()* and *setegid()* functions as portable alternatives to *setuid()* and *setgid()* for non-privileged and privileged processes.

Historical systems have provided two mechanisms for a set-user-ID process to change its effective user ID to be the same as its real user ID in such a way that it could return to the original effective user ID: the use of the *setuid()* function in the presence of a saved set-user-ID, or the use of the BSD *setreuid()* function, which was able to swap the real and effective user IDs. The changes included in POSIX.1-2008 provide a new mechanism using *seteuid()* in conjunction with a saved set-user-ID. Thus, all implementations with the new *seteuid()* mechanism will have a saved set-user-ID for each process, and most of the behavior controlled by `_POSIX_SAVED_IDS` has been changed to agree with the case where the option was defined. The *kill()* function is an exception. Implementors of the new *seteuid()* mechanism will generally be required to maintain compatibility with the older mechanisms previously supported by their systems. However, compatibility with this use of *setreuid()* and with the `_POSIX_SAVED_IDS` behavior of *kill()* is unfortunately complicated. If an implementation with a saved set-user-ID allows a process to use *setreuid()* to swap its real and effective user IDs, but were to leave the saved set-user-ID unmodified, the process would then have an effective user ID equal to the original real user ID, and both real and saved set-user-ID would be equal to the original effective user ID. In that state, the real user would be unable to kill the process, even though the effective user ID of the process matches that of the real user, if the *kill()* behavior of `_POSIX_SAVED_IDS` was used. This is obviously not acceptable. The alternative choice, which is used in at least one implementation, is to change the saved set-user-ID to the effective user ID during most calls to *setreuid()*. The standard developers considered that alternative to be less correct than the retention of the old behavior of *kill()* in such systems. Current conforming applications shall

61878 accommodate either behavior from *kill()*, and there appears to be no strong reason for *kill()* to  
61879 check the saved set-user-ID rather than the effective user ID.

#### 61880 FUTURE DIRECTIONS

#### 61885 CHANGE HISTORY

61886 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 61887 Issue 6

61888 In the SYNOPSIS, the optional include of the *<sys/types.h>* header is removed.

61889 The following new requirements on POSIX implementations derive from alignment with the  
61890 Single UNIX Specification:

- 61891 • The requirement to include *<sys/types.h>* has been removed. Although *<sys/types.h>* was  
61892 required for conforming implementations of previous POSIX specifications, it was not  
61893 required for UNIX applications.
- 61894 • The functionality associated with *\_POSIX\_SAVED\_IDS* is now mandatory. This is a FIPS  
61895 requirement.

61896 The following changes were made to align with the IEEE P1003.1a draft standard:

- 61897 • The effects of *setuid()* in processes without appropriate privileges are changed.
- 61898 • A requirement that the supplementary group list is not affected is added.

61899 **NAME**

61900       setutxent — reset the user accounting database to the first entry

61901 **SYNOPSIS**

```
61902 XSI      #include <utmpx.h>  
61903          void setutxent(void);
```

61904 **DESCRIPTION**61905       Refer to *endutxent()*.

**NAME**

setvbuf — assign buffering to a stream

**SYNOPSIS**

```
#include <stdio.h>
```

```
int setvbuf(FILE *restrict stream, char *restrict buf, int type,  
            size_t size);
```

**DESCRIPTION**

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *setvbuf()* function may be used after the stream pointed to by *stream* is associated with an open file but before any other operation (other than an unsuccessful call to *setvbuf()*) is performed on the stream. The argument *type* determines how *stream* shall be buffered, as follows:

- {\_IOFBF} shall cause input/output to be fully buffered.
- {\_IOLBF} shall cause input/output to be line buffered.
- {\_IONBF} shall cause input/output to be unbuffered.

If *buf* is not a null pointer, the array it points to may be used instead of a buffer allocated by *setvbuf()* and the argument *size* specifies the size of the array; otherwise, *size* may determine the size of a buffer allocated by the *setvbuf()* function. The contents of the array at any time are unspecified.

For information about streams, see [Section 2.5](#) (on page 495).

**RETURN VALUE**

CX Upon successful completion, *setvbuf()* shall return 0. Otherwise, it shall return a non-zero value if an invalid value is given for *type* or if the request cannot be honored, and may set *errno* to indicate the error.

**ERRORS**

The *setvbuf()* function may fail if:

CX [EBADF] The file descriptor underlying *stream* is not valid.

**EXAMPLES**

None.

**APPLICATION USAGE**

A common source of error is allocating buffer space as an “automatic” variable in a code block, and then failing to close the stream in the same block.

With *setvbuf()*, allocating a buffer of *size* bytes does not necessarily imply that all of *size* bytes are used for the buffer area.

Applications should note that many implementations only provide line buffering on input from terminal devices.

**RATIONALE**

None.

61946 **FUTURE DIRECTIONS**

61947 None.

61948 **SEE ALSO**61949 [Section 2.5](#) (on page 495), [fopen\(\)](#), [setbuf\(\)](#)61950 XBD [<stdio.h>](#)61951 **CHANGE HISTORY**

61952 First released in Issue 1. Derived from Issue 1 of the SVID.

61953 **Issue 6**

61954 Extensions beyond the ISO C standard are marked.

61955 The *setvbuf()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

**NAME**shm\_open — open a shared memory object (**REALTIME**)**SYNOPSIS**

```
SHM    #include <sys/mman.h>
int shm_open(const char *name, int oflag, mode_t mode);
```

**DESCRIPTION**

The *shm\_open()* function shall establish a connection between a shared memory object and a file descriptor. It shall create an open file description that refers to the shared memory object and a file descriptor that refers to that open file description. The file descriptor shall be allocated as described in [Section 2.14](#) (on page 549), and can be used by other functions to refer to that shared memory object. The *name* argument points to a string naming a shared memory object. It is unspecified whether the name appears in the file system and is visible to other functions that take pathnames as arguments. The *name* argument conforms to the construction rules for a pathname, except that the interpretation of <slash> characters other than the leading <slash> character in *name* is implementation-defined, and that the length limits for the *name* argument are implementation-defined and need not be the same as the pathname limits {PATH\_MAX} and {NAME\_MAX}. If *name* begins with the <slash> character, then processes calling *shm\_open()* with the same value of *name* refer to the same shared memory object, as long as that name has not been removed. If *name* does not begin with the <slash> character, the effect is implementation-defined.

If successful, *shm\_open()* shall return a file descriptor for the shared memory object. The open file description is new, and therefore the file descriptor does not share it with any other processes. It is unspecified whether the file offset is set. The FD\_CLOEXEC file descriptor flag associated with the new file descriptor is set.

The file status flags and file access modes of the open file description are according to the value of *oflag*. The *oflag* argument is the bitwise-inclusive OR of the following flags defined in the <fcntl.h> header. Applications specify exactly one of the first two values (access modes) below in the value of *oflag*:

O\_RDONLY      Open for read access only.

O\_RDWR        Open for read or write access.

Any combination of the remaining flags may be specified in the value of *oflag*:

O\_CREAT        If the shared memory object exists, this flag has no effect, except as noted under O\_EXCL below. Otherwise, the shared memory object is created. The user ID of the shared memory object shall be set to the effective user ID of the process. The group ID of the shared memory object shall be set to the effective group ID of the process; however, if the *name* argument is visible in the file system, the group ID may be set to the group ID of the containing directory. The permission bits of the shared memory object shall be set to the value of the *mode* argument except those set in the file mode creation mask of the process. When bits in *mode* other than the file permission bits are set, the effect is unspecified. The *mode* argument does not affect whether the shared memory object is opened for reading, for writing, or for both. The shared memory object has a size of zero.

O\_EXCL        If O\_EXCL and O\_CREAT are set, *shm\_open()* fails if the shared memory object exists. The check for the existence of the shared memory object and the creation of the object if it does not exist is atomic with respect to other

processes executing *shm\_open()* naming the same shared memory object with *O\_EXCL* and *O\_CREAT* set. If *O\_EXCL* is set and *O\_CREAT* is not set, the result is undefined.

*O\_TRUNC* If the shared memory object exists, and it is successfully opened *O\_RDWR*, the object shall be truncated to zero length and the mode and owner shall be unchanged by this function call. The result of using *O\_TRUNC* with *O\_RDONLY* is undefined.

When a shared memory object is created, the state of the shared memory object, including all data associated with the shared memory object, persists until the shared memory object is unlinked and all other references are gone. It is unspecified whether the name and shared memory object state remain valid after a system reboot.

#### 62013 RETURN VALUE

Upon successful completion, the *shm\_open()* function shall return a non-negative integer representing the file descriptor. Otherwise, it shall return *-1* and set *errno* to indicate the error.

#### 62016 ERRORS

The *shm\_open()* function shall fail if:

[EACCES] The shared memory object exists and the permissions specified by *oflag* are denied, or the shared memory object does not exist and permission to create the shared memory object is denied, or *O\_TRUNC* is specified and write permission is denied.

[EEXIST] *O\_CREAT* and *O\_EXCL* are set and the named shared memory object already exists.

[EINTR] The *shm\_open()* operation was interrupted by a signal.

[EINVAL] The *shm\_open()* operation is not supported for the given name.

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] Too many shared memory objects are currently open in the system.

[ENOENT] *O\_CREAT* is not set and the named shared memory object does not exist.

[ENOSPC] There is insufficient space for the creation of the new shared memory object.

The *shm\_open()* function may fail if:

[ENAMETOOLONG]

The length of the *name* argument exceeds *{\_POSIX\_PATH\_MAX}* on systems that do not support the XSI option or exceeds *{\_XOPEN\_PATH\_MAX}* on XSI systems, or has a pathname component that is longer than *{\_POSIX\_NAME\_MAX}* on systems that do not support the XSI option or longer than *{\_XOPEN\_NAME\_MAX}* on XSI systems.

62037 **EXAMPLES**62038 **Creating and Mapping a Shared Memory Object**

62039 The following code segment demonstrates the use of *shm\_open()* to create a shared memory  
 62040 object which is then sized using *ftruncate()* before being mapped into the process address space  
 62041 using *mmap()*:

```
62042 #include <unistd.h>
62043 #include <sys/mman.h>
62044 ...
62045 #define MAX_LEN 10000
62046 struct region {          /* Defines "structure" of shared memory */
62047     int len;
62048     char buf[MAX_LEN];
62049 };
62050 struct region *rptr;
62051 int fd;
62052
62053 /* Create shared memory object and set its size */
62054 fd = shm_open("/myregion", O_CREAT | O_RDWR, S_IRUSR | S_IWUSR);
62055 if (fd == -1)
62056     /* Handle error */;
62057
62058 if (ftruncate(fd, sizeof(struct region)) == -1)
62059     /* Handle error */;
62060
62061 /* Map shared memory object */
62062 rptr = mmap(NULL, sizeof(struct region),
62063             PROT_READ | PROT_WRITE, MAP_SHARED, fd, 0);
62064 if (rptr == MAP_FAILED)
62065     /* Handle error */;
62066
62067 /* Now we can refer to mapped region using fields of rptr;
62068    for example, rptr->len */
62069 ...
```

62066 **APPLICATION USAGE**

62067 None.

62068 **RATIONALE**

62069 When the Memory Mapped Files option is supported, the normal *open()* call is used to obtain a  
 62070 descriptor to a file to be mapped according to existing practice with *mmap()*. When the Shared  
 62071 Memory Objects option is supported, the *shm\_open()* function shall obtain a descriptor to the  
 62072 shared memory object to be mapped.

62073 There is ample precedent for having a file descriptor represent several types of objects. In the  
 62074 POSIX.1-1990 standard, a file descriptor can represent a file, a pipe, a FIFO, a tty, or a directory.  
 62075 Many implementations simply have an operations vector, which is indexed by the file descriptor  
 62076 type and does very different operations. Note that in some cases the file descriptor passed to  
 62077 generic operations on file descriptors is returned by *open()* or *creat()* and in some cases returned  
 62078 by alternate functions, such as *pipe()*. The latter technique is used by *shm\_open()*.

62079 Note that such shared memory objects can actually be implemented as mapped files. In both  
 62080 cases, the size can be set after the open using *ftruncate()*. The *shm\_open()* function itself does not

create a shared object of a specified size because this would duplicate an extant function that set the size of an object referenced by a file descriptor.

On implementations where memory objects are implemented using the existing file system, the *shm\_open()* function may be implemented using a macro that invokes *open()*, and the *shm\_unlink()* function may be implemented using a macro that invokes *unlink()*.

For implementations without a permanent file system, the definition of the name of the memory objects is allowed not to survive a system reboot. Note that this allows systems with a permanent file system to implement memory objects as data structures internal to the implementation as well.

On implementations that choose to implement memory objects using memory directly, a *shm\_open()* followed by an *ftruncate()* and *close()* can be used to preallocate a shared memory area and to set the size of that preallocation. This may be necessary for systems without virtual memory hardware support in order to ensure that the memory is contiguous.

The set of valid open flags to *shm\_open()* was restricted to *O\_RDONLY*, *O\_RDWR*, *O\_CREAT*, and *O\_TRUNC* because these could be easily implemented on most memory mapping systems. This volume of POSIX.1-2008 is silent on the results if the implementation cannot supply the requested file access because of implementation-defined reasons, including hardware ones.

The error conditions [EACCES] and [ENOTSUP] are provided to inform the application that the implementation cannot complete a request.

[EACCES] indicates for implementation-defined reasons, probably hardware-related, that the implementation cannot comply with a requested mode because it conflicts with another requested mode. An example might be that an application desires to open a memory object two times, mapping different areas with different access modes. If the implementation cannot map a single area into a process space in two places, which would be required if different access modes were required for the two areas, then the implementation may inform the application at the time of the second open.

[ENOTSUP] indicates for implementation-defined reasons, probably hardware-related, that the implementation cannot comply with a requested mode at all. An example would be that the hardware of the implementation cannot support write-only shared memory areas.

On all implementations, it may be desirable to restrict the location of the memory objects to specific file systems for performance (such as a RAM disk) or implementation-defined reasons (shared memory supported directly only on certain file systems). The *shm\_open()* function may be used to enforce these restrictions. There are a number of methods available to the application to determine an appropriate name of the file or the location of an appropriate directory. One way is from the environment via *getenv()*. Another would be from a configuration file.

This volume of POSIX.1-2008 specifies that memory objects have initial contents of zero when created. This is consistent with current behavior for both files and newly allocated memory. For those implementations that use physical memory, it would be possible that such implementations could simply use available memory and give it to the process uninitialized. This, however, is not consistent with standard behavior for the uninitialized data area, the stack, and of course, files. Finally, it is highly desirable to set the allocated memory to zero for security reasons. Thus, initializing memory objects to zero is required.

## FUTURE DIRECTIONS

A future version might require the *shm\_open()* and *shm\_unlink()* functions to have semantics similar to normal file system operations.

62130 **CHANGE HISTORY**

62131       First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

62132 **Issue 6**

62133       The *shm\_open()* function is marked as part of the Shared Memory Objects option.

62134       The [ENOSYS] error condition has been removed as stubs need not be provided if an  
62135       implementation does not support the Shared Memory Objects option.

62136       IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/126 is applied, adding the example to the  
62137       EXAMPLES section.

62138 **Issue 7**

62139       Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and  
62140       changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error.

62141       Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

62142       SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the  
62143       user ID and group ID of the shared memory object.

**NAME**

shm\_unlink — remove a shared memory object (**REALTIME**)

**SYNOPSIS**

```
#include <sys/mman.h>

int shm_unlink(const char *name);
```

**DESCRIPTION**

The *shm\_unlink()* function shall remove the name of the shared memory object named by the string pointed to by *name*.

If one or more references to the shared memory object exist when the object is unlinked, the name shall be removed before *shm\_unlink()* returns, but the removal of the memory object contents shall be postponed until all open and map references to the shared memory object have been removed.

Even if the object continues to exist after the last *shm\_unlink()*, reuse of the name shall subsequently cause *shm\_open()* to behave as if no shared memory object of this name exists (that is, *shm\_open()* will fail if **O\_CREAT** is not set, or will create a new shared memory object if **O\_CREAT** is set).

**RETURN VALUE**

Upon successful completion, a value of zero shall be returned. Otherwise, a value of **-1** shall be returned and *errno* set to indicate the error. If **-1** is returned, the named shared memory object shall not be changed by this function call.

**ERRORS**

The *shm\_unlink()* function shall fail if:

[**EACCES**] Permission is denied to unlink the named shared memory object.

[**ENOENT**] The named shared memory object does not exist.

The *shm\_unlink()* function may fail if:

[**ENAMETOOLONG**]

The length of the *name* argument exceeds **{\_POSIX\_PATH\_MAX}** on systems that do not support the XSI option or exceeds **{\_XOPEN\_PATH\_MAX}** on XSI systems, or has a pathname component that is longer than **{\_POSIX\_NAME\_MAX}** on systems that do not support the XSI option or longer than **{\_XOPEN\_NAME\_MAX}** on XSI systems. A call to *shm\_unlink()* with a *name* argument that contains the same shared memory object name as was previously used in a successful *shm\_open()* call shall not give an [**ENAMETOOLONG**] error.

**EXAMPLES**

None.

**APPLICATION USAGE**

Names of memory objects that were allocated with *open()* are deleted with *unlink()* in the usual fashion. Names of memory objects that were allocated with *shm\_open()* are deleted with *shm\_unlink()*. Note that the actual memory object is not destroyed until the last close and unmap on it have occurred if it was already in use.

62185 **RATIONALE**

62186 None.

62187 **FUTURE DIRECTIONS**

62188 A future version might require the *shm\_open()* and *shm\_unlink()* functions to have semantics  
62189 similar to normal file system operations.

62190 **SEE ALSO**

62191 *close(), mmap(), munmap(), shmat(), shmctl(), shmdt(), shm\_open()*

62192 XBD <sys/mman.h>

62193 **CHANGE HISTORY**

62194 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

62195 **Issue 6**

62196 The *shm\_unlink()* function is marked as part of the Shared Memory Objects option.

62197 In the DESCRIPTION, text is added to clarify that reusing the same name after a *shm\_unlink()*  
62198 will not attach to the old shared memory object.

62199 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
62200 implementation does not support the Shared Memory Objects option.

62201 **Issue 7**

62202 Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a  
62203 “shall fail” to a “may fail” error.

62204 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

62205 **NAME**

62206 shmat — XSI shared memory attach operation

62207 **SYNOPSIS**

```
62208 XSI      #include <sys/shm.h>
62209      void *shmat(int shmid, const void *shmaddr, int shmflg);
```

62210 **DESCRIPTION**

62211 The *shmat()* function operates on XSI shared memory (see XBD [Section 3.346](#), on page 89). It is  
 62212 unspecified whether this function interoperates with the realtime interprocess communication  
 62213 facilities defined in [Section 2.8](#) (on page 503).

62214 The *shmat()* function attaches the shared memory segment associated with the shared memory  
 62215 identifier specified by *shmid* to the address space of the calling process. The segment is attached  
 62216 at the address specified by one of the following criteria:

- 62217 • If *shmaddr* is a null pointer, the segment is attached at the first available address as selected  
 62218 by the system.
- 62219 • If *shmaddr* is not a null pointer and (*shmflg* &SHM\_RND) is non-zero, the segment is  
 62220 attached at the address given by (*shmaddr* - ((uintptr\_t)*shmaddr* %SHMLBA)). The character  
 62221 ' % ' is the C-language remainder operator.
- 62222 • If *shmaddr* is not a null pointer and (*shmflg* &SHM\_RND) is 0, the segment is attached at  
 62223 the address given by *shmaddr*.
- 62224 • The segment is attached for reading if (*shmflg* &SHM\_RDONLY) is non-zero and the  
 62225 calling process has read permission; otherwise, if it is 0 and the calling process has read  
 62226 and write permission, the segment is attached for reading and writing.

62227 **RETURN VALUE**

62228 Upon successful completion, *shmat()* shall increment the value of *shm\_nattch* in the data  
 62229 structure associated with the shared memory ID of the attached shared memory segment and  
 62230 return the segment's start address. Also, the *shm\_atime* timestamp shall be set to the current  
 62231 time, as described in [Section 2.7.1](#) (on page 502).

62232 Otherwise, the shared memory segment shall not be attached, *shmat()* shall return (**void \***)−1, |  
 62233 and *errno* shall be set to indicate the error.

62234 **ERRORS**

62235 The *shmat()* function shall fail if:

- |                                           |          |                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 62236<br>62237                            | [EACCES] | Operation permission is denied to the calling process; see <a href="#">Section 2.7</a> (on page 501).                                                                                                                                                                                                                                                                                                     |
| 62238<br>62239<br>62240<br>62241<br>62242 | [EINVAL] | The value of <i>shmid</i> is not a valid shared memory identifier, the <i>shmaddr</i> is not a null pointer, and the value of ( <i>shmaddr</i> - ((uintptr_t) <i>shmaddr</i> %SHMLBA)) is an illegal address for attaching shared memory; or the <i>shmaddr</i> is not a null pointer, ( <i>shmflg</i> &SHM_RND) is 0, and the value of <i>shmaddr</i> is an illegal address for attaching shared memory. |
| 62243<br>62244                            | [EMFILE] | The number of shared memory segments attached to the calling process would exceed the system-imposed limit.                                                                                                                                                                                                                                                                                               |
| 62245<br>62246                            | [ENOMEM] | The available data space is not large enough to accommodate the shared memory segment.                                                                                                                                                                                                                                                                                                                    |

**62247 EXAMPLES**

62248 None.

**62249 APPLICATION USAGE**

62250 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
62251 Application developers who need to use IPC should design their applications so that modules  
62252 using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the  
62253 alternative interfaces.

**62254 RATIONALE**

62255 None.

**62262 CHANGE HISTORY**

62263 First released in Issue 2. Derived from Issue 2 of the SVID.

**62264 Issue 5**

62265 Moved from SHARED MEMORY to BASE.

62266 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
62267 DIRECTIONS to a new APPLICATION USAGE section.

**62268 Issue 6**

62269 The Open Group Corrigendum U021/13 is applied.

**62270 Issue 7**

62271 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0572 [345] is applied.

62272 **NAME**

62273 shmctl — XSI shared memory control operations

62274 **SYNOPSIS**

```
62275 XSI      #include <sys/shm.h>
62276      int shmctl(int shmid, int cmd, struct shmids *buf);
```

62277 **DESCRIPTION**

62278 The *shmctl()* function operates on XSI shared memory (see XBD [Section 3.346](#), on page 89). It is  
 62279 unspecified whether this function interoperates with the realtime interprocess communication  
 62280 facilities defined in [Section 2.8](#) (on page 503).

62281 The *shmctl()* function provides a variety of shared memory control operations as specified by  
 62282 *cmd*. The following values for *cmd* are available:

62283 **IPC\_STAT** Place the current value of each member of the **shmids** data structure  
 62284 associated with *shmid* into the structure pointed to by *buf*. The contents of the  
 62285 structure are defined in **<sys/shm.h>**.

62286 **IPC\_SET** Set the value of the following members of the **shmids** data structure  
 62287 associated with *shmid* to the corresponding value found in the structure  
 62288 pointed to by *buf*:

```
62289     shm_perm.uid
62290     shm_perm.gid
62291     shm_perm.mode    Low-order nine bits.
```

62292 Also, the *shm\_ctime* timestamp shall be set to the current time, as described in  
 62293 [Section 2.7.1](#) (on page 502).

62294 **IPC\_SET** can only be executed by a process that has an effective user ID equal  
 62295 to either that of a process with appropriate privileges or to the value of  
 62296 *shm\_perm.cuid* or *shm\_perm.uid* in the **shmids** data structure associated with  
 62297 *shmid*.

62298 **IPC\_RMID** Remove the shared memory identifier specified by *shmid* from the system and  
 62299 destroy the shared memory segment and **shmids** data structure associated  
 62300 with it. **IPC\_RMID** can only be executed by a process that has an effective user  
 62301 ID equal to either that of a process with appropriate privileges or to the value  
 62302 of *shm\_perm.cuid* or *shm\_perm.uid* in the **shmids** data structure associated  
 62303 with *shmid*.

62304 **RETURN VALUE**

62305 Upon successful completion, *shmctl()* shall return 0; otherwise, it shall return -1 and set *errno* to  
 62306 indicate the error.

62307 **ERRORS**

62308 The *shmctl()* function shall fail if:

62309 **[EACCES]** The argument *cmd* is equal to **IPC\_STAT** and the calling process does not have  
 62310 read permission; see [Section 2.7](#) (on page 501).

62311 **[EINVAL]** The value of *shmid* is not a valid shared memory identifier, or the value of *cmd*  
 62312 is not a valid command.

62313 **[EPERM]** The argument *cmd* is equal to **IPC\_RMID** or **IPC\_SET** and the effective user ID  
 62314 of the calling process is not equal to that of a process with appropriate  
 62315 privileges and it is not equal to the value of *shm\_perm.cuid* or *shm\_perm.uid* in

62316 the data structure associated with *shmid*.

62317 The *shmctl()* function may fail if:

62318 [EOVERFLOW] The *cmd* argument is IPC\_STAT and the *gid* or *uid* value is too large to be  
62319 stored in the structure pointed to by the *buf* argument.

#### 62320 EXAMPLES

62321 None.

#### 62322 APPLICATION USAGE

62323 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
62324 Application developers who need to use IPC should design their applications so that modules  
62325 using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the  
62326 alternative interfaces.

62343 **NAME**

62344 shmdt — XSI shared memory detach operation

62345 **SYNOPSIS**

```
62346 XSI      #include <sys/shm.h>
62347      int shmdt(const void *shmaddr);
```

62348 **DESCRIPTION**

62349 The *shmdt()* function operates on XSI shared memory (see XBD [Section 3.346](#), on page 89). It is  
 62350 unspecified whether this function interoperates with the realtime interprocess communication  
 62351 facilities defined in [Section 2.8](#) (on page 503).

62352 The *shmdt()* function detaches the shared memory segment located at the address specified by  
 62353 *shmaddr* from the address space of the calling process.

62354 **RETURN VALUE**

62355 Upon successful completion, *shmdt()* shall decrement the value of *shm\_nattch* in the data  
 62356 structure associated with the shared memory ID of the attached shared memory segment and  
 62357 return 0. Also, the *shm\_dtime* timestamp shall be set to the current time, as described in [Section](#)  
 62358 [2.7.1](#) (on page 502).

62359 Otherwise, the shared memory segment shall not be detached, *shmdt()* shall return -1, and *errno*  
 62360 shall be set to indicate the error.

62361 **ERRORS**

62362 The *shmdt()* function shall fail if:

|       |          |                                                                                               |
|-------|----------|-----------------------------------------------------------------------------------------------|
| 62363 | [EINVAL] | The value of <i>shmaddr</i> is not the data segment start address of a shared memory segment. |
| 62364 |          |                                                                                               |

62365 **EXAMPLES**

62366 None.

62367 **APPLICATION USAGE**

62368 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
 62369 Application developers who need to use IPC should design their applications so that modules  
 62370 using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the  
 62371 alternative interfaces.

62372 **RATIONALE**

62381 First released in Issue 2. Derived from Issue 2 of the SVID.

62382 **Issue 5**

62383 Moved from SHARED MEMORY to BASE.

62384 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
62385 DIRECTIONS to a new APPLICATION USAGE section.62386 **Issue 7**

62387 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0574 [345] is applied.

62388 **NAME**

62389 shmget — get an XSI shared memory segment

62390 **SYNOPSIS**

```
62391 XSI    #include <sys/shm.h>
62392      int shmget(key_t key, size_t size, int shmflg);
```

62393 **DESCRIPTION**

62394 The *shmget()* function operates on XSI shared memory (see XBD [Section 3.346](#), on page 89). It is  
 62395 unspecified whether this function interoperates with the realtime interprocess communication  
 62396 facilities defined in [Section 2.8](#) (on page 503).

62397 The *shmget()* function shall return the shared memory identifier associated with *key*.

62398 A shared memory identifier, associated data structure, and shared memory segment of at least  
 62399 *size* bytes (see [<sys/shm.h>](#)) are created for *key* if one of the following is true:

- 62400 • The argument *key* is equal to `IPC_PRIVATE`.
- 62401 • The argument *key* does not already have a shared memory identifier associated with it and  
 62402 (*shmflg* & `IPC_CREAT`) is non-zero.

62403 Upon creation, the data structure associated with the new shared memory identifier shall be  
 62404 initialized as follows:

- 62405 • The values of *shm\_perm.cuid*, *shm\_perm.uid*, *shm\_perm.cgid*, and *shm\_perm.gid* are set to the  
 62406 effective user ID and effective group ID, respectively, of the calling process.
- 62407 • The low-order nine bits of *shm\_perm.mode* are set to the low-order nine bits of *shmflg*.
- 62408 • The value of *shm\_segsz* is set to the value of *size*.
- 62409 • The values of *shm\_lpid*, *shm\_nattch*, *shm\_atime*, and *shm\_dtime* are set to 0.
- 62410 • The value of *shm\_ctime* is set to the current time, as described in [Section 2.7.1](#) (on page 502).

62411 When the shared memory segment is created, it shall be initialized with all zero values.

62412 **RETURN VALUE**

62413 Upon successful completion, *shmget()* shall return a non-negative integer, namely a shared  
 62414 memory identifier; otherwise, it shall return -1 and set *errno* to indicate the error.

62415 **ERRORS**

62416 The *shmget()* function shall fail if:

- |                         |          |                                                                                                                                                                                                         |
|-------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 62417<br>62418<br>62419 | [EACCES] | A shared memory identifier exists for <i>key</i> but operation permission as specified by the low-order nine bits of <i>shmflg</i> would not be granted; see <a href="#">Section 2.7</a> (on page 501). |
| 62420<br>62421          | [EEXIST] | A shared memory identifier exists for the argument <i>key</i> but ( <i>shmflg</i> & <code>IPC_CREAT</code> ) && ( <i>shmflg</i> & <code>IPC_EXCL</code> ) is non-zero.                                  |
| 62422<br>62423          | [EINVAL] | A shared memory segment is to be created and the value of <i>size</i> is less than the system-imposed minimum or greater than the system-imposed maximum.                                               |
| 62424<br>62425          | [EINVAL] | No shared memory segment is to be created and a shared memory segment exists for <i>key</i> but the size of the segment associated with it is less than <i>size</i> .                                   |
| 62426<br>62427          | [ENOENT] | A shared memory identifier does not exist for the argument <i>key</i> and ( <i>shmflg</i> & <code>IPC_CREAT</code> ) is 0.                                                                              |

62428 [ENOMEM] A shared memory identifier and associated shared memory segment are to be  
62429 created, but the amount of available physical memory is not sufficient to fill  
62430 the request.

62431 [ENOSPC] A shared memory identifier is to be created, but the system-imposed limit on  
62432 the maximum number of allowed shared memory identifiers system-wide  
62433 would be exceeded.

#### 62434 EXAMPLES

62435 None.

#### 62436 APPLICATION USAGE

62437 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
62438 Application developers who need to use IPC should design their applications so that modules  
62439 using the IPC routines described in [Section 2.7](#) (on page 501) can be easily modified to use the  
62440 alternative interfaces.

#### 62441 RATIONALE

62442 None.

#### 62443 FUTURE DIRECTIONS

62444 None.

#### 62449 CHANGE HISTORY

62450 First released in Issue 2. Derived from Issue 2 of the SVID.

##### 62451 Issue 5

62452 Moved from SHARED MEMORY to BASE.

62453 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
62454 DIRECTIONS to a new APPLICATION USAGE section.

##### 62455 Issue 7

62456 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0575 [345], XSH/TC1-2008/0576 [363],  
62457 and XSH/TC1-2008/0577 [344] are applied.

62458 **NAME**

62459 shutdown — shut down socket send and receive operations

62460 **SYNOPSIS**

62461 #include &lt;sys/socket.h&gt;

62462 int shutdown(int *socket*, int *how*);62463 **DESCRIPTION**62464 The *shutdown()* function shall cause all or part of a full-duplex connection on the socket  
62465 associated with the file descriptor *socket* to be shut down.62466 The *shutdown()* function takes the following arguments:62467 *socket* Specifies the file descriptor of the socket.62468 *how* Specifies the type of shutdown. The values are as follows:

62469 SHUT\_RD Disables further receive operations.

62470 SHUT\_WR Disables further send operations.

62471 SHUT\_RDWR Disables further send and receive operations.

62472 The *shutdown()* function disables subsequent send and/or receive operations on a socket,  
62473 depending on the value of the *how* argument.62474 **RETURN VALUE**62475 Upon successful completion, *shutdown()* shall return 0; otherwise, -1 shall be returned and *errno*  
62476 set to indicate the error.62477 **ERRORS**62478 The *shutdown()* function shall fail if:62479 [EBADF] The *socket* argument is not a valid file descriptor.62480 [EINVAL] The *how* argument is invalid.

62481 [ENOTCONN] The socket is not connected.

62482 [ENOTSOCK] The *socket* argument does not refer to a socket.62483 The *shutdown()* function may fail if:

62484 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

62485 **EXAMPLES**

62486 None.

62487 **APPLICATION USAGE**

62488 None.

62489 **RATIONALE**

62490 None.

| 62497 | <b>CHANGE HISTORY</b>                                                     |
| 62498 | First released in Issue 6. Derived from the XNS, Issue 5.2 specification. |

62499 **NAME**

62500 sigaction — examine and change a signal action

62501 **SYNOPSIS**

```
62502 CX    #include <signal.h>
62503
62503    int sigaction(int sig, const struct sigaction *restrict act,
62504                  struct sigaction *restrict oact);
```

62505 **DESCRIPTION**

62506 The *sigaction()* function allows the calling process to examine and/or specify the action to be  
 62507 associated with a specific signal. The argument *sig* specifies the signal; acceptable values are  
 62508 defined in **<signal.h>**.

62509 The structure **sigaction**, used to describe an action to be taken, is defined in the **<signal.h>**  
 62510 header to include at least the following members:

| Member Type                               | Member Name         | Description                                                                           |
|-------------------------------------------|---------------------|---------------------------------------------------------------------------------------|
| <b>void(*) (int)</b>                      | <i>sa_handler</i>   | Pointer to a signal-catching function or one of the macros SIG_IGN or SIG_DFL.        |
| <b>sigset_t</b>                           | <i>sa_mask</i>      | Additional set of signals to be blocked during execution of signal-catching function. |
| <b>int</b>                                | <i>sa_flags</i>     | Special flags to affect behavior of signal.                                           |
| <b>void(*) (int, siginfo_t *, void *)</b> | <i>sa_sigaction</i> | Pointer to a signal-catching function.                                                |

62520 The storage occupied by *sa\_handler* and *sa\_sigaction* may overlap, and a conforming application  
 62521 shall not use both simultaneously.

62522 If the argument *act* is not a null pointer, it points to a structure specifying the action to be  
 62523 associated with the specified signal. If the argument *oact* is not a null pointer, the action  
 62524 previously associated with the signal is stored in the location pointed to by the argument *oact*. If  
 62525 the argument *act* is a null pointer, signal handling is unchanged; thus, the call can be used to  
 62526 enquire about the current handling of a given signal. The SIGKILL and SIGSTOP signals shall  
 62527 not be added to the signal mask using this mechanism; this restriction shall be enforced by the  
 62528 system without causing an error to be indicated.

62529 If the SA\_SIGINFO flag (see below) is cleared in the *sa\_flags* field of the **sigaction** structure, the  
 62530 *sa\_handler* field identifies the action to be associated with the specified signal. If the  
 62531 SA\_SIGINFO flag is set in the *sa\_flags* field, the *sa\_sigaction* field specifies a signal-catching  
 62532 function.

62533 The *sa\_flags* field can be used to modify the behavior of the specified signal.

62534 The following flags, defined in the **<signal.h>** header, can be set in *sa\_flags*:

62535 XSI SA\_NOCLDSTOP Do not generate SIGCHLD when children stop or stopped children  
 62536 continue.

62537 If *sig* is SIGCHLD and the SA\_NOCLDSTOP flag is not set in *sa\_flags*, and  
 62538 the implementation supports the SIGCHLD signal, then a SIGCHLD  
 62539 signal shall be generated for the calling process whenever any of its child  
 62540 XSI processes stop and a SIGCHLD signal may be generated for the calling  
 62541 process whenever any of its stopped child processes are continued. If *sig*  
 62542 is SIGCHLD and the SA\_NOCLDSTOP flag is set in *sa\_flags*, then the  
 62543 implementation shall not generate a SIGCHLD signal in this way.

|       |     |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------|-----|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 62544 | XSI | SA_ONSTACK   | If set and an alternate signal stack has been declared with <i>sigaltstack()</i> , the signal shall be delivered to the calling process on that stack. Otherwise, the signal shall be delivered on the current stack.                                                                                                                                                                                                                                                                                                                                                                                                           |
| 62545 |     |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 62546 |     |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 62547 |     | SA_RESETHAND | If set, the disposition of the signal shall be reset to SIG_DFL and the SA_SIGINFO flag shall be cleared on entry to the signal handler.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 62548 |     |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 62549 |     |              | <b>Note:</b> SIGILL and SIGTRAP cannot be automatically reset when delivered;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 62555 |     | SA_RESTART   | This flag affects the behavior of interruptible functions; that is, those specified to fail with <i>errno</i> set to [EINTR]. If set, and a function specified as interruptible is interrupted by this signal, the function shall restart and shall not fail with [EINTR] unless otherwise specified. If an interruptible function which uses a timeout is restarted, the duration of the timeout following the restart is set to an unspecified value that does not exceed the original timeout value. If the flag is not set, interruptible functions interrupted by this signal shall fail with <i>errno</i> set to [EINTR]. |

| 62594 |     |                     | When a signal is caught by a signal-catching function installed by <i>sigaction()</i> , a new signal mask is calculated and installed for the duration of the signal-catching function (or until a call to either <i>sigprocmask()</i> or <i>sigsuspend()</i> is made). This mask is formed by taking the union of the current signal mask and the value of the <i>sa_mask</i> for the signal being delivered, and unless SA_NODEFER or SA_RESETHAND is set, then including the signal being delivered. If and when the user's signal handler returns normally, the original signal mask is restored.                                                                                                                                                                                     |  |
| 62595 |     |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |

| 62603 |     |                     | If the previous action for <i>sig</i> had been established by <i>signal()</i> , the values of the fields returned in the structure pointed to by <i>oact</i> are unspecified, and in particular <i>oact-&gt;sa_handler</i> is not necessarily the same value passed to <i>signal()</i> . However, if a pointer to the same structure or a copy thereof is passed to a subsequent call to <i>sigaction()</i> via the <i>act</i> argument, handling of the signal shall be as if the original call to <i>signal()</i> were repeated.                                                                                                                                                                                                                                                        |  |
| 62604 |     |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |

| 62608 |     |                     | If <i>sigaction()</i> fails, no new signal handler is installed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |
| 62609 |     |                     | It is unspecified whether an attempt to set the action for a signal that cannot be caught or ignored to SIG_DFL is ignored or causes an error to be returned with <i>errno</i> set to [EINVAL].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 62610 |     |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 62611 |     |                     | If SA_SIGINFO is not set in <i>sa_flags</i> , then the disposition of subsequent occurrences of <i>sig</i> when it is already pending is implementation-defined; the signal-catching function shall be invoked with a single argument. If SA_SIGINFO is set in <i>sa_flags</i> , then subsequent occurrences of <i>sig</i> generated by <i>sigqueue()</i> or as a result of any signal-generating function that supports the specification of an application-defined value (when <i>sig</i> is already pending) shall be queued in FIFO order until delivered or accepted; the signal-catching function shall be invoked with three arguments. The application specified value is passed to the signal-catching function as the <i>si_value</i> member of the <b>siginfo_t</b> structure. |  |

| 62618 |     |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 62619 |     |                     | The result of the use of <i>sigaction()</i> and a <i>sigwait()</i> function concurrently within a process on the same signal is unspecified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |
| 62620 |     |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 62621 |     | <b>RETURN VALUE</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| 62622 |     |                     | Upon successful completion, <i>sigaction()</i> shall return 0; otherwise, -1 shall be returned, <i>errno</i> shall be set to indicate the error, and no new signal-catching function shall be installed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |  |
| 62623 |     |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |

**ERRORS**

The *sigaction()* function shall fail if:

[EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a signal that cannot be caught or ignore a signal that cannot be ignored.

The *sigaction()* function may fail if:

[EINVAL] An attempt was made to set the action to SIG\_DFL for a signal that cannot be caught or ignored (or both).

In addition, the *sigaction()* function may fail if the SA\_SIGINFO flag is set in the *sa\_flags* field of the **sigaction** structure for a signal not in the range SIGRTMIN to SIGRTMAX.

**EXAMPLES****Establishing a Signal Handler**

The following example demonstrates the use of *sigaction()* to establish a handler for the SIGINT signal.

```
#include <signal.h>

static void handler(int signum)
{
    /* Take appropriate actions for signal delivery */
}

int main()
{
    struct sigaction sa;

    sa.sa_handler = handler;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = SA_RESTART; /* Restart functions if
                               interrupted by handler */
    if (sigaction(SIGINT, &sa, NULL) == -1)
        /* Handle error */;

    /* Further code */
}
```

**APPLICATION USAGE**

The *sigaction()* function supersedes the *signal()* function, and should be used in preference. In particular, *sigaction()* and *signal()* should not be used in the same process to control the same signal. The behavior of async-signal-safe functions, as defined in their respective DESCRIPTION sections, is as specified by this volume of POSIX.1-2008, regardless of invocation from a signal-catching function. This is the only intended meaning of the statement that async-signal-safe functions may be used in signal-catching functions without restrictions. Applications must still consider all effects of such functions on such things as data structures, files, and process state. In particular, application developers need to consider the restrictions on interactions when interrupting *sleep()* and interactions among multiple handles for a file description. The fact that any specific function is listed as async-signal-safe does not necessarily mean that invocation of that function from a signal-catching function is recommended.

In order to prevent errors arising from interrupting non-async-signal-safe function calls, applications should protect calls to these functions either by blocking the appropriate signals or through the use of some programmatic semaphore (see *semget()*, *sem\_init()*, *sem\_open()*, and so

on). Note in particular that even the “safe” functions may modify *errno*; the signal-catching function, if not executing as an independent thread, should save and restore its value in order to avoid the possibility that delivery of a signal in between an error return from a function that sets *errno* and the subsequent examination of *errno* could result in the signal-catching function changing the value of *errno*. Naturally, the same principles apply to the async-signal-safety of application routines and asynchronous data access. Note that *longjmp()* and *siglongjmp()* are not in the list of async-signal-safe functions. This is because the code executing after *longjmp()* and *siglongjmp()* can call any unsafe functions with the same danger as calling those unsafe functions directly from the signal handler. Applications that use *longjmp()* and *siglongjmp()* from within signal handlers require rigorous protection in order to be portable. Many of the other functions that are excluded from the list are traditionally implemented using either *malloc()* or *free()* functions or the standard I/O library, both of which traditionally use data structures in a non-async-signal-safe manner. Since any combination of different functions using a common data structure can cause async-signal-safety problems, this volume of POSIX.1-2008 does not define the behavior when any unsafe function is called in a signal handler that interrupts an unsafe function.

Usually, the signal is executed on the stack that was in effect before the signal was delivered. An alternate stack may be specified to receive a subset of the signals being caught.

When the signal handler returns, the receiving thread resumes execution at the point it was interrupted unless the signal handler makes other arrangements. If *longjmp()* or *\_longjmp()* is used to leave the signal handler, then the signal mask must be explicitly restored.

This volume of POSIX.1-2008 defines the third argument of a signal handling function when SA\_SIGINFO is set as a **void \*** instead of a **ucontext\_t \***, but without requiring type checking. New applications should explicitly cast the third argument of the signal handling function to **ucontext\_t \***.

The BSD optional four argument signal handling function is not supported by this volume of POSIX.1-2008. The BSD declaration would be:

```
void handler(int sig, int code, struct sigcontext *scp,
             char *addr);
```

where *sig* is the signal number, *code* is additional information on certain signals, *scp* is a pointer to the **sigcontext** structure, and *addr* is additional address information. Much the same information is available in the objects pointed to by the second argument of the signal handler specified when SA\_SIGINFO is set.

Since the *sigaction()* function is allowed but not required to set SA\_NODEFER when the application sets the SA\_RESETHAND flag, applications which depend on the SA\_RESETHAND functionality for the newly installed signal handler must always explicitly set SA\_NODEFER when they set SA\_RESETHAND in order to be portable.

See also the rationale for Realtime Signal Generation and Delivery in XRAT [Section B.2.4.2](#) (on page 3568).

## RATIONALE

Although this volume of POSIX.1-2008 requires that signals that cannot be ignored shall not be added to the signal mask when a signal-catching function is entered, there is no explicit requirement that subsequent calls to *sigaction()* reflect this in the information returned in the *oact* argument. In other words, if SIGKILL is included in the *sa\_mask* field of *act*, it is unspecified whether or not a subsequent call to *sigaction()* returns with SIGKILL included in the *sa\_mask* field of *oact*.

The SA\_NOCLDSTOP flag, when supplied in the *act->sa\_flags* parameter, allows overloading

SIGCHLD with the System V semantics that each SIGCHLD signal indicates a single terminated child. Most conforming applications that catch SIGCHLD are expected to install signal-catching functions that repeatedly call the *waitpid()* function with the WNOHANG flag set, acting on each child for which status is returned, until *waitpid()* returns zero. If stopped children are not of interest, the use of the SA\_NOCLDSTOP flag can prevent the overhead from invoking the signal-catching routine when they stop.

Some historical implementations also define other mechanisms for stopping processes, such as the *ptrace()* function. These implementations usually do not generate a SIGCHLD signal when processes stop due to this mechanism; however, that is beyond the scope of this volume of POSIX.1-2008.

This volume of POSIX.1-2008 requires that calls to *sigaction()* that supply a NULL *act* argument succeed, even in the case of signals that cannot be caught or ignored (that is, SIGKILL or SIGSTOP). The System V *signal()* and BSD *sigvec()* functions return [EINVAL] in these cases and, in this respect, their behavior varies from *sigaction()*.

This volume of POSIX.1-2008 requires that *sigaction()* properly save and restore a signal action set up by the ISO C standard *signal()* function. However, there is no guarantee that the reverse is true, nor could there be given the greater amount of information conveyed by the **sigaction** structure. Because of this, applications should avoid using both functions for the same signal in the same process. Since this cannot always be avoided in case of general-purpose library routines, they should always be implemented with *sigaction()*.

It was intended that the *signal()* function should be implementable as a library routine using *sigaction()*.

The POSIX Realtime Extension extends the *sigaction()* function as specified by the POSIX.1-1990 standard to allow the application to request on a per-signal basis via an additional signal action flag that the extra parameters, including the application-defined signal value, if any, be passed to the signal-catching function.

## FUTURE DIRECTIONS

None.

XBD <signal.h>

## CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

## Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and POSIX Threads Extension.

In the DESCRIPTION, the second argument to *func* when SA\_SIGINFO is set is no longer permitted to be NULL, and the description of permitted **siginfo\_t** contents is expanded by reference to <signal.h>.

Since the X/OPEN UNIX Extension functionality is now folded into the BASE, the [ENOTSUP] error is deleted.

**Issue 6**

The Open Group Corrigendum U028/7 is applied. In the paragraph entitled “Signal Effects on Other Functions”, a reference to *sigpending()* is added.

In the DESCRIPTION, the text “Signal Generation and Delivery”, “Signal Actions”, and “Signal Effects on Other Functions” are moved to a separate section of this volume of POSIX.1-2008.

Text describing functionality from the Realtime Signals Extension option is marked.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The [ENOTSUP] error condition is added.

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *sigaction()* prototype for alignment with the ISO/IEC 9899: 1999 standard.

References to the *wait3()* function are removed.

The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an extension over the ISO C standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/57 is applied, changing text in the table describing the **sigaction** structure.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/127 is applied, removing text from the DESCRIPTION duplicated later in the same section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/128 is applied, updating the DESCRIPTION and APPLICATION USAGE sections. Changes are made to refer to the thread rather than the process.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/129 is applied, adding the example to the EXAMPLES section.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #004 is applied.

Austin Group Interpretations 1003.1-2001 #065 and #084 are applied, clarifying the role of the SA\_NODEFER flag with respect to the signal mask, and clarifying the SA\_RESTART flag for interrupted functions which use timeouts.

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XSH-ERN-167 is applied, updating the APPLICATION USAGE section.

SD5-XSH-ERN-172 is applied, updating the DESCRIPTION to make optional the requirement that when the SA\_RESETHAND flag is set, *sigaction()* shall behave as if the SA\_NODEFER flag were also set.

Functionality relating to the Realtime Signals Extension option is moved to the Base.

The description of the *si\_code* member is replaced with a reference to [Section 2.4.3](#) (on page 490).

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0578 [66] and XSH/TC1-2008/0579 [140] are applied.

62795 **NAME**

62796 sigaddset — add a signal to a signal set

62797 **SYNOPSIS**

```
62798 CX #include <signal.h>
62799 int sigaddset(sigset_t *set, int signo);
```

62800 **DESCRIPTION**

62801 The *sigaddset()* function adds the individual signal specified by the *signo* to the signal set pointed  
62802 to by *set*.

62803 Applications shall call either *sigemptyset()* or *sigfillset()* at least once for each object of type  
62804 **sigset\_t** prior to any other use of that object. If such an object is not initialized in this way, but is  
62805 nonetheless supplied as an argument to any of *pthread\_sigmask()*, *sigaction()*, *sigaddset()*,  
62806 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or  
62807 *sigwaitinfo()*, the results are undefined.

62808 **RETURN VALUE**

62809 Upon successful completion, *sigaddset()* shall return 0; otherwise, it shall return -1 and set *errno*  
62810 to indicate the error.

62811 **ERRORS**62812 The *sigaddset()* function may fail if:

62813 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

62814 **EXAMPLES**

62815 None.

62816 **APPLICATION USAGE**

62817 None.

62818 **RATIONALE**

62819 None.

62827 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

62828 **Issue 5**

62829 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
62830 previous issues.

62831 **Issue 6**

62832 The normative text is updated to avoid use of the term “must” for application requirements.

62833 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an  
62834 extension over the ISO C standard.

**NAME**

sigaltstack — set and get signal alternate stack context

**SYNOPSIS**

```
#include <signal.h>

int sigaltstack(const stack_t *restrict ss, stack_t *restrict oss);
```

**DESCRIPTION**

The *sigaltstack()* function allows a process to define and examine the state of an alternate stack for signal handlers for the current thread. Signals that have been explicitly declared to execute on the alternate stack shall be delivered on the alternate stack.

If *ss* is not a null pointer, it points to a **stack\_t** structure that specifies the alternate signal stack that shall take effect upon return from *sigaltstack()*. The *ss\_flags* member specifies the new stack state. If it is set to *SS\_DISABLE*, the stack is disabled and *ss\_sp* and *ss\_size* are ignored. Otherwise, the stack shall be enabled, and the *ss\_sp* and *ss\_size* members specify the new address and size of the stack.

The range of addresses starting at *ss\_sp* up to but not including *ss\_sp+ss\_size* is available to the implementation for use as the stack. This function makes no assumptions regarding which end is the stack base and in which direction the stack grows as items are pushed.

If *oss* is not a null pointer, upon successful completion it shall point to a **stack\_t** structure that specifies the alternate signal stack that was in effect prior to the call to *sigaltstack()*. The *ss\_sp* and *ss\_size* members specify the address and size of that stack. The *ss\_flags* member specifies the stack's state, and may contain one of the following values:

**SS\_ONSTACK**    The process is currently executing on the alternate signal stack. Attempts to modify the alternate signal stack while the process is executing on it fail. This flag shall not be modified by processes.

**SS\_DISABLE**    The alternate signal stack is currently disabled.

The value *SIGSTKSZ* is a system default specifying the number of bytes that would be used to cover the usual case when manually allocating an alternate stack area. The value *MINSIGSTKSZ* is defined to be the minimum stack size for a signal handler. In computing an alternate stack size, a program should add that amount to its stack requirements to allow for the system implementation overhead. The constants *SS\_ONSTACK*, *SS\_DISABLE*, *SIGSTKSZ*, and *MINSIGSTKSZ* are defined in **<signal.h>**.

After a successful call to one of the *exec* functions, there are no alternate signal stacks in the new process image.

In some implementations, a signal (whether or not indicated to execute on the alternate stack) shall always execute on the alternate stack if it is delivered while another signal is being caught using the alternate stack.

Use of this function by library threads that are not bound to kernel-scheduled entities results in undefined behavior.

**RETURN VALUE**

Upon successful completion, *sigaltstack()* shall return 0; otherwise, it shall return -1 and set *errno* to indicate the error.

**ERRORS**

The *sigaltstack()* function shall fail if:

[EINVAL] The *ss* argument is not a null pointer, and the *ss\_flags* member pointed to by *ss* contains flags other than *SS\_DISABLE*.

[ENOMEM] The size of the alternate stack area is less than *MINSIGSTKSZ*.

[EPERM] An attempt was made to modify an active stack.

**EXAMPLES****Allocating Memory for an Alternate Stack**

The following example illustrates a method for allocating memory for an alternate stack.

```
#include <signal.h>
...
if ((sigstk.ss_sp = malloc(SIGSTKSZ)) == NULL)
    /* Error return. */
sigstk.ss_size = SIGSTKSZ;
sigstk.ss_flags = 0;
if (sigaltstack(&sigstk, (stack_t *)0) < 0)
    perror("sigaltstack");
```

**APPLICATION USAGE**

On some implementations, stack space is automatically extended as needed. On those implementations, automatic extension is typically not available for an alternate stack. If the stack overflows, the behavior is undefined.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

The last sentence of the DESCRIPTION was included as an APPLICATION USAGE note in previous issues.

**Issue 6**

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *sigaltstack()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/58 is applied, updating the first sentence to include “for the current thread”.

62916 **NAME**

62917 sigdelset — delete a signal from a signal set

62918 **SYNOPSIS**

```
62919 CX    #include <signal.h>
62920    int sigdelset(sigset_t *set, int signo);
```

62921 **DESCRIPTION**

62922 The *sigdelset()* function deletes the individual signal specified by *signo* from the signal set  
 62923 pointed to by *set*.

62924 Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type  
 62925 **sigset\_t** prior to any other use of that object. If such an object is not initialized in this way, but is  
 62926 nonetheless supplied as an argument to any of *pthread\_sigmask()*, *sigaction()*, *sigaddset()*,  
 62927 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or  
 62928 *sigwaitinfo()*, the results are undefined.

62929 **RETURN VALUE**

62930 Upon successful completion, *sigdelset()* shall return 0; otherwise, it shall return -1 and set *errno*  
 62931 to indicate the error.

62932 **ERRORS**

62933 The *sigdelset()* function may fail if:

|       |          |                                                                                             |
|-------|----------|---------------------------------------------------------------------------------------------|
| 62934 | [EINVAL] | The <i>signo</i> argument is not a valid signal number, or is an unsupported signal number. |
| 62935 |          |                                                                                             |

62947 XBD **<signal.h>**

62948 **CHANGE HISTORY**

62949 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

62950 **Issue 5**

62951 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
 62952 previous issues.

62953 **Issue 6**

62954 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an  
 62955 extension over the ISO C standard.

**NAME**

sigemptyset — initialize and empty a signal set

**SYNOPSIS**

```
CX      #include <signal.h>
        int sigemptyset(sigset_t *set);
```

**DESCRIPTION**

The *sigemptyset()* function initializes the signal set pointed to by *set*, such that all signals defined in POSIX.1-2008 are excluded.

**RETURN VALUE**

Upon successful completion, *sigemptyset()* shall return 0; otherwise, it shall return -1 and set *errno* to indicate the error.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

The implementation of the *sigemptyset()* (or *sigfillset()*) function could quite trivially clear (or set) all the bits in the signal set. Alternatively, it would be reasonable to initialize part of the structure, such as a version field, to permit binary-compatibility between releases where the size of the set varies. For such reasons, either *sigemptyset()* or *sigfillset()* must be called prior to any other use of the signal set, even if such use is read-only (for example, as an argument to *sigpending()*). This function is not intended for dynamic allocation.

The *sigfillset()* and *sigemptyset()* functions require that the resulting signal set include (or exclude) all the signals defined in this volume of POSIX.1-2008. Although it is outside the scope of this volume of POSIX.1-2008 to place this requirement on signals that are implemented as extensions, it is recommended that implementation-defined signals also be affected by these functions. However, there may be a good reason for a particular signal not to be affected. For example, blocking or ignoring an implementation-defined signal may have undesirable side-effects, whereas the default action for that signal is harmless. In such a case, it would be preferable for such a signal to be excluded from the signal set returned by *sigfillset()*.

In early proposals there was no distinction between invalid and unsupported signals (the names of optional signals that were not supported by an implementation were not defined by that implementation). The [EINVAL] error was thus specified as a required error for invalid signals. With that distinction, it is not necessary to require implementations of these functions to determine whether an optional signal is actually supported, as that could have a significant performance impact for little value. The error could have been required for invalid signals and optional for unsupported signals, but this seemed unnecessarily complex. Thus, the error is optional in both cases.

**FUTURE DIRECTIONS**

None.

63033 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

63034 **Issue 6**

63035 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an  
63036 extension over the ISO C standard.

63037 **NAME**

63038 sighold, sigignore, sigpause, sigrelse, sigset — signal management

63039 **SYNOPSIS**

```

63040 OB XSI #include <signal.h>
63041
63041 int sighold(int sig);
63042 int sigignore(int sig);
63043 int sigpause(int sig);
63044 int sigrelse(int sig);
63045 void (*sigset(int sig, void (*disp)(int)))(int);

```

63046 **DESCRIPTION**

63047 Use of any of these functions is unspecified in a multi-threaded process.

63048 The *sighold()*, *sigignore()*, *sigpause()*, *sigrelse()*, and *sigset()* functions provide simplified signal management.

63050 The *sigset()* function shall modify signal dispositions. The *sig* argument specifies the signal, which may be any signal except SIGKILL and SIGSTOP. The *disp* argument specifies the signal's disposition, which may be SIG\_DFL, SIG\_IGN, or the address of a signal handler. If *sigset()* is used, and *disp* is the address of a signal handler, the system shall add *sig* to the signal mask of the calling process before executing the signal handler; when the signal handler returns, the system shall restore the signal mask of the calling process to its state prior to the delivery of the signal. In addition, if *sigset()* is used, and *disp* is equal to SIG\_HOLD, *sig* shall be added to the signal mask of the calling process and *sig*'s disposition shall remain unchanged. If *sigset()* is used, and *disp* is not equal to SIG\_HOLD, *sig* shall be removed from the signal mask of the calling process.

63060 The *sighold()* function shall add *sig* to the signal mask of the calling process.63061 The *sigrelse()* function shall remove *sig* from the signal mask of the calling process.63062 The *sigignore()* function shall set the disposition of *sig* to SIG\_IGN.

63063 The *sigpause()* function shall remove *sig* from the signal mask of the calling process and suspend the calling process until a signal is received. The *sigpause()* function shall restore the signal mask of the process to its original state before returning.

63066 If the action for the SIGCHLD signal is set to SIG\_IGN, child processes of the calling processes shall not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited-for children that were transformed into zombie processes, it shall block until all of its children terminate, and *wait()*, *waitid()*, and *waitpid()* shall fail and set *errno* to [ECHILD].

63071 **RETURN VALUE**

63072 Upon successful completion, *sigset()* shall return SIG\_HOLD if the signal had been blocked and the signal's previous disposition if it had not been blocked. Otherwise, SIG\_ERR shall be returned and *errno* set to indicate the error.

63075 The *sigpause()* function shall suspend execution of the thread until a signal is received, whereupon it shall return -1 and set *errno* to [EINTR].

63077 For all other functions, upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

**ERRORS**

These functions shall fail if:

[EINVAL] The *sig* argument is an illegal signal number.

The *sigset*() and *sigignore*() functions shall fail if:

[EINVAL] An attempt is made to catch a signal that cannot be caught, or to ignore a signal that cannot be ignored.

**EXAMPLES**

None.

**APPLICATION USAGE**

The *sigaction*() function provides a more comprehensive and reliable mechanism for controlling signals; new applications should use the *sigaction*() function instead of the obsolescent *sigset*() function.

The *sighold*() function, in conjunction with *sigrelse*() or *sigpause*(), may be used to establish critical regions of code that require the delivery of a signal to be temporarily deferred. For broader portability, the *pthread\_sigmask*() or *sigprocmask*() functions should be used instead of the obsolescent *sighold*() and *sigrelse*() functions.

For broader portability, the *sigsuspend*() function should be used instead of the obsolescent *sigpause*() function.

**RATIONALE**

Each of these historic functions has a direct analog in the other functions which are required to be per-thread and thread-safe (aside from *sigprocmask*(), which is replaced by *pthread\_sigmask*()). The *sigset*() function can be implemented as a simple wrapper for *sigaction*(). The *sighold*() function is equivalent to *sigprocmask*() or *pthread\_sigmask*() with SIG\_BLOCK set. The *sigignore*() function is equivalent to *sigaction*() with SIG\_IGN set. The *sigpause*() function is equivalent to *sigsuspend*(). The *sigrelse*() function is equivalent to *sigprocmask*() or *pthread\_sigmask*() with SIG\_UNBLOCK set.

**FUTURE DIRECTIONS**

These functions may be removed in a future version.

**SEE ALSO**

Section 2.4 (on page 488), *exec*, *pause*(), *pthread\_sigmask*(), *sigaction*(), *signal*(), *sigsuspend*(), *wait*(), *waitid*()

XBD <signal.h>

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

The DESCRIPTION is updated to indicate that the *sigpause*() function restores the signal mask of the process to its original state before returning.

The RETURN VALUE section is updated to indicate that the *sigpause*() function suspends execution of the process until a signal is received, whereupon it returns -1 and sets *errno* to [EINTR].

63120 **Issue 6**

63121 The normative text is updated to avoid use of the term “must” for application requirements.

63122 References to the *wait3()* function are removed.

63123 The XSI functions are split out into their own reference page.

63124 **Issue 7**

63125 SD5-XSH-ERN-113 and SD5-XSH-ERN-42 are applied, marking these functions obsolescent and  
63126 updating the APPLICATION USAGE and RATIONALE sections.

63127 **NAME**

63128 siginterrupt — allow signals to interrupt functions

63129 **SYNOPSIS**

```
63130 OB XSI #include <signal.h>
63131 int siginterrupt(int sig, int flag);
```

63132 **DESCRIPTION**

63133 The *siginterrupt()* function shall change the restart behavior when a function is interrupted by  
63134 the specified signal. The function *siginterrupt(sig, flag)* has an effect as if implemented as:

```
63135 int siginterrupt(int sig, int flag) {
63136     int ret;
63137     struct sigaction act;
63138     (void) sigaction(sig, NULL, &act);
63139     if (flag)
63140         act.sa_flags &= ~SA_RESTART;
63141     else
63142         act.sa_flags |= SA_RESTART;
63143     ret = sigaction(sig, &act, NULL);
63144     return ret;
63145 }
```

63146 **RETURN VALUE**

63147 Upon successful completion, *siginterrupt()* shall return 0; otherwise, -1 shall be returned and  
63148 *errno* set to indicate the error.

63149 **ERRORS**

63150 The *siginterrupt()* function shall fail if:

63151 [EINVAL] The *sig* argument is not a valid signal number.

63152 **EXAMPLES**

63153 None.

63154 **APPLICATION USAGE**

63155 The *siginterrupt()* function supports programs written to historical system interfaces.  
63156 Applications should use the *sigaction()* with the SA\_RESTART flag instead of the obsolescent  
63157 *siginterrupt()* function.

63158 **RATIONALE**

63159 None.

63160 **FUTURE DIRECTIONS**

63161 None.

63174 **NAME**

63175 sigismember — test for a signal in a signal set

63176 **SYNOPSIS**

```
63177 CX #include <signal.h>
63178 int sigismember(const sigset_t *set, int signo);
```

63179 **DESCRIPTION**

63180 The *sigismember()* function shall test whether the signal specified by *signo* is a member of the set  
63181 pointed to by *set*.

63182 Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type  
63183 **sigset\_t** prior to any other use of that object. If such an object is not initialized in this way, but is  
63184 nonetheless supplied as an argument to any of *pthread\_sigmask()*, *sigaction()*, *sigaddset()*,  
63185 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or  
63186 *sigwaitinfo()*, the results are undefined.

63187 **RETURN VALUE**

63188 Upon successful completion, *sigismember()* shall return 1 if the specified signal is a member of  
63189 the specified set, or 0 if it is not. Otherwise, it shall return -1 and set *errno* to indicate the error.

63190 **ERRORS**

63191 The *sigismember()* function may fail if:

63192 [EINVAL] The *signo* argument is not a valid signal number, or is an unsupported signal  
63193 number.

63209 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
63210 previous issues.

63211 **Issue 6**

63212 The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an  
63213 extension over the ISO C standard.

63214 **NAME**

63215 siglongjmp — non-local goto with signal handling

63216 **SYNOPSIS**

```
63217 CX    #include <setjmp.h>
63218    void siglongjmp(sigjmp_buf env, int val);
```

63219 **DESCRIPTION**63220 The *siglongjmp()* function shall be equivalent to the *longjmp()* function, except as follows:

- 63221 • References to *setjmp()* shall be equivalent to *sigsetjmp()*.
- 63222 • The *siglongjmp()* function shall restore the saved signal mask if and only if the *env*
- 63223 argument was initialized by a call to *sigsetjmp()* with a non-zero *savemask* argument.

63224 **RETURN VALUE**

63225 After *siglongjmp()* is completed, program execution shall continue as if the corresponding

63226 invocation of *sigsetjmp()* had just returned the value specified by *val*. The *siglongjmp()* function

63227 shall not cause *sigsetjmp()* to return 0; if *val* is 0, *sigsetjmp()* shall return the value 1.

63228 **ERRORS**

63229 No errors are defined.

63230 **EXAMPLES**

63231 None.

63232 **APPLICATION USAGE**

63233 The distinction between *setjmp()* or *longjmp()* and *sigsetjmp()* or *siglongjmp()* is only significant

63234 for programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.

63235 **RATIONALE**

63236 None.

63237 **FUTURE DIRECTIONS**

63238 None.

63239 **SEE ALSO**63240 *longjmp()*, *pthread\_sigmask()*, *setjmp()*, *sigsetjmp()*, *sigsuspend()*63241 XBD **<setjmp.h>**63242 **CHANGE HISTORY**

63243 First released in Issue 3. Included for alignment with the ISO POSIX-1 standard.

63244 **Issue 5**

63245 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

63246 **Issue 6**63247 The DESCRIPTION is rewritten in terms of *longjmp()*.

63248 The SYNOPSIS is marked CX since the presence of this function in the **<setjmp.h>** header is an

63249 extension over the ISO C standard.

## 63250 NAME

63251 signal — signal management

## 63252 SYNOPSIS

63253 #include &lt;signal.h&gt;

63254 void (\*signal(int sig, void (\*func)(int)))(int);

## 63255 DESCRIPTION

63256 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 63257 conflict between the requirements described here and the ISO C standard is unintentional. This  
 63258 volume of POSIX.1-2008 defers to the ISO C standard.

63259 The *signal()* function chooses one of three ways in which receipt of the signal number *sig* is to be  
 63260 subsequently handled. If the value of *func* is SIG\_DFL, default handling for that signal shall  
 63261 occur. If the value of *func* is SIG\_IGN, the signal shall be ignored. Otherwise, the application  
 63262 shall ensure that *func* points to a function to be called when that signal occurs. An invocation of  
 63263 such a function because of a signal, or (recursively) of any further functions called by that  
 63264 invocation (other than functions in the standard library), is called a “signal handler”.

63265 When a signal occurs, and *func* points to a function, it is implementation-defined whether the  
 63266 equivalent of a:

63267 signal(*sig*, SIG\_DFL);

63268 is executed or the implementation prevents some implementation-defined set of signals (at least  
 63269 including *sig*) from occurring until the current signal handling has completed. (If the value of *sig*  
 63270 is SIGILL, the implementation may alternatively define that no action is taken.) Next the  
 63271 equivalent of:

63272 (\*func)(*sig*);

63273 is executed. If and when the function returns, if the value of *sig* was SIGFPE, SIGILL, or  
 63274 SIGSEGV or any other implementation-defined value corresponding to a computational  
 63275 exception, the behavior is undefined. Otherwise, the program shall resume execution at the  
 63276 point it was interrupted. The ISO C standard places a restriction on applications relating to the  
 63277 CX use of *raise()* from signal handlers. This restriction does not apply to POSIX applications, as  
 63278 POSIX.1-2008 requires *raise()* to be async-signal-safe (see Section 2.4.3, on page 490).

63279 CX If the process is multi-threaded, or if the process is single-threaded and a signal handler is  
 63280 executed other than as the result of:

63281 CX • The process calling *abort()*, *raise()*, *kill()*, *pthread\_kill()*, or *sigqueue()* to generate a signal  
 63282 that is not blocked

63283 CX • A pending signal being unblocked and being delivered before the call that unblocked it  
 63284 returns

63285 CX the behavior is undefined if the signal handler refers to any object other than *errno* with static  
 63286 storage duration other than by assigning a value to an object declared as *volatile sig\_atomic\_t*,  
 63287 CX or if the signal handler calls any function defined in this standard other than one of the  
 63288 functions listed in Section 2.4 (on page 488).

63289 At program start-up, the equivalent of:

63290 signal(*sig*, SIG\_IGN);

63291 is executed for some signals, and the equivalent of:

63292 signal(*sig*, SIG\_DFL);

63293 CX is executed for all other signals (see *exec*).

63294 The *signal()* function shall not change the setting of *errno* if successful.

#### 63295 RETURN VALUE

63296 If the request can be honored, *signal()* shall return the value of *func* for the most recent call to  
 63297 *signal()* for the specified signal *sig*. Otherwise, *SIG\_ERR* shall be returned and a positive value  
 63298 shall be stored in *errno*.

#### 63299 ERRORS

63300 The *signal()* function shall fail if:

63301 CX [EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a  
 63302 signal that cannot be caught or ignore a signal that cannot be ignored.

63303 The *signal()* function may fail if:

63304 CX [EINVAL] An attempt was made to set the action to *SIG\_DFL* for a signal that cannot be  
 63305 caught or ignored (or both).

#### 63306 EXAMPLES

63307 None.

#### 63308 APPLICATION USAGE

63309 The *sigaction()* function provides a more comprehensive and reliable mechanism for controlling  
 63310 signals; new applications should use *sigaction()* rather than *signal()*.

#### 63311 RATIONALE

63312 None.

#### 63313 FUTURE DIRECTIONS

63314 None.

#### 63318 CHANGE HISTORY

63319 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 63320 Issue 5

63321 Moved from X/OPEN UNIX extension to BASE.

63322 The DESCRIPTION is updated to indicate that the *sigpause()* function restores the signal mask of  
 63323 the process to its original state before returning.

63324 The RETURN VALUE section is updated to indicate that the *sigpause()* function suspends  
 63325 execution of the process until a signal is received, whereupon it returns *-1* and sets *errno* to  
 63326 [EINTR].

#### 63327 Issue 6

63328 Extensions beyond the ISO C standard are marked.

63329 The normative text is updated to avoid use of the term “must” for application requirements.

63330 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

63331 References to the *wait3()* function are removed.

63332 The *sighold()*, *sigignore()*, *sigelse()*, and *sigset()* functions are split out onto their own reference  
 63333 page.

63334 **Issue 7**

63335 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0580 [275], XSH/TC1-2008/0581 [66],  
63336 and XSH/TC1-2008/0582 [105] are applied.

63337 **NAME**

63338 signbit — test sign

63339 **SYNOPSIS**

63340 #include &lt;math.h&gt;

63341 int signbit(real-floating x);

63342 **DESCRIPTION**

63343 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
63344 conflict between the requirements described here and the ISO C standard is unintentional. This  
63345 volume of POSIX.1-2008 defers to the ISO C standard.

63346 The *signbit()* macro shall determine whether the sign of its argument value is negative. NaNs,  
63347 zeros, and infinities have a sign bit.

63348 **RETURN VALUE**

63349 The *signbit()* macro shall return a non-zero value if and only if the sign of its argument value is  
63350 negative.

63351 **ERRORS**

63352 No errors are defined.

63353 **EXAMPLES**

63354 None.

63355 **APPLICATION USAGE**

63356 None.

63366 **NAME**

63367 signgam — log gamma function

63368 **SYNOPSIS**

```
63369 XSI      #include <math.h>
63370          extern int signgam;
```

63371 **DESCRIPTION**63372 Refer to *lgamma()*.

63373 **NAME**

63374 sigpause — remove a signal from the signal mask and suspend the thread

63375 **SYNOPSIS**

```
63376 OB XSI #include <signal.h>  
63377 int sigpause(int sig);
```

63378 **DESCRIPTION**63379 Refer to *sighold()*.

63380 **NAME**

63381 sigpending — examine pending signals

63382 **SYNOPSIS**

```
63383 CX    #include <signal.h>
63384      int sigpending(sigset_t *set);
```

63385 **DESCRIPTION**

63386 The *sigpending()* function shall store, in the location referenced by the *set* argument, the set of  
63387 signals that are blocked from delivery to the calling thread and that are pending on the process  
63388 or the calling thread.

63389 **RETURN VALUE**

63390 Upon successful completion, *sigpending()* shall return 0; otherwise, -1 shall be returned and  
63391 *errno* set to indicate the error.

63392 **ERRORS**

63393 No errors are defined.

63394 **EXAMPLES**

63395 None.

63396 **APPLICATION USAGE**

63397 None.

63398 **RATIONALE**

63399 None.

63406 First released in Issue 3.

63407 **Issue 5**

63408 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

63409 **Issue 6**

63410 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an  
63411 extension over the ISO C standard.

63412 **NAME**

63413 sigprocmask — examine and change blocked signals

63414 **SYNOPSIS**

```
63415 CX    #include <signal.h>
63416        int sigprocmask(int how, const sigset_t *restrict set,
63417                        sigset_t *restrict oset);
```

63418 **DESCRIPTION**63419 Refer to *pthread\_sigmask()*.

63420 **NAME**

63421 sigqueue — queue a signal to a process

63422 **SYNOPSIS**

```
63423 CX #include <signal.h>
63424 int sigqueue(pid_t pid, int signo, union sigval value);
```

63425 **DESCRIPTION**

63426 The *sigqueue()* function shall cause the signal specified by *signo* to be sent with the value  
63427 specified by *value* to the process specified by *pid*. If *signo* is zero (the null signal), error checking  
63428 is performed but no signal is actually sent. The null signal can be used to check the validity of  
63429 *pid*.

63430 The conditions required for a process to have permission to queue a signal to another process are  
63431 the same as for the *kill()* function.

63432 The *sigqueue()* function shall return immediately. If SA\_SIGINFO is set for *signo* and if the  
63433 resources were available to queue the signal, the signal shall be queued and sent to the receiving  
63434 process. If SA\_SIGINFO is not set for *signo*, then *signo* shall be sent at least once to the receiving  
63435 process; it is unspecified whether *value* shall be sent to the receiving process as a result of this  
63436 call.

63437 If the value of *pid* causes *signo* to be generated for the sending process, and if *signo* is not blocked  
63438 for the calling thread and if no other thread has *signo* unblocked or is waiting in a *sigwait()*  
63439 function for *signo*, either *signo* or at least the pending, unblocked signal shall be delivered to the  
63440 calling thread before the *sigqueue()* function returns. Should any multiple pending signals in the  
63441 range SIGRTMIN to SIGRTMAX be selected for delivery, it shall be the lowest numbered one.  
63442 The selection order between realtime and non-realtime signals, or between multiple pending  
63443 non-realtime signals, is unspecified.

63444 **RETURN VALUE**

63445 Upon successful completion, the specified signal shall have been queued, and the *sigqueue()*  
63446 function shall return a value of zero. Otherwise, the function shall return a value of -1 and set  
63447 *errno* to indicate the error.

63448 **ERRORS**63449 The *sigqueue()* function shall fail if:

- |       |          |                                                                                    |
|-------|----------|------------------------------------------------------------------------------------|
| 63450 | [EAGAIN] | No resources are available to queue the signal. The process has already            |
| 63451 |          | queued {SIGQUEUE_MAX} signals that are still pending at the receiver(s), or        |
| 63452 |          | a system-wide resource limit has been exceeded.                                    |
| 63453 | [EINVAL] | The value of the <i>signo</i> argument is an invalid or unsupported signal number. |
| 63454 | [EPERM]  | The process does not have appropriate privileges to send the signal to the         |
| 63455 |          | receiving process.                                                                 |
| 63456 | [ESRCH]  | The process <i>pid</i> does not exist.                                             |

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

The *sigqueue()* function allows an application to queue a realtime signal to itself or to another process, specifying the application-defined value. This is common practice in realtime applications on existing realtime systems. It was felt that specifying another function in the *sig...* name space already carved out for signals was preferable to extending the interface to *kill()*.

Such a function became necessary when the put/get event function of the message queues was removed. It should be noted that the *sigqueue()* function implies reduced performance in a security-conscious implementation as the access permissions between the sender and receiver have to be checked on each send when the *pid* is resolved into a target process. Such access checks were necessary only at message queue open in the previous interface.

The standard developers required that *sigqueue()* have the same semantics with respect to the null signal as *kill()*, and that the same permission checking be used. But because of the difficulty of implementing the “broadcast” semantic of *kill()* (for example, to process groups) and the interaction with resource allocation, this semantic was not adopted. The *sigqueue()* function queues a signal to a single process specified by the *pid* argument.

The *sigqueue()* function can fail if the system has insufficient resources to queue the signal. An explicit limit on the number of queued signals that a process could send was introduced. While the limit is “per-sender”, this volume of POSIX.1-2008 does not specify that the resources be part of the state of the sender. This would require either that the sender be maintained after exit until all signals that it had sent to other processes were handled or that all such signals that had not yet been acted upon be removed from the queue(s) of the receivers. This volume of POSIX.1-2008 does not preclude this behavior, but an implementation that allocated queuing resources from a system-wide pool (with per-sender limits) and that leaves queued signals pending after the sender exits is also permitted.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

[Section 2.8.1](#) (on page 503)

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

**Issue 6**

The *sigqueue()* function is marked as part of the Realtime Signals Extension option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Realtime Signals Extension option.

**Issue 7**

The *sigqueue()* function is moved from the Realtime Signals Extension option to the Base.

63500 **NAME**

63501 sigrelse, sigset — signal management

63502 **SYNOPSIS**

```
63503 OB XSI #include <signal.h>
63504 int sigrelse(int sig);
63505 void (*sigset(int sig, void (*disp)(int)))(int);
```

63506 **DESCRIPTION**63507 Refer to *sighold()*.

63508 **NAME**

63509 sigsetjmp — set jump point for a non-local goto

63510 **SYNOPSIS**

```
63511 CX      #include <setjmp.h>
63512      int sigsetjmp(sigjmp_buf env, int savemask);
```

63513 **DESCRIPTION**63514 The *sigsetjmp()* function shall be equivalent to the *setjmp()* function, except as follows:

- 63515 • References to *setjmp()* are equivalent to *sigsetjmp()*.
- 63516 • References to *longjmp()* are equivalent to *siglongjmp()*.
- 63517 • If the value of the *savemask* argument is not 0, *sigsetjmp()* shall also save the current signal mask of the calling thread as part of the calling environment.

63519 **RETURN VALUE**

63520 If the return is from a successful direct invocation, *sigsetjmp()* shall return 0. If the return is from  
 63521 a call to *siglongjmp()*, *sigsetjmp()* shall return a non-zero value.

63522 **ERRORS**

63523 No errors are defined.

63524 **EXAMPLES**

63525 None.

63526 **APPLICATION USAGE**

63527 The distinction between *setjmp()/longjmp()* and *sigsetjmp()/siglongjmp()* is only significant for  
 63528 programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.

63529 Note that since this function is defined in terms of *setjmp()*, if *savemask* is zero, it is unspecified  
 63530 whether the signal mask is saved.

63531 **RATIONALE**

63532 The ISO C standard specifies various restrictions on the usage of the *setjmp()* macro in order to  
 63533 permit implementors to recognize the name in the compiler and not implement an actual  
 63534 function. These same restrictions apply to the *sigsetjmp()* macro.

63535 There are processors that cannot easily support these calls, but this was not considered a  
 63536 sufficient reason to exclude them.

63537 4.2 BSD, 4.3 BSD, and XSI-conformant systems provide functions named *\_setjmp()* and  
 63538 *\_longjmp()* that, together with *setjmp()* and *longjmp()*, provide the same functionality as  
 63539 *sigsetjmp()* and *siglongjmp()*. On those systems, *setjmp()* and *longjmp()* save and restore signal  
 63540 masks, while *\_setjmp()* and *\_longjmp()* do not. On System V Release 3 and in corresponding  
 63541 issues of the SVID, *setjmp()* and *longjmp()* are explicitly defined not to save and restore signal  
 63542 masks. In order to permit existing practice in both cases, the relation of *setjmp()* and *longjmp()* to  
 63543 signal masks is not specified, and a new set of functions is defined instead.

63544 The *longjmp()* and *siglongjmp()* functions operate as in the previous issue provided the matching  
 63545 *setjmp()* or *sigsetjmp()* has been performed in the same thread. Non-local jumps into contexts  
 63546 saved by other threads would be at best a questionable practice and were not considered worthy  
 63547 of standardization.

63548 **FUTURE DIRECTIONS**

63549 None.

63550 **SEE ALSO**63551 *pthread\_sigmask(), siglongjmp(), signal(), sigsuspend()*63552 XBD **<setjmp.h>**63553 **CHANGE HISTORY**

63554 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

63555 **Issue 5**

63556 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

63557 **Issue 6**63558 The DESCRIPTION is reworded in terms of *setjmp()*.63559 The SYNOPSIS is marked CX since the presence of this function in the **<setjmp.h>** header is an  
63560 extension over the ISO C standard.

63561 **NAME**

63562 sigsuspend — wait for a signal

63563 **SYNOPSIS**

```
63564 CX    #include <signal.h>
63565      int sigsuspend(const sigset_t *sigmask);
```

63566 **DESCRIPTION**

63567 The *sigsuspend()* function shall replace the current signal mask of the calling thread with the set  
63568 of signals pointed to by *sigmask* and then suspend the thread until delivery of a signal whose  
63569 action is either to execute a signal-catching function or to terminate the process. This shall not  
63570 cause any other signals that may have been pending on the process to become pending on the  
63571 thread.

63572 If the action is to terminate the process then *sigsuspend()* shall never return. If the action is to  
63573 execute a signal-catching function, then *sigsuspend()* shall return after the signal-catching  
63574 function returns, with the signal mask restored to the set that existed prior to the *sigsuspend()*  
63575 call.

63576 It is not possible to block signals that cannot be ignored. This is enforced by the system without  
63577 causing an error to be indicated.

63578 **RETURN VALUE**

63579 Since *sigsuspend()* suspends thread execution indefinitely, there is no successful completion  
63580 return value. If a return occurs, -1 shall be returned and *errno* set to indicate the error.

63581 **ERRORS**

63582 The *sigsuspend()* function shall fail if:

|       |         |                                                                            |
|-------|---------|----------------------------------------------------------------------------|
| 63583 | [EINTR] | A signal is caught by the calling process and control is returned from the |
| 63584 |         | signal-catching function.                                                  |

63585 **EXAMPLES**

63586 None.

63587 **APPLICATION USAGE**

63588 Normally, at the beginning of a critical code section, a specified set of signals is blocked using  
63589 the *sigprocmask()* function. When the thread has completed the critical section and needs to wait  
63590 for the previously blocked signal(s), it pauses by calling *sigsuspend()* with the mask that was  
63591 returned by the *sigprocmask()* call.

63592 **RATIONALE**

63593 Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers  
63594 can install an additional cancellation handler which resets the signal mask to the expected value.

```
63595 void cleanup(void *arg)
63596 {
63597     sigset_t *ss = (sigset_t *) arg;
63598     pthread_sigmask(SIG_SETMASK, ss, NULL);
63599 }
63600 int call_sigsuspend(const sigset_t *mask)
63601 {
63602     sigset_t oldmask;
63603     int result;
63604     pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
63605     pthread_cleanup_push(cleanup, &oldmask);
```

```
63606         result = sigsuspend(sigmask);
63607         pthread_cleanup_pop(0);

#### 63615 CHANGE HISTORY

63616 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

##### 63617 Issue 5

63618 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

##### 63619 Issue 6

63620 The text in the RETURN VALUE section has been changed from “suspends process execution”  
63621 to “suspends thread execution”. This reflects IEEE PASC Interpretation 1003.1c #40.

63622 Text in the APPLICATION USAGE section has been replaced.

63623 The SYNOPSIS is marked CX since the presence of this function in the [<signal.h>](#) header is an  
63624 extension over the ISO C standard.

##### 63625 Issue 7

63626 SD5-XSH-ERN-122 is applied, adding the example code in the RATIONALE.

**NAME**

sigtimedwait, sigwaitinfo — wait for queued signals

**SYNOPSIS**

```
CX      #include <signal.h>

        int sigtimedwait(const sigset_t *restrict set,
        siginfo_t *restrict info,
        const struct timespec *restrict timeout);
        int sigwaitinfo(const sigset_t *restrict set,
        siginfo_t *restrict info);
```

**DESCRIPTION**

The *sigtimedwait()* function shall be equivalent to *sigwaitinfo()* except that if none of the signals specified by *set* are pending, *sigtimedwait()* shall wait for the time interval specified in the **timespec** structure referenced by *timeout*. If the **timespec** structure pointed to by *timeout* is zero-valued and if none of the signals specified by *set* are pending, then *sigtimedwait()* shall return immediately with an error. If *timeout* is the null pointer, the behavior is unspecified. If the Monotonic Clock option is supported, the **CLOCK\_MONOTONIC** clock shall be used to measure the time interval specified by the *timeout* argument.

The *sigwaitinfo()* function selects the pending signal from the set specified by *set*. Should any of multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it shall be the lowest numbered one. The selection order between realtime and non-realtime signals, or between multiple pending non-realtime signals, is unspecified. If no signal in *set* is pending at the time of the call, the calling thread shall be suspended until one or more signals in *set* become pending or until it is interrupted by an unblocked, caught signal.

The *sigwaitinfo()* function shall be equivalent to the *sigwait()* function, except that the return value and the error reporting method are different (see RETURN VALUE), and that if the *info* argument is non-NULL, the selected signal number shall be stored in the *si\_signo* member, and the cause of the signal shall be stored in the *si\_code* member. If any value is queued to the selected signal, the first such queued value shall be dequeued and, if the *info* argument is non-NULL, the value shall be stored in the *si\_value* member of *info*. The system resource used to queue the signal shall be released and returned to the system for other use. If no value is queued, the content of the *si\_value* member is undefined. If no further signals are queued for the selected signal, the pending indication for that signal shall be reset.

**RETURN VALUE**

Upon successful completion (that is, one of the signals specified by *set* is pending or is generated) *sigwaitinfo()* and *sigtimedwait()* shall return the selected signal number. Otherwise, the function shall return a value of -1 and set *errno* to indicate the error.

**ERRORS**

The *sigtimedwait()* function shall fail if:

[EAGAIN] No signal specified by *set* was generated within the specified timeout period.

The *sigtimedwait()* and *sigwaitinfo()* functions may fail if:

[EINTR] The wait was interrupted by an unblocked, caught signal. It shall be documented in system documentation whether this error causes these functions to fail.

63670 The *sigtimedwait()* function may also fail if:  
 63671 [EINVAL] The *timeout* argument specified a *tv\_nsec* value less than zero or greater than  
 63672 or equal to 1 000 million.

63673 An implementation should only check for this error if no signal is pending in *set* and it is  
 63674 necessary to wait.

#### 63675 EXAMPLES

63676 None.

#### 63677 APPLICATION USAGE

63678 The *sigtimedwait()* function times out and returns an [EAGAIN] error. Application developers  
 63679 should note that this is inconsistent with other functions such as *pthread\_cond\_timedwait()* that  
 63680 return [ETIMEDOUT].

63681 Note that in order to ensure that generated signals are queued and signal values passed to  
 63682 *sigqueue()* are available in *si\_value*, applications which use *sigwaitinfo()* or *sigtimedwait()* need to  
 63683 set the SA\_SIGINFO flag for each signal in the set (see [Section 2.4](#), on page 488). This means  
 63684 setting each signal to be handled by a three-argument signal-catching function, even if the  
 63685 handler will never be called. It is not possible (portably) to set a signal handler to SIG\_DFL  
 63686 while setting the SA\_SIGINFO flag, because assigning to the *sa\_handler* member of **struct**  
 63687 **sigaction** instead of the *sa\_sigaction* member would result in undefined behavior, and SIG\_DFL  
 63688 need not be assignment-compatible with *sa\_sigaction*. Even if an assignment of SIG\_DFL to  
 63689 *sa\_sigaction* is accepted by the compiler, the implementation need not treat this value as special—  
 63690 it could just be taken as the address of a signal-catching function.

#### 63691 RATIONALE

63692 Existing programming practice on realtime systems uses the ability to pause waiting for a  
 63693 selected set of events and handle the first event that occurs in-line instead of in a signal-handling  
 63694 function. This allows applications to be written in an event-directed style similar to a state  
 63695 machine. This style of programming is useful for largescale transaction processing in which the  
 63696 overall throughput of an application and the ability to clearly track states are more important  
 63697 than the ability to minimize the response time of individual event handling.

63698 It is possible to construct a signal-waiting macro function out of the realtime signal function  
 63699 mechanism defined in this volume of POSIX.1-2008. However, such a macro has to include the  
 63700 definition of a generalized handler for all signals to be waited on. A significant portion of the  
 63701 overhead of handler processing can be avoided if the signal-waiting function is provided by the  
 63702 kernel. This volume of POSIX.1-2008 therefore provides two signal-waiting functions—one that  
 63703 waits indefinitely and one with a timeout—as part of the overall realtime signal function  
 63704 specification.

63705 The specification of a function with a timeout allows an application to be written that can be  
 63706 broken out of a wait after a set period of time if no event has occurred. It was argued that setting  
 63707 a timer event before the wait and recognizing the timer event in the wait would also implement  
 63708 the same functionality, but at a lower performance level. Because of the performance  
 63709 degradation associated with the user-level specification of a timer event and the subsequent  
 63710 cancellation of that timer event after the wait completes for a valid event, and the complexity  
 63711 associated with handling potential race conditions associated with the user-level method, the  
 63712 separate function has been included.

63713 Note that the semantics of the *sigwaitinfo()* function are nearly identical to that of the *sigwait()*  
 63714 function defined by this volume of POSIX.1-2008. The only difference is that *sigwaitinfo()* returns  
 63715 the queued signal value in the *value* argument. The return of the queued value is required so that  
 63716 applications can differentiate between multiple events queued to the same signal number.

The two distinct functions are being maintained because some implementations may choose to implement the POSIX Threads Extension functions and not implement the queued signals extensions. Note, though, that *sigwaitinfo()* does not return the queued value if the *value* argument is NULL, so the POSIX Threads Extension *sigwait()* function can be implemented as a macro on *sigwaitinfo()*.

The *sigtimedwait()* function was separated from the *sigwaitinfo()* function to address concerns regarding the overloading of the *timeout* pointer to indicate indefinite wait (no timeout), timed wait, and immediate return, and concerns regarding consistency with other functions where the conditional and timed waits were separate functions from the pure blocking function. The semantics of *sigtimedwait()* are specified such that *sigwaitinfo()* could be implemented as a macro with a null pointer for *timeout*.

The *sigwait* functions provide a synchronous mechanism for threads to wait for asynchronously-generated signals. One important question was how many threads that are suspended in a call to a *sigwait()* function for a signal should return from the call when the signal is sent. Four choices were considered:

1. Return an error for multiple simultaneous calls to *sigwait* functions for the same signal.
2. One or more threads return.
3. All waiting threads return.
4. Exactly one thread returns.

Prohibiting multiple calls to *sigwait()* for the same signal was felt to be overly restrictive. The “one or more” behavior made implementation of conforming packages easy at the expense of forcing POSIX threads clients to protect against multiple simultaneous calls to *sigwait()* in application code in order to achieve predictable behavior. There was concern that the “all waiting threads” behavior would result in “signal broadcast storms”, consuming excessive CPU resources by replicating the signals in the general case. Furthermore, no convincing examples could be presented that delivery to all was either simpler or more powerful than delivery to one.

Thus, the consensus was that exactly one thread that was suspended in a call to a *sigwait* function for a signal should return when that signal occurs. This is not an onerous restriction as:

- A multi-way signal wait can be built from the single-way wait.
- Signals should only be handled by application-level code, as library routines cannot guess what the application wants to do with signals generated for the entire process.
- Applications can thus arrange for a single thread to wait for any given signal and call any needed routines upon its arrival.

In an application that is using signals for interprocess communication, signal processing is typically done in one place. Alternatively, if the signal is being caught so that process cleanup can be done, the signal handler thread can call separate process cleanup routines for each portion of the application. Since the application main line started each portion of the application, it is at the right abstraction level to tell each portion of the application to clean up.

Certainly, there exist programming styles where it is logical to consider waiting for a single signal in multiple threads. A simple *sigwait\_multiple()* routine can be constructed to achieve this goal. A possible implementation would be to have each *sigwait\_multiple()* caller registered as having expressed interest in a set of signals. The caller then waits on a thread-specific condition variable. A single server thread calls a *sigwait()* function on the union of all registered signals. When the *sigwait()* function returns, the appropriate state is set and condition variables are broadcast. New *sigwait\_multiple()* callers may cause the pending *sigwait()* call to be canceled

63762 and reissued in order to update the set of signals being waited for.

#### 63763 **FUTURE DIRECTIONS**

63764 None.

#### 63769 **CHANGE HISTORY**

63770 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
63771 POSIX Threads Extension.

#### 63772 **Issue 6**

63773 These functions are marked as part of the Realtime Signals Extension option.

63774 The Open Group Corrigendum U035/3 is applied. The SYNOPSIS of the *sigwaitinfo()* function  
63775 has been corrected so that the second argument is of type **siginfo\_t** \*.

63776 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
63777 implementation does not support the Realtime Signals Extension option.

63778 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the  
63779 CLOCK\_MONOTONIC clock, if supported, is used to measure timeout intervals.

63780 The **restrict** keyword is added to the *sigtimedwait()* and *sigwaitinfo()* prototypes for alignment  
63781 with the ISO/IEC 9899:1999 standard.

63782 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/130 is applied, restoring wording in the  
63783 RETURN VALUE section to that in the original base document (“An implementation should  
63784 only check for this error if no signal is pending in *set* and it is necessary to wait”).

#### 63785 **Issue 7**

63786 The *sigtimedwait()* and *sigwaitinfo()* functions are moved from the Realtime Signals Extension  
63787 option to the Base.

63788 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0583 [392] is applied.

63789 **NAME**

63790 sigwait — wait for queued signals

63791 **SYNOPSIS**

```
63792 CX      #include <signal.h>
63793      int sigwait(const sigset_t *restrict set, int *restrict sig);
```

63794 **DESCRIPTION**

63795 The *sigwait()* function shall select a pending signal from *set*, atomically clear it from the system's  
 63796 set of pending signals, and return that signal number in the location referenced by *sig*. If prior to  
 63797 the call to *sigwait()* there are multiple pending instances of a single signal number, it is  
 63798 implementation-defined whether upon successful return there are any remaining pending  
 63799 signals for that signal number. If the implementation supports queued signals and there are  
 63800 multiple signals queued for the signal number selected, the first such queued signal shall cause a  
 63801 return from *sigwait()* and the remainder shall remain queued. If no signal in *set* is pending at the  
 63802 time of the call, the thread shall be suspended until one or more becomes pending. The signals  
 63803 defined by *set* shall have been blocked at the time of the call to *sigwait()*; otherwise, the behavior  
 63804 is undefined. The effect of *sigwait()* on the signal actions for the signals in *set* is unspecified.

63805 If more than one thread is using *sigwait()* to wait for the same signal, no more than one of these  
 63806 threads shall return from *sigwait()* with the signal number. If more than a single thread is  
 63807 blocked in *sigwait()* for a signal when that signal is generated for the process, it is unspecified  
 63808 which of the waiting threads returns from *sigwait()*. If the signal is generated for a specific  
 63809 thread, as by *pthread\_kill()*, only that thread shall return.

63810 Should any of the multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it  
 63811 shall be the lowest numbered one. The selection order between realtime and non-realtime  
 63812 signals, or between multiple pending non-realtime signals, is unspecified.

63813 **RETURN VALUE**

63814 Upon successful completion, *sigwait()* shall store the signal number of the received signal at the  
 63815 location referenced by *sig* and return zero. Otherwise, an error number shall be returned to  
 63816 indicate the error.

63817 **ERRORS**

63818 The *sigwait()* function may fail if:

63819 [EINVAL] The *set* argument contains an invalid or unsupported signal number.

63820 **EXAMPLES**

63821 None.

63822 **APPLICATION USAGE**

63823 None.

63824 **RATIONALE**

63825 To provide a convenient way for a thread to wait for a signal, this volume of POSIX.1-2008  
 63826 provides the *sigwait()* function. For most cases where a thread has to wait for a signal, the  
 63827 *sigwait()* function should be quite convenient, efficient, and adequate.

63828 However, requests were made for a lower-level primitive than *sigwait()* and for semaphores that  
 63829 could be used by threads. After some consideration, threads were allowed to use semaphores  
 63830 and *sem\_post()* was defined to be async-signal-safe.

63831 In summary, when it is necessary for code run in response to an asynchronous signal to notify a  
 63832 thread, *sigwait()* should be used to handle the signal. Alternatively, if the implementation  
 63833 provides semaphores, they also can be used, either following *sigwait()* or from within a signal

63834 handling routine previously registered with *sigaction()*.

#### 63835 FUTURE DIRECTIONS

63840 XBD <signal.h>, <time.h>

#### 63841 CHANGE HISTORY

63842 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
63843 POSIX Threads Extension.

#### 63844 Issue 6

63845 The **restrict** keyword is added to the *sigwait()* prototype for alignment with the  
63846 ISO/IEC 9899:1999 standard.

63847 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/131 is applied, updating the  
63848 DESCRIPTION to state that if more than a single thread is blocked in *sigwait()*, it is unspecified  
63849 which of the waiting threads returns, and that if a signal is generated for a specific thread only  
63850 that thread shall return.

#### 63851 Issue 7

63852 Functionality relating to the Realtime Signals Extension option is moved to the Base.

63853 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0584 [76] is applied.

63854 **NAME**

63855 sigwaitinfo — wait for queued signals

63856 **SYNOPSIS**

```
63857 #include <signal.h>  
63858 int sigwaitinfo(const sigset_t *restrict set, siginfo_t *restrict info);
```

63859 **DESCRIPTION**63860 Refer to *sigtimedwait()*.

63861 **NAME**

63862 sin, sinf, sinl — sine function

63863 **SYNOPSIS**

```
63864 #include <math.h>
63865 double sin(double x);
63866 float sinf(float x);
63867 long double sinl(long double x);
```

63868 **DESCRIPTION**

63869 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 63870 conflict between the requirements described here and the ISO C standard is unintentional. This  
 63871 volume of POSIX.1-2008 defers to the ISO C standard.

63872 These functions shall compute the sine of their argument  $x$ , measured in radians.

63873 An application wishing to check for error situations should set *errno* to zero and call  
 63874 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 63875 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 63876 zero, an error has occurred.

63877 **RETURN VALUE**

63878 Upon successful completion, these functions shall return the sine of  $x$ .

63879 MX If  $x$  is NaN, a NaN shall be returned.

63880 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

63881 If  $x$  is subnormal, a range error may occur

63882 MXX and  $x$  should be returned.

63883 MX If  $x$  is not returned, *sin()*, *sinf()*, and *sinl()* shall return an implementation-defined value no  
 63884 greater in magnitude than DBL\_MIN, FLT\_MIN, and LDBL\_MIN, respectively.

63885 If  $x$  is  $\pm\text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

63886 **ERRORS**

63887 These functions shall fail if:

63888 MX **Domain Error** The  $x$  argument is  $\pm\text{Inf}$ .

63889 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 63890 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 63891 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 63892 shall be raised.

63893 These functions may fail if:

63894 MX **Range Error** The value of  $x$  is subnormal

63895 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 63896 then *errno* shall be set to [ERANGE]. If the integer expression  
 63897 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 63898 floating-point exception shall be raised.

63899 **EXAMPLES**63900 **Taking the Sine of a 45-Degree Angle**

```

63901 #include <math.h>
63902 ...
63903 double radians = 45.0 * M_PI / 180;
63904 double result;
63905 ...
63906 result = sin(radians);

```

63907 **APPLICATION USAGE**

63908 These functions may lose accuracy when their argument is near a multiple of  $\pi$  or is far from 0.0.

63909 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 63910 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

63911 **RATIONALE**

63912 None.

63913 **FUTURE DIRECTIONS**

63914 None.

63915 **SEE ALSO**

63916 *asin()*, *feclearexcept()*, *fetestexcept()*, *isnan()*

63917 XBD Section 4.20 (on page 117), *<math.h>*

63918 **CHANGE HISTORY**

63919 First released in Issue 1. Derived from Issue 1 of the SVID.

63920 **Issue 5**

63921 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes  
 63922 in previous issues.

63923 **Issue 6**

63924 The *sinf()* and *sinl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

63925 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 63926 revised to align with the ISO/IEC 9899:1999 standard.

63927 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 63928 marked.

63929 **Issue 7**

63930 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0585 [68] and XSH/TC1-2008/0586  
 63931 [320] are applied.

63932 **NAME**

63933       sinh, sinh, sinhl — hyperbolic sine functions

63934 **SYNOPSIS**

```
63935     #include <math.h>
63936     double sinh(double x);
63937     float  sinhf(float x);
63938     long double sinhl(long double x);
```

63939 **DESCRIPTION**

63940 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 63941 conflict between the requirements described here and the ISO C standard is unintentional. This  
 63942 volume of POSIX.1-2008 defers to the ISO C standard.

63943       These functions shall compute the hyperbolic sine of their argument *x*.

63944       An application wishing to check for error situations should set *errno* to zero and call  
 63945 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 63946 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 63947 zero, an error has occurred.

63948 **RETURN VALUE**

63949       Upon successful completion, these functions shall return the hyperbolic sine of *x*.

63950       If the result would cause an overflow, a range error shall occur and  $\pm\text{HUGE\_VAL}$ ,  
 63951  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$  (with the same sign as *x*) shall be returned as appropriate for  
 63952 the type of the function.

63953 **MX**       If *x* is NaN, a NaN shall be returned.

63954       If *x* is  $\pm 0$  or  $\pm\text{Inf}$ , *x* shall be returned.

63955       If *x* is subnormal, a range error may occur

63956 **MXX**       and *x* should be returned.

63957 **MX**       If *x* is not returned, *sinh()*, *sinhf()*, and *sinhl()* shall return an implementation-defined value no  
 63958 greater in magnitude than DBL\_MIN, FLT\_MIN, and LDBL\_MIN, respectively.

63959 **ERRORS**

63960       These functions shall fail if:

63961       Range Error       The result would cause an overflow.

63962       If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 63963 then *errno* shall be set to [ERANGE]. If the integer expression  
 63964 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 63965 floating-point exception shall be raised.

63966       These functions may fail if:

63967 **MX**       Range Error       The value *x* is subnormal.

63968       If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 63969 then *errno* shall be set to [ERANGE]. If the integer expression  
 63970 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 63971 floating-point exception shall be raised.

63972 **EXAMPLES**

63973 None.

63974 **APPLICATION USAGE**

63975 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 63976 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

63977 **RATIONALE**

63978 None.

63979 **FUTURE DIRECTIONS**

63980 None.

63986 **Issue 5**

63987 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 63988 text was previously published in the APPLICATION USAGE section.

63989 **Issue 6**63990 The *sinhf()* and *sinhl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

63991 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 63992 revised to align with the ISO/IEC 9899:1999 standard.

63993 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 63994 marked.

63995 **Issue 7**

63996 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0587 [68] is applied.

**63997 NAME**

63998       sinl — sine function

**63999 SYNOPSIS**

64000       #include <math.h>

64001       long double sinl(long double x);

**64002 DESCRIPTION**

64003       Refer to *sin()*.

64004 **NAME**

64005 sleep — suspend execution for an interval of time

64006 **SYNOPSIS**

64007 #include &lt;unistd.h&gt;

64008 unsigned sleep(unsigned *seconds*);64009 **DESCRIPTION**

64010 The *sleep()* function shall cause the calling thread to be suspended from execution until either  
 64011 the number of realtime seconds specified by the argument *seconds* has elapsed or a signal is  
 64012 delivered to the calling thread and its action is to invoke a signal-catching function or to  
 64013 terminate the process. The suspension time may be longer than requested due to the scheduling  
 64014 of other activity by the system.

64015 In single-threaded programs, *sleep()* may make use of SIGALRM. In multi-threaded programs, +  
 64016 *sleep()* shall not make use of SIGALRM and the remainder of this DESCRIPTION does not apply. +

64017 If a SIGALRM signal is generated for the calling process during execution of *sleep()* and if the  
 64018 SIGALRM signal is being ignored or blocked from delivery, it is unspecified whether *sleep()*  
 64019 returns when the SIGALRM signal is scheduled. If the signal is being blocked, it is also  
 64020 unspecified whether it remains pending after *sleep()* returns or it is discarded.

64021 If a SIGALRM signal is generated for the calling process during execution of *sleep()*, except as a  
 64022 result of a prior call to *alarm()*, and if the SIGALRM signal is not being ignored or blocked from  
 64023 delivery, it is unspecified whether that signal has any effect other than causing *sleep()* to return.

64024 If a signal-catching function interrupts *sleep()* and examines or changes either the time a  
 64025 SIGALRM is scheduled to be generated, the action associated with the SIGALRM signal, or  
 64026 whether the SIGALRM signal is blocked from delivery, the results are unspecified.

64027 If a signal-catching function interrupts *sleep()* and calls *siglongjmp()* or *longjmp()* to restore an  
 64028 environment saved prior to the *sleep()* call, the action associated with the SIGALRM signal and  
 64029 the time at which a SIGALRM signal is scheduled to be generated are unspecified. It is also  
 64030 unspecified whether the SIGALRM signal is blocked, unless the signal mask of the process is  
 64031 restored as part of the environment.

64032 XSI Interactions between *sleep()* and *setitimer()* are unspecified.

64033 **RETURN VALUE**

64034 If *sleep()* returns because the requested time has elapsed, the value returned shall be 0. If *sleep()*  
 64035 returns due to delivery of a signal, the return value shall be the “unslept” amount (the requested  
 64036 time minus the time actually slept) in seconds.

64037 **ERRORS**

64038 No errors are defined.

64039 **EXAMPLES**

64040 None.

64041 **APPLICATION USAGE**

64042 None.

64043 **RATIONALE**

64044 There are two general approaches to the implementation of the *sleep()* function. One is to use the  
 64045 *alarm()* function to schedule a SIGALRM signal and then suspend the calling thread waiting for  
 64046 that signal. The other is to implement an independent facility. This volume of POSIX.1-2008  
 64047 permits either approach in single-threaded programs, but the simple alarm/suspend  
 64048 implementation is not appropriate for multi-threaded programs.

In order to comply with the requirement that no primitive shall change a process attribute unless explicitly described by this volume of POSIX.1-2008, an implementation using SIGALRM must carefully take into account any SIGALRM signal scheduled by previous *alarm()* calls, the action previously established for SIGALRM, and whether SIGALRM was blocked. If a SIGALRM has been scheduled before the *sleep()* would ordinarily complete, the *sleep()* must be shortened to that time and a SIGALRM generated (possibly simulated by direct invocation of the signal-catching function) before *sleep()* returns. If a SIGALRM has been scheduled after the *sleep()* would ordinarily complete, it must be rescheduled for the same time before *sleep()* returns. The action and blocking for SIGALRM must be saved and restored.

Historical implementations often implement the SIGALRM-based version using *alarm()* and *pause()*. One such implementation is prone to infinite hangups, as described in *pause()*. Another such implementation uses the C-language *setjmp()* and *longjmp()* functions to avoid that window. That implementation introduces a different problem: when the SIGALRM signal interrupts a signal-catching function installed by the user to catch a different signal, the *longjmp()* aborts that signal-catching function. An implementation based on *sigprocmask()*, *alarm()*, and *sigsuspend()* can avoid these problems.

Despite all reasonable care, there are several very subtle, but detectable and unavoidable, differences between the two types of implementations. These are the cases mentioned in this volume of POSIX.1-2008 where some other activity relating to SIGALRM takes place, and the results are stated to be unspecified. All of these cases are sufficiently unusual as not to be of concern to most applications.

See also the discussion of the term *realtime* in *alarm()*.

Since *sleep()* can be implemented using *alarm()*, the discussion about alarms occurring early under *alarm()* applies to *sleep()* as well.

Application developers should note that the type of the argument *seconds* and the return value of *sleep()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces Application cannot pass a value greater than the minimum guaranteed value for {UINT\_MAX}, which the ISO C standard sets as 65535, and any application passing a larger value is restricting its portability. A different type was considered, but historical implementations, including those with a 16-bit **int** type, consistently use either **unsigned** or **int**.

Scheduling delays may cause the process to return from the *sleep()* function significantly after the requested time. In such cases, the return value should be set to zero, since the formula (requested time minus the time actually spent) yields a negative number and *sleep()* returns an **unsigned**.

## FUTURE DIRECTIONS

A future version of this standard may require that *sleep()* does not make use of SIGALRM in all programs, not just multi-threaded programs.

64096 **NAME**

64097       snprintf — print formatted output

64098 **SYNOPSIS**

64099       #include &lt;stdio.h&gt;

64100       int snprintf(char \*restrict *s*, size\_t *n*,64101           const char \*restrict *format*, ...);64102 **DESCRIPTION**64103       Refer to *fprintf()*.

**64104 NAME**

64105 sockatmark — determine whether a socket is at the out-of-band mark

**64106 SYNOPSIS**

64107 #include <sys/socket.h>

64108 int sockatmark(int s);

**64109 DESCRIPTION**

64110 The *sockatmark()* function shall determine whether the socket specified by the descriptor *s* is at  
64111 the out-of-band data mark (see [Section 2.10.12](#), on page 527). If the protocol for the socket  
64112 supports out-of-band data by marking the stream with an out-of-band data mark, the  
64113 *sockatmark()* function shall return 1 when all data preceding the mark has been read and the out-  
64114 of-band data mark is the first element in the receive queue. The *sockatmark()* function shall not  
64115 remove the mark from the stream.

**64116 RETURN VALUE**

64117 Upon successful completion, the *sockatmark()* function shall return a value indicating whether  
64118 the socket is at an out-of-band data mark. If the protocol has marked the data stream and all data  
64119 preceding the mark has been read, the return value shall be 1; if there is no mark, or if data  
64120 precedes the mark in the receive queue, the *sockatmark()* function shall return 0. Otherwise, it  
64121 shall return a value of -1 and set *errno* to indicate the error.

**64122 ERRORS**

64123 The *sockatmark()* function shall fail if:

64124 [EBADF] The *s* argument is not a valid file descriptor.

64125 [ENOTTY] The file associated with the *s* argument is not a socket.

**64126 EXAMPLES**

64127 None.

**64128 APPLICATION USAGE**

64129 The use of this function between receive operations allows an application to determine which  
64130 received data precedes the out-of-band data and which follows the out-of-band data.

64131 There is an inherent race condition in the use of this function. On an empty receive queue, the  
64132 current read of the location might well be at the “mark”, but the system has no way of knowing  
64133 that the next data segment that will arrive from the network will carry the mark, and  
64134 *sockatmark()* will return false, and the next read operation will silently consume the mark.

64135 Hence, this function can only be used reliably when the application already knows that the out-  
64136 of-band data has been seen by the system or that it is known that there is data waiting to be read  
64137 at the socket (via SIGURG or *select()*). See [Section 2.10.11](#) (on page 526), [Section 2.10.12](#) (on page  
64138 527), [Section 2.10.14](#) (on page 527), and *pselect()* for details.

**64139 RATIONALE**

64140 The *sockatmark()* function replaces the historical SIOCATMARK command to *ioctl()* which  
64141 implemented the same functionality on many implementations. Using a wrapper function  
64142 follows the adopted conventions to avoid specifying commands to the *ioctl()* function, other  
64143 than those now included to support XSI STREAMS. The *sockatmark()* function could be  
64144 implemented as follows:

64145 #include <sys/ioctl.h>

64146 int sockatmark(int s)

64147 {  
64148 int val;

```
64149         if (ioctl(s,SIOCATMARK,&val)==-1)
64150             return(-1);
64151         return(val);
64152     }
```

64153 The use of [ENOTTY] to indicate an incorrect descriptor type matches the historical behavior of  
64154 SIOCATMARK.

64155 **FUTURE DIRECTIONS**

64156 None.

64157 **SEE ALSO**

64158 [Section 2.10.12](#) (on page 527), [pselect\(\)](#), [recv\(\)](#), [recvmsg\(\)](#)

64160 **CHANGE HISTORY**

64161 First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

64162 **Issue 7**

64163 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

**NAME**

socket — create an endpoint for communication

**SYNOPSIS**

```
#include <sys/socket.h>

int socket(int domain, int type, int protocol);
```

**DESCRIPTION**

The *socket()* function shall create an unbound socket in a communications domain, and return a file descriptor that can be used in later function calls that operate on sockets. The file descriptor shall be allocated as described in [Section 2.14](#) (on page 549).

The *socket()* function takes the following arguments:

|                 |                                                                                                                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>domain</i>   | Specifies the communications domain in which a socket is to be created.                                                                                                                                |
| <i>type</i>     | Specifies the type of socket to be created.                                                                                                                                                            |
| <i>protocol</i> | Specifies a particular protocol to be used with the socket. Specifying a <i>protocol</i> of 0 causes <i>socket()</i> to use an unspecified default protocol appropriate for the requested socket type. |

The *domain* argument specifies the address family used in the communications domain. The address families supported by the system are implementation-defined.

Symbolic constants that can be used for the domain argument are defined in the `<sys/socket.h>` header.

The *type* argument specifies the socket type, which determines the semantics of communication over the socket. The following socket types are defined; implementations may specify additional socket types:

**SOCK\_STREAM** Provides sequenced, reliable, bidirectional, connection-mode byte streams, and may provide a transmission mechanism for out-of-band data.

**SOCK\_DGRAM** Provides datagrams, which are connectionless-mode, unreliable messages of fixed maximum length.

**SOCK\_SEQPACKET**

Provides sequenced, reliable, bidirectional, connection-mode transmission paths for records. A record can be sent using one or more output operations and received using one or more input operations, but a single operation never transfers part of more than one record. Record boundaries are visible to the receiver via the MSG\_EOR flag.

If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address family. If the *protocol* argument is zero, the default protocol for this address family and type shall be used. The protocols supported by the system are implementation-defined.

The process may need to have appropriate privileges to use the *socket()* function or to create some sockets.

**RETURN VALUE**

Upon successful completion, *socket()* shall return a non-negative integer, the socket file descriptor. Otherwise, a value of `-1` shall be returned and *errno* set to indicate the error.

**ERRORS**

The *socket()* function shall fail if:

[EAFNOSUPPORT]

The implementation does not support the specified address family.

[EMFILE]

All file descriptors available to the process are currently open.

[ENFILE]

No more file descriptors are available for the system.

[EPROTONOSUPPORT]

The protocol is not supported by the address family, or the protocol is not supported by the implementation.

[EPROTOTYPE] The socket type is not supported by the protocol.

The *socket()* function may fail if:

[EACCES]

The process does not have appropriate privileges.

[ENOBUFS]

Insufficient resources were available in the system to perform the operation.

[ENOMEM]

Insufficient memory was available to fulfill the request.

**EXAMPLES**

None.

**APPLICATION USAGE**

The documentation for specific address families specifies which protocols each address family supports. The documentation for specific protocols specifies which socket types each protocol supports.

The application can determine whether an address family is supported by trying to create a socket with *domain* set to the protocol in question.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

XBD <netinet/in.h>, <sys/socket.h>

**CHANGE HISTORY**

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

**NAME**

socketpair — create a pair of connected sockets

**SYNOPSIS**

```
#include <sys/socket.h>

int socketpair(int domain, int type, int protocol,
               int socket_vector[2]);
```

**DESCRIPTION**

The *socketpair()* function shall create an unbound pair of connected sockets in a specified *domain*, of a specified *type*, under the protocol optionally specified by the *protocol* argument. The two sockets shall be identical. The file descriptors used in referencing the created sockets shall be returned in *socket\_vector*[0] and *socket\_vector*[1]. The file descriptors shall be allocated as described in [Section 2.14](#) (on page 549).

The *socketpair()* function takes the following arguments:

|                      |                                                                                                                                                                                                             |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>domain</i>        | Specifies the communications domain in which the sockets are to be created.                                                                                                                                 |
| <i>type</i>          | Specifies the type of sockets to be created.                                                                                                                                                                |
| <i>protocol</i>      | Specifies a particular protocol to be used with the sockets. Specifying a <i>protocol</i> of 0 causes <i>socketpair()</i> to use an unspecified default protocol appropriate for the requested socket type. |
| <i>socket_vector</i> | Specifies a 2-integer array to hold the file descriptors of the created socket pair.                                                                                                                        |

The *type* argument specifies the socket type, which determines the semantics of communications over the socket. The following socket types are defined; implementations may specify additional socket types:

|                |                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SOCK_STREAM    | Provides sequenced, reliable, bidirectional, connection-mode byte streams, and may provide a transmission mechanism for out-of-band data.                                                                                                                                                                                                       |
| SOCK_DGRAM     | Provides datagrams, which are connectionless-mode, unreliable messages of fixed maximum length.                                                                                                                                                                                                                                                 |
| SOCK_SEQPACKET | Provides sequenced, reliable, bidirectional, connection-mode transmission paths for records. A record can be sent using one or more output operations and received using one or more input operations, but a single operation never transfers part of more than one record. Record boundaries are visible to the receiver via the MSG_EOR flag. |

If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address family. If the *protocol* argument is zero, the default protocol for this address family and type shall be used. The protocols supported by the system are implementation-defined.

The process may need to have appropriate privileges to use the *socketpair()* function or to create some sockets.

**RETURN VALUE**

Upon successful completion, this function shall return 0; otherwise,  $-1$  shall be returned and *errno* set to indicate the error, no file descriptors shall be allocated, and the contents of *socket\_vector* shall be left unmodified.

**ERRORS**

The *socketpair*( ) function shall fail if:

[EAFNOSUPPORT]

The implementation does not support the specified address family.

[EMFILE]

All, or all but one, of the file descriptors available to the process are currently open.

[ENFILE]

No more file descriptors are available for the system.

[EOPNOTSUPP] The specified protocol does not permit creation of socket pairs.

[EPROTONOSUPPORT]

The protocol is not supported by the address family, or the protocol is not supported by the implementation.

[EPROTOTYPE] The socket type is not supported by the protocol.

The *socketpair*( ) function may fail if:

[EACCES]

The process does not have appropriate privileges.

[ENOBUFS]

Insufficient resources were available in the system to perform the operation.

[ENOMEM]

Insufficient memory was available to fulfill the request.

**EXAMPLES**

None.

**APPLICATION USAGE**

The documentation for specific address families specifies which protocols each address family supports. The documentation for specific protocols specifies which socket types each protocol supports.

The *socketpair*( ) function is used primarily with UNIX domain sockets and need not be supported for other domains.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

[Section 2.14](#) (on page 549), *socket*( )

XBD [<sys/socket.h>](#)

**CHANGE HISTORY**

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

**Issue 7**

The description of the [EMFILE] error condition is aligned with the *pipe*( ) function.

64312 **NAME**

64313        sprintf — print formatted output

64314 **SYNOPSIS**

64315        #include &lt;stdio.h&gt;

64316        int sprintf(char \*restrict *s*, const char \*restrict *format*, ...);64317 **DESCRIPTION**64318        Refer to *fprintf()*.

64319 **NAME**

64320 sqrt, sqrtf, sqrtl — square root function

64321 **SYNOPSIS**

```
64322 #include <math.h>
64323 double sqrt(double x);
64324 float sqrtf(float x);
64325 long double sqrtl(long double x);
```

64326 **DESCRIPTION**

64327 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 64328 conflict between the requirements described here and the ISO C standard is unintentional. This  
 64329 volume of POSIX.1-2008 defers to the ISO C standard.

64330 These functions shall compute the square root of their argument  $x$ ,  $\sqrt{x}$ .

64331 An application wishing to check for error situations should set *errno* to zero and call  
 64332 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 64333 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 64334 zero, an error has occurred.

64335 **RETURN VALUE**

64336 Upon successful completion, these functions shall return the square root of  $x$ .

64337 MX For finite values of  $x < -0$ , a domain error shall occur, and either a NaN (if supported), or an  
 64338 implementation-defined value shall be returned.

64339 MX If  $x$  is NaN, a NaN shall be returned.

64340 If  $x$  is  $\pm 0$  or  $+\text{Inf}$ ,  $x$  shall be returned.

64341 If  $x$  is  $-\text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

64342 **ERRORS**

64343 These functions shall fail if:

64344 MX Domain Error The finite value of  $x$  is  $< -0$ , or  $x$  is  $-\text{Inf}$ .

64345 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 64346 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 64347 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 64348 shall be raised.

64349 **EXAMPLES**64350 **Taking the Square Root of 9.0**

```
64351 #include <math.h>
64352 ...
64353 double x = 9.0;
64354 double result;
64355 ...
64356 result = sqrt(x);
```

64357 **APPLICATION USAGE**

64358 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 64359 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

64360 **RATIONALE**

64361 None.

64362 **FUTURE DIRECTIONS**

64363 None.

64364 **SEE ALSO**64365 *feclearexcept()*, *fetestexcept()*, *isnan()*64366 XBD Section 4.20 (on page 117), *<math.h>*, *<stdio.h>*64367 **CHANGE HISTORY**

64368 First released in Issue 1. Derived from Issue 1 of the SVID.

64369 **Issue 5**64370 The DESCRIPTION is updated to indicate how an application should check for an error. This  
64371 text was previously published in the APPLICATION USAGE section.64372 **Issue 6**64373 The *sqrtrf()* and *sqrtrl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.64374 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
64375 revised to align with the ISO/IEC 9899:1999 standard.64376 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
64377 marked.64378 **Issue 7**

64379 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0588 [320] is applied.

64380 **NAME**

64381       srand — pseudo-random number generator

64382 **SYNOPSIS**

64383       #include &lt;stdlib.h&gt;

64384       void srand(unsigned seed);

64385 **DESCRIPTION**64386       Refer to *rand()*.

64387 **NAME**

64388       srand48 — seed the uniformly distributed double-precision pseudo-random number generator

64389 **SYNOPSIS**

```
64390 XSI      #include <stdlib.h>
64391          void srand48(long seedval);
```

64392 **DESCRIPTION**64393       Refer to *drand48()*.

## 64394 NAME

64395 srandom — seed pseudo-random number generator

## 64396 SYNOPSIS

64397 XSI `#include <stdlib.h>`

64398 `void srandom(unsigned seed);`

## 64399 DESCRIPTION

64400 Refer to *initstate()*.

64401 **NAME**

64402       scanf — convert formatted input

64403 **SYNOPSIS**

64404       #include &lt;stdio.h&gt;

64405       int sscanf(const char \*restrict *s*, const char \*restrict *format*, ...);64406 **DESCRIPTION**64407       Refer to *fscanf()*.

64408 **NAME**

64409       stat — get file status

64410 **SYNOPSIS**

64411       #include &lt;sys/stat.h&gt;

64412       int stat(const char \*restrict *path*, struct stat \*restrict *buf*);64413 **DESCRIPTION**64414       Refer to *fstatat()*.

64415 **NAME**

64416 statvfs — get file system information

64417 **SYNOPSIS**

64418 #include &lt;sys/statvfs.h&gt;

64419 int statvfs(const char \*restrict *path*, struct statvfs \*restrict *buf*);64420 **DESCRIPTION**64421 Refer to *fstatvfs()*.

## 64422 NAME

64423 stderr, stdin, stdout — standard I/O streams

## 64424 SYNOPSIS

```
64425 #include <stdio.h>
64426 extern FILE *stderr, *stdin, *stdout;
```

## 64427 DESCRIPTION

64428 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
64429 conflict between the requirements described here and the ISO C standard is unintentional. This  
64430 volume of POSIX.1-2008 defers to the ISO C standard.

64431 A file with associated buffering is called a *stream* and is declared to be a pointer to a defined type  
64432 **FILE**. The *fopen()* function shall create certain descriptive data for a stream and return a pointer  
64433 to designate the stream in all further transactions. Normally, there are three open streams with  
64434 constant pointers declared in the **<stdio.h>** header and associated with the standard open files.

64435 At program start-up, three streams shall be predefined and need not be opened explicitly:  
64436 *standard input* (for reading conventional input), *standard output* (for writing conventional output),  
64437 and *standard error* (for writing diagnostic output). When opened, the standard error stream is not  
64438 fully buffered; the standard input and standard output streams are fully buffered if and only if  
64439 the stream can be determined not to refer to an interactive device.

64440 CX The following symbolic values in **<unistd.h>** define the file descriptors that shall be associated  
64441 with the C-language *stdin*, *stdout*, and *stderr* when the application is started:

|       |                                                                          |                                                        |
|-------|--------------------------------------------------------------------------|--------------------------------------------------------|
| 64442 | STDIN_FILENO                                                             | Standard input value, <i>stdin</i> . Its value is 0.   |
| 64443 | STDOUT_FILENO                                                            | Standard output value, <i>stdout</i> . Its value is 1. |
| 64444 | STDERR_FILENO                                                            | Standard error value, <i>stderr</i> . Its value is 2.  |
| 64445 | The <i>stderr</i> stream is expected to be open for reading and writing. |                                                        |

64462 **CHANGE HISTORY**

64463 First released in Issue 1.

64464 **Issue 6**

64465 Extensions beyond the ISO C standard are marked.

64466 A note that *stderr* is expected to be open for reading and writing is added to the DESCRIPTION.

64467 **NAME**

64468       strcpy — copy a string and return a pointer to the end of the result

64469 **SYNOPSIS**

```
64470 CX       #include <string.h>
64471       char *strcpy(char *restrict s1, const char *restrict s2);
```

64472 **DESCRIPTION**64473       Refer to *strcpy()*.

64474 **NAME**

64475 stpncpy — copy fixed length string, returning a pointer to the array end

64476 **SYNOPSIS**64477 CX `#include <string.h>`64478 `char *stpncpy(char *restrict s1, const char *restrict s2, size_t size);`64479 **DESCRIPTION**64480 Refer to *strncpy()*.

**NAME**

strcasemp, strcasemp\_l, strncasemp, strncasemp\_l — case-insensitive string comparisons

**SYNOPSIS**

```
#include <strings.h>

int strcasemp(const char *s1, const char *s2);
int strcasemp_l(const char *s1, const char *s2,
    locale_t locale);
int strncasemp(const char *s1, const char *s2, size_t n);
int strncasemp_l(const char *s1, const char *s2,
    size_t n, locale_t locale);
```

**DESCRIPTION**

The *strcasemp()* and *strcasemp\_l()* functions shall compare, while ignoring differences in case, the string pointed to by *s1* to the string pointed to by *s2*. The *strncasemp()* and *strncasemp\_l()* functions shall compare, while ignoring differences in case, not more than *n* bytes from the string pointed to by *s1* to the string pointed to by *s2*.

The *strcasemp()* and *strncasemp()* functions use the current locale to determine the case of the characters.

The *strcasemp\_l()* and *strncasemp\_l()* functions use the locale represented by *locale* to determine the case of the characters.

When the *LC\_CTYPE* category of the locale being used is from the POSIX locale, these functions shall behave as if the strings had been converted to lowercase and then a byte comparison performed. Otherwise, the results are unspecified.

The behavior is undefined if the *locale* argument to *strcasemp\_l()* or *strncasemp\_l()* is the special locale object *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.

**RETURN VALUE**

Upon completion, *strcasemp()* and *strcasemp\_l()* shall return an integer greater than, equal to, or less than 0, if the string pointed to by *s1* is, ignoring case, greater than, equal to, or less than the string pointed to by *s2*, respectively.

Upon successful completion, *strncasemp()* and *strncasemp\_l()* shall return an integer greater than, equal to, or less than 0, if the possibly null-terminated array pointed to by *s1* is, ignoring case, greater than, equal to, or less than the possibly null-terminated array pointed to by *s2*, respectively.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

64523 **SEE ALSO**64524 [\*wscasecmp\(\)\*](#)64525 XBD [\*\*<strings.h>\*\*](#)64526 **CHANGE HISTORY**

64527 First released in Issue 4, Version 2.

64528 **Issue 5**

64529 Moved from X/OPEN UNIX extension to BASE.

64530 **Issue 7**64531 The *strcasecmp()* and *strncasecmp()* functions are moved from the XSI option to the Base.64532 The *strcasecmp\_l()* and *strncasecmp\_l()* functions are added from The Open Group Technical  
64533 Standard, 2006, Extended API Set Part 4.64534 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0589 [302], XSH/TC1-2008/0590 [294],  
64535 XSH/TC1-2008/0591 [283], and XSH/TC1-2008/0592 [283] are applied.

64536 **NAME**

64537       strcat — concatenate two strings

64538 **SYNOPSIS**

64539       #include &lt;string.h&gt;

64540       char \*strcat(char \*restrict s1, const char \*restrict s2);

64541 **DESCRIPTION**

64542 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
64543 conflict between the requirements described here and the ISO C standard is unintentional. This  
64544 volume of POSIX.1-2008 defers to the ISO C standard.

64545       The *strcat()* function shall append a copy of the string pointed to by *s2* (including the  
64546 terminating NUL character) to the end of the string pointed to by *s1*. The initial byte of *s2*  
64547 overwrites the NUL character at the end of *s1*. If copying takes place between objects that  
64548 overlap, the behavior is undefined.

64549 **RETURN VALUE**64550       The *strcat()* function shall return *s1*; no return value is reserved to indicate an error.64551 **ERRORS**

64552       No errors are defined.

64553 **EXAMPLES**

64554       None.

64555 **APPLICATION USAGE**

64556       This version is aligned with the ISO C standard; this does not affect compatibility with XPG3  
64557 applications. Reliable error detection by this function was never guaranteed.

64558 **RATIONALE**

64559       None.

64560 **FUTURE DIRECTIONS**

64561       None.

64562 **SEE ALSO**64563       [\*strncat\(\)\*](#)64564       XBD [\*<string.h>\*](#)64565 **CHANGE HISTORY**

64566       First released in Issue 1. Derived from Issue 1 of the SVID.

64567 **Issue 6**64568       The *strcat()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

64569 **NAME**

64570       strchr — string scanning operation

64571 **SYNOPSIS**

64572       #include &lt;string.h&gt;

64573       char \*strchr(const char \*s, int c);

64574 **DESCRIPTION**

64575 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
64576       conflict between the requirements described here and the ISO C standard is unintentional. This  
64577       volume of POSIX.1-2008 defers to the ISO C standard.

64578       The *strchr()* function shall locate the first occurrence of *c* (converted to a **char**) in the string  
64579       pointed to by *s*. The terminating NUL character is considered to be part of the string.

64580 **RETURN VALUE**

64581       Upon completion, *strchr()* shall return a pointer to the byte, or a null pointer if the byte was not  
64582       found.

64583 **ERRORS**

64584       No errors are defined.

64585 **EXAMPLES**

64586       None.

64587 **APPLICATION USAGE**

64588       None.

64589 **RATIONALE**

64590       None.

64591 **FUTURE DIRECTIONS**

64592       None.

64593 **SEE ALSO**64594       [strrchr\(\)](#)64595       XBD [<string.h>](#)64596 **CHANGE HISTORY**

64597       First released in Issue 1. Derived from Issue 1 of the SVID.

64598 **Issue 6**

64599       Extensions beyond the ISO C standard are marked.

## 64600 NAME

64601 strcmp — compare two strings

## 64602 SYNOPSIS

64603 #include &lt;string.h&gt;

64604 int strcmp(const char \*s1, const char \*s2);

## 64605 DESCRIPTION

64606 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
64607 conflict between the requirements described here and the ISO C standard is unintentional. This  
64608 volume of POSIX.1-2008 defers to the ISO C standard.

64609 The *strcmp()* function shall compare the string pointed to by *s1* to the string pointed to by *s2*.

64610 The sign of a non-zero return value shall be determined by the sign of the difference between the  
64611 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings  
64612 being compared.

## 64613 RETURN VALUE

64614 Upon completion, *strcmp()* shall return an integer greater than, equal to, or less than 0, if the  
64615 string pointed to by *s1* is greater than, equal to, or less than the string pointed to by *s2*,  
64616 respectively.

## 64617 ERRORS

64618 No errors are defined.

## 64619 EXAMPLES

## 64620 Checking a Password Entry

64621 The following example compares the information read from standard input to the value of the  
64622 name of the user entry. If the *strcmp()* function returns 0 (indicating a match), a further check  
64623 will be made to see if the user entered the proper old password. The *crypt()* function shall  
64624 encrypt the old password entered by the user, using the value of the encrypted password in the  
64625 **passwd** structure as the salt. If this value matches the value of the encrypted **passwd** in the  
64626 structure, the entered password *oldpasswd* is the correct user's password. Finally, the program  
64627 encrypts the new password so that it can store the information in the **passwd** structure.

```
64628 #include <string.h>
64629 #include <unistd.h>
64630 #include <stdio.h>
64631 ...
64632 int valid_change;
64633 struct passwd *p;
64634 char user[100];
64635 char oldpasswd[100];
64636 char newpasswd[100];
64637 char savepasswd[100];
64638 ...
64639 if (strcmp(p->pw_name, user) == 0) {
64640     if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
64641         strcpy(savepasswd, crypt(newpasswd, user));
64642         p->pw_passwd = savepasswd;
64643         valid_change = 1;
64644     }
64645     else {
```

```
64646         fprintf(stderr, "Old password is not valid\n");
64647     }
64648 }
64649 ...
```

**64650 APPLICATION USAGE**

64651 None.

**64652 RATIONALE**

64653 None.

**64659 CHANGE HISTORY**

64660 First released in Issue 1. Derived from Issue 1 of the SVID.

**64661 Issue 6**

64662 Extensions beyond the ISO C standard are marked.

## 64663 NAME

64664 strcoll, strcoll\_l — string comparison using collating information

## 64665 SYNOPSIS

```
64666 #include <string.h>
64667 int strcoll(const char *s1, const char *s2);
64668 CX int strcoll_l(const char *s1, const char *s2,
64669 locale_t locale);
```

## 64670 DESCRIPTION

64671 CX For *strcoll()*: The functionality described on this reference page is aligned with the ISO C  
 64672 standard. Any conflict between the requirements described here and the ISO C standard is  
 64673 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

64674 CX The *strcoll()* and *strcoll\_l()* functions shall compare the string pointed to by *s1* to the string  
 64675 pointed to by *s2*, both interpreted as appropriate to the *LC\_COLLATE* category of the current  
 64676 CX locale, or of the locale represented by *locale*, respectively.

64677 CX The *strcoll()* and *strcoll\_l()* functions shall not change the setting of *errno* if successful.

64678 Since no return value is reserved to indicate an error, an application wishing to check for error  
 64679 CX situations should set *errno* to 0, then call *strcoll()*, or *strcoll\_l()* then check *errno*.

64680 CX The behavior is undefined if the *locale* argument to *strcoll\_l()* is the special locale object  
 64681 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

## 64682 RETURN VALUE

64683 Upon successful completion, *strcoll()* shall return an integer greater than, equal to, or less than 0,  
 64684 according to whether the string pointed to by *s1* is greater than, equal to, or less than the string  
 64685 CX pointed to by *s2* when both are interpreted as appropriate to the current locale. On error,  
 64686 *strcoll()* may set *errno*, but no return value is reserved to indicate an error.

64687 Upon successful completion, *strcoll\_l()* shall return an integer greater than, equal to, or less than  
 64688 0, according to whether the string pointed to by *s1* is greater than, equal to, or less than the  
 64689 string pointed to by *s2* when both are interpreted as appropriate to the locale represented by  
 64690 *locale*. On error, *strcoll\_l()* may set *errno*, but no return value is reserved to indicate an error.

## 64691 ERRORS

64692 These functions may fail if:

64693 CX [EINVAL] The *s1* or *s2* arguments contain characters outside the domain of the collating  
 64694 sequence.

## 64695 EXAMPLES

## 64696 Comparing Nodes

64697 The following example uses an application-defined function, *node\_compare()*, to compare two  
 64698 nodes based on an alphabetical ordering of the *string* field.

```
64699 #include <string.h>
64700 ...
64701 struct node { /* These are stored in the table. */
64702     char *string;
64703     int length;
64704 };
64705 ...
```

```

64706     int node_compare(const void *node1, const void *node2)
64707     {
64708         return strcoll(((const struct node *)node1)->string,
64709                     ((const struct node *)node2)->string);
64710     }
64711     ...

```

#### 64712 APPLICATION USAGE

64713 The *strxfrm()* and *strcmp()* functions should be used for sorting large lists.

#### 64714 RATIONALE

64715 None.

#### 64716 FUTURE DIRECTIONS

64717 None.

#### 64718 SEE ALSO

64719 *alphasort()*, *strcmp()*, *strxfrm()*

64720 XBD <string.h>

#### 64721 CHANGE HISTORY

64722 First released in Issue 3.

#### 64723 Issue 5

64724 The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.

#### 64725 Issue 6

64726 Extensions beyond the ISO C standard are marked.

64727 The following new requirements on POSIX implementations derive from alignment with the  
64728 Single UNIX Specification:

- 64729 • The [EINVAL] optional error condition is added.

64730 An example is added.

#### 64731 Issue 7

64732 The *strcoll\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
64733 Set Part 4.

64734 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0593 [283] and XSH/TC1-2008/0594  
64735 [283] are applied.

**NAME**

strcpy, strcpy — copy a string and return a pointer to the end of the result

**SYNOPSIS**

```
#include <string.h>
```

```
char *stpcpy(char *restrict s1, const char *restrict s2);
char *strcpy(char *restrict s1, const char *restrict s2);
```

**DESCRIPTION**

For *stpcpy()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *stpcpy()* and *strcpy()* functions shall copy the string pointed to by *s2* (including the terminating NUL character) into the array pointed to by *s1*.

If copying takes place between objects that overlap, the behavior is undefined.

**RETURN VALUE**

The *stpcpy()* function shall return a pointer to the terminating NUL character copied into the *s1* buffer.

The *strcpy()* function shall return *s1*.

No return values are reserved to indicate an error.

**ERRORS**

No errors are defined.

**EXAMPLES****Construction of a Multi-Part Message in a Single Buffer**

```
#include <string.h>
#include <stdio.h>

int
main (void)
{
    char buffer [10];
    char *name = buffer;

    name = stpcpy (stpcpy (stpcpy (name, "ice"), "-"), "cream");
    puts (buffer);
    return 0;
}
```

**Initializing a String**

The following example copies the string "-----" into the *permstring* variable.

```
#include <string.h>
...
static char permstring[11];
...
strcpy(permstring, "-----");
...
```

**Storing a Key and Data**

The following example allocates space for a key using *malloc()* then uses *strcpy()* to place the key there. Then it allocates space for data using *malloc()*, and uses *strcpy()* to place data there. (The user-defined function *dbfree()* frees memory previously allocated to an array of type **struct element** \*.)

```
#include <string.h>
#include <stdlib.h>
#include <stdio.h>
...
/* Structure used to read data and store it. */
struct element {
    char *key;
    char *data;
};

struct element *tbl, *curtbl;
char *key, *data;
int count;
...
void dbfree(struct element *, int);
...
if ((curtbl->key = malloc(strlen(key) + 1)) == NULL) {
    perror("malloc"); dbfree(tbl, count); return NULL;
}
strcpy(curtbl->key, key);

if ((curtbl->data = malloc(strlen(data) + 1)) == NULL) {
    perror("malloc"); free(curtbl->key); dbfree(tbl, count); return NULL;
}
strcpy(curtbl->data, data);
...
```

**APPLICATION USAGE**

Character movement is performed differently in different implementations. Thus, overlapping moves may yield surprises.

This version is aligned with the ISO C standard; this does not affect compatibility with XPG3 applications. Reliable error detection by this function was never guaranteed.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

64820 **Issue 6**

64821 The *strcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

64822 **Issue 7**

64823 The *strcpy()* function is added from The Open Group Technical Standard, 2006, Extended API  
64824 Set Part 1.

64825 **NAME**

64826 strcspn — get the length of a complementary substring

64827 **SYNOPSIS**

64828 #include &lt;string.h&gt;

64829 size\_t strcspn(const char \*s1, const char \*s2);

64830 **DESCRIPTION**

64831 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 64832 conflict between the requirements described here and the ISO C standard is unintentional. This  
 64833 volume of POSIX.1-2008 defers to the ISO C standard.

64834 The *strcspn()* function shall compute the length (in bytes) of the maximum initial segment of the  
 64835 string pointed to by *s1* which consists entirely of bytes *not* from the string pointed to by *s2*.

64836 **RETURN VALUE**

64837 The *strcspn()* function shall return the length of the computed segment of the string pointed to  
 64838 by *s1*; no return value is reserved to indicate an error.

64839 **ERRORS**

64840 No errors are defined.

64841 **EXAMPLES**

64842 None.

64843 **APPLICATION USAGE**

64844 None.

64845 **RATIONALE**

64846 None.

64847 **FUTURE DIRECTIONS**

64848 None.

64849 **SEE ALSO**64850 *strspn()*

64851 XBD &lt;string.h&gt;

64852 **CHANGE HISTORY**

64853 First released in Issue 1. Derived from Issue 1 of the SVID.

64854 **Issue 5**

64855 The RETURN VALUE section is updated to indicate that *strcspn()* returns the length of *s1*, and  
 64856 not *s1* itself as was previously stated.

64857 **Issue 6**

64858 The Open Group Corrigendum U030/1 is applied. The text of the RETURN VALUE section is  
 64859 updated to indicate that the computed segment length is returned, not the *s1* length.

**NAME**

strdup, strndup — duplicate a specific number of bytes from a string

**SYNOPSIS**

```
CX      #include <string.h>
char *strdup(const char *s);
char *strndup(const char *s, size_t size);
```

**DESCRIPTION**

The *strdup()* function shall return a pointer to a new string, which is a duplicate of the string pointed to by *s*. The returned pointer can be passed to *free()*. A null pointer is returned if the new string cannot be created.

The *strndup()* function shall be equivalent to the *strdup()* function, duplicating the provided *s* in a new block of memory allocated as if by using *malloc()*, with the exception being that *strndup()* copies at most *size* plus one bytes into the newly allocated memory, terminating the new string with a NUL character. If the length of *s* is larger than *size*, only *size* bytes shall be duplicated. If *size* is larger than the length of *s*, all bytes in *s* shall be copied into the new memory buffer, including the terminating NUL character. The newly created string shall always be properly terminated.

**RETURN VALUE**

The *strdup()* function shall return a pointer to a new string on success. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

Upon successful completion, the *strndup()* function shall return a pointer to the newly allocated memory containing the duplicated string. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

**ERRORS**

These functions shall fail if:

[ENOMEM] Storage space available is insufficient.

**EXAMPLES**

None.

**APPLICATION USAGE**

For functions that allocate memory as if by *malloc()*, the application should release such memory when it is no longer required by a call to *free()*. For *strdup()* and *strndup()*, this is the return value.

Implementations are free to *malloc()* a buffer containing either (*size* + 1) bytes or (*strlen( s, size)* + 1) bytes. Applications should not assume that *strndup()* will allocate (*size* + 1) bytes when *strlen( s)* is smaller than *size*.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

64905 Moved from X/OPEN UNIX extension to BASE.

64906 **Issue 7**64907 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [ENOMEM]  
64908 error to become a “shall fail” error.64909 The *strdup()* function is moved from the XSI option to the Base.64910 The *strndup()* function is added from The Open Group Technical Standard, 2006, Extended API  
64911 Set Part 1.64912 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by  
64913 *malloc()*.

## 64914 NAME

64915       strerror, strerror\_l, strerror\_r — get error message string

## 64916 SYNOPSIS

64917       #include &lt;string.h&gt;

64918       char \*strerror(int errnum);

64919 CX       char \*strerror\_l(int errnum, locale\_t locale);

64920       int strerror\_r(int errnum, char \*strerrbuf, size\_t buflen);

## 64921 DESCRIPTION

64922 CX       For *strerror()*: The functionality described on this reference page is aligned with the ISO C  
 64923 standard. Any conflict between the requirements described here and the ISO C standard is  
 64924 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

64925       The *strerror()* function shall map the error number in *errnum* to a locale-dependent error  
 64926 message string and shall return a pointer to it. Typically, the values for *errnum* come from *errno*,  
 64927 but *strerror()* shall map any value of type *int* to a message.

64928 CX       The application shall not modify the string returned. The returned string pointer might be  
 64929 CX       invalidated or the string content might be overwritten by a subsequent call to *strerror()*, or by a  
 64930 subsequent call to *strerror\_l()* in the same thread. The returned pointer and the string content  
 64931 might also be invalidated if the calling thread is terminated.

64932 CX       The string may be overwritten by a subsequent call to *strerror\_l()* in the same thread.

64933       The contents of the error message strings returned by *strerror()* should be determined by the  
 64934 setting of the *LC\_MESSAGES* category in the current locale.

64935       The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
 64936 *strerror()*.

64937 CX       The *strerror()* and *strerror\_l()* functions shall not change the setting of *errno* if successful.

64938       Since no return value is reserved to indicate an error of *strerror()*, an application wishing to  
 64939 check for error situations should set *errno* to 0, then call *strerror()*, then check *errno*. Similarly,  
 64940 since *strerror\_l()* is required to return a string for some errors, an application wishing to check  
 64941 for all error situations should set *errno* to 0, then call *strerror\_l()*, then check *errno*.

64942       The *strerror()* function need not be thread-safe.

64943       The *strerror\_l()* function shall map the error number in *errnum* to a locale-dependent error  
 64944 message string in the locale represented by *locale* and shall return a pointer to it.

64945       The *strerror\_r()* function shall map the error number in *errnum* to a locale-dependent error  
 64946 message string and shall return the string in the buffer pointed to by *strerrbuf*, with length  
 64947 *buflen*.

64948 CX       If the value of *errnum* is a valid error number, the message string shall indicate what error  
 64949 occurred; if the value of *errnum* is zero, the message string shall either be an empty string or  
 64950 indicate that no error occurred; otherwise, if these functions complete successfully, the message  
 64951 string shall indicate that an unknown error occurred.

64952 CX       The behavior is undefined if the *locale* argument to *strerror\_l()* is the special locale object  
 64953 *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.

**RETURN VALUE**

Upon completion, whether successful or not, *strerror()* shall return a pointer to the generated message string. On error *errno* may be set, but no return value is reserved to indicate an error.

Upon successful completion, *strerror\_l()* shall return a pointer to the generated message string. If *errnum* is not a valid error number, *errno* may be set to [EINVAL], but a pointer to a message string shall still be returned. If any other error occurs, *errno* shall be set to indicate the error and a null pointer shall be returned.

Upon successful completion, *strerror\_r()* shall return 0. Otherwise, an error number shall be returned to indicate the error.

**ERRORS**

These functions may fail if:

[EINVAL] The value of *errnum* is neither a valid error number nor zero.

The *strerror\_r()* function may fail if:

[ERANGE] Insufficient storage was supplied via *strerrbuf* and *buflen* to contain the generated message string.

**EXAMPLES**

None.

**APPLICATION USAGE**

Historically in some implementations, calls to *perror()* would overwrite the string that the pointer returned by *strerror()* points to. Such implementations did not conform to the ISO C standard; however, application developers should be aware of this behavior if they wish their applications to be portable to such implementations.

**RATIONALE**

The *strerror\_l()* function is required to be thread-safe, thereby eliminating the need for an equivalent to the *strerror\_r()* function.

Earlier versions of this standard did not explicitly require that the error message strings returned by *strerror()* and *strerror\_r()* provide any information about the error. This version of the standard requires a meaningful message for any successful completion.

Since no return value is reserved to indicate a *strerror()* error, but all calls (whether successful or not) must return a pointer to a message string, on error *strerror()* can return a pointer to an empty string or a pointer to a meaningful string that can be printed.

Note that the [EINVAL] error condition is a may fail error. If an invalid error number is supplied as the value of *errnum*, applications should be prepared to handle any of the following:

1. Error (with no meaningful message): *errno* is set to [EINVAL], the return value is a pointer to an empty string.
2. Successful completion: *errno* is unchanged and the return value points to a string like "unknown error" or "error number xxx" (where xxx is the value of *errnum*).
3. Combination of #1 and #2: *errno* is set to [EINVAL] and the return value points to a string like "unknown error" or "error number xxx" (where xxx is the value of *errnum*). Since applications frequently use the return value of *strerror()* as an argument to functions like *fprintf()* (without checking the return value) and since applications have no way to parse an error message string to determine whether *errnum* represents a valid error number, implementations are encouraged to implement #3. Similarly, implementations are encouraged to have *strerror\_r()* return [EINVAL] and put a string

64998 like "unknown error" or "error number xxx" in the buffer pointed to by *strerrbuf*  
64999 when the value of *errnum* is not a valid error number.

65000 Some applications rely on being able to set *errno* to 0 before calling a function with no reserved  
65001 value to indicate an error, then call *strerror(errno)* afterwards to detect whether an error occurred  
65002 (because *errno* changed) or to indicate success (because *errno* remained zero). This usage pattern  
65003 requires that *strerror(0)* succeed with useful results. Previous versions of the standard did not  
65004 specify the behavior when *errnum* is zero.

#### 65005 FUTURE DIRECTIONS

65006 None.

#### 65007 SEE ALSO

65008 *perror()*

65009 XBD <string.h>

#### 65010 CHANGE HISTORY

65011 First released in Issue 3.

#### 65012 Issue 5

65013 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

65014 A note indicating that the *strerror()* function need not be reentrant is added to the  
65015 DESCRIPTION.

#### 65016 Issue 6

65017 Extensions beyond the ISO C standard are marked.

65018 The following new requirements on POSIX implementations derive from alignment with the  
65019 Single UNIX Specification:

- 65020 • In the RETURN VALUE section, the fact that *errno* may be set is added.
- 65021 • The [EINVAL] optional error condition is added.

65022 The normative text is updated to avoid use of the term “must” for application requirements.

65023 The *strerror\_r()* function is added in response to IEEE PASC Interpretation 1003.1c #39.

65024 The *strerror\_r()* function is marked as part of the Thread-Safe Functions option.

#### 65025 Issue 7

65026 Austin Group Interpretation 1003.1-2001 #072 is applied, updating the ERRORS section.

65027 Austin Group Interpretation 1003.1-2001 #156 is applied.

65028 Austin Group Interpretation 1003.1-2001 #187 is applied, clarifying the behavior when the  
65029 generated error message is an empty string.

65030 SD5-XSH-ERN-191 is applied, updating the APPLICATION USAGE section.

65031 The *strerror\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
65032 Set Part 4.

65033 The *strerror\_r()* function is moved from the Thread-Safe Functions option to the Base.

65034 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0595 [75], XSH/TC1-2008/0596 [447],  
65035 XSH/TC1-2008/0597 [382,428], XSH/TC1-2008/0598 [283], XSH/TC1-2008/0599 [382,428],  
65036 XSH/TC1-2008/0600 [283], and XSH/TC1-2008/0601 [382,428] are applied.

**NAME**

strfmon, strfmon\_l — convert monetary value to a string

**SYNOPSIS**

```
#include <monetary.h>

ssize_t strfmon(char *restrict s, size_t maxsize,
               const char *restrict format, ...);
ssize_t strfmon_l(char *restrict s, size_t maxsize,
                 locale_t locale, const char *restrict format, ...);
```

**DESCRIPTION**

The *strfmon()* function shall place characters into the array pointed to by *s* as controlled by the string pointed to by *format*. No more than *maxsize* bytes are placed into the array.

The format is a character string, beginning and ending in its initial state, if any, that contains two types of objects: *plain characters*, which are simply copied to the output stream, and *conversion specifications*, each of which shall result in the fetching of zero or more arguments which are converted and formatted. The results are undefined if there are insufficient arguments for the format. If the format is exhausted while arguments remain, the excess arguments are simply ignored.

The application shall ensure that a conversion specification consists of the following sequence:

- A '%' character
- Optional flags
- Optional field width
- Optional left precision
- Optional right precision
- A required conversion specifier character that determines the conversion to be performed

The *strfmon\_l()* function shall be equivalent to the *strfmon()* function, except that the locale data used is from the locale represented by *locale*.

**Flags**

One or more of the following optional flags can be specified to control the conversion:

- =f** An '=' followed by a single character *f* which is used as the numeric fill character. In order to work with precision or width counts, the fill character shall be a single byte character; if not, the behavior is undefined. The default numeric fill character is the <space>. This flag does not affect field width filling which always uses the <space>. This flag is ignored unless a left precision (see below) is specified.
- ^** Do not format the currency amount with grouping characters. The default is to insert the grouping characters if defined for the current locale.
- + or (** Specify the style of representing positive and negative currency amounts. Only one of '+' or '(' may be specified. If '+' is specified, the locale's equivalent of '+' and '-' are used (for example, in many locales, the empty string if positive and '-' if negative). If '(' is specified, negative amounts are enclosed within parentheses. If neither flag is specified, the '+' style is used.
- !** Suppress the currency symbol from the output conversion.

65078 – Specify the alignment. If this flag is present the result of the conversion is left-justified  
 65079 (padded to the right) rather than right-justified. This flag shall be ignored unless a field  
 65080 width (see below) is specified.

#### 65081 Field Width

65082 *w* A decimal digit string *w* specifying a minimum field width in bytes in which the result  
 65083 of the conversion is right-justified (or left-justified if the flag '*-*' is specified). The  
 65084 default is 0.

#### 65085 Left Precision

65086 *#n* A '*#*' followed by a decimal digit string *n* specifying a maximum number of digits  
 65087 expected to be formatted to the left of the radix character. This option can be used to  
 65088 keep the formatted output from multiple calls to the *strfmon()* function aligned in the  
 65089 same columns. It can also be used to fill unused positions with a special character as in  
 65090 "\$\*\*\*123.45". This option causes an amount to be formatted as if it has the number  
 65091 of digits specified by *n*. If more than *n* digit positions are required, this conversion  
 65092 specification is ignored. Digit positions in excess of those actually required are filled  
 65093 with the numeric fill character (see the *=f* flag above).

65094 If grouping has not been suppressed with the '*^*' flag, and it is defined for the current  
 65095 locale, grouping separators are inserted before the fill characters (if any) are added.  
 65096 Grouping separators are not applied to fill characters even if the fill character is a digit.

65097 To ensure alignment, any characters appearing before or after the number in the  
 65098 formatted output such as currency or sign symbols are padded as necessary with  
 65099 <space> characters to make their positive and negative formats an equal length.

#### 65100 Right Precision

65101 *.p* A <period> followed by a decimal digit string *p* specifying the number of digits after  
 65102 the radix character. If the value of the right precision *p* is 0, no radix character appears.  
 65103 If a right precision is not included, a default specified by the current locale is used. The  
 65104 amount being formatted is rounded to the specified number of digits prior to  
 65105 formatting.

#### 65106 Conversion Specifier Characters

65107 The conversion specifier characters and their meanings are:

65108 *i* The **double** argument is formatted according to the locale's international currency  
 65109 format (for example, in the US: USD 1,234.56). If the argument is  $\pm\text{Inf}$  or NaN, the result  
 65110 of the conversion is unspecified.

65111 *n* The **double** argument is formatted according to the locale's national currency format  
 65112 (for example, in the US: \$1,234.56). If the argument is  $\pm\text{Inf}$  or NaN, the result of the  
 65113 conversion is unspecified.

65114 *%* Convert to a '*%*'; no argument is converted. The entire conversion specification shall  
 65115 be *%%*.

**Locale Information**

The *LC\_MONETARY* category of the current locale affects the behavior of this function including the monetary radix character (which may be different from the numeric radix character affected by the *LC\_NUMERIC* category), the grouping separator, the currency symbols, and formats. The international currency symbol should be conformant with the ISO 4217:2001 standard.

If the value of *maxsize* is greater than `{SSIZE_MAX}`, the result is implementation-defined.

The behavior is undefined if the *locale* argument to *strfmon\_l()* is the special locale object *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.

**RETURN VALUE**

If the total number of resulting bytes including the terminating null byte is not more than *maxsize*, these functions shall return the number of bytes placed into the array pointed to by *s*, not including the terminating NUL character. Otherwise, `-1` shall be returned, the contents of the array are unspecified, and *errno* shall be set to indicate the error.

**ERRORS**

These functions shall fail if:

[E2BIG] Conversion stopped due to lack of space in the buffer.

**EXAMPLES**

Given a locale for the US and the values 123.45, `-123.45`, and `3456.781`, the following output might be produced. Square brackets ("`[ ]`") are used in this example to delimit the output.

|                      |                                                                                                         |                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| <code>%n</code>      | <code>[ \$123.45 ]</code><br><code>[ -\$123.45 ]</code><br><code>[ \$3,456.78 ]</code>                  | Default formatting                                                        |
| <code>%11n</code>    | <code>[     \$123.45 ]</code><br><code>[    -\$123.45 ]</code><br><code>[   \$3,456.78 ]</code>         | Right align within an 11-character field                                  |

| <code>%^#5.0n</code> | <code>[ \$    123 ]</code><br><code>[ -\$    123 ]</code><br><code>[ \$    3457 ]</code>                | Round off to whole units                                                  |
| <code>%^#5.4n</code> | <code>[ \$    123.4500 ]</code><br><code>[ -\$    123.4500 ]</code><br><code>[ \$    3456.7810 ]</code> | Increase the precision                                                    |
| <code>%(#5n</code>   | <code>[ \$    123.45 ]</code>                                                                           | Use an alternative pos/neg style                                          |

```

65160          [ ( $    123.45 ) ]
65161          [ $ 3,456.78 ]

65162      %! ( #5n    [    123.45 ]      Disable the currency symbol
65163          [ (    123.45 ) ]
65164          [ 3,456.78 ]

65165      %-14#5.4n [ $    123.4500 ]      Left-justify the output
65166          [ -$    123.4500 ]
65167          [ $ 3,456.7810 ]

65168      %14#5.4n  [ $    123.4500 ]      Corresponding right-justified output
65169          [ -$    123.4500 ]
65170          [ $ 3,456.7810 ]

```

65171 See also the EXAMPLES section in *fprintf()*.

## 65172 APPLICATION USAGE

65173 None.

## 65174 RATIONALE

65175 None.

## 65176 FUTURE DIRECTIONS

65177 Lowercase conversion characters are reserved for future standards use and uppercase for  
65178 implementation-defined use.

## 65179 SEE ALSO

65180 *fprintf()*, *localeconv()*

65181 XBD <monetary.h>

## 65182 CHANGE HISTORY

65183 First released in Issue 4.

### 65184 Issue 5

65185 Moved from ENHANCED I18N to BASE.

65186 The [ENOSYS] error is removed.

65187 Text is added to the DESCRIPTION warning about values of *maxsize* that are greater than  
65188 {SSIZE\_MAX}.

### 65189 Issue 6

65190 The normative text is updated to avoid use of the term “must” for application requirements.

65191 The **restrict** keyword is added to the *strfmon()* prototype for alignment with the  
65192 ISO/IEC 9899:1999 standard.

65193 The EXAMPLES section is reworked, clarifying the output format.

### 65194 Issue 7

65195 SD5-XSH-ERN-29 is applied, updating the examples for % ( #5n and % ! ( #5n.

65196 SD5-XSH-ERN-233 is applied, changing the definition of the '+' or '(' flags to refer to  
65197 multiple locales.

65198 The *strfmon()* function is moved from the XSI option to the Base.

65199  
65200

The *strfmon\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

65201  
65202

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0602 [302], XSH/TC1-2008/0603 [283], and XSH/TC1-2008/0604 [283] are applied.

65203 **NAME**65204 `strptime`, `strptime_l` — convert date and time to a string65205 **SYNOPSIS**

```

65206     #include <time.h>
65207     size_t strptime(char *restrict s, size_t maxsize,
65208                   const char *restrict format, const struct tm *restrict timeptr);
65209 CX    size_t strptime_l(char *restrict s, size_t maxsize,
65210                   const char *restrict format, const struct tm *restrict timeptr,
65211                   locale_t locale);

```

65212 **DESCRIPTION**

65213 CX For `strptime()`: The functionality described on this reference page is aligned with the ISO C  
 65214 standard. Any conflict between the requirements described here and the ISO C standard is  
 65215 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

65216 The `strptime()` function shall place bytes into the array pointed to by `s` as controlled by the string  
 65217 pointed to by `format`. The format is a character string, beginning and ending in its initial shift  
 65218 state, if any. The format string consists of zero or more conversion specifications and ordinary  
 65219 characters.

65220 Each conversion specification is introduced by the ‘%’ character after which the following  
 65221 appear in sequence:

- 65222 CX
- An optional flag:
    - 65223 0 The zero character (‘0’), which specifies that the character used as the padding  
 65224 character is ‘0’.
    - 65225 + The <plus-sign> character (‘+’), which specifies that the character used as the  
 65226 padding character is ‘0’, and that if and only if the field being produced consumes  
 65227 more than four bytes to represent a year (for %F, %G, or %Y) or more than two bytes to  
 65228 represent the year divided by 100 (for %C) then a leading <plus-sign> character shall  
 65229 be included if the year being processed is greater than or equal to zero or a leading  
 65230 <hyphen-minus> character (‘-’) shall be included if the year is less than zero.
  - 65231 The default padding character is unspecified.
  - An optional minimum field width. If the converted value, including any leading ‘+’ or  
 65232 ‘-’ sign, has fewer bytes than the minimum field width and the padding character is not  
 65233 the NUL character, the output shall be padded on the left (after any leading ‘+’ or ‘-’  
 65234 sign) with the padding character.
  - 65235
  - An optional E or O modifier.
  - 65236
  - A terminating conversion specifier character that indicates the type of conversion to be  
 65237 applied.
  - 65238

65239 CX The results are unspecified if more than one flag character is specified, a flag character is  
 65240 specified without a minimum field width; a minimum field width is specified without a flag  
 65241 character; a modifier is specified with a flag or with a minimum field width; or if a minimum  
 65242 field width is specified for any conversion specifier other than C, F, G, or Y.

65243 All ordinary characters (including the terminating NUL character) are copied unchanged into  
 65244 the array. If copying takes place between objects that overlap, the behavior is undefined. No  
 65245 more than `maxsize` bytes are placed into the array. Each conversion specifier is replaced by  
 65246 appropriate characters as described in the following list. The appropriate characters are

determined using the *LC\_TIME* category of the current locale and by the values of zero or more members of the broken-down time structure pointed to by *timeptr*, as specified in brackets in the description. If any of the specified values are outside the normal range, the characters stored are unspecified.

65251 CX The *strptime\_l()* function shall be equivalent to the *strptime()* function, except that the locale data used is from the locale represented by *locale*.

65252

65253 Local timezone information is used as though *strptime()* called *tzset()*.

65254 The following conversion specifiers shall be supported:

65255 a Replaced by the locale's abbreviated weekday name. [*tm\_wday*]

65256 A Replaced by the locale's full weekday name. [*tm\_wday*]

65257 b Replaced by the locale's abbreviated month name. [*tm\_mon*]

65258 B Replaced by the locale's full month name. [*tm\_mon*]

65259 c Replaced by the locale's appropriate date and time representation. (See the Base Definitions volume of POSIX.1-2008, <**time.h**>.)

65260

65261 C Replaced by the year divided by 100 and truncated to an integer, as a decimal number.

65262 [*tm\_year*]

65263 If a minimum field width is not specified, the number of characters placed into the

65264 array pointed to by *s* will be the number of digits in the year divided by 100 or two,

65265 CX whichever is greater. If a minimum field width is specified, the number of characters

65266 placed into the array pointed to by *s* will be the number of digits in the year divided by

65267 100 or the minimum field width, whichever is greater.

65268 d Replaced by the day of the month as a decimal number [01,31]. [*tm\_mday*]

65269 D Equivalent to %m/%d/%Y. [*tm\_mon*, *tm\_mday*, *tm\_year*]

65270 e Replaced by the day of the month as a decimal number [1,31]; a single digit is preceded

65271 by a space. [*tm\_mday*]

65272 CX F Equivalent to %<sup>+4</sup>Y-%m-%d if no flag and no minimum field width are specified.

65273 [*tm\_year*, *tm\_mon*, *tm\_mday*]

65274 CX If a minimum field width of *x* is specified, the year shall be output as if by the Y

65275 specifier (described below) with whatever flag was given and a minimum field width

65276 of *x*−6. If *x* is less than 6, the behavior shall be as if *x* equalled 6.

65277 If the minimum field width is specified to be 10, and the year is four digits long, then

65278 the output string produced will match the ISO 8601:2004 standard subclause 4.1.2.2

65279 complete representation, extended format date representation of a specific day. If a +

65280 flag is specified, a minimum field width of *x* is specified, and *x*−7 bytes are sufficient to

65281 hold the digits of the year (not including any needed sign character), then the output

65282 will match the ISO 8601:2004 standard subclause 4.1.2.4 complete representation,

65283 expanded format date representation of a specific day.

65284 g Replaced by the last 2 digits of the week-based year (see below) as a decimal number

65285 [00,99]. [*tm\_year*, *tm\_wday*, *tm\_yday*]

65286 G Replaced by the week-based year (see below) as a decimal number (for example, 1977).

65287 [*tm\_year*, *tm\_wday*, *tm\_yday*]

|       |    |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------|----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 65288 | CX | If a minimum field width is specified, the number of characters placed into the array pointed to by <i>s</i> will be the number of digits and leading sign characters (if any) in the year, or the minimum field width, whichever is greater.                                                                                                                                                                                    |
| 65289 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 65290 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 65291 | h  | Equivalent to %b. [ <i>tm_mon</i> ]                                                                                                                                                                                                                                                                                                                                                                                              |
| 65292 | H  | Replaced by the hour (24-hour clock) as a decimal number [00,23]. [ <i>tm_hour</i> ]                                                                                                                                                                                                                                                                                                                                             |
| 65293 | I  | Replaced by the hour (12-hour clock) as a decimal number [01,12]. [ <i>tm_hour</i> ]                                                                                                                                                                                                                                                                                                                                             |
| 65294 | j  | Replaced by the day of the year as a decimal number [001,366]. [ <i>tm_yday</i> ]                                                                                                                                                                                                                                                                                                                                                |
| 65295 | m  | Replaced by the month as a decimal number [01,12]. | 65313 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 65314 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 65315 | w  | Replaced by the weekday as a decimal number [0,6], with 0 representing Sunday. [ <i>tm_wday</i> ]                                                                                                                                                                                                                                                                                                                                |
| 65316 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 65317 | W  | Replaced by the week number of the year as a decimal number [00,53]. The first Monday of January is the first day of week 1; days in the new year before this are in week 0. [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ]                                                                                                                                                                                                |
| 65318 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 65319 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 65320 | x  | Replaced by the locale's appropriate date representation. (See the Base Definitions volume of POSIX.1-2008, <time.h>.)                                                                                                                                                                                                                                                                                                           |
| 65321 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 65322 | X  | Replaced by the locale's appropriate time representation. (See the Base Definitions volume of POSIX.1-2008, <time.h>.)                                                                                                                                                                                                                                                                                                           |
| 65323 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 65324 | y  | Replaced by the last two digits of the year as a decimal number [00,99]. [ <i>tm_year</i> ]                                                                                                                                                                                                                                                                                                                                      |
| 65325 | Y  | Replaced by the year as a decimal number (for example, 1997). [ <i>tm_year</i> ]                                                                                                                                                                                                                                                                                                                                                 |
| 65326 | CX | If a minimum field width is specified, the number of characters placed into the array pointed to by <i>s</i> will be the number of digits and leading sign characters (if any) in the                                                                                                                                                                                                                                            |
| 65327 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|       |     |                                                                                                                                                                 |
|-------|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 65328 |     | year, or the minimum field width, whichever is greater.                                                                                                         |
| 65329 | z   | Replaced by the offset from UTC in the ISO 8601:2004 standard format (+hhmm or -hhmm), or by no characters if no timezone is determinable. For example, "-0430" |
| 65330 |     | means 4 hours 30 minutes behind UTC (west of Greenwich). If <i>tm_isdst</i> is zero, the                                                                        |
| 65331 | CX  | standard time offset is used. If <i>tm_isdst</i> is greater than zero, the daylight savings time                                                                |
| 65332 |     | offset is used. If <i>tm_isdst</i> is negative, no characters are returned. [ <i>tm_isdst</i> ]                                                                 |
| 65333 |     |                                                                                                                                                                 |
| 65334 | Z   | Replaced by the timezone name or abbreviation, or by no bytes if no timezone                                                                                    |
| 65335 |     | information exists. [ <i>tm_isdst</i> ]                                                                                                                         |
| 65336 | %   | Replaced by %.                                                                                                                                                  |
| 65337 |     | If a conversion specification does not correspond to any of the above, the behavior is undefined.                                                               |
| 65338 | CX  | If a <b>struct tm</b> broken-down time structure is created by <i>localtime()</i> or <i>localtime_r()</i> , or modified                                         |
| 65339 |     | by <i>mktime()</i> , and the value of <i>TZ</i> is subsequently modified, the results of the %Z and %z                                                          |
| 65340 |     | <i>strptime()</i> conversion specifiers are undefined, when <i>strptime()</i> is called with such a broken-down                                                 |
| 65341 |     | time structure.                                                                                                                                                 |
| 65342 |     | If a <b>struct tm</b> broken-down time structure is created or modified by <i>gmtime()</i> or <i>gmtime_r()</i> , it is                                         |
| 65343 |     | unspecified whether the result of the %Z and %z conversion specifiers shall refer to UTC or the                                                                 |
| 65344 |     | current local timezone, when <i>strptime()</i> is called with such a broken-down time structure.                                                                |
| 65345 |     | <b>Modified Conversion Specifiers</b>                                                                                                                           |
| 65346 |     | Some conversion specifiers can be modified by the E or O modifier characters to indicate that an                                                                |
| 65347 |     | alternative format or specification should be used rather than the one normally used by the                                                                     |
| 65348 |     | unmodified conversion specifier. If the alternative format or specification does not exist for the                                                              |
| 65349 |     | current locale (see ERA in XBD <a href="#">Section 7.3.5</a> , on page 159), the behavior shall be as if the                                                    |
| 65350 |     | unmodified conversion specification were used.                                                                                                                  |
| 65351 | %Ec | Replaced by the locale's alternative appropriate date and time representation.                                                                                  |
| 65352 | %EC | Replaced by the name of the base year (period) in the locale's alternative                                                                                      |
| 65353 |     | representation.                                                                                                                                                 |
| 65354 | %Ex | Replaced by the locale's alternative date representation.                                                                                                       |
| 65355 | %EX | Replaced by the locale's alternative time representation.                                                                                                       |
| 65356 | %Ey | Replaced by the offset from %EC (year only) in the locale's alternative representation.                                                                         |
| 65357 | %EY | Replaced by the full alternative year representation.                                                                                                           |
| 65358 | %Od | Replaced by the day of the month, using the locale's alternative numeric symbols, filled                                                                        |
| 65359 |     | as needed with leading zeros if there is any alternative symbol for zero; otherwise, with                                                                       |
| 65360 |     | leading <space> characters.                                                                                                                                     |
| 65361 | %Oe | Replaced by the day of the month, using the locale's alternative numeric symbols, filled                                                                        |
| 65362 |     | as needed with leading <space> characters.                                                                                                                      |
| 65363 | %OH | Replaced by the hour (24-hour clock) using the locale's alternative numeric symbols.                                                                            |
| 65364 | %OI | Replaced by the hour (12-hour clock) using the locale's alternative numeric symbols.                                                                            |
| 65365 | %Om | Replaced by the month using the locale's alternative numeric symbols.                                                                                           |
| 65366 | %OM | Replaced by the minutes using the locale's alternative numeric symbols.                                                                                         |

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                      |

| 65379 | %g, %G, and %V give values according to the ISO 8601:2004 standard week-based year. In this system, weeks begin on a Monday and week 1 of the year is the week that includes January 4th, which is also the week that includes the first Thursday of the year, and is also the first week that contains at least four days in the year. If the first Monday of January is the 2nd, 3rd, or 4th, the preceding days are part of the last week of the preceding year; thus, for Saturday 2nd January 1999, %G is replaced by 1998 and %V is replaced by 53. If December 29th, 30th, or 31st is a Monday, it and any following days are part of week 1 of the following year. Thus, for Tuesday 30th December 1997, %G is replaced by 1998 and %V is replaced by 01. |                                                                                                                                                                      |

| 65386 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                      |
| 65387 | If a conversion specifier is not one of the above, the behavior is undefined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                      |
| 65388 | CX                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | The behavior is undefined if the <i>locale</i> argument to <i>strptime_l()</i> is the special locale object LC_GLOBAL_LOCALE or is not a valid locale object handle. |
| 65389 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                      |

## 65390 RETURN VALUE

65391 If the total number of resulting bytes including the terminating null byte is not more than  
 65392 *maxsize*, these functions shall return the number of bytes placed into the array pointed to by *s*,  
 65393 not including the terminating NUL character. Otherwise, 0 shall be returned and the contents of  
 65394 the array are unspecified.

## 65395 ERRORS

65396 No errors are defined.

## 65397 EXAMPLES

### 65398 Getting a Localized Date String

65399 The following example first sets the locale to the user's default. The locale information will be  
 65400 used in the *nl\_langinfo()* and *strptime()* functions. The *nl\_langinfo()* function returns the localized  
 65401 date string which specifies how the date is laid out. The *strptime()* function takes this  
 65402 information and, using the **tm** structure for values, places the date and time information into  
 65403 *datestring*.

```
65404 #include <time.h>
65405 #include <locale.h>
65406 #include <langinfo.h>
65407 ...
65408 struct tm *tm;
65409 char datestring[256];
65410 ...
```

```

65411     setlocale (LC_ALL, "");
65412     ...
65413     strptime (datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
65414     ...

```

## APPLICATION USAGE

The range of values for %S is [00,60] rather than [00,59] to allow for the occasional leap second.

Some of the conversion specifications are duplicates of others. They are included for compatibility with *nl\_cxtime()* and *nl\_ascxtime()*, which were published in Issue 2.

The %C, %F, %G, and %Y format specifiers in *strptime()* always print full values, but the *strptime()* %C, %F, and %Y format specifiers only scan two digits (assumed to be the first two digits of a four-digit year) for %C and four digits (assumed to be the entire (four-digit) year) for %F and %Y. This mimics the behavior of *printf()* and *scanf()*; that is:

```
printf("%2d", x = 1000);
```

prints "1000", but:

```
scanf("%2d", &x);
```

when given "1000" as input will only store 10 in x). Applications using extended ranges of years must be sure that the number of digits specified for scanning years with *strptime()* matches the number of digits that will actually be present in the input stream. Historic implementations of the %Y conversion specification (with no flags and no minimum field width) produced different output formats. Some always produced at least four digits (with 0 fill for years from 0 through 999) while others only produced the number of digits present in the year (with no fill and no padding). These two forms can be produced with the '0' flag and a minimum field width options using the conversions specifications %04Y and %01Y, respectively.

In the past, the C and POSIX standards specified that %F produced an ISO 8601:2004 standard date format, but didn't specify which one. For years in the range [0001,9999], POSIX.1-2008 requires that the output produced match the ISO 8601:2004 standard complete representation extended format (YYYY-MM-DD) and for years outside of this range produce output that matches the ISO 8601:2004 standard expanded representation extended format (<+/-><Underline>Y</Underline>YYYY-MM-DD). To fully meet ISO 8601:2004 standard requirements, the producer and consumer must agree on a date format that has a specific number of bytes reserved to hold the characters used to represent the years that is sufficiently large to hold all values that will be shared. For example, the %+13F conversion specification will produce output matching the format "<+/->YYYYYY-MM-DD" (a leading '+' or '-' sign; a six-digit, 0-filled year; a '-' ; a two-digit, leading 0-filled month; another '-' ; and the two-digit, leading 0-filled day within the month).

Note that if the year being printed is greater than 9999, the resulting string from the unadorned %F conversion specifications will not conform to the ISO 8601:2004 standard extended format, complete representation for a date and will instead be an extended format, expanded representation (presumably without the required agreement between the date's producer and consumer).

In the C or POSIX locale, the E and O modifiers are ignored and the replacement strings for the following specifiers are:

- %a      The first three characters of %A.
- %A      One of Sunday, Monday, ..., Saturday.

|       |    |                                          |
|-------|----|------------------------------------------|
| 65455 | %b | The first three characters of %B.        |
| 65456 | %B | One of January, February, ..., December. |
| 65457 | %c | Equivalent to %a %b %e %T %Y.            |
| 65458 | %p | One of AM or PM.                         |
| 65459 | %r | Equivalent to %I:%M:%S %p.               |
| 65460 | %x | Equivalent to %m/%d/%Y.                  |
| 65461 | %X | Equivalent to %T.                        |
| 65462 | %Z | Implementation-defined.                  |

#### 65463 RATIONALE

65464 The %Y conversion specification to *strptime()* was frequently assumed to be a four-digit year, but  
 65465 the ISO C standard does not specify that %Y is restricted to any subset of allowed values from the  
 65466 *tm\_year* field. Similarly, the %C conversion specification was assumed to be a two-digit field and  
 65467 the first part of the output from the %F conversion specification was assumed to be a four-digit  
 65468 field. With *tm\_year* being a signed 32 or more-bit **int** and with many current implementations  
 65469 supporting 64-bit **time\_t** types in one or more programming environments, these assumptions  
 65470 are clearly wrong.

65471 POSIX.1-2008 now allows the format specifications %0xC, %0xF, %0xG, and %0xY (where 'x' is  
 65472 a string of decimal digits used to specify printing and scanning of a string of *x* decimal digits)  
 65473 with leading zero fill characters. Allowing applications to set the field width enables them to  
 65474 agree on the number of digits to be printed and scanned in the ISO 8601:2004 standard  
 65475 expanded representation of a year (for %F, %G, and %Y) or all but the last two digits of the year  
 65476 (for %C). This is based on a feature in some versions of GNU **libc**'s *strptime()*. The GNU version  
 65477 allows specifying space, zero, or no-fill characters in *strptime()* format strings, but does not allow  
 65478 any flags to be specified in *strptime()* format strings. These implementations also allow these  
 65479 flags to be specified for any numeric field. POSIX.1-2008 only requires the zero fill flag ('0') and  
 65480 only requires that it be recognized when processing %C, %F, %G, and %Y specifications when a  
 65481 minimum field width is also specified. The '0' flag is the only flag needed to produce and scan  
 65482 the ISO 8601:2004 standard year fields using the extended format forms. POSIX.1-2008 also  
 65483 allows applications to specify the same flag and field width specifiers to be used in both  
 65484 *strptime()* and *strptime()* format strings for symmetry. Systems may provide other flag characters  
 65485 and may accept flags in conjunction with conversion specifiers other than %C, %F, %G, and %Y;  
 65486 but portable applications cannot depend on such extensions.

65487 POSIX.1-2008 now also allows the format specifications %+xC, %+xF, %+xG, and %+xY (where  
 65488 'x' is a string of decimal digits used to specify printing and scanning of a string of 'x' decimal  
 65489 digits) with leading zero fill characters and a leading '+' sign character if the year being  
 65490 converted is more than four digits or a minimum field width is specified that allows room for  
 65491 more than four digits for the year. This allows date providers and consumers to agree on a  
 65492 specific number of digits to represent a year as required by the ISO 8601:2004 standard  
 65493 expanded representation formats. The expanded representation formats all require the year to  
 65494 begin with a leading '+' or '-' sign. (All of these specifiers can also provide a leading '-'  
 65495 sign for negative years. Since negative years and the year 0 don't fit well with the Gregorian or  
 65496 Julian calendars, the normal ranges of dates start with year 1. The ISO C standard allows *tm\_year*  
 65497 to assume values corresponding to years before year 1, but the use of such years provided  
 65498 unspecified results.)

65499 Some earlier version of this standard specified that applications wanting to use *strptime()* to scan  
 65500 dates and times printed by *strptime()* should provide non-digit characters between fields to

separate years from months and days. It also supported %F to print and scan the ISO 8601:2004 standard extended format, complete representation date for years 1 through 9999 (i.e., YYYY-MM-DD). However, many applications were written to print (using *strptime()*) and scan (using *strptime()*) dates written using the basic format complete representation (four-digit years) and truncated representation (two-digit years) specified by the ISO 8601:2004 standard representation of dates and times which do not have any separation characters between fields. The ISO 8601:2004 standard also specifies basic format expanded representation where the creator and consumer of these fields agree beforehand to represent years as leading zero-filled strings of an agreed length of more than four digits to represent a year (again with no separation characters when year, month, and day are all displayed). Applications producing and consuming expanded representations are encouraged to use the '+' flag and an appropriate maximum field width to scan the year including the leading sign. Note that even without the '+' flag, years less than zero may be represented with a leading <hyphen-minus> for %F, %G, and %Y conversion specifications. Using negative years results in unspecified behavior.

If a format specification %+xF with the field width *x* greater than 11 is specified and the width is large enough to display the full year, the output string produced will match the ISO 8601:2004 standard subclause 4.1.2.4 expanded representation, extended format date representation for a specific day. (For years in the range [1,99999], %+12F is sufficient for an agreed five-digit year with a leading sign using the ISO 8601:2004 standard expanded representation, extended format for a specific day "<+/->YYYY-MM-DD".) Note also that years less than 0 may produce a leading <hyphen-minus> character ('-') when using %Y or %C whether or not the '0' or '+' flags are used.

The difference between the '0' flag and the '+' flag is whether the leading '+' character will be provided for years >9999 as required for the ISO 8601:2004 standard extended representation format containing a year. For example:

| Year   | Conversion Specification | <i>strptime()</i><br>Output | <i>strptime()</i><br>Scan Back |
|--------|--------------------------|-----------------------------|--------------------------------|
| 1970   | %Y                       | 1970                        | 1970                           |
| 1970   | %+4Y                     | 1970                        | 1970                           |
| 27     | %Y                       | 27 or 0027                  | 27                             |

| 12345  | %06Y or %04C%Y           | 012345                      | 12345                          |
| 12345  | %+6Y or %+4C%Y           | +12345                      | 12345                          |
| 123456 | %08Y or %06C%Y           | 00123456                    | 123456                         |
| 123456 | %+8Y or %+6C%Y           | +0123456                    | 123456                         |

In the cases above marked with a \* in the *strptime()* scan back field, the implied or specified number of characters scanned by *strptime()* was less than the number of characters output by *strptime()* using the same format; so the remaining digits of the year were dropped when the output date produced by *strptime()* was scanned back in by *strptime()*.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

XBD Section 7.3.5 (on page 159), **<time.h>**

**CHANGE HISTORY**

First released in Issue 3.

**Issue 5**

The description of %OV is changed to be consistent with %V and defines Monday as the first day of the week.

The description of %Oy is clarified.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The Open Group Corrigendum U033/8 is applied. The %V conversion specifier is changed from “Otherwise, it is week 53 of the previous year, and the next week is week 1” to “Otherwise, it is the last week of the previous year, and the next week is week 1”.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The %C, %D, %e, %h, %n, %r, %R, %t, and %T conversion specifiers are added.
- The modified conversion specifiers are added for consistency with the ISO POSIX-2 standard *date* utility.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *strptime()* prototype is updated.
- The DESCRIPTION is extensively revised.
- The %z conversion specifier is added.

An example is added.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/60 is applied.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #163 is applied.

The *strptime\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0605 [283], XSH/TC1-2008/0606 [283], XSH/TC1-2008/0607 [193], and XSH/TC1-2008/0608 [193] are applied.

65582 **NAME**

65583        strlen, strlen — get length of fixed size string

65584 **SYNOPSIS**

65585        #include &lt;string.h&gt;

65586        size\_t strlen(const char \*s);

65587 CX     size\_t strnlen(const char \*s, size\_t maxlen);

65588 **DESCRIPTION**

65589 CX     For *strlen()*: The functionality described on this reference page is aligned with the ISO C  
 65590 standard. Any conflict between the requirements described here and the ISO C standard is  
 65591 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

65592        The *strlen()* function shall compute the number of bytes in the string to which *s* points, not  
 65593 including the terminating NUL character.

65594 CX     The *strnlen()* function shall compute the smaller of the number of bytes in the array to which *s*  
 65595 points, not including any terminating NUL character, or the value of the *maxlen* argument. The  
 65596 *strnlen()* function shall never examine more than *maxlen* bytes of the array pointed to by *s*.

65597 **RETURN VALUE**

65598        The *strlen()* function shall return the length of *s*; no return value shall be reserved to indicate an  
 65599 error.

65600 CX     The *strnlen()* function shall return the number of bytes preceding the first null byte in the array  
 65601 to which *s* points, if *s* contains a null byte within the first *maxlen* bytes; otherwise, it shall return  
 65602 *maxlen*.

65603 **ERRORS**

65604        No errors are defined.

65605 **EXAMPLES**65606        **Getting String Lengths**

65607        The following example sets the maximum length of *key* and *data* by using *strlen()* to get the  
 65608 lengths of those strings.

```

65609     #include <string.h>
65610     ...
65611     struct element {
65612         char *key;
65613         char *data;
65614     };
65615     ...
65616     char *key, *data;
65617     int len;

65618     *keylength = *datalength = 0;
65619     ...
65620     if ((len = strlen(key)) > *keylength)
65621         *keylength = len;
65622     if ((len = strlen(data)) > *datalength)
65623         *datalength = len;
65624     ...

```

65625 **APPLICATION USAGE**

65626 None.

65627 **RATIONALE**

65628 None.

65629 **FUTURE DIRECTIONS**

65630 None.

65631 **SEE ALSO**

65632 *wcslen()*

65633 XBD <string.h>

65634 **CHANGE HISTORY**

65635 First released in Issue 1. Derived from Issue 1 of the SVID.

65636 **Issue 5**

65637 The RETURN VALUE section is updated to indicate that *strlen()* returns the length of *s*, and not  
65638 *s* itself as was previously stated.

65639 **Issue 7**

65640 The *strnlen()* function is added from The Open Group Technical Standard, 2006, Extended API  
65641 Set Part 1.

65642 **NAME**

65643 strncasecmp, strncasecmp\_l — case-insensitive string comparisons

65644 **SYNOPSIS**

65645 #include &lt;strings.h&gt;

65646 int strncasecmp(const char \*s1, const char \*s2, size\_t n);

65647 int strncasecmp\_l(const char \*s1, const char \*s2,

65648 size\_t n, locale\_t locale);

65649 **DESCRIPTION**65650 Refer to *strcasecmp()*.

65651 **NAME**

65652 strncat — concatenate a string with part of another

65653 **SYNOPSIS**

65654 #include &lt;string.h&gt;

65655 char \*strncat(char \*restrict s1, const char \*restrict s2, size\_t n);

65656 **DESCRIPTION**

65657 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
65658 conflict between the requirements described here and the ISO C standard is unintentional. This  
65659 volume of POSIX.1-2008 defers to the ISO C standard.

65660 The *strncat()* function shall append not more than *n* bytes (a NUL character and bytes that  
65661 follow it are not appended) from the array pointed to by *s2* to the end of the string pointed to by  
65662 *s1*. The initial byte of *s2* overwrites the NUL character at the end of *s1*. A terminating NUL  
65663 character is always appended to the result. If copying takes place between objects that overlap,  
65664 the behavior is undefined.

65665 **RETURN VALUE**65666 The *strncat()* function shall return *s1*; no return value shall be reserved to indicate an error.65667 **ERRORS**

65668 No errors are defined.

65669 **EXAMPLES**

65670 None.

65671 **APPLICATION USAGE**

65672 None.

65673 **RATIONALE**

65674 None.

65675 **FUTURE DIRECTIONS**

65676 None.

65681 First released in Issue 1. Derived from Issue 1 of the SVID.

65682 **Issue 6**65683 The *strncat()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

65684 **NAME**

65685 strncmp — compare part of two strings

65686 **SYNOPSIS**

65687 #include &lt;string.h&gt;

65688 int strncmp(const char \*s1, const char \*s2, size\_t n);

65689 **DESCRIPTION**

65690 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 65691 conflict between the requirements described here and the ISO C standard is unintentional. This  
 65692 volume of POSIX.1-2008 defers to the ISO C standard.

65693 The *strncmp()* function shall compare not more than *n* bytes (bytes that follow a NUL character  
 65694 are not compared) from the array pointed to by *s1* to the array pointed to by *s2*.

65695 The sign of a non-zero return value is determined by the sign of the difference between the  
 65696 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings  
 65697 being compared.

65698 **RETURN VALUE**

65699 Upon successful completion, *strncmp()* shall return an integer greater than, equal to, or less than  
 65700 0, if the possibly null-terminated array pointed to by *s1* is greater than, equal to, or less than the  
 65701 possibly null-terminated array pointed to by *s2* respectively.

65702 **ERRORS**

65703 No errors are defined.

65704 **EXAMPLES**

65705 None.

65706 **APPLICATION USAGE**

65707 None.

65708 **RATIONALE**

65709 None.

65710 **FUTURE DIRECTIONS**

65711 None.

65712 **SEE ALSO**65713 *strcmp()*

65714 XBD &lt;string.h&gt;

65715 **CHANGE HISTORY**

65716 First released in Issue 1. Derived from Issue 1 of the SVID.

65717 **Issue 6**

65718 Extensions beyond the ISO C standard are marked.

65719 **NAME**

65720       stpnpcy, strncpy — copy fixed length string, returning a pointer to the array end

65721 **SYNOPSIS**

65722       #include &lt;string.h&gt;

```
65723 CX     char *stpnpcy(char *restrict s1, const char *restrict s2, size_t n);
65724     char *strncpy(char *restrict s1, const char *restrict s2, size_t n);
```

65725 **DESCRIPTION**

65726 CX     For *strncpy()*: The functionality described on this reference page is aligned with the ISO C  
65727 standard. Any conflict between the requirements described here and the ISO C standard is  
65728 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

65729 CX     The *stpnpcy()* and *strncpy()* functions shall copy not more than *n* bytes (bytes that follow a NUL  
65730 character are not copied) from the array pointed to by *s2* to the array pointed to by *s1*.

65731       If the array pointed to by *s2* is a string that is shorter than *n* bytes, NUL characters shall be  
65732 appended to the copy in the array pointed to by *s1*, until *n* bytes in all are written.

65733       If copying takes place between objects that overlap, the behavior is undefined.

65734 **RETURN VALUE**

65735 CX     If a NUL character is written to the destination, the *stpnpcy()* function shall return the address of  
65736 the first such NUL character. Otherwise, it shall return *&s1[n]*.

65737       The *strncpy()* function shall return *s1*.

65738       No return values are reserved to indicate an error.

65739 **ERRORS**

65740       No errors are defined.

65741 **EXAMPLES**

65742       None.

65743 **APPLICATION USAGE**

65744       Applications must provide the space in *s1* for the *n* bytes to be transferred, as well as ensure that  
65745 the *s2* and *s1* arrays do not overlap.

65746       Character movement is performed differently in different implementations. Thus, overlapping  
65747 moves may yield surprises.

65748       If there is no NUL character byte in the first *n* bytes of the array pointed to by *s2*, the result is not  
65749 null-terminated.

65750 **RATIONALE**

65751       None.

65752 **FUTURE DIRECTIONS**

65753       None.

65754 **SEE ALSO**

65755       *strcpy()*, *wcsncpy()*

65756       XBD <string.h>

65757 **CHANGE HISTORY**

65758       First released in Issue 1. Derived from Issue 1 of the SVID.

65759 **Issue 6**

65760 The *strncpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

65761 **Issue 7**

65762 The *stpncpy()* function is added from The Open Group Technical Standard, 2006, Extended API  
65763 Set Part 1.

65764 **NAME**

65765       strndup — duplicate a specific number of bytes from a string

65766 **SYNOPSIS**

65767 CX       #include &lt;string.h&gt;

65768       char \*strndup(const char \*s, size\_t size);

65769 **DESCRIPTION**65770       Refer to *strdup()*.

65771 **NAME**

65772 strnlen — get length of fixed size string

65773 **SYNOPSIS**

```
65774 CX #include <string.h>
65775 size_t strnlen(const char *s, size_t maxlen);
```

65776 **DESCRIPTION**65777 Refer to *strlen()*.

65778 **NAME**

65779 strpbrk — scan a string for a byte

65780 **SYNOPSIS**

65781 #include &lt;string.h&gt;

65782 char \*strpbrk(const char \*s1, const char \*s2);

65783 **DESCRIPTION**

65784 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
65785 conflict between the requirements described here and the ISO C standard is unintentional. This  
65786 volume of POSIX.1-2008 defers to the ISO C standard.

65787 The *strpbrk()* function shall locate the first occurrence in the string pointed to by *s1* of any byte  
65788 from the string pointed to by *s2*.

65789 **RETURN VALUE**

65790 Upon successful completion, *strpbrk()* shall return a pointer to the byte or a null pointer if no  
65791 byte from *s2* occurs in *s1*.

65792 **ERRORS**

65793 No errors are defined.

65794 **EXAMPLES**

65795 None.

65796 **APPLICATION USAGE**

65797 None.

65798 **RATIONALE**

65799 None.

65800 **FUTURE DIRECTIONS**

65801 None.

65802 **SEE ALSO**65803 *strchr()*, *strrchr()*

65804 XBD &lt;string.h&gt;

65805 **CHANGE HISTORY**

65806 First released in Issue 1. Derived from Issue 1 of the SVID.

65807 **NAME**

65808 strptime — date and time conversion

65809 **SYNOPSIS**

```
65810 XSI    #include <time.h>
65811
65811    char *strptime(const char *restrict buf, const char *restrict format,
65812                  struct tm *restrict tm);
```

65813 **DESCRIPTION**

65814 The *strptime()* function shall convert the character string pointed to by *buf* to values which are  
 65815 stored in the **tm** structure pointed to by *tm*, using the format specified by *format*.

65816 The format is composed of zero or more directives. Each directive is composed of one of the  
 65817 following: one or more white-space characters (as specified by *isspace()*); an ordinary character  
 65818 (neither '%' nor a white-space character); or a conversion specification.

65819 Each conversion specification is introduced by the '%' character after which the following  
 65820 appear in sequence:

- 65821 • An optional flag, the zero character ('0') or the <plus-sign> character ('+'), which is  
 65822 ignored.
- 65823 • An optional field width. If a field width is specified, it shall be interpreted as a string of  
 65824 decimal digits that will determine the maximum number of bytes converted for the  
 65825 conversion rather than the number of bytes specified below in the description of the  
 65826 conversion specifiers.
- 65827 • An optional E or O modifier.
- 65828 • A terminating conversion specifier character that indicates the type of conversion to be  
 65829 applied.

65830 The conversions are determined using the *LC\_TIME* category of the current locale. The  
 65831 application shall ensure that there is white-space or other non-alphanumeric characters between  
 65832 any two conversion specifications unless all of the adjacent conversion specifications convert a  
 65833 known, fixed number of characters. In the following list, the maximum number of characters  
 65834 scanned (excluding the one matching the next directive) is as follows:

- 65835 • If a maximum field width is specified, then that number
- 65836 • Otherwise, the pattern "{x}" indicates that the maximum is *x*
- 65837 • Otherwise, the pattern "[x,y]" indicates that the value shall fall within the range given  
 65838 (both bounds being inclusive), and the maximum number of characters scanned shall be  
 65839 the maximum required to represent any value in the range without leading zeros and  
 65840 without a leading <plus-sign>

65841 The following conversion specifiers are supported.

65842 The results are unspecified if a modifier is specified with a flag or with a minimum field width,  
 65843 or if a field width is specified for any conversion specifier other than C or Y.

- |       |   |                                                                                       |
|-------|---|---------------------------------------------------------------------------------------|
| 65844 | a | The day of the week, using the locale's weekday names; either the abbreviated or full |
| 65845 |   | name may be specified.                                                                |
| 65846 | A | Equivalent to %a.                                                                     |

|       |   |                                                                                                                                                                                                                                                                                                                                                                   |
|-------|---|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 65847 | b | The month, using the locale's month names; either the abbreviated or full name may be specified.                                                                                                                                                                                                                                                                  |
| 65848 |   |                                                                                                                                                                                                                                                                                                                                                                   |
| 65849 | B | Equivalent to %b.                                                                                                                                                                                                                                                                                                                                                 |
| 65850 | c | Replaced by the locale's appropriate date and time representation.                                                                                                                                                                                                                                                                                                |

| 65870 |   |                                                                                                                                                                                                                                                                                                                                                                   |
| 65871 | R | The time as %H:%M.                                                                                                                                                                                                                                                                                                                                                |
| 65872 | S | The seconds [00,60]; leading zeros shall be permitted but shall not be required.                                                                                                                                                                                                                                                                                  |
| 65873 | t | Any white space.                                                                                                                                                                                                                                                                                                                                                  |
| 65874 | T | The time as %H:%M:%S.                                                                                                                                                                                                                                                                                                                                             |
| 65875 | U | The week number of the year (Sunday as the first day of the week) as a decimal number [00,53]; leading zeros shall be permitted but shall not be required.                                                                                                                                                                                                        |
| 65876 |   |                                                                                                                                                                                                                                                                                                                                                                   |
| 65877 | w | The weekday as a decimal number [0,6], with 0 representing Sunday.                                                                                                                                                                                                                                                                                                |
| 65878 | W | The week number of the year (Monday as the first day of the week) as a decimal number [00,53]; leading zeros shall be permitted but shall not be required.                                                                                                                                                                                                        |
| 65879 |   |                                                                                                                                                                                                                                                                                                                                                                   |
| 65880 | x | The date, using the locale's date format.                                                                                                                                                                                                                                                                                                                         |
| 65881 | X | The time, using the locale's time format.                                                                                                                                                                                                                                                                                                                         |
| 65882 | y | The last two digits of the year. When <i>format</i> contains neither a C conversion specifier nor a Y conversion specifier, values in the range [69,99] shall refer to years 1969 to 1999 inclusive and values in the range [00,68] shall refer to years 2000 to 2068 inclusive; leading zeros shall be permitted but shall not be required. A leading '+' or '-' |
| 65883 |   |                                                                                                                                                                                                                                                                                                                                                                   |
| 65884 |   |                                                                                                                                                                                                                                                                                                                                                                   |
| 65885 |   |                                                                                                                                                                                                                                                                                                                                                                   |

|       |              |                                                                                          |
|-------|--------------|------------------------------------------------------------------------------------------|
| 65886 |              | character shall be permitted before any leading zeros but shall not be required.         |
| 65887 | <b>Note:</b> | It is expected that in a future version of this standard the default century inferred    |
| 65888 |              | from a 2-digit year will change. (This would apply to all commands accepting a           |
| 65889 |              | 2-digit year as input.)                                                                  |
| 65890 | Y            | The full year {4}; leading zeros shall be permitted but shall not be required. A leading |
| 65891 |              | '+' or '-' character shall be permitted before any leading zeros but shall not be        |
| 65892 |              | required.                                                                                |
| 65893 | %            | Replaced by %.                                                                           |

#### 65894 Modified Conversion Specifiers

65895 Some conversion specifiers can be modified by the E and O modifier characters to indicate that  
 65896 an alternative format or specification should be used rather than the one normally used by the  
 65897 unmodified conversion specifier. If the alternative format or specification does not exist in the  
 65898 current locale, the behavior shall be as if the unmodified conversion specification were used.

|       |     |                                                                                      |
|-------|-----|--------------------------------------------------------------------------------------|
| 65899 | %Ec | The locale's alternative appropriate date and time representation.                   |
| 65900 | %EC | The name of the base year (period) in the locale's alternative representation.       |
| 65901 | %Ex | The locale's alternative date representation.                                        |
| 65902 | %EX | The locale's alternative time representation.                                        |
| 65903 | %Ey | The offset from %EC (year only) in the locale's alternative representation.          |
| 65904 | %EY | The full alternative year representation.                                            |
| 65905 | %Od | The day of the month using the locale's alternative numeric symbols; leading zeros   |
| 65906 |     | shall be permitted but shall not be required.                                        |
| 65907 | %Oe | Equivalent to %Od.                                                                   |
| 65908 | %OH | The hour (24-hour clock) using the locale's alternative numeric symbols.             |
| 65909 | %OI | The hour (12-hour clock) using the locale's alternative numeric symbols.             |
| 65910 | %Om | The month using the locale's alternative numeric symbols.                            |
| 65911 | %OM | The minutes using the locale's alternative numeric symbols.                          |
| 65912 | %OS | The seconds using the locale's alternative numeric symbols.                          |
| 65913 | %OU | The week number of the year (Sunday as the first day of the week) using the locale's |
| 65914 |     | alternative numeric symbols.                                                         |
| 65915 | %Ow | The number of the weekday (Sunday=0) using the locale's alternative numeric          |
| 65916 |     | symbols.                                                                             |
| 65917 | %OW | The week number of the year (Monday as the first day of the week) using the locale's |
| 65918 |     | alternative numeric symbols.                                                         |
| 65919 | %Oy | The year (offset from %C) using the locale's alternative numeric symbols.            |

65920 A conversion specification composed of white-space characters is executed by scanning input up  
 65921 to the first character that is not white-space (which remains unscanned), or until no more  
 65922 characters can be scanned.

65923 A conversion specification that is an ordinary character is executed by scanning the next  
 65924 character from the buffer. If the character scanned from the buffer differs from the one  
 65925 comprising the directive, the directive fails, and the differing and subsequent characters remain

65926 unscanned.

65927 A series of conversion specifications composed of %n, %t, white-space characters, or any  
65928 combination is executed by scanning up to the first character that is not white space (which  
65929 remains unscanned), or until no more characters can be scanned.

65930 Any other conversion specification is executed by scanning characters until a character matching  
65931 the next directive is scanned, or until no more characters can be scanned. These characters,  
65932 except the one matching the next directive, are then compared to the locale values associated  
65933 with the conversion specifier. If a match is found, values for the appropriate **tm** structure  
65934 members are set to values corresponding to the locale information. Case is ignored when  
65935 matching items in *buf* such as month or weekday names. If no match is found, *strptime()* fails  
65936 and no more characters are scanned.

#### 65937 RETURN VALUE

65938 Upon successful completion, *strptime()* shall return a pointer to the character following the last  
65939 character parsed. Otherwise, a null pointer shall be returned.

#### 65940 ERRORS

65941 No errors are defined.

#### 65942 EXAMPLES

##### 65943 Convert a Date-Plus-Time String to Broken-Down Time and Then into Seconds

65944 The following example demonstrates the use of *strptime()* to convert a string into broken-down  
65945 time. The broken-down time is then converted into seconds since the Epoch using *mktime()*.

```
65946 #include <time.h>
65947 ...
65948 struct tm tm;
65949 time_t t;
65950 if (strptime("6 Dec 2001 12:33:45", "%d %b %Y %H:%M:%S", &tm) == NULL)
65951     /* Handle error */;
65952 printf("year: %d; month: %d; day: %d;\n",
65953        tm.tm_year, tm.tm_mon, tm.tm_mday);
65954 printf("hour: %d; minute: %d; second: %d\n",
65955        tm.tm_hour, tm.tm_min, tm.tm_sec);
65956 printf("week day: %d; year day: %d\n", tm.tm_wday, tm.tm_yday);
65957 tm.tm_isdst = -1;          /* Not set by strptime(); tells mktime()
65958                            to determine whether daylight saving time
65959                            is in effect */
65960 t = mktime(&tm);
65961 if (t == -1)
65962     /* Handle error */;
65963 printf("seconds since the Epoch: %ld\n", (long) t);"
```

#### 65964 APPLICATION USAGE

65965 Several “equivalent to” formats and the special processing of white-space characters are  
65966 provided in order to ease the use of identical *format* strings for *strptime()* and *strptime()*.

65967 It should be noted that dates constructed by the *strptime()* function with the %Y or %C%y  
65968 conversion specifiers may have values larger than 9999. If the *strptime()* function is used to read  
65969 such values using %C%y or %Y, the year values will be truncated to four digits. Applications

65970 should use `%+w%y` or `%+xY` with *w* and *x* set large enough to contain the full value of any years  
65971 that will be printed or scanned.

65972 See also the APPLICATION USAGE section in *strptime()*.

65973 It is unspecified whether multiple calls to *strptime()* using the same **tm** structure will update the  
65974 current contents of the structure or overwrite all contents of the structure. Conforming  
65975 applications should make a single call to *strptime()* with a format and all data needed to  
65976 completely specify the date and time being converted.

#### 65977 RATIONALE

65978 See the RATIONALE section for *strptime()*.

#### 65979 FUTURE DIRECTIONS

65980 None.

#### 65981 SEE ALSO

65982 *fprintf()*, *fscanf()*, *strptime()*, *time()*

65983 XBD **<time.h>**

#### 65984 CHANGE HISTORY

65985 First released in Issue 4.

#### 65986 Issue 5

65987 Moved from ENHANCED I18N to BASE.

65988 The [ENOSYS] error is removed.

65989 The exact meaning of the `%y` and `%Oy` specifiers is clarified in the DESCRIPTION.

#### 65990 Issue 6

65991 The Open Group Corrigendum U033/5 is applied. The `%r` specifier description is reworded.

65992 The normative text is updated to avoid use of the term “must” for application requirements.

65993 The **restrict** keyword is added to the *strptime()* prototype for alignment with the  
65994 ISO/IEC 9899:1999 standard.

65995 The Open Group Corrigendum U047/2 is applied.

65996 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion  
65997 specification” for consistency with *strptime()*.

65998 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/133 is applied, adding the example to the  
65999 EXAMPLES section.

#### 66000 Issue 7

66001 Austin Group Interpretation 1003.1-2001 #041 is applied, updating the DESCRIPTION and  
66002 APPLICATION USAGE sections.

66003 Austin Group Interpretation 1003.1-2001 #163 is applied.

66004 SD5-XSH-ERN-67 is applied, correcting the APPLICATION USAGE to remove the impression  
66005 that `%Y` is 4-digit years.

66006 **NAME**

66007       strrchr — string scanning operation

66008 **SYNOPSIS**

66009       #include &lt;string.h&gt;

66010       char \*strrchr(const char \*s, int c);

66011 **DESCRIPTION**

66012 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
66013       conflict between the requirements described here and the ISO C standard is unintentional. This  
66014       volume of POSIX.1-2008 defers to the ISO C standard.

66015       The *strrchr()* function shall locate the last occurrence of *c* (converted to a **char**) in the string  
66016       pointed to by *s*. The terminating NUL character is considered to be part of the string.

66017 **RETURN VALUE**

66018       Upon successful completion, *strrchr()* shall return a pointer to the byte or a null pointer if *c* does  
66019       not occur in the string.

66020 **ERRORS**

66021       No errors are defined.

66022 **EXAMPLES**66023       **Finding the Base Name of a File**

66024       The following example uses *strrchr()* to get a pointer to the base name of a file. The *strrchr()*  
66025       function searches backwards through the name of the file to find the last '/' character in *name*.  
66026       This pointer (plus one) will point to the base name of the file.

```
66027       #include <string.h>
66028       ...
66029       const char *name;
66030       char *basename;
66031       ...
66032       basename = strrchr(name, '/') + 1;
66033       ...
```

66034 **APPLICATION USAGE**

66035       None.

66036 **RATIONALE**

66037       None.

66038 **FUTURE DIRECTIONS**

66039       None.

66040 **SEE ALSO**66041       [\*strchr\(\)\*](#)66042       XBD [\*<string.h>\*](#)66043 **CHANGE HISTORY**

66044       First released in Issue 1. Derived from Issue 1 of the SVID.

66045 **NAME**

66046 strsignal — get name of signal

66047 **SYNOPSIS**

```
66048 CX    #include <string.h>
66049      char *strsignal(int signum);
```

66050 **DESCRIPTION**

66051 The *strsignal()* function shall map the signal number in *signum* to an implementation-defined  
 66052 string and shall return a pointer to it. It shall use the same set of messages as the *psignal()*  
 66053 function.

66054 The application shall not modify the string returned. The returned pointer might be invalidated  
 66055 or the string content might be overwritten by a subsequent call to *strsignal()* or *setlocale()*. The  
 66056 returned pointer might also be invalidated if the calling thread is terminated. +

66057 The contents of the message strings returned by *strsignal()* should be determined by the setting  
 66058 of the *LC\_MESSAGES* category in the current locale.

66059 The implementation shall behave as if no function defined in this standard calls *strsignal()*.

66060 Since no return value is reserved to indicate an error, an application wishing to check for error  
 66061 situations should set *errno* to 0, then call *strsignal()*, then check *errno*.

66062 The *strsignal()* function need not be thread-safe.

66063 **RETURN VALUE**

66064 Upon successful completion, *strsignal()* shall return a pointer to a string. Otherwise, if *signum* is  
 66065 not a valid signal number, the return value is unspecified.

66066 **ERRORS**

66067 No errors are defined.

66068 **EXAMPLES**

66069 None.

66070 **APPLICATION USAGE**

66071 None.

66072 **RATIONALE**

66073 If *signum* is not a valid signal number, some implementations return NULL, while for others the  
 66074 *strsignal()* function returns a pointer to a string containing an unspecified message denoting an  
 66075 unknown signal. POSIX.1-2008 leaves this return value unspecified.

66076 **FUTURE DIRECTIONS**

66077 None.

66078 **SEE ALSO**

66079 *psiginfo()*, *setlocale()*

66080 XBD *<string.h>*

66081 **CHANGE HISTORY**

66082 First released in Issue 7.

66083 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0609 [75] is applied.

66084 **NAME**

66085 strspn — get length of a substring

66086 **SYNOPSIS**

66087 #include &lt;string.h&gt;

66088 size\_t strspn(const char \*s1, const char \*s2);

66089 **DESCRIPTION**

66090 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
66091 conflict between the requirements described here and the ISO C standard is unintentional. This  
66092 volume of POSIX.1-2008 defers to the ISO C standard.

66093 The *strspn()* function shall compute the length (in bytes) of the maximum initial segment of the  
66094 string pointed to by *s1* which consists entirely of bytes from the string pointed to by *s2*.

66095 **RETURN VALUE**

66096 The *strspn()* function shall return the computed length; no return value is reserved to indicate an  
66097 error.

66098 **ERRORS**

66099 No errors are defined.

66100 **EXAMPLES**

66101 None.

66102 **APPLICATION USAGE**

66103 None.

66104 **RATIONALE**

66105 None.

66106 **FUTURE DIRECTIONS**

66107 None.

66112 First released in Issue 1. Derived from Issue 1 of the SVID.

66113 **Issue 5**

66114 The RETURN VALUE section is updated to indicate that *strspn()* returns the length of *s*, and not  
66115 *s* itself as was previously stated.

66116 **Issue 7**

66117 SD5-XSH-ERN-182 is applied.

66118 **NAME**

66119        strstr — find a substring

66120 **SYNOPSIS**

66121        #include &lt;string.h&gt;

66122        char \*strstr(const char \*s1, const char \*s2);

66123 **DESCRIPTION**

66124 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
 66125        conflict between the requirements described here and the ISO C standard is unintentional. This  
 66126        volume of POSIX.1-2008 defers to the ISO C standard.

66127        The *strstr()* function shall locate the first occurrence in the string pointed to by *s1* of the  
 66128        sequence of bytes (excluding the terminating NUL character) in the string pointed to by *s2*.

66129 **RETURN VALUE**

66130        Upon successful completion, *strstr()* shall return a pointer to the located string or a null pointer  
 66131        if the string is not found.

66132        If *s2* points to a string with zero length, the function shall return *s1*.

66133 **ERRORS**

66134        No errors are defined.

66135 **EXAMPLES**

66136        None.

66137 **APPLICATION USAGE**

66138        None.

66139 **RATIONALE**

66146 **CHANGE HISTORY**

66147        First released in Issue 3. Included for alignment with the ANSI C standard.

**NAME**

strtod, strtodf, strtold — convert a string to a double-precision number

**SYNOPSIS**

```
#include <stdlib.h>
```

```
double strtod(const char *restrict nptr, char **restrict endptr);
```

```
float strtodf(const char *restrict nptr, char **restrict endptr);
```

```
long double strtold(const char *restrict nptr, char **restrict endptr);
```

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

These functions shall convert the initial portion of the string pointed to by *nptr* to **double**, **float**, and **long double** representation, respectively. First, they decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
2. A subject sequence interpreted as a floating-point constant or representing infinity or NaN
3. A final string of one or more unrecognized characters, including the terminating NUL character of the input string

Then they shall attempt to convert the subject sequence to a floating-point number, and return the result.

The expected form of the subject sequence is an optional '+' or '-' sign, then one of the following:

- A non-empty sequence of decimal digits optionally containing a radix character; then an optional exponent part consisting of the character 'e' or the character 'E', optionally followed by a '+' or '-' character, and then followed by one or more decimal digits
- A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix character; then an optional binary exponent part consisting of the character 'p' or the character 'P', optionally followed by a '+' or '-' character, and then followed by one or more decimal digits
- One of INF or INFINITY, ignoring case
- One of NAN or NAN(*n-char-sequence<sub>opt</sub>*), ignoring case in the NAN part, where:

n-char-sequence:

digit

nondigit

n-char-sequence digit

n-char-sequence nondigit

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character, that is of the expected form. The subject sequence contains no characters if the input string is not of the expected form.

If the subject sequence has the expected form for a floating-point number, the sequence of characters starting with the first digit or the decimal-point character (whichever occurs first) shall be interpreted as a floating constant of the C language, except that the radix character shall be used in place of a period, and that if neither an exponent part nor a radix character appears in

66192 a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal  
 66193 floating-point number, an exponent part of the appropriate type with value zero is assumed to  
 66194 follow the last digit in the string. If the subject sequence begins with a <hyphen-minus>, the  
 66195 sequence shall be interpreted as negated. A character sequence INF or INFINITY shall be  
 66196 interpreted as an infinity, if representable in the return type, else as if it were a floating constant  
 66197 that is too large for the range of the return type. A character sequence NAN or NAN(*n-char-*  
 66198 *sequence<sub>opt</sub>*) shall be interpreted as a quiet NaN, if supported in the return type, else as if it were a  
 66199 subject sequence part that does not have the expected form; the meaning of the *n-char* sequences  
 66200 is implementation-defined. A pointer to the final string is stored in the object pointed to by  
 66201 *endptr*, provided that *endptr* is not a null pointer.

66202 If the subject sequence has the hexadecimal form and FLT\_RADIX is a power of 2, the value  
 66203 resulting from the conversion is correctly rounded.

66204 CX The radix character is defined in the current locale (category *LC\_NUMERIC*). In the POSIX  
 66205 locale, or in a locale where the radix character is not defined, the radix character shall default to  
 66206 a <period> ( ' . ' ).

66207 CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be  
 66208 accepted.

66209 If the subject sequence is empty or does not have the expected form, no conversion shall be  
 66210 performed; the value of *nptr* is stored in the object pointed to by *endptr*, provided that *endptr* is  
 66211 not a null pointer.

66212 These functions shall not change the setting of *errno* if successful.

66213 Since 0 is returned on error and is also a valid return on success, an application wishing to check  
 66214 for error situations should set *errno* to 0, then call *strtod()*, *strtodf()*, or *strtold()*, then check *errno*.

#### 66215 RETURN VALUE

66216 Upon successful completion, these functions shall return the converted value. If no conversion  
 66217 could be performed, 0 shall be returned, and *errno* may be set to [EINVAL].

66218 If the correct value is outside the range of representable values,  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, or  
 66219  $\pm$ HUGE\_VALL shall be returned (according to the sign of the value), and *errno* shall be set to  
 66220 [ERANGE].

66221 If the correct value would cause an underflow, a value whose magnitude is no greater than the  
 66222 smallest normalized positive number in the return type shall be returned and *errno* set to  
 66223 [ERANGE].

#### 66224 ERRORS

66225 These functions shall fail if:

66226 CX [ERANGE] The value to be returned would cause overflow or underflow.

66227 These functions may fail if:

66228 CX [EINVAL] No conversion could be performed.

**EXAMPLES**

None.

**APPLICATION USAGE**

If the subject sequence has the hexadecimal form and FLT\_RADIX is not a power of 2, and the result is not exactly representable, the result should be one of the two numbers in the appropriate internal format that are adjacent to the hexadecimal floating source value, with the extra stipulation that the error should have a correct sign for the current rounding direction.

If the subject sequence has the decimal form and at most DECIMAL\_DIG (defined in `<float.h>`) significant digits, the result should be correctly rounded. If the subject sequence *D* has the decimal form and more than DECIMAL\_DIG significant digits, consider the two bounding, adjacent decimal strings *L* and *U*, both having DECIMAL\_DIG significant digits, such that the values of *L*, *D*, and *U* satisfy  $L \leq D \leq U$ . The result should be one of the (equal or adjacent) values that would be obtained by correctly rounding *L* and *U* according to the current rounding direction, with the extra stipulation that the error with respect to *D* should have a correct sign for the current rounding direction.

The changes to `strtod()` introduced by the ISO/IEC 9899:1999 standard can alter the behavior of well-formed applications complying with the ISO/IEC 9899:1990 standard and thus earlier versions of this standard. One such example would be:

```
int
what_kind_of_number (char *s)
{
    char *endp;
    double d;
    long l;

    d = strtod(s, &endp);
    if (s != endp && *endp == '\0')
        printf("It's a float with value %g\n", d);
    else
    {
        l = strtol(s, &endp, 0);
        if (s != endp && *endp == '\0')
            printf("It's an integer with value %ld\n", l);
        else
            return 1;
    }
    return 0;
}
```

If the function is called with:

```
what_kind_of_number ("0x10")
```

an ISO/IEC 9899:1990 standard-compliant library will result in the function printing:

```
It's an integer with value 16
```

With the ISO/IEC 9899:1999 standard, the result is:

```
It's a float with value 16
```

The change in behavior is due to the inclusion of floating-point numbers in hexadecimal notation without requiring that either a decimal point or the binary exponent be present.

66274 **RATIONALE**

66275 None.

66276 **FUTURE DIRECTIONS**

66277 None.

66278 **SEE ALSO**66279 *fscanf()*, *isspace()*, *localeconv()*, *setlocale()*, *strtol()*66280 XBD Chapter 7 (on page 135), *<float.h>*, *<stdlib.h>*66281 **CHANGE HISTORY**

66282 First released in Issue 1. Derived from Issue 1 of the SVID.

66283 **Issue 5**66284 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.66285 **Issue 6**

66286 Extensions beyond the ISO C standard are marked.

66287 The following new requirements on POSIX implementations derive from alignment with the  
66288 Single UNIX Specification:

- 66289 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
- 66290 added if no conversion could be performed.

66291 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 66292 • The *strtod()* function is updated.
- 66293 • The *strtof()* and *strtold()* functions are added.
- 66294 • The DESCRIPTION is extensively revised.

66295 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

66296 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/61 is applied, correcting the second  
66297 paragraph in the RETURN VALUE section. This change clarifies the sign of the return value.66298 **Issue 7**

66299 Austin Group Interpretation 1003.1-2001 #015 is applied.

66300 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0610 [302], XSH/TC1-2008/0611 [94],  
66301 and XSH/TC1-2008/0612 [105] are applied.

66302 **NAME**

66303 strtoimax, strtoumax — convert string to integer type

66304 **SYNOPSIS**

66305 #include &lt;inttypes.h&gt;

66306 intmax\_t strtoimax(const char \*restrict nptr, char \*\*restrict endptr,  
66307 int base);66308 uintmax\_t strtoumax(const char \*restrict nptr, char \*\*restrict endptr,  
66309 int base);66310 **DESCRIPTION**66311 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
66312 conflict between the requirements described here and the ISO C standard is unintentional. This  
66313 volume of POSIX.1-2008 defers to the ISO C standard.66314 These functions shall be equivalent to the *strtol()*, *strtoll()*, *strtoul()*, and *strtoull()* functions,  
66315 except that the initial portion of the string shall be converted to **intmax\_t** and **uintmax\_t**  
66316 representation, respectively.66317 **RETURN VALUE**

66318 These functions shall return the converted value, if any.

66319 CX If no conversion could be performed, zero shall be returned and *errno* may be set to [EINVAL].66320 CX If the value of *base* is not supported, 0 shall be returned and *errno* shall be set to [EINVAL].66321 If the correct value is outside the range of representable values, {INTMAX\_MAX},  
66322 {INTMAX\_MIN}, or {UINTMAX\_MAX} shall be returned (according to the return type and sign  
66323 of the value, if any), and *errno* shall be set to [ERANGE].66324 **ERRORS**

66325 These functions shall fail if:

66326 CX [EINVAL] The value of *base* is not supported.

66327 [ERANGE] The value to be returned is not representable.

66328 These functions may fail if:

66329 [EINVAL] No conversion could be performed.

66330 **EXAMPLES**

66331 None.

66332 **APPLICATION USAGE**66333 Since the value of *\*endptr* is unspecified if the value of *base* is not supported, applications should  
66334 either ensure that *base* has a supported value (0 or between 2 and 36) before the call, or check for  
66335 an [EINVAL] error before examining *\*endptr*.66336 **RATIONALE**

66337 None.

66338 **FUTURE DIRECTIONS**

66339 None.

66340 **SEE ALSO**66341 *strtol()*, *strtoul()*

**CHANGE HISTORY**

66343  
66344 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

**Issue 7**

66345  
66346 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0613 [453] and XSH/TC1-2008/0614  
66347 [453] are applied.

66348 **NAME**

66349        strtok, strtok\_r — split string into tokens

66350 **SYNOPSIS**

66351        #include &lt;string.h&gt;

66352        char \*strtok(char \*restrict *s*, const char \*restrict *sep*);66353 CX       char \*strtok\_r(char \*restrict *s*, const char \*restrict *sep*,66354           char \*\*restrict *state*);66355 **DESCRIPTION**

66356 CX       For *strtok()*: The functionality described on this reference page is aligned with the ISO C  
 66357 standard. Any conflict between the requirements described here and the ISO C standard is  
 66358 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

66359        A sequence of calls to *strtok()* breaks the string pointed to by *s* into a sequence of tokens, each of  
 66360 which is delimited by a byte from the string pointed to by *sep*. The first call in the sequence has *s*  
 66361 as its first argument, and is followed by calls with a null pointer as their first argument. The  
 66362 separator string pointed to by *sep* may be different from call to call.

66363        The first call in the sequence searches the string pointed to by *s* for the first byte that is *not*  
 66364 contained in the current separator string pointed to by *sep*. If no such byte is found, then there  
 66365 are no tokens in the string pointed to by *s* and *strtok()* shall return a null pointer. If such a byte is  
 66366 found, it is the start of the first token.

66367        The *strtok()* function then searches from there for a byte that *is* contained in the current separator  
 66368 string. If no such byte is found, the current token extends to the end of the string pointed to by *s*,  
 66369 and subsequent searches for a token shall return a null pointer. If such a byte is found, it is  
 66370 overwritten by a NUL character, which terminates the current token. The *strtok()* function saves  
 66371 a pointer to the following byte, from which the next search for a token shall start.

66372        Each subsequent call, with a null pointer as the value of the first argument, starts searching from  
 66373 the saved pointer and behaves as described above.

66374        The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
 66375 *strtok()*.

66376 CX       The *strtok()* function need not be thread-safe.

66377        The *strtok\_r()* function shall be equivalent to *strtok()*, except that *strtok\_r()* shall be thread-safe  
 66378 and the argument *state* points to a user-provided pointer that allows *strtok\_r()* to maintain state  
 66379 between calls which scan the same string. The application shall ensure that the pointer pointed  
 66380 to by *state* is unique for each string (*s*) being processed concurrently by *strtok\_r()* calls. The  
 66381 application need not initialize the pointer pointed to by *state* to any particular value. The  
 66382 implementation shall not update the pointer pointed to by *state* to point (directly or indirectly) to  
 66383 resources, other than within the string *s*, that need to be freed or released by the caller.

66384 **RETURN VALUE**

66385        Upon successful completion, *strtok()* shall return a pointer to the first byte of a token. Otherwise,  
 66386 if there is no token, *strtok()* shall return a null pointer.

66387 CX       The *strtok\_r()* function shall return a pointer to the token found, or a null pointer when no token  
 66388 is found.

**ERRORS**

No errors are defined.

**EXAMPLES****Searching for Word Separators**

The following example searches for tokens separated by <space> characters.

```
#include <string.h>
...
char *token;
char line[] = "LINE TO BE SEPARATED";
char *search = " ";

/* Token will point to "LINE". */
token = strtok(line, search);

/* Token will point to "TO". */
token = strtok(NULL, search);
```

**Find First two Fields in a Buffer**

The following example uses *strtok()* to find two character strings (a key and data associated with that key) separated by any combination of <space>, <tab>, or <newline> characters at the start of the array of characters pointed to by *buffer*.

```
#include <string.h>
...
char    *buffer;
...
struct element {
    char *key;
    char *data;
} e;
...
// Load the buffer...
...
// Get the key and its data...
e.key = strtok(buffer, " \t\n");
e.data = strtok(NULL, " \t\n");
// Process the rest of the contents of the buffer...
...
```

**APPLICATION USAGE**

Note that if *sep* is the empty string, *strtok()* and *strtok\_r()* return a pointer to the remainder of the string being tokenized. +

The *strtok\_r()* function is thread-safe and stores its state in a user-supplied buffer instead of possibly using a static data area that may be overwritten by an unrelated call from another thread. +

**RATIONALE**

The *strtok()* function searches for a separator string within a larger string. It returns a pointer to the last substring between separator strings. This function uses static storage to keep track of the current string position between calls. The new function, *strtok\_r()*, takes an additional

66433 argument, *state*, to keep track of the current position in the string.

66434 **FUTURE DIRECTIONS**

66435 None.

66436 **SEE ALSO**

66437 XBD <string.h>

66438 **CHANGE HISTORY**

66439 First released in Issue 1. Derived from Issue 1 of the SVID.

66440 **Issue 5**

66441 The *strtok\_r()* function is included for alignment with the POSIX Threads Extension.

66442 A note indicating that the *strtok()* function need not be reentrant is added to the DESCRIPTION.

66443 **Issue 6**

66444 Extensions beyond the ISO C standard are marked.

66445 The *strtok\_r()* function is marked as part of the Thread-Safe Functions option.

66446 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

66447 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
66448 its avoidance of possibly using a static data area.

66449 The **restrict** keyword is added to the *strtok()* and *strtok\_r()* prototypes for alignment with the  
66450 ISO/IEC 9899:1999 standard.

66451 **Issue 7**

66452 Austin Group Interpretation 1003.1-2001 #156 is applied.

66453 SD5-XSH-ERN-235 is applied, correcting an example.

66454 The *strtok\_r()* function is moved from the Thread-Safe Functions option to the Base.

66455 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0615 [177] is applied.

## NAME

strtol, strtoll — convert a string to a long integer

## SYNOPSIS

```
#include <stdlib.h>
```

```
long strtol(const char *restrict nptr, char **restrict endptr, int base);
long long strtoll(const char *restrict nptr, char **restrict endptr,
                  int base)
```

## DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

These functions shall convert the initial portion of the string pointed to by *nptr* to a type **long** and **long long** representation, respectively. First, they decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
2. A subject sequence interpreted as an integer represented in some radix determined by the value of *base*
3. A final string of one or more unrecognized characters, including the terminating NUL character of the input string.

Then they shall attempt to convert the subject sequence to an integer, and return the result.

If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence of letters and digits representing an integer with the radix specified by *base*, optionally preceded by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and digits, following the sign if present.

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character that is of the expected form. The subject sequence shall contain no characters if the input string is empty or consists entirely of white-space characters, or if the first non-white-space character is other than a sign or a permissible letter or digit.

If the subject sequence has the expected form and the value of *base* is 0, the sequence of characters starting with the first digit shall be interpreted as an integer constant. If the subject sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the base for conversion, ascribing to each letter its value as given above. If the subject sequence begins with a <hyphen-minus>, the value resulting from the conversion shall be negated. A pointer to the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be accepted.

66501 If the subject sequence is empty or does not have the expected form, no conversion is performed;  
 66502 the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a  
 66503 null pointer.

66504 These functions shall not change the setting of *errno* if successful.

66505 Since 0, {LONG\_MIN} or {LLONG\_MIN}, and {LONG\_MAX} or {LLONG\_MAX} are returned  
 66506 on error and are also valid returns on success, an application wishing to check for error  
 66507 situations should set *errno* to 0, then call *strtol()* or *strtoll()*, then check *errno*.

#### 66508 RETURN VALUE

66509 Upon successful completion, these functions shall return the converted value, if any. If no  
 66510 CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

66511 CX If the value of *base* is not supported, 0 shall be returned and *errno* shall be set to [EINVAL].

66512 If the correct value is outside the range of representable values, {LONG\_MIN}, {LONG\_MAX},  
 66513 {LLONG\_MIN}, or {LLONG\_MAX} shall be returned (according to the sign of the value), and  
 66514 *errno* set to [ERANGE].

#### 66515 ERRORS

66516 These functions shall fail if:

66517 CX [EINVAL] The value of *base* is not supported.

66518 [ERANGE] The value to be returned is not representable.

66519 These functions may fail if:

66520 [EINVAL] No conversion could be performed.

#### 66521 EXAMPLES

66522 None.

#### 66523 APPLICATION USAGE

66524 Since the value of *\*endptr* is unspecified if the value of *base* is not supported, applications should  
 66525 either ensure that *base* has a supported value (0 or between 2 and 36) before the call, or check for  
 66526 an [EINVAL] error before examining *\*endptr*.

#### 66527 RATIONALE

66528 None.

#### 66529 FUTURE DIRECTIONS

66530 None.

#### 66531 SEE ALSO

66532 *fscanf()*, *isalpha()*, *strtod()*

66533 XBD <stdlib.h>

#### 66534 CHANGE HISTORY

66535 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 66536 Issue 5

66537 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

#### 66538 Issue 6

66539 Extensions beyond the ISO C standard are marked.

66540 The following new requirements on POSIX implementations derive from alignment with the  
 66541 Single UNIX Specification:

- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *strtol()* prototype is updated.
- The *strtoll()* function is added.

#### Issue 7

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0616 [453], XSH/TC1-2008/0617 [105], XSH/TC1-2008/0618 [453], XSH/TC1-2008/0619 [453], and XSH/TC1-2008/0620 [453] are applied.

## NAME

strtol, strtoull — convert a string to an unsigned long

## SYNOPSIS

```
#include <stdlib.h>

unsigned long strtol(const char *restrict str,
                    char **restrict endptr, int base);
unsigned long long strtoull(const char *restrict str,
                           char **restrict endptr, int base);
```

## DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

These functions shall convert the initial portion of the string pointed to by *str* to a type **unsigned long** and **unsigned long long** representation, respectively. First, they decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
2. A subject sequence interpreted as an integer represented in some radix determined by the value of *base*
3. A final string of one or more unrecognized characters, including the terminating NUL character of the input string

Then they shall attempt to convert the subject sequence to an unsigned integer, and return the result.

If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence of letters and digits representing an integer with the radix specified by *base*, optionally preceded by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and digits, following the sign if present.

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character that is of the expected form. The subject sequence shall contain no characters if the input string is empty or consists entirely of white-space characters, or if the first non-white-space character is other than a sign or a permissible letter or digit.

If the subject sequence has the expected form and the value of *base* is 0, the sequence of characters starting with the first digit shall be interpreted as an integer constant. If the subject sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the base for conversion, ascribing to each letter its value as given above. If the subject sequence begins with a <hyphen-minus>, the value resulting from the conversion shall be negated. A pointer to the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

66611 CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be  
66612 accepted.

66613 If the subject sequence is empty or does not have the expected form, no conversion shall be  
66614 performed; the value of *str* shall be stored in the object pointed to by *endptr*, provided that *endptr*  
66615 is not a null pointer.

66616 These functions shall not change the setting of *errno* if successful.

66617 Since 0, {ULONG\_MAX}, and {ULLONG\_MAX} are returned on error and are also valid returns  
66618 on success, an application wishing to check for error situations should set *errno* to 0, then call  
66619 *strtoul()* or *strtoull()*, then check *errno*.

#### 66620 RETURN VALUE

66621 Upon successful completion, these functions shall return the converted value, if any. If no  
66622 CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

66623 CX If the value of *base* is not supported, 0 shall be returned and *errno* shall be set to [EINVAL].

66624 If the correct value is outside the range of representable values, {ULONG\_MAX} or  
66625 {ULLONG\_MAX} shall be returned and *errno* set to [ERANGE].

#### 66626 ERRORS

66627 These functions shall fail if:

66628 CX [EINVAL] The value of *base* is not supported.

66629 [ERANGE] The value to be returned is not representable.

66630 These functions may fail if:

66631 CX [EINVAL] No conversion could be performed.

#### 66632 EXAMPLES

66633 None.

#### 66634 APPLICATION USAGE

66635 Since the value of *\*endptr* is unspecified if the value of *base* is not supported, applications should  
66636 either ensure that *base* has a supported value (0 or between 2 and 36) before the call, or check for  
66637 an [EINVAL] error before examining *\*endptr*.

#### 66638 RATIONALE

66639 None.

#### 66640 FUTURE DIRECTIONS

66641 None.

#### 66642 SEE ALSO

66643 *fscanf()*, *isalpha()*, *strtod()*, *strtol()*

66644 XBD <stdlib.h>

#### 66645 CHANGE HISTORY

66646 First released in Issue 4. Derived from the ANSI C standard.

#### 66647 Issue 5

66648 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

66649 **Issue 6**

66650 Extensions beyond the ISO C standard are marked.

66651 The following new requirements on POSIX implementations derive from alignment with the  
66652 Single UNIX Specification:

- 66653 • The [EINVAL] error condition is added for when the value of *base* is not supported.
- 66654 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
66655 added if no conversion could be performed.

66656 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 66657 • The *strtoul()* prototype is updated.
- 66658 • The *strtoull()* function is added.

66659 **Issue 7**66660 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0621 [105], XSH/TC1-2008/0622 [453],  
66661 and XSH/TC1-2008/0623 [453] are applied.

66662 **NAME**

66663        strtoumax — convert a string to an integer type

66664 **SYNOPSIS**

66665        #include &lt;inttypes.h&gt;

66666        uintmax\_t strtoumax(const char \*restrict *nptr*, char \*\*restrict *endptr*,  
66667                            int *base*);66668 **DESCRIPTION**66669        Refer to *strtoimax()*.

## 66670 NAME

66671 strxfrm, strxfrm\_l — string transformation

## 66672 SYNOPSIS

66673 #include &lt;string.h&gt;

66674 size\_t strxfrm(char \*restrict s1, const char \*restrict s2, size\_t n);

66675 CX size\_t strxfrm\_l(char \*restrict s1, const char \*restrict s2,  
66676 size\_t n, locale\_t locale);

## 66677 DESCRIPTION

66678 CX For *strxfrm()*: The functionality described on this reference page is aligned with the ISO C  
66679 standard. Any conflict between the requirements described here and the ISO C standard is  
66680 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.66681 CX The *strxfrm()* and *strxfrm\_l()* functions shall transform the string pointed to by *s2* and place the  
66682 resulting string into the array pointed to by *s1*. The transformation is such that if *strcmp()* is  
66683 applied to two transformed strings, it shall return a value greater than, equal to, or less than 0,  
66684 CX corresponding to the result of *strcoll()* or *strcoll\_l()*, respectively, applied to the same two  
66685 CX original strings with the same locale. No more than *n* bytes are placed into the resulting array  
66686 pointed to by *s1*, including the terminating NUL character. If *n* is 0, *s1* is permitted to be a null  
66687 pointer. If copying takes place between objects that overlap, the behavior is undefined.66688 CX The *strxfrm()* and *strxfrm\_l()* functions shall not change the setting of *errno* if successful.66689 Since no return value is reserved to indicate an error, an application wishing to check for error  
66690 CX situations should set *errno* to 0, then call *strxfrm()* or *strxfrm\_l()*, then check *errno*.66691 CX The behavior is undefined if the *locale* argument to *strxfrm\_l()* is the special locale object  
66692 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

## 66693 RETURN VALUE

66694 CX Upon successful completion, *strxfrm()* and *strxfrm\_l()* shall return the length of the  
66695 transformed string (not including the terminating NUL character). If the value returned is *n* or  
66696 more, the contents of the array pointed to by *s1* are unspecified.66697 CX On error, *strxfrm()* and *strxfrm\_l()* may set *errno* but no return value is reserved to indicate an  
66698 error.

## 66699 ERRORS

66700 These functions may fail if:

66701 CX [EINVAL] The string pointed to by the *s2* argument contains characters outside the  
66702 domain of the collating sequence.

## 66703 EXAMPLES

66704 None.

## 66705 APPLICATION USAGE

66706 The transformation function is such that two transformed strings can be ordered by *strcmp()* as  
66707 appropriate to collating sequence information in the current locale (category *LC\_COLLATE*).66708 The fact that when *n* is 0 *s1* is permitted to be a null pointer is useful to determine the size of the  
66709 *s1* array prior to making the transformation.

66710 **RATIONALE**

66711 None.

66712 **FUTURE DIRECTIONS**

66713 None.

66714 **SEE ALSO**66715 *strcmp()*, *strcoll()*

66716 XBD &lt;string.h&gt;

66717 **CHANGE HISTORY**

66718 First released in Issue 3. Included for alignment with the ISO C standard.

66719 **Issue 5**66720 The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.66721 **Issue 6**

66722 Extensions beyond the ISO C standard are marked.

66723 The following new requirements on POSIX implementations derive from alignment with the  
66724 Single UNIX Specification:

- 66725
- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
- 
- 66726 added if no conversion could be performed.

66727 The *strxfrm()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.66728 **Issue 7**66729 The *strxfrm\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
66730 Set Part 4.66731 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0624 [283], XSH/TC1-2008/0625 [283],  
66732 and XSH/TC1-2008/0626 [302] are applied.

66733 **NAME**

66734 swab — swap bytes

66735 **SYNOPSIS**

```
66736 XSI #include <unistd.h>
66737 void swab(const void *restrict src, void *restrict dest,
66738          ssize_t nbytes);
```

66739 **DESCRIPTION**

66740 The *swab()* function shall copy *nbytes* bytes, which are pointed to by *src*, to the object pointed to  
66741 by *dest*, exchanging adjacent bytes. The *nbytes* argument should be even. If *nbytes* is odd, *swab()*  
66742 copies and exchanges *nbytes*–1 bytes and the disposition of the last byte is unspecified. If  
66743 copying takes place between objects that overlap, the behavior is undefined. If *nbytes* is  
66744 negative, *swab()* does nothing.

66745 **RETURN VALUE**

66746 None.

66747 **ERRORS**

66748 No errors are defined.

66749 **EXAMPLES**

66750 None.

66751 **APPLICATION USAGE**

66752 None.

66753 **RATIONALE**

66754 None.

66755 **FUTURE DIRECTIONS**

66756 None.

66757 **SEE ALSO**66758 XBD [<unistd.h>](#)66759 **CHANGE HISTORY**

66760 First released in Issue 1. Derived from Issue 1 of the SVID.

66761 **Issue 6**

66762 The **restrict** keyword is added to the *swab()* prototype for alignment with the  
66763 ISO/IEC 9899:1999 standard.

66764 **NAME**

66765 swprintf — print formatted wide-character output

66766 **SYNOPSIS**

66767 #include &lt;stdio.h&gt;

66768 #include &lt;wchar.h&gt;

66769 int swprintf(wchar\_t \*restrict ws, size\_t n,

66770 const wchar\_t \*restrict format, ...);

66771 **DESCRIPTION**66772 Refer to *fwprintf()*.

66773 **NAME**

66774 swscanf — convert formatted wide-character input

66775 **SYNOPSIS**

66776 #include &lt;stdio.h&gt;

66777 #include &lt;wchar.h&gt;

```
66778 int swscanf(const wchar_t *restrict ws,  
66779             const wchar_t *restrict format, ...);
```

66780 **DESCRIPTION**66781 Refer to *fwscanf()*.

66782 **NAME**66783        `symlink, symlinkat` — make a symbolic link |66784 **SYNOPSIS**66785        `#include <unistd.h>`66786        `int symlink(const char *path1, const char *path2);`66787 OH     `#include <fcntl.h>` +

66788 +

66789        `int symlinkat(const char *path1, int fd, const char *path2);`66790 **DESCRIPTION**

66791        The `symlink()` function shall create a symbolic link called *path2* that contains the string pointed to  
 66792        by *path1* (*path2* is the name of the symbolic link created, *path1* is the string contained in the  
 66793        symbolic link).

66794        The string pointed to by *path1* shall be treated only as a string and shall not be validated as a |  
 66795        pathname.

66796        If the `symlink()` function fails for any reason other than [EIO], any file named by *path2* shall be  
 66797        unaffected.

66798        If *path2* names a symbolic link, `symlink()` shall fail and set *errno* to [EEXIST].

66799        The symbolic link's user ID shall be set to the process' effective user ID. The symbolic link's  
 66800        group ID shall be set to the group ID of the parent directory or to the effective group ID of the  
 66801        process. Implementations shall provide a way to initialize the symbolic link's group ID to the  
 66802        group ID of the parent directory. Implementations may, but need not, provide an  
 66803        implementation-defined way to initialize the symbolic link's group ID to the effective group ID  
 66804        of the calling process.

66805        The values of the file mode bits for the created symbolic link are unspecified. All interfaces  
 66806        specified by POSIX.1-2008 shall behave as if the contents of symbolic links can always be read,  
 66807        except that the value of the file mode bits returned in the *st\_mode* field of the **stat** structure is  
 66808        unspecified.

66809        Upon successful completion, `symlink()` shall mark for update the last data access, last data  
 66810        modification, and last file status change timestamps of the symbolic link. Also, the last data  
 66811        modification and last file status change timestamps of the directory that contains the new entry  
 66812        shall be marked for update.

66813        The `symlinkat()` function shall be equivalent to the `symlink()` function except in the case where  
 66814        *path2* specifies a relative path. In this case the symbolic link is created relative to the directory  
 66815        associated with the file descriptor *fd* instead of the current working directory. If the access mode |  
 66816        of the open file description associated with the file descriptor is not O\_SEARCH, the function |  
 66817        shall check whether directory searches are permitted using the current permissions of the |  
 66818        directory underlying the file descriptor. If the access mode is O\_SEARCH, the function shall not |  
 66819        perform the check.

66820        If `symlinkat()` is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 66821        directory shall be used and the behavior shall be identical to a call to `symlink()`.

66822 **RETURN VALUE**

66823        Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 66824        return -1 and set *errno* to indicate the error.

**ERRORS**

These functions shall fail if:

[EACCES] Write permission is denied in the directory where the symbolic link is being created, or search permission is denied for a component of the path prefix of *path2*.

[EEXIST] The *path2* argument names an existing file.

[EIO] An I/O error occurs while reading from or writing to the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path2* argument.

[ENAMETOOLONG]

The length of a component of the pathname specified by the *path2* argument is longer than {NAME\_MAX} or the length of the *path1* argument is longer than {SYMLINK\_MAX}.

[ENOENT] A component of the path prefix of *path2* does not name an existing file or *path2* is an empty string.

[ENOENT] or [ENOTDIR]

The *path2* argument contains at least one non-`<slash>` character and ends with one or more trailing `<slash>` characters. If *path2* without the trailing `<slash>` characters would name an existing file, an [ENOENT] error shall not occur.

[ENOSPC] The directory in which the entry for the new symbolic link is being placed cannot be extended because no space is left on the file system containing the directory, or the new symbolic link cannot be created because no space is left on the file system which shall contain the link, or the file system is out of file-allocation resources.

[ENOTDIR] A component of the path prefix of *path2* names an existing file that is neither a directory nor a symbolic link to a directory.

[EROFS] The new symbolic link would reside on a read-only file system.

The *symlinkat*( ) function shall fail if:

[EACCES] The access mode of the open file description associated with *fd* is not O\_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path2* argument does not specify an absolute path and the *fd* argument is neither AT\_FDCWD nor a valid file descriptor open for reading or searching.

[ENOTDIR] The *path2* argument is not an absolute path and *fd* is a file descriptor associated with a non-directory file.

These functions may fail if:

[ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during resolution of the *path2* argument.

[ENAMETOOLONG]

The length of the *path2* argument exceeds {PATH\_MAX} or pathname resolution of a symbolic link in the *path2* argument produced an intermediate result with a length that exceeds {PATH\_MAX}.

**EXAMPLES**

None.

**APPLICATION USAGE**

Like a hard link, a symbolic link allows a file to have multiple logical names. The presence of a hard link guarantees the existence of a file, even after the original name has been removed. A symbolic link provides no such assurance; in fact, the file named by the *path1* argument need not exist when the link is created. A symbolic link can cross file system boundaries.

Normal permission checks are made on each component of the symbolic link pathname during its resolution.

**RATIONALE**

The purpose of the *symlinkat()* function is to create symbolic links in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *symlink()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *symlinkat()* function it can be guaranteed that the created symbolic link is located relative to the desired directory.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

**Issue 6**

The following changes were made to align with the IEEE P1003.1a draft standard:

- The DESCRIPTION text is updated.
- The [ELOOP] optional error condition is added.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *symlinkat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Additions have been made describing how *symlink()* sets the user and group IDs and file mode of the symbolic link, and its effect on timestamps.

Changes are made to allow a directory to be opened for searching.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0627 [146,428], XSH/TC1-2008/0628 [461], XSH/TC1-2008/0629 [146,428], XSH/TC1-2008/0630 [146,428,436], XSH/TC1-2008/0631 [324], XSH/TC1-2008/0632 [278], XSH/TC1-2008/0633 [278], and XSH/TC1-2008/0634 [151] are applied.

66906 **NAME**

66907 sync — schedule file system updates

66908 **SYNOPSIS**

```
66909 XSI    #include <unistd.h>  
66910      void sync(void);
```

66911 **DESCRIPTION**

66912 The *sync()* function shall cause all information in memory that updates file systems to be  
66913 scheduled for writing out to all file systems.

66914 The writing, although scheduled, is not necessarily complete upon return from *sync()*.

66915 **RETURN VALUE**

66916 The *sync()* function shall not return a value.

66917 **ERRORS**

66918 No errors are defined.

66919 **EXAMPLES**

66920 None.

66921 **APPLICATION USAGE**

66922 None.

66923 **RATIONALE**

66924 None.

66925 **FUTURE DIRECTIONS**

66926 None.

66927 **SEE ALSO**

66933 Moved from X/OPEN UNIX extension to BASE.

66934 **NAME**

66935 sysconf — get configurable system variables

66936 **SYNOPSIS**

66937 #include &lt;unistd.h&gt;

66938 long sysconf(int name);

66939 **DESCRIPTION**

66940 The *sysconf()* function provides a method for the application to determine the current value of a  
 66941 configurable system limit or option (*variable*). The implementation shall support all of the  
 66942 variables listed in the following table and may support others.

66943 The *name* argument represents the system variable to be queried. The following table lists the  
 66944 minimal set of system variables from <limits.h> or <unistd.h> that can be returned by *sysconf()*,  
 66945 and the symbolic constants defined in <unistd.h> that are the corresponding values used for  
 66946 *name*.

| Variable                                                                    | Value of Name                    |
|-----------------------------------------------------------------------------|----------------------------------|
| {AIO_LISTIO_MAX}                                                            | _SC_AIO_LISTIO_MAX               |
| {AIO_MAX}                                                                   | _SC_AIO_MAX                      |
| {AIO_PRIO_DELTA_MAX}                                                        | _SC_AIO_PRIO_DELTA_MAX           |
| {ARG_MAX}                                                                   | _SC_ARG_MAX                      |
| {ATEXIT_MAX}                                                                | _SC_ATEXIT_MAX                   |
| {BC_BASE_MAX}                                                               | _SC_BC_BASE_MAX                  |
| {BC_DIM_MAX}                                                                | _SC_BC_DIM_MAX                   |
| {BC_SCALE_MAX}                                                              | _SC_BC_SCALE_MAX                 |
| {BC_STRING_MAX}                                                             | _SC_BC_STRING_MAX                |

**RETURN VALUE**

If *name* is an invalid value, *sysconf()* shall return  $-1$  and set *errno* to indicate the error. If the variable corresponding to *name* is described in **<limits.h>** as a maximum or minimum value and the variable has no limit, *sysconf()* shall return  $-1$  without changing the value of *errno*. Note that indefinite limits do not imply infinite limits; see **<limits.h>**.

Otherwise, *sysconf()* shall return the current variable value on the system. The value returned shall not be more restrictive than the corresponding value described to the application when it was compiled with the implementation's **<limits.h>** or **<unistd.h>**. The value shall not change during the lifetime of the calling process, except that *sysconf(\_SC\_OPEN\_MAX)* may return different values before and after a call to *setrlimit()* which changes the RLIMIT\_NOFILE soft limit.

If the variable corresponding to *name* is dependent on an unsupported option, the results are unspecified.

**ERRORS**

The *sysconf()* function shall fail if:

[EINVAL] The value of the *name* argument is invalid.

**EXAMPLES**

None.

**APPLICATION USAGE**

As `-1` is a permissible return value in a successful situation, an application wishing to check for error situations should set `errno` to 0, then call `sysconf()`, and, if it returns `-1`, check to see if `errno` is non-zero.

Application developers should check whether an option, such as `_POSIX_TRACE`, is supported prior to obtaining and using values for related variables, such as `_POSIX_TRACE_NAME_MAX`.

**RATIONALE**

This functionality was added in response to requirements of application developers and of system vendors who deal with many international system configurations. It is closely related to `pathconf()` and `fpathconf()`.

Although a conforming application can run on all systems by never demanding more resources than the minimum values published in this volume of POSIX.1-2008, it is useful for that application to be able to use the actual value for the quantity of a resource available on any given system. To do this, the application makes use of the value of a symbolic constant in `<limits.h>` or `<unistd.h>`.

However, once compiled, the application must still be able to cope if the amount of resource available is increased. To that end, an application may need a means of determining the quantity of a resource, or the presence of an option, at execution time.

Two examples are offered:

1. Applications may wish to act differently on systems with or without job control. Applications vendors who wish to distribute only a single binary package to all instances of a computer architecture would be forced to assume job control is never available if it were to rely solely on the `<unistd.h>` value published in this volume of POSIX.1-2008.
2. International applications vendors occasionally require knowledge of the number of clock ticks per second. Without these facilities, they would be required to either distribute their applications partially in source form or to have 50 Hz and 60 Hz versions for the various countries in which they operate.

It is the knowledge that many applications are actually distributed widely in executable form that leads to this facility. If limited to the most restrictive values in the headers, such applications would have to be prepared to accept the most limited environments offered by the smallest microcomputers. Although this is entirely portable, there was a consensus that they should be able to take advantage of the facilities offered by large systems, without the restrictions associated with source and object distributions.

During the discussions of this feature, it was pointed out that it is almost always possible for an application to discern what a value might be at runtime by suitably testing the various functions themselves. And, in any event, it could always be written to adequately deal with error returns from the various functions. In the end, it was felt that this imposed an unreasonable level of complication and sophistication on the application developer.

This runtime facility is not meant to provide ever-changing values that applications have to check multiple times. The values are seen as changing no more frequently than once per system initialization, such as by a system administrator or operator with an automatic configuration program. This volume of POSIX.1-2008 specifies that they shall not change within the lifetime of the process.

Some values apply to the system overall and others vary at the file system or directory level. The

latter are described in *fpathconf()*.

Note that all values returned must be expressible as integers. String values were considered, but the additional flexibility of this approach was rejected due to its added complexity of implementation and use.

Some values, such as {PATH\_MAX}, are sometimes so large that they must not be used to, say, allocate arrays. The *sysconf()* function returns a negative value to show that this symbolic constant is not even defined in this case.

Similar to *pathconf()*, this permits the implementation not to have a limit. When one resource is infinite, returning an error indicating that some other resource limit has been reached is conforming behavior.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

### Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

The \_XBS\_ variables and name values are added to the table of system variables in the DESCRIPTION. These are all marked EX.

### Issue 6

The symbol CLK\_TCK is obsolescent and removed. It is replaced with the phrase “clock ticks per second”.

The symbol {PASS\_MAX} is removed.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Table entries are added for the following variables: \_SC\_REGEX, \_SC\_SHELL, \_SC\_REGEX\_VERSION, \_SC\_SYMLINK\_MAX.

The following *sysconf()* variables and their associated names are added for alignment with IEEE Std 1003.1d-1999:

\_POSIX\_ADVISORY\_INFO  
\_POSIX\_CPUTIME  
\_POSIX\_SPAWN  
\_POSIX\_SPORADIC\_SERVER  
\_POSIX\_THREAD\_CPUTIME  
\_POSIX\_THREAD\_SPORADIC\_SERVER  
\_POSIX\_TIMEOUTS

The following changes are made to the DESCRIPTION for alignment with IEEE Std 1003.1j-2000:

- A statement expressing the dependency of support for some system variables on implementation options is added.
- The following system variables are added:

```
_POSIX_BARRIERS
_POSIX_CLOCK_SELECTION
_POSIX_MONOTONIC_CLOCK
_POSIX_READER_WRITER_LOCKS
_POSIX_SPIN_LOCKS
_POSIX_TYPED_MEMORY_OBJECTS
```

The following system variables are added for alignment with IEEE Std 1003.2d-1994:

```
_POSIX2_PBS
_POSIX2_PBS_ACCOUNTING
_POSIX2_PBS_LOCATE
_POSIX2_PBS_MESSAGE
_POSIX2_PBS_TRACK
```

The following *sysconf()* variables and their associated names are added for alignment with IEEE Std 1003.1q-2000:

```
_POSIX_TRACE
_POSIX_TRACE_EVENT_FILTER
_POSIX_TRACE_INHERIT
_POSIX_TRACE_LOG
```

The macros associated with the *c89* programming models are marked LEGACY, and new equivalent macros associated with *c99* are introduced.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/62 is applied, updating the DESCRIPTION to denote that the *\_PC\** and *\_SC\** symbols are now required to be supported. A corresponding change has been made in the Base Definitions volume of POSIX.1-2008. The deletion in the second paragraph removes some duplicated text. Additional symbols that were erroneously omitted from this reference page have been added.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/63 is applied, making it clear in the RETURN VALUE section that the value returned for *sysconf(\_SC\_OPEN\_MAX)* may change if a call to *setrlimit()* adjusts the RLIMIT\_NOFILE soft limit.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/134 is applied, updating the DESCRIPTION to remove an erroneous entry for *\_POSIX\_SYMLINK\_MAX*. This corrects an error in IEEE Std 1003.1-2001/Cor 1-2002.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/135 is applied, removing *\_POSIX\_FILE\_LOCKING*, *\_POSIX\_MULTI\_PROCESS*, *\_POSIX2\_C\_VERSION*, and *\_XOPEN\_XCU\_VERSION* (and their associated *\_SC\_\** variables) from the DESCRIPTION and APPLICATION USAGE sections.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/136 is applied, adding the following constants (and their associated *\_SC\_\** variables) to the DESCRIPTION:

67220            \_POSIX\_SS\_REPL\_MAX  
67221            \_POSIX\_TRACE\_EVENT\_NAME\_MAX  
67222            \_POSIX\_TRACE\_NAME\_MAX  
67223            \_POSIX\_TRACE\_SYS\_MAX  
67224            \_POSIX\_TRACE\_USER\_EVENT\_MAX

67225            The RETURN VALUE and APPLICATION USAGE sections are updated to note that if variables  
67226            are dependent on unsupported options, the results are unspecified.

67227            IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/137 is applied, removing  
67228            \_REGEX\_VERSION and \_SC\_REGEX\_VERSION.

67229 **Issue 7**

67230            Austin Group Interpretation 1003.1-2001 #160 is applied.

67231            SD5-XSH-ERN-166 is applied, changing “Maximum size” to “Initial size” for the “Maximum  
67232            size of ...” entries in the table in the DESCRIPTION.

67233            The variables for the supported programming environments are updated to be V7 and the  
67234            LEGACY variables are removed.

67235            The following constants are added:

67236            \_POSIX\_THREAD\_ROBUST\_PRIO\_INHERIT  
67237            \_POSIX\_THREAD\_ROBUST\_PRIO\_PROTECT

67238            The \_XOPEN\_UUCP variable and its associated \_SC\_XOPEN\_UUCP value is added to the table  
67239            of system variables.

67240 **NAME**

67241 syslog — log a message

67242 **SYNOPSIS**

```
67243 XSI      #include <syslog.h>
67244          void syslog(int priority, const char *message, ... /* argument */);
```

67245 **DESCRIPTION**67246 Refer to *closelog()*.

67247 **NAME**

67248       system — issue a command

67249 **SYNOPSIS**

67250       #include &lt;stdlib.h&gt;

67251       int system(const char \*command);

67252 **DESCRIPTION**

67253 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 67254 conflict between the requirements described here and the ISO C standard is unintentional. This  
 67255 volume of POSIX.1-2008 defers to the ISO C standard.

67256 If *command* is a null pointer, the *system()* function shall determine whether the host environment  
 67257 has a command processor. If *command* is not a null pointer, the *system()* function shall pass the  
 67258 string pointed to by *command* to that command processor to be executed in an implementation-  
 67259 defined manner; this might then cause the program calling *system()* to behave in a non-  
 67260 conforming manner or to terminate.

67261 CX       The *system()* function shall behave as if a child process were created using *fork()*, and the child  
 67262 process invoked the *sh* utility using *execl()* as follows:

67263       execl(&lt;shell path&gt;, "sh", "-c", command, (char \*)0);

67264 where <shell path> is an unspecified pathname for the *sh* utility. It is unspecified whether the  
 67265 handlers registered with *pthread\_atfork()* are called as part of the creation of the child process.

67266 The *system()* function shall ignore the SIGINT and SIGQUIT signals, and shall block the  
 67267 SIGCHLD signal, while waiting for the command to terminate. If this might cause the  
 67268 application to miss a signal that would have killed it, then the application should examine the  
 67269 return value from *system()* and take whatever action is appropriate to the application if the  
 67270 command terminated due to receipt of a signal.

67271 The *system()* function shall not affect the termination status of any child of the calling processes  
 67272 other than the process or processes it itself creates.

67273       The *system()* function shall not return until the child process has terminated.67274       The *system()* function need not be thread-safe.67275 **RETURN VALUE**

67276 If *command* is a null pointer, *system()* shall return non-zero to indicate that a command processor  
 67277 CX       is available, or zero if none is available. The *system()* function shall always return non-zero  
 67278 when *command* is NULL.

67279 CX       If *command* is not a null pointer, *system()* shall return the termination status of the command  
 67280 language interpreter in the format specified by *waitpid()*. The termination status shall be as  
 67281 defined for the *sh* utility; otherwise, the termination status is unspecified. If some error prevents  
 67282 the command language interpreter from executing after the child process is created, the return  
 67283 value from *system()* shall be as if the command language interpreter had terminated using  
 67284 *exit*(127) or *\_exit*(127). If a child process cannot be created, or if the termination status for the  
 67285 command language interpreter cannot be obtained, *system()* shall return -1 and set *errno* to  
 67286 indicate the error.

67287 **ERRORS**67288 CX       The *system()* function may set *errno* values as described by *fork()*.

67289 In addition, *system()* may fail if:

67290 CX [ECHILD] The status of the child process created by *system()* is no longer available.

## 67291 EXAMPLES

67292 None.

## 67293 APPLICATION USAGE

67294 If the return value of *system()* is not `-1`, its value can be decoded through the use of the macros  
67295 described in `<sys/wait.h>`. For convenience, these macros are also provided in `<stdlib.h>`.

67296 Note that, while *system()* must ignore `SIGINT` and `SIGQUIT` and block `SIGCHLD` while waiting  
67297 for the child to terminate, the handling of signals in the executed command is as specified by  
67298 *fork()* and *exec*. For example, if `SIGINT` is being caught or is set to `SIG_DFL` when *system()* is  
67299 called, then the child is started with `SIGINT` handling set to `SIG_DFL`.

67300 Ignoring `SIGINT` and `SIGQUIT` in the parent process prevents coordination problems (two  
67301 processes reading from the same terminal, for example) when the executed command ignores or  
67302 catches one of the signals. It is also usually the correct action when the user has given a  
67303 command to the application to be executed synchronously (as in the `'!'` command in many  
67304 interactive applications). In either case, the signal should be delivered only to the child process,  
67305 not to the application itself. There is one situation where ignoring the signals might have less  
67306 than the desired effect. This is when the application uses *system()* to perform some task invisible  
67307 to the user. If the user typed the interrupt character ("`^C`", for example) while *system()* is being  
67308 used in this way, one would expect the application to be killed, but only the executed command  
67309 is killed. Applications that use *system()* in this way should carefully check the return status from  
67310 *system()* to see if the executed command was successful, and should take appropriate action  
67311 when the command fails.

67312 Blocking `SIGCHLD` while waiting for the child to terminate prevents the application from  
67313 catching the signal and obtaining status from *system()*'s child process before *system()* can get the  
67314 status itself.

67315 The context in which the utility is ultimately executed may differ from that in which *system()*  
67316 was called. For example, file descriptors that have the `FD_CLOEXEC` flag set are closed, and the  
67317 process ID and parent process ID are different. Also, if the executed utility changes its  
67318 environment variables or its current working directory, that change is not reflected in the caller's  
67319 context.

67320 There is no defined way for an application to find the specific path for the shell. However,  
67321 *confstr()* can provide a value for *PATH* that is guaranteed to find the *sh* utility.

67322 Using the *system()* function in more than one thread in a process or when the `SIGCHLD` signal is  
67323 being manipulated by more than one thread in a process may produce unexpected results.

## 67324 RATIONALE

67325 The *system()* function should not be used by programs that have set user (or group) ID  
67326 privileges. The *fork()* and *exec* family of functions (except *execlp()* and *execvp()*), should be used  
67327 instead. This prevents any unforeseen manipulation of the environment of the user that could  
67328 cause execution of commands not anticipated by the calling program.

67329 There are three levels of specification for the *system()* function. The ISO C standard gives the  
67330 most basic. It requires that the function exists, and defines a way for an application to query  
67331 whether a command language interpreter exists. It says nothing about the command language  
67332 or the environment in which the command is interpreted.

67333 POSIX.1-2008 places additional restrictions on *system()*. It requires that if there is a command  
67334 language interpreter, the environment must be as specified by *fork()* and *exec*. This ensures, for

example, that close-on-exec works, that file locks are not inherited, and that the process ID is different. It also specifies the return value from *system()* when the command line can be run, thus giving the application some information about the command's completion status.

Finally, POSIX.1-2008 requires the command to be interpreted as in the shell command language defined in the Shell and Utilities volume of POSIX.1-2008.

Note that, *system(NULL)* is required to return non-zero, indicating that there is a command language interpreter. At first glance, this would seem to conflict with the ISO C standard which allows *system(NULL)* to return zero. There is no conflict, however. A system must have a command language interpreter, and is non-conforming if none is present. It is therefore permissible for the *system()* function on such a system to implement the behavior specified by the ISO C standard as long as it is understood that the implementation does not conform to POSIX.1-2008 if *system(NULL)* returns zero.

It was explicitly decided that when *command* is NULL, *system()* should not be required to check to make sure that the command language interpreter actually exists with the correct mode, that there are enough processes to execute it, and so on. The call *system(NULL)* could, theoretically, check for such problems as too many existing child processes, and return zero. However, it would be inappropriate to return zero due to such a (presumably) transient condition. If some condition exists that is not under the control of this application and that would cause any *system()* call to fail, that system has been rendered non-conforming.

Early drafts required, or allowed, *system()* to return with *errno* set to [EINTR] if it was interrupted with a signal. This error return was removed, and a requirement that *system()* not return until the child has terminated was added. This means that if a *waitpid()* call in *system()* exits with *errno* set to [EINTR], *system()* must reissue the *waitpid()*. This change was made for two reasons:

1. There is no way for an application to clean up if *system()* returns [EINTR], short of calling *wait()*, and that could have the undesirable effect of returning the status of children other than the one started by *system()*.
2. While it might require a change in some historical implementations, those implementations already have to be changed because they use *wait()* instead of *waitpid()*.

Note that if the application is catching SIGCHLD signals, it will receive such a signal before a successful *system()* call returns.

To conform to POSIX.1-2008, *system()* must use *waitpid()*, or some similar function, instead of *wait()*.

The following code sample illustrates how *system()* might be implemented on an implementation conforming to POSIX.1-2008.

```
#include <signal.h>
int system(const char *cmd)
{
    int stat;
    pid_t pid;
    struct sigaction sa, savintr, savequit;
    sigset_t saveblock;
    if (cmd == NULL)
        return(1);
    sa.sa_handler = SIG_IGN;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = 0;
```

```

67382     sigemptyset(&saveintr.sa_mask);
67383     sigemptyset(&savequit.sa_mask);
67384     sigaction(SIGINT, &sa, &saveintr);
67385     sigaction(SIGQUIT, &sa, &savequit);
67386     sigaddset(&sa.sa_mask, SIGCHLD);
67387     sigprocmask(SIG_BLOCK, &sa.sa_mask, &saveblock);
67388     if ((pid = fork()) == 0) {
67389         sigaction(SIGINT, &saveintr, (struct sigaction *)0);
67390         sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
67391         sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
67392         execl("/bin/sh", "sh", "-c", cmd, (char *)0);
67393         _exit(127);
67394     }
67395     if (pid == -1) {
67396         stat = -1; /* errno comes from fork() */
67397     } else {
67398         while (waitpid(pid, &stat, 0) == -1) {
67399             if (errno != EINTR){
67400                 stat = -1;
67401                 break;
67402             }
67403         }
67404     }
67405     sigaction(SIGINT, &saveintr, (struct sigaction *)0);
67406     sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
67407     sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
67408     return(stat);
67409 }

```

Note that, while a particular implementation of *system()* (such as the one above) can assume a particular path for the shell, such a path is not necessarily valid on another system. The above example is not portable, and is not intended to be.

Note also that the above example implementation is not thread-safe. Implementations can provide a thread-safe *system()* function, but doing so involves complications such as how to restore the signal dispositions for SIGINT and SIGQUIT correctly if there are overlapping calls, and how to deal with cancellation. The example above would not restore the signal dispositions and would leak a process ID if cancelled. This does not matter for a non-thread-safe implementation since canceling a non-thread-safe function results in undefined behavior (see [Section 2.9.5.2](#), on page 518). To avoid leaking a process ID, a thread-safe implementation would need to terminate the child process when acting on a cancellation.

One reviewer suggested that an implementation of *system()* might want to use an environment variable such as *SHELL* to determine which command interpreter to use. The supposed implementation would use the default command interpreter if the one specified by the environment variable was not available. This would allow a user, when using an application that prompts for command lines to be processed using *system()*, to specify a different command interpreter. Such an implementation is discouraged. If the alternate command interpreter did not follow the command line syntax specified in the Shell and Utilities volume of POSIX.1-2008, then changing *SHELL* would render *system()* non-conforming. This would affect applications that expected the specified behavior from *system()*, and since the Shell and Utilities volume of POSIX.1-2008 does not mention that *SHELL* affects *system()*, the application would not know that it needed to unset *SHELL*.

67439 First released in Issue 1. Derived from Issue 1 of the SVID.

67440 **Issue 6**

67441 Extensions beyond the ISO C standard are marked.

67442 **Issue 7**67443 Austin Group Interpretation 1003.1-2001 #055 is applied, clarifying the thread-safety of this  
67444 function and treatment of *at\_fork()* handlers.

67445 Austin Group Interpretation 1003.1-2001 #156 is applied.

67446 SD5-XSH-ERN-30 is applied.

67447 **NAME**

67448 tan, tanf, tanl — tangent function

67449 **SYNOPSIS**

```
67450 #include <math.h>
67451 double tan(double x);
67452 float tanf(float x);
67453 long double tanl(long double x);
```

67454 **DESCRIPTION**

67455 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 67456 conflict between the requirements described here and the ISO C standard is unintentional. This  
 67457 volume of POSIX.1-2008 defers to the ISO C standard.

67458 These functions shall compute the tangent of their argument  $x$ , measured in radians.

67459 An application wishing to check for error situations should set *errno* to zero and call  
 67460 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 67461 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 67462 zero, an error has occurred.

67463 **RETURN VALUE**

67464 Upon successful completion, these functions shall return the tangent of  $x$ .

67465 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 67466 MXX and *tan()*, *tanf()*, and *tanl()* shall return 0.0, or (if IEC 60559 Floating-Point is not supported) an  
 67467 implementation-defined value no greater in magnitude than DBL\_MIN, FLT\_MIN, and  
 67468 LDBL\_MIN, respectively.

67469 MX If  $x$  is NaN, a NaN shall be returned.

67470 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

67471 If  $x$  is subnormal, a range error may occur

67472 MXX and  $x$  should be returned.

67473 MX If  $x$  is not returned, *tan()*, *tanf()*, and *tanl()* shall return an implementation-defined value no  
 67474 greater in magnitude than DBL\_MIN, FLT\_MIN, and LDBL\_MIN, respectively.

67475 If  $x$  is  $\pm\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 67476 defined value shall be returned.

67477 MXX If the correct value would cause underflow, and is representable, a range error may occur and  
 67478 the correct value shall be returned.

67479 XSI If the correct value would cause overflow, a range error shall occur and *tan()*, *tanf()*, and *tanl()*  
 67480 shall return  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$ , respectively, with the same sign  
 67481 as the correct value of the function.

67482 **ERRORS**

67483 These functions shall fail if:

67484 MX **Domain Error** The value of  $x$  is  $\pm\text{Inf}$ .

67485 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 67486 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 67487 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 67488 shall be raised.

67489 XSI **Range Error** The result overflows

67490 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,

67491 then *errno* shall be set to [ERANGE]. If the integer expression

67492 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow

67493 floating-point exception shall be raised.

67494 These functions may fail if:

67495 MX **Range Error** The result underflows, or the value of *x* is subnormal.

67496 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,

67497 then *errno* shall be set to [ERANGE]. If the integer expression

67498 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow

67499 floating-point exception shall be raised.

## 67500 EXAMPLES

### 67501 Taking the Tangent of a 45-Degree Angle

```
67502 #include <math.h>
67503 ...
67504 double radians = 45.0 * M_PI / 180;
67505 double result;
67506 ...
67507 result = tan (radians);
```

## 67508 APPLICATION USAGE

67509 There are no known floating-point representations such that for a normal argument, *tan(x)* is

67510 either overflow or underflow.

67511 These functions may lose accuracy when their argument is near a multiple of  $\pi/2$  or is far from

67512 0.0.

67513 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &

67514 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

67635 **CHANGE HISTORY**

67636 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

67637 **Issue 6**

67638 The following new requirements on POSIX implementations derive from alignment with the  
67639 Single UNIX Specification:

- 67640 • In the DESCRIPTION, the final paragraph is no longer conditional on  
67641 \_POSIX\_JOB\_CONTROL. This is a FIPS requirement.
- 67642 • The [EIO] error is added.

67643 **Issue 7**

67644 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0639 [79], XSH/TC1-2008/0640 [79],  
67645 and XSH/TC1-2008/0641 [79] are applied.

**NAME**

tcflow — suspend or restart the transmission or reception of data

**SYNOPSIS**

```
#include <termios.h>

int tcflow(int fildes, int action);
```

**DESCRIPTION**

The *tcflow()* function shall suspend or restart transmission or reception of data on the object referred to by *fildes*, depending on the value of *action*. The *fildes* argument is an open file descriptor associated with a terminal.

- If *action* is TCOOFF, output shall be suspended.
- If *action* is TCOON, suspended output shall be restarted.
- If *action* is TCIOFF and *fildes* refers to a terminal device, the system shall transmit a STOP character, which is intended to cause the terminal device to stop transmitting data to the system. If *fildes* is associated with a pseudo-terminal, the STOP character need not be transmitted.
- If *action* is TCION and *fildes* refers to a terminal device, the system shall transmit a START character, which is intended to cause the terminal device to start transmitting data to the system. If *fildes* is associated with a pseudo-terminal, the START character need not be transmitted.

The default on the opening of a terminal file is that neither its input nor its output are suspended.

Attempts to use *tcflow()* from a process which is a member of a background process group on a *fildes* associated with its controlling terminal, shall cause the process group to be sent a SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

**RETURN VALUE**

Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

**ERRORS**

The *tcflow()* function shall fail if:

- |          |                                                                                                                                            |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| [EBADF]  | The <i>fildes</i> argument is not a valid file descriptor.                                                                                 |
| [EINVAL] | The <i>action</i> argument is not a supported value.                                                                                       |
| [EIO]    | The process group of the writing process is orphaned, the calling thread is not blocking SIGTTOU, and the process is not ignoring SIGTTOU. |
| [ENOTTY] | The file associated with <i>fildes</i> is not a terminal.                                                                                  |

67696       Single UNIX Specification:

- 67697
- The [EIO] error is added.

67698 **Issue 7**67699       SD5-XSH-ERN-190 is applied, clarifying in the DESCRIPTION the transmission of START and  
67700       STOP characters.67701       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0642 [79], XSH/TC1-2008/0643 [79],  
67702       and XSH/TC1-2008/0644 [79] are applied.

67703 **NAME**

67704 tcflush — flush non-transmitted output data, non-read input data, or both

67705 **SYNOPSIS**

67706 #include &lt;termios.h&gt;

67707 int tcflush(int *fildes*, int *queue\_selector*);67708 **DESCRIPTION**

67709 Upon successful completion, *tcflush()* shall discard data written to the object referred to by *fildes*  
 67710 (an open file descriptor associated with a terminal) but not transmitted, or data received but not  
 67711 read, depending on the value of *queue\_selector*:

- 67712 • If *queue\_selector* is TCIFLUSH, it shall flush data received but not read.
- 67713 • If *queue\_selector* is TCOFLUSH, it shall flush data written but not transmitted.
- 67714 • If *queue\_selector* is TCIOFLUSH, it shall flush both data received but not read and data  
 67715 written but not transmitted.

67716 Attempts to use *tcflush()* from a process which is a member of a background process group on a  
 67717 *fildes* associated with its controlling terminal shall cause the process group to be sent a SIGTTOU  
 67718 signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring SIGTTOU  
 67719 signals, the process shall be allowed to perform the operation, and no signal is sent.

67720 **RETURN VALUE**

67721 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 67722 indicate the error.

67723 **ERRORS**67724 The *tcflush()* function shall fail if:

- |       |          |                                                                                 |
|-------|----------|---------------------------------------------------------------------------------|
| 67725 | [EBADF]  | The <i>fildes</i> argument is not a valid file descriptor.                      |
| 67726 | [EINVAL] | The <i>queue_selector</i> argument is not a supported value.                    |
| 67727 | [EIO]    | The process group of the writing process is orphaned, the calling thread is not |
| 67728 |          | blocking SIGTTOU, and the process is not ignoring SIGTTOU.                      |
| 67729 | [ENOTTY] | The file associated with <i>fildes</i> is not a terminal.                       |

67741 **CHANGE HISTORY**

67742 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

67743 **Issue 6**

67744 The Open Group Corrigendum U035/1 is applied. In the ERRORS and APPLICATION USAGE  
67745 sections, references to *tcflow()* are replaced with *tcflush()*.

67746 The following new requirements on POSIX implementations derive from alignment with the  
67747 Single UNIX Specification:

- 67748 • In the DESCRIPTION, the final paragraph is no longer conditional on  
67749 \_POSIX\_JOB\_CONTROL. This is a FIPS requirement.
- 67750 • The [EIO] error is added.

67751 **Issue 7**

67752 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0645 [79], XSH/TC1-2008/0646 [79],  
67753 and XSH/TC1-2008/0647 [79] are applied.

67754 **NAME**

67755 tcgetattr — get the parameters associated with the terminal

67756 **SYNOPSIS**

67757 #include &lt;termios.h&gt;

67758 int tcgetattr(int *fildev*, struct termios \**termios\_p*);67759 **DESCRIPTION**

67760 The *tcgetattr()* function shall get the parameters associated with the terminal referred to by *fildev*  
 67761 and store them in the **termios** structure referenced by *termios\_p*. The *fildev* argument is an open  
 67762 file descriptor associated with a terminal.

67763 The *termios\_p* argument is a pointer to a **termios** structure.

67764 The *tcgetattr()* operation is allowed from any process.

67765 If the terminal device supports different input and output baud rates, the baud rates stored in  
 67766 the **termios** structure returned by *tcgetattr()* shall reflect the actual baud rates, even if they are  
 67767 equal. If differing baud rates are not supported, the rate returned as the output baud rate shall  
 67768 be the actual baud rate. If the terminal device does not support split baud rates, the input baud  
 67769 rate stored in the **termios** structure shall be the output rate (as one of the symbolic values).

67770 **RETURN VALUE**

67771 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 67772 indicate the error.

67773 **ERRORS**

67774 The *tcgetattr()* function shall fail if:

67775 [EBADF] The *fildev* argument is not a valid file descriptor.

67776 [ENOTTY] The file associated with *fildev* is not a terminal.

67777 **EXAMPLES**

67778 None.

67779 **APPLICATION USAGE**

67780 None.

67781 **RATIONALE**

67782 Care must be taken when changing the terminal attributes. Applications should always do a  
 67783 *tcgetattr()*, save the **termios** structure values returned, and then do a *tcsetattr()*, changing only  
 67784 the necessary fields. The application should use the values saved from the *tcgetattr()* to reset the  
 67785 terminal state whenever it is done with the terminal. This is necessary because terminal  
 67786 attributes apply to the underlying port and not to each individual open instance; that is, all  
 67787 processes that have used the terminal see the latest attribute changes.

67788 A program that uses these functions should be written to catch all signals and take other  
 67789 appropriate actions to ensure that when the program terminates, whether planned or not, the  
 67790 terminal device's state is restored to its original state.

67791 Existing practice dealing with error returns when only part of a request can be honored is based  
 67792 on calls to the *ioctl()* function. In historical BSD and System V implementations, the  
 67793 corresponding *ioctl()* returns zero if the requested actions were semantically correct, even if  
 67794 some of the requested changes could not be made. Many existing applications assume this  
 67795 behavior and would no longer work correctly if the return value were changed from zero to -1  
 67796 in this case.

67797 Note that either specification has a problem. When zero is returned, it implies everything

67798 succeeded even if some of the changes were not made. When -1 is returned, it implies  
67799 everything failed even though some of the changes were made.

67800 Applications that need all of the requested changes made to work properly should follow  
67801 `tcsetattr()` with a call to `tcgetattr()` and compare the appropriate field values.

67808 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 67809 **Issue 6**

67810 In the DESCRIPTION, the rate returned as the input baud rate shall be the output rate.  
67811 Previously, the number zero was also allowed but was obsolescent.

67812 **NAME**

67813 tcgetpgrp — get the foreground process group ID

67814 **SYNOPSIS**

67815 #include &lt;unistd.h&gt;

67816 pid\_t tcgetpgrp(int *fildes*);67817 **DESCRIPTION**67818 The *tcgetpgrp()* function shall return the value of the process group ID of the foreground process  
67819 group associated with the terminal.67820 If there is no foreground process group, *tcgetpgrp()* shall return a value greater than 1 that does  
67821 not match the process group ID of any existing process group.67822 The *tcgetpgrp()* function is allowed from a process that is a member of a background process  
67823 group; however, the information may be subsequently changed by a process that is a member of  
67824 a foreground process group.67825 **RETURN VALUE**67826 Upon successful completion, *tcgetpgrp()* shall return the value of the process group ID of the  
67827 foreground process associated with the terminal. Otherwise, -1 shall be returned and *errno* set to  
67828 indicate the error.67829 **ERRORS**67830 The *tcgetpgrp()* function shall fail if:67831 [EBADF] The *fildes* argument is not a valid file descriptor.67832 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the  
67833 controlling terminal.67834 **EXAMPLES**

67835 None.

67836 **APPLICATION USAGE**

67837 None.

67838 **RATIONALE**

67844 XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

67845 **CHANGE HISTORY**

67846 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

67847 **Issue 6**

67848 In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

67849 The following new requirements on POSIX implementations derive from alignment with the  
67850 Single UNIX Specification:

- 67851 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
67852 required for conforming implementations of previous POSIX specifications, it was not  
67853 required for UNIX applications.

67854  
67855

- In the DESCRIPTION, text previously conditional on support for \_POSIX\_JOB\_CONTROL is now mandatory. This is a FIPS requirement.

**67856 NAME**

67857 tcgetsid — get the process group ID for the session leader for the controlling terminal

**67858 SYNOPSIS**

67859 #include <termios.h>  
67860 pid\_t tcgetsid(int *fildes*);

**67861 DESCRIPTION**

67862 The *tcgetsid()* function shall obtain the process group ID of the session for which the terminal  
67863 specified by *fildes* is the controlling terminal.

**67864 RETURN VALUE**

67865 Upon successful completion, *tcgetsid()* shall return the process group ID of the session  
67866 associated with the terminal. Otherwise, a value of -1 shall be returned and *errno* set to indicate  
67867 the error.

**67868 ERRORS**

67869 The *tcgetsid()* function shall fail if:

|       |          |                                                                                  |

**67883 CHANGE HISTORY**

67884 First released in Issue 4, Version 2.

**67885 Issue 5**

67886 Moved from X/OPEN UNIX extension to BASE.

67887 The [EACCES] error has been removed from the list of mandatory errors, and the description of  
67888 [ENOTTY] has been reworded.

**67889 Issue 7**

67890 SD5-XSH-ERN-180 is applied, clarifying the RETURN VALUE section.

67891 The *tcgetsid()* function is moved from the XSI option to the Base.

67892 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0648 [421] is applied.

67893 **NAME**

67894 `tcsendbreak` — send a break for a specific duration

67895 **SYNOPSIS**

67896 `#include <termios.h>`  
67897 `int tcsendbreak(int fildes, int duration);`

67898 **DESCRIPTION**

67899 If the terminal is using asynchronous serial data transmission, `tcsendbreak()` shall cause  
67900 transmission of a continuous stream of zero-valued bits for a specific duration. If *duration* is 0, it  
67901 shall cause transmission of zero-valued bits for at least 0.25 seconds, and not more than 0.5  
67902 seconds. If *duration* is not 0, it shall send zero-valued bits for an implementation-defined period  
67903 of time.

67904 The *fildes* argument is an open file descriptor associated with a terminal.

67905 If the terminal is not using asynchronous serial data transmission, it is implementation-defined  
67906 whether `tcsendbreak()` sends data to generate a break condition or returns without taking any  
67907 action.

67908 Attempts to use `tcsendbreak()` from a process which is a member of a background process group  
67909 on a *fildes* associated with its controlling terminal shall cause the process group to be sent a  
67910 SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring  
67911 SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

67912 **RETURN VALUE**

67913 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
67914 indicate the error.

67915 **ERRORS**

67916 The `tcsendbreak()` function shall fail if:

- |       |          |                                                                                 |
|-------|----------|---------------------------------------------------------------------------------|
| 67917 | [EBADF]  | The <i>fildes</i> argument is not a valid file descriptor.                      |
| 67918 | [EIO]    | The process group of the writing process is orphaned, the calling thread is not |
| 67919 |          | blocking SIGTTOU, and the process is not ignoring SIGTTOU.                      |
| 67920 | [ENOTTY] | The file associated with <i>fildes</i> is not a terminal.                       |

67931 **CHANGE HISTORY**

67932 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

67933 **Issue 6**

67934 The following new requirements on POSIX implementations derive from alignment with the  
67935 Single UNIX Specification:

- 67936 • In the DESCRIPTION, text previously conditional on \_POSIX\_JOB\_CONTROL is now  
67937 mandated. This is a FIPS requirement.
- 67938 • The [EIO] error is added.

67939 **Issue 7**

67940 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0649 [79], XSH/TC1-2008/0650 [79],  
67941 and XSH/TC1-2008/0651 [79] are applied.

## NAME

tcsetattr — set the parameters associated with the terminal

## SYNOPSIS

```
#include <termios.h>
```

```
int tcsetattr(int fildes, int optional_actions,  
              const struct termios *termios_p);
```

## DESCRIPTION

The *tcsetattr()* function shall set the parameters associated with the terminal referred to by the open file descriptor *fildes* (an open file descriptor associated with a terminal) from the **termios** structure referenced by *termios\_p* as follows:

- If *optional\_actions* is TCSANOW, the change shall occur immediately.
- If *optional\_actions* is TCSADRAIN, the change shall occur after all output written to *fildes* is transmitted. This function should be used when changing parameters that affect output.
- If *optional\_actions* is TCSAFLUSH, the change shall occur after all output written to *fildes* is transmitted, and all input so far received but not read shall be discarded before the change is made.

If the output baud rate stored in the **termios** structure pointed to by *termios\_p* is the zero baud rate, B0, the modem control lines shall no longer be asserted. Normally, this shall disconnect the line.

If the input baud rate stored in the **termios** structure pointed to by *termios\_p* is 0, the input baud rate given to the hardware is the same as the output baud rate stored in the **termios** structure.

The *tcsetattr()* function shall return successfully if it was able to perform any of the requested actions, even if some of the requested actions could not be performed. It shall set all the attributes that the implementation supports as requested and leave all the attributes not supported by the implementation unchanged. If no part of the request can be honored, it shall return -1 and set *errno* to [EINVAL]. If the input and output baud rates differ and are a combination that is not supported, neither baud rate shall be changed. A subsequent call to *tcgetattr()* shall return the actual state of the terminal device (reflecting both the changes made and not made in the previous *tcsetattr()* call). The *tcsetattr()* function shall not change the values found in the **termios** structure under any circumstances.

The effect of *tcsetattr()* is undefined if the value of the **termios** structure pointed to by *termios\_p* was not derived from the result of a call to *tcgetattr()* on *fildes*; an application should modify only fields and flags defined by this volume of POSIX.1-2008 between the call to *tcgetattr()* and *tcsetattr()*, leaving all other fields and flags unmodified.

No actions defined by this volume of POSIX.1-2008, other than a call to *tcsetattr()*, a close of the last file descriptor in the system associated with this terminal device, or an open of the first file descriptor in the system associated with this terminal device (using the O\_TTY\_INIT flag if it is non-zero and the device is not a pseudo-terminal), shall cause any of the terminal attributes defined by this volume of POSIX.1-2008 to change.

If *tcsetattr()* is called from a process which is a member of a background process group on a *fildes* associated with its controlling terminal:

- If the calling thread is blocking SIGTTOU signals or the process is ignoring SIGTTOU signals, the operation completes normally and no signal is sent.

- Otherwise, a SIGTTOU signal shall be sent to the process group.

**RETURN VALUE**

Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

**ERRORS**

The *tcsetattr()* function shall fail if:

- |       |          |                                                                                                                                                                                   |
|-------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 67991 | [EBADF]  | The <i>fildev</i> argument is not a valid file descriptor.                                                                                                                        |
| 67992 | [EINTR]  | A signal interrupted <i>tcsetattr()</i> .                                                                                                                                         |
| 67993 | [EINVAL] | The <i>optional_actions</i> argument is not a supported value, or an attempt was made to change an attribute represented in the <b>termios</b> structure to an unsupported value. |
| 67996 | [EIO]    | The process group of the writing process is orphaned, the calling thread is not blocking SIGTTOU, and the process is not ignoring SIGTTOU.                                        |
| 67998 | [ENOTTY] | The file associated with <i>fildev</i> is not a terminal.                                                                                                                         |

**EXAMPLES**

None.

**APPLICATION USAGE**

If trying to change baud rates, applications should call *tcsetattr()* then call *tcgetattr()* in order to determine what baud rates were actually selected.

In general, there are two reasons for an application to change the parameters associated with a terminal device:

1. The device already has working parameter settings but the application needs a different behavior, such as non-canonical mode instead of canonical mode. The application sets (or clears) only a few flags or *c\_cc[]* values. Typically, the terminal device in this case is either the controlling terminal for the process or a pseudo-terminal.
2. The device is a modem or similar piece of equipment connected by a serial line, and it was not open before the application opened it. In this case, the application needs to initialize all of the parameter settings “from scratch”. However, since the **termios** structure may include both standard and non-standard parameters, the application cannot just initialize the whole structure in an arbitrary way (e.g., using *memset()*) as this may cause some of the non-standard parameters to be set incorrectly, resulting in non-conforming behavior of the terminal device. Conversely, the application cannot just set the standard parameters, assuming that the non-standard parameters will already have suitable values, as the device might previously have been used with non-conforming parameter settings (and some implementations retain the settings from one use to the next). The solution is to open the terminal device using the *O\_TTY\_INIT* flag to initialize the terminal device to have conforming parameter settings, obtain those settings using *tcgetattr()*, and then set all of the standard parameters to the desired settings.

**RATIONALE**

The *tcsetattr()* function can be interrupted in the following situations:

- It is interrupted while waiting for output to drain.
- It is called from a process in a background process group and SIGTTOU is caught.

See also the RATIONALE section in *tcgetattr()*.

**FUTURE DIRECTIONS**

Using an input baud rate of 0 to set the input rate equal to the output rate may not necessarily be supported in a future version of this volume of POSIX.1-2008.

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 6**

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text previously conditional on `_POSIX_JOB_CONTROL` is now mandated. This is a FIPS requirement.
- The [EIO] error is added.

In the DESCRIPTION, the text describing use of *tcsetattr()* from a process which is a member of a background process group is clarified.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #144 is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0652 [79], XSH/TC1-2008/0653 [79], and XSH/TC1-2008/0654 [79] are applied.

68048 **NAME**

68049 tcsetpgrp — set the foreground process group ID

68050 **SYNOPSIS**

68051 #include &lt;unistd.h&gt;

68052 int tcsetpgrp(int *fildes*, pid\_t *pgid\_id*);68053 **DESCRIPTION**

68054 If the process has a controlling terminal, *tcsetpgrp()* shall set the foreground process group ID  
 68055 associated with the terminal to *pgid\_id*. The application shall ensure that the file associated with  
 68056 *fildes* is the controlling terminal of the calling process and the controlling terminal is currently  
 68057 associated with the session of the calling process. The application shall ensure that the value of  
 68058 *pgid\_id* matches a process group ID of a process in the same session as the calling process.

68059 Attempts to use *tcsetpgrp()* from a process which is a member of a background process group on  
 68060 a *fildes* associated with its controlling terminal shall cause the process group to be sent a  
 68061 SIGTTOU signal. If the calling thread is blocking SIGTTOU signals or the process is ignoring  
 68062 SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

68063 **RETURN VALUE**

68064 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 68065 indicate the error.

68066 **ERRORS**68067 The *tcsetpgrp()* function shall fail if:68068 [EBADF] The *fildes* argument is not a valid file descriptor.68069 [EINVAL] This implementation does not support the value in the *pgid\_id* argument.

68070 [EIO] The process group of the writing process is orphaned, the calling thread is not  
 68071 blocking SIGTTOU, and the process is not ignoring SIGTTOU.

68072 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the  
 68073 controlling terminal, or the controlling terminal is no longer associated with  
 68074 the session of the calling process.

68075 [EPERM] The value of *pgid\_id* is a value supported by the implementation, but does not  
 68076 match the process group ID of a process in the same session as the calling  
 68077 process.

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 6**

In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the DESCRIPTION and ERRORS sections, text previously conditional on `_POSIX_JOB_CONTROL` is now mandated. This is a FIPS requirement.

The normative text is updated to avoid use of the term “must” for application requirements.

The Open Group Corrigendum U047/4 is applied.

**Issue 7**

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0655 [79] and XSH/TC1-2008/0656 [79] are applied.

**NAME**

tdelete, tfind, tsearch, twalk — manage a binary search tree

**SYNOPSIS**

```

#include <search.h>

void *tdelete(const void *restrict key, void **restrict rootp,
              int(*compar)(const void *, const void *));
void *tfind(const void *key, void *const *rootp,
            int(*compar)(const void *, const void *));
void *tsearch(const void *key, void **rootp,
              int (*compar)(const void *, const void *));
void twalk(const void *root,
           void (*action)(const void *, VISIT, int));

```

**DESCRIPTION**

The *tdelete()*, *tfind()*, *tsearch()*, and *twalk()* functions manipulate binary search trees. Comparisons are made with a user-supplied routine, the address of which is passed as the *compar* argument. This routine is called with two arguments, which are the pointers to the elements being compared. The application shall ensure that the user-supplied routine returns an integer less than, equal to, or greater than 0, according to whether the first argument is to be considered less than, equal to, or greater than the second argument. The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

The *tsearch()* function shall build and access the tree. The *key* argument is a pointer to an element to be accessed or stored. If there is a node in the tree whose element is equal to the value pointed to by *key*, a pointer to this found node shall be returned. Otherwise, the value pointed to by *key* shall be inserted (that is, a new node is created and the value of *key* is copied to this node), and a pointer to this node returned. Only pointers are copied, so the application shall ensure that the calling routine stores the data. The *rootp* argument points to a variable that points to the root node of the tree. A null pointer value for the variable pointed to by *rootp* denotes an empty tree; in this case, the variable shall be set to point to the node which shall be at the root of the new tree.

Like *tsearch()*, *tfind()* shall search for a node in the tree, returning a pointer to it if found. However, if it is not found, *tfind()* shall return a null pointer. The arguments for *tfind()* are the same as for *tsearch()*.

The *tdelete()* function shall delete a node from a binary search tree. The arguments are the same as for *tsearch()*. The variable pointed to by *rootp* shall be changed if the deleted node was the root of the tree. If the deleted node was the root of the tree and had no children, the variable pointed to by *rootp* shall be set to a null pointer. The *tdelete()* function shall return a pointer to the parent of the deleted node, or an unspecified non-null pointer if the deleted node was the root node, or a null pointer if the node is not found.

If *tsearch()* adds an element to a tree, or *tdelete()* successfully deletes an element from a tree, the concurrent use of that tree in another thread, or use of pointers produced by a previous call to *tfind()* or *tsearch()*, produces undefined results.

The *twalk()* function shall traverse a binary search tree. The *root* argument is a pointer to the root node of the tree to be traversed. (Any node in a tree may be used as the root for a walk below that node.) The argument *action* is the name of a routine to be invoked at each node. This routine is, in turn, called with three arguments. The first argument shall be the address of the node being visited. The structure pointed to by this argument is unspecified and shall not be modified by

the application, but it shall be possible to cast a pointer-to-node into a pointer-to-pointer-to-element to access the element stored in the node. The second argument shall be a value from an enumeration data type:

```
typedef enum { preorder, postorder, endorder, leaf } VISIT;
```

(defined in `<search.h>`), depending on whether this is the first, second, or third time that the node is visited (during a depth-first, left-to-right traversal of the tree), or whether the node is a leaf. The third argument shall be the level of the node in the tree, with the root being level 0.

If the calling function alters the pointer to the root, the result is undefined.

If the functions pointed to by *action* or *compar* (for any of these binary search functions) change the tree, the results are undefined.

These functions are thread-safe only as long as multiple threads do not access the same tree.

## RETURN VALUE

If the node is found, both *tsearch()* and *tfind()* shall return a pointer to it. If not, *tfind()* shall return a null pointer, and *tsearch()* shall return a pointer to the inserted item.

A null pointer shall be returned by *tsearch()* if there is not enough space available to create a new node.

A null pointer shall be returned by *tdelete()*, *tfind()*, and *tsearch()* if *rootp* is a null pointer on entry.

The *tdelete()* function shall return a pointer to the parent of the deleted node, or an unspecified non-null pointer if the deleted node was the root node, or a null pointer if the node is not found.

The *twalk()* function shall not return a value.

## ERRORS

No errors are defined.

## EXAMPLES

The following code reads in strings and stores structures containing a pointer to each string and a count of its length. It then walks the tree, printing out the stored strings and their lengths in alphabetical order.

```
#include <limits.h>
#include <search.h>
#include <stdlib.h>
#include <string.h>
#include <stdio.h>

struct element {          /* Pointers to these are stored in the tree. */
    int    count;
    char   string[];
};

void *root = NULL;        /* This points to the root. */

int main(void)
{
    char   str[_POSIX2_LINE_MAX+1];
    int    length = 0;
    struct element *elementptr;
    void   *node;
    void   print_node(const void *, VISIT, int);
```

```

68196         int      node_compare(const void *, const void *),
68197                 delete_root(const void *, const void *);

68198     while (fgets(str, sizeof(str), stdin)) {
68199         /* Set element. */
68200         length = strlen(str);
68201         if (str[length-1] == '\n')
68202             str[--length] = '\0';
68203         elementptr = malloc(sizeof(struct element) + length + 1);
68204         strcpy(elementptr->string, str);
68205         elementptr->count = 1;
68206         /* Put element into the tree. */
68207         node = tsearch((void *)elementptr, &root, node_compare);
68208         if (node == NULL) {
68209             fprintf(stderr,
68210                 "tsearch: Not enough space available\n");
68211             exit(EXIT_FAILURE);
68212         }
68213         else if (*(struct element **)node != elementptr) {
68214             /* A node containing the element already exists */
68215             (*(struct element **)node)->count++;
68216             free(elementptr);
68217         }
68218     }
68219     twalk(root, print_node);

68220     /* Delete all nodes in the tree */
68221     while (root != NULL) {
68222         elementptr = *(struct element **)root;
68223         printf("deleting node: string = %s, count = %d\n",
68224             elementptr->string,
68225             elementptr->count);
68226         tdelete((void *)elementptr, &root, delete_root);
68227         free(elementptr);
68228     }

68229     return 0;
68230 }

68231 /*
68232  * This routine compares two nodes, based on an
68233  * alphabetical ordering of the string field.
68234  */
68235 int
68236 node_compare(const void *node1, const void *node2)
68237 {
68238     return strcmp(((const struct element *) node1)->string,
68239         ((const struct element *) node2)->string);
68240 }

68241 /*
68242  * This comparison routine can be used with tdelete()
68243  * when explicitly deleting a root node, as no comparison
68244  * is necessary.

```

```

68245     */
68246     int
68247     delete_root(const void *node1, const void *node2)
68248     {
68249         return 0;
68250     }
68251     /*
68252     *   This routine prints out a node, the second time
68253     *   twalk encounters it or if it is a leaf.
68254     */
68255     void
68256     print_node(const void *ptr, VISIT order, int level)
68257     {
68258         const struct element *p = *(const struct element **) ptr;
68259         if (order == postorder || order == leaf) {
68260             (void) printf("string = %s,   count = %d\n",
68261                 p->string, p->count);
68262         }
68263     }

```

#### APPLICATION USAGE

The *root* argument to *twalk()* is one level of indirection less than the *rootp* arguments to *tdelete()* and *tsearch()*.

There are two nomenclatures used to refer to the order in which tree nodes are visited. The *twalk()* function uses **preorder**, **postorder**, and **endorder** to refer respectively to visiting a node before any of its children, after its left child and before its right, and after both its children. The alternative nomenclature uses **preorder**, **inorder**, and **postorder** to refer to the same visits, which could result in some confusion over the meaning of **postorder**.

Since the return value of *tdelete()* is an unspecified non-null pointer in the case that the root of the tree has been deleted, applications should only use the return value of *tdelete()* as indication of success or failure and should not assume it can be dereferenced. Some implementations in this case will return a pointer to the new root of the tree (or to an empty tree if the deleted root node was the only node in the tree); other implementations return arbitrary non-null pointers.

#### CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

#### Issue 5

The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in previous issues.

68289 **Issue 6**

68290 The normative text is updated to avoid use of the term “must” for application requirements.

68291 The **restrict** keyword is added to the *tdelete()* prototype for alignment with the  
68292 ISO/IEC 9899:1999 standard.

68293 **Issue 7**

68294 Austin Group Interpretation 1003.1-2001 #149 is applied, clarifying concurrent use of the tree in  
68295 another thread.

68296 Austin Group Interpretation 1003.1-2001 #151 is applied, clarifying behavior for *tdelete()* when  
68297 the deleted node is the root node.

68298 Austin Group Interpretation 1003.1-2001 #153 is applied.

68299 **NAME**

68300 telldir — current location of a named directory stream

68301 **SYNOPSIS**

```
68302 XSI    #include <dirent.h>
68303        long telldir(DIR *dirp);
```

68304 **DESCRIPTION**

68305 The *telldir()* function shall obtain the current location associated with the directory stream  
68306 specified by *dirp*.

68307 If the most recent operation on the directory stream was a *seekdir()*, the directory position  
68308 returned from the *telldir()* shall be the same as that supplied as a *loc* argument for *seekdir()*.

68309 **RETURN VALUE**

68310 Upon successful completion, *telldir()* shall return the current location of the specified directory  
68311 stream.

68312 **ERRORS**

68313 No errors are defined.

68314 **EXAMPLES**

68315 None.

68316 **APPLICATION USAGE**

68317 None.

68318 **RATIONALE**

68319 None.

68321 None.

68322 **SEE ALSO**68323 *fdopendir()*, *readdir()*, *seekdir()*

68324 XBD &lt;dirent.h&gt;

68325 **CHANGE HISTORY**

68326 First released in Issue 2.

68327 **NAME**

68328 tempnam — create a name for a temporary file

68329 **SYNOPSIS**

```
68330 OB XSI #include <stdio.h>
68331 char *tempnam(const char *dir, const char *pfx);
```

68332 **DESCRIPTION**68333 The *tempnam()* function shall generate a pathname that may be used for a temporary file.

68334 The *tempnam()* function allows the user to control the choice of a directory. The *dir* argument  
 68335 points to the name of the directory in which the file is to be created. If *dir* is a null pointer or  
 68336 points to a string which is not a name for an appropriate directory, the path prefix defined as  
 68337 P\_tmpdir in the <stdio.h> header shall be used. If that directory is not accessible, an  
 68338 implementation-defined directory may be used.

68339 Many applications prefer their temporary files to have certain initial letter sequences in their  
 68340 names. The *pfx* argument should be used for this. This argument may be a null pointer or point  
 68341 to a string of up to five bytes to be used as the beginning of the filename.

68342 Some implementations of *tempnam()* may use *tmpnam()* internally. On such implementations, if  
 68343 called more than {TMP\_MAX} times in a single process, the behavior is implementation-defined.

68344 **RETURN VALUE**

68345 Upon successful completion, *tempnam()* shall allocate space for a string, put the generated  
 68346 pathname in that space, and return a pointer to it. The pointer shall be suitable for use in a  
 68347 subsequent call to *free()*. Otherwise, it shall return a null pointer and set *errno* to indicate the  
 68348 error.

68349 **ERRORS**68350 The *tempnam()* function shall fail if:

68351 [ENOMEM] Insufficient storage space is available.

68352 **EXAMPLES**68353 **Generating a Pathname**

68354 The following example generates a pathname for a temporary file in directory */tmp*, with the  
 68355 prefix *file*. After the pathname has been created, the call to *free()* deallocates the space used to  
 68356 store the pathname.

```
68357 #include <stdio.h>
68358 #include <stdlib.h>
68359 ...
68360 const char *directory = "/tmp";
68361 const char *fileprefix = "file";
68362 char *file;

68363 file = tempnam(directory, fileprefix);
68364 free(file);
```

68365 **APPLICATION USAGE**

68366 This function only creates pathnames. It is the application's responsibility to create and remove  
 68367 the files. Between the time a pathname is created and the file is opened, it is possible for some  
 68368 other process to create a file with the same name. Applications may find *tmpfile()* more useful.

68369 Applications should use the *tmpfile()*, *mkdtemp()*, or *mkstemp()* functions instead of the

68370 obsolescent *tempnam()* function.

68371 **RATIONALE**

68372 None.

68373 **FUTURE DIRECTIONS**

68374 The *tempnam()* function may be removed in a future version.

68375 **SEE ALSO**

68376 *fopen()*, *free()*, *mkdtemp()*, *open()*, *tmpfile()*, *tmpnam()*, *unlink()*

68380 **Issue 5**

68381 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
68382 previous issues.

68383 **Issue 7**

68384 The *tempnam()* function is marked obsolescent.

68385 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0657 [291], XSH/TC1-2008/0658 [137],  
68386 and XSH/TC1-2008/0659 [137] are applied.

68387 **NAME**

68388       tfind — search binary search tree

68389 **SYNOPSIS**

```
68390 XSI      #include <search.h>
68391          void *tfind(const void *key, void *const *rootp,
68392                     int (*compar)(const void *, const void *));
```

68393 **DESCRIPTION**68394       Refer to *tdelete()*.

68395 .mc +

## 68396 NAME

68397 tgamma, tgammaf, tgammal — compute gamma() function

## 68398 SYNOPSIS

```
68399 #include <math.h>
68400 double tgamma(double x);
68401 float tgammaf(float x);
68402 long double tgammal(long double x);
```

## 68403 DESCRIPTION

68404 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
68405 conflict between the requirements described here and the ISO C standard is unintentional. This  
68406 volume of POSIX.1-2008 defers to the ISO C standard.

68407 These functions shall compute  $\Gamma(x)$  where  $\Gamma(x)$  is defined as  $\int_0^{\infty} e^{-t} t^{x-1} dt$ .

68408 An application wishing to check for error situations should set *errno* to zero and call  
68409 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
68410 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
68411 zero, an error has occurred.

## 68412 RETURN VALUE

68413 Upon successful completion, these functions shall return the gamma of *x*.

68414 CX If *x* is a negative integer, a domain error may occur and either a NaN (if supported) or an  
68415 MX implementation-defined value shall be returned. On systems that support the IEC 60559  
68416 Floating-Point option, a domain error shall occur and a NaN shall be returned.

68417 If *x* is  $\pm 0$ , *tgamma()*, *tgammaf()*, and *tgammal()* shall return  $\pm \text{HUGE\_VAL}$ ,  $\pm \text{HUGE\_VALF}$ , and  
68418 MX  $\pm \text{HUGE\_VALL}$ , respectively. On systems that support the IEC 60559 Floating-Point option, a  
68419 CX pole error shall occur; otherwise, a pole error may occur.

68420 If the correct value would cause overflow, a range error shall occur and *tgamma()*, *tgammaf()*,  
68421 and *tgammal()* shall return  $\pm \text{HUGE\_VAL}$ ,  $\pm \text{HUGE\_VALF}$ , or  $\pm \text{HUGE\_VALL}$ , respectively, with  
68422 the same sign as the correct value of the function.

68423 MX If the correct value would cause underflow, and is not representable, a range error may occur,  
68424 MX and *tgamma()*, *tgammaf()*, and *tgammal()* shall return 0.0, or (if IEC 60559 Floating-Point is not  
68425 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
68426 FLT\_MIN, and LDBL\_MIN, respectively.

68427 MX If the correct value would cause underflow, and is representable, a range error may occur and  
68428 the correct value shall be returned.

68429 If *x* is subnormal and  $1/x$  is representable,  $1/x$  should be returned.

68430 MX If *x* is NaN, a NaN shall be returned.

68431 If *x* is  $+\text{Inf}$ , *x* shall be returned.

68432 If *x* is  $-\text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

## 68433 ERRORS

68434 These functions shall fail if:

68435 MX **Domain Error** The value of *x* is a negative integer, or *x* is  $-\text{Inf}$ .  
68436 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
68437 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*

|       |    |                                                                                               |
|-------|----|-----------------------------------------------------------------------------------------------|
| 68438 |    | & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.     |
| 68439 |    |                                                                                               |
| 68440 | MX | <b>Pole Error</b> The value of $x$ is zero.                                                   |
| 68441 |    | If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,                |
| 68442 |    | then <i>errno</i> shall be set to [ERANGE]. If the integer expression                         |
| 68443 |    | ( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the divide-by-zero              |
| 68444 |    | floating-point exception shall be raised.                                                     |
| 68445 |    | <b>Range Error</b> The value overflows.                                                       |
| 68446 |    | If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,                |
| 68447 |    | then <i>errno</i> shall be set to [ERANGE]. If the integer expression                         |
| 68448 |    | ( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the overflow                    |
| 68449 |    | floating-point exception shall be raised.                                                     |
| 68450 |    | These functions may fail if:                                                                  |
| 68451 |    | <b>Domain Error</b> The value of $x$ is a negative integer.                                   |
| 68452 |    | If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,                |
| 68453 |    | then <i>errno</i> shall be set to [EDOM]. If the integer expression ( <i>math_errhandling</i> |
| 68454 |    | & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception                      |
| 68455 |    | shall be raised.                                                                              |
| 68456 |    | <b>Pole Error</b> The value of $x$ is zero.                                                   |
| 68457 |    | If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,                |
| 68458 |    | then <i>errno</i> shall be set to [ERANGE]. If the integer expression                         |
| 68459 |    | ( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the divide-by-zero              |
| 68460 |    | floating-point exception shall be raised.                                                     |
| 68461 |    | <b>Range Error</b> The result underflows.                                                     |
| 68462 |    | If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,                |
| 68463 |    | then <i>errno</i> shall be set to [ERANGE]. If the integer expression                         |
| 68464 |    | ( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the underflow                   |
| 68465 |    | floating-point exception shall be raised.                                                     |

**EXAMPLES**

None.

**APPLICATION USAGE**

On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* & MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**RATIONALE**

This function is named *tgamma()* in order to avoid conflicts with the historical *gamma()* and *lgamma()* functions.

**FUTURE DIRECTIONS**

It is possible that the error response for a negative integer argument may be changed to a pole error and a return value of  $\pm\text{Inf}$ .

**SEE ALSO**

*feclearexcept()*, *fetestexcept()*, *lgamma()*

XBD Section 4.20 (on page 117), <math.h>

68480 **CHANGE HISTORY**

68481 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

68482 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/65 is applied, correcting the third  
68483 paragraph in the RETURN VALUE section.

68484 **Issue 7**

68485 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #52 (SD5-XSH-ERN-85) is applied.

68486 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0660 [68], XSH/TC1-2008/0661 [320],  
68487 and XSH/TC1-2008/0662 [68] are applied. .mc +

68488 **NAME**

68489       time — get time

68490 **SYNOPSIS**

68491       #include &lt;time.h&gt;

68492       time\_t time(time\_t \*tloc);

68493 **DESCRIPTION**

68494 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 68495       conflict between the requirements described here and the ISO C standard is unintentional. This  
 68496       volume of POSIX.1-2008 defers to the ISO C standard.

68497 CX       The *time()* function shall return the value of time in seconds since the Epoch.

68498       The *tloc* argument points to an area where the return value is also stored. If *tloc* is a null pointer,  
 68499       no value is stored.

68500 **RETURN VALUE**

68501       Upon successful completion, *time()* shall return the value of time. Otherwise, (**time\_t**)−1 shall be  
 68502       returned.

68503 **ERRORS**

68504       The *time()* function may fail if:

68505 CX       [**EOverflow**] The number of seconds since the Epoch will not fit in an object of type **time\_t**.

68506 **EXAMPLES**68507       **Getting the Current Time**

68508       The following example uses the *time()* function to calculate the time elapsed, in seconds, since  
 68509       the Epoch, *localtime()* to convert that value to a broken-down time, and *asctime()* to convert the  
 68510       broken-down time values into a printable string.

```
68511       #include <stdio.h>
68512       #include <time.h>

68513       int main(void)
68514       {
68515       time_t result;

68516       result = time(NULL);
68517       printf("%s%ju secs since the Epoch\n",
68518              asctime(localtime(&result)),
68519              (uintmax_t)result);
68520       return(0);
68521       }
```

68522       This example writes the current time to *stdout* in a form like this:

```
68523       Wed Jun 26 10:32:15 1996
68524       835810335 secs since the Epoch
```

## Timing an Event

The following example gets the current time, prints it out in the user's format, and prints the number of minutes to an event being timed.

```
#include <time.h>
#include <stdio.h>
...
time_t now;
int minutes_to_event;
...
time(&now);
minutes_to_event = ...;
printf("The time is ");
puts(asctime(localtime(&now)));
printf("There are %d minutes to the event.\n",
      minutes_to_event);
...
```

## APPLICATION USAGE

None.

## RATIONALE

The *time()* function returns a value in seconds while *clock\_gettime()* and *gettimeofday()* return a **struct timespec** (seconds and nanoseconds) and **struct timeval** (seconds and microseconds), respectively, and are therefore capable of returning more precise times. The *times()* function is also capable of more precision than *time()* as it returns a value in clock ticks, although it returns the elapsed time since an arbitrary point such as system boot time, not since the epoch.

Implementations in which **time\_t** is a 32-bit signed integer (many historical implementations) fail in the year 2038. POSIX.1-2008 does not address this problem. However, the use of the **time\_t** type is mandated in order to ease the eventual fix.

On some systems the *time()* function is implemented using a system call that does not return an error condition in addition to the return value. On these systems it is impossible to differentiate between valid and invalid return values and hence overflow conditions cannot be reliably detected.

The use of the **<time.h>** header instead of **<sys/types.h>** allows compatibility with the ISO C standard.

Many historical implementations (including Version 7) and the 1984 /usr/group standard use **long** instead of **time\_t**. This volume of POSIX.1-2008 uses the latter type in order to agree with the ISO C standard.

## FUTURE DIRECTIONS

In a future version of this volume of POSIX.1-2008, **time\_t** is likely to be required to be capable of representing times far in the future. Whether this will be mandated as a 64-bit type or a requirement that a specific date in the future be representable (for example, 10000 AD) is not yet determined. Systems purchased after the approval of this volume of POSIX.1-2008 should be evaluated to determine whether their lifetime will extend past 2038.

68575 The EXAMPLES, RATIONALE, and FUTURE DIRECTIONS sections are added.

68576 **Issue 7**68577 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0663 [106], XSH/TC1-2008/0664 [350],  
68578 XSH/TC1-2008/0665 [106], XSH/TC1-2008/0666 [350], and XSH/TC1-2008/0667 [350] are  
68579 applied.

68580

NAME

68581

timer\_create — create a per-process timer

68582

SYNOPSIS

68583

CX

```
#include <signal.h>
#include <time.h>

int timer_create(clockid_t clockid, struct sigevent *restrict evp,
timer_t *restrict timerid);
```

68584

68585

68586

68587

DESCRIPTION

68588

The *timer\_create()* function shall create a per-process timer using the specified clock, *clock\_id*, as the timing base. The *timer\_create()* function shall return, in the location referenced by *timerid*, a timer ID of type **timer\_t** used to identify the timer in timer requests. This timer ID shall be unique within the calling process until the timer is deleted. The particular clock, *clock\_id*, is defined in **<time.h>**. The timer whose ID is returned shall be in a disarmed state upon return from *timer\_create()*.

68589

68590

68591

68592

68593

68594

The *evp* argument, if non-NULL, points to a **sigevent** structure. This structure, allocated by the application, defines the asynchronous notification to occur as specified in [Section 2.4.1](#) (on page 488) when the timer expires. If the *evp* argument is NULL, the effect is as if the *evp* argument pointed to a **sigevent** structure with the *sigev\_notify* member having the value SIGEV\_SIGNAL, the *sigev\_signo* having a default signal number, and the *sigev\_value* member having the value of the timer ID.

68595

68596

68597

68598

68599

68600

Each implementation shall define a set of clocks that can be used as timing bases for per-process timers. All implementations shall support a *clock\_id* of CLOCK\_REALTIME. If the Monotonic Clock option is supported, implementations shall support a *clock\_id* of CLOCK\_MONOTONIC.

68601

MON

68602

68603

Per-process timers shall not be inherited by a child process across a *fork()* and shall be disarmed and deleted by an *exec*.

68604

68605

CPT

If \_POSIX\_CPUTIME is defined, implementations shall support *clock\_id* values representing the CPU-time clock of the calling process.

68606

68607

TCT

If \_POSIX\_THREAD\_CPUTIME is defined, implementations shall support *clock\_id* values representing the CPU-time clock of the calling thread.

68608

68609

CPT|TCT

It is implementation-defined whether a *timer\_create()* function will succeed if the value defined by *clock\_id* corresponds to the CPU-time clock of a process or thread different from the process or thread invoking the function.

68610

68611

68612

TSA

If *evp*→*sigev\_sigev\_notify* is SIGEV\_THREAD and *sev*→*sigev\_notify\_attributes* is not NULL, if the attribute pointed to by *sev*→*sigev\_notify\_attributes* has a thread stack address specified by a call to *pthread\_attr\_setstack()*, the results are unspecified if the signal is generated more than once.

68613

68614

68615

RETURN VALUE

68616

If the call succeeds, *timer\_create()* shall return zero and update the location referenced by *timerid* to a **timer\_t**, which can be passed to the per-process timer calls. If an error occurs, the function shall return a value of –1 and set *errno* to indicate the error. The value of *timerid* is undefined if an error occurs.

68617

68618

68619

68620

ERRORS

68621

The *timer\_create()* function shall fail if:

68622

|          |                                                                            |
|----------|----------------------------------------------------------------------------|
| [EAGAIN] | The system lacks sufficient signal queuing resources to honor the request. |
|----------|----------------------------------------------------------------------------|

68623 [EAGAIN] The calling process has already created all of the timers it is allowed by this  
 68624 implementation.

68625 [EINVAL] The specified clock ID is not defined.

68626 CPT|TCT [ENOTSUP] The implementation does not support the creation of a timer attached to the  
 68627 CPU-time clock that is specified by *clock\_id* and associated with a process or  
 68628 thread different from the process or thread invoking *timer\_create()*.

## 68629 EXAMPLES

68630 None.

## 68631 APPLICATION USAGE

68632 If a timer is created which has *evp->sigev\_sigev\_notify* set to SIGEV\_THREAD and the attribute  
 68633 pointed to by *evp->sigev\_notify\_attributes* has a thread stack address specified by a call to  
 68634 *pthread\_attr\_setstack()*, the memory dedicated as a thread stack cannot be recovered. The reason  
 68635 for this is that the threads created in response to a timer expiration are created detached, or in an  
 68636 unspecified way if the thread attribute's *detachstate* is PTHREAD\_CREATE\_JOINABLE. In  
 68637 neither case is it valid to call *pthread\_join()*, which makes it impossible to determine the lifetime  
 68638 of the created thread which thus means the stack memory cannot be reused.

## 68639 RATIONALE

### 68640 Periodic Timer Overrun and Resource Allocation

68641 The specified timer facilities may deliver realtime signals (that is, queued signals) on  
 68642 implementations that support this option. Since realtime applications cannot afford to lose  
 68643 notifications of asynchronous events, like timer expirations or asynchronous I/O completions, it  
 68644 must be possible to ensure that sufficient resources exist to deliver the signal when the event  
 68645 occurs. In general, this is not a difficulty because there is a one-to-one correspondence between a  
 68646 request and a subsequent signal generation. If the request cannot allocate the signal delivery  
 68647 resources, it can fail the call with an [EAGAIN] error.

68648 Periodic timers are a special case. A single request can generate an unspecified number of  
 68649 signals. This is not a problem if the requesting process can service the signals as fast as they are  
 68650 generated, thus making the signal delivery resources available for delivery of subsequent  
 68651 periodic timer expiration signals. But, in general, this cannot be assured—processing of periodic  
 68652 timer signals may “overrun”; that is, subsequent periodic timer expirations may occur before the  
 68653 currently pending signal has been delivered.

68654 Also, for signals, according to the POSIX.1-1990 standard, if subsequent occurrences of a  
 68655 pending signal are generated, it is implementation-defined whether a signal is delivered for each  
 68656 occurrence. This is not adequate for some realtime applications. So a mechanism is required to  
 68657 allow applications to detect how many timer expirations were delayed without requiring an  
 68658 indefinite amount of system resources to store the delayed expirations.

68659 The specified facilities provide for an overrun count. The overrun count is defined as the  
 68660 number of extra timer expirations that occurred between the time a timer expiration signal is  
 68661 generated and the time the signal is delivered. The signal-catching function, if it is concerned  
 68662 with overruns, can retrieve this count on entry. With this method, a periodic timer only needs  
 68663 one “signal queuing resource” that can be allocated at the time of the *timer\_create()* function call.

68664 A function is defined to retrieve the overrun count so that an application need not allocate static  
 68665 storage to contain the count, and an implementation need not update this storage  
 68666 asynchronously on timer expirations. But, for some high-frequency periodic applications, the  
 68667 overhead of an additional system call on each timer expiration may be prohibitive. The  
 68668 functions, as defined, permit an implementation to maintain the overrun count in user space,

associated with the *timerid*. The *timer\_getoverrun()* function can then be implemented as a macro that uses the *timerid* argument (which may just be a pointer to a user space structure containing the counter) to locate the overrun count with no system call overhead. Other implementations, less concerned with this class of applications, can avoid the asynchronous update of user space by maintaining the count in a system structure at the cost of the extra system call to obtain it.

#### Timer Expiration Signal Parameters

The Realtime Signals Extension option supports an application-specific datum that is delivered to the extended signal handler. This value is explicitly specified by the application, along with the signal number to be delivered, in a **sigevent** structure. The type of the application-defined value can be either an integer constant or a pointer. This explicit specification of the value, as opposed to always sending the timer ID, was selected based on existing practice.

It is common practice for realtime applications (on non-POSIX systems or realtime extended POSIX systems) to use the parameters of event handlers as the case label of a switch statement or as a pointer to an application-defined data structure. Since *timer\_ids* are dynamically allocated by the *timer\_create()* function, they can be used for neither of these functions without additional application overhead in the signal handler; for example, to search an array of saved timer IDs to associate the ID with a constant or application data structure.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

*clock\_getres()*, *timer\_delete()*, *timer\_getoverrun()*

XBD **<signal.h>**, **<time.h>**

#### CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

#### Issue 6

The *timer\_create()* function is marked as part of the Timers option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

CPU-time clocks are added for alignment with IEEE Std 1003.1d-1999.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding the requirement for the CLOCK\_MONOTONIC clock under the Monotonic Clock option.

The **restrict** keyword is added to the *timer\_create()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/138 is applied, updating the DESCRIPTION and APPLICATION USAGE sections to describe the case when a timer is created with the notification method set to SIGEV\_THREAD.

#### Issue 7

The *timer\_create()* function is moved from the Timers option to the Base.

**NAME**

timer\_delete — delete a per-process timer

**SYNOPSIS**

```
CX      #include <time.h>
68711   int timer_delete(timer_t timerid);
```

**DESCRIPTION**

The *timer\_delete()* function deletes the specified timer, *timerid*, previously created by the *timer\_create()* function. If the timer is armed when *timer\_delete()* is called, the behavior shall be as if the timer is automatically disarmed before removal. The disposition of pending signals for the deleted timer is unspecified.

The behavior is undefined if the value specified by the *timerid* argument to *timer\_delete()* does not correspond to a timer ID returned by *timer\_create()* but not yet deleted by *timer\_delete()*.

**RETURN VALUE**

If successful, the *timer\_delete()* function shall return a value of zero. Otherwise, the function shall return a value of -1 and set *errno* to indicate the error.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

If an implementation detects that the value specified by the *timerid* argument to *timer\_delete()* does not correspond to a timer ID returned by *timer\_create()* but not yet deleted by *timer\_delete()*, it is recommended that the function should fail and report an [EINVAL] error.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*timer\_create()*  
XBD <time.h>

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

The *timer\_delete()* function is marked as part of the Timers option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/139 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

**Issue 7**

The *timer\_delete()* function is moved from the Timers option to the Base.

**NAME**

timer\_getoverrun, timer\_gettime, timer\_settime — per-process timers

**SYNOPSIS**

```
CX      #include <time.h>

68751      int timer_getoverrun(timer_t timerid);
68752      int timer_gettime(timer_t timerid, struct itimerspec *value);
68753      int timer_settime(timer_t timerid, int flags,
68754          const struct itimerspec *restrict value,
68755          struct itimerspec *restrict ovalue);
```

**DESCRIPTION**

The *timer\_gettime()* function shall store the amount of time until the specified timer, *timerid*, expires and the reload value of the timer into the space pointed to by the *value* argument. The *it\_value* member of this structure shall contain the amount of time before the timer expires, or zero if the timer is disarmed. This value is returned as the interval until timer expiration, even if the timer was armed with absolute time. The *it\_interval* member of *value* shall contain the reload value last set by *timer\_settime()*.

The *timer\_settime()* function shall set the time until the next expiration of the timer specified by *timerid* from the *it\_value* member of the *value* argument and arm the timer if the *it\_value* member of *value* is non-zero. If the specified timer was already armed when *timer\_settime()* is called, this call shall reset the time until next expiration to the *value* specified. If the *it\_value* member of *value* is zero, the timer shall be disarmed. The effect of disarming or resetting a timer with pending expiration notifications is unspecified.

If the flag *TIMER\_ABSTIME* is not set in the argument *flags*, *timer\_settime()* shall behave as if the time until next expiration is set to be equal to the interval specified by the *it\_value* member of *value*. That is, the timer shall expire in *it\_value* nanoseconds from when the call is made. If the flag *TIMER\_ABSTIME* is set in the argument *flags*, *timer\_settime()* shall behave as if the time until next expiration is set to be equal to the difference between the absolute time specified by the *it\_value* member of *value* and the current value of the clock associated with *timerid*. That is, the timer shall expire when the clock reaches the value specified by the *it\_value* member of *value*. If the specified time has already passed, the function shall succeed and the expiration notification shall be made.

The reload value of the timer shall be set to the value specified by the *it\_interval* member of *value*. When a timer is armed with a non-zero *it\_interval*, a periodic (or repetitive) timer is specified.

Time values that are between two consecutive non-negative integer multiples of the resolution of the specified timer shall be rounded up to the larger multiple of the resolution. Quantization error shall not cause the timer to expire earlier than the rounded time value.

If the argument *ovalue* is not NULL, the *timer\_settime()* function shall store, in the location referenced by *ovalue*, a value representing the previous amount of time before the timer would have expired, or zero if the timer was disarmed, together with the previous timer reload value. Timers shall not expire before their scheduled time.

Only a single signal shall be queued to the process for a given timer at any point in time. When a timer for which a signal is still pending expires, no signal shall be queued, and a timer overrun shall occur. When a timer expiration signal is delivered to or accepted by a process, the *timer\_getoverrun()* function shall return the timer expiration overrun count for the specified timer. The overrun count returned contains the number of extra timer expirations that occurred between the time the signal was generated (queued) and when it was delivered or accepted, up

to but not including an implementation-defined maximum of {DELAYTIMER\_MAX}. If the number of such extra expirations is greater than or equal to {DELAYTIMER\_MAX}, then the overrun count shall be set to {DELAYTIMER\_MAX}. The value returned by *timer\_getoverrun()* shall apply to the most recent expiration signal delivery or acceptance for the timer. If no expiration signal has been delivered for the timer, the return value of *timer\_getoverrun()* is unspecified.

The behavior is undefined if the value specified by the *timerid* argument to *timer\_getoverrun()*, *timer\_gettime()*, or *timer\_settime()* does not correspond to a timer ID returned by *timer\_create()* but not yet deleted by *timer\_delete()*.

## RETURN VALUE

If the *timer\_getoverrun()* function succeeds, it shall return the timer expiration overrun count as explained above.

If the *timer\_gettime()* or *timer\_settime()* functions succeed, a value of 0 shall be returned.

If an error occurs for any of these functions, the value -1 shall be returned, and *errno* set to indicate the error.

## ERRORS

The *timer\_settime()* function shall fail if:

[EINVAL] A *value* structure specified a nanosecond value less than zero or greater than or equal to 1 000 million, and the *it\_value* member of that structure did not specify zero seconds and nanoseconds.

The *timer\_settime()* function may fail if:

[EINVAL] The *it\_interval* member of *value* is not zero and the timer was created with notification by creation of a new thread (*sigev\_sigev\_notify* was SIGEV\_THREAD) and a fixed stack address has been set in the thread attribute pointed to by *sigev\_notify\_attributes*.

## EXAMPLES

None.

## APPLICATION USAGE

Using fixed stack addresses is problematic when timer expiration is signaled by the creation of a new thread. Since it cannot be assumed that the thread created for one expiration is finished before the next expiration of the timer, it could happen that two threads use the same memory as a stack at the same time. This is invalid and produces undefined results.

## RATIONALE

Practical clocks tick at a finite rate, with rates of 100 hertz and 1 000 hertz being common. The inverse of this tick rate is the clock resolution, also called the clock granularity, which in either case is expressed as a time duration, being 10 milliseconds and 1 millisecond respectively for these common rates. The granularity of practical clocks implies that if one reads a given clock twice in rapid succession, one may get the same time value twice; and that timers must wait for the next clock tick after the theoretical expiration time, to ensure that a timer never returns too soon. Note also that the granularity of the clock may be significantly coarser than the resolution of the data format used to set and get time and interval values. Also note that some implementations may choose to adjust time and/or interval values to exactly match the ticks of the underlying clock.

This volume of POSIX.1-2008 defines functions that allow an application to determine the implementation-supported resolution for the clocks and requires an implementation to document the resolution supported for timers and *nanosleep()* if they differ from the supported

68840 clock resolution. This is more of a procurement issue than a runtime application issue.

68841 If an implementation detects that the value specified by the *timerid* argument to +  
68842 *timer\_getoverrun()*, *timer\_gettime()*, or *timer\_settime()* does not correspond to a timer ID returned +  
68843 by *timer\_create()* but not yet deleted by *timer\_delete()*, it is recommended that the function +  
68844 should fail and report an [EINVAL] error.

#### 68845 FUTURE DIRECTIONS

68846 None.

#### 68847 SEE ALSO

68848 *clock\_getres()*, *timer\_create()*

68849 XBD <time.h>

#### 68850 CHANGE HISTORY

68851 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

#### 68852 Issue 6

68853 The *timer\_getoverrun()*, *timer\_gettime()*, and *timer\_settime()* functions are marked as part of the  
68854 Timers option.

68855 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
68856 implementation does not support the Timers option.

68857 The [EINVAL] error condition is updated to include the following: “and the *it\_value* member of  
68858 that structure did not specify zero seconds and nanoseconds.” This change is for IEEE PASC  
68859 Interpretation 1003.1 #89.

68860 The DESCRIPTION for *timer\_getoverrun()* is updated to clarify that “If no expiration signal has  
68861 been delivered for the timer, or if the Realtime Signals Extension is not supported, the return  
68862 value of *timer\_getoverrun()* is unspecified”.

68863 The **restrict** keyword is added to the *timer\_settime()* prototype for alignment with the  
68864 ISO/IEC 9899:1999 standard.

68865 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/140 is applied, updating the ERRORS  
68866 section so that the mandatory [EINVAL] error (“The *timerid* argument does not correspond to an  
68867 ID returned by *timer\_create()* but not yet deleted by *timer\_delete()*”) becomes optional.

68868 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/141 is applied, updating the ERRORS  
68869 section to include an optional [EINVAL] error for the case when a timer is created with the  
68870 notification method set to SIGEV\_THREAD. APPLICATION USAGE text is also added.

#### 68871 Issue 7

68872 The *timer\_getoverrun()*, *timer\_gettime()*, and *timer\_settime()* functions are moved from the Timers  
68873 option to the Base.

68874 Functionality relating to the Realtime Signals Extension option is moved to the Base.

**NAME**

times — get process and waited-for child process times

**SYNOPSIS**

```
#include <sys/times.h>

clock_t times(struct tms *buffer);
```

**DESCRIPTION**

The *times()* function shall fill the **tms** structure pointed to by *buffer* with time-accounting information. The **tms** structure is defined in **<sys/times.h>**.

All times are measured in terms of the number of clock ticks used.

The times of a terminated child process shall be included in the *tms\_cutime* and *tms\_cstime* elements of the parent when *wait()*, *waitid()*, or *waitpid()* returns the process ID of this terminated child. If a child process has not waited for its children, their times shall not be included in its times.

- The *tms\_utime* structure member is the CPU time charged for the execution of user instructions of the calling process.
- The *tms\_stime* structure member is the CPU time charged for execution by the system on behalf of the calling process.
- The *tms\_cutime* structure member is the sum of the *tms\_utime* and *tms\_cutime* times of the child processes.
- The *tms\_cstime* structure member is the sum of the *tms\_stime* and *tms\_cstime* times of the child processes.

**RETURN VALUE**

Upon successful completion, *times()* shall return the elapsed real time, in clock ticks, since an arbitrary point in the past (for example, system start-up time). This point does not change from one invocation of *times()* within the process to another. The return value may overflow the possible range of type **clock\_t**. If *times()* fails, **(clock\_t)-1** shall be returned and *errno* set to indicate the error.

**ERRORS**

The *times()* function shall fail if:

[EOVERFLOW] The return value would overflow the range of **clock\_t**.

**EXAMPLES****Timing a Database Lookup**

The following example defines two functions, *start\_clock()* and *end\_clock()*, that are used to time a lookup. It also defines variables of type **clock\_t** and **tms** to measure the duration of transactions. The *start\_clock()* function saves the beginning times given by the *times()* function. The *end\_clock()* function gets the ending times and prints the difference between the two times.

```
#include <sys/times.h>
#include <stdio.h>
...
void start_clock(void);
void end_clock(char *msg);
...
static clock_t st_time;
static clock_t en_time;
```

```

68919     static struct tms st_cpu;
68920     static struct tms en_cpu;
68921     ...
68922     void
68923     start_clock()
68924     {
68925         st_time = times(&st_cpu);
68926     }
68927
68928     /* This example assumes that the result of each subtraction
68929        is within the range of values that can be represented in
68930        an integer type. */
68931     void
68932     end_clock(char *msg)
68933     {
68934         en_time = times(&en_cpu);
68935
68936         fputs(msg, stdout);
68937         printf("Real Time: %jd, User Time %jd, System Time %jd\n",
68938             (intmax_t)(en_time - st_time),
68939             (intmax_t)(en_cpu.tms_utime - st_cpu.tms_utime),
68940             (intmax_t)(en_cpu.tms_stime - st_cpu.tms_stime));
68941     }

```

## APPLICATION USAGE

Applications should use `sysconf(_SC_CLK_TCK)` to determine the number of clock ticks per second as it may vary from system to system.

## RATIONALE

The accuracy of the times reported is intentionally left unspecified to allow implementations flexibility in design, from uniprocessor to multi-processor networks.

The inclusion of times of child processes is recursive, so that a parent process may collect the total times of all of its descendants. But the times of a child are only added to those of its parent when its parent successfully waits on the child. Thus, it is not guaranteed that a parent process can always see the total times of all its descendants; see also the discussion of the term “realtime” in [alarm\(\)](#).

If the type `clock_t` is defined to be a signed 32-bit integer, it overflows in somewhat more than a year if there are 60 clock ticks per second, or less than a year if there are 100. There are individual systems that run continuously for longer than that. This volume of POSIX.1-2008 permits an implementation to make the reference point for the returned value be the start-up time of the process, rather than system start-up time.

The term “charge” in this context has nothing to do with billing for services. The operating system accounts for time used in this way. That information must be correct, regardless of how that information is used.

## FUTURE DIRECTIONS

None.

## SEE ALSO

68964

68965

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

68966 **NAME**

68967       timezone — difference from UTC and local standard time

68968 **SYNOPSIS**

```
68969 XSI      #include <time.h>
68970          extern long timezone;
```

68971 **DESCRIPTION**68972       Refer to *tzset()*.

68973 **NAME**

68974 tmpfile — create a temporary file

68975 **SYNOPSIS**

68976 #include &lt;stdio.h&gt;

68977 FILE \*tmpfile(void);

68978 **DESCRIPTION**

68979 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 68980 conflict between the requirements described here and the ISO C standard is unintentional. This  
 68981 volume of POSIX.1-2008 defers to the ISO C standard.

68982 The *tmpfile()* function shall create a temporary file and open a corresponding stream. The file  
 68983 shall be automatically deleted when all references to the file are closed. The file shall be opened  
 68984 as in *fopen()* for update (*wb+*), except that implementations may restrict the permissions, either  
 68985 by clearing the file mode bits or setting them to the value *S\_IRUSR* | *S\_IWUSR*.

68986 CX In some implementations, a permanent file may be left behind if the process calling *tmpfile()* is  
 68987 killed while it is processing a call to *tmpfile()*.

68988 An error message may be written to standard error if the stream cannot be opened.

68989 **RETURN VALUE**

68990 Upon successful completion, *tmpfile()* shall return a pointer to the stream of the file that is  
 68991 CX created. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

68992 **ERRORS**68993 The *tmpfile()* function shall fail if:

68994 CX [EINTR] A signal was caught during *tmpfile()*.

68995 CX [EMFILE] All file descriptors available to the process are currently open.

68996 CX [EMFILE] {STREAM\_MAX} streams are currently open in the calling process.

68997 CX [ENFILE] The maximum allowable number of files is currently open in the system.

68998 CX [ENOSPC] The directory or file system which would contain the new file cannot be  
 68999 expanded.

69000 CX [EOVERFLOW] The file is a regular file and the size of the file cannot be represented correctly  
 69001 in an object of type *off\_t*.

69002 The *tmpfile()* function may fail if:

69003 CX [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

69004 CX [ENOMEM] Insufficient storage space is available.

69005 **EXAMPLES**69006 **Creating a Temporary File**

69007 The following example creates a temporary file for update, and returns a pointer to a stream for  
 69008 the created file in the *fp* variable.

69009 #include &lt;stdio.h&gt;

69010 ...

69011 FILE \*fp;

69012 fp = tmpfile ();

**APPLICATION USAGE**

It should be possible to open at least {TMP\_MAX} temporary files during the lifetime of the program (this limit may be shared with *tmpnam()*) and there should be no limit on the number simultaneously open other than this limit and any limit on the number of open file descriptors or streams ({OPEN\_MAX}, {FOPEN\_MAX}, {STREAM\_MAX}).

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

Section 2.5 (on page 495), *fopen()*, *mkdtemp()*, *tmpnam()*, *unlink()*

XBD <stdio.h>

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

Large File Summit extensions are added.

The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes in previous issues.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.
- The [EMFILE] optional error condition is added.

The APPLICATION USAGE section is added for alignment with the ISO/IEC 9899:1999 standard.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #025 is applied, clarifying that implementations may restrict the permissions of the file created.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-149 is applied, adding the mandatory [EMFILE] error condition for {STREAM\_MAX} streams open.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0668 [14] is applied.

69047 **NAME**

69048 tmpnam — create a name for a temporary file

69049 **SYNOPSIS**

```
69050 OB      #include <stdio.h>
69051      char *tmpnam(char *s);
```

69052 **DESCRIPTION**

69053 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 69054 conflict between the requirements described here and the ISO C standard is unintentional. This  
 69055 volume of POSIX.1-2008 defers to the ISO C standard.

69056 The *tmpnam()* function shall generate a string that is a valid pathname that does not name an  
 69057 existing file. The function is potentially capable of generating {TMP\_MAX} different strings, but  
 69058 any or all of them may already be in use by existing files and thus not be suitable return values.

69059 The *tmpnam()* function generates a different string each time it is called from the same process,  
 69060 up to {TMP\_MAX} times. If it is called more than {TMP\_MAX} times, the behavior is  
 69061 implementation-defined.

69062 The implementation shall behave as if no function defined in this volume of POSIX.1-2008,  
 69063 except *tmpnam()*, calls *tmpnam()*.

69064 CX The *tmpnam()* function need not be thread-safe if called with a NULL parameter.

69065 **RETURN VALUE**

69066 Upon successful completion, *tmpnam()* shall return a pointer to a string. If no suitable string can  
 69067 be generated, the *tmpnam()* function shall return a null pointer.

69068 If the argument *s* is a null pointer, *tmpnam()* shall leave its result in an internal static object and  
 69069 return a pointer to that object. Subsequent calls to *tmpnam()* may modify the same object. If the  
 69070 argument *s* is not a null pointer, it is presumed to point to an array of at least L\_tmpnam **chars**;  
 69071 *tmpnam()* shall write its result in that array and shall return the argument as its value.

69072 **ERRORS**

69073 No errors are defined.

69074 **EXAMPLES**69075 **Generating a Pathname**

69076 The following example generates a unique pathname and stores it in the array pointed to by *ptr*.

```
69077 #include <stdio.h>
69078 ...
69079 char pathname[L_tmpnam+1];
69080 char *ptr;
69081 ptr = tmpnam(pathname);
```

69082 **APPLICATION USAGE**

69083 This function only creates pathnames. It is the application's responsibility to create and remove  
 69084 the files.

69085 Between the time a pathname is created and the file is opened, it is possible for some other  
 69086 process to create a file with the same name. Applications may find *tmpfile()* more useful.

69087 Applications should use the *tmpfile()*, *mkstemp()*, or *mkdtemp()* functions instead of the  
 69088 obsolescent *tmpnam()* function.

69089 **RATIONALE**

69090 None.

69091 **FUTURE DIRECTIONS**69092 The *tmpnam()* function may be removed in a future version.69093 **SEE ALSO**69094 *fopen()*, *open()*, *mkdtemp()*, *tmpnam()*, *tmpfile()*, *unlink()*

69095 XBD &lt;stdio.h&gt;

69096 **CHANGE HISTORY**

69097 First released in Issue 1. Derived from Issue 1 of the SVID.

69098 **Issue 5**

69099 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

69100 **Issue 6**

69101 Extensions beyond the ISO C standard are marked.

69102 The normative text is updated to avoid use of the term “must” for application requirements.

69103 The DESCRIPTION is expanded for alignment with the ISO/IEC 9899:1999 standard.

69104 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/142 is applied, updating the  
69105 DESCRIPTION to allow implementations of the *tmpnam()* function to call *tmpnam()*.69106 **Issue 7**69107 Austin Group Interpretation 1003.1-2001 #148 is applied, clarifying that the *tmpnam()* function  
69108 need not be thread-safe if called with a NULL parameter.69109 The *tmpnam()* function is marked obsolescent.69110 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0669 [291] and XSH/TC1-2008/0670  
69111 [291,429] are applied.

**69112 NAME**

69113       toascii — translate an integer to a 7-bit ASCII character

**69114 SYNOPSIS**

```
69115 OB XSI #include <ctype.h>  
69116       int toascii(int c);
```

**69117 DESCRIPTION**

69118       The *toascii()* function shall convert its argument into a 7-bit ASCII character.

**69119 RETURN VALUE**

69120       The *toascii()* function shall return the value (*c* &0x7f).

**69121 ERRORS**

69122       No errors are returned.

**69123 EXAMPLES**

69124       None.

**69125 APPLICATION USAGE**

69126       The *toascii()* function cannot be used portably in a localized application.

**69127 RATIONALE**

69128       None.

**69129 FUTURE DIRECTIONS**

69130       The *toascii()* function may be removed in a future version.

**69131 SEE ALSO**

69132       *isascii()*

69133       XBD <ctype.h>

**69134 CHANGE HISTORY**

69135       First released in Issue 1. Derived from Issue 1 of the SVID.

**69136 Issue 7**

69137       The *toascii()* function is marked obsolescent.

69138 **NAME**

69139       tolower, tolower\_l — transliterate uppercase characters to lowercase

69140 **SYNOPSIS**

```
69141       #include <ctype.h>
69142       int tolower(int c);
69143 CX     int tolower_l(int c, locale_t locale);
```

69144 **DESCRIPTION**

69145 CX     For *tolower()*: The functionality described on this reference page is aligned with the ISO C  
69146 standard. Any conflict between the requirements described here and the ISO C standard is  
69147 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

69148 CX     The *tolower()* and *tolower\_l()* functions have as a domain a type **int**, the value of which is  
69149 representable as an **unsigned char** or the value of EOF. If the argument has any other value, the  
69150 CX     behavior is undefined. If the argument of *tolower()* or *tolower\_l()* represents an uppercase letter,  
69151 and there exists a corresponding lowercase letter as defined by character type information in the  
69152 CX     current locale or in the locale represented by *locale*, respectively (category *LC\_CTYPE*), the  
69153 result shall be the corresponding lowercase letter. All other arguments in the domain are  
69154 returned unchanged.

69155 CX     The behavior is undefined if the *locale* argument to *tolower\_l()* is the special locale object  
69156 *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.

69157 **RETURN VALUE**

69158 CX     Upon successful completion, the *tolower()* and *tolower\_l()* functions shall return the lowercase  
69159 letter corresponding to the argument passed; otherwise, they shall return the argument  
69160 unchanged.

69161 **ERRORS**

69162       No errors are defined.

69163 **EXAMPLES**

69164       None.

69165 **APPLICATION USAGE**

69166       None.

69167 **RATIONALE**

69168       None.

69169 **FUTURE DIRECTIONS**

69170       None.

69171 **SEE ALSO**

69172       [\*setlocale\(\)\*](#), [\*uselocale\(\)\*](#)  
69173       XBD [Chapter 7](#) (on page 135), [\*<ctype.h>\*](#), [\*<locale.h>\*](#)

69174 **CHANGE HISTORY**

69175       First released in Issue 1. Derived from Issue 1 of the SVID.

69176 **Issue 6**

69177       Extensions beyond the ISO C standard are marked.

69178 **Issue 7**

69179 The *tolower\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
69180 Set Part 4.

69181 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0671 [283] and XSH/TC1-2008/0672  
69182 [283] are applied.

69183 **NAME**

69184 toupper, toupper\_l — transliterate lowercase characters to uppercase

69185 **SYNOPSIS**

```
69186 #include <ctype.h>
69187 int toupper(int c);
69188 CX int toupper_l(int c, locale_t locale);
```

69189 **DESCRIPTION**

69190 CX For `toupper()`: The functionality described on this reference page is aligned with the ISO C  
69191 standard. Any conflict between the requirements described here and the ISO C standard is  
69192 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

69193 CX The `toupper()` and `toupper_l()` functions have as a domain a type `int`, the value of which is  
69194 representable as an **unsigned char** or the value of EOF. If the argument has any other value, the  
69195 behavior is undefined.

69196 CX If the argument of `toupper()` or `toupper_l()` represents a lowercase letter, and there exists a  
69197 CX corresponding uppercase letter as defined by character type information in the current locale or  
69198 in the locale represented by `locale`, respectively (category `LC_CTYPE`), the result shall be the  
69199 corresponding uppercase letter.

69200 All other arguments in the domain are returned unchanged.

69201 CX The behavior is undefined if the `locale` argument to `toupper_l()` is the special locale object  
69202 `LC_GLOBAL_LOCALE` or is not a valid locale object handle.

69203 **RETURN VALUE**

69204 CX Upon successful completion, `toupper()` and `toupper_l()` shall return the uppercase letter  
69205 corresponding to the argument passed; otherwise, they shall return the argument unchanged.

69206 **ERRORS**

69207 No errors are defined.

69208 **EXAMPLES**

69209 None.

69210 **APPLICATION USAGE**

69211 None.

69212 **RATIONALE**

69213 None.

69214 **FUTURE DIRECTIONS**

69215 None.

69216 **SEE ALSO**

69217 [`setlocale\(\)`](#), [`uselocale\(\)`](#)

69218 XBD [Chapter 7](#) (on page 135), [`<ctype.h>`](#), [`<locale.h>`](#)

69219 **CHANGE HISTORY**

69220 First released in Issue 1. Derived from Issue 1 of the SVID.

69221 **Issue 6**

69222 Extensions beyond the ISO C standard are marked.

69223 **Issue 7**

69224 SD5-XSH-ERN-181 is applied, clarifying the RETURN VALUE section.

69225 The *toupper\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
69226 Set Part 4.

69227 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0673 [283] and XSH/TC1-2008/0674  
69228 [283] are applied.

69229 **NAME**

69230 towctrans, towctrans\_l — wide-character transliteration

69231 **SYNOPSIS**

69232 #include &lt;wctype.h&gt;

69233 wint\_t towctrans(wint\_t wc, wctrans\_t desc);

69234 CX wint\_t towctrans\_l(wint\_t wc, wctrans\_t desc,  
69235 locale\_t locale);69236 **DESCRIPTION**69237 CX For towctrans(): The functionality described on this reference page is aligned with the ISO C  
69238 standard. Any conflict between the requirements described here and the ISO C standard is  
69239 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.69240 CX The towctrans() and towctrans\_l() functions shall transliterate the wide-character code wc using  
69241 the mapping described by desc.69242 CX The current setting of the LC\_CTYPE category in the current locale or in the locale represented  
69243 CX by locale, respectively, should be the same as during the call to wctrans() or wctrans\_l() that  
69244 returned the value desc.69245 If the value of desc is invalid (that is, not obtained by a call to wctrans() or desc is invalidated by a  
69246 subsequent call to setlocale() that has affected category LC\_CTYPE), the result is unspecified.69247 CX If the value of desc is invalid (that is, not obtained by a call to wctrans\_l() with the same locale  
69248 object locale) the result is unspecified.69249 CX An application wishing to check for error situations should set errno to 0 before calling  
69250 towctrans() or towctrans\_l().

69251 If errno is non-zero on return, an error has occurred.

69252 The behavior is undefined if the locale argument to towctrans\_l() is the special locale object  
69253 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.69254 **RETURN VALUE**69255 CX If successful, the towctrans() and towctrans\_l() functions shall return the mapped value of wc  
69256 using the mapping described by desc. Otherwise, they shall return wc unchanged.69257 **ERRORS**

69258 These functions may fail if:

69259 CX [EINVAL] desc contains an invalid transliteration descriptor.

69260 **EXAMPLES**

69261 None.

69262 **APPLICATION USAGE**69263 The strings "tolower" and "toupper" are reserved for the standard mapping names. In the  
69264 table below, the functions in the left column are equivalent to the functions in the right column.

|                             |                                             |
|-----------------------------|---------------------------------------------|
| 69265 tolower(wc)           | towctrans(wc, wctrans("tolower"))           |
| 69266 tolower_l(wc, locale) | towctrans_l(wc, wctrans("tolower"), locale) |
| 69267 toupper(wc)           | towctrans(wc, wctrans("toupper"))           |
| 69268 toupper_l(wc, locale) | towctrans_l(wc, wctrans("toupper"), locale) |

69269 **RATIONALE**

69270 None.

69271 **FUTURE DIRECTIONS**

69272 None.

69273 **SEE ALSO**69274 *tolower()*, *towupper()*, *wctrans()*69275 XBD <**wctype.h**>69276 **CHANGE HISTORY**

69277 First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

69278 **Issue 6**

69279 Extensions beyond the ISO C standard are marked.

69280 **Issue 7**69281 The *towctrans\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
69282 API Set Part 4.69283 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0675 [302], XSH/TC1-2008/0676 [283],  
69284 and XSH/TC1-2008/0677 [283] are applied.

69285 **NAME**

69286 towlower, towlower\_l — transliterate uppercase wide-character code to lowercase

69287 **SYNOPSIS**

69288 #include &lt;wctype.h&gt;

69289 wint\_t towlower(wint\_t wc);

69290 CX wint\_t towlower\_l(wint\_t wc, locale\_t locale);

69291 **DESCRIPTION**69292 CX For *towlower()*: The functionality described on this reference page is aligned with the ISO C  
69293 standard. Any conflict between the requirements described here and the ISO C standard is  
69294 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.69295 CX The *towlower()* and *towlower\_l()* functions have as a domain a type **wint\_t**, the value of which  
69296 the application shall ensure is a character representable as a **wchar\_t**, and a wide-character code  
69297 corresponding to a valid character in the locale used by the function or the value of WEOF. If  
69298 CX the argument has any other value, the behavior is undefined. If the argument of *towlower()* or  
69299 *towlower\_l()* represents an uppercase wide-character code, and there exists a corresponding  
69300 CX lowercase wide-character code as defined by character type information in the current locale or  
69301 in the locale represented by *locale*, respectively (category *LC\_CTYPE*), the result shall be the  
69302 corresponding lowercase wide-character code. All other arguments in the domain are returned  
69303 unchanged.69304 CX The behavior is undefined if the *locale* argument to *towlower\_l()* is the special locale object  
69305 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.69306 **RETURN VALUE**69307 CX Upon successful completion, the *towlower()* and *towlower\_l()* functions shall return the  
69308 lowercase letter corresponding to the argument passed; otherwise, they shall return the  
69309 argument unchanged.69310 **ERRORS**

69311 No errors are defined.

69312 **EXAMPLES**

69313 None.

69314 **APPLICATION USAGE**

69315 None.

69316 **RATIONALE**

69317 None.

69318 **FUTURE DIRECTIONS**

69319 None.

69320 **SEE ALSO**69321 *setlocale()*, *uselocale()*

69322 XBD Chapter 7 (on page 135), &lt;locale.h&gt;, &lt;wctype.h&gt;

69323 **CHANGE HISTORY**

69324 First released in Issue 4.

69325 **Issue 5**

69326 The following change has been made in this version for alignment with  
69327 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 69328       • The SYNOPSIS has been changed to indicate that this function and associated data types  
69329       are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

69330 **Issue 6**

69331 The normative text is updated to avoid use of the term “must” for application requirements.

69332 **Issue 7**

69333 The *tolower\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
69334 API Set Part 4.

69335 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0678 [302], XSH/TC1-2008/0679 [283],  
69336 and XSH/TC1-2008/0680 [283] are applied.

69337 **NAME**

69338 towupper, towupper\_l — transliterate lowercase wide-character code to uppercase

69339 **SYNOPSIS**

69340 #include &lt;wctype.h&gt;

69341 wint\_t towupper(wint\_t wc);

69342 CX wint\_t towupper\_l(wint\_t wc, locale\_t locale);

69343 **DESCRIPTION**69344 CX For *towupper()*: The functionality described on this reference page is aligned with the ISO C  
69345 standard. Any conflict between the requirements described here and the ISO C standard is  
69346 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.69347 CX The *towupper()* and *towupper\_l()* functions have as a domain a type **wint\_t**, the value of which  
69348 the application shall ensure is a character representable as a **wchar\_t**, and a wide-character code  
69349 corresponding to a valid character in the locale used by the function or the value of WEOF. If  
69350 CX the argument has any other value, the behavior is undefined. If the argument of *towupper()* or  
69351 *towupper\_l()* represents a lowercase wide-character code, and there exists a corresponding  
69352 CX uppercase wide-character code as defined by character type information in the current locale or  
69353 in the locale represented by *locale*, respectively (category *LC\_CTYPE*), the result shall be the  
69354 corresponding uppercase wide-character code. All other arguments in the domain are returned  
69355 unchanged.69356 CX The behavior is undefined if the *locale* argument to *towupper\_l()* is the special locale object  
69357 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.69358 **RETURN VALUE**69359 CX Upon successful completion, the *towupper()* and *towupper\_l()* functions shall return the  
69360 uppercase letter corresponding to the argument passed. Otherwise, they shall return the  
69361 argument unchanged.69362 **ERRORS**

69363 No errors are defined.

69364 **EXAMPLES**

69365 None.

69366 **APPLICATION USAGE**

69367 None.

69368 **RATIONALE**

69369 None.

69370 **FUTURE DIRECTIONS**

69371 None.

69372 **SEE ALSO**69373 *setlocale()*, *uselocale()*

69374 XBD Chapter 7 (on page 135), &lt;locale.h&gt;, &lt;wctype.h&gt;

69375 **CHANGE HISTORY**

69376 First released in Issue 4.

69377 **Issue 5**

69378 The following change has been made in this version for alignment with  
69379 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 69380 • The SYNOPSIS has been changed to indicate that this function and associated data types  
69381 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

69382 **Issue 6**

69383 The normative text is updated to avoid use of the term “must” for application requirements.

69384 **Issue 7**

69385 The `towupper_l()` function is added from The Open Group Technical Standard, 2006, Extended  
69386 API Set Part 4.

69387 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0681 [302], XSH/TC1-2008/0682 [283],  
69388 and XSH/TC1-2008/0683 [283] are applied.

69389 **NAME**

69390 trunc, truncf, trunc1 — round to truncated integer value

69391 **SYNOPSIS**

```
69392 #include <math.h>
69393 double trunc(double x);
69394 float truncf(float x);
69395 long double trunc1(long double x);
```

69396 **DESCRIPTION**

69397 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
69398 conflict between the requirements described here and the ISO C standard is unintentional. This  
69399 volume of POSIX.1-2008 defers to the ISO C standard.

69400 These functions shall round their argument to the integer value, in floating format, nearest to but  
69401 no larger in magnitude than the argument.

69402 **RETURN VALUE**

69403 Upon successful completion, these functions shall return the truncated integer value.

69404 MX The result shall have the same sign as *x*.

69405 MX If *x* is NaN, a NaN shall be returned.

69406 If *x* is  $\pm 0$  or  $\pm \text{Inf}$ , *x* shall be returned.

69407 **ERRORS**

69408 No errors are defined.

69409 **EXAMPLES**

69410 None.

69411 **APPLICATION USAGE**

69412 The integral value returned by these functions need not be expressible as an **intmax\_t**. The  
69413 return value should be tested before assigning it to an integer type to avoid the undefined  
69414 results of an integer overflow.

69415 These functions may raise the inexact floating-point exception if the result differs in value from  
69416 the argument.

69417 **RATIONALE**

69418 None.

69419 **FUTURE DIRECTIONS**

69420 None.

69421 **SEE ALSO**

69422 XBD [<math.h>](#)

69423 **CHANGE HISTORY**

69424 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

69425 **Issue 7**

69426 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0684 [346] is applied.

69427 **NAME**

69428 truncate — truncate a file to a specified length

69429 **SYNOPSIS**

69430 #include &lt;unistd.h&gt;

69431 int truncate(const char \*path, off\_t length);

69432 **DESCRIPTION**69433 The *truncate()* function shall cause the regular file named by *path* to have a size which shall be  
69434 equal to *length* bytes.69435 If the file previously was larger than *length*, the extra data is discarded. If the file was previously  
69436 shorter than *length*, its size is increased, and the extended area appears as if it were zero-filled.

69437 The application shall ensure that the process has write permission for the file.

69438 XSI If the request would cause the file size to exceed the soft file size limit for the process, the  
69439 request shall fail and the implementation shall generate the SIGXFSZ signal for the process.69440 The *truncate()* function shall not modify the file offset for any open file descriptions associated  
69441 with the file. Upon successful completion, *truncate()* shall mark for update the last data  
69442 modification and last file status change timestamps of the file, and the S\_ISUID and S\_ISGID bits  
69443 of the file mode may be cleared.69444 **RETURN VALUE**69445 Upon successful completion, *truncate()* shall return 0. Otherwise, -1 shall be returned, and *errno*  
69446 set to indicate the error.69447 **ERRORS**69448 The *truncate()* function shall fail if:

69449 [EINTR] A signal was caught during execution.

69450 [EINVAL] The *length* argument was less than 0.

69451 [EFBIG] or [EINVAL]

69452 The *length* argument was greater than the maximum file size.

69453 [EIO] An I/O error occurred while reading from or writing to a file system.

69454 [EACCES] A component of the path prefix denies search permission, or write permission  
69455 is denied on the file.

69456 [EISDIR] The named file is a directory.

69457 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
69458 argument.

69459 [ENAMETOOLONG]

69460 The length of a component of a pathname is longer than {NAME\_MAX}.

69461 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.69462 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
69463 directory nor a symbolic link to a directory, or the *path* argument contains at  
69464 least one non-*<slash>* character and ends with one or more trailing *<slash>*  
69465 characters and the last pathname component names an existing file that is  
69466 neither a directory nor a symbolic link to a directory.

69467 [EROFS] The named file resides on a read-only file system.  
69468 The *truncate()* function may fail if:  
69469 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
69470 resolution of the *path* argument.  
69471 [ENAMETOOLONG]  
69472 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
69473 symbolic link produced an intermediate result with a length that exceeds  
69474 {PATH\_MAX}.

69482 None.

#### 69483 SEE ALSO

69484 *open()*

69485 XBD <unistd.h>

#### 69486 CHANGE HISTORY

69487 First released in Issue 4, Version 2.

#### 69488 Issue 5

69489 Moved from X/OPEN UNIX extension to BASE.

69490 Large File Summit extensions are added.

#### 69491 Issue 6

69492 This reference page is split out from the *ftruncate()* reference page.

69493 The normative text is updated to avoid use of the term “must” for application requirements.

69494 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
69495 [ELOOP] error condition is added.

#### 69496 Issue 7

69497 Austin Group Interpretation 1003.1-2001 #143 is applied.

69498 The *truncate()* function is moved from the XSI option to the Base.

69499 Changes are made related to support for finegrained timestamps.

69500 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
69501 pathname exists but is not a directory or a symbolic link to a directory.

69502 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0685 [324] is applied.

69503 **NAME**

69504       truncf, trunc — round to truncated integer value

69505 **SYNOPSIS**

69506       #include &lt;math.h&gt;

69507       float truncf(float x);

69508       long double trunc1(long double x);

69509 **DESCRIPTION**69510       Refer to *trunc()*.

69511 **NAME**

69512       tsearch — search a binary search tree

69513 **SYNOPSIS**

```
69514 XSI      #include <search.h>
69515          void *tsearch(const void *key, void **rootp,
69516                      int (*compar)(const void *, const void *));
```

69517 **DESCRIPTION**69518       Refer to *tdelete()*.

**NAME**

ttyname, ttyname\_r — find the pathname of a terminal

**SYNOPSIS**

```
#include <unistd.h>
```

```
char *ttyname(int fildes);
```

```
int ttyname_r(int fildes, char *name, size_t namesize);
```

**DESCRIPTION**

The *ttyname()* function shall return a pointer to a string containing a null-terminated pathname of the terminal associated with file descriptor *fildes*. The application shall not modify the string returned. The returned pointer might be invalidated or the string content might be overwritten by a subsequent call to *ttyname()*. The returned pointer and the string content might also be invalidated if the calling thread is terminated.

The *ttyname()* function need not be thread-safe.

The *ttyname\_r()* function shall store the null-terminated pathname of the terminal associated with the file descriptor *fildes* in the character array referenced by *name*. The array is *namesize* characters long and should have space for the name and the terminating null character. The maximum length of the terminal name shall be {TTY\_NAME\_MAX}.

**RETURN VALUE**

Upon successful completion, *ttyname()* shall return a pointer to a string. Otherwise, a null pointer shall be returned and *errno* set to indicate the error.

If successful, the *ttyname\_r()* function shall return zero. Otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The *ttyname()* function may fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[ENOTTY] The file associated with the *fildes* argument is not a terminal.

The *ttyname\_r()* function may fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[ENOTTY] The file associated with the *fildes* argument is not a terminal.

[ERANGE] The value of *namesize* is smaller than the length of the string to be returned including the terminating null character.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

The term “terminal” is used instead of the historical term “terminal device” in order to avoid a reference to an undefined term.

The thread-safe version places the terminal name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.

## 69560 FUTURE DIRECTIONS

69561 None.

## 69562 SEE ALSO

69563 XBD <unistd.h>

## 69564 CHANGE HISTORY

69565 First released in Issue 1. Derived from Issue 1 of the SVID.

### 69566 Issue 5

69567 The *ttynamename\_r()* function is included for alignment with the POSIX Threads Extension.

69568 A note indicating that the *ttynamename()* function need not be reentrant is added to the  
69569 DESCRIPTION.

### 69570 Issue 6

69571 The *ttynamename\_r()* function is marked as part of the Thread-Safe Functions option.

69572 The following new requirements on POSIX implementations derive from alignment with the  
69573 Single UNIX Specification:

- 69574 • The statement that *errno* is set on error is added.
- 69575 • The [EBADF] and [ENOTTY] optional error conditions are added.

### 69576 Issue 7

69577 Austin Group Interpretation 1003.1-2001 #156 is applied.

69578 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

69579 The *ttynamename\_r()* function is moved from the Thread-Safe Functions option to the Base.

69580 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0686 [75] is applied.

69581 **NAME**

69582 twalk — traverse a binary search tree

69583 **SYNOPSIS**

```
69584 XSI      #include <search.h>
69585          void twalk(const void *root,
69586                   void (*action)(const void *, VISIT, int ));
```

69587 **DESCRIPTION**69588 Refer to *tdelete()*.

**NAME**

daylight, timezone, tzname, tzset — set timezone conversion information

**SYNOPSIS**

```
#include <time.h>
```

```
extern int daylight;
extern long timezone;
extern char *tzname[2];
void tzset(void);
```

**DESCRIPTION**

The `tzset()` function shall use the value of the environment variable `TZ` to set time conversion information used by `ctime()`, `localtime()`, `mktime()`, and `strftime()`. If `TZ` is absent from the environment, implementation-defined default timezone information shall be used.

The `tzset()` function shall set the external variable `tzname` as follows:

```
tzname[0] = "std";
tzname[1] = "dst";
```

where `std` and `dst` are as described in XBD Chapter 8 (on page 173).

The `tzset()` function also shall set the external variable `daylight` to 0 if Daylight Savings Time conversions should never be applied for the timezone in use; otherwise, non-zero. The external variable `timezone` shall be set to the difference, in seconds, between Coordinated Universal Time (UTC) and local standard time.

If a thread accesses `tzname`, `daylight`, or `timezone` directly while another thread is in a call to `tzset()`, or to any function that is required or allowed to set timezone information as if by calling `tzset()`, the behavior is undefined.

**RETURN VALUE**

The `tzset()` function shall not return a value.

**ERRORS**

No errors are defined.

**EXAMPLES**

Example `TZ` variables and their timezone differences are given in the table below:

| <i>TZ</i> | <i>timezone</i> |
|-----------|-----------------|
| EST5EDT   | 5*60*60         |
| GMT0      | 0*60*60         |
| JST-9     | -9*60*60        |
| MET-1MEST | -1*60*60        |
| MST7MDT   | 7*60*60         |
| PST8PDT   | 8*60*60         |

**APPLICATION USAGE**

Since the `ctime()`, `localtime()`, `mktime()`, `strftime()`, and `strftime_l()` functions are required to set timezone information as if by calling `tzset()`, there is no need for an explicit `tzset()` call before using these functions. However, portable applications should call `tzset()` explicitly before using `ctime_r()` or `localtime_r()` because setting timezone information is optional for those functions.

69630 **RATIONALE**

69631 None.

69632 **FUTURE DIRECTIONS**

69633 None.

69634 **SEE ALSO**69635 *ctime()*, *localtime()*, *mktime()*, *strftime()*69636 XBD Chapter 8 (on page 173), **<time.h>**69637 **CHANGE HISTORY**

69640 The example is corrected.

69641 **NAME**

69642 ulimit — get and set process limits

69643 **SYNOPSIS**

```
69644 OB XSI #include <ulimit.h>
69645 long ulimit(int cmd, ...);
```

69646 **DESCRIPTION**

69647 The *ulimit()* function shall control process limits. The process limits that can be controlled by  
 69648 this function include the maximum size of a single file that can be written (this is equivalent to  
 69649 using *setrlimit()* with *RLIMIT\_FSIZE*). The *cmd* values, defined in **<ulimit.h>**, include:

69650 **UL\_GETFSIZE** Return the file size limit (*RLIMIT\_FSIZE*) of the process. The limit shall be in  
 69651 units of 512-byte blocks and shall be inherited by child processes. Files of any  
 69652 size can be read. The return value shall be the integer part of the soft file size  
 69653 limit divided by 512. If the result cannot be represented as a **long**, the result is  
 69654 unspecified.

69655 **UL\_SETFSIZE** Set the file size limit for output operations of the process to the value of the  
 69656 second argument, taken as a **long**, multiplied by 512. If the result would  
 69657 overflow an **rlim\_t**, the actual value set is unspecified. Any process may  
 69658 decrease its own limit, but only a process with appropriate privileges may  
 69659 increase the limit. The return value shall be the integer part of the new file size  
 69660 limit divided by 512.

69661 The *ulimit()* function shall not change the setting of *errno* if successful.

69662 As all return values are permissible in a successful situation, an application wishing to check for  
 69663 error situations should set *errno* to 0, then call *ulimit()*, and, if it returns  $-1$ , check to see if *errno* is  
 69664 non-zero.

69665 **RETURN VALUE**

69666 Upon successful completion, *ulimit()* shall return the value of the requested limit. Otherwise,  $-1$   
 69667 shall be returned and *errno* set to indicate the error.

69668 **ERRORS**

69669 The *ulimit()* function shall fail and the limit shall be unchanged if:

|       |          |                                                                                       |
|-------|----------|---------------------------------------------------------------------------------------|
| 69670 | [EINVAL] | The <i>cmd</i> argument is not valid.                                                 |
| 69671 | [EPERM]  | A process not having appropriate privileges attempts to increase its file size limit. |
| 69672 |          |                                                                                       |

69673 **EXAMPLES**

69674 None.

69675 **APPLICATION USAGE**

69676 Since the *ulimit()* function uses type **long** rather than **rlim\_t**, this function is not sufficient for file  
 69677 sizes on many current systems. Applications should use the *getrlimit()* or *setrlimit()* functions  
 69678 instead of the obsolescent *ulimit()* function.

69679 **RATIONALE**

69680 None.

69681 **FUTURE DIRECTIONS**

69682       The *ulimit()* function may be removed in a future version.

69683 **SEE ALSO**

69684       *exec*, *getrlimit()*, *write()*

69685       XBD <ulimit.h>

69686 **CHANGE HISTORY**

69687       First released in Issue 1. Derived from Issue 1 of the SVID.

69688 **Issue 5**

69689       In the description of UL\_SETFSIZE, the text is corrected to refer to **rlim\_t** rather than the  
69690       spurious **rlimit\_t**.

69691       The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

69692 **Issue 7**

69693       The *ulimit()* function is marked obsolescent.

**NAME**

umask — set and get the file mode creation mask

**SYNOPSIS**

```
#include <sys/stat.h>
```

```
mode_t umask(mode_t cmask);
```

**DESCRIPTION**

The *umask()* function shall set the file mode creation mask of the process to *cmask* and return the previous value of the mask. Only the file permission bits of *cmask* (see <sys/stat.h>) are used; the meaning of the other bits is implementation-defined.

The file mode creation mask of the process is used to turn off permission bits in the *mode* argument supplied during calls to the following functions:

- *open()*, *openat()*, *creat()*, *mkdir()*, *mkdirat()*, *mkfifo()*, and *mkfifoat()*
- *mknod()*, *mknodat()*
- *mq\_open()*
- *sem\_open()*

Bit positions that are set in *cmask* are cleared in the mode of the created file.

**RETURN VALUE**

The file permission bits in the value returned by *umask()* shall be the previous value of the file mode creation mask. The state of any other bits in that value is unspecified, except that a subsequent call to *umask()* with the returned value as *cmask* shall leave the state of the mask the same as its state before the first call, including any unspecified use of those bits.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

Unsigned argument and return types for *umask()* were proposed. The return type and the argument were both changed to **mode\_t**.

Historical implementations have made use of additional bits in *cmask* for their implementation-defined purposes. The addition of the text that the meaning of other bits of the field is implementation-defined permits these implementations to conform to this volume of POSIX.1-2008.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

XBD <sys/stat.h>, <sys/types.h>

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/143 is applied, adding the `mknod()`, `mq_open()`, and `sem_open()` functions to the DESCRIPTION and SEE ALSO sections.

69744 **NAME**69745        `uname` — get the name of the current system69746 **SYNOPSIS**69747        `#include <sys/utsname.h>`69748        `int uname(struct utsname *name);`69749 **DESCRIPTION**69750        The `uname()` function shall store information identifying the current system in the structure pointed to by `name`.69752        The `uname()` function uses the **utsname** structure defined in `<sys/utsname.h>`.69753        The `uname()` function shall return a string naming the current system in the character array `sysname`. Similarly, `nodename` shall contain the name of this node within an implementation-defined communications network. The arrays `release` and `version` shall further identify the operating system. The array `machine` shall contain a name that identifies the hardware that the system is running on.

69758        The format of each member is implementation-defined.

69759 **RETURN VALUE**69760        Upon successful completion, a non-negative value shall be returned. Otherwise, `-1` shall be returned and `errno` set to indicate the error.69762 **ERRORS**

69763        No errors are defined.

69764 **EXAMPLES**

69765        None.

69766 **APPLICATION USAGE**69767        The inclusion of the `nodename` member in this structure does not imply that it is sufficient information for interfacing to communications networks.69769 **RATIONALE**69770        The values of the structure members are not constrained to have any relation to the version of this volume of POSIX.1-2008 implemented in the operating system. An application should instead depend on `_POSIX_VERSION` and related constants defined in `<unistd.h>`.69773        This volume of POSIX.1-2008 does not define the sizes of the members of the structure and permits them to be of different sizes, although most implementations define them all to be the same size: eight bytes plus one byte for the string terminator. That size for `nodename` is not enough for use with many networks.69777        The `uname()` function originated in System III, System V, and related implementations, and it does not exist in Version 7 or 4.3 BSD. The values it returns are set at system compile time in those historical implementations.69780        4.3 BSD has `gethostname()` and `gethostid()`, which return a symbolic name and a numeric value, respectively. There are related `sethostname()` and `sethostid()` functions that are used to set the values the other two functions return. The former functions are included in this specification, the latter are not.69784 **FUTURE DIRECTIONS**

69785        None.

69786 **SEE ALSO**69787 XBD [<sys/utsname.h>](#)69788 **CHANGE HISTORY**

69789 First released in Issue 1. Derived from Issue 1 of the SVID.

69790 **NAME**

69791 ungetc — push byte back into input stream

69792 **SYNOPSIS**

69793 #include &lt;stdio.h&gt;

69794 int ungetc(int *c*, FILE \**stream*);69795 **DESCRIPTION**

69796 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
69797 conflict between the requirements described here and the ISO C standard is unintentional. This  
69798 volume of POSIX.1-2008 defers to the ISO C standard.

69799 The *ungetc()* function shall push the byte specified by *c* (converted to an **unsigned char**) back  
69800 onto the input stream pointed to by *stream*. The pushed-back bytes shall be returned by  
69801 subsequent reads on that stream in the reverse order of their pushing. A successful intervening  
69802 CX call (with the stream pointed to by *stream*) to a file-positioning function (*fseek()*, *fseeko()*,  
69803 CX *fsetpos()*, or *rewind()*) or *fflush()* shall discard any pushed-back bytes for the stream. The  
69804 external storage corresponding to the stream shall be unchanged.

69805 One byte of push-back shall be provided. If *ungetc()* is called too many times on the same stream  
69806 without an intervening read or file-positioning operation on that stream, the operation may fail.

69807 If the value of *c* equals that of the macro EOF, the operation shall fail and the input stream shall  
69808 be left unchanged.

69809 A successful call to *ungetc()* shall clear the end-of-file indicator for the stream. The value of the  
69810 file-position indicator for the stream after all pushed-back bytes have been read, or discarded by  
69811 CX calling *fseek()*, *fseeko()*, *fsetpos()*, or *rewind()* (but not *fflush()*), shall be the same as it was before  
69812 the bytes were pushed back. The file-position indicator is decremented by each successful call to  
69813 *ungetc()*; if its value was 0 before a call, its value is unspecified after the call.

69814 **RETURN VALUE**

69815 Upon successful completion, *ungetc()* shall return the byte pushed back after conversion.  
69816 Otherwise, it shall return EOF.

69817 **ERRORS**

69818 No errors are defined.

69819 **EXAMPLES**

69820 None.

69821 **APPLICATION USAGE**

69822 None.

69823 **RATIONALE**

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0687 [87,93], XSH/TC1-2008/0688 [87], and XSH/TC1-2008/0689 [14] are applied.

69835 **NAME**

69836 ungetwc — push wide-character code back into the input stream

69837 **SYNOPSIS**

69838 #include &lt;stdio.h&gt;

69839 #include &lt;wchar.h&gt;

69840 wint\_t ungetwc(wint\_t wc, FILE \*stream);

69841 **DESCRIPTION**

69842 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 69843 conflict between the requirements described here and the ISO C standard is unintentional. This  
 69844 volume of POSIX.1-2008 defers to the ISO C standard.

69845 The *ungetwc()* function shall push the character corresponding to the wide-character code  
 69846 specified by *wc* back onto the input stream pointed to by *stream*. The pushed-back characters  
 69847 shall be returned by subsequent reads on that stream in the reverse order of their pushing. A  
 69848 successful intervening call (with the stream pointed to by *stream*) to a file-positioning function  
 69849 CX (*fseek()*, *fseeko()*, *fsetpos()*, or *rewind()*) or *fflush()* shall discard any pushed-back characters for  
 69850 the stream. The external storage corresponding to the stream is unchanged.

69851 At least one character of push-back shall be provided. If *ungetwc()* is called too many times on  
 69852 the same stream without an intervening read or file-positioning operation on that stream, the  
 69853 operation may fail.

69854 If the value of *wc* equals that of the macro WEOF, the operation shall fail and the input stream  
 69855 shall be left unchanged.

69856 A successful call to *ungetwc()* shall clear the end-of-file indicator for the stream. The value of the  
 69857 file-position indicator for the stream after all pushed-back characters have been read, or  
 69858 CX discarded by calling *fseek()*, *fseeko()*, *fsetpos()*, or *rewind()* (but not *fflush()*), shall be the same as  
 69859 it was before the characters were pushed back. The file-position indicator is decremented (by  
 69860 one or more) by each successful call to *ungetwc()*; if its value was 0 before a call, its value is  
 69861 unspecified after the call.

69862 **RETURN VALUE**

69863 Upon successful completion, *ungetwc()* shall return the wide-character code corresponding to  
 69864 the pushed-back character. Otherwise, it shall return WEOF.

69865 **ERRORS**69866 The *ungetwc()* function may fail if:

69867 CX [EILSEQ] An invalid character sequence is detected, or a wide-character code does not  
 69868 correspond to a valid character.

## NAME

unlink, unlinkat — remove a directory entry

## SYNOPSIS

```
#include <unistd.h>
```

```
int unlink(const char *path);
```

```
#include <fcntl.h>
```

```
int unlinkat(int fd, const char *path, int flag);
```

## DESCRIPTION

The *unlink()* function shall remove a link to a file. If *path* names a symbolic link, *unlink()* shall remove the symbolic link named by *path* and shall not affect any file or directory named by the contents of the symbolic link. Otherwise, *unlink()* shall remove the link named by the pathname pointed to by *path* and shall decrement the link count of the file referenced by the link.

When the file's link count becomes 0 and no process has the file open, the space occupied by the file shall be freed and the file shall no longer be accessible. If one or more processes have the file open when the last link is removed, the link shall be removed before *unlink()* returns, but the removal of the file contents shall be postponed until all references to the file are closed.

The *path* argument shall not name a directory unless the process has appropriate privileges and the implementation supports using *unlink()* on directories.

Upon successful completion, *unlink()* shall mark for update the last data modification and last file status change timestamps of the parent directory. Also, if the file's link count is not 0, the last file status change timestamp of the file shall be marked for update.

The *unlinkat()* function shall be equivalent to the *unlink()* or *rmdir()* function except in the case where *path* specifies a relative path. In this case the directory entry to be removed is determined relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the access mode of the open file description associated with the file descriptor is not O\_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the access mode is O\_SEARCH, the function shall not perform the check.

Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in <fcntl.h>:

AT\_REMOVEDIR

Remove the directory entry specified by *fd* and *path* as a directory, not a normal file.

If *unlinkat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working directory shall be used and the behavior shall be identical to a call to *unlink()* or *rmdir()* respectively, depending on whether or not the AT\_REMOVEDIR bit is set in *flag*.

## RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return -1 and set *errno* to indicate the error. If -1 is returned, the named file shall not be changed.

## ERRORS

These functions shall fail and shall not unlink the file if:

[EACCES] Search permission is denied for a component of the path prefix, or write permission is denied on the directory containing the directory entry to be removed.

|       |                         |                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 69972 | [ENAMETOOLONG]          |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 69973 |                         | The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.                                                                                                                                                                                                                                                     |
| 69974 |                         |                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 69975 |                         |                                                                                                                                                                                                                                                                                                                                                                                                                   |

69976 [ETXTBSY] The entry to be unlinked is the last directory entry to a pure procedure (shared  
69977 text) file that is being executed.

69978 The *unlinkat()* function may fail if:

69979 [EINVAL] The value of the *flag* argument is not valid.

## 69980 EXAMPLES

### 69981 Removing a Link to a File

69982 The following example shows how to remove a link to a file named */home/cnd/mod1* by  
69983 removing the entry named */modules/pass1*.

```
69984 #include <unistd.h>
69985 char *path = "/modules/pass1";
69986 int status;
69987 ...
69988 status = unlink(path);
```

### 69989 Checking for an Error

69990 The following example fragment creates a temporary password lock file named **LOCKFILE**,  
69991 which is defined as */etc/ptmp*, and gets a file descriptor for it. If the file cannot be opened for  
69992 writing, *unlink()* is used to remove the link between the file descriptor and **LOCKFILE**.

```
69993 #include <sys/types.h>
69994 #include <stdio.h>
69995 #include <fcntl.h>
69996 #include <errno.h>
69997 #include <unistd.h>
69998 #include <sys/stat.h>
69999 #define LOCKFILE "/etc/ptmp"
70000 int pfd; /* Integer for file descriptor returned by open call. */
70001 FILE *fpfd; /* File pointer for use in putpwent(). */
70002 ...
70003 /* Open password Lock file. If it exists, this is an error. */
70004 if ((pfd = open(LOCKFILE, O_WRONLY| O_CREAT | O_EXCL, S_IRUSR
70005 | S_IWUSR | S_IRGRP | S_IROTH)) == -1) {
70006     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
70007     exit(1);
70008 }
70009 /* Lock file created; proceed with fdopen of lock file so that
70010 putpwent() can be used.
70011 */
70012 if ((fpfd = fdopen(pfd, "w")) == NULL) {
70013     close(pfd);
70014     unlink(LOCKFILE);
70015     exit(1);
70016 }
```

## Replacing Files

The following example fragment uses *unlink()* to discard links to files, so that they can be replaced with new versions of the files. The first call removes the link to **LOCKFILE** if an error occurs. Successive calls remove the links to **SAVEFILE** and **PASSWDFILE** so that new links can be created, then removes the link to **LOCKFILE** when it is no longer needed.

```
#include <sys/types.h>
#include <stdio.h>
#include <fcntl.h>
#include <errno.h>
#include <unistd.h>
#include <sys/stat.h>

#define LOCKFILE "/etc/ptmp"
#define PASSWDFILE "/etc/passwd"
#define SAVEFILE "/etc/opasswd"
...
/* If no change was made, assume error and leave passwd unchanged. */
if (!valid_change) {
    fprintf(stderr, "Could not change password for user %s\n", user);
    unlink(LOCKFILE);
    exit(1);
}

/* Change permissions on new password file. */
chmod(LOCKFILE, S_IRUSR | S_IRGRP | S_IROTH);

/* Remove saved password file. */
unlink(SAVEFILE);

/* Save current password file. */
link(PASSWDFILE, SAVEFILE);

/* Remove current password file. */
unlink(PASSWDFILE);

/* Save new password file as current password file. */
link(LOCKFILE, PASSWDFILE);

/* Remove lock file. */
unlink(LOCKFILE);

exit(0);
```

## APPLICATION USAGE

Applications should use *rmdir()* to remove a directory.

## RATIONALE

Unlinking a directory is restricted to the superuser in many historical implementations for reasons given in *link()* (see also *rename()*).

The meaning of [EBUSY] in historical implementations is “mount point busy”. Since this volume of POSIX.1-2008 does not cover the system administration concepts of mounting and unmounting, the description of the error was changed to “resource busy”. (This meaning is used by some device drivers when a second process tries to open an exclusive use device.) The wording is also intended to allow implementations to refuse to remove a directory if it is the root or current working directory of any process.

70062 The standard developers reviewed TR 24715-2006 and noted that LSB-conforming  
70063 implementations may return [EISDIR] instead of [EPERM] when unlinking a directory. A change  
70064 to permit this behavior by changing the requirement for [EPERM] to [EPERM] or [EISDIR] was  
70065 considered, but decided against since it would break existing strictly conforming and  
70066 conforming applications. Applications written for portability to both POSIX.1-2008 and the LSB  
70067 should be prepared to handle either error code.

70068 The purpose of the *unlinkat()* function is to remove directory entries in directories other than the  
70069 current working directory without exposure to race conditions. Any part of the path of a file  
70070 could be changed in parallel to a call to *unlink()*, resulting in unspecified behavior. By opening a  
70071 file descriptor for the target directory and using the *unlinkat()* function it can be guaranteed that  
70072 the removed directory entry is located relative to the desired directory.

#### 70073 FUTURE DIRECTIONS

70074 None.

#### 70075 SEE ALSO

70076 *close()*, *link()*, *remove()*, *rename()*, *rmdir()*, *symlink()*

70077 XBD Section 4.3 (on page 108), *<fcntl.h>*, *<unistd.h>*

#### 70078 CHANGE HISTORY

70079 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 70080 Issue 5

70081 The [EBUSY] error is added to the optional part of the ERRORS section.

#### 70082 Issue 6

70083 The following new requirements on POSIX implementations derive from alignment with the  
70084 Single UNIX Specification:

- 70085 • In the DESCRIPTION, the effect is specified if *path* specifies a symbolic link.
- 70086 • The [ELOOP] mandatory error condition is added.
- 70087 • A second [ENAMETOOLONG] is added as an optional error condition.
- 70088 • The [ETXTBSY] optional error condition is added.

70089 The following changes were made to align with the IEEE P1003.1a draft standard:

- 70090 • The [ELOOP] optional error condition is added.

70091 The normative text is updated to avoid use of the term “must” for application requirements.

#### 70092 Issue 7

70093 Austin Group Interpretation 1003.1-2001 #143 is applied.

70094 Austin Group Interpretation 1003.1-2001 #181 is applied, updating the requirements for  
70095 operations when the S\_ISVTX bit is set.

70096 Text arising from the LSB Conflicts TR is added to the RATIONALE about the use of [EPERM]  
70097 and [EISDIR].

70098 The *unlinkat()* function is added from The Open Group Technical Standard, 2006, Extended API  
70099 Set Part 2.

70100 Changes are made related to support for finegrained timestamps.

70101 Changes are made to allow a directory to be opened for searching.

70102 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
70103 pathname exists but is not a directory or a symbolic link to a directory.  
70104 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0693 [461], XSH/TC1-2008/0694 [324],  
70105 XSH/TC1-2008/0695 [278], and XSH/TC1-2008/0696 [278] are applied.

70106 **NAME**

70107 unlockpt — unlock a pseudo-terminal master/slave pair

70108 **SYNOPSIS**

```
70109 XSI #include <stdlib.h>  
70110 int unlockpt(int fildes);
```

70111 **DESCRIPTION**

70112 The *unlockpt()* function shall unlock the slave pseudo-terminal device associated with the master  
70113 to which *fildes* refers.

70114 Conforming applications shall ensure that they call *unlockpt()* before opening the slave side of a  
70115 pseudo-terminal device.

70116 **RETURN VALUE**

70117 Upon successful completion, *unlockpt()* shall return 0. Otherwise, it shall return -1 and set *errno*  
70118 to indicate the error.

70119 **ERRORS**

70120 The *unlockpt()* function may fail if:

70121 [EBADF] The *fildes* argument is not a file descriptor open for writing.

70122 [EINVAL] The *fildes* argument is not associated with a master pseudo-terminal device.

70123 **EXAMPLES**

70124 None.

70125 **APPLICATION USAGE**

70126 None.

70127 **RATIONALE**

70128 See the RATIONALE section for *posix\_openpt()*.

70129 **FUTURE DIRECTIONS**

70134 **CHANGE HISTORY**

70135 First released in Issue 4, Version 2.

70136 **Issue 5**

70137 Moved from X/OPEN UNIX extension to BASE.

70138 **Issue 6**

70139 The normative text is updated to avoid use of the term “must” for application requirements.

70140 **Issue 7**

70141 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0697 [96] is applied.

70142 **NAME**

70143       unsetenv — remove an environment variable

70144 **SYNOPSIS**

```
70145 CX      #include <stdlib.h>
70146      int unsetenv(const char *name);
```

70147 **DESCRIPTION**

70148       The *unsetenv()* function shall remove an environment variable from the environment of the  
 70149       calling process. The *name* argument points to a string, which is the name of the variable to be  
 70150       removed. The named argument shall not contain an '=' character. If the named variable does  
 70151       not exist in the current environment, the environment shall be unchanged and the function is  
 70152       considered to have completed successfully.

70153       The *unsetenv()* function shall update the list of pointers to which *environ* points.

70154       The *unsetenv()* function need not be thread-safe.

70155 **RETURN VALUE**

70156       Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to  
 70157       indicate the error, and the environment shall be unchanged.

70158 **ERRORS**

70159       The *unsetenv()* function shall fail if:

|       |          |                                                                                      |
|-------|----------|--------------------------------------------------------------------------------------|
| 70160 | [EINVAL] | The <i>name</i> argument points to an empty string, or points to a string containing |
| 70161 |          | an '=' character.                                                                    |

70162 **EXAMPLES**

70163       None.

70164 **APPLICATION USAGE**

70165       None.

70166 **RATIONALE**

70167       Refer to the RATIONALE section in *setenv()*.

70168 **FUTURE DIRECTIONS**

70169       None.

70172       XBD *<stdlib.h>*, *<sys/types.h>*

70173 **CHANGE HISTORY**

70174       First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

70175 **Issue 7**

70176       Austin Group Interpretation 1003.1-2001 #156 is applied.

70177       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0698 [167] and XSH/TC1-2008/0699  
 70178       [185] are applied.

**NAME**

uselocale — use locale in current thread

**SYNOPSIS**

```
CX      #include <locale.h>
       locale_t uselocale(locale_t newloc);
```

**DESCRIPTION**

The *uselocale()* function shall set or query the current locale for the calling thread.

The value for the *newloc* argument shall be one of the following:

1. A value returned by the *newlocale()* or *duplocale()* functions
2. The special locale object descriptor `LC_GLOBAL_LOCALE`
3. `(locale_t)0`

If the *newloc* argument is `(locale_t)0`, the current locale shall not be changed; this value can be used to query the current locale setting. If the *newloc* argument is `LC_GLOBAL_LOCALE`, any thread-local locale for the calling thread shall be uninstalled; the thread shall again use the global locale as the current locale, and changes to the global locale shall affect the thread. Otherwise, the locale represented by *newloc* shall be installed as a thread-local locale to be used as the current locale for the calling thread.

Once the *uselocale()* function has been called to install a thread-local locale, the behavior of every interface using data from the current locale shall be affected for the calling thread. The current locale for other threads shall remain unchanged.

**RETURN VALUE**

Upon successful completion, the *uselocale()* function shall return a handle for the thread-local locale that was in use as the current locale for the calling thread on entry to the function, or `LC_GLOBAL_LOCALE` if no thread-local locale was in use. Otherwise, *uselocale()* shall return `(locale_t)0` and set *errno* to indicate the error.

**ERRORS**

The *uselocale()* function may fail if:

[EINVAL] *newloc* is not a valid locale object and is not `(locale_t)0`.

**EXAMPLES**

None.

**APPLICATION USAGE**

Unlike the *setlocale()* function, the *uselocale()* function does not allow replacing some locale categories only. Applications that need to install a locale which differs only in a few categories must use *newlocale()* to change a locale object equivalent to the currently used locale and install it.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

70218 **SEE ALSO**70219 *duplocale(), freelocale(), newlocale(), setlocale()*

70220 XBD &lt;locale.h&gt;

70221 **CHANGE HISTORY**

70222 First released in Issue 7.

70223 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0700 [290] and XSH/TC1-2008/0701  
70224 [334] are applied.

## NAME

utime — set file access and modification times

## SYNOPSIS

```
#include <utime.h>

int utime(const char *path, const struct utimbuf *times);
```

## DESCRIPTION

The *utime()* function shall set the access and modification times of the file named by the *path* argument.

If *times* is a null pointer, the access and modification times of the file shall be set to the current time. The effective user ID of the process shall match the owner of the file, or the process has write permission to the file or has appropriate privileges, to use *utime()* in this manner.

If *times* is not a null pointer, *times* shall be interpreted as a pointer to a **utimbuf** structure and the access and modification times shall be set to the values contained in the designated structure. Only a process with the effective user ID equal to the user ID of the file or a process with appropriate privileges may use *utime()* this way.

The **utimbuf** structure is defined in the **<utime.h>** header. The times in the structure **utimbuf** are measured in seconds since the Epoch.

Upon successful completion, the *utime()* function shall mark the last file status change timestamp for update; see **<sys/stat.h>**.

## RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* shall be set to indicate the error, and the file times shall not be affected.

## ERRORS

The *utime()* function shall fail if:

[EACCES] Search permission is denied by a component of the path prefix; or the *times* argument is a null pointer and the effective user ID of the process does not match the owner of the file, the process does not have write permission for the file, and the process does not have appropriate privileges.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG] The length of a component of a pathname is longer than {NAME\_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the *path* argument contains at least one non-**<slash>** character and ends with one or more trailing **<slash>** characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

[EPERM] The *times* argument is not a null pointer and the effective user ID of the calling process does not match the owner of the file and the calling process does not have appropriate privileges.

70266 [EROFS] The file system containing the file is read-only.  
 70267 The *utime()* function may fail if:  
 70268 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 70269 resolution of the *path* argument.  
 70270 [ENAMETOOLONG]  
 70271 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 70272 symbolic link produced an intermediate result with a length that exceeds  
 70273 {PATH\_MAX}.

**EXAMPLES**

70274 None.  
 70275

**APPLICATION USAGE**

70276 Since the **utimbuf** structure only contains **time\_t** variables and is not accurate to fractions of a  
 70277 second, applications should use the *utimensat()* function instead of the obsolescent *utime()*  
 70278 function.  
 70279

**RATIONALE**

70280 The *actime* structure member must be present so that an application may set it, even though an  
 70281 implementation may ignore it and not change the last data access timestamp on the file. If an  
 70282 application intends to leave one of the times of a file unchanged while changing the other, it  
 70283 should use *stat()* or *fstat()* to retrieve the file's *st\_atim* and *st\_mtim* parameters, set *actime* and  
 70284 *modtime* in the buffer, and change one of them before making the *utime()* call.  
 70285

**FUTURE DIRECTIONS**

70286 The *utime()* function may be removed in a future version.  
 70287

**SEE ALSO**

70288 *fstat()*, *fstatat()*, *futimens()*  
 70289 XBD <sys/stat.h>, <utime.h>  
 70290

**CHANGE HISTORY**

70291 First released in Issue 1. Derived from Issue 1 of the SVID.  
 70292

**Issue 6**

70293 The following new requirements on POSIX implementations derive from alignment with the  
 70294 Single UNIX Specification:  
 70295

- 70296 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
 70297 required for conforming implementations of previous POSIX specifications, it was not  
 70298 required for UNIX applications.
- 70299 • The [ELOOP] mandatory error condition is added.
- 70300 • A second [ENAMETOOLONG] is added as an optional error condition.

70301 The following changes were made to align with the IEEE P1003.1a draft standard:

- 70302 • The [ELOOP] optional error condition is added.

70303 The normative text is updated to avoid use of the term “must” for application requirements.

**Issue 7**

70304 Austin Group Interpretation 1003.1-2001 #143 is applied.  
 70305

70306 The *utime()* function is marked obsolescent.

70307 Changes are made related to support for finegrained timestamps.

70308

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0702 [324] is applied.

70309 **NAME**

70310 utimensat, utimes — set file access and modification times |

70311 **SYNOPSIS**

70312 #include &lt;sys/stat.h&gt;

70313 int utimensat(int *fd*, const char \**path*, const struct timespec *times*[2],  
70314 int *flag*);

70315 XSI #include &lt;sys/time.h&gt;

70316 int utimes(const char \**path*, const struct timeval *times*[2]);70317 **DESCRIPTION**70318 Refer to *futimens()*.

**va\_arg()**70319 **NAME**

70320       va\_arg, va\_copy, va\_end, va\_start — handle variable argument list

70321 **SYNOPSIS**

70322       #include &lt;stdarg.h&gt;

70323       type va\_arg(va\_list ap, type);

70324       void va\_copy(va\_list dest, va\_list src);

70325       void va\_end(va\_list ap);

70326       void va\_start(va\_list ap, argN);

70327 **DESCRIPTION**

70328       Refer to XBD &lt;stdarg.h&gt;

70329 **NAME**70330 `vdprintf`, `vfprintf`, `vprintf`, `vsprintf`, `vsnprintf` — format output of a stdarg argument list70331 **SYNOPSIS**70332 `#include <stdarg.h>`70333 `#include <stdio.h>`

```

70334 CX int vdprintf(int fildes, const char *restrict format, va_list ap);
70335 int vfprintf(FILE *restrict stream, const char *restrict format,
70336 va_list ap);
70337 int vprintf(const char *restrict format, va_list ap);
70338 int vsnprintf(char *restrict s, size_t n, const char *restrict format,
70339 va_list ap);
70340 int vsprintf(char *restrict s, const char *restrict format, va_list ap);

```

70341 **DESCRIPTION**

70342 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 70343 conflict between the requirements described here and the ISO C standard is unintentional. This  
 70344 volume of POSIX.1-2008 defers to the ISO C standard.

70345 CX The `vdprintf()`, `vfprintf()`, `vprintf()`, `vsnprintf()`, and `vsprintf()` functions shall be equivalent to the  
 70346 CX `dprintf()`, `fprintf()`, `printf()`, `snprintf()`, and `sprintf()` functions respectively, except that instead of  
 70347 being called with a variable number of arguments, they are called with an argument list as  
 70348 defined by `<stdarg.h>`.

70349 These functions shall not invoke the `va_end` macro. As these functions invoke the `va_arg` macro,  
 70350 the value of `ap` after the return is unspecified.

70351 **RETURN VALUE**70352 Refer to `fprintf()`.70353 **ERRORS**70354 Refer to `fprintf()`.70355 **EXAMPLES**

70356 None.

70357 **APPLICATION USAGE**70358 Applications using these functions should call `va_end(ap)` afterwards to clean up.70359 **RATIONALE**

70360 None.

70361 **FUTURE DIRECTIONS**

70362 None.

70363 **SEE ALSO**70364 [Section 2.5](#) (on page 495), `fprintf()`70365 XBD `<stdarg.h>`, `<stdio.h>`70366 **CHANGE HISTORY**

70367 First released in Issue 1. Derived from Issue 1 of the SVID.

70368 **Issue 5**70369 The `vsnprintf()` function is added.

70370 **Issue 6**

70371 The *vfprintf()*, *vprintf()*, *vsprintf()*, and *vsprintf()* functions are updated for alignment with the  
70372 ISO/IEC 9899:1999 standard.

70373 **Issue 7**

70374 The *vdprintf()* function is added to complement the *dprintf()* function from The Open Group  
70375 Technical Standard, 2006, Extended API Set Part 1.

70376 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0703 [14] is applied.

**NAME**

vfscanf, vscanf, vsscanf — format input of a stdarg argument list

**SYNOPSIS**

```
#include <stdarg.h>
#include <stdio.h>

int vfscanf(FILE *restrict stream, const char *restrict format,
            va_list arg);
int vscanf(const char *restrict format, va_list arg);
int vsscanf(const char *restrict s, const char *restrict format,
            va_list arg);
```

**DESCRIPTION**

**CX** The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *vscanf()*, *vfscanf()*, and *vsscanf()* functions shall be equivalent to the *scanf()*, *fscanf()*, and *sscanf()* functions, respectively, except that instead of being called with a variable number of arguments, they are called with an argument list as defined in the **<stdarg.h>** header. These functions shall not invoke the *va\_end* macro. As these functions invoke the *va\_arg* macro, the value of *ap* after the return is unspecified.

**RETURN VALUE**

Refer to *fscanf()*.

**ERRORS**

Refer to *fscanf()*.

**EXAMPLES**

None.

**APPLICATION USAGE**

Applications using these functions should call *va\_end(ap)* afterwards to clean up.

**RATIONALE**

None.

70568       int vwscanf(const wchar\_t \*restrict *format*, va\_list *arg*);70569 **DESCRIPTION**70570       Refer to *vwscanf()*.

**NAME**

wait, waitpid — wait for a child process to stop or terminate

**SYNOPSIS**

```
#include <sys/wait.h>
```

```
pid_t wait(int *stat_loc);
```

```
pid_t waitpid(pid_t pid, int *stat_loc, int options);
```

**DESCRIPTION**

The *wait()* and *waitpid()* functions shall obtain status information (see [Section 2.13](#), on page 548) pertaining to one of the caller's child processes. The *wait()* function obtains status information for process termination from any child process. The *waitpid()* function obtains status information for process termination, and optionally process stop and/or continue, from a specified subset of the child processes.

The *wait()* function shall cause the calling thread to become blocked until status information generated by child process termination is made available to the thread, or until delivery of a signal whose action is either to execute a signal-catching function or to terminate the process, or an error occurs. If termination status information is available prior to the call to *wait()*, return shall be immediate. If termination status information is available for two or more child processes, the order in which their status is reported is unspecified.

As described in [Section 2.13](#) (on page 548), the *wait()* and *waitpid()* functions consume the status information they obtain.

The behavior when multiple threads are blocked in *wait()*, *waitid()*, or *waitpid()* is described in [Section 2.13](#) (on page 548).

The *waitpid()* function shall be equivalent to *wait()* if the *pid* argument is **(pid\_t)−1** and the *options* argument is 0. Otherwise, its behavior shall be modified by the values of the *pid* and *options* arguments.

The *pid* argument specifies a set of child processes for which *status* is requested. The *waitpid()* function shall only return the status of a child process from this set:

- If *pid* is equal to **(pid\_t)−1**, *status* is requested for any child process. In this respect, *waitpid()* is then equivalent to *wait()*.
- If *pid* is greater than 0, it specifies the process ID of a single child process for which *status* is requested.
- If *pid* is 0, *status* is requested for any child process whose process group ID is equal to that of the calling process.
- If *pid* is less than **(pid\_t)−1**, *status* is requested for any child process whose process group ID is equal to the absolute value of *pid*.

The *options* argument is constructed from the bitwise-inclusive OR of zero or more of the following flags, defined in the **<sys/wait.h>** header:

XSI **WCONTINUED** The *waitpid()* function shall report the status of any continued child process specified by *pid* whose status has not been reported since it continued from a job control stop.

**WNOHANG** The *waitpid()* function shall not suspend execution of the calling thread if *status* is not immediately available for one of the child processes specified by *pid*.

70614 WUNTRACED The status of any child processes specified by *pid* that are stopped, and whose  
 70615 status has not yet been reported since they stopped, shall also be reported to  
 70616 the requesting process.

70617 If *wait()* or *waitpid()* return because the status of a child process is available, these functions -  
 70618 shall return a value equal to the process ID of the child process. In this case, if the value of the  
 70619 argument *stat\_loc* is not a null pointer, information shall be stored in the location pointed to by  
 70620 *stat\_loc*. The value stored at the location pointed to by *stat\_loc* shall be 0 if and only if the status  
 70621 returned is from a terminated child process that terminated by one of the following means:

- 70622 1. The process returned 0 from *main()*.
- 70623 2. The process called *\_exit()* or *exit()* with a *status* argument of 0.
- 70624 3. The process was terminated because the last thread in the process terminated.

70625 Regardless of its value, this information may be interpreted using the following macros, which  
 70626 are defined in **<sys/wait.h>** and evaluate to integral expressions; the *stat\_val* argument is the  
 70627 integer value pointed to by *stat\_loc*.

70628 WIFEXITED(*stat\_val*)  
 70629 Evaluates to a non-zero value if *status* was returned for a child process that terminated  
 70630 normally.

70631 WEXITSTATUS(*stat\_val*)  
 70632 If the value of WIFEXITED(*stat\_val*) is non-zero, this macro evaluates to the low-order 8 bits  
 70633 of the *status* argument that the child process passed to *\_exit()* or *exit()*, or the value the child  
 70634 process returned from *main()*.

70635 WIFSIGNALED(*stat\_val*)  
 70636 Evaluates to a non-zero value if *status* was returned for a child process that terminated due  
 70637 to the receipt of a signal that was not caught (see **<signal.h>**).

70638 WTERMSIG(*stat\_val*)  
 70639 If the value of WIFSIGNALED(*stat\_val*) is non-zero, this macro evaluates to the number of  
 70640 the signal that caused the termination of the child process.

70641 WIFSTOPPED(*stat\_val*)  
 70642 Evaluates to a non-zero value if *status* was returned for a child process that is currently  
 70643 stopped.

70644 WSTOPSIG(*stat\_val*)  
 70645 If the value of WIFSTOPPED(*stat\_val*) is non-zero, this macro evaluates to the number of the  
 70646 signal that caused the child process to stop.

70647 XSI WIFCONTINUED(*stat\_val*)  
 70648 Evaluates to a non-zero value if *status* was returned for a child process that has continued  
 70649 from a job control stop.

70650 SPN It is unspecified whether the *status* value returned by calls to *wait()* or *waitpid()* for processes  
 70651 created by *posix\_spawn()* or *posix\_spawnnp()* can indicate a WIFSTOPPED(*stat\_val*) before  
 70652 subsequent calls to *wait()* or *waitpid()* indicate WIFEXITED(*stat\_val*) as the result of an error  
 70653 detected before the new process image starts executing.

70654 It is unspecified whether the *status* value returned by calls to *wait()* or *waitpid()* for processes  
 70655 created by *posix\_spawn()* or *posix\_spawnnp()* can indicate a WIFSIGNALED(*stat\_val*) if a signal is  
 70656 sent to the parent's process group after *posix\_spawn()* or *posix\_spawnnp()* is called.

70657 If the information pointed to by *stat\_loc* was stored by a call to *waitpid()* that specified the

70658 XSI WUNTRACED flag and did not specify the WCONTINUED flag, exactly one of the macros |  
 70659 WIFEXITED(\*stat\_loc), WIFSIGNALED(\*stat\_loc), and WIFSTOPPED(\*stat\_loc) shall evaluate to a |  
 70660 non-zero value.

70661 XSI If the information pointed to by *stat\_loc* was stored by a call to *waitpid()* that specified the |  
 70662 WUNTRACED and WCONTINUED flags, exactly one of the macros WIFEXITED(\*stat\_loc), |  
 70663 WIFSIGNALED(\*stat\_loc), WIFSTOPPED(\*stat\_loc), and WIFCONTINUED(\*stat\_loc) shall |  
 70664 evaluate to a non-zero value. -

70665 If the information pointed to by *stat\_loc* was stored by a call to *waitpid()* that did not specify the |  
 70666 XSI WUNTRACED or WCONTINUED flags, or by a call to the *wait()* function, exactly one of the |  
 70667 macros WIFEXITED(\*stat\_loc) and WIFSIGNALED(\*stat\_loc) shall evaluate to a non-zero value.

70668 XSI If the information pointed to by *stat\_loc* was stored by a call to *waitpid()* that did not specify the |  
 70669 WUNTRACED flag and specified the WCONTINUED flag, exactly one of the macros |  
 70670 WIFEXITED(\*stat\_loc), WIFSIGNALED(\*stat\_loc), and WIFCONTINUED(\*stat\_loc) shall evaluate |  
 70671 to a non-zero value.

70672 If `_POSIX_REALTIME_SIGNALS` is defined, and the implementation queues the SIGCHLD |  
 70673 signal, then if *wait()* or *waitpid()* returns because the status of a child process is available, any |  
 70674 pending SIGCHLD signal associated with the process ID of the child process shall be discarded. |  
 70675 Any other pending SIGCHLD signals shall remain pending.

70676 Otherwise, if SIGCHLD is blocked, if *wait()* or *waitpid()* return because the status of a child |  
 70677 process is available, any pending SIGCHLD signal shall be cleared unless the status of another |  
 70678 child process is available.

70679 For all other conditions, it is unspecified whether child *status* will be available when a SIGCHLD |  
 70680 signal is delivered.

70681 There may be additional implementation-defined circumstances under which *wait()* or *waitpid()* |  
 70682 report *status*. This shall not occur unless the calling process or one of its child processes |  
 70683 explicitly makes use of a non-standard extension. In these cases the interpretation of the |  
 70684 reported *status* is implementation-defined.

70685 If a parent process terminates without waiting for all of its child processes to terminate, the |  
 70686 remaining child processes shall be assigned a new parent process ID corresponding to an |  
 70687 implementation-defined system process.

## 70688 RETURN VALUE

70689 If *wait()* or *waitpid()* returns because the status of a child process is available, these functions |  
 70690 shall return a value equal to the process ID of the child process for which *status* is reported. If |  
 70691 *wait()* or *waitpid()* returns due to the delivery of a signal to the calling process, -1 shall be |  
 70692 returned and *errno* set to [EINTR]. If *waitpid()* was invoked with WNOHANG set in *options*, it |  
 70693 has at least one child process specified by *pid* for which *status* is not available, and *status* is not |  
 70694 available for any process specified by *pid*, 0 is returned. Otherwise, -1 shall be returned, and |  
 70695 *errno* set to indicate the error.

## 70696 ERRORS

70697 The *wait()* function shall fail if:

70698 [ECHILD] The calling process has no existing unwaited-for child processes.

70699 [EINTR] The function was interrupted by a signal. The value of the location pointed to |  
 70700 by *stat\_loc* is undefined.

70701 The *waitpid()* function shall fail if:

|       |          |                                                                                                                                                                                                                                      |
|-------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 70702 | [ECHILD] | The process specified by <i>pid</i> does not exist or is not a child of the calling process, or the process group specified by <i>pid</i> does not exist or does not have any member process that is a child of the calling process. |
| 70703 |          |                                                                                                                                                                                                                                      |
| 70704 |          |                                                                                                                                                                                                                                      |
| 70705 | [EINTR]  | The function was interrupted by a signal. The value of the location pointed to by <i>stat_loc</i> is undefined.                                                                                                                      |
| 70706 |          |                                                                                                                                                                                                                                      |
| 70707 | [EINVAL] | The <i>options</i> argument is not valid.                                                                                                                                                                                            |

## 70708 EXAMPLES

### 70709 Waiting for a Child Process and then Checking its Status

70710 The following example demonstrates the use of *waitpid()*, *fork()*, and the macros used to  
 70711 interpret the status value returned by *waitpid()* (and *wait()*). The code segment creates a child  
 70712 process which does some unspecified work. Meanwhile the parent loops performing calls to  
 70713 *waitpid()* to monitor the status of the child. The loop terminates when child termination is  
 70714 detected.

```

70715 #include <stdio.h>
70716 #include <stdlib.h>
70717 #include <unistd.h>
70718 #include <sys/wait.h>
70719 ...
70720 pid_t child_pid, wpid;
70721 int status;
70722
70723 child_pid = fork();
70724 if (child_pid == -1) {          /* fork() failed */
70725     perror("fork");
70726     exit(EXIT_FAILURE);
70727 }
70728 if (child_pid == 0) {          /* This is the child */
70729     /* Child does some work and then terminates */
70730     ...
70731 } else {                        /* This is the parent */
70732     do {
70733         wpid = waitpid(child_pid, &status, WUNTRACED
70734 #ifdef WCONTINUED          /* Not all implementations support this */
70735         | WCONTINUED
70736 #endif
70737         );
70738         if (wpid == -1) {
70739             perror("waitpid");
70740             exit(EXIT_FAILURE);
70741         }
70742         if (WIFEXITED(status)) {
70743             printf("child exited, status=%d\n", WEXITSTATUS(status));
70744         } else if (WIFSIGNALED(status)) {
70745             printf("child killed (signal %d)\n", WTERMSIG(status));
70746         } else if (WIFSTOPPED(status)) {
70747             printf("child stopped (signal %d)\n", WSTOPSIG(status));

```

```

70747 #ifndef WIFCONTINUED      /* Not all implementations support this */
70748     } else if (WIFCONTINUED(status)) {
70749         printf("child continued\n");
70750 #endif
70751     } else {      /* Non-standard case -- may never happen */
70752         printf("Unexpected status (0x%x)\n", status);
70753     }
70754     } while (!WIFEXITED(status) && !WIFSIGNALED(status));
70755 }

```

### Waiting for a Child Process in a Signal Handler for SIGCHLD

The following example demonstrates how to use *waitpid()* in a signal handler for SIGCHLD without passing -1 as the *pid* argument. (See the APPLICATION USAGE section below for the reasons why passing a *pid* of -1 is not recommended.) The method used here relies on the standard behavior of *waitpid()* when SIGCHLD is blocked. On historical non-conforming systems, the status of some child processes might not be reported.

```

70762 #include <stdlib.h>
70763 #include <stdio.h>
70764 #include <signal.h>
70765 #include <sys/types.h>
70766 #include <sys/wait.h>
70767 #include <unistd.h>
70768
70769 #define CHILDREN 10
70770
70771 static void
70772 handle_sigchld(int signum, siginfo_t *sinfo, void *unused)
70773 {
70774     int sav_errno = errno;
70775     int status;
70776
70777     /*
70778      * Obtain status information for the child which
70779      * caused the SIGCHLD signal and write its exit code
70780      * to stdout.
70781      */
70782     if (sinfo->si_code != CLD_EXITED)
70783     {
70784         static char msg[] = "wrong si_code\n";
70785         write(2, msg, sizeof msg - 1);
70786     }
70787     else if (waitpid(sinfo->si_pid, &status, 0) == -1)
70788     {
70789         static char msg[] = "waitpid() failed\n";
70790         write(2, msg, sizeof msg - 1);
70791     }
70792     else if (!WIFEXITED(status))
70793     {
70794         static char msg[] = "WIFEXITED was false\n";
70795         write(2, msg, sizeof msg - 1);
70796     }
70797     else

```

```

70795     {
70796         int code = WEXITSTATUS(status);
70797         char buf[2];
70798         buf[0] = '0' + code;
70799         buf[1] = '\n';
70800         write(1, buf, 2);
70801     }
70802     errno = sav_errno;
70803 }
70804
70805 int
70806 main(void)
70807 {
70808     int i;
70809     pid_t pid;
70810     struct sigaction sa;
70811
70812     sa.sa_flags = SA_SIGINFO;
70813     sa.sa_sigaction = handle_sigchld;
70814     sigemptyset(&sa.sa_mask);
70815     if (sigaction(SIGCHLD, &sa, NULL) == -1)
70816     {
70817         perror("sigaction");
70818         exit(EXIT_FAILURE);
70819     }
70820
70821     for (i = 0; i < CHILDREN; i++)
70822     {
70823         switch (pid = fork())
70824         {
70825             case -1:
70826                 perror("fork");
70827                 exit(EXIT_FAILURE);
70828             case 0:
70829                 sleep(2);
70830                 _exit(i);
70831         }
70832     }
70833
70834     /* Wait for all the SIGCHLD signals, then terminate on SIGALRM */
70835     alarm(3);
70836     for (;;)
70837         pause();
70838
70839     return 0; /* NOTREACHED */
70840 }

```

## APPLICATION USAGE

Calls to *wait()* will collect information about any child process. This may result in interactions with other interfaces that may be waiting for their own children (such as by use of *system()*). For this and other reasons it is recommended that portable applications not use *wait()*, but instead use *waitpid()*. For these same reasons, the use of *waitpid()* with a *pid* argument of -1, and the use of *waitid()* with the *idtype* argument set to P\_ALL, are also not recommended for portable applications.

70843 XSI As specified in [Consequences of Process Termination](#) (on page 553), if the calling process has +  
 70844 SA\_NOCLDWAIT set or has SIGCHLD set to SIG\_IGN, then the termination of a child process +  
 70845 will not cause status information to become available to a thread blocked in *wait()*, *waitid()*, or +  
 70846 *waitpid()*. Thus, a thread blocked in one of the wait functions will remain blocked unless some +  
 70847 other condition causes the thread to resume execution (such as an [ECHILD] failure due to no +  
 70848 remaining children in the set of waited-for children).

## 70849 RATIONALE

70850 A call to the *wait()* or *waitpid()* function only returns *status* on an immediate child process of the  
 70851 calling process; that is, a child that was produced by a single *fork()* call (perhaps followed by an  
 70852 *exec* or other function calls) from the parent. If a child produces grandchildren by further use of  
 70853 *fork()*, none of those grandchildren nor any of their descendants affect the behavior of a *wait()*  
 70854 from the original parent process. Nothing in this volume of POSIX.1-2008 prevents an  
 70855 implementation from providing extensions that permit a process to get *status* from a grandchild  
 70856 or any other process, but a process that does not use such extensions must be guaranteed to see  
 70857 *status* from only its direct children.

70858 The *waitpid()* function is provided for three reasons:

- 70859 1. To support job control
- 70860 2. To permit a non-blocking version of the *wait()* function
- 70861 3. To permit a library routine, such as *system()* or *pclose()*, to wait for its children without  
 70862 interfering with other terminated children for which the process has not waited

70863 The first two of these facilities are based on the *wait3()* function provided by 4.3 BSD. The  
 70864 function uses the *options* argument, which is equivalent to an argument to *wait3()*. The  
 70865 WUNTRACED flag is used only in conjunction with job control on systems supporting job  
 70866 control. Its name comes from 4.3 BSD and refers to the fact that there are two types of stopped  
 70867 processes in that implementation: processes being traced via the *ptrace()* debugging facility and  
 70868 (untraced) processes stopped by job control signals. Since *ptrace()* is not part of this volume of  
 70869 POSIX.1-2008, only the second type is relevant. The name WUNTRACED was retained because  
 70870 its usage is the same, even though the name is not intuitively meaningful in this context.

70871 The third reason for the *waitpid()* function is to permit independent sections of a process to  
 70872 spawn and wait for children without interfering with each other. For example, the following  
 70873 problem occurs in developing a portable shell, or command interpreter:

```
70874 stream = popen("/bin/true");
70875 (void) system("sleep 100");
70876 (void) pclose(stream);
```

70877 On all historical implementations, the final *pclose()* fails to reap the *wait()* *status* of the *popen()*.

70878 The status values are retrieved by macros, rather than given as specific bit encodings as they are  
 70879 in most historical implementations (and thus expected by existing programs). This was  
 70880 necessary to eliminate a limitation on the number of signals an implementation can support that  
 70881 was inherent in the traditional encodings. This volume of POSIX.1-2008 does require that a *status*  
 70882 value of zero corresponds to a process calling *\_exit(0)*, as this is the most common encoding  
 70883 expected by existing programs. Some of the macro names were adopted from 4.3 BSD.

70884 These macros syntactically operate on an arbitrary integer value. The behavior is undefined  
 70885 unless that value is one stored by a successful call to *wait()* or *waitpid()* in the location pointed to  
 70886 by the *stat\_loc* argument. An early proposal attempted to make this clearer by specifying each  
 70887 argument as *\*stat\_loc* rather than *stat\_val*. However, that did not follow the conventions of other  
 70888 specifications in this volume of POSIX.1-2008 or traditional usage. It also could have implied

that the argument to the macro must literally be *\*stat\_loc*; in fact, that value can be stored or passed as an argument to other functions before being interpreted by these macros.

The extension that affects *wait()* and *waitpid()* and is common in historical implementations is the *ptrace()* function. It is called by a child process and causes that child to stop and return a *status* that appears identical to the *status* indicated by WIFSTOPPED. The *status* of *ptrace()* children is traditionally returned regardless of the WUNTRACED flag (or by the *wait()* function). Most applications do not need to concern themselves with such extensions because they have control over what extensions they or their children use. However, applications, such as command interpreters, that invoke arbitrary processes may see this behavior when those arbitrary processes misuse such extensions.

Implementations that support **core** file creation or other implementation-defined actions on termination of some processes traditionally provide a bit in the *status* returned by *wait()* to indicate that such actions have occurred.

Allowing the *wait()* family of functions to discard a pending SIGCHLD signal that is associated with a successfully waited-for child process puts them into the *sigwait()* and *sigwaitinfo()* category with respect to SIGCHLD.

This definition allows implementations to treat a pending SIGCHLD signal as accepted by the process in *wait()*, with the same meaning of “accepted” as when that word is applied to the *sigwait()* family of functions.

Allowing the *wait()* family of functions to behave this way permits an implementation to be able to deal precisely with SIGCHLD signals.

In particular, an implementation that does accept (discard) the SIGCHLD signal can make the following guarantees regardless of the queuing depth of signals in general (the list of waitable children can hold the SIGCHLD queue):

1. If a SIGCHLD signal handler is established via *sigaction()* without the SA\_RESETHAND flag, SIGCHLD signals can be accurately counted; that is, exactly one SIGCHLD signal will be delivered to or accepted by the process for every child process that terminates.
2. A single *wait()* issued from a SIGCHLD signal handler can be guaranteed to return immediately with status information for a child process.
3. When SA\_SIGINFO is requested, the SIGCHLD signal handler can be guaranteed to receive a non-null pointer to a **siginfo\_t** structure that describes a child process for which a wait via *waitpid()* or *waitid()* will not block or fail.
4. The *system()* function will not cause the SIGCHLD handler of a process to be called as a result of the *fork()/exec* executed within *system()* because *system()* will accept the SIGCHLD signal when it performs a *waitpid()* for its child process. This is a desirable behavior of *system()* so that it can be used in a library without causing side-effects to the application linked with the library.

An implementation that does not permit the *wait()* family of functions to accept (discard) a pending SIGCHLD signal associated with a successfully waited-for child, cannot make the guarantees described above for the following reasons:

#### Guarantee #1

Although it might be assumed that reliable queuing of all SIGCHLD signals generated by the system can make this guarantee, the counter-example is the case of a process that blocks SIGCHLD and performs an indefinite loop of *fork()/wait()* operations. If the implementation supports queued signals, then eventually the system will run out of memory for the queue. The guarantee cannot be made because there must be some limit to

the depth of queuing.

#### Guarantees #2 and #3

These cannot be guaranteed unless the *wait()* family of functions accepts the SIGCHLD signal. Otherwise, a *fork()/wait()* executed while SIGCHLD is blocked (as in the *system()* function) will result in an invocation of the handler when SIGCHLD is unblocked, after the process has disappeared.

#### Guarantee #4

Although possible to make this guarantee, *system()* would have to set the SIGCHLD handler to SIG\_DFL so that the SIGCHLD signal generated by its *fork()* would be discarded (the SIGCHLD default action is to be ignored), then restore it to its previous setting. This would have the undesirable side-effect of discarding all SIGCHLD signals pending to the process.

### FUTURE DIRECTIONS

None.

### CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

#### Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

#### Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include *<sys/types.h>* has been removed. Although *<sys/types.h>* was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The processing of the SIGCHLD signal and the [ECHILD] error is clarified.

The semantics of *WIFSTOPPED(stat\_val)*, *WIFEXITED(stat\_val)*, and *WIFSIGNALED(stat\_val)* are defined with respect to *posix\_spawn()* or *posix\_spawnnp()* for alignment with IEEE Std 1003.1d-1999.

The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/145 is applied, adding the example to the EXAMPLES section.

#### Issue 7

SD5-XSH-ERN-202 is applied.

APPLICATION USAGE is added, recommending that the *wait()* function not be used.

An additional example for *waitpid()* is added.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0707 [421], XSH/TC1-2008/0708 [166], XSH/TC1-2008/0709 [166], and XSH/TC1-2008/0710 [69] are applied.

**NAME**

waitid — wait for a child process to change state

**SYNOPSIS**

```
#include <sys/wait.h>
```

```
int waitid(idtype_t idtype, id_t id, siginfo_t *infop, int options);
```

**DESCRIPTION**

The *waitid()* function shall obtain status information (see [Section 2.13](#), on page 548) pertaining to termination, stop, and/or continue events in one of the caller’s child processes.

The *waitid()* function shall cause the calling thread to become blocked until an error occurs or status information becomes available to the calling thread that satisfies all of the following properties (“matching status information”):

- The status information is from one of the child processes in the set of child processes specified by the *idtype* and *id* arguments.
- The state change in the status information matches one of the state change flags set in the *options* argument.

If matching status information is available prior to the call to *waitid()*, return shall be immediate. If matching status information is available for two or more child processes, the order in which their status is reported is unspecified.

As described in [Section 2.13](#) (on page 548), the *waitid()* function consumes the status information it obtains unless the WNOWAIT flag is set in the *options* argument.

The behavior when multiple threads are blocked in *wait()*, *waitid()*, or *waitpid()* is described in [Section 2.13](#) (on page 548).

The *waitid()* function shall record the obtained status information in the structure pointed to by *infop*. The fields of the structure pointed to by *infop* shall be filled in as described under “Pointer to a Function” in [Section 2.4.3](#) (on page 490).

The *idtype* and *id* arguments are used to specify which children *waitid()* waits for.

If *idtype* is P\_PID, *waitid()* shall wait for the child with a process ID equal to (**pid\_t**)*id*.

If *idtype* is P\_PGID, *waitid()* shall wait for any child with a process group ID equal to (**pid\_t**)*id*.

If *idtype* is P\_ALL, *waitid()* shall wait for any children and *id* is ignored.

The *options* argument is used to specify which state changes *waitid()* shall wait for. It is formed by OR’ing together the following flags:

WCONTINUED Status shall be returned for any continued child process whose status either has not been reported since it continued from a job control stop or has been reported only by calls to *waitid()* with the WNOWAIT flag set.

WEXITED Wait for processes that have exited.

WNOHANG Do not hang if no status is available; return immediately.

WNOWAIT Keep the process whose status is returned in *infop* in a waitable state. This shall not affect the state of the process; the process may be waited for again after this call completes.

WSTOPPED Status shall be returned for any child that has stopped upon receipt of a signal, and whose status either has not been reported since it stopped or has been reported only by calls to *waitid()* with the WNOWAIT flag set.

Applications shall specify at least one of the flags WEXITED, WSTOPPED, or WCONTINUED to be OR'ed in with the *options* argument.

The application shall ensure that the *infop* argument points to a **siginfo\_t** structure. If *waitid()* returns because a child process was found that satisfied the conditions indicated by the arguments *idtype* and *options*, then the structure pointed to by *infop* shall be filled in by the system with the status of the process; the *si\_signo* member shall be set equal to SIGCHLD. If *waitid()* returns because WNOHANG was specified and status is not available for any process specified by *idtype* and *id*, then the *si\_signo* and *si\_pid* members of the structure pointed to by *infop* shall be set to zero and the values of other members of the structure are unspecified.

#### 71027 RETURN VALUE

If WNOHANG was specified and status is not available for any process specified by *idtype* and *id*, 0 shall be returned. If *waitid()* returns due to the change of state of one of its children, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

#### 71031 ERRORS

The *waitid()* function shall fail if:

|       |          |                                                                                                                         |
|-------|----------|-------------------------------------------------------------------------------------------------------------------------|
| 71033 | [ECHILD] | The calling process has no existing unwaited-for child processes.                                                       |
| 71034 | [EINTR]  | The <i>waitid()</i> function was interrupted by a signal.                                                               |
| 71035 | [EINVAL] | An invalid value was specified for <i>options</i> , or <i>idtype</i> and <i>id</i> specify an invalid set of processes. |

#### 71037 EXAMPLES

71038 None.

#### 71039 APPLICATION USAGE

Calls to *waitid()* with *idtype* equal to P\_ALL will collect information about any child process. This may result in interactions with other interfaces that may be waiting for their own children (such as by use of *system()*). For this reason it is recommended that portable applications not use *waitid()* with *idtype* of P\_ALL. See also APPLICATION USAGE for *wait()*.

71044 XSI As specified in [Consequences of Process Termination](#) (on page 553), if the calling process has +  
 71045 SA\_NOCLDWAIT set or has SIGCHLD set to SIG\_IGN, then the termination of a child process +  
 71046 will not cause status information to become available to a thread blocked in *wait()*, *waitid()*, or +  
 71047 *waitpid()*. Thus, a thread blocked in one of the wait functions will remain blocked unless some +  
 71048 other condition causes the thread to resume execution (such as an [ECHILD] failure due to no +  
 71049 remaining children in the set of waited-for children).

#### 71050 RATIONALE

71051 None.

#### 71052 FUTURE DIRECTIONS

71053 None.

#### 71057 CHANGE HISTORY

71058 First released in Issue 4, Version 2.

71059 **Issue 5**

71060 Moved from X/OPEN UNIX extension to BASE.

71061 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

71062 **Issue 6**

71063 The normative text is updated to avoid use of the term “must” for application requirements.

71064 **Issue 7**

71065 Austin Group Interpretation 1003.1-2001 #060 is applied, updating the DESCRIPTION.

71066 The *waitid()* function is moved from the XSI option to the Base.

71067 APPLICATION USAGE is added, recommending that the *waitid()* function not be used with  
71068 *idtype* equal to P\_ALL.

71069 The description of the WNOHANG flag is updated.

71070 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0711 [154], XSH/TC1-2008/0712 [154],  
71071 and XSH/TC1-2008/0713 [153] are applied.

71072 **NAME**

71073       waitpid — wait for a child process to stop or terminate

71074 **SYNOPSIS**

71075       #include &lt;sys/wait.h&gt;

71076       pid\_t waitpid(pid\_t pid, int \*stat\_loc, int options);

71077 **DESCRIPTION**71078       Refer to *wait()*.

71079 **NAME**

71080       wcpcpy — copy a wide-character string, returning a pointer to its end

71081 **SYNOPSIS**

```
71082 CX      #include <wchar.h>
71083          wchar_t *wcpcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);
```

71084 **DESCRIPTION**71085       Refer to *wcscpy()*.

71086 **NAME**

71087       wcpncpy — copy a fixed-size wide-character string, returning a pointer to its end

71088 **SYNOPSIS**

```
71089 CX      #include <wchar.h>
71090          wchar_t *wcpncpy(wchar_t restrict *ws1, const wchar_t *restrict ws2,
71091                          size_t n);
```

71092 **DESCRIPTION**71093       Refer to *wcsncpy()*.

71094 **NAME**71095 `wrtomb` — convert a wide-character code to a character (restartable)71096 **SYNOPSIS**71097 `#include <wchar.h>`71098 `size_t wrtomb(char *restrict s, wchar_t wc, mbstate_t *restrict ps);`71099 **DESCRIPTION**

71100 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 71101 conflict between the requirements described here and the ISO C standard is unintentional. This  
 71102 volume of POSIX.1-2008 defers to the ISO C standard.

71103 If *s* is a null pointer, the `wrtomb()` function shall be equivalent to the call:71104 `wrtomb(buf, L'\0', ps)`71105 where *buf* is an internal buffer.

71106 If *s* is not a null pointer, the `wrtomb()` function shall determine the number of bytes needed to  
 71107 represent the character that corresponds to the wide character given by *wc* (including any shift  
 71108 sequences), and store the resulting bytes in the array whose first element is pointed to by *s*. At  
 71109 most {MB\_CUR\_MAX} bytes are stored. If *wc* is a null wide character, a null byte shall be stored,  
 71110 preceded by any shift sequence needed to restore the initial shift state. The resulting state  
 71111 described shall be the initial conversion state.

71112 If *ps* is a null pointer, the `wrtomb()` function shall use its own internal **mbstate\_t** object, which is  
 71113 initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t** object  
 71114 pointed to by *ps* shall be used to completely describe the current conversion state of the  
 71115 associated character sequence. The implementation shall behave as if no function defined in this  
 71116 volume of POSIX.1-2008 calls `wrtomb()`.

71117 CX The `wrtomb()` function need not be thread-safe if called with a NULL *ps* argument.71118 The behavior of this function shall be affected by the `LC_CTYPE` category of the current locale.71119 The `wrtomb()` function shall not change the setting of *errno* if successful.71120 **RETURN VALUE**

71121 The `wrtomb()` function shall return the number of bytes stored in the array object (including any  
 71122 shift sequences). When *wc* is not a valid wide character, an encoding error shall occur. In this  
 71123 case, the function shall store the value of the macro [EILSEQ] in *errno* and shall return (**size\_t**)−1;  
 71124 the conversion state shall be undefined.

71125 **ERRORS**71126 The `wrtomb()` function shall fail if:

71127 [EILSEQ] An invalid wide-character code is detected.

71128 The `wrtomb()` function may fail if:71129 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

71130 **EXAMPLES**

71131 None.

71132 **APPLICATION USAGE**

71133 None.

71134 **RATIONALE**

71135 None.

71136 **FUTURE DIRECTIONS**

71137 None.

71138 **SEE ALSO**71139 *mbsinit()*, *wcsrtombs()*

71140 XBD &lt;wchar.h&gt;

71141 **CHANGE HISTORY**71142 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
71143 (E).71144 **Issue 6**

71145 In the DESCRIPTION, a note on using this function in a threaded application is added.

71146 Extensions beyond the ISO C standard are marked.

71147 The normative text is updated to avoid use of the term “must” for application requirements.

71148 The *wcr tomb()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.71149 **Issue 7**71150 Austin Group Interpretation 1003.1-2001 #148 is applied, clarifying that the *wcr tomb()* function  
71151 need not be thread-safe if called with a NULL *ps* argument.

71152 Austin Group Interpretation 1003.1-2001 #170 is applied.

71153 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0714 [88] and XSH/TC1-2008/0715  
71154 [105] are applied.

## 71155 NAME

71156 `wcscasecmp`, `wcscasecmp_l`, `wcsncasecmp`, `wcsncasecmp_l` — case-insensitive wide-character  
71157 string comparison

## 71158 SYNOPSIS

```
71159 CX #include <wchar.h>
71160
71161 int wcscasecmp(const wchar_t *ws1, const wchar_t *ws2);
71162 int wcscasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
71163                 locale_t locale);
71164 int wcsncasecmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);
71165 int wcsncasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
71166                  size_t n, locale_t locale);
```

## 71166 DESCRIPTION

71167 The `wcscasecmp()` and `wcsncasecmp()` functions are the wide-character equivalent of the  
71168 `strcasecmp()` and `strncasecmp()` functions, respectively.

71169 The `wcscasecmp()` and `wcscasecmp_l()` functions shall compare, while ignoring differences in case,  
71170 the wide-character string pointed to by `ws1` to the wide-character string pointed to by `ws2`.

71171 The `wcsncasecmp()` and `wcsncasecmp_l()` functions shall compare, while ignoring differences in  
71172 case, not more than `n` wide-characters from the wide-character string pointed to by `ws1` to the  
71173 wide-character string pointed to by `ws2`.

71174 The `wcscasecmp()` and `wcsncasecmp()` functions use the current locale to determine the case of the  
71175 wide characters.

71176 The `wcscasecmp_l()` and `wcsncasecmp_l()` functions use the locale represented by `locale` to  
71177 determine the case of the wide characters.

71178 When the `LC_CTYPE` category of the locale being used is from the POSIX locale, these functions  
71179 shall behave as if the wide-character strings had been converted to lowercase and then a  
71180 comparison of wide-character codes performed. Otherwise, the results are unspecified.

71181 The information for `wcscasecmp_l()` and `wcsncasecmp_l()` about the case of the characters comes  
71182 from the locale represented by `locale`.

71183 The behavior is undefined if the `locale` argument to `wcscasecmp_l()` or `wcsncasecmp_l()` is the  
71184 special locale object `LC_GLOBAL_LOCALE` or is not a valid locale object handle.

## 71185 RETURN VALUE

71186 Upon completion, the `wcscasecmp()` and `wcscasecmp_l()` functions shall return an integer greater  
71187 than, equal to, or less than 0 if the wide-character string pointed to by `ws1` is, ignoring case,  
71188 greater than, equal to, or less than the wide-character string pointed to by `ws2`, respectively.

71189 Upon completion, the `wcsncasecmp()` and `wcsncasecmp_l()` functions shall return an integer  
71190 greater than, equal to, or less than 0 if the possibly null wide-character terminated string pointed  
71191 to by `ws1` is, ignoring case, greater than, equal to, or less than the possibly null wide-character  
71192 terminated string pointed to by `ws2`, respectively.

71193 No return values are reserved to indicate an error.

## 71194 ERRORS

71195 No errors are defined.

71196 **EXAMPLES**

71197 None.

71198 **APPLICATION USAGE**

71199 None.

71200 **RATIONALE**

71201 None.

71202 **FUTURE DIRECTIONS**

71203 None.

71204 **SEE ALSO**71205 *strcasecmp()*, *wscmp()*, *wcsncmp()*

71206 XBD &lt;wchar.h&gt;

71207 **CHANGE HISTORY**

71208 First released in Issue 7.

71209 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0716 [294], XSH/TC1-2008/0717 [283],  
71210 and XSH/TC1-2008/0718 [283] are applied.

71211 **NAME**

71212 wscat — concatenate two wide-character strings

71213 **SYNOPSIS**

71214 #include &lt;wchar.h&gt;

71215 wchar\_t \*wscat(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2);

71216 **DESCRIPTION**

71217 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
71218 conflict between the requirements described here and the ISO C standard is unintentional. This  
71219 volume of POSIX.1-2008 defers to the ISO C standard.

71220 The *wscat()* function shall append a copy of the wide-character string pointed to by *ws2*  
71221 (including the terminating null wide-character code) to the end of the wide-character string  
71222 pointed to by *ws1*. The initial wide-character code of *ws2* shall overwrite the null wide-character  
71223 code at the end of *ws1*. If copying takes place between objects that overlap, the behavior is  
71224 undefined.

71225 **RETURN VALUE**71226 The *wscat()* function shall return *ws1*; no return value is reserved to indicate an error.71227 **ERRORS**

71228 No errors are defined.

71229 **EXAMPLES**

71230 None.

71231 **APPLICATION USAGE**

71232 None.

71233 **RATIONALE**

71234 None.

71235 **FUTURE DIRECTIONS**

71236 None.

71237 **SEE ALSO**71238 [wcsncat\(\)](#)71239 XBD [<wchar.h>](#)71240 **CHANGE HISTORY**

71241 First released in Issue 4. Derived from the MSE working draft.

71242 **Issue 6**

71243 The Open Group Corrigendum U040/2 is applied. In the RETURN VALUE section, *s1* is  
71244 changed to *ws1*.

71245 The *wscat()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

71246 **NAME**71247        `wcschr` — wide-character string scanning operation71248 **SYNOPSIS**71249        `#include <wchar.h>`71250        `wchar_t *wcschr(const wchar_t *ws, wchar_t wc);`71251 **DESCRIPTION**

71252 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
 71253 conflict between the requirements described here and the ISO C standard is unintentional. This  
 71254 volume of POSIX.1-2008 defers to the ISO C standard.

71255        The `wcschr()` function shall locate the first occurrence of `wc` in the wide-character string pointed  
 71256 to by `ws`. The application shall ensure that the value of `wc` is a character representable as a type  
 71257 **wchar\_t** and a wide-character code corresponding to a valid character in the current locale. The  
 71258 terminating null wide-character code is considered to be part of the wide-character string.

71259 **RETURN VALUE**

71260        Upon completion, `wcschr()` shall return a pointer to the wide-character code, or a null pointer if  
 71261 the wide-character code is not found.

71262 **ERRORS**

71263        No errors are defined.

71264 **EXAMPLES**

71265        None.

71266 **APPLICATION USAGE**

71267        None.

71268 **RATIONALE**

71269        None.

71270 **FUTURE DIRECTIONS**

71271        None.

71272 **SEE ALSO**71273        [\*wcsrchr\(\)\*](#)71274        XBD [\*<wchar.h>\*](#)71275 **CHANGE HISTORY**

71276        First released in Issue 4. Derived from the MSE working draft.

71277 **Issue 6**

71278        The normative text is updated to avoid use of the term “must” for application requirements.

71279 **NAME**71280 `wcscmp` — compare two wide-character strings71281 **SYNOPSIS**71282 `#include <wchar.h>`71283 `int wcscmp(const wchar_t *ws1, const wchar_t *ws2);`71284 **DESCRIPTION**

71285 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
71286 conflict between the requirements described here and the ISO C standard is unintentional. This  
71287 volume of POSIX.1-2008 defers to the ISO C standard.

71288 The `wcscmp()` function shall compare the wide-character string pointed to by `ws1` to the wide-  
71289 character string pointed to by `ws2`.

71290 The sign of a non-zero return value shall be determined by the sign of the difference between the  
71291 values of the first pair of wide-character codes that differ in the objects being compared.

71292 **RETURN VALUE**

71293 Upon completion, `wcscmp()` shall return an integer greater than, equal to, or less than 0, if the  
71294 wide-character string pointed to by `ws1` is greater than, equal to, or less than the wide-character  
71295 string pointed to by `ws2`, respectively.

71296 **ERRORS**

71297 No errors are defined.

71298 **EXAMPLES**

71299 None.

71300 **APPLICATION USAGE**

71301 None.

71302 **RATIONALE**

71303 None.

71304 **FUTURE DIRECTIONS**

71305 None.

71306 **SEE ALSO**71307 [`wscasecmp\(\)`](#), [`wcsncmp\(\)`](#)71308 XBD [`<wchar.h>`](#)71309 **CHANGE HISTORY**

71310 First released in Issue 4. Derived from the MSE working draft.

71311 **NAME**

71312 wscoll, wscoll\_l — wide-character string comparison using collating information

71313 **SYNOPSIS**

```
71314 #include <wchar.h>
71315 int wscoll(const wchar_t *ws1, const wchar_t *ws2);
71316 CX int wscoll_l(const wchar_t *ws1, const wchar_t *ws2,
71317 locale_t locale);
```

71318 **DESCRIPTION**

71319 CX For *wscoll()*: The functionality described on this reference page is aligned with the ISO C  
 71320 standard. Any conflict between the requirements described here and the ISO C standard is  
 71321 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

71322 CX The *wscoll()* and *wscoll\_l()* functions shall compare the wide-character string pointed to by  
 71323 *ws1* to the wide-character string pointed to by *ws2*, both interpreted as appropriate to the  
 71324 CX LC\_COLLATE category of the current locale, or the locale represented by *locale*, respectively.

71325 CX The *wscoll()* and *wscoll\_l()* functions shall not change the setting of *errno* if successful.

71326 CX An application wishing to check for error situations should set *errno* to 0 before calling *wscoll()*  
 71327 or *wscoll\_l()*. If *errno* is non-zero on return, an error has occurred.

71328 CX The behavior is undefined if the *locale* argument to *wscoll\_l()* is the special locale object  
 71329 LC\_GLOBAL\_LOCALE or is not a valid locale object handle.

71330 **RETURN VALUE**

71331 CX Upon successful completion, *wscoll()* and *wscoll\_l()* shall return an integer greater than, equal  
 71332 to, or less than 0, according to whether the wide-character string pointed to by *ws1* is greater  
 71333 than, equal to, or less than the wide-character string pointed to by *ws2*, when both are  
 71334 CX interpreted as appropriate to the current locale, or to the locale represented by *locale*,  
 71335 CX respectively. On error, *wscoll()* and *wscoll\_l()* shall set *errno*, but no return value is reserved  
 71336 to indicate an error.

71337 **ERRORS**

71338 These functions may fail if:

71339 CX [EINVAL] The *ws1* or *ws2* arguments contain wide-character codes outside the domain of  
 71340 the collating sequence.

71341 **EXAMPLES**

71342 None.

71343 **APPLICATION USAGE**

71344 The *wcsxfrm()* and *wscmp()* functions should be used for sorting large lists.

71345 **RATIONALE**

71346 None.

71347 **FUTURE DIRECTIONS**

71348 None.

71349 **SEE ALSO**

71350 *wscmp()*, *wcsxfrm()*

71351 XBD <wchar.h>

71352 **CHANGE HISTORY**

71353 First released in Issue 4. Derived from the MSE working draft.

71354 **Issue 5**

71355 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

71356 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

71357 **Issue 7**

71358 The *wccoll\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
71359 Set Part 4.

71360 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0719 [302], XSH/TC1-2008/0720 [283],  
71361 and XSH/TC1-2008/0721 [283] are applied.

71362 **NAME**

71363       wcpcpy, wcscpy — copy a wide-character string, returning a pointer to its end

71364 **SYNOPSIS**

71365       #include &lt;wchar.h&gt;

71366 CX       wchar\_t \*wcpcpy(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2);

71367       wchar\_t \*wcscpy(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2);

71368 **DESCRIPTION**71369 CX       For *wcscpy()*: The functionality described on this reference page is aligned with the ISO C  
71370 standard. Any conflict between the requirements described here and the ISO C standard is  
71371 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.71372 CX       The *wcpcpy()* and *wcscpy()* functions shall copy the wide-character string pointed to by *ws2*  
71373 (including the terminating null wide-character code) into the array pointed to by *ws1*.71374       The application shall ensure that there is room for at least *wcslen(ws2)+1* wide characters in the  
71375 *ws1* array, and that the *ws2* and *ws1* arrays do not overlap.

71376       If copying takes place between objects that overlap, the behavior is undefined.

71377 **RETURN VALUE**71378 CX       The *wcpcpy()* function shall return a pointer to the terminating null wide-character code copied  
71379 into the *ws1* buffer.71380       The *wcscpy()* function shall return *ws1*.

71381       No return values are reserved to indicate an error.

71382 **ERRORS**

71383       No errors are defined.

71384 **EXAMPLES**

71385       None.

71386 **APPLICATION USAGE**

71387       None.

71388 **RATIONALE**

71389       None.

71390 **FUTURE DIRECTIONS**

71391       None.

71392 **SEE ALSO**71393       *strcpy()*, *wcsdup()*, *wcsncpy()*

71394       XBD &lt;wchar.h&gt;

71395 **CHANGE HISTORY**

71396       First released in Issue 4. Derived from the MSE working draft.

71397 **Issue 6**71398       The *wcscpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.71399 **Issue 7**71400       The *wcpcpy()* function is added from The Open Group Technical Standard, 2006, Extended API  
71401 Set Part 1.

71402 **NAME**

71403       wcscspn — get the length of a complementary wide substring

71404 **SYNOPSIS**

71405       #include &lt;wchar.h&gt;

71406       size\_t wcscspn(const wchar\_t \*ws1, const wchar\_t \*ws2);

71407 **DESCRIPTION**

71408 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
71409 conflict between the requirements described here and the ISO C standard is unintentional. This  
71410 volume of POSIX.1-2008 defers to the ISO C standard.

71411       The *wcscspn()* function shall compute the length (in wide characters) of the maximum initial  
71412 segment of the wide-character string pointed to by *ws1* which consists entirely of wide-character  
71413 codes *not* from the wide-character string pointed to by *ws2*.

71414 **RETURN VALUE**

71415       The *wcscspn()* function shall return the length of the initial substring of *ws1*; no return value is  
71416 reserved to indicate an error.

71417 **ERRORS**

71418       No errors are defined.

71419 **EXAMPLES**

71420       None.

71421 **APPLICATION USAGE**

71422       None.

71423 **RATIONALE**

71424       None.

71425 **FUTURE DIRECTIONS**

71426       None.

71427 **SEE ALSO**71428       *wcsspn()*

71429       XBD &lt;wchar.h&gt;

71430 **CHANGE HISTORY**

71431       First released in Issue 4. Derived from the MSE working draft.

71432 **Issue 5**

71433       The RETURN VALUE section is updated to indicate that *wcscspn()* returns the length of *ws1*,  
71434 rather than *ws1* itself.

71435 **NAME**

71436       wcsdup — duplicate a wide-character string

71437 **SYNOPSIS**

```
71438 CX       #include <wchar.h>
71439       wchar_t *wcsdup(const wchar_t *string);
```

71440 **DESCRIPTION**71441       The *wcsdup()* function is the wide-character equivalent of the *strdup()* function.

71442       The *wcsdup()* function shall return a pointer to a new wide-character string, allocated as if by a  
71443       call to *malloc()*, which is the duplicate of the wide-character string *string*. The returned pointer  
71444       can be passed to *free()*. A null pointer is returned if the new wide-character string cannot be  
71445       created.

71446 **RETURN VALUE**

71447       Upon successful completion, the *wcsdup()* function shall return a pointer to the newly allocated  
71448       wide-character string. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

71449 **ERRORS**71450       The *wcsdup()* function shall fail if:

71451       [ENOMEM]       Memory large enough for the duplicate string could not be allocated.

71452 **EXAMPLES**

71453       None.

71454 **APPLICATION USAGE**

71455       For functions that allocate memory as if by *malloc()*, the application should release such memory  
71456       when it is no longer required by a call to *free()*. For *wcsdup()*, this is the return value.

71457 **RATIONALE**

71458       None.

71459 **FUTURE DIRECTIONS**

71460       None.

71461 **SEE ALSO**71462       *free()*, *strdup()*, *wscpy()*

71463       XBD &lt;wchar.h&gt;

71464 **CHANGE HISTORY**

71465       First released in Issue 7.

71466 **NAME**71467 `wcsftime` — convert date and time to a wide-character string71468 **SYNOPSIS**71469 `#include <wchar.h>`

```
71470 size_t wcsftime(wchar_t *restrict wcs, size_t maxsize,  
71471               const wchar_t *restrict format, const struct tm *restrict timeptr);
```

71472 **DESCRIPTION**

71473 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
71474 conflict between the requirements described here and the ISO C standard is unintentional. This  
71475 volume of POSIX.1-2008 defers to the ISO C standard.

71476 The `wcsftime()` function shall be equivalent to the `strftime()` function, except that:

- 71477 • The argument *wcs* points to the initial element of an array of wide characters into which  
71478 the generated output is to be placed.
- 71479 • The argument *maxsize* indicates the maximum number of wide characters to be placed in  
71480 the output array.
- 71481 • The argument *format* is a wide-character string and the conversion specifications are  
71482 replaced by corresponding sequences of wide characters. It is unspecified whether an +  
71483 encoding error occurs if the format string contains **wchar\_t** values that do not correspond +  
71484 to members of the character set of the current locale. +
- 71485 CX • Field widths specify the number of wide characters instead of the number of bytes.
- 71486 • The return value indicates the number of wide characters placed in the output array.

71487 If copying takes place between objects that overlap, the behavior is undefined.

71488 **RETURN VALUE**

71489 If the total number of resulting wide-character codes including the terminating null wide-  
71490 character code is no more than *maxsize*, `wcsftime()` shall return the number of wide-character  
71491 codes placed into the array pointed to by *wcs*, not including the terminating null wide-character  
71492 code. Otherwise, zero is returned and the contents of the array are unspecified.

71493 **ERRORS**

71494 No errors are defined.

71495 **EXAMPLES**

71496 None.

71497 **APPLICATION USAGE**

71498 None.

71499 **RATIONALE**

71500 None.

71501 **FUTURE DIRECTIONS**

71502 None.

71503 **SEE ALSO**71504 [\*strftime\(\)\*](#)71505 XBD [\*\*<wchar.h>\*\*](#)

71506 **CHANGE HISTORY**

71507 First released in Issue 4.

71508 **Issue 5**

71509 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

71510 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of the *format*  
71511 argument is changed from **const char \*** to **const wchar\_t \***.71512 **Issue 6**71513 The *wcsftime()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

71514 **NAME**

71515       wcslen, wcsnlen — get length of a fixed-sized wide-character string

71516 **SYNOPSIS**

71517       #include &lt;wchar.h&gt;

71518       size\_t wcslen(const wchar\_t \*ws);

71519 CX      size\_t wcsnlen(const wchar\_t \*ws, size\_t maxlen);

71520 **DESCRIPTION**

71521 CX      For *wcslen()*: The functionality described on this reference page is aligned with the ISO C  
 71522 standard. Any conflict between the requirements described here and the ISO C standard is  
 71523 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

71524       The *wcslen()* function shall compute the number of wide-character codes in the wide-character  
 71525 string to which *ws* points, not including the terminating null wide-character code.

71526 CX      The *wcsnlen()* function shall compute the smaller of the number of wide characters in the array  
 71527 to which *ws* points, not including any terminating null wide-character code, and the value of  
 71528 *maxlen*. The *wcsnlen()* function shall never examine more than the first *maxlen* characters of the  
 71529 wide-character array pointed to by *ws*.

71530 **RETURN VALUE**71531       The *wcslen()* function shall return the length of *ws*.

71532 CX      The *wcsnlen()* function shall return the number of wide characters preceding the first null wide-  
 71533 character code in the array to which *ws* points, if *ws* contains a null wide-character code within  
 71534 the first *maxlen* wide characters; otherwise, it shall return *maxlen*.

71535       No return values are reserved to indicate an error.

71536 **ERRORS**

71537       No errors are defined.

71538 **EXAMPLES**

71539       None.

71540 **APPLICATION USAGE**

71541       None.

71542 **RATIONALE**

71543       None.

71544 **FUTURE DIRECTIONS**

71545       None.

71546 **SEE ALSO**71547       *strlen()*

71548       XBD &lt;wchar.h&gt;

71549 **CHANGE HISTORY**

71550       First released in Issue 4. Derived from the MSE working draft.

71551 **Issue 7**

71552       The *wcsnlen()* function is added from The Open Group Technical Standard, 2006, Extended API  
 71553 Set Part 1.

71554 **NAME**

71555       wcsncasecmp, wcsncasecmp\_l — case-insensitive wide-character string comparison

71556 **SYNOPSIS**

```
71557 CX      #include <wchar.h>
71558          int wcsncasecmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);
71559          int wcsncasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
71560                          size_t n, locale_t locale);
```

71561 **DESCRIPTION**71562       Refer to *wcscasecmp()*.

71563 **NAME**

71564       wcsncat — concatenate a wide-character string with part of another

71565 **SYNOPSIS**

71566       #include &lt;wchar.h&gt;

71567       wchar\_t \*wcsncat(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2,  
71568                   size\_t n);71569 **DESCRIPTION**71570 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
71571       conflict between the requirements described here and the ISO C standard is unintentional. This  
71572       volume of POSIX.1-2008 defers to the ISO C standard.71573       The *wcsncat()* function shall append not more than *n* wide-character codes (a null wide-  
71574       character code and wide-character codes that follow it are not appended) from the array pointed  
71575       to by *ws2* to the end of the wide-character string pointed to by *ws1*. The initial wide-character  
71576       code of *ws2* shall overwrite the null wide-character code at the end of *ws1*. A terminating null  
71577       wide-character code shall always be appended to the result. If copying takes place between  
71578       objects that overlap, the behavior is undefined.71579 **RETURN VALUE**71580       The *wcsncat()* function shall return *ws1*; no return value is reserved to indicate an error.71581 **ERRORS**

71582       No errors are defined.

71583 **EXAMPLES**

71584       None.

71585 **APPLICATION USAGE**

71586       None.

71587 **RATIONALE**

71588       None.

71589 **FUTURE DIRECTIONS**

71590       None.

71591 **SEE ALSO**71592       *wcscat()*

71593       XBD &lt;wchar.h&gt;

71594 **CHANGE HISTORY**

71595       First released in Issue 4. Derived from the MSE working draft.

71596 **Issue 6**71597       The *wcsncat()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

71598 **NAME**

71599       wcsncmp — compare part of two wide-character strings

71600 **SYNOPSIS**

71601       #include &lt;wchar.h&gt;

71602       int wcsncmp(const wchar\_t \*ws1, const wchar\_t \*ws2, size\_t n);

71603 **DESCRIPTION**

71604 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
71605 conflict between the requirements described here and the ISO C standard is unintentional. This  
71606 volume of POSIX.1-2008 defers to the ISO C standard.

71607       The *wcsncmp()* function shall compare not more than *n* wide-character codes (wide-character  
71608 codes that follow a null wide-character code are not compared) from the array pointed to by *ws1*  
71609 to the array pointed to by *ws2*.

71610       The sign of a non-zero return value shall be determined by the sign of the difference between the  
71611 values of the first pair of wide-character codes that differ in the objects being compared.

71612 **RETURN VALUE**

71613       Upon successful completion, *wcsncmp()* shall return an integer greater than, equal to, or less  
71614 than 0, if the possibly null-terminated array pointed to by *ws1* is greater than, equal to, or less  
71615 than the possibly null-terminated array pointed to by *ws2*, respectively.

71616 **ERRORS**

71617       No errors are defined.

71618 **EXAMPLES**

71619       None.

71620 **APPLICATION USAGE**

71621       None.

71622 **RATIONALE**

71623       None.

71624 **FUTURE DIRECTIONS**

71625       None.

71626 **SEE ALSO**71627       *wscasecmp()*, *wscmp()*

71628       XBD &lt;wchar.h&gt;

71629 **CHANGE HISTORY**

71630       First released in Issue 4. Derived from the MSE working draft.

71631 **NAME**

71632       wcpncpy, wcsncpy — copy a fixed-size wide-character string, returning a pointer to its end

71633 **SYNOPSIS**

71634       #include &lt;wchar.h&gt;

71635 CX       wchar\_t \*wcpncpy(wchar\_t restrict \*ws1, const wchar\_t \*restrict ws2,  
71636           size\_t n);71637       wchar\_t \*wcsncpy(wchar\_t \*restrict ws1, const wchar\_t \*restrict ws2,  
71638           size\_t n);71639 **DESCRIPTION**71640 CX       For *wcsncpy()*: The functionality described on this reference page is aligned with the ISO C  
71641 standard. Any conflict between the requirements described here and the ISO C standard is  
71642 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.71643 CX       The *wcpncpy()* and *wcsncpy()* functions shall copy not more than *n* wide-character codes (wide-  
71644 character codes that follow a null wide-character code are not copied) from the array pointed to  
71645 by *ws2* to the array pointed to by *ws1*. If copying takes place between objects that overlap, the  
71646 behavior is undefined.71647       If the array pointed to by *ws2* is a wide-character string that is shorter than *n* wide-character  
71648 codes, null wide-character codes shall be appended to the copy in the array pointed to by *ws1*,  
71649 until *n* wide-character codes in all are written.71650 **RETURN VALUE**71651 CX       If any null wide-character codes were written into the destination, the *wcpncpy()* function shall  
71652 return the address of the first such null wide-character code. Otherwise, it shall return *&ws1[n]*.71653       The *wcsncpy()* function shall return *ws1*.

71654       No return values are reserved to indicate an error.

71655 **ERRORS**

71656       No errors are defined.

71657 **EXAMPLES**

71658       None.

71659 **APPLICATION USAGE**71660       If there is no null wide-character code in the first *n* wide-character codes of the array pointed to  
71661 by *ws2*, the result is not null-terminated.71662 **RATIONALE**

71663       None.

71664 **FUTURE DIRECTIONS**

71665       None.

71666 **SEE ALSO**71667       *strncpy()*, *wcscpy()*

71668       XBD &lt;wchar.h&gt;

71669 **CHANGE HISTORY**

71670       First released in Issue 4. Derived from the MSE working draft.

71671 **Issue 6**

71672 The *wcsncpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

71673 **Issue 7**

71674 The *wcpncpy()* function is added from The Open Group Technical Standard, 2006, Extended API  
71675 Set Part 1.

71676 **NAME**

71677       wcsnlen — get length of a fixed-sized wide-character string

71678 **SYNOPSIS**

```
71679 CX       #include <wchar.h>
71680       size_t wcsnlen(const wchar_t *ws, size_t maxlen);
```

71681 **DESCRIPTION**71682       Refer to *wcslen()*.

71683 **NAME**

71684       wcsnrtombs — convert wide-character string to multi-byte string

71685 **SYNOPSIS**

```
71686 CX       #include <wchar.h>
71687       size_t wcsnrtombs(char *restrict dst, const wchar_t **restrict src,
71688                       size_t nwc, size_t len, mbstate_t *restrict ps);
```

71689 **DESCRIPTION**71690       Refer to *wcsrtombs()*.

71691 **NAME**

71692 wcpbrk — scan a wide-character string for a wide-character code

71693 **SYNOPSIS**

71694 #include &lt;wchar.h&gt;

71695 wchar\_t \*wcpbrk(const wchar\_t \*ws1, const wchar\_t \*ws2);

71696 **DESCRIPTION**

71697 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
71698 conflict between the requirements described here and the ISO C standard is unintentional. This  
71699 volume of POSIX.1-2008 defers to the ISO C standard.

71700 The *wcpbrk()* function shall locate the first occurrence in the wide-character string pointed to by  
71701 *ws1* of any wide-character code from the wide-character string pointed to by *ws2*.

71702 **RETURN VALUE**

71703 Upon successful completion, *wcpbrk()* shall return a pointer to the wide-character code or a null  
71704 pointer if no wide-character code from *ws2* occurs in *ws1*.

71705 **ERRORS**

71706 No errors are defined.

71707 **EXAMPLES**

71708 None.

71709 **APPLICATION USAGE**

71710 None.

71711 **RATIONALE**

71712 None.

71713 **FUTURE DIRECTIONS**

71714 None.

71715 **SEE ALSO**71716 *wcschr()*, *wcsrchr()*

71717 XBD &lt;wchar.h&gt;

71718 **CHANGE HISTORY**

71719 First released in Issue 4. Derived from the MSE working draft.

71720 **NAME**

71721 wcsrchr — wide-character string scanning operation

71722 **SYNOPSIS**

71723 #include &lt;wchar.h&gt;

71724 wchar\_t \*wcsrchr(const wchar\_t \*ws, wchar\_t wc);

71725 **DESCRIPTION**

71726 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
71727 conflict between the requirements described here and the ISO C standard is unintentional. This  
71728 volume of POSIX.1-2008 defers to the ISO C standard.

71729 The *wcsrchr()* function shall locate the last occurrence of *wc* in the wide-character string pointed  
71730 to by *ws*. The application shall ensure that the value of *wc* is a character representable as a type  
71731 **wchar\_t** and a wide-character code corresponding to a valid character in the current locale. The  
71732 terminating null wide-character code shall be considered to be part of the wide-character string.

71733 **RETURN VALUE**

71734 Upon successful completion, *wcsrchr()* shall return a pointer to the wide-character code or a null  
71735 pointer if *wc* does not occur in the wide-character string.

71736 **ERRORS**

71737 No errors are defined.

71738 **EXAMPLES**

71739 None.

71740 **APPLICATION USAGE**

71741 None.

71742 **RATIONALE**

71743 None.

71745 None.

71746 **SEE ALSO**71747 *wcschr()*

71748 XBD &lt;wchar.h&gt;

71749 **CHANGE HISTORY**

71750 First released in Issue 4. Derived from the MSE working draft.

71751 **Issue 6**

71752 The normative text is updated to avoid use of the term “must” for application requirements.

## 71753 NAME

71754 wcsnrtombs, wcsrtombs — convert a wide-character string to a character string (restartable)

## 71755 SYNOPSIS

71756 #include &lt;wchar.h&gt;

```
71757 CX size_t wcsnrtombs(char *restrict dst, const wchar_t **restrict src,
71758 size_t nwc, size_t len, mbstate_t *restrict ps);
71759 size_t wcsrtombs(char *restrict dst, const wchar_t **restrict src,
71760 size_t len, mbstate_t *restrict ps);
```

## 71761 DESCRIPTION

71762 CX For *wcsrtombs()*: The functionality described on this reference page is aligned with the ISO C  
 71763 standard. Any conflict between the requirements described here and the ISO C standard is  
 71764 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

71765 The *wcsrtombs()* function shall convert a sequence of wide characters from the array indirectly  
 71766 pointed to by *src* into a sequence of corresponding characters, beginning in the conversion state  
 71767 described by the object pointed to by *ps*. If *dst* is not a null pointer, the converted characters  
 71768 shall then be stored into the array pointed to by *dst*. Conversion continues up to and including a  
 71769 terminating null wide character, which shall also be stored. Conversion shall stop earlier in the  
 71770 following cases:

- 71771 • When a code is reached that does not correspond to a valid character
- 71772 • When the next character would exceed the limit of *len* total bytes to be stored in the array
- 71773 pointed to by *dst* (and *dst* is not a null pointer)

71774 Each conversion shall take place as if by a call to the *wcrtomb()* function.

71775 If *dst* is not a null pointer, the pointer object pointed to by *src* shall be assigned either a null  
 71776 pointer (if conversion stopped due to reaching a terminating null wide character) or the address  
 71777 just past the last wide character converted (if any). If conversion stopped due to reaching a  
 71778 terminating null wide character, the resulting state described shall be the initial conversion state.

71779 If *ps* is a null pointer, the *wcsrtombs()* function shall use its own internal **mbstate\_t** object, which  
 71780 is initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t** object  
 71781 pointed to by *ps* shall be used to completely describe the current conversion state of the  
 71782 associated character sequence.

71783 CX The *wcsnrtombs()* and *wcsrtombs()* functions need not be thread-safe if called with a NULL *ps*  
 71784 argument.

71785 The *wcsnrtombs()* function shall be equivalent to the *wcsrtombs()* function, except that the  
 71786 conversion is limited to the first *nwc* wide characters.

71787 The *wcsrtombs()* function shall not change the setting of *errno* if successful.71788 The behavior of these functions shall be affected by the *LC\_CTYPE* category of the current locale.

71789 The implementation shall behave as if no function defined in System Interfaces volume of  
 71790 POSIX.1-2008 calls these functions.

## 71791 RETURN VALUE

71792 If conversion stops because a code is reached that does not correspond to a valid character, an  
 71793 encoding error occurs. In this case, these functions shall store the value of the macro [EILSEQ] in  
 71794 *errno* and return (**size\_t**)–1; the conversion state is undefined. Otherwise, these functions shall  
 71795 return the number of bytes in the resulting character sequence, not including the terminating  
 71796 null (if any).

**71797 ERRORS**

71798 These functions shall fail if:

71799 [EILSEQ] A wide-character code does not correspond to a valid character.

71800 These functions may fail if:

71801 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

## NAME

wcstod, wcstof, wcstold — convert a wide-character string to a double-precision number

## SYNOPSIS

```
#include <wchar.h>

double wcstod(const wchar_t *restrict nptr, wchar_t **restrict endptr);
float wcstof(const wchar_t *restrict nptr, wchar_t **restrict endptr);
long double wcstold(const wchar_t *restrict nptr,
    wchar_t **restrict endptr);
```

## DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to **double**, **float**, and **long double** representation, respectively. First, they shall decompose the input wide-character string into three parts:

1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by *iswspace()*)
2. A subject sequence interpreted as a floating-point constant or representing infinity or NaN
3. A final wide-character string of one or more unrecognized wide-character codes, including the terminating null wide-character code of the input wide-character string

Then they shall attempt to convert the subject sequence to a floating-point number, and return the result.

The expected form of the subject sequence is an optional '+' or '-' sign, then one of the following:

- A non-empty sequence of decimal digits optionally containing a radix character; then an optional exponent part consisting of the wide character 'e' or the wide character 'E', optionally followed by a '+' or '-' wide character, and then followed by one or more decimal digits
- A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix character; then an optional binary exponent part consisting of the wide character 'p' or the wide character 'P', optionally followed by a '+' or '-' wide character, and then followed by one or more decimal digits
- One of INF or INFINITY, or any other wide string equivalent except for case
- One of NAN or NAN(*n-wchar-sequence<sub>opt</sub>*), or any other wide string ignoring case in the NAN part, where:

```
n-wchar-sequence:
    digit
    nondigit
    n-wchar-sequence digit
    n-wchar-sequence nondigit
```

The subject sequence is defined as the longest initial subsequence of the input wide string, starting with the first non-white-space wide character, that is of the expected form. The subject sequence contains no wide characters if the input wide string is not of the expected form.

If the subject sequence has the expected form for a floating-point number, the sequence of wide characters starting with the first digit or the radix character (whichever occurs first) shall be interpreted as a floating constant according to the rules of the C language, except that the radix character shall be used in place of a period, and that if neither an exponent part nor a radix character appears in a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal floating-point number, an exponent part of the appropriate type with value zero shall be assumed to follow the last digit in the string. If the subject sequence begins with a <hyphen-minus>, the sequence shall be interpreted as negated. A wide-character sequence INF or INFINITY shall be interpreted as an infinity, if representable in the return type, else as if it were a floating constant that is too large for the range of the return type. A wide-character sequence NAN or NAN(*n-wchar-sequence<sub>opt</sub>*) shall be interpreted as a quiet NaN, if supported in the return type, else as if it were a subject sequence part that does not have the expected form; the meaning of the *n-wchar* sequences is implementation-defined. A pointer to the final wide string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

If the subject sequence has the hexadecimal form and FLT\_RADIX is a power of 2, the conversion shall be rounded in an implementation-defined manner.

CX The radix character shall be as defined in the current locale (category *LC\_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a <period> ( ' . ' ).

CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be accepted.

If the subject sequence is empty or does not have the expected form, no conversion shall be performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

These functions shall not change the setting of *errno* if successful.

Since 0 is returned on error and is also a valid return on success, an application wishing to check for error situations should set *errno* to 0, then call *wcstod()*, *wcstof()*, or *wcstold()*, then check *errno*.

## 71969 RETURN VALUE

Upon successful completion, these functions shall return the converted value. If no conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

If the correct value is outside the range of representable values,  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, or  $\pm$ HUGE\_VALL shall be returned (according to the sign of the value), and *errno* shall be set to [ERANGE].

If the correct value would cause underflow, a value whose magnitude is no greater than the smallest normalized positive number in the return type shall be returned and *errno* set to [ERANGE].

## 71978 ERRORS

The *wcstod()* function shall fail if:

[ERANGE] The value to be returned would cause overflow or underflow.

The *wcstod()* function may fail if:

CX [EINVAL] No conversion could be performed.

**EXAMPLES**

None.

**APPLICATION USAGE**

If the subject sequence has the hexadecimal form and FLT\_RADIX is not a power of 2, and the result is not exactly representable, the result should be one of the two numbers in the appropriate internal format that are adjacent to the hexadecimal floating source value, with the extra stipulation that the error should have a correct sign for the current rounding direction.

If the subject sequence has the decimal form and at most DECIMAL\_DIG (defined in `<float.h>`) significant digits, the result should be correctly rounded. If the subject sequence *D* has the decimal form and more than DECIMAL\_DIG significant digits, consider the two bounding, adjacent decimal strings *L* and *U*, both having DECIMAL\_DIG significant digits, such that the values of *L*, *D*, and *U* satisfy "*L* <= *D* <= *U*". The result should be one of the (equal or adjacent) values that would be obtained by correctly rounding *L* and *U* according to the current rounding direction, with the extra stipulation that the error with respect to *D* should have a correct sign for the current rounding direction.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 4. Derived from the MSE working draft.

**Issue 5**

The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *wcstod()* prototype is updated.
- The *wcstof()* and *wcstold()* functions are added.
- If the correct value for *wcstod()* would cause underflow, the return value changed from 0 (as specified in Issue 5) to the smallest normalized positive number.
- The DESCRIPTION, RETURN VALUE, and APPLICATION USAGE sections are extensively updated.

ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/66 is applied, correcting the second paragraph in the RETURN VALUE section.

72025 **Issue 7**

72026 Austin Group Interpretation 1003.1-2001 #015 is applied.

72027 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0723 [302] and XSH/TC1-2008/0724  
72028 [105] are applied.

72029 **NAME**

72030       wcstoimax, wcstoumax — convert a wide-character string to an integer type

72031 **SYNOPSIS**

```
72032       #include <stddef.h>
72033       #include <inttypes.h>
72034       intmax_t wcstoimax(const wchar_t *restrict nptr,
72035                        wchar_t **restrict endptr, int base);
72036       uintmax_t wcstoumax(const wchar_t *restrict nptr,

72069       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**NAME**

wcstok — split a wide-character string into tokens

**SYNOPSIS**

```
#include <wchar.h>
```

```
wchar_t *wcstok(wchar_t *restrict ws1, const wchar_t *restrict ws2,  
                wchar_t **restrict ptr);
```

**DESCRIPTION**

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

A sequence of calls to *wcstok()* shall break the wide-character string pointed to by *ws1* into a sequence of tokens, each of which shall be delimited by a wide-character code from the wide-character string pointed to by *ws2*. The *ptr* argument points to a caller-provided **wchar\_t** pointer into which the *wcstok()* function shall store information necessary for it to continue scanning the same wide-character string.

The first call in the sequence has *ws1* as its first argument, and is followed by calls with a null pointer as their first argument. The separator string pointed to by *ws2* may be different from call to call.

The first call in the sequence shall search the wide-character string pointed to by *ws1* for the first wide-character code that is *not* contained in the current separator string pointed to by *ws2*. If no such wide-character code is found, then there are no tokens in the wide-character string pointed to by *ws1* and *wcstok()* shall return a null pointer. If such a wide-character code is found, it shall be the start of the first token.

The *wcstok()* function shall then search from there for a wide-character code that *is* contained in the current separator string. If no such wide-character code is found, the current token extends to the end of the wide-character string pointed to by *ws1*, and subsequent searches for a token shall return a null pointer. If such a wide-character code is found, it shall be overwritten by a null wide character, which terminates the current token. The *wcstok()* function shall save a pointer to the following wide-character code, from which the next search for a token shall start.

Each subsequent call, with a null pointer as the value of the first argument, shall start searching from the saved pointer and behave as described above.

The implementation shall behave as if no function calls *wcstok()*.

**RETURN VALUE**

Upon successful completion, the *wcstok()* function shall return a pointer to the first wide-character code of a token. Otherwise, if there is no token, *wcstok()* shall return a null pointer.

**ERRORS**

No errors are defined.

72107 **EXAMPLES**

72108 None.

72109 **APPLICATION USAGE**

72110 None.

72111 **RATIONALE**

72112 None.

72118 First released in Issue 4.

72119 **Issue 5**72120 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, a third argument is  
72121 added to the definition of *wcstok()* in the SYNOPSIS.72122 **Issue 6**72123 The *wcstok()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

## NAME

wcstol, wcstoll — convert a wide-character string to a long integer

## SYNOPSIS

```
#include <wchar.h>

long wcstol(const wchar_t *restrict nptr, wchar_t **restrict endptr,
            int base);
long long wcstoll(const wchar_t *restrict nptr,
                  wchar_t **restrict endptr, int base);
```

## DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to **long** and **long long**, respectively. First, they shall decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by *iswspace()*)
2. A subject sequence interpreted as an integer represented in some radix determined by the value of *base*
3. A final wide-character string of one or more unrecognized wide-character codes, including the terminating null wide-character code of the input wide-character string

Then they shall attempt to convert the subject sequence to an integer, and return the result.

If *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence of letters and digits representing an integer with the radix specified by *base*, optionally preceded by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less than that of *base* shall be permitted. If the value of *base* is 16, the wide-character code representations of 0x or 0X may optionally precede the sequence of letters and digits, following the sign if present.

The subject sequence is defined as the longest initial subsequence of the input wide-character string, starting with the first non-white-space wide-character code that is of the expected form. The subject sequence contains no wide-character codes if the input wide-character string is empty or consists entirely of white-space wide-character code, or if the first non-white-space wide-character code is other than a sign or a permissible letter or digit.

If the subject sequence has the expected form and *base* is 0, the sequence of wide-character codes starting with the first digit shall be interpreted as an integer constant. If the subject sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the base for conversion, ascribing to each letter its value as given above. If the subject sequence begins with a <hyphen-minus>, the value resulting from the conversion shall be negated. A pointer to the final wide-character string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

72170 CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be  
72171 accepted.

72172 If the subject sequence is empty or does not have the expected form, no conversion shall be  
72173 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that  
72174 *endptr* is not a null pointer.

72175 These functions shall not change the setting of *errno* if successful.

72176 Since 0, {LONG\_MIN} or {LLONG\_MIN} and {LONG\_MAX} or {LLONG\_MAX} are returned on  
72177 error and are also valid returns on success, an application wishing to check for error situations  
72178 should set *errno* to 0, then call *wcstol()* or *wcstoll()*, then check *errno*.

#### 72179 RETURN VALUE

72180 Upon successful completion, these functions shall return the converted value, if any. If no  
72181 CX conversion could be performed, 0 shall be returned and *errno* may be set to indicate the error. If  
72182 the correct value is outside the range of representable values, {LONG\_MIN}, {LONG\_MAX},  
72183 {LLONG\_MIN}, or {LLONG\_MAX} shall be returned (according to the sign of the value), and  
72184 *errno* set to [ERANGE].

#### 72185 ERRORS

72186 These functions shall fail if:

72187 CX [EINVAL] The value of *base* is not supported.  
72188 [ERANGE] The value to be returned is not representable.

72189 These functions may fail if:

72190 CX [EINVAL] No conversion could be performed.

72201 XBD <wchar.h>

#### 72202 CHANGE HISTORY

72203 First released in Issue 4. Derived from the MSE working draft.

#### 72204 Issue 5

72205 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

#### 72206 Issue 6

72207 Extensions beyond the ISO C standard are marked.

- 72208 The following new requirements on POSIX implementations derive from alignment with the  
72209 Single UNIX Specification:
- 72210 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
72211 added if no conversion could be performed.
- 72212 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:
- 72213 • The *wcstol()* prototype is updated.
  - 72214 • The *wcstoll()* function is added.
- 72215 **Issue 7**
- 72216 SD5-XSH-ERN-56 is applied, removing the reference to **unsigned long** and **unsigned long long**  
72217 from the DESCRIPTION.
- 72218 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0725 [105] is applied.

72219 **NAME**

72220       wcstold — convert a wide-character string to a double-precision number

72221 **SYNOPSIS**

72222       #include &lt;wchar.h&gt;

72223       long double wcstold(const wchar\_t \*restrict nptr,

72224                   wchar\_t \*\*restrict endptr);

72225 **DESCRIPTION**72226       Refer to *wcstod()*.

72227 **NAME**

72228       wcstoll — convert a wide-character string to a long integer

72229 **SYNOPSIS**

72230       #include &lt;wchar.h&gt;

72231       long long wcstoll(const wchar\_t \*restrict *nptr*,72232                       wchar\_t \*\*restrict *endptr*, int *base*);72233 **DESCRIPTION**72234       Refer to *wcstol()*.

72235 **NAME**

72236 wcstombs — convert a wide-character string to a character string

72237 **SYNOPSIS**

72238 #include &lt;stdlib.h&gt;

```
72239 size_t wcstombs(char *restrict s, const wchar_t *restrict pwcs,
72240                 size_t n);
```

72241 **DESCRIPTION**

72242 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 72243 conflict between the requirements described here and the ISO C standard is unintentional. This  
 72244 volume of POSIX.1-2008 defers to the ISO C standard.

72245 The *wcstombs()* function shall convert the sequence of wide-character codes that are in the array  
 72246 pointed to by *pwcs* into a sequence of characters that begins in the initial shift state and store  
 72247 these characters into the array pointed to by *s*, stopping if a character would exceed the limit of *n*  
 72248 total bytes or if a null byte is stored. Each wide-character code shall be converted as if by a call to  
 72249 *wctomb()*, except that the shift state of *wctomb()* shall not be affected.

72250 The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.

72251 No more than *n* bytes shall be modified in the array pointed to by *s*. If copying takes place  
 72252 CX between objects that overlap, the behavior is undefined. If *s* is a null pointer, *wcstombs()* shall  
 72253 return the length required to convert the entire array regardless of the value of *n*, but no values  
 72254 are stored.

72255 **RETURN VALUE**

72256 If a wide-character code is encountered that does not correspond to a valid character (of one or  
 72257 more bytes each), *wcstombs()* shall return (**size\_t**)–1. Otherwise, *wcstombs()* shall return the  
 72258 number of bytes stored in the character array, not including any terminating null byte. The array  
 72259 shall not be null-terminated if the value returned is *n*.

72260 **ERRORS**72261 The *wcstombs()* function shall fail if:

72262 CX [EILSEQ] A wide-character code does not correspond to a valid character.

72263 **EXAMPLES**

72264 None.

72265 **APPLICATION USAGE**

72266 None.

72267 **RATIONALE**

72268 None.

72269 **FUTURE DIRECTIONS**

72270 None.

72271 **SEE ALSO**72272 *mblen()*, *mbtowc()*, *mbstowcs()*, *wctomb()*

72273 XBD &lt;stdlib.h&gt;

72274 **CHANGE HISTORY**

72275 First released in Issue 4. Derived from the ISO C standard.

72276 **Issue 6**

72277 The following new requirements on POSIX implementations derive from alignment with the  
72278 Single UNIX Specification:

- 72279 • The DESCRIPTION states the effect of when *s* is a null pointer.
- 72280 • The [EILSEQ] error condition is added.

72281 The *wcstombs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

72282 **Issue 7**

72283 Austin Group Interpretations 1003.1-2001 #156 and #170 are applied.

72284 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0726 [109] is applied.

## NAME

wcstoul, wcstoull — convert a wide-character string to an unsigned long

## SYNOPSIS

```
#include <wchar.h>

unsigned long wcstoul(const wchar_t *restrict nptr,
    wchar_t **restrict endptr, int base);
unsigned long long wcstoull(const wchar_t *restrict nptr,
    wchar_t **restrict endptr, int base);
```

## DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *wcstoul()* and *wcstoull()* functions shall convert the initial portion of the wide-character string pointed to by *nptr* to **unsigned long** and **unsigned long long** representation, respectively. First, they shall decompose the input wide-character string into three parts:

1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by *iswspace()*)
2. A subject sequence interpreted as an integer represented in some radix determined by the value of *base*
3. A final wide-character string of one or more unrecognized wide-character codes, including the terminating null wide-character code of the input wide-character string

Then they shall attempt to convert the subject sequence to an unsigned integer, and return the result.

If *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence of letters and digits representing an integer with the radix specified by *base*, optionally preceded by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less than that of *base* shall be permitted. If the value of *base* is 16, the wide-character codes 0x or 0X may optionally precede the sequence of letters and digits, following the sign if present.

The subject sequence is defined as the longest initial subsequence of the input wide-character string, starting with the first wide-character code that is not white space and is of the expected form. The subject sequence contains no wide-character codes if the input wide-character string is empty or consists entirely of white-space wide-character codes, or if the first wide-character code that is not white space is other than a sign or a permissible letter or digit.

If the subject sequence has the expected form and *base* is 0, the sequence of wide-character codes starting with the first digit shall be interpreted as an integer constant. If the subject sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the base for conversion, ascribing to each letter its value as given above. If the subject sequence begins with a <hyphen-minus>, the value resulting from the conversion shall be negated. A pointer to the final wide-character string shall be stored in the object pointed to by *endptr*, provided that *endptr* is

72331 not a null pointer.

72332 CX In other than the C or POSIX locale, additional locale-specific subject sequence forms may be  
72333 accepted.

72334 If the subject sequence is empty or does not have the expected form, no conversion shall be  
72335 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that  
72336 *endptr* is not a null pointer.

72337 These functions shall not change the setting of *errno* if successful.

72338 Since 0, {ULONG\_MAX}, and {ULLONG\_MAX} are returned on error and 0 is also a valid return  
72339 on success, an application wishing to check for error situations should set *errno* to 0, then call  
72340 *wcstoul()* or *wcstoull()*, then check *errno*.

#### 72341 RETURN VALUE

72342 Upon successful completion, the *wcstoul()* and *wcstoull()* functions shall return the converted  
72343 CX value, if any. If no conversion could be performed, 0 shall be returned and *errno* may be set to  
72344 indicate the error. If the correct value is outside the range of representable values,  
72345 {ULONG\_MAX} or {ULLONG\_MAX} respectively shall be returned and *errno* set to [ERANGE].

#### 72346 ERRORS

72347 These functions shall fail if:

72348 CX [EINVAL] The value of *base* is not supported.

72349 [ERANGE] The value to be returned is not representable.

72350 These functions may fail if:

72351 CX [EINVAL] No conversion could be performed.

#### 72352 EXAMPLES

72353 None.

#### 72354 APPLICATION USAGE

72355 None.

#### 72356 RATIONALE

72357 None.

#### 72358 FUTURE DIRECTIONS

72359 None.

#### 72360 SEE ALSO

72361 *fscanf()*, *iswalpha()*, *wcstod()*, *wcstol()*

72362 XBD <wchar.h>

#### 72363 CHANGE HISTORY

72364 First released in Issue 4. Derived from the MSE working draft.

#### 72365 Issue 5

72366 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

#### 72367 Issue 6

72368 Extensions beyond the ISO C standard are marked.

72369 The following new requirements on POSIX implementations derive from alignment with the  
72370 Single UNIX Specification:

- 72371 • The [EINVAL] error condition is added for when the value of *base* is not supported.

72372 In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
72373 added if no conversion could be performed.

72374 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 72375 • The *wcstoul()* prototype is updated.
- 72376 • The *wcstoull()* function is added.

72377 **Issue 7**

72378 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0727 [105] is applied.

72379 **NAME**

72380       wcstoumax — convert a wide-character string to an integer type

72381 **SYNOPSIS**

72382       #include &lt;stddef.h&gt;

72383       #include &lt;inttypes.h&gt;

72384       uintmax\_t wcstoumax(const wchar\_t \*restrict nptr,

72385                    wchar\_t \*\*restrict endptr, int base);

72386 **DESCRIPTION**72387       Refer to *wcstoimax()*.

72388 **NAME**

72389       wcswidth — number of column positions of a wide-character string

72390 **SYNOPSIS**

72391 XSI       #include &lt;wchar.h&gt;

72392       int wcswidth(const wchar\_t \*pwcs, size\_t n);

72393 **DESCRIPTION**

72394       The *wcswidth()* function shall determine the number of column positions required for *n* wide-  
72395       character codes (or fewer than *n* wide-character codes if a null wide-character code is  
72396       encountered before *n* wide-character codes are exhausted) in the string pointed to by *pwcs*.

72397 **RETURN VALUE**

72398       The *wcswidth()* function either shall return 0 (if *pwcs* points to a null wide-character code), or  
72399       return the number of column positions to be occupied by the wide-character string pointed to by  
72400       *pwcs*, or return -1 (if any of the first *n* wide-character codes in the wide-character string pointed  
72401       to by *pwcs* is not a printable wide-character code).

72402 **ERRORS**

72403       No errors are defined.

72404 **EXAMPLES**

72405       None.

72406 **APPLICATION USAGE**

72407       This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the  
72408       return value for a non-printable wide character is not specified.

72409 **RATIONALE**

72410       None.

72411 **FUTURE DIRECTIONS**

72412       None.

72413 **SEE ALSO**72414       *wcwidth()*72415       XBD [Section 3.103](#) (on page 50), [<wchar.h>](#)72416 **CHANGE HISTORY**

72417       First released in Issue 4. Derived from the MSE working draft.

72418 **Issue 6**

72419       The Open Group Corrigendum U021/11 is applied. The function is marked as an extension.

72420 **NAME**72421        `wcsxfrm`, `wcsxfrm_l` — wide-character string transformation72422 **SYNOPSIS**

```

72423     #include <wchar.h>
72424     size_t wcsxfrm(wchar_t *restrict ws1, const wchar_t *restrict ws2,
72425                   size_t n);
72426 CX    size_t wcsxfrm_l(wchar_t *restrict ws1, const wchar_t *restrict ws2,
72427                      size_t n, locale_t locale);

```

72428 **DESCRIPTION**

72429 CX     For `wcsxfrm()`: The functionality described on this reference page is aligned with the ISO C  
72430 standard. Any conflict between the requirements described here and the ISO C standard is  
72431 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

72432 CX     The `wcsxfrm()` and `wcsxfrm_l()` functions shall transform the wide-character string pointed to  
72433 by `ws2` and place the resulting wide-character string into the array pointed to by `ws1`. The  
72434 transformation shall be such that if `wcscmp()` is applied to two transformed wide strings, it shall  
72435 CX     return a value greater than, equal to, or less than 0, corresponding to the result of `wcscoll()` and  
72436 `wcscoll_l()` applied to the same two original wide-character strings, and the same `LC_COLLATE`  
72437 CX     category of the current locale or the locale object `locale`, respectively. No more than `n` wide-  
72438 character codes shall be placed into the resulting array pointed to by `ws1`, including the  
72439 terminating null wide-character code. If `n` is 0, `ws1` is permitted to be a null pointer. If copying  
72440 takes place between objects that overlap, the behavior is undefined.

72441 CX     The `wcsxfrm()` and `wcsxfrm_l()` functions shall not change the setting of `errno` if successful.

72442     Since no return value is reserved to indicate an error, an application wishing to check for error  
72443 situations should set `errno` to 0, then call `wcsxfrm()` or `wcsxfrm_l()`, then check `errno`.

72444     The behavior is undefined if the `locale` argument to `wcsxfrm_l()` is the special locale object  
72445 `LC_GLOBAL_LOCALE` or is not a valid locale object handle.

72446 **RETURN VALUE**

72447 CX     The `wcsxfrm()` and `wcsxfrm_l()` functions shall return the length of the transformed wide-  
72448 character string (not including the terminating null wide-character code). If the value returned is  
72449 `n` or more, the contents of the array pointed to by `ws1` are unspecified.

72450 CX     On error, the `wcsxfrm()` and `wcsxfrm_l()` functions may set `errno`, but no return value is reserved  
72451 to indicate an error.

72452 **ERRORS**

72453     These functions may fail if:

72454 CX     [EINVAL]     The wide-character string pointed to by `ws2` contains wide-character codes  
72455 outside the domain of the collating sequence.

**EXAMPLES**

None.

**APPLICATION USAGE**

The transformation function is such that two transformed wide-character strings can be ordered by *wscmp()* as appropriate to collating sequence information in the current locale (category *LC\_COLLATE*).

The fact that when *n* is 0 *ws1* is permitted to be a null pointer is useful to determine the size of the *ws1* array prior to making the transformation.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*wscmp()*, *wscoll()*

XBD <**wchar.h**>

**CHANGE HISTORY**

First released in Issue 4. Derived from the MSE working draft.

**Issue 5**

Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

**Issue 6**

In earlier versions, this function was required to return -1 on error.

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

The *wcsxfrm()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

**Issue 7**

The *wcsxfrm\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0728 [302], XSH/TC1-2008/0729 [283], XSH/TC1-2008/0730 [283], and XSH/TC1-2008/0731 [302] are applied.

72489 **NAME**

72490 wctob — wide-character to single-byte conversion

72491 **SYNOPSIS**

72492 #include &lt;stdio.h&gt;

72493 #include &lt;wchar.h&gt;

72494 int wctob(wint\_t c);

72495 **DESCRIPTION**

72496 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 72497 conflict between the requirements described here and the ISO C standard is unintentional. This  
 72498 volume of POSIX.1-2008 defers to the ISO C standard.

72499 The *wctob()* function shall determine whether *c* corresponds to a member of the extended  
 72500 character set whose character representation is a single byte when in the initial shift state.

72501 The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.

72502 **RETURN VALUE**

72503 The *wctob()* function shall return EOF if *c* does not correspond to a character with length one in  
 72504 the initial shift state. Otherwise, it shall return the single-byte representation of that character as  
 72505 an **unsigned char** converted to **int**.

72506 **ERRORS**

72507 No errors are defined.

72508 **EXAMPLES**

72509 None.

72510 **APPLICATION USAGE**

72511 None.

72512 **RATIONALE**

72513 None.

72514 **FUTURE DIRECTIONS**

72515 None.

72516 **SEE ALSO**72517 *btowc()*

72518 XBD &lt;stdio.h&gt;, &lt;wchar.h&gt;

72519 **CHANGE HISTORY**

72520 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 72521 (E).

72522 **NAME**

72523 wctomb — convert a wide-character code to a character

72524 **SYNOPSIS**

72525 #include &lt;stdlib.h&gt;

72526 int wctomb(char \*s, wchar\_t wchar);

72527 **DESCRIPTION**

72528 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 72529 conflict between the requirements described here and the ISO C standard is unintentional. This  
 72530 volume of POSIX.1-2008 defers to the ISO C standard.

72531 The *wctomb()* function shall determine the number of bytes needed to represent the character  
 72532 corresponding to the wide-character code whose value is *wchar* (including any change in the  
 72533 shift state). It shall store the character representation (possibly multiple bytes and any special  
 72534 bytes to change shift state) in the array object pointed to by *s* (if *s* is not a null pointer). At most  
 72535 {MB\_CUR\_MAX} bytes shall be stored. If *wchar* is 0, a null byte shall be stored, preceded by any  
 72536 shift sequence needed to restore the initial shift state, and *wctomb()* shall be left in the initial shift  
 72537 state.

72538 CX The behavior of this function is affected by the *LC\_CTYPE* category of the current locale. For a  
 72539 state-dependent encoding, this function shall be placed into its initial state by a call for which its  
 72540 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null  
 72541 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a  
 72542 null pointer shall cause this function to return a non-zero value if encodings have state  
 72543 dependency, and 0 otherwise. Changing the *LC\_CTYPE* category causes the shift state of this  
 72544 function to be unspecified.

72545 The *wctomb()* function need not be thread-safe.

72546 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
 72547 *wctomb()*.

72548 **RETURN VALUE**

72549 If *s* is a null pointer, *wctomb()* shall return a non-zero or 0 value, if character encodings,  
 72550 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *wctomb()*  
 72551 shall return -1 if the value of *wchar* does not correspond to a valid character, or return the  
 72552 number of bytes that constitute the character corresponding to the value of *wchar*.

72553 In no case shall the value returned be greater than the value of the {MB\_CUR\_MAX} macro.

72554 **ERRORS**72555 The *wctomb()* function shall fail if:

72556 CX [EILSEQ] An invalid wide-character code is detected.

72557 **EXAMPLES**

72558 None.

72559 **APPLICATION USAGE**

72560 None.

72561 **RATIONALE**

72562 None.

72563 **FUTURE DIRECTIONS**

72564 None.

72565 **SEE ALSO**72566 *mblen()*, *mbtowc()*, *mbstowcs()*, *wcstombs()*72567 XBD **<stdlib.h>**72568 **CHANGE HISTORY**

72569 First released in Issue 4. Derived from the ANSI C standard.

72570 **Issue 6**

72571 Extensions beyond the ISO C standard are marked.

72572 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

72573 **Issue 7**

72574 Austin Group Interpretations 1003.1-2001 #156 and #170 are applied.

72575 **NAME**

72576 wctrans, wctrans\_l — define character mapping

72577 **SYNOPSIS**

72578 #include &lt;wctype.h&gt;

72579 wctrans\_t wctrans(const char \*charclass);

72580 CX wctrans\_t wctrans\_l(const char \*charclass, locale\_t locale);

72581 **DESCRIPTION**

72582 CX For *wctrans()*: The functionality described on this reference page is aligned with the ISO C  
 72583 standard. Any conflict between the requirements described here and the ISO C standard is  
 72584 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

72585 CX The *wctrans()* and *wctrans\_l()* functions are defined for valid character mapping names  
 72586 identified in the current locale. The *charclass* is a string identifying a generic character mapping  
 72587 name for which codeset-specific information is required. The following character mapping  
 72588 names are defined in all locales: **tolower** and **toupper**.

72589 These functions shall return a value of type **wctrans\_t**, which can be used as the second  
 72590 CX argument to subsequent calls of *towctrans()* and *towctrans\_l()*.

72591 CX The *wctrans()* and *wctrans\_l()* functions shall determine values of **wctrans\_t** according to the  
 72592 CX rules of the coded character set defined by character mapping information in the current locale  
 72593 or in the locale represented by *locale*, respectively (category *LC\_CTYPE*).

72594 The values returned by *wctrans()* shall be valid until a call to *setlocale()* that modifies the  
 72595 category *LC\_CTYPE*.

72596 CX The values returned by *wctrans\_l()* shall be valid only in calls to *towctrans\_l()* with a locale  
 72597 represented by *locale* with the same *LC\_CTYPE* category value.

72598 The behavior is undefined if the *locale* argument to *wctrans\_l()* is the special locale object  
 72599 *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.

72600 **RETURN VALUE**

72601 CX The *wctrans()* and *wctrans\_l()* functions shall return 0 and may set *errno* to indicate the error if  
 72602 the given character mapping name is not valid for the current locale (category *LC\_CTYPE*);  
 72603 otherwise, they shall return a non-zero object of type **wctrans\_t** that can be used in calls to  
 72604 CX *towctrans()* and *towctrans\_l()*.

72605 **ERRORS**

72606 These functions may fail if:

72607 CX **[EINVAL]** The character mapping name pointed to by *charclass* is not valid in the current  
 72608 locale.

72609 **EXAMPLES**

72610 None.

72611 **APPLICATION USAGE**

72612 None.

72613 **RATIONALE**

72614 None.

72615 **FUTURE DIRECTIONS**

72616 None.

72617 **SEE ALSO**72618 *towctrans()*

72619 XBD &lt;wctype.h&gt;

72620 **CHANGE HISTORY**

72621 First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

72622 **Issue 7**72623 The *wctrans\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
72624 API Set Part 4.72625 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0732 [302], XSH/TC1-2008/0733 [289],  
72626 XSH/TC1-2008/0734 [283], and XSH/TC1-2008/0735 [283] are applied.

72627 **NAME**

72628       wctype, wctype\_l — define character class

72629 **SYNOPSIS**

72630       #include &lt;wctype.h&gt;

72631       wctype\_t wctype(const char \*property);

72632 CX     wctype\_t wctype\_l(const char \*property, locale\_t locale);

72633 **DESCRIPTION**

72634 CX     For *wctype()*: The functionality described on this reference page is aligned with the ISO C  
 72635 standard. Any conflict between the requirements described here and the ISO C standard is  
 72636 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

72637 CX     The *wctype()* and *wctype\_l()* functions are defined for valid character class names as defined in  
 72638 CX     the current locale or in the locale represented by *locale*, respectively.

72639     The *property* argument is a string identifying a generic character class for which codeset-specific  
 72640 type information is required. The following character class names shall be defined in all locales:

|       |              |              |               |
|-------|--------------|--------------|---------------|
| 72641 | <b>alnum</b> | <b>digit</b> | <b>punct</b>  |
| 72642 | <b>alpha</b> | <b>graph</b> | <b>space</b>  |
| 72643 | <b>blank</b> | <b>lower</b> | <b>upper</b>  |
| 72644 | <b>cntrl</b> | <b>print</b> | <b>xdigit</b> |

72645     Additional character class names defined in the locale definition file (category *LC\_CTYPE*) can  
 72646 also be specified.

72647     These functions shall return a value of type **wctype\_t**, which can be used as the second  
 72648 CX     argument to subsequent calls of *iswctype()* and *iswctype\_l()*.

72649 CX     The *wctype()* and *wctype\_l()* functions shall determine values of **wctype\_t** according to the  
 72650 CX     rules of the coded character set defined by character type information in the current locale or in  
 72651 the locale represented by *locale*, respectively (category *LC\_CTYPE*).

72652     The values returned by *wctype()* shall be valid until a call to *setlocale()* that modifies the category  
 72653 *LC\_CTYPE*.

72654 CX     The values returned by *wctype\_l()* shall be valid only in calls to *iswctype\_l()* with a locale  
 72655 represented by *locale* with the same *LC\_CTYPE* category value.

72656     The behavior is undefined if the *locale* argument to *wctype\_l()* is the special locale object  
 72657 *LC\_GLOBAL\_LOCALE* or is not a valid locale object handle.

72658 **RETURN VALUE**

72659 CX     The *wctype()* and *wctype\_l()* functions shall return 0 if the given character class name is not  
 72660 valid for the current locale (category *LC\_CTYPE*); otherwise, they shall return an object of type  
 72661 CX     **wctype\_t** that can be used in calls to *iswctype()* and *iswctype\_l()*.

72662 **ERRORS**

72663     No errors are defined.

72664 **EXAMPLES**

72665 None.

72666 **APPLICATION USAGE**

72667 None.

72668 **RATIONALE**

72669 None.

72670 **FUTURE DIRECTIONS**

72671 None.

72674 XBD &lt;wctype.h&gt;

72675 **CHANGE HISTORY**

72676 First released in Issue 4.

72677 **Issue 5**72678 The following change has been made in this version for alignment with  
72679 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 72680 • The SYNOPSIS has been changed to indicate that this function and associated data types  
72681 are now made visible by inclusion of the <wctype.h> header rather than <wchar.h>.

72682 **Issue 7**72683 The *wctype\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
72684 Set Part 4.72685 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0736 [302], XSH/TC1-2008/0737 [283],  
72686 and XSH/TC1-2008/0738 [283] are applied.

72687 **NAME**

72688       wctype — number of column positions of a wide-character code

72689 **SYNOPSIS**

```
72690 XSI      #include <wctype.h>
72691          int wctype(wchar_t wc);
```

72692 **DESCRIPTION**

72693       The *wctype()* function shall determine the number of column positions required for the wide  
72694       character *wc*. The application shall ensure that the value of *wc* is a character representable as a  
72695       *wchar\_t*, and is a wide-character code corresponding to a valid character in the current locale.

72696 **RETURN VALUE**

72697       The *wctype()* function shall either return 0 (if *wc* is a null wide-character code), or return the  
72698       number of column positions to be occupied by the wide-character code *wc*, or return -1 (if *wc*  
72699       does not correspond to a printable wide-character code).

72700 **ERRORS**

72701       No errors are defined.

72702 **EXAMPLES**

72703       None.

72704 **APPLICATION USAGE**

72705       This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the  
72706       return value for a non-printable wide character is not specified.

72707 **RATIONALE**

72708       None.

72709 **FUTURE DIRECTIONS**

72710       None.

72711 **SEE ALSO**72712       *wcswidth()*

72713       XBD &lt;wctype.h&gt;

72714 **CHANGE HISTORY**

72715       First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working  
72716       draft.

72717 **Issue 6**

72718       The Open Group Corrigendum U021/12 is applied. This function is marked as an extension.

72719       The normative text is updated to avoid use of the term “must” for application requirements.

72720 **NAME**

72721 wmemchr — find a wide character in memory

72722 **SYNOPSIS**

72723 #include &lt;wchar.h&gt;

72724 wchar\_t \*wmemchr(const wchar\_t \*ws, wchar\_t wc, size\_t n);

72725 **DESCRIPTION**

72726 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 72727 conflict between the requirements described here and the ISO C standard is unintentional. This  
 72728 volume of POSIX.1-2008 defers to the ISO C standard.

72729 The *wmemchr()* function shall locate the first occurrence of *wc* in the initial *n* wide characters of  
 72730 the object pointed to by *ws*. This function shall not be affected by locale and all **wchar\_t** values  
 72731 shall be treated identically. The null wide character and **wchar\_t** values not corresponding to  
 72732 valid characters shall not be treated specially.

72733 If *n* is zero, the application shall ensure that *ws* is a valid pointer and the function behaves as if  
 72734 no valid occurrence of *wc* is found.

72735 **RETURN VALUE**

72736 The *wmemchr()* function shall return a pointer to the located wide character, or a null pointer if  
 72737 the wide character does not occur in the object.

72738 **ERRORS**

72739 No errors are defined.

72740 **EXAMPLES**

72741 None.

72742 **APPLICATION USAGE**

72743 None.

72744 **RATIONALE**

72745 None.

72746 **FUTURE DIRECTIONS**

72747 None.

72748 **SEE ALSO**72749 *wmemcmp()*, *wmemcpy()*, *wmemmove()*, *wmemset()*

72750 XBD &lt;wchar.h&gt;

72751 **CHANGE HISTORY**

72752 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 72753 (E).

72754 **Issue 6**

72755 The normative text is updated to avoid use of the term “must” for application requirements.

72756 **NAME**

72757 wmemcmp — compare wide characters in memory

72758 **SYNOPSIS**

72759 #include &lt;wchar.h&gt;

72760 int wmemcmp(const wchar\_t \*ws1, const wchar\_t \*ws2, size\_t n);

72761 **DESCRIPTION**

72762 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
72763 conflict between the requirements described here and the ISO C standard is unintentional. This  
72764 volume of POSIX.1-2008 defers to the ISO C standard.

72765 The *wmemcmp()* function shall compare the first *n* wide characters of the object pointed to by  
72766 *ws1* to the first *n* wide characters of the object pointed to by *ws2*. This function shall not be  
72767 affected by locale and all **wchar\_t** values shall be treated identically. The null wide character and  
72768 **wchar\_t** values not corresponding to valid characters shall not be treated specially.

72769 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function  
72770 shall behave as if the two objects compare equal.

72771 **RETURN VALUE**

72772 The *wmemcmp()* function shall return an integer greater than, equal to, or less than zero,  
72773 respectively, as the object pointed to by *ws1* is greater than, equal to, or less than the object  
72774 pointed to by *ws2*.

72775 **ERRORS**

72776 No errors are defined.

72777 **EXAMPLES**

72778 None.

72779 **APPLICATION USAGE**

72780 None.

72781 **RATIONALE**

72782 None.

72783 **FUTURE DIRECTIONS**

72784 None.

72785 **SEE ALSO**72786 *wmemchr()*, *wmemcpy()*, *wmemmove()*, *wmemset()*

72787 XBD &lt;wchar.h&gt;

72788 **CHANGE HISTORY**

72789 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
72790 (E).

72791 **Issue 6**

72792 The normative text is updated to avoid use of the term “must” for application requirements.

72793 **NAME**

72794       wmemcpy — copy wide characters in memory

72795 **SYNOPSIS**

72796       #include &lt;wchar.h&gt;

```
72797     wchar_t *wmemcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2,
72798                     size_t n);
```

72799 **DESCRIPTION**

72800 CX     The functionality described on this reference page is aligned with the ISO C standard. Any  
 72801       conflict between the requirements described here and the ISO C standard is unintentional. This  
 72802       volume of POSIX.1-2008 defers to the ISO C standard.

72803       The *wmemcpy()* function shall copy *n* wide characters from the object pointed to by *ws2* to the  
 72804       object pointed to by *ws1*. This function shall not be affected by locale and all **wchar\_t** values  
 72805       shall be treated identically. The null wide character and **wchar\_t** values not corresponding to  
 72806       valid characters shall not be treated specially.

72807       If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function  
 72808       shall copy zero wide characters.

72809 **RETURN VALUE**72810       The *wmemcpy()* function shall return the value of *ws1*.72811 **ERRORS**

72812       No errors are defined.

72813 **EXAMPLES**

72814       None.

72815 **APPLICATION USAGE**

72816       None.

72817 **RATIONALE**

72818       None.

72819 **FUTURE DIRECTIONS**

72820       None.

72821 **SEE ALSO**72822       *wmemchr()*, *wmemcmp()*, *wmemmove()*, *wmemset()*

72823       XBD &lt;wchar.h&gt;

72824 **CHANGE HISTORY**

72825       First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 72826       (E).

72827 **Issue 6**

72828       The normative text is updated to avoid use of the term “must” for application requirements.

72829       The *wmemcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

72830 **NAME**

72831 `wmemmove` — copy wide characters in memory with overlapping areas

72832 **SYNOPSIS**

72833 `#include <wchar.h>`

72834 `wchar_t *wmemmove(wchar_t *ws1, const wchar_t *ws2, size_t n);`

72835 **DESCRIPTION**

72836 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
72837 conflict between the requirements described here and the ISO C standard is unintentional. This  
72838 volume of POSIX.1-2008 defers to the ISO C standard.

72839 The `wmemmove()` function shall copy *n* wide characters from the object pointed to by *ws2* to the  
72840 object pointed to by *ws1*. Copying shall take place as if the *n* wide characters from the object  
72841 pointed to by *ws2* are first copied into a temporary array of *n* wide characters that does not  
72842 overlap the objects pointed to by *ws1* or *ws2*, and then the *n* wide characters from the temporary  
72843 array are copied into the object pointed to by *ws1*.

72844 This function shall not be affected by locale and all **wchar\_t** values shall be treated identically.  
72845 The null wide character and **wchar\_t** values not corresponding to valid characters shall not be  
72846 treated specially.

72847 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function  
72848 shall copy zero wide characters.

72849 **RETURN VALUE**

72850 The `wmemmove()` function shall return the value of *ws1*.

72851 **ERRORS**

72852 No errors are defined

72853 **EXAMPLES**

72854 None.

72855 **APPLICATION USAGE**

72856 None.

72857 **RATIONALE**

72858 None.

72859 **FUTURE DIRECTIONS**

72860 None.

72866 (E).

72867 **Issue 6**

72868 The normative text is updated to avoid use of the term “must” for application requirements.

72869 **NAME**

72870 wmemset — set wide characters in memory

72871 **SYNOPSIS**

72872 #include &lt;wchar.h&gt;

72873 wchar\_t \*wmemset(wchar\_t \*ws, wchar\_t wc, size\_t n);

72874 **DESCRIPTION**

72875 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 72876 conflict between the requirements described here and the ISO C standard is unintentional. This  
 72877 volume of POSIX.1-2008 defers to the ISO C standard.

72878 The *wmemset()* function shall copy the value of *wc* into each of the first *n* wide characters of the  
 72879 object pointed to by *ws*. This function shall not be affected by locale and all **wchar\_t** values shall  
 72880 be treated identically. The null wide character and **wchar\_t** values not corresponding to valid  
 72881 characters shall not be treated specially.

72882 If *n* is zero, the application shall ensure that *ws* is a valid pointer, and the function shall copy  
 72883 zero wide characters.

72884 **RETURN VALUE**72885 The *wmemset()* functions shall return the value of *ws*.72886 **ERRORS**

72887 No errors are defined.

72902 **Issue 6**

72903 The normative text is updated to avoid use of the term “must” for application requirements.

**NAME**

wordexp, wordfree — perform word expansions

**SYNOPSIS**

```
#include <wordexp.h>

int wordexp(const char *restrict words, wordexp_t *restrict pwordexp,
            int flags);
void wordfree(wordexp_t *pwordexp);
```

**DESCRIPTION**

The *wordexp()* function shall perform word expansions as described in XCU [Section 2.6](#) (on page 2343), subject to quoting as described in XCU [Section 2.2](#) (on page 2336), and place the list of expanded words into the structure pointed to by *pwordexp*.

The *words* argument is a pointer to a string containing one or more words to be expanded. The expansions shall be the same as would be performed by the command line interpreter if *words* were the part of a command line representing the arguments to a utility. Therefore, the application shall ensure that *words* does not contain an unquoted <newline> character or any of the unquoted shell special characters ' | ', '&', ';', '<', '>' except in the context of command substitution as specified in XCU [Section 2.6.3](#) (on page 2347). It also shall not contain unquoted parentheses or braces, except in the context of command or variable substitution. The application shall ensure that every member of *words* which it expects to have expanded by *wordexp()* does not contain an unquoted initial comment character. The application shall also ensure that any words which it intends to be ignored (because they begin or continue a comment) are deleted from *words*. If the argument *words* contains an unquoted comment character (<number-sign>) that is the beginning of a token, *wordexp()* shall either treat the comment character as a regular character, or interpret it as a comment indicator and ignore the remainder of *words*.

The structure type **wordexp\_t** is defined in the **<wordexp.h>** header and includes at least the following members:

| Member Type | Member Name     | Description                                                         |
|-------------|-----------------|---------------------------------------------------------------------|
| size_t      | <i>we_wordc</i> | Count of words matched by <i>words</i> .                            |
| char **     | <i>we_wordv</i> | Pointer to list of expanded words.                                  |
| size_t      | <i>we_offs</i>  | Slots to reserve at the beginning of <i>pwordexp-&gt;we_wordv</i> . |

The *wordexp()* function shall store the number of generated words into *pwordexp->we\_wordc* and a pointer to a list of pointers to words in *pwordexp->we\_wordv*. Each individual field created during field splitting (see XCU [Section 2.6.5](#), on page 2349) or pathname expansion (see XCU [Section 2.6.6](#), on page 2350) shall be a separate word in the *pwordexp->we\_wordv* list. The words shall be in order as described in XCU [Section 2.6](#) (on page 2343). The first pointer after the last word pointer shall be a null pointer. The expansion of special parameters described in XCU [Section 2.5.2](#) (on page 2340) is unspecified.

It is the caller's responsibility to allocate the storage pointed to by *pwordexp*. The *wordexp()* function shall allocate other space as needed, including memory pointed to by *pwordexp->we\_wordv*. The *wordfree()* function frees any memory associated with *pwordexp* from a previous call to *wordexp()*.

The *flags* argument is used to control the behavior of *wordexp()*. The value of *flags* is the bitwise-inclusive OR of zero or more of the following constants, which are defined in **<wordexp.h>**:

|       |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 72985 |              | Unless WRDE_SHOWERR is set in <i>flags</i> , <i>wordexp()</i> shall redirect <i>stderr</i> to <i>/dev/null</i> for any utilities executed as a result of command substitution while expanding <i>words</i> . If WRDE_SHOWERR is set, <i>wordexp()</i> may write messages to <i>stderr</i> if syntax errors are detected while expanding <i>words</i> , unless the <i>stderr</i> stream has wide orientation in which case the behavior is undefined. It is unspecified whether any write errors encountered while outputting such messages will affect the <i>stderr</i> error indicator or the value of <i>errno</i> . |
| 72986 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 72987 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 72988 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 72989 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 72990 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 72991 |              | The application shall ensure that if WRDE_DOOFFS is set, then <i>pwordexp-&gt;we_offs</i> has the same                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

72992 value for each *wordexp()* call and *wordfree()* call using a given *pwordexp*.

72993 The results are unspecified if WRDE\_APPEND and WRDE\_REUSE are both specified. +

72994 The following constants are defined as error return values:

72995 WRDE\_BADCHAR One of the unquoted characters—<newline>, ' | ', '&', ';', '<', '>',  
72996 ' ( ', ' ) ', ' { ', ' } '—appears in *words* in an inappropriate context.

72997 WRDE\_BADVAL Reference to undefined shell variable when WRDE\_UNDEF is set in *flags*.

72998 WRDE\_CMDSUB Command substitution requested when WRDE\_NOCMD was set in *flags*.

72999 WRDE\_NOSPACE Attempt to allocate memory failed.

73000 WRDE\_SYNTAX Shell syntax error, such as unbalanced parentheses or unterminated  
73001 string.

## 73002 RETURN VALUE

73003 Upon successful completion, *wordexp()* shall return 0. Otherwise, a non-zero value, as described  
73004 in <**wordexp.h**>, shall be returned to indicate an error. If *wordexp()* returns the value  
73005 WRDE\_NOSPACE, then *pwordexp->we\_wordc* and *pwordexp->we\_wordv* shall be updated to  
73006 reflect any words that were successfully expanded. In other error cases, if the WRDE\_APPEND  
73007 flag was specified, *pwordexp->we\_wordc* and *pwordexp->we\_wordv* shall not be modified. |

73008 The *wordfree()* function shall not return a value.

## 73009 ERRORS

73010 No errors are defined.

## 73011 EXAMPLES

73012 None.

## 73013 APPLICATION USAGE

73014 The *wordexp()* function is intended to be used by an application that wants to do all of the shell's  
73015 expansions on a word or words obtained from a user. For example, if the application prompts  
73016 for a pathname (or list of pathnames) and then uses *wordexp()* to process the input, the user  
73017 could respond with anything that would be valid as input to the shell.

73018 The WRDE\_NOCMD flag is provided for applications that, for security or other reasons, want to  
73019 prevent a user from executing shell commands. Disallowing unquoted shell special characters  
73020 also prevents unwanted side-effects, such as executing a command or writing a file.

73021 POSIX.1-2008 does not require the *wordexp()* function to be thread-safe if passed an expression  
73022 referencing an environment variable while any other thread is concurrently modifying any  
73023 environment variable; see *exec* (on page 781).

73024 Even though the WRDE\_SHOWERR flag allows the implementation to write messages to *stderr*  
73025 during command substitution or syntax errors, this standard does not provide any way to detect  
73026 write failures during the output of such messages.

73027 Applications which use wide-character output functions with *stderr* should ensure that any calls +  
73028 to *wordexp()* do not write to *stderr*, by avoiding use of the WRDE\_SHOWERR flag.

## 73029 RATIONALE

73030 This function was included as an alternative to *glob()*. There had been continuing controversy  
73031 over exactly what features should be included in *glob()*. It is hoped that by providing *wordexp()*  
73032 (which provides all of the shell word expansions, but which may be slow to execute) and *glob()*  
73033 (which is faster, but which only performs pathname expansion, without tilde or parameter  
73034 expansion) this will satisfy the majority of applications.

While *wordexp()* could be implemented entirely as a library routine, it is expected that most implementations run a shell in a subprocess to do the expansion.

Two different approaches have been proposed for how the required information might be presented to the shell and the results returned. They are presented here as examples.

One proposal is to extend the *echo* utility by adding a *-q* option. This option would cause *echo* to add a *<backslash>* before each *<backslash>* and *<blank>* that occurs within an argument. The *wordexp()* function could then invoke the shell as follows:

```
(void) strcpy(buffer, "echo -q");
(void) strcat(buffer, words);
if ((flags & WRDE_SHOWERR) == 0)
    (void) strcat(buffer, "2>/dev/null");
f = popen(buffer, "r");
```

The *wordexp()* function would read the resulting output, remove unquoted *<backslash>* characters, and break into words at unquoted *<blank>* characters. If the *WRDE\_NOCMD* flag was set, *wordexp()* would have to scan *words* before starting the subshell to make sure that there would be no command substitution. In any case, it would have to scan *words* for unquoted special characters.

Another proposal is to add the following options to *sh*:

**-w** *wordlist*

This option provides a wordlist expansion service to applications. The words in *wordlist* shall be expanded and the following written to standard output:

1. The count of the number of words after expansion, in decimal, followed by a null byte
2. The number of bytes needed to represent the expanded words (not including null separators), in decimal, followed by a null byte
3. The expanded words, each terminated by a null byte

If an error is encountered during word expansion, *sh* exits with a non-zero status after writing the former to report any words successfully expanded

**-P** Run in “protected” mode. If specified with the *-w* option, no command substitution shall be performed.

With these options, *wordexp()* could be implemented fairly simply by creating a subprocess using *fork()* and executing *sh* using the line:

```
execl(<shell path>, "sh", "-P", "-w", words, (char *)0);
```

after directing standard error to */dev/null*.

It seemed objectionable for a library routine to write messages to standard error, unless explicitly requested, so *wordexp()* is required to redirect standard error to */dev/null* to ensure that no messages are generated, even for commands executed for command substitution. The *WRDE\_SHOWERR* flag can be specified to request that error messages be written.

The *WRDE\_REUSE* flag allows the implementation to avoid the expense of freeing and reallocating memory, if that is possible. A minimal implementation can call *wordfree()* when *WRDE\_REUSE* is set.

73076 **FUTURE DIRECTIONS**

73077 None.

73082 **CHANGE HISTORY**

73083 First released in Issue 4. Derived from the ISO POSIX-2 standard.

73084 **Issue 5**

73085 Moved from POSIX2 C-language Binding to BASE.

73086 **Issue 6**

73087 The normative text is updated to avoid use of the term “must” for application requirements.

73088 The **restrict** keyword is added to the *wordexp()* prototype for alignment with the  
73089 ISO/IEC 9899:1999 standard.73090 **Issue 7**

73091 Austin Group Interpretation 1003.1-2001 #148 is applied, adding APPLICATION USAGE.

73092 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0739 [460], XSH/TC1-2008/0740 [291],  
73093 and XSH/TC1-2008/0741 [460] are applied.

73094 **NAME**

73095       wprintf — print formatted wide-character output

73096 **SYNOPSIS**

73097       #include &lt;stdio.h&gt;

73098       #include &lt;wchar.h&gt;

73099       int wprintf(const wchar\_t \*restrict *format*, ...);73100 **DESCRIPTION**73101       Refer to *fwprintf()*.

## 73102 NAME

73103 pwrite, write — write on a file

## 73104 SYNOPSIS

```
73105 #include <unistd.h>
73106 ssize_t pwrite(int fildes, const void *buf, size_t nbyte,
73107               off_t offset);
73108 ssize_t write(int fildes, const void *buf, size_t nbyte);
```

## 73109 DESCRIPTION

73110 The *write()* function shall attempt to write *nbyte* bytes from the buffer pointed to by *buf* to the  
73111 file associated with the open file descriptor, *fildes*.

73112 Before any action described below is taken, and if *nbyte* is zero and the file is a regular file, the  
73113 *write()* function may detect and return errors as described below. In the absence of errors, or if  
73114 error detection is not performed, the *write()* function shall return zero and have no other results.  
73115 If *nbyte* is zero and the file is not a regular file, the results are unspecified.

73116 On a regular file or other file capable of seeking, the actual writing of data shall proceed from  
73117 the position in the file indicated by the file offset associated with *fildes*. Before successful return  
73118 from *write()*, the file offset shall be incremented by the number of bytes actually written. On a  
73119 regular file, if the position of the last byte written is greater than or equal to the length of the file,  
73120 the length of the file shall be set to this position plus one.

73121 On a file not capable of seeking, writing shall always take place starting at the current position.  
73122 The value of a file offset associated with such a device is undefined.

73123 If the O\_APPEND flag of the file status flags is set, the file offset shall be set to the end of the file  
73124 prior to each write and no intervening file modification operation shall occur between changing  
73125 the file offset and the write operation.

73126 XSI If a *write()* requests that more bytes be written than there is room for (for example, the file size  
73127 limit of the process or the physical end of a medium), only as many bytes as there is room for  
73128 shall be written. For example, suppose there is space for 20 bytes more in a file before reaching a  
73129 limit. A write of 512 bytes will return 20. The next write of a non-zero number of bytes would  
73130 give a failure return (except as noted below).

73131 XSI If the request would cause the file size to exceed the soft file size limit for the process and there  
73132 is no room for any bytes to be written, the request shall fail and the implementation shall  
73133 generate the SIGXFSZ signal for the thread.

73134 If *write()* is interrupted by a signal before it writes any data, it shall return -1 with *errno* set to  
73135 [EINTR].

73136 If *write()* is interrupted by a signal after it successfully writes some data, it shall return the  
73137 number of bytes written.

73138 If the value of *nbyte* is greater than {SSIZE\_MAX}, the result is implementation-defined.

73139 After a *write()* to a regular file has successfully returned:

- 73140 • Any successful *read()* from each byte position in the file that was modified by that write  
73141 shall return the data specified by the *write()* for that position until such byte positions are  
73142 again modified.
- 73143 • Any subsequent successful *write()* to the same byte position in the file shall overwrite that  
73144 file data.

73145 Write requests to a pipe or FIFO shall be handled in the same way as a regular file with the  
73146 following exceptions:

- 73147 • There is no file offset associated with a pipe, hence each write request shall append to the  
73148 end of the pipe.
- 73149 • Write requests of {PIPE\_BUF} bytes or less shall not be interleaved with data from other  
73150 processes doing writes on the same pipe. Writes of greater than {PIPE\_BUF} bytes may  
73151 have data interleaved, on arbitrary boundaries, with writes by other processes, whether or  
73152 not the O\_NONBLOCK flag of the file status flags is set.
- 73153 • If the O\_NONBLOCK flag is clear, a write request may cause the thread to block, but on  
73154 normal completion it shall return *nbyte*.
- 73155 • If the O\_NONBLOCK flag is set, *write()* requests shall be handled differently, in the  
73156 following ways:
  - 73157 — The *write()* function shall not block the thread.
  - 73158 — A write request for {PIPE\_BUF} or fewer bytes shall have the following effect: if there  
73159 is sufficient space available in the pipe, *write()* shall transfer all the data and return  
73160 the number of bytes requested. Otherwise, *write()* shall transfer no data and return  
73161  $-1$  with *errno* set to [EAGAIN].
  - 73162 — A write request for more than {PIPE\_BUF} bytes shall cause one of the following:
    - 73163 — When at least one byte can be written, transfer what it can and return the  
73164 number of bytes written. When all data previously written to the pipe is read, it  
73165 shall transfer at least {PIPE\_BUF} bytes.
    - 73166 — When no data can be written, transfer no data, and return  $-1$  with *errno* set to  
73167 [EAGAIN].

73168 When attempting to write to a file descriptor (other than a pipe or FIFO) that supports non-  
73169 blocking writes and cannot accept the data immediately:

- 73170 • If the O\_NONBLOCK flag is clear, *write()* shall block the calling thread until the data can  
73171 be accepted.
- 73172 • If the O\_NONBLOCK flag is set, *write()* shall not block the thread. If some data can be  
73173 written without blocking the thread, *write()* shall write what it can and return the number  
73174 of bytes written. Otherwise, it shall return  $-1$  and set *errno* to [EAGAIN].

73175 Upon successful completion, where *nbyte* is greater than 0, *write()* shall mark for update the last  
73176 data modification and last file status change timestamps of the file, and if the file is a regular file,  
73177 the S\_ISUID and S\_ISGID bits of the file mode may be cleared.

73178 For regular files, no data transfer shall occur past the offset maximum established in the open  
73179 file description associated with *filides*.

73180 If *filides* refers to a socket, *write()* shall be equivalent to *send()* with no flags set.

73181 SIO If the O\_DSYNC bit has been set, write I/O operations on the file descriptor shall complete as  
73182 defined by synchronized I/O data integrity completion.

73183 If the O\_SYNC bit has been set, write I/O operations on the file descriptor shall complete as  
73184 defined by synchronized I/O file integrity completion.

73185 SHM If *filides* refers to a shared memory object, the result of the *write()* function is unspecified.

| 73187    | OB XSR                                                                                                                                                                                  | <p>If <i>filides</i> refers to a STREAM, the operation of <i>write()</i> shall be determined by the values of the minimum and maximum <i>nbyte</i> range (packet size) accepted by the STREAM. These values are determined by the topmost STREAM module. If <i>nbyte</i> falls within the packet size range, <i>nbyte</i> bytes shall be written. If <i>nbyte</i> does not fall within the range and the minimum packet size value is 0, <i>write()</i> shall break the buffer into maximum packet size segments prior to sending the data downstream (the last segment may contain less than the maximum packet size). If <i>nbyte</i> does not fall within the range and the minimum value is non-zero, <i>write()</i> shall fail with <i>errno</i> set to [ERANGE]. Writing a zero-length buffer (<i>nbyte</i> is 0) to a STREAMS device sends 0 bytes with 0 returned. However, writing a zero-length buffer to a STREAMS-based pipe or FIFO sends no message and 0 is returned. The process may issue <code>I_SWROPT ioctl()</code> to enable zero-length messages to be sent across the pipe or FIFO.</p> <p>When writing to a STREAM, data messages are created with a priority band of 0. When writing to a STREAM that is not a pipe or FIFO:</p> <ul style="list-style-type: none"><li>• If <code>O_NONBLOCK</code> is clear, and the STREAM cannot accept data (the STREAM write queue is full due to internal flow control conditions), <i>write()</i> shall block until data can be accepted.</li><li>• If <code>O_NONBLOCK</code> is set and the STREAM cannot accept data, <i>write()</i> shall return <code>-1</code> and set <i>errno</i> to [EAGAIN].</li><li>• If <code>O_NONBLOCK</code> is set and part of the buffer has been written while a condition in which the STREAM cannot accept additional data occurs, <i>write()</i> shall terminate and return the number of bytes written.</li></ul> <p>In addition, <i>write()</i> shall fail if the STREAM head has processed an asynchronous error before the call. In this case, the value of <i>errno</i> does not reflect the result of <i>write()</i>, but reflects the prior error.</p> <p>The <i>pwrite()</i> function shall be equivalent to <i>write()</i>, except that it writes into a given position and does not change the file offset (regardless of whether <code>O_APPEND</code> is set). The first three arguments to <i>pwrite()</i> are the same as <i>write()</i> with the addition of a fourth argument <i>offset</i> for the desired position inside the file. An attempt to perform a <i>pwrite()</i> on a file that is incapable of seeking shall result in an error.</p> |          |                                                                                                                                                                                         |         |                                                                              |         |                                                                                                                                                                                         |

| 73267 | OB XSR                    | A write to a STREAMS file may fail if an error message has been received at the STREAM head.                                                                                                                                                                                                                                      |
| 73268 |                           | In this case, <i>errno</i> is set to the value included in the error message.                                                                                                                                                                                                                                                     |

- 73269 The *write()* function may fail if:
- 73270 [EACCES] A write was attempted on a socket and the calling process does not have  
73271 appropriate privileges.
- 73272 [ENETDOWN] A write was attempted on a socket and the local network interface used to  
73273 reach the destination is down.
- 73274 [ENETUNREACH]  
73275 A write was attempted on a socket and no route to the network is present.

## 73276 EXAMPLES

### 73277 Writing from a Buffer

73278 The following example writes data from the buffer pointed to by *buf* to the file associated with  
73279 the file descriptor *fd*.

```
73280 #include <sys/types.h>
73281 #include <string.h>
73282 ...
73283 char buf[20];
73284 size_t nbytes;
73285 ssize_t bytes_written;
73286 int fd;
73287 ...
73288 strcpy(buf, "This is a test\n");
73289 nbytes = strlen(buf);
73290 bytes_written = write(fd, buf, nbytes);
73291 ...
```

## 73292 APPLICATION USAGE

73293 None.

## 73294 RATIONALE

73295 See also the RATIONALE section in *read()*.

73296 An attempt to write to a pipe or FIFO has several major characteristics:

- 73297 • *Atomic/non-atomic*: A write is atomic if the whole amount written in one operation is not  
73298 interleaved with data from any other process. This is useful when there are multiple  
73299 writers sending data to a single reader. Applications need to know how large a write  
73300 request can be expected to be performed atomically. This maximum is called {PIPE\_BUF}.  
73301 This volume of POSIX.1-2008 does not say whether write requests for more than  
73302 {PIPE\_BUF} bytes are atomic, but requires that writes of {PIPE\_BUF} or fewer bytes shall  
73303 be atomic.
- 73304 • *Blocking/immediate*: Blocking is only possible with O\_NONBLOCK clear. If there is enough  
73305 space for all the data requested to be written immediately, the implementation should do  
73306 so. Otherwise, the calling thread may block; that is, pause until enough space is available  
73307 for writing. The effective size of a pipe or FIFO (the maximum amount that can be written  
73308 in one operation without blocking) may vary dynamically, depending on the  
73309 implementation, so it is not possible to specify a fixed value for it.
- 73310 • *Complete/partial/deferred*: A write request:  
73311 

```
int fildes;
```

  
73312 

```
size_t nbyte;
```

```

73313     ssize_t ret;
73314     char *buf;

73315     ret = write(fildes, buf, nbyte);

```

73316 may return:

```

73317     Complete    ret=nbyte
73318     Partial     ret<nbyte

```

73319 This shall never happen if  $nbyte \leq \{PIPE\_BUF\}$ . If it does happen (with  
73320  $nbyte > \{PIPE\_BUF\}$ ), this volume of POSIX.1-2008 does not guarantee  
73321 atomicity, even if  $ret \leq \{PIPE\_BUF\}$ , because atomicity is guaranteed according  
73322 to the amount *requested*, not the amount *written*.

```

73323     Deferred:   ret=-1, errno=[EAGAIN]

```

73324 This error indicates that a later request may succeed. It does not indicate that  
73325 it *shall* succeed, even if  $nbyte \leq \{PIPE\_BUF\}$ , because if no process reads from  
73326 the pipe or FIFO, the write never succeeds. An application could usefully  
73327 count the number of times [EAGAIN] is caused by a particular value of  
73328  $nbyte > \{PIPE\_BUF\}$  and perhaps do later writes with a smaller value, on the  
73329 assumption that the effective size of the pipe may have decreased.

73330 Partial and deferred writes are only possible with O\_NONBLOCK set.

73331 The relations of these properties are shown in the following tables:

| Write to a Pipe or FIFO with O_NONBLOCK clear |                                 |                                 |                                  |
|-----------------------------------------------|---------------------------------|---------------------------------|----------------------------------|
| Immediately Writable:                         | None                            | Some                            | <i>nbyte</i>                     |
| $nbyte \leq \{PIPE\_BUF\}$                    | Atomic blocking<br><i>nbyte</i> | Atomic blocking<br><i>nbyte</i> | Atomic immediate<br><i>nbyte</i> |
| $nbyte > \{PIPE\_BUF\}$                       | Blocking <i>nbyte</i>           | Blocking <i>nbyte</i>           | Blocking <i>nbyte</i>            |

73337 If the O\_NONBLOCK flag is clear, a write request shall block if the amount writable  
73338 immediately is less than that requested. If the flag is set (by *fcntl()*), a write request shall never  
73339 block.

| Write to a Pipe or FIFO with O_NONBLOCK set |              |                                   |                                 |
|---------------------------------------------|--------------|-----------------------------------|---------------------------------|
| Immediately Writable:                       | None         | Some                              | <i>nbyte</i>                    |
| $nbyte \leq \{PIPE\_BUF\}$                  | -1, [EAGAIN] | -1, [EAGAIN]                      | Atomic <i>nbyte</i>             |
| $nbyte > \{PIPE\_BUF\}$                     | -1, [EAGAIN] | < <i>nbyte</i> or -1,<br>[EAGAIN] | $\leq nbyte$ or -1,<br>[EAGAIN] |

73345 There is no exception regarding partial writes when O\_NONBLOCK is set. With the exception  
73346 of writing to an empty pipe, this volume of POSIX.1-2008 does not specify exactly when a partial  
73347 write is performed since that would require specifying internal details of the implementation.  
73348 Every application should be prepared to handle partial writes when O\_NONBLOCK is set and  
73349 the requested amount is greater than {PIPE\_BUF}, just as every application should be prepared  
73350 to handle partial writes on other kinds of file descriptors.

73351 The intent of forcing writing at least one byte if any can be written is to assure that each write  
73352 makes progress if there is any room in the pipe. If the pipe is empty, {PIPE\_BUF} bytes must be  
73353 written; if not, at least some progress must have been made.

73354 Where this volume of POSIX.1-2008 requires -1 to be returned and *errno* set to [EAGAIN], most

historical implementations return zero (with the `O_NDELAY` flag set, which is the historical predecessor of `O_NONBLOCK`, but is not itself in this volume of POSIX.1-2008). The error indications in this volume of POSIX.1-2008 were chosen so that an application can distinguish these cases from end-of-file. While `write()` cannot receive an indication of end-of-file, `read()` can, and the two functions have similar return values. Also, some existing systems (for example, Eighth Edition) permit a write of zero bytes to mean that the reader should get an end-of-file indication; for those systems, a return value of zero from `write()` indicates a successful write of an end-of-file indication.

Implementations are allowed, but not required, to perform error checking for `write()` requests of zero bytes.

The concept of a `{PIPE_MAX}` limit (indicating the maximum number of bytes that can be written to a pipe in a single operation) was considered, but rejected, because this concept would unnecessarily limit application writing.

See also the discussion of `O_NONBLOCK` in `read()`.

Writes can be serialized with respect to other reads and writes. If a `read()` of file data can be proven (by any means) to occur after a `write()` of the data, it must reflect that `write()`, even if the calls are made by different processes. A similar requirement applies to multiple write operations to the same file position. This is needed to guarantee the propagation of data from `write()` calls to subsequent `read()` calls. This requirement is particularly significant for networked file systems, where some caching schemes violate these semantics.

Note that this is specified in terms of `read()` and `write()`. The XSI extensions `readv()` and `writew()` also obey these semantics. A new “high-performance” write analog that did not follow these serialization requirements would also be permitted by this wording. This volume of POSIX.1-2008 is also silent about any effects of application-level caching (such as that done by `stdio`).

This volume of POSIX.1-2008 does not specify the value of the file offset after an error is returned; there are too many cases. For programming errors, such as `[EBADF]`, the concept is meaningless since no file is involved. For errors that are detected immediately, such as `[EAGAIN]`, clearly the pointer should not change. After an interrupt or hardware error, however, an updated value would be very useful and is the behavior of many implementations.

This volume of POSIX.1-2008 does not specify the behavior of concurrent writes to a regular file from multiple threads, except that each write is atomic (see [Section 2.9.7](#), on page 522). Applications should use some form of concurrency control.

This volume of POSIX.1-2008 intentionally does not specify any `pwrite()` errors related to pipes, FIFOs, and sockets other than `[ESPIPE]`.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

The *pwrite()* function is added.

**Issue 6**

The DESCRIPTION states that the *write()* function does not block the thread. Previously this said “process” rather than “thread”.

The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION now states that if *write()* is interrupted by a signal after it has successfully written some data, it returns the number of bytes written. In the POSIX.1-1988 standard, it was optional whether *write()* returned the number of bytes written, or whether it returned -1 with *errno* set to [EINTR]. This is a FIPS requirement.
- The following changes are made to support large files:
  - For regular files, no data transfer occurs past the offset maximum established in the open file description associated with the *files*.
  - A second [EFBIG] error condition is added.
- The [EIO] error condition is added.
- The [EPIPE] error condition is added for when a pipe has only one end open.
- The [ENXIO] optional error condition is added.

Text referring to sockets is added to the DESCRIPTION.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effect of reading zero bytes is clarified.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *write()* results are unspecified for typed memory objects.

The following error conditions are added for operations on sockets: [EAGAIN], [EWOULDBLOCK], [ECONNRESET], [ENOTCONN], and [EPIPE].

The [EIO] error is made optional.

The [ENOBUFFS] error is added for sockets.

The following error conditions are added for operations on sockets: [EACCES], [ENETDOWN], and [ENETUNREACH].

The *writetv()* function is split out into a separate reference page.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/146 is applied, updating text in the ERRORS section from “a SIGPIPE signal is generated to the calling process” to “a SIGPIPE signal shall also be sent to the thread”.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/147 is applied, making a correction to the RATIONALE.

73437 **Issue 7**

73438 The *pwrite()* function is moved from the XSI option to the Base.

73439 Functionality relating to the XSI STREAMS option is marked obsolescent.

73440 SD5-XSH-ERN-160 is applied, updating the DESCRIPTION to clarify the requirements for the  
73441 *pwrite()* function, and to change the use of the phrase “file pointer” to “file offset”.

73442 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0742 [219], XSH/TC1-2008/0743 [215],  
73443 XSH/TC1-2008/0744 [79], and XSH/TC1-2008/0745 [215] are applied.

73444 **NAME**

73445 writev — write a vector

73446 **SYNOPSIS**

```
73447 XSI    #include <sys/uio.h>
73448      ssize_t writev(int fildes, const struct iovec *iov, int iovcnt);
```

73449 **DESCRIPTION**

73450 The *writev()* function shall be equivalent to *write()*, except as described below. The *writev()*  
 73451 function shall gather output data from the *iovcnt* buffers specified by the members of the *iov*  
 73452 array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*−1]. The *iovcnt* argument is valid if greater than 0 and less than  
 73453 or equal to {IOV\_MAX}, as defined in <limits.h>.

73454 Each *iovec* entry specifies the base address and length of an area in memory from which data  
 73455 should be written. The *writev()* function shall always write a complete area before proceeding to  
 73456 the next.

73457 If *fildes* refers to a regular file and all of the *iov\_len* members in the array pointed to by *iov* are 0,  
 73458 *writev()* shall return 0 and have no other effect. For other file types, the behavior is unspecified.

73459 If the sum of the *iov\_len* values is greater than {SSIZE\_MAX}, the operation shall fail and no data  
 73460 shall be transferred.

73461 **RETURN VALUE**

73462 Upon successful completion, *writev()* shall return the number of bytes actually written.  
 73463 Otherwise, it shall return a value of −1, the file-pointer shall remain unchanged, and *errno* shall  
 73464 be set to indicate an error.

73465 **ERRORS**73466 Refer to *write()*.73467 In addition, the *writev()* function shall fail if:73468 [EINVAL] The sum of the *iov\_len* values in the *iov* array would overflow an *ssize\_t*.73469 The *writev()* function may fail and set *errno* to:73470 [EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV\_MAX}.73471 **EXAMPLES**73472 **Writing Data from an Array**

73473 The following example writes data from the buffers specified by members of the *iov* array to the  
 73474 file associated with the file descriptor *fd*.

```
73475 #include <sys/types.h>
73476 #include <sys/uio.h>
73477 #include <unistd.h>
73478 ...
73479 ssize_t bytes_written;
73480 int fd;
73481 char *buf0 = "short string\n";
73482 char *buf1 = "This is a longer string\n";
73483 char *buf2 = "This is the longest string in this example\n";
73484 int iocnt;
73485 struct iovec iov[3];
```

```
73486     iov[0].iov_base = buf0;
73487     iov[0].iov_len = strlen(buf0);
73488     iov[1].iov_base = buf1;
73489     iov[1].iov_len = strlen(buf1);
73490     iov[2].iov_base = buf2;
73491     iov[2].iov_len = strlen(buf2);
73492     ...
73493     iovcnt = sizeof(iov) / sizeof(struct iovec);
73494     bytes_written = writev(fd, iov, iovcnt);
73495     ...
```

#### 73496 APPLICATION USAGE

73497 None.

#### 73498 RATIONALE

73499 Refer to *write()*.

#### 73500 FUTURE DIRECTIONS

73501 None.

#### 73502 SEE ALSO

73503 *readv()*, *write()*

73504 XBD [\*<limits.h>\*](#), [\*<sys/uio.h>\*](#)

#### 73505 CHANGE HISTORY

73506 First released in Issue 4, Version 2.

#### 73507 Issue 6

73508 Split out from the *write()* reference page.

73509 **NAME**

73510       wscanf — convert formatted wide-character input

73511 **SYNOPSIS**

73512       #include &lt;stdio.h&gt;

73513       #include &lt;wchar.h&gt;

73514       int wscanf(const wchar\_t \*restrict *format*, ...);73515 **DESCRIPTION**73516       Refer to *fwscanf()*.

73517 **NAME**

73518 y0, y1, yn — Bessel functions of the second kind

73519 **SYNOPSIS**

```
73520 XSI      #include <math.h>
73521          double y0(double x);
73522          double y1(double x);
73523          double yn(int n, double x);
```

73524 **DESCRIPTION**

73525 The *y0()*, *y1()*, and *yn()* functions shall compute Bessel functions of *x* of the second kind of  
 73526 orders 0, 1, and *n*, respectively.

73527 An application wishing to check for error situations should set *errno* to zero and call  
 73528 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 73529 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 73530 zero, an error has occurred.

73531 **RETURN VALUE**

73532 Upon successful completion, these functions shall return the relevant Bessel value of *x* of the  
 73533 second kind.

73534 MXX If *x* is NaN, NaN shall be returned.

73535 If the *x* argument to these functions is negative, *-HUGE\_VAL* or NaN shall be returned, and a  
 73536 domain error may occur.

73537 If *x* is 0.0, *-HUGE\_VAL* shall be returned and a pole error may occur.

73538 If the correct result would cause underflow, 0.0 shall be returned and a range error may occur.

73539 If the correct result would cause overflow, *-HUGE\_VAL* or 0.0 shall be returned and a range  
 73540 error may occur.

73541 **ERRORS**

73542 These functions may fail if:

73543 Domain Error     The value of *x* is negative.

73544 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 73545 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 73546 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 73547 shall be raised.

73548 Pole Error       The value of *x* is zero.

73549 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 73550 then *errno* shall be set to [ERANGE]. If the integer expression  
 73551 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 73552 floating-point exception shall be raised.

73553 Range Error      The correct result would cause overflow.

73554 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 73555 then *errno* shall be set to [ERANGE]. If the integer expression  
 73556 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 73557 floating-point exception shall be raised.

73558 Range Error The value of  $x$  is too large in magnitude, or the correct result would cause  
73559 underflow.

73560 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
73561 then *errno* shall be set to [ERANGE]. If the integer expression  
73562 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
73563 floating-point exception shall be raised.

#### 73564 EXAMPLES

73565 None.

#### 73566 APPLICATION USAGE

73567 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
73568 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

#### 73569 RATIONALE

73570 None.

#### 73571 FUTURE DIRECTIONS

73572 None.

#### 73573 SEE ALSO

73574 *feclearexcept()*, *fetestexcept()*, *isnan()*, *j0()*

#### 73576 CHANGE HISTORY

73577 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 73578 Issue 5

73579 The DESCRIPTION is updated to indicate how an application should check for an error. This  
73580 text was previously published in the APPLICATION USAGE section.

#### 73581 Issue 6

73582 The normative text is updated to avoid use of the term “must” for application requirements.

73583 The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling  
73584 with the ISO/IEC 9899:1999 standard.

73585 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/148 is applied, updating the RETURN  
73586 VALUE and ERRORS sections. The changes are made for consistency with the general rules  
73587 stated in “Treatment of Error Conditions for Mathematical Functions” in the Base Definitions  
73588 volume of POSIX.1-2008.

#### 73589 Issue 7

73590 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0746 [68] is applied.

73596

Chapter 1

73597

# Introduction

73598

73599

The Shell and Utilities volume of POSIX.1-2008 describes the commands and utilities offered to application programs by POSIX-conformant systems.

73600

## 1.1 Relationship to Other Documents

73601

### 1.1.1 System Interfaces

73602

73603

73604

73605

73606

73607

This subsection describes some of the features provided by the System Interfaces volume of POSIX.1-2008 that are assumed to be globally available on all systems conforming to this volume of POSIX.1-2008. This subsection does not attempt to detail all of the features defined in the System Interfaces volume of POSIX.1-2008 that are required by all of the utilities defined in this volume of POSIX.1-2008; the utility and function descriptions point out additional functionality required to provide the corresponding specific features needed by each.

73608

73609

73610

The following subsections describe frequently used concepts. Many of these concepts are described in the Base Definitions volume of POSIX.1-2008. Utility and function description statements override these defaults when appropriate.

73611

#### 1.1.1.1 Process Attributes

73612

73613

The following process attributes, as described in the System Interfaces volume of POSIX.1-2008, are assumed to be supported for all processes in this volume of POSIX.1-2008:

73614

73615

73616

73617

73618

73619

73620

73621

|                           |                         |
|---------------------------|-------------------------|
| Controlling Terminal      | Real Group ID           |
| Current Working Directory | Real User ID            |
| Effective Group ID        | Root Directory          |
| Effective User ID         | Saved Set-Group-ID      |
| File Descriptors          | Saved Set-User-ID       |
| File Mode Creation Mask   | Session Membership      |
| Process Group ID          | Supplementary Group IDs |
| Process ID                |                         |

73622

A conforming implementation may include additional process attributes.

73623

#### 1.1.1.2 Concurrent Execution of Processes

73624

73625

The following functionality of the *fork()* function defined in the System Interfaces volume of POSIX.1-2008 shall be available on all systems conforming to this volume of POSIX.1-2008:

73626

73627

1. Independent processes shall be capable of executing independently without either process terminating.

73628 2. A process shall be able to create a new process with all of the attributes referenced in  
 73629 [Section 1.1.1.1](#) (on page 2317), determined according to the semantics of a call to the *fork()*  
 73630 function defined in the System Interfaces volume of POSIX.1-2008 followed by a call in  
 73631 the child process to one of the *exec* functions defined in the System Interfaces volume of  
 73632 POSIX.1-2008.

#### 73633 1.1.1.3 File Access Permissions

73634 The file access control mechanism described by XBD [Section 4.5](#) (on page 108) shall apply to all  
 73635 files on an implementation conforming to this volume of POSIX.1-2008.

#### 73636 1.1.1.4 File Read, Write, and Creation

73637 If a file that does not exist is to be written, it shall be created as described below, unless the  
 73638 utility description states otherwise.

73639 When a file that does not exist is created, the following features defined in the System Interfaces  
 73640 volume of POSIX.1-2008 shall apply unless the utility or function description states otherwise:

- 73641 1. The user ID of the file shall be set to the effective user ID of the calling process.
- 73642 2. The group ID of the file shall be set to the effective group ID of the calling process or the  
 73643 group ID of the directory in which the file is being created.

- 73644 3. If the file is a regular file, the permission bits of the file shall be set to:

73645 S\_IROTH | S\_IWOTH | S\_IRGRP | S\_IWGRP | S\_IRUSR | S\_IWUSR

73646 (see the description of *File Modes* in XBD [Chapter 13](#) (on page 219), `<sys/stat.h>`) except  
 73647 that the bits specified by the file mode creation mask of the process shall be cleared. If the  
 73648 file is a directory, the permission bits shall be set to:

73649 S\_IRWXU | S\_IRWXG | S\_IRWXO

73650 except that the bits specified by the file mode creation mask of the process shall be  
 73651 cleared.

- 73652 4. The last data access, last data modification, and last file status change timestamps of the  
 73653 file shall be updated as specified in XBD [Section 4.9](#) (on page 109).

- 73654 5. If the file is a directory, it shall be an empty directory; otherwise, the file shall have length  
 73655 zero.

- 73656 6. If the file is a symbolic link, the effect shall be undefined unless the {POSIX2\_SYMLINKS}  
 73657 variable is in effect for the directory in which the symbolic link would be created.

- 73658 7. Unless otherwise specified, the file created shall be a regular file.

73659 When an attempt is made to create a file that already exists, the utility shall take the action  
 73660 indicated in [Table 1-1](#) (on page 2319) corresponding to the type of the file the utility is trying to  
 73661 create and the type of the existing file, unless the utility description states otherwise.

**Table 1-1** Actions when Creating a File that Already Exists

| Existing Type                 | New Type |   |   |   |   |   |   |   |    |   |   | Function Creating New |
|-------------------------------|----------|---|---|---|---|---|---|---|----|---|---|-----------------------|
|                               | B        | C | D | F | L | M | P | Q | R  | S | T |                       |
| A <i>fattach()</i> -ed STREAM | F        | F | F | F | F | — | — | — | OF | — | U | N/A                   |
| B Block Special               | F        | F | F | F | F | U | U | U | OF | U | U | <i>mknod()</i> **     |
| C Character Special           | F        | F | F | F | F | U | U | U | OF | U | U | <i>mknod()</i> **     |
| D Directory                   | F        | F | F | F | F | — | — | — | F  | — | U | <i>mkdir()</i>        |
| F FIFO Special File           | F        | F | F | F | F | — | — | — | O  | — | U | <i>mkfifo()</i>       |
| L Symbolic Link               | F        | F | F | F | F | — | — | — | FL | — | U | <i>symlink()</i>      |
| M Shared Memory               | F        | F | F | F | F | — | — | — | —  | — | U | <i>shm_open()</i>     |
| P Semaphore                   | F        | F | F | F | F | — | — | — | —  | — | U | <i>sem_open()</i>     |
| Q Message Queue               | F        | F | F | F | F | — | — | — | —  | — | U | <i>mq_open()</i>      |
| R Regular File                | F        | F | F | F | F | — | — | — | RF | — | U | <i>open()</i>         |
| S Socket                      | F        | F | F | F | F | — | — | — | —  | — | U | <i>bind()</i>         |
| T Typed Memory                | F        | F | F | F | F | U | U | U | U  | U | U | *                     |

The following codes are used in [Table 1-1](#):

**F** Fail. The attempt to create the new file shall fail and the utility shall either continue with its operation or exit immediately with a non-zero exit status, depending on the description of the utility.

**FL** Follow link. Unless otherwise specified, the symbolic link shall be followed as specified for pathname resolution, and the operation performed shall be as if the target of the symbolic link (after all resolution) had been named. If the target of the symbolic link does not exist, it shall be as if that nonexistent target had been named directly.

**O** Open FIFO. When attempting to create a regular file, and the existing file is a FIFO special file:

1. If the FIFO is not already open for reading, the attempt shall block until the FIFO is opened for reading.
2. Once the FIFO is open for reading, the utility shall open the FIFO for writing and continue with its operation.

**OF** The named file shall be opened with the consequences defined for that file type.

**RF** Regular file. When attempting to create a regular file, and the existing file is a regular file:

1. The user ID, group ID, and permission bits of the file shall not be changed.
2. The file shall be truncated to zero length.
3. The last data modification and last file status change timestamps shall be marked for update.

**—** The effect is implementation-defined unless specified by the utility description.

**U** The effect is unspecified unless specified by the utility description.

**\*** There is no portable way to create a file of this type.

**\*\*** Not portable.

When a file is to be appended, the file shall be opened in a manner equivalent to using the `O_APPEND` flag, without the `O_TRUNC` flag, in the *open()* function defined in the System Interfaces volume of POSIX.1-2008.

73704 When a file is to be read or written, the file shall be opened with an access mode corresponding  
 73705 to the operation to be performed. If file access permissions deny access, the requested operation  
 73706 shall fail.

#### 73707 1.1.1.5 File Removal

73708 When a directory that is the root directory or current working directory of any process is  
 73709 removed, the effect is implementation-defined. If file access permissions deny access, the  
 73710 requested operation shall fail. Otherwise, when a file is removed:

- 73711 1. Its directory entry shall be removed from the file system.
- 73712 2. The link count of the file shall be decremented.
- 73713 3. If the file is an empty directory (see XBD [Section 3.144](#), on page 56):
  - 73714 a. If no process has the directory open, the space occupied by the directory shall be  
 73715 freed and the directory shall no longer be accessible.
  - 73716 b. If one or more processes have the directory open, the directory contents shall be  
 73717 preserved until all references to the file have been closed.
- 73718 4. If the file is a directory that is not empty, the last file status change timestamp shall be  
 73719 marked for update.
- 73720 5. If the file is not a directory:
  - 73721 a. If the link count becomes zero:
    - 73722 i. If no process has the file open, the space occupied by the file shall be freed  
 73723 and the file shall no longer be accessible.
    - 73724 ii. If one or more processes have the file open, the file contents shall be  
 73725 preserved until all references to the file have been closed.
  - 73726 b. If the link count is not reduced to zero, the last file status change timestamp shall  
 73727 be marked for update.
- 73728 6. The last data modification and last file status change timestamps of the containing  
 73729 directory shall be marked for update.

#### 73730 1.1.1.6 File Time Values

73731 All files shall have the three time values described by XBD [Section 4.9](#) (on page 109).

#### 73732 1.1.1.7 File Contents

73733 When a reference is made to the contents of a file, *pathname*, this means the equivalent of all of  
 73734 the data placed in the space pointed to by *buf* when performing the *read()* function calls in the  
 73735 following operations defined in the System Interfaces volume of POSIX.1-2008:

```
73736 while (read (fildes, buf, nbytes) > 0)
73737     ;
```

73738 If the file is indicated by a pathname *pathname*, the file descriptor shall be determined by the  
 73739 equivalent of the following operation defined in the System Interfaces volume of POSIX.1-2008:

```
73740 fildes = open (pathname, O_RDONLY);
```

73741 The value of *nbytes* in the above sequence is unspecified; if the file is of a type where the data

73742 returned by *read()* would vary with different values, the value shall be one that results in the  
73743 most data being returned.

73744 If the *read()* function calls would return an error, it is unspecified whether the contents of the file  
73745 are considered to include any data from offsets in the file beyond where the error would be  
73746 returned.

#### 73747 1.1.1.8 Pathname Resolution

73748 The pathname resolution algorithm, described by XBD [Section 4.13](#) (on page 111), shall be used  
73749 by implementations conforming to this volume of POSIX.1-2008; see also XBD [Section 4.6](#) (on  
73750 page 109).

#### 73751 1.1.1.9 Changing the Current Working Directory

73752 When the current working directory (see XBD [Section 3.122](#), on page 53) is to be changed, unless  
73753 the utility or function description states otherwise, the operation shall succeed unless a call to  
73754 the *chdir()* function defined in the System Interfaces volume of POSIX.1-2008 would fail when  
73755 invoked with the new working directory pathname as its argument.

#### 73756 1.1.1.10 Establish the Locale

73757 The functionality of the *setlocale()* function defined in the System Interfaces volume of  
73758 POSIX.1-2008 shall be available on all systems conforming to this volume of POSIX.1-2008; that  
73759 is, utilities that require the capability of establishing an international operating environment  
73760 shall be permitted to set the specified category of the international environment.

#### 73761 1.1.1.11 Actions Equivalent to Functions

73762 Some utility descriptions specify that a utility performs actions equivalent to a function defined  
73763 in the System Interfaces volume of POSIX.1-2008. Such specifications require only that the  
73764 external effects be equivalent, not that any effect within the utility and visible only to the utility  
73765 be equivalent.

### 73766 1.1.2 Concepts Derived from the ISO C Standard

73767 Some of the standard utilities perform complex data manipulation using their own procedure  
73768 and arithmetic languages, as defined in their EXTENDED DESCRIPTION or OPERANDS  
73769 sections. Unless otherwise noted, the arithmetic and semantic concepts (precision, type  
73770 conversion, control flow, and so on) shall be equivalent to those defined in the ISO C standard,  
73771 as described in the following sections. Note that there is no requirement that the standard  
73772 utilities be implemented in any particular programming language.

#### 73773 1.1.2.1 Arithmetic Precision and Operations

73774 Integer variables and constants, including the values of operands and option-arguments, used  
73775 by the standard utilities listed in this volume of POSIX.1-2008 shall be implemented as  
73776 equivalent to the ISO C standard **signed long** data type; floating point shall be implemented as  
73777 equivalent to the ISO C standard **double** type. Conversions between types shall be as described  
73778 in the ISO C standard. All variables shall be initialized to zero if they are not otherwise assigned  
73779 by the input to the application.

Arithmetic operators and control flow keywords shall be implemented as equivalent to those in the cited ISO C standard section, as listed in [Table 1-2](#).

**Table 1-2** Selected ISO C Standard Operators and Control Flow Keywords

| Operation                                                          | ISO C Standard Equivalent Reference           |
|--------------------------------------------------------------------|-----------------------------------------------|
| ()                                                                 | Section 6.5.1, Primary Expressions            |
| postfix ++<br>postfix --                                           | Section 6.5.2, Postfix Operators              |
| unary +<br>unary -<br>prefix ++<br>prefix --<br>~<br>!<br>sizeof() | Section 6.5.3, Unary Operators                |
| *<br>/<br>%                                                        | Section 6.5.5, Multiplicative Operators       |
| +<br>-                                                             | Section 6.5.6, Additive Operators             |
| <<<br>>>                                                           | Section 6.5.7, Bitwise Shift Operators        |
| <, <=<br>>, >=                                                     | Section 6.5.8, Relational Operators           |
| ==<br>!=                                                           | Section 6.5.9, Equality Operators             |
| &                                                                  | Section 6.5.10, Bitwise AND Operator          |
| ^                                                                  | Section 6.5.11, Bitwise Exclusive OR Operator |
|                                                                    | Section 6.5.12, Bitwise Inclusive OR Operator |
| &&                                                                 | Section 6.5.13, Logical AND Operator          |
|                                                                    | Section 6.5.14, Logical OR Operator           |
| expr?expr:expr                                                     | Section 6.5.15, Conditional Operator          |
| =, *=, /=, %=, +=, -=<br><<=, >>=, &=, ^=,  =                      | Section 6.5.16, Assignment Operators          |
| if ()<br>if () ... else<br>switch ()                               | Section 6.8.4, Selection Statements           |
| while ()<br>do ... while ()<br>for ()                              | Section 6.8.5, Iteration Statements           |
| goto<br>continue<br>break<br>return                                | Section 6.8.6, Jump Statements                |

73823 The evaluation of arithmetic expressions shall be equivalent to that described in Section 6.5,  
73824 Expressions, of the ISO C standard.

#### 73825 1.1.2.2 Mathematical Functions

73826 Any mathematical functions with the same names as those in the following sections of the ISO C  
73827 standard:

- 73828 • Section 7.12, Mathematics, <math.h>
- 73829 • Section 7.20.2, Pseudo-Random Sequence Generation Functions

73830 shall be implemented to return the results equivalent to those returned from a call to the  
73831 corresponding function described in the ISO C standard.

## 73832 1.2 Utility Limits

73833 This section lists magnitude limitations imposed by a specific implementation. The braces  
73834 notation, {LIMIT}, is used in this volume of POSIX.1-2008 to indicate these values, but the braces  
73835 are not part of the name.

73836 **Table 1-3** Utility Limit Minimum Values

| Name                      | Description                                                                                                                                                                                                                                | Value |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| {POSIX2_BC_BASE_MAX}      | The maximum <i>obase</i> value allowed by the <i>bc</i> utility.                                                                                                                                                                           | 99    |
| {POSIX2_BC_DIM_MAX}       | The maximum number of elements permitted in an array by the <i>bc</i> utility.                                                                                                                                                             | 2 048 |
| {POSIX2_BC_SCALE_MAX}     | The maximum <i>scale</i> value allowed by the <i>bc</i> utility.                                                                                                                                                                           | 99    |
| {POSIX2_BC_STRING_MAX}    | The maximum length of a string constant accepted by the <i>bc</i> utility.                                                                                                                                                                 | 1 000 |
| {POSIX2_COLL_WEIGHTS_MAX} | The maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> <b>order</b> keyword in the locale definition file; see the <b>border_start</b> keyword in XBD <a href="#">Section 7.3.2</a> (on page 147).        | 2     |
| {POSIX2_EXPR_NEST_MAX}    | The maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.                                                                                                                                        | 32    |
| {POSIX2_LINE_MAX}         | Unless otherwise noted, the maximum length, in bytes, of the input line of a utility (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>. | 2 048 |
| {POSIX_RE_DUP_MAX}        | Maximum number of repeated occurrences of a BRE or ERE interval expression; see XBD <a href="#">Section 9.3.6</a> (on page 186) and <a href="#">Section 9.4.6</a> (on page 190).                                                           | 255   |

73862 The values specified in [Table 1-3](#) represent the lowest values conforming implementations shall  
73863 provide and, consequently, the largest values on which an application can rely without further

enquiries, as described below. These values shall be accessible to applications via the *getconf* utility (see *getconf*, on page 2820).

Implementations may provide more liberal, or less restrictive, values than shown in [Table 1-3](#) (on page 2323). These possibly more liberal values are accessible using the symbols in [Table 1-4](#).

The *sysconf()* function defined in the System Interfaces volume of POSIX.1-2008 or the *getconf* utility return the value of each symbol on each specific implementation. The value so retrieved is the largest, or most liberal, value that is available throughout the session lifetime, as determined at session creation. The literal names shown in the table apply only to the *getconf* utility; the high-level language binding describes the exact form of each name to be used by the interfaces in that binding.

All numeric limits defined by the System Interfaces volume of POSIX.1-2008, such as {PATH\_MAX}, shall also apply to this volume of POSIX.1-2008. All the utilities defined by this volume of POSIX.1-2008 are implicitly limited by these values, unless otherwise noted in the utility descriptions.

It is not guaranteed that the application can actually reach the specified limit of an implementation in any given case, or at all, as a lack of virtual memory or other resources may prevent this. The limit value indicates only that the implementation does not specifically impose any arbitrary, more restrictive limit.

**Table 1-4** Symbolic Utility Limits

| Name               | Description                                                                                                                                                                                                                        | Minimum Value             |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| {BC_BASE_MAX}      | The maximum <i>obase</i> value allowed by the <i>bc</i> utility.                                                                                                                                                                   | {POSIX2_BC_BASE_MAX}      |
| {BC_DIM_MAX}       | The maximum number of elements permitted in an array by the <i>bc</i> utility.                                                                                                                                                     | {POSIX2_BC_DIM_MAX}       |
| {BC_SCALE_MAX}     | The maximum <i>scale</i> value allowed by the <i>bc</i> utility.                                                                                                                                                                   | {POSIX2_BC_SCALE_MAX}     |
| {BC_STRING_MAX}    | The maximum length of a string constant accepted by the <i>bc</i> utility.                                                                                                                                                         | {POSIX2_BC_STRING_MAX}    |
| {COLL_WEIGHTS_MAX} | The maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> <b>order</b> keyword in the locale definition file; see the <b>order_start</b> keyword in XBD <a href="#">Section 7.3.2</a> (on page 147). | {POSIX2_COLL_WEIGHTS_MAX} |
| {EXPR_NEST_MAX}    | The maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.                                                                                                                                | {POSIX2_EXPR_NEST_MAX}    |

| Name         | Description                                                                                                                                                                                                                                | Minimum Value      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| {LINE_MAX}   | Unless otherwise noted, the maximum length, in bytes, of the input line of a utility (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>. | {POSIX2_LINE_MAX}  |
| {RE_DUP_MAX} | Maximum number of repeated occurrences of a BRE or ERE interval expression; see XBD <a href="#">Section 9.3.6</a> (on page 186) and <a href="#">Section 9.4.6</a> (on page 190).                                                           | {POSIX_RE_DUP_MAX} |

The following value may be a constant within an implementation or may vary from one pathname to another.

{POSIX2\_SYMLINKS}

When referring to a directory, the system supports the creation of symbolic links within that directory; for non-directory files, the meaning of {POSIX2\_SYMLINKS} is undefined.

## 1.3 Grammar Conventions

Portions of this volume of POSIX.1-2008 are expressed in terms of a special grammar notation. It is used to portray the complex syntax of certain program input. The grammar is based on the syntax used by the *yacc* utility. However, it does not represent fully functional *yacc* input, suitable for program use; the lexical processing and all semantic requirements are described only in textual form. The grammar is not based on source used in any traditional implementation and has not been tested with the semantic code that would normally be required to accompany it. Furthermore, there is no implication that the partial *yacc* code presented represents the most efficient, or only, means of supporting the complex syntax within the utility. Implementations may use other programming languages or algorithms, as long as the syntax supported is the same as that represented by the grammar.

The following typographical conventions are used in the grammar; they have no significance except to aid in reading.

- The identifiers for the reserved words of the language are shown with a leading capital letter. (These are terminals in the grammar; for example, **While**, **Case**.)
- The identifiers for terminals in the grammar are all named with uppercase letters and underscores; for example, **NEWLINE**, **ASSIGN\_OP**, **NAME**.
- The identifiers for non-terminals are all lowercase.

## 1.4 Utility Description Defaults

This section describes all of the subsections used within the utility descriptions, including:

- Intended usage of the section
- Global defaults that affect all the standard utilities
- The meanings of notations used in this volume of POSIX.1-2008 that are specific to individual utility sections

### NAME

This section gives the name or names of the utility and briefly states its purpose.

### SYNOPSIS

The SYNOPSIS section summarizes the syntax of the calling sequence for the utility, including options, option-arguments, and operands. Standards for utility naming are described in XBD [Section 12.2](#) (on page 216); for describing the utility's arguments in XBD [Section 12.1](#) (on page 213).

### DESCRIPTION

The DESCRIPTION section describes the actions of the utility. If the utility has a very complex set of subcommands or its own procedural language, an EXTENDED DESCRIPTION section is also provided. Most explanations of optional functionality are omitted here, as they are usually explained in the OPTIONS section.

As stated in [Section 1.1.1.11](#) (on page 2321), some functions are described in terms of equivalent functionality. When specific functions are cited, the implementation shall provide equivalent functionality including side-effects associated with successful execution of the function. The treatment of errors and intermediate results from the individual functions cited is generally not specified by this volume of POSIX.1-2008. See the utility's EXIT STATUS and CONSEQUENCES OF ERRORS sections for all actions associated with errors encountered by the utility.

### OPTIONS

The OPTIONS section describes the utility options and option-arguments, and how they modify the actions of the utility. Standard utilities that have options either fully comply with XBD [Section 12.2](#) (on page 216) or describe all deviations. Apparent disagreements between functionality descriptions in the OPTIONS and DESCRIPTION (or EXTENDED DESCRIPTION) sections are always resolved in favor of the OPTIONS section.

Each OPTIONS section that uses the phrase "The ... utility shall conform to the Utility Syntax Guidelines ..." refers only to the use of the utility as specified by this volume of POSIX.1-2008; implementation extensions should also conform to the guidelines, but may allow exceptions for historical practice.

Unless otherwise stated in the utility description, when given an option unrecognized by the implementation, or when a required option-argument is not provided, standard utilities shall issue a diagnostic message to standard error and exit with a non-zero exit status.

All utilities in this volume of POSIX.1-2008 shall be capable of processing arguments using eight-bit transparency.

**Default Behavior:** When this section is listed as "None.", it means that the implementation need not support any options. Standard utilities that do not accept options, but that do accept operands, shall recognize "--" as a first argument to be discarded.

The requirement for recognizing "--" is because conforming applications need a way to shield their operands from any arbitrary options that the implementation may provide as an extension. For example, if the standard utility *foo* is listed as taking no options, and the application needed to give it a pathname with a leading <hyphen-minus>, it could safely do it as:

```
foo -- -myfile
```

and avoid any problems with **-m** used as an extension.

## OPERANDS

The OPERANDS section describes the utility operands, and how they affect the actions of the utility. Apparent disagreements between functionality descriptions in the OPERANDS and DESCRIPTION (or EXTENDED DESCRIPTION) sections shall be resolved in favor of the OPERANDS section.

If an operand naming a file can be specified as '-', which means to use the standard input instead of a named file, this is explicitly stated in this section. Unless otherwise stated, the use of multiple instances of '-' to mean standard input in a single command produces unspecified results.

Unless otherwise stated, the standard utilities that accept operands shall process those operands in the order specified in the command line.

**Default Behavior:** When this section is listed as "None.", it means that the implementation need not support any operands.

## STDIN

The STDIN section describes the standard input of the utility. This section is frequently merely a reference to the following section, as many utilities treat standard input and input files in the same manner. Unless otherwise stated, all restrictions described in the INPUT FILES section shall apply to this section as well.

Use of a terminal for standard input can cause any of the standard utilities that read standard input to stop when used in the background. For this reason, applications should not use interactive features in scripts to be placed in the background.

The specified standard input format of the standard utilities shall not depend on the existence or value of the environment variables defined in this volume of POSIX.1-2008, except as provided by this volume of POSIX.1-2008.

**Default Behavior:** When this section is listed as "Not used.", it means that the standard input shall not be read when the utility is used as described by this volume of POSIX.1-2008.

## INPUT FILES

The INPUT FILES section describes the files, other than the standard input, used as input by the utility. It includes files named as operands and option-arguments as well as other files that are referred to, such as start-up and initialization files, databases, and so on. Commonly-used files are generally described in one place and cross-referenced by other utilities.

All utilities in this volume of POSIX.1-2008 shall be capable of processing input files using eight-bit transparency.

When a standard utility reads a seekable input file and terminates without an error before it reaches end-of-file, the utility shall ensure that the file offset in the open file description is properly positioned just past the last byte processed by the utility. For files that are not seekable, the state of the file offset in the open file description for that

file is unspecified. A conforming application shall not assume that the following three commands are equivalent:

```
tail -n +2 file
(sed -n 1q; cat) < file
cat file | (sed -n 1q; cat)
```

The second command is equivalent to the first only when the file is seekable. The third command leaves the file offset in the open file description in an unspecified state. Other utilities, such as *head*, *read*, and *sh*, have similar properties.

Some of the standard utilities, such as filters, process input files a line or a block at a time and have no restrictions on the maximum input file size. Some utilities may have size limitations that are not as obvious as file space or memory limitations. Such limitations should reflect resource limitations of some sort, not arbitrary limits set by implementors. Implementations shall document those utilities that are limited by constraints other than file system space, available memory, and other limits specifically cited by this volume of POSIX.1-2008, and identify what the constraint is and indicate a way of estimating when the constraint would be reached. Similarly, some utilities descend the directory tree (recursively). Implementations shall also document any limits that they may have in descending the directory tree that are beyond limits cited by this volume of POSIX.1-2008.

When an input file is described as a “text file”, the utility produces undefined results if given input that is not from a text file, unless otherwise stated. Some utilities (for example, *make*, *read*, *sh*) allow for continued input lines using an escaped <newline> convention; unless otherwise stated, the utility need not be able to accumulate more than {LINE\_MAX} bytes from a set of multiple, continued input lines. Thus, for a conforming application the total of all the continued lines in a set cannot exceed {LINE\_MAX}. If a utility using the escaped <newline> convention detects an end-of-file condition immediately after an escaped <newline>, the results are unspecified.

Record formats are described in a notation similar to that used by the C-language function, *printf()*. See XBD Chapter 5 (on page 121) for a description of this notation. The format description is intended to be sufficiently rigorous to allow other applications to generate these input files. However, since <blank>s can legitimately be included in some of the fields described by the standard utilities, particularly in locales other than the POSIX locale, this intent is not always realized.

**Default Behavior:** When this section is listed as “None.”, it means that no input files are required to be supplied when the utility is used as described by this volume of POSIX.1-2008.

## ENVIRONMENT VARIABLES

The ENVIRONMENT VARIABLES section lists what variables affect the utility’s execution.

The entire manner in which environment variables described in this volume of POSIX.1-2008 affect the behavior of each utility is described in the ENVIRONMENT VARIABLES section for that utility, in conjunction with the global effects of the *LANG*, *LC\_ALL*, and *NLSPATH* environment variables described in XBD Chapter 8 (on page 173). The existence or value of environment variables described in this volume of POSIX.1-2008 shall not otherwise affect the specified behavior of the standard utilities. Any effects of the existence or value of environment variables not described by this volume of POSIX.1-2008 upon the standard utilities are unspecified.

For those standard utilities that use environment variables as a means for selecting a

utility to execute (such as CC in *make*), the string provided to the utility is subjected to the path search described for *PATH* in XBD [Chapter 8](#) (on page 173).

All utilities in this volume of POSIX.1-2008 shall be capable of processing environment variable names and values using eight-bit transparency.

**Default Behavior:** When this section is listed as “None.”, it means that the behavior of the utility is not directly affected by environment variables described by this volume of POSIX.1-2008 when the utility is used as described by this volume of POSIX.1-2008.

## ASYNCHRONOUS EVENTS

The ASYNCHRONOUS EVENTS section lists how the utility reacts to such events as signals and what signals are caught.

**Default Behavior:** When this section is listed as “Default.”, or it refers to “the standard action for all other signals; see [Section 1.4](#) (on page 2326)” it means that the action taken as a result of the signal shall be one of the following:

1. The action shall be that inherited from the parent according to the rules of inheritance of signal actions defined in the System Interfaces volume of POSIX.1-2008.
2. When no action has been taken to change the default, the default action shall be that specified by the System Interfaces volume of POSIX.1-2008.
3. The result of the utility’s execution is as if default actions had been taken.

A utility is permitted to catch a signal, perform some additional processing (such as deleting temporary files), restore the default signal action (or action inherited from the parent process), and resignal itself.

## STDOUT

The STDOUT section completely describes the standard output of the utility. This section is frequently merely a reference to the following section, OUTPUT FILES, because many utilities treat standard output and output files in the same manner.

Use of a terminal for standard output may cause any of the standard utilities that write standard output to stop when used in the background. For this reason, applications should not use interactive features in scripts to be placed in the background.

Record formats are described in a notation similar to that used by the C-language function, *printf()*. See XBD [Chapter 5](#) (on page 121) for a description of this notation.

The specified standard output of the standard utilities shall not depend on the existence or value of the environment variables defined in this volume of POSIX.1-2008, except as provided by this volume of POSIX.1-2008.

Some of the standard utilities describe their output using the verb *display*, defined in XBD [Section 3.133](#) (on page 54). Output described in the STDOUT sections of such utilities may be produced using means other than standard output. When standard output is directed to a terminal, the output described shall be written directly to the terminal. Otherwise, the results are undefined.

**Default Behavior:** When this section is listed as “Not used.”, it means that the standard output shall not be written when the utility is used as described by this volume of POSIX.1-2008.

## STDERR

The STDERR section describes the standard error output of the utility. Only those messages that are purposely sent by the utility are described.

74130 Use of a terminal for standard error may cause any of the standard utilities that write  
 74131 standard error output to stop when used in the background. For this reason,  
 74132 applications should not use interactive features in scripts to be placed in the  
 74133 background.

74134 The format of diagnostic messages for most utilities is unspecified, but the language  
 74135 and cultural conventions of diagnostic and informative messages whose format is  
 74136 unspecified by this volume of POSIX.1-2008 should be affected by the setting of  
 74137 XSI `LC_MESSAGES` and `NLSPATH`.

74138 The specified standard error output of standard utilities shall not depend on the  
 74139 existence or value of the environment variables defined in this volume of POSIX.1-2008,  
 74140 except as provided by this volume of POSIX.1-2008.

74141 **Default Behavior:** When this section is listed as “The standard error shall be used only  
 74142 for diagnostic messages.”, it means that, unless otherwise stated, the diagnostic  
 74143 messages shall be sent to the standard error only when the exit status indicates that an  
 74144 error occurred and the utility is used as described by this volume of POSIX.1-2008.

74145 When this section is listed as “Not used.”, it means that the standard error shall not be  
 74146 used when the utility is used as described in this volume of POSIX.1-2008.

## 74147 OUTPUT FILES

74148 The OUTPUT FILES section completely describes the files created or modified by the  
 74149 utility. Temporary or system files that are created for internal usage by this utility or  
 74150 other parts of the implementation (for example, spool, log, and audit files) are not  
 74151 described in this, or any, section. The utilities creating such files and the names of such  
 74152 files are unspecified. If applications are written to use temporary or intermediate files,  
 74153 they should use the `TMPDIR` environment variable, if it is set and represents an  
 74154 accessible directory, to select the location of temporary files.

74155 Implementations shall ensure that temporary files, when used by the standard utilities,  
 74156 are named so that different utilities or multiple instances of the same utility can operate  
 74157 simultaneously without regard to their working directories, or any other process  
 74158 characteristic other than process ID. There are two exceptions to this rule:

- 74159 1. Resources for temporary files other than the name space (for example, disk  
 74160 space, available directory entries, or number of processes allowed) are not  
 74161 guaranteed.
- 74162 2. Certain standard utilities generate output files that are intended as input for  
 74163 other utilities (for example, *lex* generates `lex.yy.c`), and these cannot have unique  
 74164 names. These cases are explicitly identified in the descriptions of the respective  
 74165 utilities.

74166 Any temporary file created by the implementation shall be removed by the  
 74167 implementation upon a utility’s successful exit, exit because of errors, or before  
 74168 termination by any of the `SIGHUP`, `SIGINT`, or `SIGTERM` signals, unless specified  
 74169 otherwise by the utility description.

74170 Receipt of the `SIGQUIT` signal should generally cause termination (unless in some  
 74171 debugging mode) that would bypass any attempted recovery actions.

74172 Record formats are described in a notation similar to that used by the C-language  
 74173 function, `printf()`; see XBD Chapter 5 (on page 121) for a description of this notation.

74174 **Default Behavior:** When this section is listed as “None.”, it means that no files are  
 74175 created or modified as a consequence of direct action on the part of the utility when the  
 74176 utility is used as described by this volume of POSIX.1-2008. However, the utility may

create or modify system files, such as log files, that are outside the utility's normal execution environment.

## EXTENDED DESCRIPTION

The EXTENDED DESCRIPTION section provides a place for describing the actions of very complicated utilities, such as text editors or language processors, which typically have elaborate command languages.

**Default Behavior:** When this section is listed as "None.", no further description is necessary.

## EXIT STATUS

The EXIT STATUS section describes the values the utility shall return to the calling program, or shell, and the conditions that cause these values to be returned. Usually, utilities return zero for successful completion and values greater than zero for various error conditions. If specific numeric values are listed in this section, the system shall use those values for the errors described. In some cases, status values are listed more loosely, such as >0. A strictly conforming application shall not rely on any specific value in the range shown and shall be prepared to receive any value in the range.

For example, a utility may list zero as a successful return, 1 as a failure for a specific reason, and >1 as "an error occurred". In this case, unspecified conditions may cause a 2 or 3, or other value, to be returned. A conforming application should be written so that it tests for successful exit status values (zero in this case), rather than relying upon the single specific error value listed in this volume of POSIX.1-2008. In that way, it has maximum portability, even on implementations with extensions.

Unspecified error conditions may be represented by specific values not listed in this volume of POSIX.1-2008.

## CONSEQUENCES OF ERRORS

The CONSEQUENCES OF ERRORS section describes the effects on the environment, file systems, process state, and so on, when error conditions occur. It does not describe error messages produced or exit status values used.

The many reasons for failure of a utility are generally not specified by the utility descriptions. Utilities may terminate prematurely if they encounter: invalid usage of options, arguments, or environment variables; invalid usage of the complex syntaxes expressed in EXTENDED DESCRIPTION sections; resource exhaustion; difficulties accessing, creating, reading, or writing files; or difficulties associated with the privileges of the process.

The following shall apply to each utility, unless otherwise stated:

- If the requested action cannot be performed on an operand representing a file, directory, user, process, and so on, the utility shall issue a diagnostic message to standard error and continue processing the next operand in sequence, but the final exit status shall be returned as non-zero.

For a utility that recursively traverses a file hierarchy (such as *find* or *chown -R*), if the requested action cannot be performed on a file or directory encountered in the hierarchy, the utility shall issue a diagnostic message to standard error and continue processing the remaining files in the hierarchy, but the final exit status shall be returned as non-zero.

- If the requested action characterized by an option or option-argument cannot be performed, the utility shall issue a diagnostic message to standard error and the exit status returned shall be non-zero.

- When an unrecoverable error condition is encountered, the utility shall exit with a non-zero exit status.
- A diagnostic message shall be written to standard error whenever an error condition occurs.

When a utility encounters an error condition several actions are possible, depending on the severity of the error and the state of the utility. Included in the possible actions of various utilities are: deletion of temporary or intermediate work files; deletion of incomplete files; validity checking of the file system or directory.

**Default Behavior:** When this section is listed as “Default.”, it means that any changes to the environment, file systems, process state, and so on are unspecified.

## APPLICATION USAGE

This section is informative.

The APPLICATION USAGE section gives advice to the application programmer or user about the way the utility should be used.

## EXAMPLES

This section is informative.

The EXAMPLES section gives one or more examples of usage, where appropriate. In the event of conflict between an example and a normative part of the specification, the normative material is to be taken as correct.

In all examples, quoting has been used, showing how sample commands (utility names combined with arguments) could be passed correctly to a shell (see *sh*) or as a string to the *system()* function defined in the System Interfaces volume of POSIX.1-2008. Such quoting would not be used if the utility is invoked using one of the *exec* functions defined in the System Interfaces volume of POSIX.1-2008.

## RATIONALE

This section is informative.

This section contains historical information concerning the contents of this volume of POSIX.1-2008 and why features were included or discarded by the standard developers.

## FUTURE DIRECTIONS

This section is informative.

The FUTURE DIRECTIONS section should be used as a guide to current thinking; there is not necessarily a commitment to implement all of these future directions in their entirety.

## SEE ALSO

This section is informative.

The SEE ALSO section lists related entries.

## CHANGE HISTORY

This section is informative.

This section shows the derivation of the entry and any significant changes that have been made to it.

Certain of the standard utilities describe how they can invoke other utilities or applications, such as by passing a command string to the command interpreter. The external influences (STDIN, ENVIRONMENT VARIABLES, and so on) and external effects (STDOUT, CONSEQUENCES OF

74268 ERRORS, and so on) of such invoked utilities are not described in the section concerning the  
 74269 standard utility that invokes them.

## 74270 1.5 Considerations for Utilities in Support of Files of Arbitrary Size

74271 The following utilities support files of any size up to the maximum that can be created by the  
 74272 implementation. This support includes correct writing of file size-related values (such as file  
 74273 sizes and offsets, line numbers, and block counts) and correct interpretation of command line  
 74274 arguments that contain such values.

|       |                 |                                                   |
|-------|-----------------|---------------------------------------------------|
| 74275 | <i>basename</i> | Return non-directory portion of pathname.         |
| 74276 | <i>cat</i>      | Concatenate and print files.                      |
| 74277 | <i>cd</i>       | Change working directory.                         |
| 74278 | <i>chgrp</i>    | Change file group ownership.                      |
| 74279 | <i>chmod</i>    | Change file modes.                                |
| 74280 | <i>chown</i>    | Change file ownership.                            |
| 74281 | <i>cksum</i>    | Write file checksums and sizes.                   |
| 74282 | <i>cmp</i>      | Compare two files.                                |
| 74283 | <i>cp</i>       | Copy files.                                       |
| 74284 | <i>dd</i>       | Convert and copy a file.                          |
| 74285 | <i>df</i>       | Report free disk space.                           |
| 74286 | <i>dirname</i>  | Return directory portion of pathname.             |
| 74287 | <i>du</i>       | Estimate file space usage.                        |
| 74288 | <i>find</i>     | Find files.                                       |
| 74289 | <i>ln</i>       | Link files.                                       |
| 74290 | <i>ls</i>       | List directory contents.                          |
| 74291 | <i>mkdir</i>    | Make directories.                                 |
| 74292 | <i>mv</i>       | Move files.                                       |
| 74293 | <i>pathchk</i>  | Check pathnames.                                  |
| 74294 | <i>pwd</i>      | Return working directory name.                    |
| 74295 | <i>rm</i>       | Remove directory entries.                         |
| 74296 | <i>rmdir</i>    | Remove directories.                               |
| 74297 | <i>sh</i>       | Shell, the standard command language interpreter. |
| 74298 | <i>sum</i>      | Print checksum and block or byte count of a file. |
| 74299 | <i>test</i>     | Evaluate expression.                              |
| 74300 | <i>touch</i>    | Change file access and modification times.        |
| 74301 | <i>ulimit</i>   | Set or report file size limit.                    |

Exceptions to the requirement that utilities support files of any size up to the maximum are as follows:

1. Uses of files as command scripts, or for configuration or control, are exempt. For example, it is not required that *sh* be able to read an arbitrarily large **.profile**.
2. Shell input and output redirection are exempt. For example, it is not required that the redirections *sum < file* or *echo foo > file* succeed for an arbitrarily large existing file.

## 1.6 Built-In Utilities

Any of the standard utilities may be implemented as regular built-in utilities within the command language interpreter. This is usually done to increase the performance of frequently used utilities or to achieve functionality that would be more difficult in a separate environment. The utilities named in Table 1-5 are frequently provided in built-in form. All of the utilities named in the table have special properties in terms of command search order within the shell, as described in Section 2.9.1.1 (on page 2357).

**Table 1-5** Regular Built-In Utilities

|                |                |               |             |                |
|----------------|----------------|---------------|-------------|----------------|
| <i>alias</i>   | <i>false</i>   | <i>hash</i>   | <i>pwd</i>  | <i>ulimit</i>  |
| <i>bg</i>      | <i>fc</i>      | <i>jobs</i>   | <i>read</i> | <i>umask</i>   |
| <i>cd</i>      | <i>fg</i>      | <i>kill</i>   | <i>true</i> | <i>unalias</i> |
| <i>command</i> | <i>getopts</i> | <i>newgrp</i> | <i>type</i> | <i>wait</i>    |

However, all of the standard utilities, including the regular built-ins in the table, but not the special built-ins described in Section 2.14 (on page 2374), shall be implemented in a manner so that they can be accessed via the *exec* family of functions as defined in the System Interfaces volume of POSIX.1-2008 and can be invoked directly by those standard utilities that require it - (*env*, *find*, *nice*, *nohup*, *time*, *xargs*).

74325

Chapter 2

74326

# Shell Command Language

74327

This chapter contains the definition of the Shell Command Language.

74328

## 2.1 Shell Introduction

74329

74330

74331

The shell is a command language interpreter. This chapter describes the syntax of that command language as it is used by the *sh* utility and the *system()* and *popen()* functions defined in the System Interfaces volume of POSIX.1-2008.

74332

74333

The shell operates according to the following general overview of operations. The specific details are included in the cited sections of this chapter.

74334

74335

74336

74337

1. The shell reads its input from a file (see *sh*), from the `-c` option or from the *system()* and *popen()* functions defined in the System Interfaces volume of POSIX.1-2008. If the first line of a file of shell commands starts with the characters "#!", the results are unspecified.

74338

2. The shell breaks the input into tokens: words and operators; see [Section 2.3](#).

74339

74340

3. The shell parses the input into simple commands (see [Section 2.9.1](#)) and compound commands (see [Section 2.9.4](#)).

74341

74342

74343

4. The shell performs various expansions (separately) on different parts of each command, resulting in a list of pathnames and fields to be treated as a command and arguments; see [Section 2.6](#).

74344

74345

5. The shell performs redirection (see [Section 2.7](#)) and removes redirection operators and their operands from the parameter list.

74346

74347

74348

74349

6. The shell executes a function (see [Section 2.9.5](#)), built-in (see [Section 2.14](#)), executable file, or script, giving the names of the arguments as positional parameters numbered 1 to *n*, and the name of the command (or in the case of a function within a script, the name of the script) as the positional parameter numbered 0 (see [Section 2.9.1.1](#)).

74350

74351

7. The shell optionally waits for the command to complete and collects the exit status (see [Section 2.8.2](#)).

## 2.2 Quoting

Quoting is used to remove the special meaning of certain characters or words to the shell. Quoting can be used to preserve the literal meaning of the special characters in the next paragraph, prevent reserved words from being recognized as such, and prevent parameter expansion and command substitution within here-document processing (see [Section 2.7.4](#)).

The application shall quote the following characters if they are to represent themselves:

| & ; < > ( ) \$ ' \ " ' <space> <tab> <newline>

and the following may need to be quoted under certain circumstances. That is, these characters may be special depending on conditions described elsewhere in this volume of POSIX.1-2008:

\* ? [ # ~ = %

The various quoting mechanisms are the escape character, single-quotes, and double-quotes. The here-document represents another form of quoting; see [Section 2.7.4](#).

### 2.2.1 Escape Character (Backslash)

A <backslash> that is not quoted shall preserve the literal value of the following character, with the exception of a <newline>. If a <newline> follows the <backslash>, the shell shall interpret this as line continuation. The <backslash> and <newline> shall be removed before splitting the input into tokens. Since the escaped <newline> is removed entirely from the input and is not replaced by any white space, it cannot serve as a token separator.

### 2.2.2 Single-Quotes

Enclosing characters in single-quotes ( ' ' ) shall preserve the literal value of each character within the single-quotes. A single-quote cannot occur within single-quotes.

### 2.2.3 Double-Quotes

Enclosing characters in double-quotes ( " " ) shall preserve the literal value of all characters within the double-quotes, with the exception of the characters backquote, <dollar-sign>, and <backslash>, as follows:

\$ The <dollar-sign> shall retain its special meaning introducing parameter expansion (see [Section 2.6.2](#)), a form of command substitution (see [Section 2.6.3](#)), and arithmetic expansion (see [Section 2.6.4](#)).

The input characters within the quoted string that are also enclosed between "\$ ( " and the matching ' ) ' shall not be affected by the double-quotes, but rather shall define that command whose output replaces the "\$ ( . . . ) " when the word is expanded. The tokenizing rules in [Section 2.3](#), not including the alias substitutions in [Section 2.3.1](#), shall be applied recursively to find the matching ' ) '.

Within the string of characters from an enclosed "\$ { " to the matching ' } ' , an even number of unescaped double-quotes or single-quotes, if any, shall occur. A preceding <backslash> character shall be used to escape a literal ' { ' or ' } ' . The rule in [Section 2.6.2](#) shall be used to determine the matching ' } ' .

74389     ``` The backquote shall retain its special meaning introducing the other form of command  
 74390 substitution (see [Section 2.6.3](#)). The portion of the quoted string from the initial backquote  
 74391 and the characters up to the next backquote that is not preceded by a `<backslash>`, having  
 74392 escape characters removed, defines that command whose output replaces `"`...`"` when  
 74393 the word is expanded. Either of the following cases produces undefined results:

- 74394         • A single-quoted or double-quoted string that begins, but does not end, within the  
 74395         `"`...`"` sequence
- 74396         • A `"`...`"` sequence that begins, but does not end, within the same double-quoted  
 74397         string

74398     `\` The `<backslash>` shall retain its special meaning as an escape character (see [Section 2.2.1](#))  
 74399     only when followed by one of the following characters when considered special:

74400         `$   `   "   \   <newline>`

74401     The application shall ensure that a double-quote is preceded by a `<backslash>` to be included  
 74402     within double-quotes. The parameter `'@'` has special meaning inside double-quotes and is  
 74403     described in [Section 2.5.2](#).

## 74404   2.3   Token Recognition

74405     The shell shall read its input in terms of lines. (For details about how the shell reads its input, see  
 74406     the description of [sh](#).) The input lines can be of unlimited length. These lines shall be parsed  
 74407     using two major modes: ordinary token recognition and processing of here-documents.

74408     When an **io\_here** token has been recognized by the grammar (see [Section 2.10](#)), one or more of  
 74409     the subsequent lines immediately following the next **NEWLINE** token form the body of one or  
 74410     more here-documents and shall be parsed according to the rules of [Section 2.7.4](#).

74411     When it is not processing an **io\_here**, the shell shall break its input into tokens by applying the  
 74412     first applicable rule below to the next character in its input. The token shall be from the current  
 74413     position in the input until a token is delimited according to one of the rules below; the characters  
 74414     forming the token are exactly those in the input, including any quoting characters. If it is  
 74415     indicated that a token is delimited, and no characters have been included in a token, processing  
 74416     shall continue until an actual token is delimited.

- 74417         1. If the end of input is recognized, the current token (if any) shall be delimited. |
- 74418         2. If the previous character was used as part of an operator and the current character is not |  
 74419         quoted and can be used with the previous characters to form an operator, it shall be used  
 74420         as part of that (operator) token.
- 74421         3. If the previous character was used as part of an operator and the current character cannot |  
 74422         be used with the previous characters to form an operator, the operator containing the  
 74423         previous character shall be delimited.
- 74424         4. If the current character is `<backslash>`, single-quote, or double-quote and it is not quoted,  
 74425         it shall affect quoting for subsequent characters up to the end of the quoted text. The rules  
 74426         for quoting are as described in [Section 2.2](#). During token recognition no substitutions  
 74427         shall be actually performed, and the result token shall contain exactly the characters that  
 74428         appear in the input (except for `<newline>` joining), unmodified, including any embedded  
 74429         or enclosing quotes or substitution operators, between the `<quotation-mark>` and the end  
 74430         of the quoted text. The token shall not be delimited by the end of the quoted field.

5. If the current character is an unquoted '\$' or '\', the shell shall identify the start of any candidates for parameter expansion (Section 2.6.2), command substitution (Section 2.6.3), or arithmetic expansion (Section 2.6.4) from their introductory unquoted character sequences: '\$' or '\${', '\$(' or '\', and '\$((', respectively. The shell shall read sufficient input to determine the end of the unit to be expanded (as explained in the cited sections). While processing the characters, if instances of expansions or quoting are found nested within the substitution, the shell shall recursively process them in the manner specified for the construct that is found. The characters found from the beginning of the substitution to its end, allowing for any recursion necessary to recognize embedded constructs, shall be included unmodified in the result token, including any embedded or enclosing substitution operators or quotes. The token shall not be delimited by the end of the substitution.
6. If the current character is not quoted and can be used as the first character of a new operator, the current token (if any) shall be delimited. The current character shall be used as the beginning of the next (operator) token.
7. If the current character is an unquoted <blank>, any token containing the previous character is delimited and the current character shall be discarded.
8. If the previous character was part of a word, the current character shall be appended to that word.
9. If the current character is a '#', it and all subsequent characters up to, but excluding, the next <newline> shall be discarded as a comment. The <newline> that ends the line is not considered part of the comment.
10. The current character is used as the start of a new word.

Once a token is delimited, it is categorized as required by the grammar in Section 2.10.

### 2.3.1 Alias Substitution

After a token has been delimited, but before applying the grammatical rules in Section 2.10, a resulting word that is identified to be the command name word of a simple command shall be examined to determine whether it is an unquoted, valid alias name. However, reserved words in correct grammatical context shall not be candidates for alias substitution. A valid alias name (see XBD Section 3.10) shall be one that has been defined by the *alias* utility and not subsequently undefined using *unalias*. Implementations also may provide predefined valid aliases that are in effect when the shell is invoked. To prevent infinite loops in recursive aliasing, if the shell is not currently processing an alias of the same name, the word shall be replaced by the value of the alias; otherwise, it shall not be replaced.

If the value of the alias replacing the word ends in a <blank>, the shell shall check the next command word for alias substitution; this process shall continue until a word is found that is not a valid alias or an alias value does not end in a <blank>.

When used as specified by this volume of POSIX.1-2008, alias definitions shall not be inherited by separate invocations of the shell or by the utility execution environments invoked by the shell; see Section 2.12.

## 2.4 Reserved Words

Reserved words are words that have special meaning to the shell; see [Section 2.9](#). The following words shall be recognized as reserved words:

|      |      |      |       |
|------|------|------|-------|
| !    | do   | esac | in    |
| {    | done | fi   | then  |
| }    | elif | for  | until |
| case | else | if   | while |

This recognition shall only occur when none of the characters is quoted and when the word is used as:

- The first word of a command
- The first word following one of the reserved words other than **case**, **for**, or **in**
- The third word in a **case** command (only **in** is valid in this case)
- The third word in a **for** command (only **in** and **do** are valid in this case)

See the grammar in [Section 2.10](#).

The following words may be recognized as reserved words on some implementations (when none of the characters are quoted), causing unspecified results:

|   |   |          |        |
|---|---|----------|--------|
| [ | ] | function | select |
|---|---|----------|--------|

Words that are the concatenation of a name and a <colon> ( ' : ' ) are reserved; their use produces unspecified results.

## 2.5 Parameters and Variables

A parameter can be denoted by a name, a number, or one of the special characters listed in [Section 2.5.2](#). A variable is a parameter denoted by a name.

A parameter is set if it has an assigned value (null is a valid value). Once a variable is set, it can only be unset by using the *unset* special built-in command.

### 2.5.1 Positional Parameters

A positional parameter is a parameter denoted by the decimal value represented by one or more digits, other than the single digit 0. The digits denoting the positional parameters shall always be interpreted as a decimal value, even if there is a leading zero. When a positional parameter with more than one digit is specified, the application shall enclose the digits in braces (see [Section 2.6.2](#)). Positional parameters are initially assigned when the shell is invoked (see *sh*), temporarily replaced when a shell function is invoked (see [Section 2.9.5](#)), and can be reassigned with the *set* special built-in command.

## 2.5.2 Special Parameters

Listed below are the special parameters and the values to which they shall expand. Only the values of the special parameters are listed; see [Section 2.6](#) for a detailed summary of all the stages involved in expanding words.

@ Expands to the positional parameters, starting from one, initially producing one field for each positional parameter that is set. When the expansion occurs in a context where field splitting will be performed, any empty fields may be discarded and each of the non-empty fields shall be further split as described in [Section 2.6.5](#). When the expansion occurs within double-quotes, the behavior is unspecified unless one of the following is true:

- Field splitting as described in [Section 2.6.5](#) would be performed if the expansion were not within double-quotes (regardless of whether field splitting would have any effect; for example, if *IFS* is null).
- The double-quotes are within the *word* of a  $\${parameter}:-word$  or a  $\${parameter}:+word$  expansion (with or without the `<colon>`; see [Section 2.6.2](#)) which would have been subject to field splitting if *parameter* had been expanded instead of *word*.

If one of these conditions is true, the initial fields shall be retained as separate fields, except that if the parameter being expanded was embedded within a word, the first field shall be joined with the beginning part of the original word and the last field shall be joined with the end part of the original word. In all other contexts the results of the expansion are unspecified. If there are no positional parameters, the expansion of '@' shall generate zero fields, even when '@' is within double-quotes; however, if the expansion is embedded within a word which contains one or more other parts that expand to a quoted null string, these null string(s) shall still produce an empty field, except that if the other parts are all within the same double-quotes as the '@', it is unspecified whether the result is zero fields or one empty field.

\* Expands to the positional parameters, starting from one, initially producing one field for each positional parameter that is set. When the expansion occurs in a context where field splitting will be performed, any empty fields may be discarded and each of the non-empty fields shall be further split as described in [Section 2.6.5](#). When the expansion occurs in a context where field splitting will not be performed, the initial fields shall be joined to form a single field with the value of each parameter separated by the first character of the *IFS* variable if *IFS* contains at least one character, or separated by a `<space>` if *IFS* is unset, or with no separation if *IFS* is set to a null string.

# Expands to the decimal number of positional parameters. The command name (parameter 0) shall not be counted in the number given by '#' because it is a special parameter, not a positional parameter.

? Expands to the decimal exit status of the most recent pipeline (see [Section 2.9.2](#)).

– (Hyphen.) Expands to the current option flags (the single-letter option names concatenated into a string) as specified on invocation, by the *set* special built-in command, or implicitly by the shell.

\$ Expands to the decimal process ID of the invoked shell. In a subshell (see [Section 2.12](#)), '\$' shall expand to the same value as that of the current shell.

! Expands to the decimal process ID of the most recent background command (see [Section 2.9.3](#)) executed from the current shell. (For example, background commands executed from subshells do not affect the value of "\$!" in the current shell environment.) For a pipeline, the process ID is that of the last command in the pipeline.

74549 0 (Zero.) Expands to the name of the shell or shell script. See *sh* for a detailed description of  
 74550 how this name is derived.  
 74551 See the description of the *IFS* variable in [Section 2.5.3](#).

### 74552 2.5.3 Shell Variables

74553 Variables shall be initialized from the environment (as defined by XBD [Chapter 8](#) and the *exec*  
 74554 function in the System Interfaces volume of POSIX.1-2008) and can be given new values with  
 74555 variable assignment commands. If a variable is initialized from the environment, it shall be  
 74556 marked for export immediately; see the *export* special built-in. New variables can be defined and  
 74557 initialized with variable assignments, with the *read* or *getopts* utilities, with the *name* parameter  
 74558 in a **for** loop, with the  $\${name=word}$  expansion, or with other mechanisms provided as  
 74559 implementation extensions.

74560 The following variables shall affect the execution of the shell:

|       |    |            |                                                                                                                                  |
|-------|----|------------|----------------------------------------------------------------------------------------------------------------------------------|
| 74561 | UP | <b>ENV</b> | The processing of the <i>ENV</i> shell variable shall be supported if the system supports the User Portability Utilities option. |
|-------|----|------------|----------------------------------------------------------------------------------------------------------------------------------|

|       |  |  |                                                                                            |
|-------|--|--|--------------------------------------------------------------------------------------------|
| 74562 |  |  |                                                                                            |
| 74563 |  |  | This variable, when and only when an interactive shell is invoked, shall be                |
| 74564 |  |  | subjected to parameter expansion (see <a href="#">Section 2.6.2</a> ) by the shell and the |
| 74565 |  |  | resulting value shall be used as a pathname of a file containing shell                     |
| 74566 |  |  | commands to execute in the current environment. The file need not be                       |
| 74567 |  |  | executable. If the expanded value of <i>ENV</i> is not an absolute pathname, the           |
| 74568 |  |  | results are unspecified. <i>ENV</i> shall be ignored if the user's real and effective      |
| 74569 |  |  | user IDs or real and effective group IDs are different.                                    |

|       |             |  |                                                                                    |
|-------|-------------|--|------------------------------------------------------------------------------------|
| 74570 | <i>HOME</i> |  | The pathname of the user's home directory. The contents of <i>HOME</i> are used in |
| 74571 |             |  | tilde expansion (see <a href="#">Section 2.6.1</a> ).                              |

|       |            |  |                                                                                                   |
|-------|------------|--|---------------------------------------------------------------------------------------------------|
| 74572 | <i>IFS</i> |  | A string treated as a list of characters that is used for field splitting, expansion              |
| 74573 |            |  | of the <i>'*'</i> special parameter, and to split lines into fields with the <i>read</i> utility. |
| 74574 |            |  | If the value of <i>IFS</i> includes any bytes that do not form part of a valid character,         |
| 74575 |            |  | the results of field splitting, expansion of <i>'*'</i> , and use of the <i>read</i> utility are  |
| 74576 |            |  | unspecified.                                                                                      |

|       |  |  |                                                                                                       |
|-------|--|--|-------------------------------------------------------------------------------------------------------|
| 74577 |  |  | If <i>IFS</i> is not set, it shall behave as normal for an unset variable, except that                |
| 74578 |  |  | field splitting by the shell and line splitting by the <i>read</i> utility shall be                   |
| 74579 |  |  | performed as if the value of <i>IFS</i> is <space><tab><newline>; see <a href="#">Section 2.6.5</a> . |

|       |  |  |                                                                             |
|-------|--|--|-----------------------------------------------------------------------------|
| 74580 |  |  | The shell shall set <i>IFS</i> to <space><tab><newline> when it is invoked. |
|-------|--|--|-----------------------------------------------------------------------------|

|       |             |  |                                                                                                 |
|-------|-------------|--|-------------------------------------------------------------------------------------------------|
| 74581 | <i>LANG</i> |  | Provide a default value for the internationalization variables that are unset or                |
| 74582 |             |  | null. (See XBD <a href="#">Section 8.2</a> for the precedence of internationalization variables |
| 74583 |             |  | used to determine the values of locale categories.)                                             |

|       |               |  |                                                                                     |
|-------|---------------|--|-------------------------------------------------------------------------------------|
| 74584 | <i>LC_ALL</i> |  | The value of this variable overrides the <i>LC_*</i> variables and <i>LANG</i> , as |
| 74585 |               |  | described in XBD <a href="#">Chapter 8</a> .                                        |

|       |                   |  |                                                                              |
|-------|-------------------|--|------------------------------------------------------------------------------|
| 74586 | <i>LC_COLLATE</i> |  | Determine the behavior of range expressions, equivalence classes, and multi- |
| 74587 |                   |  | character collating elements within pattern matching.                        |

|       |                 |  |                                                                                          |
|-------|-----------------|--|------------------------------------------------------------------------------------------|
| 74588 | <i>LC_CTYPE</i> |  | Determine the interpretation of sequences of bytes of text data as characters            |
| 74589 |                 |  | (for example, single-byte as opposed to multi-byte characters), which                    |
| 74590 |                 |  | characters are defined as letters (character class <b>alpha</b> ) and <blank> characters |
| 74591 |                 |  | (character class <b>blank</b> ), and the behavior of character classes within pattern    |
| 74592 |                 |  | matching. Changing the value of <i>LC_CTYPE</i> after the shell has started shall        |

|       |                    |                                                                                            |
|-------|--------------------|--------------------------------------------------------------------------------------------|
| 74593 |                    | not affect the lexical processing of shell commands in the current shell                   |
| 74594 |                    | execution environment or its subshells. Invoking a shell script or performing              |
| 74595 |                    | <i>exec sh</i> subjects the new shell to the changes in <i>LC_CTYPE</i> .                  |
| 74596 | <i>LC_MESSAGES</i> | Determine the language in which messages should be written.                                |
| 74597 | <i>LINENO</i>      | Set by the shell to a decimal number representing the current sequential line              |
| 74598 |                    | number (numbered starting with 1) within a script or function before it                    |
| 74599 |                    | executes each command. If the user unsets or resets <i>LINENO</i> , the variable may       |
| 74600 |                    | lose its special meaning for the life of the shell. If the shell is not currently          |
| 74601 |                    | executing a script or function, the value of <i>LINENO</i> is unspecified. This            |
| 74602 |                    | volume of POSIX.1-2008 specifies the effects of the variable only for systems              |
| 74603 |                    | supporting the User Portability Utilities option.                                          |
| 74604 | XSI                | <i>NLSPATH</i> Determine the location of message catalogs for the processing of            |
| 74605 |                    | <i>LC_MESSAGES</i> .                                                                       |
| 74606 | <i>PATH</i>        | A string formatted as described in XBD Chapter 8, used to effect command                   |
| 74607 |                    | interpretation; see Section 2.9.1.1.                                                       |
| 74608 | <i>PPID</i>        | Set by the shell to the decimal value of its parent process ID during                      |
| 74609 |                    | initialization of the shell. In a subshell (see Section 2.12), <i>PPID</i> shall be set to |
| 74610 |                    | the same value as that of the parent of the current shell. For example, <i>echo</i>        |
| 74611 |                    | <i>\$PPID</i> and ( <i>echo \$PPID</i> ) would produce the same value.                     |
| 74612 | <i>PS1</i>         | Each time an interactive shell is ready to read a command, the value of this               |
| 74613 |                    | variable shall be subjected to parameter expansion and written to standard                 |
| 74614 |                    | error. The default value shall be "\$ ". For users who have specific additional            |
| 74615 |                    | implementation-defined privileges, the default may be another,                             |
| 74616 |                    | implementation-defined value. The shell shall replace each instance of the                 |
| 74617 |                    | character '!' in <i>PS1</i> with the history file number of the next command to be         |
| 74618 |                    | typed. Escaping the '!' with another '!' (that is, "!!") shall place the literal           |
| 74619 |                    | character '!' in the prompt. This volume of POSIX.1-2008 specifies the effects             |
| 74620 |                    | of the variable only for systems supporting the User Portability Utilities                 |
| 74621 |                    | option.                                                                                    |
| 74622 | <i>PS2</i>         | Each time the user enters a <newline> prior to completing a command line in                |
| 74623 |                    | an interactive shell, the value of this variable shall be subjected to parameter           |
| 74624 |                    | expansion and written to standard error. The default value is "> ". This                   |
| 74625 |                    | volume of POSIX.1-2008 specifies the effects of the variable only for systems              |
| 74626 |                    | supporting the User Portability Utilities option.                                          |
| 74627 | <i>PS4</i>         | When an execution trace ( <i>set -x</i> ) is being performed in an interactive shell,      |
| 74628 |                    | before each line in the execution trace, the value of this variable shall be               |
| 74629 |                    | subjected to parameter expansion and written to standard error. The default                |
| 74630 |                    | value is "+ ". This volume of POSIX.1-2008 specifies the effects of the                    |
| 74631 |                    | variable only for systems supporting the User Portability Utilities option.                |
| 74632 | <i>PWD</i>         | Set by the shell and by the <i>cd</i> utility. In the shell the value shall be initialized |
| 74633 |                    | from the environment as follows. If a value for <i>PWD</i> is passed to the shell in       |
| 74634 |                    | the environment when it is executed, the value is an absolute pathname of the              |
| 74635 |                    | current working directory that is no longer than {PATH_MAX} bytes including                |
| 74636 |                    | the terminating null byte, and the value does not contain any components that              |
| 74637 |                    | are dot or dot-dot, then the shell shall set <i>PWD</i> to the value from the              |
| 74638 |                    | environment. Otherwise, if a value for <i>PWD</i> is passed to the shell in the            |
| 74639 |                    | environment when it is executed, the value is an absolute pathname of the                  |
| 74640 |                    | current working directory, and the value does not contain any components                   |

that are dot or dot-dot, then it is unspecified whether the shell sets *PWD* to the value from the environment or sets *PWD* to the pathname that would be output by *pwd -P*. Otherwise, the *sh* utility sets *PWD* to the pathname that would be output by *pwd -P*. In cases where *PWD* is set to the value from the environment, the value can contain components that refer to files of type symbolic link. In cases where *PWD* is set to the pathname that would be output by *pwd -P*, if there is insufficient permission on the current working directory, or on any parent of that directory, to determine what that pathname would be, the value of *PWD* is unspecified. Assignments to this variable may be ignored. If an application sets or unsets the value of *PWD*, the behaviors of the *cd* and *pwd* utilities are unspecified.

## 2.6 Word Expansions

This section describes the various expansions that are performed on words. Not all expansions are performed on every word, as explained in the following sections.

Tilde expansions, parameter expansions, command substitutions, arithmetic expansions, and quote removals that occur within a single word expand to a single field. It is only field splitting or pathname expansion that can create multiple fields from a single word. The single exception to this rule is the expansion of the special parameter '@' within double-quotes, as described in [Section 2.5.2](#).

The order of word expansion shall be as follows:

1. Tilde expansion (see [Section 2.6.1](#)), parameter expansion (see [Section 2.6.2](#)), command substitution (see [Section 2.6.3](#)), and arithmetic expansion (see [Section 2.6.4](#)) shall be performed, beginning to end. See item 5 in [Section 2.3](#).
2. Field splitting (see [Section 2.6.5](#)) shall be performed on the portions of the fields generated by step 1, unless *IFS* is null.
3. Pathname expansion (see [Section 2.6.6](#)) shall be performed, unless *set -f* is in effect.
4. Quote removal (see [Section 2.6.7](#)) shall always be performed last.

The expansions described in this section shall occur in the same shell environment as that in which the command is executed.

If the complete expansion appropriate for a word results in an empty field, that empty field shall be deleted from the list of fields that form the completely expanded command, unless the original word contained single-quote or double-quote characters.

The '\$' character is used to introduce parameter expansion, command substitution, or arithmetic evaluation. If an unquoted '\$' is followed by a character that is not one of the following:

- A numeric character
- The name of one of the special parameters (see [Section 2.5.2](#))
- A valid first character of a variable name
- A <left-curly-bracket> ('{')
- A <left-parenthesis> '('

the result is unspecified.

## 2.6.1 Tilde Expansion

A “tilde-prefix” consists of an unquoted <tilde> character at the beginning of a word, followed by all of the characters preceding the first unquoted <slash> in the word, or all the characters in the word if there is no <slash>. In an assignment (see XBD [Section 4.23](#)), multiple tilde-prefixes can be used: at the beginning of the word (that is, following the <equals-sign> of the assignment), following any unquoted <colon>, or both. A tilde-prefix in an assignment is terminated by the first unquoted <colon> or <slash>. If none of the characters in the tilde-prefix are quoted, the characters in the tilde-prefix following the <tilde> are treated as a possible login name from the user database. A portable login name cannot contain characters outside the set given in the description of the *LOGNAME* environment variable in XBD [Section 8.3](#). If the login name is null (that is, the tilde-prefix contains only the tilde), the tilde-prefix is replaced by the value of the variable *HOME*. If *HOME* is unset, the results are unspecified. Otherwise, the tilde-prefix shall be replaced by a pathname of the initial working directory associated with the login name obtained using the *getpwnam()* function as defined in the System Interfaces volume of POSIX.1-2008. If the system does not recognize the login name, the results are undefined.

The pathname resulting from tilde expansion shall be treated as if quoted to prevent it being altered by field splitting and pathname expansion.

## 2.6.2 Parameter Expansion

The format for parameter expansion is as follows:

```
${expression}
```

where *expression* consists of all characters until the matching '}'. Any '}' escaped by a <backslash> or within a quoted string, and characters in embedded arithmetic expansions, command substitutions, and variable expansions, shall not be examined in determining the matching '}'.

The simplest form for parameter expansion is:

```
${parameter}
```

The value, if any, of *parameter* shall be substituted.

The parameter name or symbol can be enclosed in braces, which are optional except for positional parameters with more than one digit or when *parameter* is a name and is followed by a character that could be interpreted as part of the name. The matching closing brace shall be determined by counting brace levels, skipping over enclosed quoted strings, and command substitutions.

If the parameter is not enclosed in braces, and is a name, the expansion shall use the longest valid name (see XBD [Section 3.235](#)), whether or not the variable represented by that name exists. Otherwise, the parameter is a single-character symbol, and behavior is unspecified if that character is neither a digit nor one of the special parameters (see [Section 2.5.2](#)).

If a parameter expansion occurs inside double-quotes:

- Pathname expansion shall not be performed on the results of the expansion.
- Field splitting shall not be performed on the results of the expansion.

In addition, a parameter expansion can be modified by using one of the following formats. In each case that a value of *word* is needed (based on the state of *parameter*, as described below), *word* shall be subjected to tilde expansion, parameter expansion, command substitution, and arithmetic expansion. If *word* is not needed, it shall not be expanded. The '}' character that

delimits the following parameter expansion modifications shall be determined as described previously in this section and in [Section 2.2.3](#).

**Use Default Values.** If *parameter* is unset or null, the expansion of *word* (or an empty string if *word* is omitted) shall be substituted; otherwise, the value of *parameter* shall be substituted.

**Assign Default Values.** If *parameter* is unset or null, the expansion of *word* (or an empty string if *word* is omitted) shall be assigned to *parameter*. In all cases, the final value of *parameter* shall be substituted. Only variables, not positional parameters or special parameters, can be assigned in this way.

**Indicate Error if Null or Unset.** If *parameter* is unset or null, the expansion of *word* (or a message indicating it is unset if *word* is omitted) shall be written to standard error and the shell exits with a non-zero exit status. Otherwise, the value of *parameter* shall be substituted. An interactive shell need not exit.

**Use Alternative Value.** If *parameter* is unset or null, null shall be substituted; otherwise, the expansion of *word* (or an empty string if *word* is omitted) shall be substituted.

In the parameter expansions shown previously, use of the <colon> in the format shall result in a test for a parameter that is unset or null; omission of the <colon> shall result in a test for a parameter that is only unset. If *parameter* is '#' and the colon is omitted, the application shall ensure that *word* is specified (this is necessary to avoid ambiguity with the string length expansion). The following table summarizes the effect of the <colon>:

|                                  | <i>parameter</i><br>Set and Not Null | <i>parameter</i><br>Set But Null | <i>parameter</i><br>Unset |
|----------------------------------|--------------------------------------|----------------------------------|---------------------------|
| <code>\${parameter:-word}</code> | substitute <i>parameter</i>          | substitute <i>word</i>           | substitute <i>word</i>    |
| <code>\${parameter-word}</code>  | substitute <i>parameter</i>          | substitute null                  | substitute <i>word</i>    |
| <code>\${parameter:=word}</code> | substitute <i>parameter</i>          | assign <i>word</i>               | assign <i>word</i>        |
| <code>\${parameter=word}</code>  | substitute <i>parameter</i>          | substitute null                  | assign <i>word</i>        |
| <code>\${parameter:?word}</code> | substitute <i>parameter</i>          | error, exit                      | error, exit               |
| <code>\${parameter?word}</code>  | substitute <i>parameter</i>          | substitute null                  | error, exit               |
| <code>\${parameter:+word}</code> | substitute <i>word</i>               | substitute null                  | substitute null           |
| <code>\${parameter+word}</code>  | substitute <i>word</i>               | substitute <i>word</i>           | substitute null           |

In all cases shown with “substitute”, the expression is replaced with the value shown. In all cases shown with “assign”, *parameter* is assigned that value, which also replaces the expression.

**String Length.** The length in characters of the value of *parameter* shall be substituted. If *parameter* is '\*' or '@', the result of the expansion is unspecified. If *parameter* is unset and *set -u* is in effect, the expansion shall fail.

The following four varieties of parameter expansion provide for substring processing. In each case, pattern matching notation (see [Section 2.13](#)), rather than regular expression notation, shall be used to evaluate the patterns. If *parameter* is '#', '\*', or '@', the result of the expansion is unspecified. If *parameter* is unset and *set -u* is in effect, the expansion shall fail. Enclosing the full parameter expansion string in double-quotes shall not cause the following four varieties of pattern characters to be quoted, whereas quoting characters within the braces shall have this effect. In each variety, if *word* is omitted, the empty pattern shall be used.

74771 `${parameter%[word]}` **Remove Smallest Suffix Pattern.** The *word* shall be expanded to produce  
 74772 a pattern. The parameter expansion shall then result in *parameter*, with the  
 74773 smallest portion of the suffix matched by the *pattern* deleted. If present,  
 74774 *word* shall not begin with an unquoted ' % '.

74775 `${parameter%%[word]}` **Remove Largest Suffix Pattern.** The *word* shall be expanded to produce a  
 74776 pattern. The parameter expansion shall then result in *parameter*, with the  
 74777 largest portion of the suffix matched by the *pattern* deleted.

74778 `${parameter#[word]}` **Remove Smallest Prefix Pattern.** The *word* shall be expanded to produce  
 74779 a pattern. The parameter expansion shall then result in *parameter*, with the  
 74780 smallest portion of the prefix matched by the *pattern* deleted. If present,  
 74781 *word* shall not begin with an unquoted ' # '.

74782 `${parameter##[word]}` **Remove Largest Prefix Pattern.** The *word* shall be expanded to produce a  
 74783 pattern. The parameter expansion shall then result in *parameter*, with the  
 74784 largest portion of the prefix matched by the *pattern* deleted.

### Examples

74785 `${parameter}`  
 74786 In this example, the effects of omitting braces are demonstrated.  
 74787  
 74788 `a=1`  
 74789 `set 2`  
 74790 `echo ${a}b-$ab-${1}0-${10}-${10}`  
 74791 **1b--20--20**

74792 `${parameter-word}`  
 74793 This example demonstrates the difference between unset and set to the empty string, as well +  
 74794 as the rules for finding the delimiting close brace. +

74795 `foo=asdf`  
 74796 `echo ${foo-bar}xyz}`  
 74797 **asdfxyz}**  
 74798 `foo=`  
 74799 `echo ${foo-bar}xyz}`  
 74800 **xyz}**  
 74801 `unset foo`  
 74802 `echo ${foo-bar}xyz}`  
 74803 **barxyz}**

74804 `${parameter:-word}`  
 74805 In this example, *ls* is executed only if *x* is null or unset. (The `$(ls)` command substitution  
 74806 notation is explained in [Section 2.6.3](#).)

74807 `${x:-$(ls)}`

74808 `${parameter:=word}`  
 74809 `unset X`  
 74810 `echo ${X:=abc}`  
 74811 **abc**

74812 `${parameter:?word}`  
 74813 `unset posix`  
 74814 `echo ${posix:?}`  
 74815 **sh: posix: parameter null or not set**

```

74816  ${parameter:+word}
74817      set a b c
74818      echo ${3:+posix}
74819      posix

74820  ${#parameter}
74821      HOME=/usr/posix
74822      echo ${#HOME}
74823      10

74824  ${parameter%word}
74825      x=file.c
74826      echo ${x%.c}.o
74827      file.o

74828  ${parameter%%word}
74829      x=posix/src/std
74830      echo ${x%/*}
74831      posix

74832  ${parameter#word}
74833      x=$HOME/src/cmd
74834      echo ${x#$HOME}
74835      /src/cmd

74836  ${parameter##word}
74837      x=/one/two/three
74838      echo ${x##*/}
74839      three

```

The double-quoting of patterns is different depending on where the double-quotes are placed:

```

74841  "$ {x#*} "    The <asterisk> is a pattern character.
74842  "${x#" *"} "  The literal <asterisk> is quoted and not special.

```

### 74843 2.6.3 Command Substitution

74844 Command substitution allows the output of a command to be substituted in place of the  
 74845 command name itself. Command substitution shall occur when the command is enclosed as  
 74846 follows:

```
74847 $( command )
```

74848 or (backquoted version):

```
74849 `command`
```

74850 The shell shall expand the command substitution by executing *command* in a subshell  
 74851 environment (see [Section 2.12](#)) and replacing the command substitution (the text of *command*  
 74852 plus the enclosing "\$ ( ) " or backquotes) with the standard output of the command, removing  
 74853 sequences of one or more <newline> characters at the end of the substitution. Embedded  
 74854 <newline> characters before the end of the output shall not be removed; however, they may be  
 74855 treated as field delimiters and eliminated during field splitting, depending on the value of *IFS*  
 74856 and quoting that is in effect. If the output contains any null bytes, the behavior is unspecified.

74857 Within the backquoted style of command substitution, <backslash> shall retain its literal  
 74858 meaning, except when followed by: '\$', '`', or <backslash>. The search for the matching

backquote shall be satisfied by the first unquoted non-escaped backquote; during this search, if a non-escaped backquote is encountered within a shell comment, a here-document, an embedded command substitution of the  $\$(command)$  form, or a quoted string, undefined results occur. A single-quoted or double-quoted string that begins, but does not end, within the `"`...`"` sequence produces undefined results.

With the  $\$(command)$  form, all characters following the open parenthesis to the matching closing parenthesis constitute the *command*. Any valid shell script can be used for *command*, except a script consisting solely of redirections which produces unspecified results.

The results of command substitution shall not be processed for further tilde expansion, parameter expansion, command substitution, or arithmetic expansion. If a command substitution occurs inside double-quotes, field splitting and pathname expansion shall not be performed on the results of the substitution.

Command substitution can be nested. To specify nesting within the backquoted version, the application shall precede the inner backquotes with `<backslash>` characters; for example:

```
\`command\`
```

The syntax of the shell command language has an ambiguity for expansions beginning with `"$( "`, which can introduce an arithmetic expansion or a command substitution that starts with a subshell. Arithmetic expansion has precedence; that is, the shell shall first determine whether it can parse the expansion as an arithmetic expansion and shall only parse the expansion as a command substitution if it determines that it cannot parse the expansion as an arithmetic expansion. The shell need not evaluate nested expansions when performing this determination. If it encounters the end of input without already having determined that it cannot parse the expansion as an arithmetic expansion, the shell shall treat the expansion as an incomplete arithmetic expansion and report a syntax error. A conforming application shall ensure that it separates the `"$( "` and `'( '` into two tokens (that is, separate them with white space) in a command substitution that starts with a subshell. For example, a command substitution containing a single subshell could be written as:

```
$( (command) )
```

## 2.6.4 Arithmetic Expansion

Arithmetic expansion provides a mechanism for evaluating an arithmetic expression and substituting its value. The format for arithmetic expansion shall be as follows:

```
$( (expression) )
```

The expression shall be treated as if it were in double-quotes, except that a double-quote inside the expression is not treated specially. The shell shall expand all tokens in the expression for parameter expansion, command substitution, and quote removal.

Next, the shell shall treat this as an arithmetic expression and substitute the value of the expression. The arithmetic expression shall be processed according to the rules given in [Section 1.1.2.1](#), with the following exceptions:

- Only signed long integer arithmetic is required.
- Only the decimal-constant, octal-constant, and hexadecimal-constant constants specified in the ISO C standard, Section 6.4.4.1 are required to be recognized as constants.
- The `sizeof()` operator and the prefix and postfix `"++"` and `"--"` operators are not required.

- Selection, iteration, and jump statements are not supported.

All changes to variables in an arithmetic expression shall be in effect after the arithmetic expansion, as in the parameter expansion "`${x=value}`".

If the shell variable *x* contains a value that forms a valid integer constant, optionally including a leading `<plus-sign>` or `<hyphen-minus>`, then the arithmetic expansions "`$( (x) )`" and "`$( ( $x ) )`" shall return the same value.

As an extension, the shell may recognize arithmetic expressions beyond those listed. The shell may use a signed integer type with a rank larger than the rank of **signed long**. The shell may use a real-floating type instead of **signed long** as long as it does not affect the results in cases where there is no overflow. If the expression is invalid, or the contents of a shell variable used in the expression are not recognized by the shell, the expansion fails and the shell shall write a diagnostic message to standard error indicating the failure.

### Examples

A simple example using arithmetic expansion:

```
# repeat a command 100 times
x=100
while [ $x -gt 0 ]
do
    command
    x=$(( $x-1 ))
done
```

## 2.6.5 Field Splitting

After parameter expansion (Section 2.6.2), command substitution (Section 2.6.3), and arithmetic expansion (Section 2.6.4), the shell shall scan the results of expansions and substitutions that did not occur in double-quotes for field splitting and multiple fields can result.

The shell shall treat each character of the *IFS* as a delimiter and use the delimiters as field terminators to split the results of parameter expansion, command substitution, and arithmetic expansion into fields.

1. If the value of *IFS* is a `<space>`, `<tab>`, and `<newline>`, or if it is unset, any sequence of `<space>`, `<tab>`, or `<newline>` characters at the beginning or end of the input shall be ignored and any sequence of those characters within the input shall delimit a field. For example, the input:

```
<newline><space><tab>foo<tab><tab>bar<space>
```

yields two fields, **foo** and **bar**.

2. If the value of *IFS* is null, no field splitting shall be performed.
3. Otherwise, the following rules shall be applied in sequence. The term "*IFS* white space" is used to mean any sequence (zero or more instances) of white-space characters that are in the *IFS* value (for example, if *IFS* contains `<space>/<comma>/<tab>`, any sequence of `<space>` and `<tab>` characters is considered *IFS* white space).

- 74940 a. *IFS* white space shall be ignored at the beginning and end of the input.
- 74941 b. Each occurrence in the input of an *IFS* character that is not *IFS* white space, along
- 74942 with any adjacent *IFS* white space, shall delimit a field, as described previously.
- 74943 c. Non-zero-length *IFS* white space shall delimit a field.

## 74944 2.6.6 Pathname Expansion

74945 After field splitting, if *set -f* is not in effect, each field in the resulting command line shall be  
 74946 expanded using the algorithm described in [Section 2.13](#), qualified by the rules in [Section 2.13.3](#).

## 74947 2.6.7 Quote Removal

74948 The quote characters (<backslash>, single-quote, and double-quote) that were present in the  
 74949 original word shall be removed unless they have themselves been quoted.

## 74950 2.7 Redirection

74951 Redirection is used to open and close files for the current shell execution environment (see  
 74952 [Section 2.12](#)) or for any command. Redirection operators can be used with numbers representing  
 74953 file descriptors (see XBD [Section 3.166](#)) as described below.

74954 The overall format used for redirection is:

74955 `[n]redir-op word`

74956 The number *n* is an optional decimal number designating the file descriptor number; the  
 74957 application shall ensure it is delimited from any preceding text and immediately precede the  
 74958 redirection operator *redir-op*. If *n* is quoted, the number shall not be recognized as part of the  
 74959 redirection expression. For example:

74960 `echo \2>a`

74961 writes the character 2 into file **a**. If any part of *redir-op* is quoted, no redirection expression is  
 74962 recognized. For example:

74963 `echo 2\>a`

74964 writes the characters `2>a` to standard output. The optional number, redirection operator, and  
 74965 *word* shall not appear in the arguments provided to the command to be executed (if any).

74966 Open files are represented by decimal numbers starting with zero. The largest possible value is  
 74967 implementation-defined; however, all implementations shall support at least 0 to 9, inclusive, for  
 74968 use by the application. These numbers are called “file descriptors”. The values 0, 1, and 2 have  
 74969 special meaning and conventional uses and are implied by certain redirection operations; they  
 74970 are referred to as *standard input*, *standard output*, and *standard error*, respectively. Programs  
 74971 usually take their input from standard input, and write output on standard output. Error  
 74972 messages are usually written on standard error. The redirection operators can be preceded by  
 74973 one or more digits (with no intervening <blank> characters allowed) to designate the file  
 74974 descriptor number.

74975 If the redirection operator is “<<” or “<<-”, the word that follows the redirection operator shall  
 74976 be subjected to quote removal; it is unspecified whether any of the other expansions occur. For  
 74977 the other redirection operators, the word that follows the redirection operator shall be subjected

74978 to tilde expansion, parameter expansion, command substitution, arithmetic expansion, and  
 74979 quote removal. Pathname expansion shall not be performed on the word by a non-interactive  
 74980 shell; an interactive shell may perform it, but shall do so only when the expansion would result  
 74981 in one word.

74982 If more than one redirection operator is specified with a command, the order of evaluation is  
 74983 from beginning to end.

74984 A failure to open or create a file shall cause a redirection to fail.

### 74985 **2.7.1 Redirecting Input**

74986 Input redirection shall cause the file whose name results from the expansion of *word* to be  
 74987 opened for reading on the designated file descriptor, or standard input if the file descriptor is  
 74988 not specified.

74989 The general format for redirecting input is:

74990 `[n]<word`

74991 where the optional *n* represents the file descriptor number. If the number is omitted, the  
 74992 redirection shall refer to standard input (file descriptor 0).

### 74993 **2.7.2 Redirecting Output**

74994 The two general formats for redirecting output are:

74995 `[n]>word`

74996 `[n]>|word`

74997 where the optional *n* represents the file descriptor number. If the number is omitted, the  
 74998 redirection shall refer to standard output (file descriptor 1).

74999 Output redirection using the '*>*' format shall fail if the *noclobber* option is set (see the  
 75000 description of *set -C*) and the file named by the expansion of *word* exists and is a regular file.  
 75001 Otherwise, redirection using the '*>*' or '*>|*' formats shall cause the file whose name results  
 75002 from the expansion of *word* to be created and opened for output on the designated file  
 75003 descriptor, or standard output if none is specified. If the file does not exist, it shall be created;  
 75004 otherwise, it shall be truncated to be an empty file after being opened.

### 75005 **2.7.3 Appending Redirected Output**

75006 Appended output redirection shall cause the file whose name results from the expansion of  
 75007 *word* to be opened for output on the designated file descriptor. The file is opened as if the *open()*  
 75008 function as defined in the System Interfaces volume of POSIX.1-2008 was called with the  
 75009 *O\_APPEND* flag. If the file does not exist, it shall be created.

75010 The general format for appending redirected output is as follows:

75011 `[n]>>word`

75012 where the optional *n* represents the file descriptor number. If the number is omitted, the  
 75013 redirection refers to standard output (file descriptor 1).

## 2.7.4 Here-Document

The redirection operators "<<" and "<<-" both allow redirection of subsequent lines read by the shell to the input of a command. The redirected lines are known as a "here-document".

The here-document shall be treated as a single word that begins after the next <newline> and continues until there is a line containing only the delimiter and a <newline>, with no <blank> characters in between. Then the next here-document starts, if there is one. The format is as follows:

```
[n]<<word
      here-document
      delimiter
```

where the optional *n* represents the file descriptor number. If the number is omitted, the here-document refers to standard input (file descriptor 0). It is unspecified whether the file descriptor is opened as a regular file, a special file, or a pipe. Portable applications cannot rely on the file descriptor being seekable (see [lseek\(\)](#)).

If any part of *word* is quoted, the delimiter shall be formed by performing quote removal on *word*, and the here-document lines shall not be expanded. Otherwise, the delimiter shall be the *word* itself.

If no part of *word* is quoted, all lines of the here-document shall be expanded for parameter expansion, command substitution, and arithmetic expansion. In this case, the <backslash> in the input behaves as the <backslash> inside double-quotes (see [Section 2.2.3](#)). However, the double-quote character ('"') shall not be treated specially within a here-document, except when the double-quote appears within "\$()", "\$`", or "\${ }".

If the redirection operator is "<<-", all leading <tab> characters shall be stripped from input lines and the line containing the trailing delimiter. If more than one "<<" or "<<-" operator is specified on a line, the here-document associated with the first operator shall be supplied first by the application and shall be read first by the shell.

When a here-document is read from a terminal device and the shell is interactive, it shall write the contents of the variable *PS2*, processed as described in [Section 2.5.3](#), to standard error before reading each line of input until the delimiter has been recognized.

### Examples

An example of a here-document follows:

```
cat <<eof1; cat <<eof2
Hi,
eof1
Helene.
eof2
```

**2.7.5 Duplicating an Input File Descriptor**

The redirection operator:

`[n]<&word`

shall duplicate one input file descriptor from another, or shall close one. If *word* evaluates to one or more digits, the file descriptor denoted by *n*, or standard input if *n* is not specified, shall be made to be a copy of the file descriptor denoted by *word*; if the digits in *word* do not represent a file descriptor already open for input, a redirection error shall result; see [Section 2.8.1](#). If *word* evaluates to `'-'`, file descriptor *n*, or standard input if *n* is not specified, shall be closed. Attempts to close a file descriptor that is not open shall not constitute an error. If *word* evaluates to something else, the behavior is unspecified.

**2.7.6 Duplicating an Output File Descriptor**

The redirection operator:

`[n]>&word`

shall duplicate one output file descriptor from another, or shall close one. If *word* evaluates to one or more digits, the file descriptor denoted by *n*, or standard output if *n* is not specified, shall be made to be a copy of the file descriptor denoted by *word*; if the digits in *word* do not represent a file descriptor already open for output, a redirection error shall result; see [Section 2.8.1](#). If *word* evaluates to `'-'`, file descriptor *n*, or standard output if *n* is not specified, is closed. Attempts to close a file descriptor that is not open shall not constitute an error. If *word* evaluates to something else, the behavior is unspecified.

**2.7.7 Open File Descriptors for Reading and Writing**

The redirection operator:

`[n]<>word`

shall cause the file whose name is the expansion of *word* to be opened for both reading and writing on the file descriptor denoted by *n*, or standard input if *n* is not specified. If the file does not exist, it shall be created.

**2.8 Exit Status and Errors****2.8.1 Consequences of Shell Errors**

Certain errors shall cause the shell to write a diagnostic message to standard error and exit as shown in the following table:

| Error                                                          | Non-Interactive Shell | Interactive Shell | Shell Diagnostic Message Required |
|----------------------------------------------------------------|-----------------------|-------------------|-----------------------------------|
| Shell language syntax error                                    | shall exit            | shall not exit    | yes                               |
| Special built-in utility error                                 | shall exit            | shall not exit    | no <sup>1</sup>                   |
| Other utility (not a special built-in) error                   | shall not exit        | shall not exit    | no <sup>2</sup>                   |
| Redirection error with special built-in utilities              | shall exit            | shall not exit    | yes                               |
| Redirection error with compound commands                       | may exit <sup>3</sup> | shall not exit    | yes                               |
| Redirection error with function execution                      | may exit <sup>3</sup> | shall not exit    | yes                               |
| Redirection error with other utilities (not special built-ins) | shall not exit        | shall not exit    | yes                               |
| Variable assignment error                                      | shall exit            | shall not exit    | yes                               |
| Expansion error                                                | shall exit            | shall not exit    | yes                               |
| Command not found                                              | may exit              | shall not exit    | yes                               |

Notes:

1. Although special built-ins are part of the shell, a diagnostic message written by a special built-in is not considered to be a shell diagnostic message, and can be redirected like any other utility.
2. The shell is not required to write a diagnostic message, but the utility itself shall write a diagnostic message if required to do so.
3. A future version of this standard may require the shell to not exit in this condition.

An expansion error is one that occurs when the shell expansions define in [Section 2.6](#) are carried out (for example, "`{x!y}`", because '`!`' is not a valid operator); an implementation may treat these as syntax errors if it is able to detect them during tokenization, rather than during expansion.

If any of the errors shown as "shall exit" or "may exit" occur in a subshell environment, the shell shall (respectively, may) exit from the subshell environment with a non-zero status and continue in the environment from which that subshell environment was invoked.

In all of the cases shown in the table where an interactive shell is required not to exit, the shell shall not perform any further processing of the command in which the error occurred.

## 2.8.2 Exit Status for Commands

Each command has an exit status that can influence the behavior of other shell commands. The exit status of commands that are not utilities is documented in this section. The exit status of the standard utilities is documented in their respective sections.

If a command is not found, the exit status shall be 127. If the command name is found, but it is not an executable utility, the exit status shall be 126. Applications that invoke utilities without using the shell should use these exit status values to report similar errors.

If a command fails during word expansion or redirection, its exit status shall be between 1 and 125 inclusive.

Internally, for purposes of deciding whether a command exits with a non-zero exit status, the

shell shall recognize the entire status value retrieved for the command by the equivalent of the `wait()` function WEXITSTATUS macro (as defined in the System Interfaces volume of POSIX.1-2008). When reporting the exit status with the special parameter `'?'`, the shell shall report the full eight bits of exit status available. The exit status of a command that terminated because it received a signal shall be reported as greater than 128.

## 2.9 Shell Commands

This section describes the basic structure of shell commands. The following command descriptions each describe a format of the command that is only used to aid the reader in recognizing the command type, and does not formally represent the syntax. In particular, the representations include spacing between tokens in some places where `<blank>s` would not be necessary (when one of the tokens is an operator). Each description discusses the semantics of the command; for a formal definition of the command language, consult [Section 2.10](#).

A *command* is one of the following:

- Simple command (see [Section 2.9.1](#))
- Pipeline (see [Section 2.9.2](#))
- List compound-list (see [Section 2.9.3](#))
- Compound command (see [Section 2.9.4](#))
- Function definition (see [Section 2.9.5](#))

Unless otherwise stated, the exit status of a command shall be that of the last simple command executed by the command. There shall be no limit on the size of any shell command other than that imposed by the underlying system (memory constraints, `{ARG_MAX}`, and so on).

### 2.9.1 Simple Commands

A “simple command” is a sequence of optional variable assignments and redirections, in any sequence, optionally followed by words and redirections, terminated by a control operator.

When a given simple command is required to be executed (that is, when any conditional construct such as an AND-OR list or a **case** statement has not bypassed the simple command), the following expansions, assignments, and redirections shall all be performed from the beginning of the command text to the end:

1. The words that are recognized as variable assignments or redirections according to [Section 2.10.2](#) are saved for processing in steps 3 and 4.
2. The words that are not variable assignments or redirections shall be expanded. If any fields remain following their expansion, the first field shall be considered the command name and remaining fields are the arguments for the command.
3. Redirections shall be performed as described in [Section 2.7](#).
4. Each variable assignment shall be expanded for tilde expansion, parameter expansion, command substitution, arithmetic expansion, and quote removal prior to assigning the value.

In the preceding list, the order of steps 3 and 4 may be reversed if no command name results from step 2 or if the command name matches the name of a special built-in utility; see [Section 2.14](#).

|       |                                                                                                                            |   |
|-------|----------------------------------------------------------------------------------------------------------------------------|---|
| 75163 | Variable assignments shall be performed as follows:                                                                        |   |
| 75164 | • If no command name results, variable assignments shall affect the current execution                                      | + |
| 75165 | environment.                                                                                                               | + |
| 75166 | • If the command name is not a special built-in utility or function, the variable assignments                              | + |
| 75167 | shall be exported for the execution environment of the command and shall not affect the                                    | + |
| 75168 | current execution environment except as a side-effect of the expansions performed in step                                  | + |
| 75169 | 4. In this case it is unspecified:                                                                                         | + |
| 75170 | — Whether or not the assignments are visible for subsequent expansions in step 4                                           |   |
| 75171 | — Whether variable assignments made as side-effects of these expansions are visible for                                    |   |
| 75172 | subsequent expansions in step 4, or in the current shell execution environment, or                                         |   |
| 75173 | both                                                                                                                       |   |
| 75174 | • If the command name is a standard utility implemented as a function (see XBD <a href="#">Section</a>                     | + |
| 75175 | <a href="#">4.22</a> ), the effect of variable assignments shall be as if the utility was not implemented as a             | + |
| 75176 | function.                                                                                                                  | + |
| 75177 | • If the command name is a special built-in utility, variable assignments shall affect the                                 | + |
| 75178 | current execution environment. Unless the <i>set</i> <b>-a</b> option is on (see <a href="#">set</a> ), it is unspecified: | + |
| 75179 | — Whether or not the variables gain the <i>export</i> attribute during the execution of the                                | + |
| 75180 | special built-in utility                                                                                                   | + |
| 75181 | — Whether or not <i>export</i> attributes gained as a result of the variable assignments persist                           | + |
| 75182 | after the completion of the special built-in utility                                                                       | + |
| 75183 | • If the command name is a function that is not a standard utility implemented as a function,                              | + |
| 75184 | variable assignments shall affect the current execution environment during the execution                                   | + |
| 75185 | of the function. It is unspecified:                                                                                        | + |
| 75186 | — Whether or not the variable assignments persist after the completion of the function                                     | + |
| 75187 | — Whether or not the variables gain the <i>export</i> attribute during the execution of the                                | + |
| 75188 | function                                                                                                                   | + |
| 75189 | — Whether or not <i>export</i> attributes gained as a result of the variable assignments persist                           | + |
| 75190 | after the completion of the function (if variable assignments persist after the                                            | + |
| 75191 | completion of the function)                                                                                                | + |
| 75192 | If any of the variable assignments attempt to assign a value to a variable for which the <i>readonly</i>                   |   |
| 75193 | attribute is set in the current shell environment (regardless of whether the assignment is made in                         |   |
| 75194 | that environment), a variable assignment error shall occur. See <a href="#">Section 2.8.1</a> for the consequences         |   |
| 75195 | of these errors.                                                                                                           |   |
| 75196 | If there is no command name, any redirections shall be performed in a subshell environment; it                             |   |
| 75197 | is unspecified whether this subshell environment is the same one as that used for a command                                |   |
| 75198 | substitution within the command. (To affect the current execution environment, see the <i>exec</i>                         |   |
| 75199 | special built-in.) If any of the redirections performed in the current shell execution environment                         |   |
| 75200 | fail, the command shall immediately fail with an exit status greater than zero, and the shell shall                        |   |
| 75201 | write an error message indicating the failure. See <a href="#">Section 2.8.1</a> for the consequences of these             |   |
| 75202 | failures on interactive and non-interactive shells.                                                                        |   |
| 75203 | If there is a command name, execution shall continue as described in <a href="#">Section 2.9.1.1</a> . If there is         |   |
| 75204 | no command name, but the command contained a command substitution, the command shall                                       |   |
| 75205 | complete with the exit status of the last command substitution performed. Otherwise, the                                   |   |
| 75206 | command shall complete with a zero exit status.                                                                            |   |

## 75207 2.9.1.1 Command Search and Execution

75208 If a simple command results in a command name and an optional list of arguments, the  
75209 following actions shall be performed:

75210 1. If the command name does not contain any <slash> characters, the first successful step in  
75211 the following sequence shall occur:

75212 a. If the command name matches the name of a special built-in utility, that special  
75213 built-in utility shall be invoked.

75214 b. If the command name matches the name of a utility listed in the following table, +  
75215 the results are unspecified. +

|       |                 |                      |                   |                |                    |
|-------|-----------------|----------------------|-------------------|----------------|--------------------|
| 75216 | <i>alloc</i>    | <i>comparguments</i> | <i>comptry</i>    | <i>history</i> | <i>pushd</i>       |
| 75217 | <i>autoload</i> | <i>compcall</i>      | <i>compvalues</i> | <i>hist</i>    | <i>readarray</i>   |
| 75218 | <i>bind</i>     | <i>compctl</i>       | <i>declare</i>    | <i>let</i>     | <i>repeat</i>      |
| 75219 | <i>bindkey</i>  | <i>compdescribe</i>  | <i>dirs</i>       | <i>local</i>   | <i>savehistory</i> |
| 75220 | <i>builtin</i>  | <i>compfiles</i>     | <i>disable</i>    | <i>login</i>   | <i>source</i>      |
| 75221 | <i>bye</i>      | <i>compgen</i>       | <i>disown</i>     | <i>logout</i>  | <i>shopt</i>       |
| 75222 | <i>caller</i>   | <i>compgroups</i>    | <i>dosh</i>       | <i>map</i>     | <i>stop</i>        |
| 75223 | <i>cap</i>      | <i>complete</i>      | <i>echoct</i>     | <i>mapfile</i> | <i>suspend</i>     |
| 75224 | <i>chdir</i>    | <i>compquote</i>     | <i>echoit</i>     | <i>popd</i>    | <i>typeset</i>     |
| 75225 | <i>clone</i>    | <i>comptags</i>      | <i>help</i>       | <i>print</i>   | <i>whence</i>      |

75226 c. If the command name matches the name of a function known to this shell, the  
75227 function shall be invoked as described in [Section 2.9.5](#). If the implementation has  
75228 provided a standard utility in the form of a function, it shall not be recognized at  
75229 this point. It shall be invoked in conjunction with the path search in step 1d.

75230 XSI d. If the command name matches the name of the *type* or *ulimit* utility, or of a utility |  
75231 listed in the following table, that utility shall be invoked.

|       |                |                |               |              |                |
|-------|----------------|----------------|---------------|--------------|----------------|
| 75232 | <i>alias</i>   | <i>false</i>   | <i>hash</i>   | <i>pwd</i>   | <i>unalias</i> |
| 75233 | <i>bg</i>      | <i>fc</i>      | <i>jobs</i>   | <i>read</i>  | <i>wait</i>    |
| 75234 | <i>cd</i>      | <i>fg</i>      | <i>kill</i>   | <i>true</i>  |                |
| 75235 | <i>command</i> | <i>getopts</i> | <i>newgrp</i> | <i>umask</i> |                |

75236 e. Otherwise, the command shall be searched for using the *PATH* environment  
75237 variable as described in XBD [Chapter 8](#):

75238 i. If the search is successful:

75239 a. If the system has implemented the utility as a regular built-in or as a  
75240 shell function, it shall be invoked at this point in the path search.

75241 b. Otherwise, the shell executes the utility in a separate utility  
75242 environment (see [Section 2.12](#)) with actions equivalent to calling the  
75243 *execl()* function as defined in the System Interfaces volume of  
75244 POSIX.1-2008 with the *path* argument set to the pathname resulting  
75245 from the search, *arg0* set to the command name, and the remaining  
75246 *execl()* arguments set to the command arguments (if any) and the  
75247 null terminator.

75248 If the *execl()* function fails due to an error equivalent to the  
75249 [ENOEXEC] error defined in the System Interfaces volume of  
75250 POSIX.1-2008, the shell shall execute a command equivalent to  
75251 having a shell invoked with the pathname resulting from the search  
75252 as its first operand, with any remaining arguments passed to the new

shell, except that the value of "\$0" in the new shell may be set to the command name. If the executable file is not a text file, the shell may bypass this command execution. In this case, it shall write an error message, and shall return an exit status of 126.

It is unspecified whether environment variables that were passed to the shell when it was invoked, but were not used to initialize shell variables (see [Section 2.5.3](#)) because they had invalid names, are included in the environment passed to *execl()* and (if *execl()* fails as described above) to the new shell.

Once a utility has been searched for and found (either as a result of this specific search or as part of an unspecified shell start-up activity), an implementation may remember its location and need not search for the utility again unless the *PATH* variable has been the subject of an assignment. If the remembered location fails for a subsequent invocation, the shell shall repeat the search to find the new location for the utility, if any.

- ii. If the search is unsuccessful, the command shall fail with an exit status of 127 and the shell shall write an error message.

2. If the command name contains at least one <slash>, the shell shall execute the utility in a separate utility environment with actions equivalent to calling the *execl()* function defined in the System Interfaces volume of POSIX.1-2008 with the *path* and *arg0* arguments set to the command name, and the remaining *execl()* arguments set to the command arguments (if any) and the null terminator.

If the *execl()* function fails due to an error equivalent to the [ENOEXEC] error, the shell shall execute a command equivalent to having a shell invoked with the command name as its first operand, with any remaining arguments passed to the new shell. If the executable file is not a text file, the shell may bypass this command execution. In this case, it shall write an error message and shall return an exit status of 126.

It is unspecified whether environment variables that were passed to the shell when it was invoked, but were not used to initialize shell variables (see [Section 2.5.3](#)) because they had invalid names, are included in the environment passed to *execl()* and (if *execl()* fails as described above) to the new shell.

If the utility would be executed with file descriptor 0, 1, or 2 closed, implementations may execute the utility with the file descriptor open to an unspecified file. If a standard utility or a conforming application is executed with file descriptor 0 not open for reading or with file descriptor 1 or 2 not open for writing, the environment in which the utility or application is executed shall be deemed non-conforming, and consequently the utility or application might not behave as described in this standard.

## 2.9.2 Pipelines

A *pipeline* is a sequence of one or more commands separated by the control operator '|'. For each command but the last, the shell shall connect the standard output of the command to the standard input of the next command as if by creating a pipe and passing the write end of the pipe as the standard output of the command and the read end of the pipe as the standard input of the next command.

The format for a pipeline is:

```
[!] command1 [ | command2 ... ]
```

If the pipeline begins with the reserved word `!` and *command1* is a subshell command, the application shall ensure that the `(` operator at the beginning of *command1* is separated from the `!` by one or more <blank> characters. The behavior of the reserved word `!` immediately followed by the `(` operator is unspecified.

The standard output of *command1* shall be connected to the standard input of *command2*. The standard input, standard output, or both of a command shall be considered to be assigned by the pipeline before any redirection specified by redirection operators that are part of the command (see [Section 2.7](#)).

If the pipeline is not in the background (see [Section 2.9.3.1](#)), the shell shall wait for the last command specified in the pipeline to complete, and may also wait for all commands to complete.

### Exit Status

If the pipeline does not begin with the `!` reserved word, the exit status shall be the exit status of the last command specified in the pipeline. Otherwise, the exit status shall be the logical NOT of the exit status of the last command. That is, if the last command returns zero, the exit status shall be 1; if the last command returns greater than zero, the exit status shall be zero.

## 2.9.3 Lists

An *AND-OR list* is a sequence of one or more pipelines separated by the operators `&&` and `||`.

A *list* is a sequence of one or more AND-OR lists separated by the operators `;` and `&'`.

The operators `&&` and `||` shall have equal precedence and shall be evaluated with left associativity. For example, both of the following commands write solely **bar** to standard output:

```
false && echo foo || echo bar
true || echo foo && echo bar
```

A `;` separator or a `&'` or <newline> terminator shall cause the preceding AND-OR list to be executed sequentially; an `&'` separator or terminator shall cause asynchronous execution of the preceding AND-OR list.

The term “compound-list” is derived from the grammar in [Section 2.10](#); it is equivalent to a sequence of *lists*, separated by <newline> characters, that can be preceded or followed by an arbitrary number of <newline> characters.

### Examples

The following is an example that illustrates <newline> characters in compound-lists:

```
while
    # a couple of <newline>s
    # a list
    date && who || ls; cat file
    # a couple of <newline>s
    # another list
    wc file > output & true
do
    # 2 lists
```

```

75339         ls
75340         cat file
75341     done

```

#### 75342 2.9.3.1 Asynchronous Lists

75343 If a command is terminated by the control operator <ampersand> ('&'), the shell shall execute  
 75344 the command asynchronously in a subshell. This means that the shell shall not wait for the  
 75345 command to finish before executing the next command.

75346 The format for running a command in the background is:

```
75347 command1 & [command2 & ... ]
```

75348 If job control is disabled (see [set](#), **-m**), the standard input for an asynchronous list, before any  
 75349 explicit redirections are performed, shall be considered to be assigned to a file that has the same  
 75350 properties as **/dev/null**. This shall not happen if job control is enabled. In all cases, explicit  
 75351 redirection of standard input shall override this activity.

75352 When an element of an asynchronous list (the portion of the list ended by an <ampersand>,  
 75353 such as *command1*, above) is started by the shell, the process ID of the last command in the  
 75354 asynchronous list element shall become known in the current shell execution environment; see  
 75355 [Section 2.12](#). This process ID shall remain known until:

- 75356 1. The command terminates and the application waits for the process ID.
- 75357 2. Another asynchronous list is invoked before "\$!" (corresponding to the previous  
 75358 asynchronous list) is expanded in the current execution environment.

75359 The implementation need not retain more than the {CHILD\_MAX} most recent entries in its list  
 75360 of known process IDs in the current shell execution environment.

#### 75361 Exit Status

75362 The exit status of an asynchronous list shall be zero.

#### 75363 2.9.3.2 Sequential Lists

75364 Commands that are separated by a <semicolon> (';') shall be executed sequentially.

75365 The format for executing commands sequentially shall be:

```
75366 command1 [ ; command2 ] ...
```

75367 Each command shall be expanded and executed in the order specified.

#### 75368 Exit Status

75369 The exit status of a sequential list shall be the exit status of the last command in the list.

#### 75370 2.9.3.3 AND Lists

75371 The control operator "&&" denotes an AND list. The format shall be:

```
75372 command1 [ && command2 ] ...
```

75373 First *command1* shall be executed. If its exit status is zero, *command2* shall be executed, and so on,  
 75374 until a command has a non-zero exit status or there are no more commands left to execute. The

75375 commands are expanded only if they are executed.

#### 75376 **Exit Status**

75377 The exit status of an AND list shall be the exit status of the last command that is executed in the  
75378 list.

#### 75379 2.9.3.4 *OR Lists*

75380 The control operator "`|`" denotes an OR List. The format shall be:

75381 `command1 [ | | command2 ] . . .`

75382 First, *command1* shall be executed. If its exit status is non-zero, *command2* shall be executed, and  
75383 so on, until a command has a zero exit status or there are no more commands left to execute.

#### 75384 **Exit Status**

75385 The exit status of an OR list shall be the exit status of the last command that is executed in the  
75386 list.

### 75387 **2.9.4 Compound Commands**

75388 The shell has several programming constructs that are “compound commands”, which provide  
75389 control flow for commands. Each of these compound commands has a reserved word or control  
75390 operator at the beginning, and a corresponding terminator reserved word or operator at the end.  
75391 In addition, each can be followed by redirections on the same line as the terminator. Each  
75392 redirection shall apply to all the commands within the compound command that do not  
75393 explicitly override that redirection.

#### 75394 2.9.4.1 *Grouping Commands*

75395 The format for grouping commands is as follows:

75396 (`compound-list`) Execute *compound-list* in a subshell environment; see [Section 2.12](#).  
75397 Variable assignments and built-in commands that affect the environment  
75398 shall not remain in effect after the list finishes.

75399 If a character sequence beginning with "`(`" would be parsed by the shell  
75400 as an arithmetic expansion if preceded by a '`$`', shells which implement  
75401 an extension whereby "`((expression))`" is evaluated as an arithmetic  
75402 expression may treat the "`(`" as introducing as an arithmetic evaluation  
75403 instead of a grouping command. A conforming application shall ensure  
75404 that it separates the two leading '`(`' characters with white space to  
75405 prevent the shell from performing an arithmetic evaluation.

75406 { `compound-list` ; } Execute *compound-list* in the current process environment. The semicolon  
75407 shown here is an example of a control operator delimiting the `}` reserved  
75408 word. Other delimiters are possible, as shown in [Section 2.10](#); a  
75409 `<newline>` is frequently used.

**Exit Status**

The exit status of a grouping command shall be the exit status of *compound-list*.

2.9.4.2 *The for Loop*

The **for** loop shall execute a sequence of commands for each member in a list of *items*. The **for** loop requires that the reserved words **do** and **done** be used to delimit the sequence of commands.

The format for the **for** loop is as follows:

```
for name [ in [word ... ] ]
do
    compound-list
done
```

First, the list of words following **in** shall be expanded to generate a list of items. Then, the variable *name* shall be set to each item, in turn, and the *compound-list* executed each time. If no items result from the expansion, the *compound-list* shall not be executed. Omitting:

```
in word ...
```

shall be equivalent to:

```
in "$@"
```

**Exit Status**

The exit status of a **for** command shall be the exit status of the last command that executes. If there are no items, the exit status shall be zero.

2.9.4.3 *Case Conditional Construct*

The conditional construct **case** shall execute the *compound-list* corresponding to the first one of several *patterns* (see [Section 2.13](#)) that is matched by the string resulting from the tilde expansion, parameter expansion, command substitution, arithmetic expansion, and quote removal of the given word. The reserved word **in** shall denote the beginning of the patterns to be matched. Multiple patterns with the same *compound-list* shall be delimited by the '|' symbol. The control operator ')' terminates a list of patterns corresponding to a given action. The *compound-list* for each list of patterns, with the possible exception of the last, shall be terminated with ";;". The **case** construct terminates with the reserved word **esac** (**case** reversed).

The format for the **case** construct is as follows:

```
case word in
    [(] pattern1 ) compound-list ;;
    [(] pattern[ | pattern] ... ) compound-list ;;] ...
    [(] pattern[ | pattern] ... ) compound-list]
esac
```

The " ; ; " is optional for the last *compound-list*.

In order from the beginning to the end of the **case** statement, each *pattern* that labels a *compound-list* shall be subjected to tilde expansion, parameter expansion, command substitution, and arithmetic expansion, and the result of these expansions shall be compared against the expansion of *word*, according to the rules described in [Section 2.13](#) (which also describes the

effect of quoting parts of the pattern). After the first match, no more patterns shall be expanded, and the *compound-list* shall be executed. The order of expansion and comparison of multiple *patterns* that label a *compound-list* statement is unspecified.

#### Exit Status

The exit status of **case** shall be zero if no patterns are matched. Otherwise, the exit status shall be the exit status of the last command executed in the *compound-list*.

#### 2.9.4.4 The if Conditional Construct

The **if** command shall execute a *compound-list* and use its exit status to determine whether to execute another *compound-list*.

The format for the **if** construct is as follows:

```
if compound-list
then
    compound-list
[elif compound-list
then
    compound-list] ...
[else
    compound-list]
fi
```

The **if** *compound-list* shall be executed; if its exit status is zero, the **then** *compound-list* shall be executed and the command shall complete. Otherwise, each **elif** *compound-list* shall be executed, in turn, and if its exit status is zero, the **then** *compound-list* shall be executed and the command shall complete. Otherwise, the **else** *compound-list* shall be executed.

#### Exit Status

The exit status of the **if** command shall be the exit status of the **then** or **else** *compound-list* that was executed, or zero, if none was executed.

#### 2.9.4.5 The while Loop

The **while** loop shall continuously execute one *compound-list* as long as another *compound-list* has a zero exit status.

The format of the **while** loop is as follows:

```
while compound-list-1
do
    compound-list-2
done
```

The *compound-list-1* shall be executed, and if it has a non-zero exit status, the **while** command shall complete. Otherwise, the *compound-list-2* shall be executed, and the process shall repeat.

75487 **Exit Status**

75488 The exit status of the **while** loop shall be the exit status of the last *compound-list-2* executed, or  
 75489 zero if none was executed.

75490 2.9.4.6 *The until Loop*

75491 The **until** loop shall continuously execute one *compound-list* as long as another *compound-list* has  
 75492 a non-zero exit status.

75493 The format of the **until** loop is as follows:

```
75494 until compound-list-1
75495 do
75496     compound-list-2
75497 done
```

75498 The *compound-list-1* shall be executed, and if it has a zero exit status, the **until** command  
 75499 completes. Otherwise, the *compound-list-2* shall be executed, and the process repeats.

75500 **Exit Status**

75501 The exit status of the **until** loop shall be the exit status of the last *compound-list-2* executed, or  
 75502 zero if none was executed.

75503 **2.9.5 Function Definition Command**

75504 A function is a user-defined name that is used as a simple command to call a compound  
 75505 command with new positional parameters. A function is defined with a “function definition  
 75506 command”.

75507 The format of a function definition command is as follows:

```
75508 fname ( ) compound-command [io-redirect ...]
```

75509 The function is named *fname*; the application shall ensure that it is a name (see XBD [Section](#)  
 75510 [3.235](#)) and that it is not the name of a special built-in utility. An implementation may allow other  
 75511 characters in a function name as an extension. The implementation shall maintain separate name  
 75512 spaces for functions and variables.

75513 The argument *compound-command* represents a compound command, as described in [Section](#)  
 75514 [2.9.4](#).

75515 When the function is declared, none of the expansions in [Section 2.6](#) shall be performed on the  
 75516 text in *compound-command* or *io-redirect*; all expansions shall be performed as normal each time  
 75517 the function is called. Similarly, the optional *io-redirect* redirections and any variable assignments  
 75518 within *compound-command* shall be performed during the execution of the function itself, not the  
 75519 function definition. See [Section 2.8.1](#) for the consequences of failures of these operations on  
 75520 interactive and non-interactive shells.

75521 When a function is executed, it shall have the syntax-error properties described for special built-  
 75522 in utilities in the first item in the enumerated list at the beginning of [Section 2.14](#).

75523 The *compound-command* shall be executed whenever the function name is specified as the name  
 75524 of a simple command (see [Section 2.9.1.1](#)). The operands to the command temporarily shall  
 75525 become the positional parameters during the execution of the *compound-command*; the special  
 75526 parameter ‘#’ also shall be changed to reflect the number of operands. The special parameter 0  
 75527 shall be unchanged. When the function completes, the values of the positional parameters and

75528 the special parameter '#' shall be restored to the values they had before the function was  
 75529 executed. If the special built-in *return* (see *return*) is executed in the *compound-command*, the  
 75530 function completes and execution shall resume with the next command after the function call.

## 75531 Exit Status

75532 The exit status of a function definition shall be zero if the function was declared successfully;  
 75533 otherwise, it shall be greater than zero. The exit status of a function invocation shall be the exit  
 75534 status of the last command executed by the function.

## 75535 2.10 Shell Grammar

75536 The following grammar defines the Shell Command Language. This formal syntax shall take  
 75537 precedence over the preceding text syntax description.

### 75538 2.10.1 Shell Grammar Lexical Conventions

75539 The input language to the shell must be first recognized at the character level. The resulting  
 75540 tokens shall be classified by their immediate context according to the following rules (applied in  
 75541 order). These rules shall be used to determine what a "token" is that is subject to parsing at the  
 75542 token level. The rules for token recognition in [Section 2.3](#) shall apply.

- 75543 1. If the token is an operator, the token identifier for that operator shall result.
- 75544 2. If the string consists solely of digits and the delimiter character is one of '<' or '>', the  
 75545 token identifier **IO\_NUMBER** shall be returned.
- 75546 3. Otherwise, the token identifier **TOKEN** results.

75547 Further distinction on **TOKEN** is context-dependent. It may be that the same **TOKEN** yields  
 75548 **WORD**, a **NAME**, an **ASSIGNMENT\_WORD**, or one of the reserved words below, dependent  
 75549 upon the context. Some of the productions in the grammar below are annotated with a rule  
 75550 number from the following list. When a **TOKEN** is seen where one of those annotated  
 75551 productions could be used to reduce the symbol, the applicable rule shall be applied to convert  
 75552 the token identifier type of the **TOKEN** to a token identifier acceptable at that point in the  
 75553 grammar. The reduction shall then proceed based upon the token identifier type yielded by the  
 75554 rule applied. When more than one rule applies, the highest numbered rule shall apply (which in  
 75555 turn may refer to another rule). (Note that except in rule 7, the presence of an '=' in the token  
 75556 has no effect.)

75557 The **WORD** tokens shall have the word expansion rules applied to them immediately before the  
 75558 associated command is executed, not at the time the command is parsed.

### 75559 2.10.2 Shell Grammar Rules

- 75560 1. [Command Name]

75561 When the **TOKEN** is exactly a reserved word, the token identifier for that reserved word  
 75562 shall result. Otherwise, the token **WORD** shall be returned. Also, if the parser is in any  
 75563 state where only a reserved word could be the next correct token, proceed as above.

75564 **Note:** Because at this point <quotation-mark> characters are retained in the token, quoted  
 75565 strings cannot be recognized as reserved words. This rule also implies that reserved  
 75566 words are not recognized except in certain positions in the input, such as after a

<newline> or <semicolon>; the grammar presumes that if the reserved word is intended, it is properly delimited by the user, and does not attempt to reflect that requirement directly. Also note that line joining is done before tokenization, as described in [Section 2.2.1](#), so escaped <newline> characters are already removed at this point.

Rule 1 is not directly referenced in the grammar, but is referred to by other rules, or applies globally.

## 2. [Redirection to or from filename]

The expansions specified in [Section 2.7](#) shall occur. As specified there, exactly one field can result (or the result is unspecified), and there are additional requirements on pathname expansion.

## 3. [Redirection from here-document]

Quote removal shall be applied to the word to determine the delimiter that is used to find the end of the here-document that begins after the next <newline>.

## 4. [Case statement termination]

When the **TOKEN** is exactly the reserved word **esac**, the token identifier for **esac** shall result. Otherwise, the token **WORD** shall be returned.

## 5. [NAME in for]

When the **TOKEN** meets the requirements for a name (see XBD [Section 3.235](#)), the token identifier **NAME** shall result. Otherwise, the token **WORD** shall be returned.

## 6. [Third word of for and case]

### a. [case only]

When the **TOKEN** is exactly the reserved word **in**, the token identifier for **in** shall result. Otherwise, the token **WORD** shall be returned.

### b. [for only]

When the **TOKEN** is exactly the reserved word **in** or **do**, the token identifier for **in** or **do** shall result, respectively. Otherwise, the token **WORD** shall be returned.

(For a. and b.: As indicated in the grammar, a *linebreak* precedes the tokens **in** and **do**. If <newline> characters are present at the indicated location, it is the token after them that is treated in this fashion.)

## 7. [Assignment preceding command name]

### a. [When the first word]

If the **TOKEN** does not contain the character ' = ', rule 1 is applied. Otherwise, 7b shall be applied.

### b. [Not the first word]

If the **TOKEN** contains an unquoted (as determined while applying rule 4 from [Section 2.3](#)) <equals-sign> character that is not part of an embedded parameter expansion, command substitution, or arithmetic expansion construct (as determined while applying rule 5 from [Section 2.3](#)):

— If the **TOKEN** begins with ' = ', then rule 1 shall be applied.

— If all the characters in the **TOKEN** preceding the first such <equals-sign> form a valid name (see XBD [Section 3.235](#), on page 71), the token **ASSIGNMENT\_WORD** shall be returned.

```

75609         — Otherwise, it is unspecified whether rule 1 is applied or |
75610         ASSIGNMENT_WORD is returned. |
75611         Otherwise, rule 1 shall be applied. +
75612         Assignment to the name within a returned ASSIGNMENT_WORD token shall occur as |
75613         specified in Section 2.9.1.
75614     8. [NAME in function]
75615         When the TOKEN is exactly a reserved word, the token identifier for that reserved word
75616         shall result. Otherwise, when the TOKEN meets the requirements for a name, the token
75617         identifier NAME shall result. Otherwise, rule 7 applies.
75618     9. [Body of function]
75619         Word expansion and assignment shall never occur, even when required by the rules
75620         above, when this rule is being parsed. Each TOKEN that might either be expanded or
75621         have assignment applied to it shall instead be returned as a single WORD consisting only
75622         of characters that are exactly the token described in Section 2.3.

## 75813 2.11 Signals and Error Handling

75814 If job control is disabled (see the description of *set -m*) when the shell executes an asynchronous |  
 75815 list, the commands in the list shall inherit from the shell a signal action of ignored (SIG\_IGN) for |  
 75816 the SIGINT and SIGQUIT signals. In all other cases, commands executed by the shell shall |  
 75817 inherit the same signal actions as those inherited by the shell from its parent unless a signal |  
 75818 action is modified by the *trap* special built-in (see *trap*)

75819 When a signal for which a trap has been set is received while the shell is waiting for the  
 75820 completion of a utility executing a foreground command, the trap associated with that signal  
 75821 shall not be executed until after the foreground command has completed. When the shell is  
 75822 waiting, by means of the *wait* utility, for asynchronous commands to complete, the reception of a  
 75823 signal for which a trap has been set shall cause the *wait* utility to return immediately with an exit  
 75824 status >128, immediately after which the trap associated with that signal shall be taken.

75825 If multiple signals are pending for the shell for which there are associated trap actions, the order  
 75826 of execution of trap actions is unspecified.

## 75827 2.12 Shell Execution Environment

75828 A shell execution environment consists of the following:

- 75829 • Open files inherited upon invocation of the shell, plus open files controlled by *exec*
- 75830 • Working directory as set by *cd*
- 75831 • File creation mask set by *umask*
- 75832 XSI • File size limit as set by *ulimit* +
- 75833 • Current traps set by *trap*
- 75834 • Shell parameters that are set by variable assignment (see the *set* special built-in) or from
- 75835 the System Interfaces volume of POSIX.1-2008 environment inherited by the shell when it
- 75836 begins (see the *export* special built-in)
- 75837 • Shell functions; see [Section 2.9.5](#)
- 75838 • Options turned on at invocation or by *set*
- 75839 • Process IDs of the last commands in asynchronous lists known to this shell environment;
- 75840 see [Section 2.9.3.1](#)
- 75841 • Shell aliases; see [Section 2.3.1](#)

75842 Utilities other than the special built-ins (see [Section 2.14](#)) shall be invoked in a separate  
 75843 environment that consists of the following. The initial value of these objects shall be the same as  
 75844 that for the parent shell, except as noted below.

- 75845 • Open files inherited on invocation of the shell, open files controlled by the *exec* special
- 75846 built-in plus any modifications, and additions specified by any redirections to the utility

- Current working directory
- File creation mask
- If the utility is a shell script, traps caught by the shell shall be set to the default values and traps ignored by the shell shall be set to be ignored by the utility; if the utility is not a shell script, the trap actions (default or ignore) shall be mapped into the appropriate signal handling actions for the utility
- Variables with the *export* attribute, along with those explicitly exported for the duration of the command, shall be passed to the utility environment variables

The environment of the shell process shall not be changed by the utility unless explicitly specified by the utility description (for example, *cd* and *umask*).

A subshell environment shall be created as a duplicate of the shell environment, except that signal traps that are not being ignored shall be set to the default action. Changes made to the subshell environment shall not affect the shell environment. Command substitution, commands that are grouped with parentheses, and asynchronous lists shall be executed in a subshell environment. Additionally, each command of a multi-command pipeline is in a subshell environment; as an extension, however, any or all commands in a pipeline may be executed in the current environment. All other commands shall be executed in the current shell environment.

## 2.13 Pattern Matching Notation

The pattern matching notation described in this section is used to specify patterns for matching strings in the shell. Historically, pattern matching notation is related to, but slightly different from, the regular expression notation described in XBD [Chapter 9](#). For this reason, the description of the rules for this pattern matching notation are based on the description of regular expression notation, modified to account for the differences.

### 2.13.1 Patterns Matching a Single Character

The following patterns matching a single character shall match a single character: ordinary characters, special pattern characters, and pattern bracket expressions. The pattern bracket expression also shall match a single collating element. A `<backslash>` character shall escape the following character. The escaping `<backslash>` shall be discarded. If a pattern ends with an unescaped `<backslash>`, it is unspecified whether the pattern does not match anything or the pattern is treated as invalid.

An ordinary character is a pattern that shall match itself. It can be any character in the supported character set except for NUL, those special shell characters in [Section 2.2](#) that require quoting, and the following three special pattern characters. Matching shall be based on the bit pattern used for encoding the character, not on the graphic representation of the character. If any character (ordinary, shell special, or pattern special) is quoted, that pattern shall match the character itself. The shell special characters always require quoting.

When unquoted and outside a bracket expression, the following three characters shall have special meaning in the specification of patterns:

- ? A `<question-mark>` is a pattern that shall match any character.

\* An <asterisk> is a pattern that shall match multiple characters, as described in [Section 2.13.2](#).

[ If an open bracket introduces a bracket expression as in XBD [Section 9.3.5](#), except that the <exclamation-mark> character ( ' ! ' ) shall replace the <circumflex> character ( ' ^ ' ) in its role in a non-matching list in the regular expression notation, it shall introduce a pattern bracket expression. A bracket expression starting with an unquoted <circumflex> character produces unspecified results. Otherwise, ' [ ' shall match the character itself.

When pattern matching is used where shell quote removal is not performed (such as in the argument to the *find -name* primary when *find* is being called using one of the *exec* functions as defined in the System Interfaces volume of POSIX.1-2008, or in the *pattern* argument to the *fnmatch()* function), special characters can be escaped to remove their special meaning by preceding them with a <backslash> character. This escaping <backslash> is discarded. The sequence "\\\" represents one literal <backslash>. All of the requirements and effects of quoting on ordinary, shell special, and special pattern characters shall apply to escaping in this context.

## 2.13.2 Patterns Matching Multiple Characters

The following rules are used to construct patterns matching multiple characters from patterns matching a single character:

1. The <asterisk> ( ' \* ' ) is a pattern that shall match any string, including the null string.
2. The concatenation of patterns matching a single character is a valid pattern that shall match the concatenation of the single characters or collating elements matched by each of the concatenated patterns.
3. The concatenation of one or more patterns matching a single character with one or more <asterisk> characters is a valid pattern. In such patterns, each <asterisk> shall match a string of zero or more characters, matching the greatest possible number of characters that still allows the remainder of the pattern to match the string.

## 2.13.3 Patterns Used for Filename Expansion

The rules described so far in [Section 2.13.1](#) and [Section 2.13.2](#) are qualified by the following rules that apply when pattern matching notation is used for filename expansion:

1. The <slash> character in a pathname shall be explicitly matched by using one or more <slash> characters in the pattern; it shall neither be matched by the <asterisk> or <question-mark> special characters nor by a bracket expression. <slash> characters in the pattern shall be identified before bracket expressions; thus, a <slash> cannot be included in a pattern bracket expression used for filename expansion. If a <slash> character is found following an unescaped <left-square-bracket> character before a corresponding <right-square-bracket> is found, the open bracket shall be treated as an ordinary character. For example, the pattern "a[b/c]d" does not match such pathnames as **abd** or **a/d**. It only matches a pathname of literally **a[b/c]d**.
2. If a filename begins with a <period> ( ' . ' ), the <period> shall be explicitly matched by using a <period> as the first character of the pattern or immediately following a <slash> character. The leading <period> shall not be matched by:
  - The <asterisk> or <question-mark> special characters

- A bracket expression containing a non-matching list, such as "[!a]", a range expression, such as "[%–0]", or a character class expression, such as "[[:punct:]]"

It is unspecified whether an explicit <period> in a bracket expression matching list, such as "[.abc]", can match a leading <period> in a filename.

3. Specified patterns shall be matched against existing filenames and pathnames, as appropriate. Each component that contains a pattern character shall require read permission in the directory containing that component. Any component, except the last, that does not contain a pattern character shall require search permission. For example, given the pattern:

/foo/bar/x\*/bam

search permission is needed for directories / and **foo**, search and read permissions are needed for directory **bar**, and search permission is needed for each **x\*** directory. If the pattern matches any existing filenames or pathnames, the pattern shall be replaced with those filenames and pathnames, sorted according to the collating sequence in effect in the current locale. If this collating sequence does not have a total ordering of all characters (see XBD [Section 7.3.2](#), on page 147), any filenames or pathnames that collate equally should be further compared byte-by-byte using the collating sequence for the POSIX locale.

**Note:** A future version of this standard may require the byte-by-byte further comparison described above.

If the pattern contains an open bracket ('[') that does not introduce a bracket expression as in XBD [Section 9.3.5](#), it is unspecified whether other unquoted pattern matching characters within the same slash-delimited component of the pattern retain their special meanings or are treated as ordinary characters. For example, the pattern "a\*[b\*]" may match all filenames beginning with 'b' in the directory "a\*" or it may match all filenames beginning with 'b' in all directories with names beginning with 'a' and ending with '['.

If the pattern does not match any existing filenames or pathnames, the pattern string shall be left unchanged.

## 2.14 Special Built-In Utilities

The following “special built-in” utilities shall be supported in the shell command language. The output of each command, if any, shall be written to standard output, subject to the normal redirection and piping possible with all commands.

The term “built-in” implies that the shell can execute the utility directly and does not need to search for it. An implementation may choose to make any utility a built-in; however, the special built-in utilities described here differ from regular built-in utilities in two respects:

1. An error in a special built-in utility may cause a shell executing that utility to abort, while an error in a regular built-in utility shall not cause a shell executing that utility to abort. (See [Section 2.8.1](#) for the consequences of errors on interactive and non-interactive shells.) If a special built-in utility encountering an error does not abort the shell, its exit value shall be non-zero.

- 75970           2. As described in [Section 2.9.1](#), variable assignments preceding the invocation of a special |  
75971           built-in utility remain in effect after the built-in completes; this shall not be the case with a |  
75972           regular built-in or other utility.

75973           The special built-in utilities in this section need not be provided in a manner accessible via the  
75974           *exec* family of functions defined in the System Interfaces volume of POSIX.1-2008.

75975           Some of the special built-ins are described as conforming to XBD [Section 12.2](#). For those that are  
75976           not, the requirement in [Section 1.4](#) that "--" be recognized as a first argument to be discarded  
75977           does not apply and a conforming application shall not use that argument.

75978 **NAME**

75979 break — exit from for, while, or until loop

75980 **SYNOPSIS**75981 break [*n*]75982 **DESCRIPTION**

75983 If *n* is specified, the *break* utility shall exit from the *n*th enclosing **for**, **while**, or **until** loop. If *n* is  
 75984 not specified, *break* shall behave as if *n* was specified as 1. Execution shall continue with the  
 75985 command immediately following the exited loop. The value of *n* is a positive decimal integer. If  
 75986 *n* is greater than the number of enclosing loops, the outermost enclosing loop shall be exited. If  
 75987 there is no enclosing loop, the behavior is unspecified.

75988 A loop shall enclose a *break* or *continue* command if the loop lexically encloses the command. A  
 75989 loop lexically encloses a *break* or *continue* command if the command is:

- 75990 • Executing in the same execution environment (see [Section 2.12](#)) as the compound-list of the  
 75991 loop's do-group (see [Section 2.10.2](#)), and
- 75992 • Contained in a compound-list associated with the loop (either in the compound-list of the  
 75993 loop's do-group or, if the loop is a **while** or **until** loop, in the compound-list following the  
 75994 **while** or **until** reserved word), and
- 75995 • Not in the body of a function whose function definition command (see [Section 2.9.5](#)) is  
 75996 contained in a compound-list associated with the loop.

75997 If *n* is greater than the number of lexically enclosing loops and there is a non-lexically enclosing  
 75998 loop in progress in the same execution environment as the *break* or *continue* command, it is  
 75999 unspecified whether that loop encloses the command.

76000 **OPTIONS**

76001 None.

76002 **OPERANDS**

76003 See the DESCRIPTION.

76004 **STDIN**

76005 Not used.

76006 **INPUT FILES**

76007 None.

76008 **ENVIRONMENT VARIABLES**

76009 None.

76010 **ASYNCHRONOUS EVENTS**

76011 Default.

76012 **STDOUT**

76013 Not used.

76014 **STDERR**

76015 The standard error shall be used only for diagnostic messages.

76016 **OUTPUT FILES**

76017 None.

76018 **EXTENDED DESCRIPTION**

76019       None.

76020 **EXIT STATUS**

76021       0   Successful completion.

76022       >0   The *n* value was not an unsigned decimal integer greater than or equal to 1.76023 **CONSEQUENCES OF ERRORS**

76024       Default.

76025 **APPLICATION USAGE**

76026       None.

76027 **EXAMPLES**

```

76028     for i in *
76029     do
76030         if test -d "$i"
76031         then break
76032         fi
76033     done

```

76034       The results of running the following example are unspecified: there are two loops in progress +  
 76035       when the *break* command is executed, and they are in the same execution environment, but +  
 76036       neither loop is lexically enclosing the *break* command. (There are no loops lexically enclosing the +  
 76037       *continue* commands, either.) +

```

76038     foo() { +
76039         for j in 1 2; do +
76040             echo 'break 2' >/tmp/do_break +
76041             echo "   sourcing /tmp/do_break ($j)..." +
76042             # the behavior of the break from running the following command +
76043             # results in unspecified behavior: +
76044             . /tmp/do_break +
76045 +
76046             do_continue() { continue 2; } +
76047             echo "   running do_continue ($j)..." +
76048             # the behavior of the continue in the following function call +
76049             # results in unspecified behavior (if execution reaches this +
76050             # point): +
76051             do_continue +
76052 +
76053             trap 'continue 2' USR1 +
76054             echo "   sending SIGUSR1 to self ($j)..." +
76055             # the behavior of the continue in the trap invoked from the +
76056             # following signal results in unspecified behavior (if +
76057             # execution reaches this point): +
76058             kill -s USR1 $$ +
76059             sleep 1 +
76060         done +
76061     } +
76062     for i in 1 2; do +
76063         echo "running foo ($i)..." +
76064         foo +
76065     done +

```

**RATIONALE**

In early proposals, consideration was given to expanding the syntax of *break* and *continue* to refer to a label associated with the appropriate loop as a preferable alternative to the *n* method. However, this volume of POSIX.1-2008 does reserve the name space of command names ending with a <colon>. It is anticipated that a future implementation could take advantage of this and provide something like:

```
outofloop: for i in a b c d e
do
    for j in 0 1 2 3 4 5 6 7 8 9
    do
        if test -r "${i}${j}"
        then break outofloop
        fi
    done
done
```

and that this might be standardized after implementation experience is achieved.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY****Issue 6**

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in behavior is intended.

76089 **NAME**

76090 colon — null utility

76091 **SYNOPSIS**76092 : [*argument...*]76093 **DESCRIPTION**

76094 This utility shall only expand command *arguments*. It is used when a command is needed, as in  
 76095 the **then** condition of an **if** command, but nothing is to be done by the command.

76096 **OPTIONS**

76097 None.

76098 **OPERANDS**

76099 See the DESCRIPTION.

76100 **STDIN**

76101 Not used.

76102 **INPUT FILES**

76103 None.

76104 **ENVIRONMENT VARIABLES**

76105 None.

76106 **ASYNCHRONOUS EVENTS**

76107 Default.

76108 **STDOUT**

76109 Not used.

76110 **STDERR**

76111 The standard error shall be used only for diagnostic messages.

76112 **OUTPUT FILES**

76113 None.

76114 **EXTENDED DESCRIPTION**

76115 None.

76116 **EXIT STATUS**

76117 Zero.

76118 **CONSEQUENCES OF ERRORS**

76119 Default.

76120 **APPLICATION USAGE**

76121 None.

76122 **EXAMPLES**

```
76123 : ${X=abc}
76124 if     false
76125 then  :
76126 else  echo $X
76127 fi
76128 abc
```

76129 As with any of the special built-ins, the null utility can also have variable assignments and  
 76130 redirections associated with it, such as:

76131 **x=y : > z**

76132 which sets variable *x* to the value *y* (so that it persists after the null utility completes) and creates  
76133 or truncates file *z*.

76134 **RATIONALE**

76135 None.

76136 **FUTURE DIRECTIONS**

76137 None.

76138 **SEE ALSO**

76139 [Section 2.14](#)

76140 **CHANGE HISTORY**

76141 **Issue 6**

76142 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
76143 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
76144 behavior is intended.

76145 **Issue 7**

76146 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

76147 **NAME**

76148           continue — continue for, while, or until loop

76149 **SYNOPSIS**76150           continue [*n*]76151 **DESCRIPTION**

76152           If *n* is specified, the *continue* utility shall return to the top of the *n*th enclosing **for**, **while**, or **until** |  
 76153           loop. If *n* is not specified, *continue* shall behave as if *n* was specified as 1. Returning to the top of |  
 76154           the loop involves repeating the condition list of a **while** or **until** loop or performing the next |  
 76155           assignment of a **for** loop, and re-executing the loop if appropriate.

76156           The value of *n* is a positive decimal integer. If *n* is greater than the number of enclosing loops, |  
 76157           the outermost enclosing loop shall be used. If there is no enclosing loop, the behavior is |  
 76158           unspecified.

76159           The meaning of “enclosing” shall be as specified in the description of the *break* utility.

76160 **OPTIONS**

76161           None.

76162 **OPERANDS**

76163           See the DESCRIPTION.

76164 **STDIN**

76165           Not used.

76166 **INPUT FILES**

76167           None.

76168 **ENVIRONMENT VARIABLES**

76169           None.

76170 **ASYNCHRONOUS EVENTS**

76171           Default.

76172 **STDOUT**

76173           Not used.

76174 **STDERR**

76175           The standard error shall be used only for diagnostic messages.

76176 **OUTPUT FILES**

76177           None.

76178 **EXTENDED DESCRIPTION**

76179           None.

76180 **EXIT STATUS**

76181           0   Successful completion.

76182           >0   The *n* value was not an unsigned decimal integer greater than or equal to 1.76183 **CONSEQUENCES OF ERRORS**

76184           Default.

76185 **APPLICATION USAGE**

76186 None.

76187 **EXAMPLES**

```
76188     for i in *
76189     do
76190         if test -d "$i"
76191         then continue
76192         fi
76193         printf "%s" is not a directory.\n' "$i"
76194     done
```

76195 **RATIONALE**

76196 None.

76197 **FUTURE DIRECTIONS**

76198 None.

76199 **SEE ALSO**76200 [Section 2.14](#)76201 **CHANGE HISTORY**76202 **Issue 6**

76203 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
76204 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
76205 behavior is intended.

76206 **Issue 7**

76207 The example is changed to use the *printf* utility rather than *echo*.

76208 **NAME**

76209 dot — execute commands in the current environment

76210 **SYNOPSIS**76211 . *file*76212 **DESCRIPTION**76213 The shell shall execute commands from the *file* in the current environment.

76214 If *file* does not contain a <slash>, the shell shall use the search path specified by *PATH* to find the  
 76215 directory containing *file*. Unlike normal command search, however, the file searched for by the  
 76216 *dot* utility need not be executable. If no readable file is found, a non-interactive shell shall abort;  
 76217 an interactive shell shall write a diagnostic message to standard error, but this condition shall  
 76218 not be considered a syntax error.

76219 **OPTIONS**

76220 None.

76221 **OPERANDS**

76222 See the DESCRIPTION.

76223 **STDIN**

76224 Not used.

76225 **INPUT FILES**

76226 See the DESCRIPTION.

76227 **ENVIRONMENT VARIABLES**

76228 See the DESCRIPTION.

76229 **ASYNCHRONOUS EVENTS**

76230 Default.

76231 **STDOUT**

76232 Not used.

76233 **STDERR**

76234 The standard error shall be used only for diagnostic messages.

76235 **OUTPUT FILES**

76236 None.

76237 **EXTENDED DESCRIPTION**

76238 None.

76239 **EXIT STATUS**

76240 If no readable file was found or if the commands in the file could not be parsed, and the shell is  
 76241 interactive (and therefore does not abort; see [Section 2.8.1](#)), the exit status shall be non-zero.  
 76242 Otherwise, return the value of the last command executed, or a zero exit status if no command is  
 76243 executed.

76244 **CONSEQUENCES OF ERRORS**

76245 Default.

**76246 APPLICATION USAGE**

76247 None.

**76248 EXAMPLES**

```
76249 cat foobar
76250 foo=hello bar=world
76251 . ./foobar
76252 echo $foo $bar
76253 hello world
```

**76254 RATIONALE**

76255 Some older implementations searched the current directory for the *file*, even if the value of *PATH*  
76256 disallowed it. This behavior was omitted from this volume of POSIX.1-2008 due to concerns  
76257 about introducing the susceptibility to trojan horses that the user might be trying to avoid by  
76258 leaving **dot** out of *PATH*.

76259 The KornShell version of *dot* takes optional arguments that are set to the positional parameters.  
76260 This is a valid extension that allows a *dot* script to behave identically to a function.

**76261 FUTURE DIRECTIONS**

76262 None.

**76263 SEE ALSO**

76264 [Section 2.14, \*return\*](#)

**76265 CHANGE HISTORY****76266 Issue 6**

76267 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
76268 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
76269 behavior is intended.

**76270 Issue 7**

76271 SD5-XCU-ERN-164 is applied.

76272 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0038 [114] and XCU/TC1-2008/0039  
76273 [214] are applied.

76274 **NAME**

76275 eval — construct command by concatenating arguments

76276 **SYNOPSIS**76277 eval [*argument...*]76278 **DESCRIPTION**76279 The *eval* utility shall construct a command by concatenating *arguments* together, separating each  
76280 with a <space> character. The constructed command shall be read and executed by the shell.76281 **OPTIONS**

76282 None.

76283 **OPERANDS**

76284 See the DESCRIPTION.

76285 **STDIN**

76286 Not used.

76287 **INPUT FILES**

76288 None.

76289 **ENVIRONMENT VARIABLES**

76290 None.

76291 **ASYNCHRONOUS EVENTS**

76292 Default.

76293 **STDOUT**

76294 Not used.

76295 **STDERR**

76296 The standard error shall be used only for diagnostic messages.

76297 **OUTPUT FILES**

76298 None.

76299 **EXTENDED DESCRIPTION**

76300 None.

76301 **EXIT STATUS**76302 If there are no *arguments*, or only null *arguments*, *eval* shall return a zero exit status; otherwise, it  
76303 shall return the exit status of the command defined by the string of concatenated *arguments*  
76304 separated by <space> characters, or a non-zero exit status if the concatenation could not be  
76305 parsed as a command and the shell is interactive (and therefore did not abort).76306 **CONSEQUENCES OF ERRORS**

76307 Default.

76308 **APPLICATION USAGE**76309 Since *eval* is not required to recognize the "--" end of options delimiter, in cases where the  
76310 argument(s) to *eval* might begin with '-' it is recommended that the first argument is prefixed  
76311 by a string that will not alter the commands to be executed, such as a <space> character:

76312 eval " \$commands"

76313 or:

76314 eval " \$(some\_command)"

**EXAMPLES**

```
foo=10 x=foo
y=' '$x
echo $y
$foo
eval y=' '$x
echo $y
10
```

**RATIONALE**

This standard allows, but does not require, *eval* to recognize "--". Although this means applications cannot use "--" to protect against options supported as an extension (or errors reported for unsupported options), the nature of the *eval* utility is such that other means can be used to provide this protection (see APPLICATION USAGE above).

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

[Section 2.14](#)

**CHANGE HISTORY****Issue 6**

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in behavior is intended.

**Issue 7**

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0040 [114], XCU/TC1-2008/0041 [163], and XCU/TC1-2008/0042 [163] are applied.

76341 **NAME**76342        *exec* — execute commands and open, close, or copy file descriptors76343 **SYNOPSIS**76344        *exec* [*command* [*argument...*]]76345 **DESCRIPTION**76346        The *exec* utility shall open, close, and/or copy file descriptors as specified by any redirections as  
76347        part of the command.76348        If *exec* is specified without *command* or *arguments*, and any file descriptors with numbers greater  
76349        than 2 are opened with associated redirection statements, it is unspecified whether those file  
76350        descriptors remain open when the shell invokes another utility. Scripts concerned that child  
76351        shells could misuse open file descriptors can always close them explicitly, as shown in one of the  
76352        following examples.76353        If *exec* is specified with *command*, it shall replace the shell with *command* without creating a new  
76354        process. If *arguments* are specified, they shall be arguments to *command*. Redirection affects the  
76355        current shell execution environment.76356 **OPTIONS**

76357        None.

76358 **OPERANDS**

76359        See the DESCRIPTION.

76360 **STDIN**

76361        Not used.

76362 **INPUT FILES**

76363        None.

76364 **ENVIRONMENT VARIABLES**

76365        None.

76366 **ASYNCHRONOUS EVENTS**

76367        Default.

76368 **STDOUT**

76369        Not used.

76370 **STDERR**

76371        The standard error shall be used only for diagnostic messages.

76372 **OUTPUT FILES**

76373        None.

76374 **EXTENDED DESCRIPTION**

76375        None.

76376 **EXIT STATUS**76377        If *command* is specified, *exec* shall not return to the shell; rather, the exit status of the process shall  
76378        be the exit status of the program implementing *command*, which overlaid the shell. If *command* is  
76379        not found, the exit status shall be 127. If *command* is found, but it is not an executable utility, the  
76380        exit status shall be 126. If a redirection error occurs (see [Section 2.8.1](#)), the shell shall exit with a  
76381        value in the range 1–125. Otherwise, *exec* shall return a zero exit status.

76382 **CONSEQUENCES OF ERRORS**

76383 Default.

76384 **APPLICATION USAGE**

76385 None.

76386 **EXAMPLES**76387 Open *readfile* as file descriptor 3 for reading:76388 `exec 3< readfile`76389 Open *writefile* as file descriptor 4 for writing:76390 `exec 4> writefile`

76391 Make file descriptor 5 a copy of file descriptor 0:

76392 `exec 5<&0`

76393 Close file descriptor 3:

76394 `exec 3<&-`76395 Cat the file **maggie** by replacing the current shell with the *cat* utility:76396 `exec cat maggie`76397 **RATIONALE**

76398 Most historical implementations were not conformant in that:

76399 `foo=bar exec cmd`76400 did not pass **foo** to **cmd**.76401 **FUTURE DIRECTIONS**

76402 None.

76403 **SEE ALSO**76404 [Section 2.14](#)76405 **CHANGE HISTORY**76406 **Issue 6**

76407 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
76408 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
76409 behavior is intended.

76410 **Issue 7**

76411 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

76412 **NAME**

76413       exit — cause the shell to exit

76414 **SYNOPSIS**76415       exit [*n*]76416 **DESCRIPTION**

76417       The *exit* utility shall cause the shell to exit from its current execution environment with the exit  
 76418       status specified by the unsigned decimal integer *n*. If the current execution environment is a  
 76419       subshell environment, the shell shall exit from the subshell environment with the specified exit  
 76420       status and continue in the environment from which that subshell environment was invoked;  
 76421       otherwise, the shell utility shall terminate with the specified exit status. If *n* is specified, but its  
 76422       value is not between 0 and 255 inclusively, the exit status is undefined.

76423       A *trap* on **EXIT** shall be executed before the shell terminates, except when the *exit* utility is  
 76424       invoked in that *trap* itself, in which case the shell shall exit immediately.

76425 **OPTIONS**

76426       None.

76427 **OPERANDS**

76428       See the DESCRIPTION.

76429 **STDIN**

76430       Not used.

76436       Default.

76437 **STDOUT**

76438       Not used.

76439 **STDERR**

76440       The standard error shall be used only for diagnostic messages.

76441 **OUTPUT FILES**

76442       None.

76443 **EXTENDED DESCRIPTION**

76444       None.

76445 **EXIT STATUS**

76446       The exit status shall be *n*, if specified, except that the behavior is unspecified if *n* is not an  
 76447       unsigned decimal integer or is greater than 255. Otherwise, the value shall be the exit value of  
 76448       the last command executed, or zero if no command was executed. When *exit* is executed in a *trap*  
 76449       action, the last command is considered to be the command that executed immediately preceding  
 76450       the *trap* action.

76451 **CONSEQUENCES OF ERRORS**

76452       Default.

**APPLICATION USAGE**

None.

**EXAMPLES**

Exit with a *true* value:

```
exit 0
```

Exit with a *false* value:

```
exit 1
```

Propagate error handling from within a subshell:

```
(
    command1 || exit 1
    command2 || exit 1
    exec command3
) > outputfile || exit 1
echo "outputfile created successfully"
```

**RATIONALE**

As explained in other sections, certain exit status values have been reserved for special uses and should be used by applications only for those purposes:

126 A file to be executed was found, but it was not an executable utility.

127 A utility to be executed was not found.

>128 A command was interrupted by a signal.

The behavior of *exit* when given an invalid argument or unknown option is unspecified, because of differing practices in the various historical implementations. A value larger than 255 might be truncated by the shell, and be unavailable even to a parent process that uses *waitid()* to get the full exit value. It is recommended that implementations that detect any usage error should cause a non-zero exit status (or, if the shell is interactive and the error does not cause the shell to abort, store a non-zero value in "\$?"), but even this was not done historically in all shells.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY****Issue 6**

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in behavior is intended.

76488 **NAME**

76489       export — set the export attribute for variables

76490 **SYNOPSIS**

76491       export name[=word]...

76492       export -p

76493 **DESCRIPTION**

76494       The shell shall give the *export* attribute to the variables corresponding to the specified *names*,  
 76495       which shall cause them to be in the environment of subsequently executed commands. If the  
 76496       name of a variable is followed by =*word*, then the value of that variable shall be set to *word*.

76497       The *export* special built-in shall support XBD [Section 12.2](#).

76498       When **-p** is specified, *export* shall write to the standard output the names and values of all  
 76499       exported variables, in the following format:

76500       "export %s=%s\n", &lt;name&gt;, &lt;value&gt;

76501       if *name* is set, and:

76502       "export %s\n", &lt;name&gt;

76503       if *name* is unset.

76504       The shell shall format the output, including the proper use of quoting, so that it is suitable for  
 76505       reinput to the shell as commands that achieve the same exporting results, except:

- 76506       1. Read-only variables with values cannot be reset.
- 76507       2. Variables that were unset at the time they were output need not be reset to the unset state  
 76508       if a value is assigned to the variable between the time the state was saved and the time at  
 76509       which the saved output is reinput to the shell.

76510       When no arguments are given, the results are unspecified. |

76511 **OPTIONS**

76512       See the DESCRIPTION.

76513 **OPERANDS**

76514       See the DESCRIPTION.

76515 **STDIN**

76516       Not used.

76517 **INPUT FILES**

76518       None.

76519 **ENVIRONMENT VARIABLES**

76520       None.

76521 **ASYNCHRONOUS EVENTS**

76522       Default.

76523 **STDOUT**

76524       See the DESCRIPTION.

76525 **STDERR**

76526       The standard error shall be used only for diagnostic messages.

76527 **OUTPUT FILES**

76528 None.

76529 **EXTENDED DESCRIPTION**

76530 None.

76531 **EXIT STATUS**76532 0 All *name* operands were successfully exported. |76533 >0 At least one *name* could not be exported, or the **-p** option was specified and an error |  
76534 occurred. |76535 **CONSEQUENCES OF ERRORS**

76536 Default.

76537 **APPLICATION USAGE**76538 Note that, unless *X* was previously marked readonly, the value of "\$?" after: |76539 `export X=$(false)` |76540 will be 0 (because *export* successfully set *X* to the empty string) and that execution continues, |  
76541 even if *set -e* is in effect. In order to detect command substitution failures, a user must separate |  
76542 the assignment from the export, as in: |76543 `X=$(false)` |76544 `export X` |76545 **EXAMPLES**76546 Export *PWD* and *HOME* variables:76547 `export PWD HOME`76548 Set and export the *PATH* variable:76549 `export PATH=/local/bin:$PATH`

76550 Save and restore all exported variables:

76551 `export -p > temp-file`76552 `unset a lot of variables`76553 `... processing`76554 `. temp-file`76555 **RATIONALE**76556 Some historical shells use the no-argument case as the functional equivalent of what is required  
76557 here with **-p**. This feature was left unspecified because it is not historical practice in all shells,  
76558 and some scripts may rely on the now-unspecified results on their implementations. Attempts to  
76559 specify the **-p** output as the default case were unsuccessful in achieving consensus. The **-p**  
76560 option was added to allow portable access to the values that can be saved and then later restored  
76561 using; for example, a *dot* script.76562 **FUTURE DIRECTIONS**

76563 None.

76564 **SEE ALSO**76565 [Section 2.14](#)76566 [XBD Section 12.2](#)

76567 **CHANGE HISTORY**

76568 **Issue 6**

76569 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the format when a variable is unset.

76570 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
76571 sections use terms as described in the Utility Description Defaults (Section 1.4). No change in  
76572 behavior is intended.

76573 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/6 is applied, adding the following text to  
76574 the end of the first paragraph of the DESCRIPTION: "If the name of a variable is followed by  
76575 *=word*, then the value of that variable shall be set to *word*.". The reason for this change is that the  
76576 SYNOPSIS for *export* includes:

76577 `export name[=word]...`

76578 but the meaning of the optional "*=word*" is never explained in the text.

76579 **Issue 7**

76580 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0043 [352] is applied.

76581 **NAME**

76582       readonly — set the readonly attribute for variables

76583 **SYNOPSIS**76584       readonly name[=*word*]...

76585       readonly -p

76586 **DESCRIPTION**

76587       The variables whose *names* are specified shall be given the *readonly* attribute. The values of  
76588       variables with the *readonly* attribute cannot be changed by subsequent assignment, nor can those  
76589       variables be unset by the *unset* utility. If the name of a variable is followed by =*word*, then the  
76590       value of that variable shall be set to *word*.

76591       The *readonly* special built-in shall support XBD [Section 12.2](#).

76592       When -p is specified, *readonly* writes to the standard output the names and values of all read-  
76593       only variables, in the following format:

76594       "readonly %s=%s\n", <*name*>, <*value*>76595       if *name* is set, and76596       "readonly %s\n", <*name*>76597       if *name* is unset.

76598       The shell shall format the output, including the proper use of quoting, so that it is suitable for  
76599       reinput to the shell as commands that achieve the same value and *readonly* attribute-setting  
76600       results in a shell execution environment in which:

- 76601           1. Variables with values at the time they were output do not have the *readonly* attribute set.
- 76602           2. Variables that were unset at the time they were output do not have a value at the time at  
76603           which the saved output is reinput to the shell.

76604       When no arguments are given, the results are unspecified.

76605 **OPTIONS**

76606       See the DESCRIPTION.

76607 **OPERANDS**

76608       See the DESCRIPTION.

76609 **STDIN**

76610       Not used.

76611 **INPUT FILES**

76612       None.

76613 **ENVIRONMENT VARIABLES**

76614       None.

76615 **ASYNCHRONOUS EVENTS**

76616       Default.

76617 **STDOUT**

76618       See the DESCRIPTION.

76619 **STDERR**

76620 The standard error shall be used only for diagnostic messages.

76621 **OUTPUT FILES**

76622 None.

76623 **EXTENDED DESCRIPTION**

76624 None.

76625 **EXIT STATUS**

76626 0 All *name* operands were successfully marked readonly. |

76627 >0 At least one *name* could not be marked readonly, or the **-p** option was specified and an error |  
76628 occurred. |

76629 **CONSEQUENCES OF ERRORS**

76630 Default.

76631 **APPLICATION USAGE**

76632 None.

76633 **EXAMPLES**

76634 readonly HOME PWD

76635 **RATIONALE**

76636 Some historical shells preserve the *readonly* attribute across separate invocations. This volume of  
76637 POSIX.1-2008 allows this behavior, but does not require it.

76638 The **-p** option allows portable access to the values that can be saved and then later restored  
76639 using, for example, a *dot* script. Also see the RATIONALE for *export* for a description of the no-  
76640 argument and **-p** output cases and a related example.

76641 Read-only functions were considered, but they were omitted as not being historical practice or  
76642 particularly useful. Furthermore, functions must not be read-only across invocations to preclude  
76643 “spoofing” (spoofing is the term for the practice of creating a program that acts like a well-  
76644 known utility with the intent of subverting the real intent of the user) of administrative or  
76645 security-relevant (or security-conscious) shell scripts.

76646 **FUTURE DIRECTIONS**

76647 None.

76648 **SEE ALSO**

76649 [Section 2.14](#)

76650 [XBD Section 12.2](#)

76651 **CHANGE HISTORY**

76652 **Issue 6**

76653 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the format when a variable is unset.

76654 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
76655 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
76656 behavior is intended.

76657 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/7 is applied, adding the following text to  
76658 the end of the first paragraph of the DESCRIPTION: “If the name of a variable is followed by  
76659 *=word*, then the value of that variable shall be set to *word*.”. The reason for this change is that the  
76660 SYNOPSIS for *readonly* includes:

76661        `readonly name[=word]...`

76662        but the meaning of the optional “=word” is never explained in the text.

76663 **NAME**

76664       return — return from a function or dot script

76665 **SYNOPSIS**76666       return [*n*]76667 **DESCRIPTION**

76668       The *return* utility shall cause the shell to stop executing the current function or *dot* script. If the  
 76669       shell is not currently executing a function or *dot* script, the results are unspecified.

76670 **OPTIONS**

76671       None.

76672 **OPERANDS**

76673       See the DESCRIPTION.

76674 **STDIN**

76675       Not used.

76676 **INPUT FILES**

76677       None.

76678 **ENVIRONMENT VARIABLES**

76679       None.

76680 **ASYNCHRONOUS EVENTS**

76681       Default.

76682 **STDOUT**

76683       Not used.

76684 **STDERR**

76685       The standard error shall be used only for diagnostic messages.

76686 **OUTPUT FILES**

76687       None.

76688 **EXTENDED DESCRIPTION**

76689       None.

76690 **EXIT STATUS**

76691       The value of the special parameter '?' shall be set to *n*, an unsigned decimal integer, or to the  
 76692       exit status of the last command executed if *n* is not specified. If *n* is not an unsigned decimal  
 76693       integer, or is greater than 255, the results are unspecified. When *return* is executed in a *trap*  
 76694       action, the last command is considered to be the command that executed immediately preceding  
 76695       the *trap* action.

76696 **CONSEQUENCES OF ERRORS**

76697       Default.

76698 **APPLICATION USAGE**

76699       None.

76700 **EXAMPLES**

76701       None.

76702 **RATIONALE**

76703       The behavior of *return* when not in a function or *dot* script differs between the System V shell  
 76704       and the KornShell. In the System V shell this is an error, whereas in the KornShell, the effect is  
 76705       the same as *exit*.

76706 The results of returning a number greater than 255 are undefined because of differing practices  
76707 in the various historical implementations. Some shells AND out all but the low-order 8 bits;  
76708 others allow larger values, but not of unlimited size.

76709 See the discussion of appropriate exit status values under *exit*.

#### 76710 FUTURE DIRECTIONS

76711 None.

#### 76712 SEE ALSO

76713 [Section 2.9.5](#), [Section 2.14](#), *dot*

#### 76714 CHANGE HISTORY

##### 76715 Issue 6

76716 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
76717 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
76718 behavior is intended.

##### 76719 Issue 7

76720 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0044 [214] and XCU/TC1-2008/0045  
76721 [214] are applied.

**NAME**

set — set or unset options and positional parameters

**SYNOPSIS**

set [-abCefhmnvux] [-o *option*] [*argument...*]

set [+abCefhmnvux] [+o *option*] [*argument...*]

set -- [*argument...*]

set -o

set +o

**DESCRIPTION**

If no *options* or *arguments* are specified, *set* shall write the names and values of all shell variables in the collation sequence of the current locale. Each *name* shall start on a separate line, using the format:

"%s=%s\n", <name>, <value>

The *value* string shall be written with appropriate quoting; see the description of shell quoting in [Section 2.2](#). The output shall be suitable for reinput to the shell, setting or resetting, as far as possible, the variables that are currently set; read-only variables cannot be reset.

When options are specified, they shall set or unset attributes of the shell, as described below. When *arguments* are specified, they cause positional parameters to be set or unset, as described below. Setting or unsetting attributes and positional parameters are not necessarily related actions, but they can be combined in a single invocation of *set*.

The *set* special built-in shall support XBD [Section 12.2](#) except that options can be specified with either a leading <hyphen-minus> (meaning enable the option) or <plus-sign> (meaning disable it) unless otherwise specified.

Implementations shall support the options in the following list in both their <hyphen-minus> and <plus-sign> forms. These options can also be specified as options to *sh*.

–a When this option is on, the *export* attribute shall be set for each variable to which an assignment is performed; see XBD [Section 4.23](#). If the assignment precedes a utility name in a command, the *export* attribute shall not persist in the current execution environment after the utility completes, with the exception that preceding one of the special built-in utilities causes the *export* attribute to persist after the built-in has completed. If the assignment does not precede a utility name in the command, or if the assignment is a result of the operation of the *getopts* or *read* utilities, the *export* attribute shall persist until the variable is unset.

–b This option shall be supported if the implementation supports the User Portability Utilities option. It shall cause the shell to notify the user asynchronously of background job completions. The following message is written to standard error:

"[%d]%c %s\n", <job-number>, <current>, <status>, <job-name>

where the fields shall be as follows:

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <current> | The character '+' identifies the job that would be used as a default for the <i>fg</i> or <i>bg</i> utilities; this job can also be specified using the <i>job_id</i> "%+" or "%%". The character '-' identifies the job that would become the default if the current default job were to exit; this job can also be specified using the <i>job_id</i> "%-". For other jobs, this field is a <space>. At most one job can be identified with '+' and at most one job can be identified with '-'. If there is any suspended job, then the current job shall be a suspended |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

76766 job. If there are at least two suspended jobs, then the previous job also  
76767 shall be a suspended job.

76768 `<job-number>` A number that can be used to identify the process group to the *wait*, *fg*, *bg*,  
76769 and *kill* utilities. Using these utilities, the job can be identified by prefixing  
76770 the job number with ' % '.

76771 `<status>` Unspecified.

76772 `<job-name>` Unspecified.

76773 When the shell notifies the user a job has been completed, it may remove the job's process  
76774 ID from the list of those known in the current shell execution environment; see [Section](#)  
76775 [2.9.3.1](#). Asynchronous notification shall not be enabled by default.

76776 **-C** (Uppercase C.) Prevent existing files from being overwritten by the shell's '`>`' redirection  
76777 operator (see [Section 2.7.2](#)); the '`>|`' redirection operator shall override this *noclobber*  
76778 option for an individual file.

76779 **-e** When this option is on, when any command fails (for any of the reasons listed in [Section](#)  
76780 [2.8.1](#) or by returning an exit status greater than zero), the shell immediately shall exit, as if  
76781 by executing the *exit* special built-in utility with no arguments, with the following  
76782 exceptions:

- 76783 1. The failure of any individual command in a multi-command pipeline shall not cause  
76784 the shell to exit. Only the failure of the pipeline itself shall be considered.
- 76785 2. The **-e** setting shall be ignored when executing the compound list following the  
76786 **while**, **until**, **if**, or **elif** reserved word, a pipeline beginning with the **!** reserved word,  
76787 or any command of an AND-OR list other than the last.
- 76788 3. If the exit status of a compound command other than a subshell command was the  
76789 result of a failure while **-e** was being ignored, then **-e** shall not apply to this  
76790 command.

76791 This requirement applies to the shell environment and each subshell environment  
76792 separately. For example, in:

76793 `set -e; (false; echo one) | cat; echo two`

76794 the *false* command causes the subshell to exit without executing `echo one`; however, `echo`  
76795 `two` is executed because the exit status of the pipeline `(false; echo one) | cat` is  
76796 zero.

76797 **-f** The shell shall disable pathname expansion.

76798 **-h** Locate and remember utilities invoked by functions as those functions are defined (the  
76799 utilities are normally located when the function is executed).

76800 **-m** This option shall be supported if the implementation supports the User Portability Utilities  
76801 option. All jobs shall be run in their own process groups. Immediately before the shell issues  
76802 a prompt after completion of the background job, a message reporting the exit status of the  
76803 background job shall be written to standard error. If a foreground job stops, the shell shall  
76804 write a message to standard error to that effect, formatted as described by the *jobs* utility. In  
76805 addition, if a job changes status other than exiting (for example, if it stops for input or  
76806 output or is stopped by a SIGSTOP signal), the shell shall write a similar message  
76807 immediately prior to writing the next prompt. This option is enabled by default for  
76808 interactive shells.

- 76809        **-n** The shell shall read commands but does not execute them; this can be used to check for  
 76810        shell script syntax errors. An interactive shell may ignore this option.
- 76811        **-o** Write the current settings of the options to standard output in an unspecified format.
- 76812        **+o** Write the current option settings to standard output in a format that is suitable for reinput  
 76813        to the shell as commands that achieve the same options settings.
- 76814        **-o option**
- 76815        This option is supported if the system supports the User Portability Utilities option. It shall  
 76816        set various options, many of which shall be equivalent to the single option letters. The  
 76817        following values of *option* shall be supported:
- 76818        *allexport*        Equivalent to **-a**.
- 76819        *errexit*        Equivalent to **-e**.
- 76820        *ignoreeof*        Prevent an interactive shell from exiting on end-of-file. This setting prevents  
 76821        accidental logouts when <control>-D is entered. A user shall explicitly *exit* to  
 76822        leave the interactive shell.
- 76823        *monitor*        Equivalent to **-m**. This option is supported if the system supports the User  
 76824        Portability Utilities option.
- 76825        *noclobber*        Equivalent to **-C** (uppercase C).
- 76826        *noglob*        Equivalent to **-f**.
- 76827        *noexec*        Equivalent to **-n**.
- 76828        *nolog*        Prevent the entry of function definitions into the command history; see  
 76829        [Command History List](#).
- 76830        *notify*        Equivalent to **-b**.
- 76831        *nounset*        Equivalent to **-u**.
- 76832        *verbose*        Equivalent to **-v**.
- 76833        *vi*        Allow shell command line editing using the built-in *vi* editor. Enabling *vi*  
 76834        mode shall disable any other command line editing mode provided as an  
 76835        implementation extension.
- 76836        It need not be possible to set *vi* mode on for certain block-mode terminals.
- 76837        *xtrace*        Equivalent to **-x**.
- 76838        **-u** When the shell tries to expand an unset parameter other than the '@' and '\*' special  
 76839        parameters, it shall write a message to standard error and the expansion shall fail with the  
 76840        consequences specified in [Section 2.8.1](#).
- 76841        **-v** The shell shall write its input to standard error as it is read.
- 76842        **-x** The shell shall write to standard error a trace for each command after it expands the  
 76843        command and before it executes it. It is unspecified whether the command that turns  
 76844        tracing off is traced.
- 76845        The default for all these options shall be off (unset) unless stated otherwise in the description of  
 76846        the option or unless the shell was invoked with them on; see *sh*.
- 76847        The remaining arguments shall be assigned in order to the positional parameters. The special  
 76848        parameter '#' shall be set to reflect the number of positional parameters. All positional  
 76849        parameters shall be unset before any new values are assigned.

76850 If the first argument is `'-'`, the results are unspecified.

76851 The special argument `--` immediately following the `set` command name can be used to

76852 delimit the arguments if the first argument begins with `'+'` or `'-'`, or to prevent inadvertent

76853 listing of all shell variables when there are no arguments. The command `set --` without *argument*

76854 shall unset all positional parameters and set the special parameter `'#'` to zero.

#### 76855 OPTIONS

76856 See the DESCRIPTION.

#### 76857 OPERANDS

76858 See the DESCRIPTION.

#### 76859 STDIN

76860 Not used.

#### 76861 INPUT FILES

76862 None.

#### 76863 ENVIRONMENT VARIABLES

76864 None.

#### 76865 ASYNCHRONOUS EVENTS

76866 Default.

#### 76867 STDOUT

76868 See the DESCRIPTION.

#### 76869 STDERR

76870 The standard error shall be used only for diagnostic messages.

#### 76871 OUTPUT FILES

76872 None.

#### 76873 EXTENDED DESCRIPTION

76874 None.

#### 76875 EXIT STATUS

76876 0 Successful completion. |

76877 >0 An invalid option was specified, or an error occurred. |

#### 76878 CONSEQUENCES OF ERRORS

76879 Default.

#### 76880 APPLICATION USAGE

76881 Application writers should avoid relying on `set -e` within functions. For example, in the

76882 following script:

```
76883 set -e
76884 start() {
76885     some_server
76886     echo some_server started successfully
76887 }
76888 start || echo >&2 some_server failed
```

76889 the `-e` setting is ignored within the function body (because the function is a command in an

76890 AND-OR list other than the last). Therefore, if `some_server` fails, the function carries on to

76891 echo "some\_server started successfully", and the exit status of the function is zero

76892 (which means "some\_server failed" is not output).

**EXAMPLES**

Write out all variables and their values:

```
set
```

Set \$1, \$2, and \$3 and set "\$#" to 3:

```
set c a b
```

Turn on the `-x` and `-v` options:

```
set -xv
```

Unset all positional parameters:

```
set --
```

Set \$1 to the value of *x*, even if it begins with `'-'` or `'+'`:

```
set -- "$x"
```

Set the positional parameters to the expansion of *x*, even if *x* expands with a leading `'-'` or `'+'`:

```
set -- $x
```

**RATIONALE**

The `set --` form is listed specifically in the SYNOPSIS even though this usage is implied by the Utility Syntax Guidelines. The explanation of this feature removes any ambiguity about whether the `set --` form might be misinterpreted as being equivalent to `set` without any options or arguments. The functionality of this form has been adopted from the KornShell. In System V, `set --` only unsets parameters if there is at least one argument; the only way to unset all parameters is to use *shift*. Using the KornShell version should not affect System V scripts because there should be no reason to issue it without arguments deliberately; if it were issued as, for example:

```
set -- "$@"
```

and there were in fact no arguments resulting from `"$@"`, unsetting the parameters would have no result.

The `set +` form in early proposals was omitted as being an unnecessary duplication of `set` alone and not widespread historical practice.

The *noclobber* option was changed to allow `set -C` as well as the `set -o noclobber` option. The single-letter version was added so that the historical `"$-"` paradigm would not be broken; see [Section 2.5.2](#).

The description of the `-e` option is intended to match the behavior of the 1988 version of the KornShell.

The `-h` flag is related to command name hashing. See [hash](#).

The following `set` flags were omitted intentionally with the following rationale:

**-k** The `-k` flag was originally added by the author of the Bourne shell to make it easier for users of pre-release versions of the shell. In early versions of the Bourne shell the construct `set name=value` had to be used to assign values to shell variables. The problem with `-k` is that the behavior affects parsing, virtually precluding writing any compilers. To explain the behavior of `-k`, it is necessary to describe the parsing algorithm, which is implementation-defined. For example:

```
set -k; echo name=value
```

and:

```
76934     set -k
76935     echo name=value
```

76936 behave differently. The interaction with functions is even more complex. What is more, the  
76937 `-k` flag is never needed, since the command line could have been reordered.

76938 `-t` The `-t` flag is hard to specify and almost never used. The only known use could be done  
76939 with here-documents. Moreover, the behavior with *ksh* and *sh* differs. The reference page  
76940 says that it exits after reading and executing one command. What is one command? If the  
76941 input is *date;date*, *sh* executes both *date* commands while *ksh* does only the first.

76942 Consideration was given to rewriting *set* to simplify its confusing syntax. A specific suggestion  
76943 was that the *unset* utility should be used to unset options instead of using the non-*getopt*()-able  
76944 `+option` syntax. However, the conclusion was reached that the historical practice of using `+option`  
76945 was satisfactory and that there was no compelling reason to modify such widespread historical  
76946 practice.

76947 The `-o` option was adopted from the KornShell to address user needs. In addition to its  
76948 generally friendly interface, `-o` is needed to provide the *vi* command line editing mode, for  
76949 which historical practice yields no single-letter option name. (Although it might have been  
76950 possible to invent such a letter, it was recognized that other editing modes would be developed  
76951 and `-o` provides ample name space for describing such extensions.)

76952 Historical implementations are inconsistent in the format used for `-o` option status reporting.  
76953 The `+o` format without an option-argument was added to allow portable access to the options  
76954 that can be saved and then later restored using, for instance, a dot script.

76955 Historically, *sh* did trace the command *set +x*, but *ksh* did not.

76956 The *ignoreeof* setting prevents accidental logouts when the end-of-file character (typically  
76957 `<control>-D`) is entered. A user shall explicitly *exit* to leave the interactive shell.

76958 The *set -m* option was added to apply only to the UPE because it applies primarily to interactive  
76959 use, not shell script applications.

76960 The ability to do asynchronous notification became available in the 1988 version of the  
76961 KornShell. To have it occur, the user had to issue the command:

```
76962     trap "jobs -n" CLD
```

76963 The C shell provides two different levels of an asynchronous notification capability. The  
76964 environment variable *notify* is analogous to what is done in *set -b* or *set -o notify*. When set, it  
76965 notifies the user immediately of background job completions. When unset, this capability is  
76966 turned off.

76967 The other notification ability comes through the built-in utility *notify*. The syntax is:

```
76968     notify [%job ... ]
```

76969 By issuing *notify* with no operands, it causes the C shell to notify the user asynchronously when  
76970 the state of the current job changes. If given operands, *notify* asynchronously informs the user of  
76971 changes in the states of the specified jobs.

76972 To add asynchronous notification to the POSIX shell, neither the KornShell extensions to *trap*,  
76973 nor the C shell *notify* environment variable seemed appropriate (*notify* is not a proper POSIX  
76974 environment variable name).

76975 The *set -b* option was selected as a compromise.

76976 The *notify* built-in was considered to have more functionality than was required for simple

76977 asynchronous notification.

76978 Historically, some shells applied the `-u` option to all parameters including `$@` and `$*`. The  
 76979 standard developers felt that this was a misfeature since it is normal and common for `$@` and `$*`  
 76980 to be used in shell scripts regardless of whether they were passed any arguments. Treating these  
 76981 uses as an error when no arguments are passed reduces the value of `-u` for its intended purpose  
 76982 of finding spelling mistakes in variable names and uses of unset positional parameters.

## 76983 FUTURE DIRECTIONS

76984 None.

## 76988 CHANGE HISTORY

### 76989 Issue 6

76990 The obsolescent *set* command name followed by `'-'` has been removed.

76991 The following new requirements on POSIX implementations derive from alignment with the  
 76992 Single UNIX Specification:

- 76993 • The *nolog* option is added to *set* `-o`.

76994 IEEE PASC Interpretation 1003.2 #167 is applied, clarifying that the options default also takes  
 76995 into account the description of the option.

76996 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
 76997 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
 76998 behavior is intended.

76999 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/8 is applied, changing the square  
 77000 brackets in the example in RATIONALE to be in bold, which is the typeface used for optional  
 77001 items.

### 77002 Issue 7

77003 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first  
 77004 argument is `'-'`.

77005 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

77006 XSI shading is removed from the `-h` functionality.

77007 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0046 [52], XCU/TC1-2008/0047  
 77008 [155,280], XCU/TC1-2008/0048 [52], XCU/TC1-2008/0049 [52], and XCU/TC1-2008/0050  
 77009 [155,430] are applied.

77010 **NAME**

77011 shift — shift positional parameters

77012 **SYNOPSIS**77013 shift [*n*]77014 **DESCRIPTION**

77015 The positional parameters shall be shifted. Positional parameter 1 shall be assigned the value of  
77016 parameter (1+*n*), parameter 2 shall be assigned the value of parameter (2+*n*), and so on. The  
77017 parameters represented by the numbers "\$#" down to "\$#-*n*+1" shall be unset, and the  
77018 parameter '#' is updated to reflect the new number of positional parameters.

77019 The value *n* shall be an unsigned decimal integer less than or equal to the value of the special  
77020 parameter '#'. If *n* is not given, it shall be assumed to be 1. If *n* is 0, the positional and special  
77021 parameters are not changed.

77022 **OPTIONS**

77023 None.

77024 **OPERANDS**

77025 See the DESCRIPTION.

77026 **STDIN**

77027 Not used.

77028 **INPUT FILES**

77063 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
77064 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
77065 behavior is intended.

77066 **Issue 7**

77067 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0051 [459] is applied.

77068 **NAME**

77069 times — write process times

77070 **SYNOPSIS**

77071 times

77072 **DESCRIPTION**

77073 The *times* utility shall write the accumulated user and system times for the shell and for all of its  
 77074 child processes, in the following POSIX locale format:

```
77075 "%dm%fs %dm%fs\n%dm%fs %dm%fs\n", <shell user minutes>,  

77076 <shell user seconds>, <shell system minutes>,  

77077 <shell system seconds>, <children user minutes>,  

77078 <children user seconds>, <children system minutes>,  

77079 <children system seconds>
```

77080 The four pairs of times shall correspond to the members of the **<sys/times.h> tms** structure  
 77081 (defined in XBD [Chapter 13](#)) as returned by *times()*: *tms\_utime*, *tms\_stime*, *tms\_cutime*, and  
 77082 *tms\_cstime*, respectively.

77083 **OPTIONS**

77084 None.

77085 **OPERANDS**

77086 None.

77087 **STDIN**

77088 Not used.

77092 None.

77093 **ASYNCHRONOUS EVENTS**

77094 Default.

77095 **STDOUT**

77096 See the DESCRIPTION.

77097 **STDERR**

77098 The standard error shall be used only for diagnostic messages.

77099 **OUTPUT FILES**

77100 None.

77101 **EXTENDED DESCRIPTION**

77102 None.

77103 **EXIT STATUS**

77104 0 Successful completion. |

77105 &gt;0 An error occurred. |

77106 **CONSEQUENCES OF ERRORS**

77107 Default.

77108 **APPLICATION USAGE**

77109 None.

77110 **EXAMPLES**

77111 **\$ times**

77112 **0m0.43s 0m1.11s**

77113 **8m44.18s 1m43.23s**

77114 **RATIONALE**

77115 The *times* special built-in from the Single UNIX Specification is now required for all conforming  
77116 shells.

77117 **FUTURE DIRECTIONS**

77118 None.

77119 **SEE ALSO**

77120 [Section 2.14](#)

77121 XBD [<sys/times.h>](#)

77122 **CHANGE HISTORY**

77123 **Issue 6**

77124 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/9 is applied, changing text in the  
77125 DESCRIPTION from: "Write the accumulated user and system times for the shell and for all of  
77126 its child processes ..." to: "The *times* utility shall write the accumulated user and system times for  
77127 the shell and for all of its child processes ...".

77128 **NAME**

77129 trap — trap signals

77130 **SYNOPSIS**77131 trap *n* [*condition...*]77132 trap [*action condition...*]77133 **DESCRIPTION**

77134 If the first operand is an unsigned decimal integer, the shell shall treat all operands as  
 77135 conditions, and shall reset each condition to the default value. Otherwise, if there are operands,  
 77136 the first is treated as an action and the remaining as conditions.

77137 If *action* is `'-'`, the shell shall reset each *condition* to the default value. If *action* is null (`" "`), the  
 77138 shell shall ignore each specified *condition* if it arises. Otherwise, the argument *action* shall be read  
 77139 and executed by the shell when one of the corresponding conditions arises. The action of *trap*  
 77140 shall override a previous action (either default action or one explicitly set). The value of `"$?"`  
 77141 after the *trap* action completes shall be the value it had before *trap* was invoked.

77142 The condition can be EXIT, 0 (equivalent to EXIT), or a signal specified using a symbolic name,  
 77143 without the SIG prefix, as listed in the tables of signal names in the `<signal.h>` header defined in  
 77144 XBD [Chapter 13](#); for example, HUP, INT, QUIT, TERM. Implementations may permit names  
 77145 with the SIG prefix or ignore case in signal names as an extension. Setting a trap for SIGKILL or  
 77146 SIGSTOP produces undefined results.

77147 The environment in which the shell executes a *trap* on EXIT shall be identical to the environment  
 77148 immediately after the last command executed before the *trap* on EXIT was taken.

77149 Each time *trap* is invoked, the *action* argument shall be processed in a manner equivalent to:

77150 eval *action*

77151 Signals that were ignored on entry to a non-interactive shell cannot be trapped or reset, although  
 77152 no error need be reported when attempting to do so. An interactive shell may reset or catch  
 77153 signals ignored on entry. Traps shall remain in place for a given shell until explicitly changed  
 77154 with another *trap* command.

77155 When a subshell is entered, traps that are not being ignored shall be set to the default actions,  
 77156 except in the case of a command substitution containing only a single *trap* command, when the  
 77157 traps need not be altered. Implementations may check for this case using only lexical analysis;  
 77158 for example, if `'trap'` and `$( trap -- )` do not alter the traps in the subshell, cases such as  
 77159 assigning `var=trap` and then using `$( $var )` may still alter them. This does not imply that the  
 77160 *trap* command cannot be used within the subshell to set new traps.

77161 The *trap* command with no operands shall write to standard output a list of commands  
 77162 associated with each condition. If the command is executed in a subshell, the implementation  
 77163 does not perform the optional check described above for a command substitution containing  
 77164 only a single *trap* command, and no *trap* commands with operands have been executed since  
 77165 entry to the subshell, the list shall contain the commands that were associated with each  
 77166 condition immediately before the subshell environment was entered. Otherwise, the list shall  
 77167 contain the commands currently associated with each condition. The format shall be:

77168 "trap -- %s %s ...\n", *<action>*, *<condition>* ...

77169 The shell shall format the output, including the proper use of quoting, so that it is suitable for  
 77170 reinput to the shell as commands that achieve the same trapping results. For example:

77171 save\_traps=\$(trap)

77172 ...

77173 eval "\$save\_traps"

77174 XSI XSI-conformant systems also allow numeric signal numbers for the conditions corresponding to  
 77175 the following signal names:

|       |    |         |
|-------|----|---------|
| 77176 | 1  | SIGHUP  |
| 77177 | 2  | SIGINT  |
| 77178 | 3  | SIGQUIT |
| 77179 | 6  | SIGABRT |
| 77180 | 9  | SIGKILL |
| 77181 | 14 | SIGALRM |
| 77182 | 15 | SIGTERM |

77183 The *trap* special built-in shall conform to XBD [Section 12.2](#).

#### 77184 OPTIONS

77185 None.

#### 77186 OPERANDS

77187 See the DESCRIPTION.

#### 77188 STDIN

77189 Not used.

#### 77190 INPUT FILES

77191 None.

#### 77192 ENVIRONMENT VARIABLES

77193 None.

#### 77194 ASYNCHRONOUS EVENTS

77195 Default.

#### 77196 STDOUT

77197 See the DESCRIPTION.

#### 77198 STDERR

77199 The standard error shall be used only for diagnostic messages.

#### 77200 OUTPUT FILES

77201 None.

#### 77202 EXTENDED DESCRIPTION

77203 None.

#### 77204 EXIT STATUS

77205 XSI If the trap name **or number** is invalid, a non-zero exit status shall be returned; otherwise, zero  
 77206 XSI shall be returned. For both interactive and non-interactive shells, invalid signal names **or**  
 77207 **numbers** shall not be considered a syntax error and do not cause the shell to abort.

#### 77208 CONSEQUENCES OF ERRORS

77209 Default.

**APPLICATION USAGE**

None.

**EXAMPLES**

Write out a list of all traps and actions:

```
trap
```

Set a trap so the *logout* utility in the directory referred to by the *HOME* environment variable executes when the shell terminates:

```
trap "$HOME"/logout EXIT
```

or:

```
trap "$HOME"/logout 0
```

Unset traps on INT, QUIT, TERM, and EXIT:

```
trap - INT QUIT TERM EXIT
```

**RATIONALE**

Implementations may permit lowercase signal names as an extension. Implementations may also accept the names with the SIG prefix; no known historical shell does so. The *trap* and *kill* utilities in this volume of POSIX.1-2008 are now consistent in their omission of the SIG prefix for signal names. Some *kill* implementations do not allow the prefix, and *kill -l* lists the signals without prefixes.

Trapping SIGKILL or SIGSTOP is syntactically accepted by some historical implementations, but it has no effect. Portable POSIX applications cannot attempt to trap these signals.

The output format is not historical practice. Since the output of historical *trap* commands is not portable (because numeric signal values are not portable) and had to change to become so, an opportunity was taken to format the output in a way that a shell script could use to save and then later reuse a trap if it wanted.

The KornShell uses an **ERR** trap that is triggered whenever *set -e* would cause an exit. This is allowable as an extension, but was not mandated, as other shells have not used it.

The text about the environment for the EXIT trap invalidates the behavior of some historical versions of interactive shells which, for example, close the standard input before executing a trap on 0. For example, in some historical interactive shell sessions the following trap on 0 would always print "--":

```
trap 'read foo; echo "--$foo--"' 0
```

The command:

```
trap 'eval "$cmd"' 0
```

causes the contents of the shell variable *cmd* to be executed as a command when the shell exits. Using:

```
trap '$cmd' 0
```

does not work correctly if *cmd* contains any special characters such as quoting or redirections. Using:

```
trap "$cmd" 0
```

also works (the leading <space> character protects against unlikely cases where *cmd* is a decimal integer or begins with '-'), but it expands the *cmd* variable when the *trap* command is executed,

77251 not when the exit action is executed.

## 77252 FUTURE DIRECTIONS

77253 None.

77256 XBD [Section 12.2, <signal.h>](#)

## 77257 CHANGE HISTORY

### 77258 Issue 6

77259 XSI-conforming implementations provide the mapping of signal names to numbers given above  
77260 (previously this had been marked obsolescent). Other implementations need not provide this  
77261 optional mapping.

77262 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
77263 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
77264 behavior is intended.

### 77265 Issue 7

77266 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

77267 Austin Group Interpretation 1003.1-2001 #116 is applied.

77268 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0052 [53,268,440],  
77269 XCU/TC1-2008/0053 [53,268,440], XCU/TC1-2008/0054 [163], XCU/TC1-2008/0055 [163], and  
77270 XCU/TC1-2008/0056 [163] are applied.

77271 **NAME**

77272       unset — unset values and attributes of variables and functions

77273 **SYNOPSIS**77274       unset [-fv] *name*...77275 **DESCRIPTION**77276       Each variable or function specified by *name* shall be unset.77277       If **-v** is specified, *name* refers to a variable name and the shell shall unset it and remove it from  
77278       the environment. Read-only variables cannot be unset.77279       If **-f** is specified, *name* refers to a function and the shell shall unset the function definition.77280       If neither **-f** nor **-v** is specified, *name* refers to a variable; if a variable by that name does not  
77281       exist, it is unspecified whether a function by that name, if any, shall be unset.77282       Unsetting a variable or function that was not previously set shall not be considered an error and  
77283       does not cause the shell to abort.77284       The *unset* special built-in shall support XBD [Section 12.2](#).

77285       Note that:

77286       VARIABLE=

77287       is not equivalent to an *unset* of **VARIABLE**; in the example, **VARIABLE** is set to " ". Also, the  
77288       variables that can be *unset* should not be misinterpreted to include the special parameters (see  
77289       [Section 2.5.2](#)).77290 **OPTIONS**

77291       See the DESCRIPTION.

77292 **OPERANDS**

77293       See the DESCRIPTION.

77294 **STDIN**

77295       Not used.

77296 **INPUT FILES**

77297       None.

77298 **ENVIRONMENT VARIABLES**

77299       None.

77300 **ASYNCHRONOUS EVENTS**

77301       Default.

77302 **STDOUT**

77303       Not used.

77304 **STDERR**

77305       The standard error shall be used only for diagnostic messages.

77306 **OUTPUT FILES**

77307       None.

77308 **EXTENDED DESCRIPTION**

77309       None.

77310 **EXIT STATUS**

77311           0   All *name* operands were successfully unset.

77312           >0   At least one *name* could not be unset.

77313 **CONSEQUENCES OF ERRORS**

77314           Default.

77315 **APPLICATION USAGE**

77316           None.

77317 **EXAMPLES**

77318           Unset *VISUAL* variable:

77319           unset -v VISUAL

77320           Unset the functions **foo** and **bar**:

77321           unset -f foo bar

77322 **RATIONALE**

77323           Consideration was given to omitting the **-f** option in favor of an *unfunction* utility, but the  
77324           standard developers decided to retain historical practice.

77325           The **-v** option was introduced because System V historically used one name space for both  
77326           variables and functions. When *unset* is used without options, System V historically unset either a  
77327           function or a variable, and there was no confusion about which one was intended. A portable  
77328           POSIX application can use *unset* without an option to unset a variable, but not a function; the **-f**  
77329           option must be used.

77330 **FUTURE DIRECTIONS**

77331           None.

77335 **CHANGE HISTORY**

77336 **Issue 6**

77337           IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
77338           sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
77339           behavior is intended.

77340 **Issue 7**

77341           SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

# Batch Environment Services

This chapter describes the services and utilities that shall be implemented on all systems that claim conformance to the Batch Environment Services and Utilities option. The functionality described in this section shall be provided on implementations that support the Batch Environment Services and Utilities option (and the rest of this section is not further shaded for this option).

Note that the Batch Environment Services and Utilities option is marked obsolescent in Issue 7.

## 3.1 General Concepts

### 3.1.1 Batch Client-Server Interaction

Batch jobs are created and managed by batch servers. A batch client interacts with a batch server to access batch services on behalf of the user. In order to use batch services, a user must have access to a batch client.

A batch server is a computational entity, such as a daemon process, that provides batch services. Batch servers route, queue, modify, and execute batch jobs on behalf of batch clients.

The batch utilities described in this volume of POSIX.1-2008 (and listed in Table 3-1) are clients of batch services; they allow users to perform actions on the job such as creating, modifying, and deleting batch jobs from a shell command line. Although these batch utilities may be said to accomplish certain services, they actually obtain services on behalf of a user by means of requests to batch servers.

Table 3-1 Batch Utilities

|               |               |                |              |
|---------------|---------------|----------------|--------------|
| <i>qalter</i> | <i>qmove</i>  | <i>qrls</i>    | <i>qstat</i> |
| <i>qdel</i>   | <i>qmsg</i>   | <i>qselect</i> | <i>qsub</i>  |
| <i>qhold</i>  | <i>qrerun</i> | <i>qsig</i>    |              |

Client-server interaction takes place by means of the batch requests defined in this chapter. Because direct access to batch jobs and queues is limited to batch servers, clients and servers of different implementations can interoperate, since dependencies on private structures for batch jobs and queues are limited to batch servers. Also, batch servers may be clients of other batch servers.

### 3.1.2 Batch Queues

Two types of batch queue are described: routing queues and execution queues. When a batch job is placed in a routing queue, it is a candidate for routing. A batch job is removed from routing queues under the following conditions:

- The batch job has been routed to another queue.
- The batch job has been deleted from the batch queue.
- The batch job has been aborted.

When a batch job is placed in an execution queue, it is a candidate for execution.

A batch job is removed from an execution queue under the following conditions:

- The batch job has been executed and exited.
- The batch job has been aborted.
- The batch job has been deleted from the batch queue.
- The batch job has been moved to another queue.

Access to a batch queue is limited to the batch server that manages the batch queue. Clients never access a batch queue or a batch job directly, either to read or write information; all client access to batch queues or jobs takes place through batch servers.

### 3.1.3 Batch Job Creation

When a batch server creates a batch job on behalf of a client, it shall assign a batch job identifier to the job. A batch job identifier consists of both a sequence number that is unique among the sequence numbers issued by that server and the name of the server. Since the batch server name is unique within a name space, the job identifier is likewise unique within the name space.

The batch server that creates a batch job shall return the batch server-assigned job identifier to the client that requested the job creation. If the batch server routes or moves the job to another server, it sends the job identifier with the job. Once assigned, the job identifier of a batch job shall never change.

### 3.1.4 Batch Job Tracking

Since a batch job may be moved after creation, the batch server name component of the job identifier need not indicate the location of the job. An implementation may provide a batch job tracking mechanism, in which case the user generally does not need to know the location of the job. However, an implementation need not provide a batch job tracking mechanism, in which case the user must find routed jobs by probing the possible destinations.

**3.1.5 Batch Job Routing**

To route a batch job, a batch server either moves the job to some other queue that is managed by the batch server, or requests that some other batch server accept the job.

Each routing queue has one or more queues to which it can route batch jobs. The batch server administrator creates routing queues.

A batch server may route a batch job from a routing queue to another routing queue. Batch servers shall prevent or otherwise handle cases of circular routing paths. As a deferred service, a batch server routes jobs from the routing queues that it manages. The algorithm by which a batch server selects a batch queue to which to route a batch job is implementation-defined.

A batch job need not be eligible for routing to all the batch queues fed by the routing queue from which it is routed. A batch server that has been asked to accept the job may reject the request if the job requires resources that are unavailable to that batch server, or if the client is not authorized to access the batch server.

Batch servers may route high-priority jobs before low-priority jobs, but, on other than overloaded systems, the effect may be imperceptible to the user. If all the batch servers fed by a routing queue reject requests to accept the job for reasons that are permanent, the batch server that manages the job shall abort the job. If all or some rejections are temporary, the batch server should try to route the job again at some later point.

The reasons for rejecting a batch job are implementation-defined.

The reasons for which the routing should be retried later and the reasons for which the job should be aborted are also implementation-defined.

**3.1.6 Batch Job Execution**

To execute a batch job is to create a session leader (a process) that runs the shell program indicated by the *Shell\_Path* attribute of the job. The script shall be passed to the program as its standard input. An implementation may pass the script to the program by other implementation-defined means. At the time a batch job begins execution, it is defined to enter the RUNNING state. The primary program that is executed by a batch job is typically, though not necessarily, a shell program.

A batch server shall execute eligible jobs as a deferred service—no client request is necessary once the batch job is created and eligible. However, the attributes of a batch job, such as the job hold type, may render the job ineligible. A batch server shall scan the execution queues that it manages for jobs that are eligible for execution. The algorithm by which the batch server selects eligible jobs for execution is implementation-defined.

As part of creating the process for the batch job, the batch server shall open the standard output and standard error streams of the session.

The attributes of a batch job may indicate that the batch server executing the job shall send mail to a list of users at the time it begins execution of the job.

### 77439 3.1.7 Batch Job Exit

77440 When the session leader of an executing job terminates, the job exits. As part of exiting a batch  
77441 job, the batch server that manages the job shall remove the job from the batch queue in which it  
77442 resides. The server shall transfer output files of the job to a location described by the attributes of  
77443 the job.

77444 The attributes of a batch job may indicate that the batch server managing the job shall send mail  
77445 to a list of users at the time the job exits.

### 77446 3.1.8 Batch Job Abort

77447 A batch server shall abort jobs for which a required deferred service cannot be performed. The  
77448 attributes of a batch job may indicate that the batch server that aborts the job shall send mail to a  
77449 list of users at the time it aborts the job.

### 77450 3.1.9 Batch Authorization

77451 Clients, such as the batch environment utilities (marked BE), access batch services by means of  
77452 requests to one or more batch servers. To acquire the services of any given batch server, the user  
77453 identifier under which the client runs must be authorized to use that batch server.

77454 The user with an associated user name that creates a batch job shall own the job and can perform  
77455 actions such as read, modify, delete, and move.

77456 A user identifier of the same value at a different host need not be the same user. For example,  
77457 user name *smith* at host **alpha** may or may not represent the same person as user name *smith* at  
77458 host **beta**. Likewise, the same person may have access to different user names on different hosts.

77459 An implementation may optionally provide an authorization mechanism that permits one user  
77460 name to access jobs under another user name.

77461 A process on a client host may be authorized to run processes under multiple user names at a  
77462 batch server host. Where appropriate, the utilities defined in this volume of POSIX.1-2008  
77463 provide a means for a user to choose from among such user names when creating or modifying  
77464 a batch job.

### 77465 3.1.10 Batch Administration

77466 The processing of a batch job by a batch server is affected by the attributes of the job. The  
77467 processing of a batch job may also be affected by the attributes of the batch queue in which the  
77468 job resides and by the status of the batch server that manages the job. See also XBD [Chapter 3](#)  
77469 (on page 33) for batch definitions.

**3.1.11 Batch Notification**

Whereas batch servers are persistent entities, clients are often transient. For example, the *qsub* utility creates a batch job and exits. For this reason, batch servers notify users of batch job events by sending mail to the user that owns the job, or to other designated users.

**3.2 Batch Services**

The presence of Batch Environment Services and Utilities option services is indicated by the configuration variable `POSIX2_PBS`. A conforming batch server provides services as defined in this section.

A batch server shall provide batch services in two ways:

1. The batch server provides a service at the request of a client.
2. The batch server provides a deferred service as a result of a change in conditions monitored by the batch server.

If a batch server cannot complete a request, it shall reject the request. If a batch server cannot complete a deferred service for a batch job, the batch server shall abort the batch job. [Table 3-2](#) is a summary of environment variables that shall be supported by an implementation of the batch server and utilities.

**Table 3-2** Environment Variable Summary

| Variable                     | Description                                                                       |
|------------------------------|-----------------------------------------------------------------------------------|
| <code>PBS_DPREFIX</code>     | Defines the directive prefix (see <a href="#">qsub</a> )                          |
| <code>PBS_ENVIRONMENT</code> | Batch Job is batch or interactive (see <a href="#">Section 3.2.2.1</a> )          |
| <code>PBS_JOBID</code>       | The <i>job_identifier</i> attribute of job (see <a href="#">Section 3.2.3.8</a> ) |
| <code>PBS_JOBNAME</code>     | The <i>job_name</i> attribute of job (see <a href="#">Section 3.2.3.8</a> )       |
| <code>PBS_O_HOME</code>      | Defines the <i>HOME</i> of the batch client (see <a href="#">qsub</a> )           |
| <code>PBS_O_HOST</code>      | Defines the host name of the batch client (see <a href="#">qsub</a> )             |
| <code>PBS_O_LANG</code>      | Defines the <i>LANG</i> of the batch client (see <a href="#">qsub</a> )           |
| <code>PBS_O_LOGNAME</code>   | Defines the <i>LOGNAME</i> of the batch client (see <a href="#">qsub</a> )        |
| <code>PBS_O_MAIL</code>      | Defines the <i>MAIL</i> of the batch client (see <a href="#">qsub</a> )           |
| <code>PBS_O_PATH</code>      | Defines the <i>PATH</i> of the batch client (see <a href="#">qsub</a> )           |
| <code>PBS_O_QUEUE</code>     | Defines the submit queue of the batch client (see <a href="#">qsub</a> )          |
| <code>PBS_O_SHELL</code>     | Defines the <i>SHELL</i> of the batch client (see <a href="#">qsub</a> )          |
| <code>PBS_O_TZ</code>        | Defines the <i>TZ</i> of the batch client (see <a href="#">qsub</a> )             |
| <code>PBS_O_WORKDIR</code>   | Defines the working directory of the batch client (see <a href="#">qsub</a> )     |
| <code>PBS_QUEUE</code>       | Defines the initial execution queue (see <a href="#">Section 3.2.2.1</a> )        |

### 3.2.1 Batch Job States

A batch job shall always be in one of the following states: QUEUED, RUNNING, HELD, WAITING, EXITING, or TRANSITING. The state of a batch job determines the types of requests that the batch server that manages the batch job can accept for the batch job. A batch server shall change the state of a batch job either in response to service requests from clients or as a result of deferred services, such as job execution or job routing.

A batch job that is in the QUEUED state resides in a queue but is still pending either execution or routing, depending on the queue type.

A batch server that queues a batch job in a routing queue shall put the batch job in the QUEUED state. A batch server that puts a batch job in an execution queue, but has not yet executed the batch job, shall put the batch job in the QUEUED state. A batch job that resides in an execution queue and is executing is defined to be in the RUNNING state. While a batch job is in the RUNNING state, a session leader is associated with the batch job.

A batch job that resides in an execution queue, but is ineligible to run because of a hold attribute, is defined to be in the HELD state.

A batch job that is not held, but must wait until a future date and time before executing, is defined to be in the WAITING state.

When the session leader associated with a running job exits, the batch job shall be placed in the EXITING state.

A batch job for which the session leader has terminated is defined to be in the EXITING state, and the batch server that manages such a batch job cannot accept job modification requests that affect the batch job. While a batch job is in the EXITING state, the batch server that manages the batch job is staging output files and notifying clients of job completion. Once a batch job has exited, it no longer exists as an object managed by a batch server.

A batch job that is being moved from a routing queue to another queue is defined to be in the TRANSITING state.

When a batch job in a routing queue has been selected to be moved to a new destination, then the batch job shall be in either the QUEUED state or the TRANSITING state, depending on the batch server implementation.

Batch jobs with either an *Execution\_Time* attribute value set in the future or a *Hold\_Types* attribute of value not equal to NO\_HOLD, or both, may be routed or held in the routing queue. The treatment of jobs with the *Execution\_Time* or *Hold\_Types* attributes in a routing queue is implementation-defined.

When a batch job in a routing queue has not been selected to be moved to a new destination and the batch job has a *Hold\_Types* attribute value of other than NO\_HOLD, then the job should be in the HELD state.

**Note:** The effect of a hold upon a batch job in a routing queue is implementation-defined. The implementation should use the state that matches whether the batch job can route with a hold or not.

When a batch job in a routing queue has not been selected to be moved to a new destination and the batch job has:

- A *Hold\_Types* attribute value of NO\_HOLD
- An *Execution\_Time* attribute in the past

then the batch job shall be in the QUEUED state.

When a batch job in a routing queue has not been selected to be moved to a new destination and the batch job has:

- A *Hold\_Types* attribute value of NO\_HOLD
- An *Execution\_Time* attribute in the future

then the batch job may be in the WAITING state.

**Note:** The effect of a future execution time upon a batch job in a routing queue is implementation-defined. The implementation should use the state that matches whether the batch job can route with a hold or not.

Table 3-3 describes the next state of a batch job, given the current state of the batch job and the type of request. Table 3-4 (on page 2425) describes the response of a batch server to a request, given the current state of the batch job and the type of request.

### 3.2.2 Deferred Batch Services

This section describes the deferred services performed by batch servers: job execution, job routing, job exit, job abort, and the rerunning of jobs after a restart.

#### 3.2.2.1 Batch Job Execution

To execute a batch job is to create a session leader (a process) that runs the shell program indicated by the *Shell\_Path\_List* attribute of the batch job. The script is passed to the program as its standard input. An implementation may pass the script to the program by other implementation-defined means. At the time a batch job begins execution, it is defined to enter the RUNNING state.

Table 3-3 Next State Table

| Request Type               | Current State |   |     |       |   |   |   |
|----------------------------|---------------|---|-----|-------|---|---|---|
|                            | X             | Q | R   | H     | W | E | T |
| Queue Batch Job Request    | Q             | e | e   | e     | e | e | e |
| Modify Batch Job Request   | e             | Q | R   | H     | W | e | T |
| Delete Batch Job Request   | e             | X | E   | X     | X | E | X |
| Batch Job Message Request  | e             | Q | R   | H     | W | E | T |
| Rerun Batch Job Request    | e             | e | Q   | e     | e | e | e |
| Signal Batch Job Request   | e             | e | R   | H     | W | e | e |

| Batch Queue Status Request | X             | Q | R   | H     | W | E | T |
| Server Status Request      | X             | Q | R   | H     | W | E | T |
| Select Batch Jobs Request  | X             | Q | R   | H     | W | E | T |
| Move Batch Job Request     | e             | Q | R   | H     | W | e | T |
| Hold Batch Job Request     | e             | H | R/H | H     | H | e | T |
| Release Batch Job Request  | e             | Q | R   | Q/W/H | W | e | T |
| Server Shutdown Request    | X             | Q | Q   | H     | W | E | T |
| Locate Batch Job Request   | e             | Q | R   | H     | W | E | T |

77585      **Legend**

77586      X    Nonexistent

77587      Q    QUEUED

77588      R    RUNNING

77589      H    HELD

77590      W    WAITING

77591      E    EXITING

77592      T    TRANSITING

77593      e    Error

77594      A batch server that has an execution queue containing jobs is said to own the queue and manage  
 77595      the batch jobs in that queue. A batch server that has been started shall execute the batch jobs in  
 77596      the execution queues owned by the batch server. The batch server shall schedule for execution  
 77597      those jobs in the execution queues that are in the QUEUED state. The algorithm for scheduling  
 77598      jobs is implementation-defined.

77599      A batch server that executes a batch job shall create, in the environment of the session leader of  
 77600      the batch job, an environment variable named *PBS\_ENVIRONMENT*, the value of which is the  
 77601      string PBS\_BATCH encoded in the portable character set.

77602      A batch server that executes a batch job shall create, in the environment of the session leader of  
 77603      the batch job, an environment variable named *PBS\_QUEUE*, the value of which is the name of  
 77604      the execution queue of the batch job encoded in the portable character set.

77605      To rerun a batch job is to requeue a batch job that is currently executing and then kill the session  
 77606      leader of the executing job by sending a SIGKILL prior to completion; see [Section 3.2.3.11](#) (on  
 77607      page 2437). A batch server that reruns a batch job shall append the standard output and  
 77608      standard error files of the batch job to the corresponding files of the previous execution, if they  
 77609      exist, with appropriate annotation. If either file does not exist, that file shall be created as in  
 77610      normal execution.

Table 3-4 Results/Output Table

| Request Type               | Current State |   |   |   |   |   |   |
|----------------------------|---------------|---|---|---|---|---|---|
|                            | X             | Q | R | H | W | E | T |
| Queue Batch Job Request    | O             | e | e | e | e | e | e |

**Legend**

O OK

e Error message

The execution of a batch job by a batch server shall be controlled by job, queue, and server attributes, as defined in this section.

**Account\_Name Attribute**

Batch accounting is an optional feature of batch servers. If a batch server implements accounting, the statements in this section apply and the configuration variable POSIX2\_PBS\_ACCOUNTING shall be set to 1.

A batch server that executes a batch job shall charge the account named in the *Account\_Name* attribute of the batch job for resources consumed by the batch job.

If the *Account\_Name* attribute of the batch job is absent from the batch job attribute list or is altered while the batch job is in execution, the batch server action is implementation-defined.

**Checkpoint Attribute**

Batch checkpointing is an optional feature of batch servers. If a batch server implements checkpointing, the statements in this section apply and the configuration variable POSIX2\_PBS\_CHECKPOINT shall be set to 1.

There are two attributes associated with the checkpointing feature: *Checkpoint* and *Minimum\_Cpu\_Interval*. *Checkpoint* is a batch job attribute, while *Minimum\_Cpu\_Interval* is a queue attribute. An implementation that does not support checkpointing shall support the *Checkpoint* job attribute to the extent that the batch server shall maintain and pass this attribute to other servers.

The behavior of a batch server that executes a batch job for which the value of the *Checkpoint* attribute is CHECKPOINT\_UNSPECIFIED is implementation-defined. A batch server that executes a batch job for which the value of the *Checkpoint* attribute is NO\_CHECKPOINT shall

77654 not checkpoint the batch job.

77655 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is  
77656 CHECKPOINT\_AT\_SHUTDOWN shall checkpoint the batch job only when the batch server  
77657 accepts a request to shut down during the time when the batch job is in the RUNNING state.

77658 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is  
77659 CHECKPOINT\_AT\_MIN\_CPU\_INTERVAL shall checkpoint the batch job at the interval  
77660 specified by the *Minimum\_Cpu\_Interval* attribute of the queue for which the batch job has been  
77661 selected. The *Minimum\_Cpu\_Interval* attribute shall be specified in units of CPU minutes.

77662 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is an  
77663 unsigned integer shall checkpoint the batch job at an interval that is the value of either the  
77664 *Checkpoint* attribute, or the *Minimum\_Cpu\_Interval* attribute of the queue for which the batch job  
77665 has been selected, whichever is greater. Both intervals shall be in units of CPU minutes. When  
77666 the *Minimum\_Cpu\_Interval* attribute is greater than the *Checkpoint* attribute, the batch job shall  
77667 write a warning message to the standard error stream of the batch job.

#### 77668 **Error\_Path Attribute**

77669 The *Error\_Path* attribute of a running job cannot be changed by a *Modify Batch Job Request*. When  
77670 the *Join\_Path* attribute of the batch job is set to the value FALSE and the *Keep\_Files* attribute of  
77671 the batch job does not contain the value KEEP\_STD\_ERROR, a batch server that executes a batch  
77672 job shall perform one of the following actions:

- 77673 • Set the standard error stream of the session leader of the batch job to the path described by  
77674 the value of the *Error\_Path* attribute of the batch job.
- 77675 • Buffer the standard error of the session leader of the batch job until completion of the batch  
77676 job, and when the batch job exits return the contents to the destination described by the  
77677 value of the *Error\_Path* attribute of the batch job.

77678 Applications shall not rely on having access to the standard error of a batch job prior to the  
77679 completion of the batch job.

77680 When the *Error\_Path* attribute does not specify a host name, then the batch server shall retain the  
77681 standard error of the batch job on the host of execution.

77682 When the *Error\_Path* attribute does specify a host name and the *Keep\_Files* attribute does not  
77683 contain the value KEEP\_STD\_ERROR, then the final destination of the standard error of the  
77684 batch job shall be on the host whose host name is specified.

77685 If the path indicated by the value of the *Error\_Path* attribute of the batch job is a relative path, the  
77686 batch server shall expand the path relative to the home directory of the user on the host to which  
77687 the file is being returned.

77688 When the batch server buffers the standard error of the batch job and the file cannot be opened  
77689 for write upon completion of the batch job, then the server shall place the standard error in an  
77690 implementation-defined location and notify the user of the location via mail. It shall be possible  
77691 for the user to process this mail using the *mailx* utility.

77692 If a batch server that does not buffer the standard error cannot open the standard error path of  
77693 the batch job for write access, then the batch server shall abort the batch job.

**Execution\_Time Attribute**

A batch server shall not execute a batch job before the time represented by the value of the *Execution\_Time* attribute of the batch job. The *Execution\_Time* attribute is defined in seconds since the Epoch.

**Hold\_Types Attribute**

A batch server shall support the following hold types:

- s Can be set or released by a user with at least a privilege level of batch administrator (SYSTEM).
- o Can be set or released by a user with at least a privilege level of batch operator (OPERATOR).
- u Can be set or released by the user with at least a privilege level of user, where the user is defined in the *Job\_Owner* attribute (USER).
- n Indicates that none of the *Hold\_Types* attributes are set (NO\_HOLD).

An implementation may define other hold types. Any additional hold types, how they are specified, their internal representation, their behavior, and how they affect the behavior of other utilities are implementation-defined.

The value of the *Hold\_Types* attribute shall be the union of the valid hold types ('s', 'o', 'u', and any implementation-defined hold types), or 'n'.

A batch server shall not execute a batch job if the *Hold\_Types* attribute of the batch job has a value other than NO\_HOLD. If the *Hold\_Types* attribute of the batch job has a value other than NO\_HOLD, the batch job shall be in the HELD state.

**Job\_Owner Attribute**

The *Job\_Owner* attribute consists of a pair of user name and host name values of the form:

username@hostname

A batch server that accepts a *Queue Batch Job Request* shall set the *Job\_Owner* attribute to a string that is the *username@hostname* of the user who submitted the job.

**Join\_Path Attribute**

A batch server that executes a batch job for which the value of the *Join\_Path* attribute is TRUE shall ignore the value of the *Error\_Path* attribute and merge the standard error of the batch job with the standard output of the batch job.

**Keep\_Files Attribute**

A batch server that executes a batch job for which the value of the *Keep\_Files* attribute includes the value KEEP\_STD\_OUTPUT shall retain the standard output of the batch job on the host where execution occurs. The standard output shall be retained in the home directory of the user under whose user ID the batch job is executed and the filename shall be the default filename for the standard output as defined under the *-o* option of the *qsub* utility. The *Output\_Path* attribute is not modified.

A batch server that executes a batch job for which the value of the *Keep\_Files* attribute includes the value KEEP\_STD\_ERROR shall retain the standard error of the batch job on the host where execution occurs. The standard error shall be retained in the home directory of the user under whose user ID the batch job is executed and the filename shall be the default filename for

standard error as defined under the `-e` option of the *qsub* utility. The *Error\_Path* attribute is not modified.

A batch server that executes a batch job for which the value of the *Keep\_Files* attribute includes values other than `KEEP_STD_OUTPUT` and `KEEP_STD_ERROR` shall retain these other files on the host where execution occurs. These files (with implementation-defined names) shall be retained in the home directory of the user under whose user identifier the batch job is executed.

#### Mail\_Points and Mail\_Users Attributes

A batch server that executes a batch job for which one of the values of the *Mail\_Points* attribute is the value `MAIL_AT_BEGINNING` shall send a mail message to each user account listed in the *Mail\_Users* attribute of the batch job.

The mail message shall contain at least the batch job identifier, queue, and server at which the batch job currently resides, and the *Job\_Owner* attribute.

#### Output\_Path Attribute

The *Output\_Path* attribute of a running job cannot be changed by a *Modify Batch Job Request*. When the *Keep\_Files* attribute of the batch job does not contain the value `KEEP_STD_OUTPUT`, a batch server that executes a batch job shall either:

- Set the standard output stream of the session leader of the batch job to the destination described by the value of the *Output\_Path* attribute of the batch job.

or:

- Buffer the standard output of the session leader of the batch job until completion of the batch job, and when the batch job exits return the contents to the destination described by the value of the *Output\_Path* attribute of the batch job.

When the *Output\_Path* attribute does not specify a host name, then the batch server shall retain the standard output of the batch job on the host of execution.

When the *Keep\_Files* attribute does not contain the value `KEEP_STD_OUTPUT` and the *Output\_Path* attribute does specify a host name, then the final destination of the standard output of the batch job shall be on the host specified.

If the path specified in the *Output\_Path* attribute of the batch job is a relative path, the batch server shall expand the path relative to the home directory of the user on the host to which the file is being returned.

Whether or not the batch server buffers the standard output of the batch job until completion of the batch job is implementation-defined. Applications shall not rely on having access to the standard output of a batch job prior to the completion of the batch job.

When the batch server does buffer the standard output of the batch job and the file cannot be opened for write upon completion of the batch job, then the batch server shall place the standard output in an implementation-defined location and notify the user of the location via mail. It shall be possible for the user to process this mail using the *mailx* utility.

If a batch server that does not buffer the standard output cannot open the standard output path of the batch job for write access, then the batch server shall abort the batch job.

**Priority Attribute**

A batch server implementation may choose to preferentially execute a batch job based on the *Priority* attribute. The interpretation of the batch job *Priority* attribute by a batch server is implementation-defined. If an implementation uses the *Priority* attribute, it shall interpret larger values of the *Priority* attribute to mean the batch job shall be preferentially selected for execution.

**Rerunable Attribute**

A batch job that began execution but did not complete, because the batch server either shut down or terminated abnormally, shall be requeued if the *Rerunable* attribute of the batch job has the value TRUE.

If a batch job, which was requeued after beginning execution but prior to completion, has a valid checkpoint file and the batch server supports checkpointing, then the batch job shall be restarted from the last valid checkpoint.

If the batch job cannot be restarted from a checkpoint, then when a batch job has a *Rerunable* attribute value of TRUE and was requeued after beginning execution but prior to completion, the batch server shall place the batch job into execution at the beginning of the job.

When a batch job has a *Rerunable* attribute value other than TRUE and was requeued after beginning execution but prior to completion, and the batch job cannot be restarted from a checkpoint, then the batch server shall abort the batch job.

**Resource\_List Attribute**

A batch server that executes a batch job shall establish the resource limits of the session leader of the batch job according to the values of the *Resource\_List* attribute of the batch job. Resource limits shall be enforced by an implementation-defined method.

**Shell\_Path\_List Attribute**

The *Shell\_Path\_List* job attribute consists of a list of pairs of pathname and host name values. The host name component can be omitted, in which case the pathname serves as the default pathname when a batch server cannot find the name of the host on which it is running in the list.

A batch server that executes a batch job shall select, from the value of the *Shell\_Path\_List* attribute of the batch job, a pathname where the shell to execute the batch job shall be found. The batch server shall select the pathname, in order of preference, according to the following methods:

- Select the pathname that contains the name of the host on which the batch server is running.
- Select the pathname for which the host name has been omitted.
- Select the pathname for the login shell of the user under which the batch job is to execute.

If the shell path value selected is an invalid pathname, the batch server shall abort the batch job.

If the value of the selected pathname from the *Shell\_Path\_List* attribute of the batch job represents a partial path, the batch server shall expand the path relative to a path that is implementation-defined.

The batch server that executes the batch job shall execute the program that was selected from the *Shell\_Path\_List* attribute of the batch job. The batch server shall pass the path to the script of the batch job as the first argument to the shell program.

**User\_List Attribute**

The *User\_List* job attribute consists of a list of pairs of user name and host name values. The host name component can be omitted, in which case the user name serves as a default when a batch server cannot find the name of the host on which it is running in the list.

A batch server that executes a batch job shall select, from the value of the *User\_List* attribute of the batch job, a user name under which to create the session leader. The server shall select the user name, in order of preference, according to the following methods:

- Select the user name of a value that contains the name of the host on which the batch server executes.
- Select the user name of a value for which the host name has been omitted.
- Select the user name from the *Job\_Owner* attribute of the batch job.

**Variable\_List Attribute**

A batch server that executes a batch job shall create, in the environment of the session leader of the batch job, each environment variable listed in the *Variable\_List* attribute of the batch job, and set the value of each such environment variable to that of the corresponding variable in the variable list.

**3.2.2.2 Batch Job Routing**

To route a batch job is to select a queue from a list and move the batch job to that queue.

A batch server that has routing queues, which have been started, shall route the jobs in the routing queues owned by the batch server. A batch server may delay the routing of a batch job. The algorithm for selecting a batch job and the queue to which it will be routed is implementation-defined.

When a routing queue has multiple possible destinations specified, then the precedence of the destinations is implementation-defined.

A batch server that routes a batch job to a queue at another server shall move the batch job into the target queue with a *Queue Batch Job Request*.

If the target server rejects the *Queue Batch Job Request*, the routing server shall retry routing the batch job or abort the batch job. A batch server that retries failed routings shall provide a means for the batch administrator to specify the number of retries and the minimum period of time between retries. The means by which an administrator specifies the number of retries and the delay between retries is implementation-defined. When the number of retries specified by the batch administrator has been exhausted, the batch server shall abort the batch job and perform the functions of *Batch Job Exit*; see [Section 3.2.2.3](#).

**3.2.2.3 Batch Job Exit**

For each job in the EXITING state, the batch server that exited the batch job shall perform the following deferred services in the order specified:

1. If buffering standard error, move that file into the location specified by the *Error\_Path* attribute of the batch job.
2. If buffering standard output, move that file into the location specified by the *Output\_Path* attribute of the batch job.

3. If the *Mail\_Points* attribute of the batch job includes MAIL\_AT\_EXIT, send mail to the users listed in the *Mail\_Users* attribute of the batch job. The mail message shall contain at least the batch job identifier, queue, and server at which the batch job currently resides, and the *Job\_Owner* attribute.

4. Remove the batch job from the queue.

If a batch server that buffers the standard error output cannot return the standard error file to the standard error path at the time the batch job exits, the batch server shall do one of the following:

- Mail the standard error file to the batch job owner.
- Save the standard error file and mail the location and name of the file where the standard error is stored to the batch job owner.
- Save the standard error file and notify the user by other implementation-defined means.

If a batch server that buffers the standard output cannot return the standard output file to the standard output path at the time the batch job exits, the batch server shall do one of the following:

- Mail the standard output file to the batch job owner.
- Save the standard output file and mail the location and name of the file where the standard output is stored to the batch job owner.
- Save the standard output file and notify the user by other implementation-defined means.

At the conclusion of job exit processing, the batch job is no longer managed by a batch server.

#### 3.2.2.4 Batch Server Restart

A batch server that has been either shutdown or terminated abnormally, and has returned to operation, is said to have “restarted”.

Upon restarting, a batch server shall requeue those jobs managed by the batch server that were in the RUNNING state at the time the batch server shut down and for which the *Rerunable* attribute of the batch job has the value TRUE.

Queues are defined to be non-volatile. A batch server shall store the content of queues that it controls in such a way that server and system shutdowns do not erase the content of the queues.

#### 3.2.2.5 Batch Job Abort

A batch server that cannot perform a deferred service for a batch job shall abort the batch job.

A batch server that aborts a batch job shall perform the following services:

- Delete the batch job from the queue in which it resides.
- If the *Mail\_Points* attribute of the batch job includes the value MAIL\_AT\_ABORT, send mail to the users listed in the value of the *Mail\_Users* attribute of the job. The mail message shall contain at least the batch job identifier, queue, and server at which the batch job currently resides, the *Job\_Owner* attribute, and the reason for the abort.
- If the batch job was in the RUNNING state, terminate the session leader of the executing job by sending the session leader a SIGKILL, place the batch job in the EXITING state, and perform the actions of *Batch Job Exit*.

### 3.2.3 Requested Batch Services

This section describes the services provided by batch servers in response to requests from clients. Table 3-5 summarizes the current set of batch service requests and for each gives its type (deferred or not) and whether it is an optional function.

**Table 3-5** Batch Services Summary

| Batch Service                     | Deferred | Optional |
|-----------------------------------|----------|----------|
| <i>Batch Job Execution</i>        | Yes      | No       |
| <i>Batch Job Routing</i>          | Yes      | No       |
| <i>Batch Job Exit</i>             | Yes      | No       |
| <i>Batch Server Restart</i>       | Yes      | No       |
| <i>Batch Job Abort</i>            | Yes      | No       |
| <i>Delete Batch Job Request</i>   | No       | No       |
| <i>Hold Batch Job Request</i>     | No       | No       |
| <i>Batch Job Message Request</i>  | No       | Yes      |
| <i>Batch Job Status Request</i>   | No       | No       |
| <i>Locate Batch Job Request</i>   | No       | Yes      |
| <i>Modify Batch Job Request</i>   | No       | No       |
| <i>Move Batch Job Request</i>     | No       | No       |
| <i>Queue Batch Job Request</i>    | No       | No       |
| <i>Batch Queue Status Request</i> | No       | No       |
| <i>Release Batch Job Request</i>  | No       | No       |
| <i>Rerun Batch Job Request</i>    | No       | No       |
| <i>Select Batch Jobs Request</i>  | No       | No       |
| <i>Server Shutdown Request</i>    | No       | No       |
| <i>Server Status Request</i>      | No       | No       |
| <i>Signal Batch Job Request</i>   | No       | No       |
| <i>Track Batch Job Request</i>    | No       | Yes      |

If a request is rejected because the batch client is not authorized to perform the action, the batch server shall return the same status as when the batch job does not exist.

#### 3.2.3.1 Delete Batch Job Request

A batch job is defined to have been deleted when it has been removed from the queue in which it resides and not instantiated in another queue. A client requests that the server that manages a batch job delete the batch job. Such a request is called a *Delete Batch Job Request*.

A batch server shall reject a *Delete Batch Job Request* if any of the following statements are true:

- The user of the batch client is not authorized to delete the designated job.
- The designated job is not managed by the batch server.
- The designated job is in a state inconsistent with the delete request.

A batch server may reject a *Delete Batch Job Request* for other implementation-defined reasons. The method used to determine whether the user of a client is authorized to perform the requested action is implementation-defined.

A batch server requested to delete a batch job shall delete the batch job if the batch job exists and is not in the EXITING state.

A batch server that deletes a batch job in the RUNNING state shall send a SIGKILL signal to the

77937 session leader of the batch job. It is implementation-defined whether additional signals are sent  
77938 to the session leader of the job prior to sending the SIGKILL signal.

77939 A batch server that deletes a batch job in the RUNNING state shall place the batch job in the  
77940 EXITING state after it has killed the session leader of the batch job and shall perform the actions  
77941 of *Batch Job Exit*.

#### 77942 3.2.3.2 *Hold Batch Job Request*

77943 A batch client can request that the batch server add one or more holds to a batch job. Such a  
77944 request is called a *Hold Batch Job Request*.

77945 A batch server shall reject a *Hold Batch Job Request* if any of the following statements are true:

- 77946 • The batch server does not support one or more of the requested holds to be added to the  
77947 batch job.
- 77948 • The user of the batch client is not authorized to add one or more of the requested holds to  
77949 the batch job.
- 77950 • The batch server does not manage the specified job.
- 77951 • The designated job is in the EXITING state.

77952 A batch server may reject a *Hold Batch Job Request* for other implementation-defined reasons. The  
77953 method used to determine whether the user of a client is authorized to perform the requested  
77954 action is implementation-defined.

77955 A batch server that accepts a *Hold Batch Job Request* for a batch job in the RUNNING state shall  
77956 place a hold on the batch job. The effects, if any, the hold will have on a batch job in the  
77957 RUNNING state are implementation-defined.

77958 A batch server that accepts a *Hold Batch Job Request* shall add each type of hold listed in the *Hold*  
77959 *Batch Job Request*, that is not already present, to the value of the *Hold\_Types* attribute of the batch  
77960 job.

#### 77961 3.2.3.3 *Batch Job Message Request*

77962 *Batch Job Message Request* is an optional feature of batch servers. If an implementation supports  
77963 *Batch Job Message Request*, the statements in this section apply and the configuration variable  
77964 POSIX2\_PBS\_MESSAGE shall be set to 1.

77965 A batch client can request that a batch server write a message into certain output files of a batch  
77966 job. Such a request is called a *Batch Job Message Request*.

77967 A batch server shall reject a *Batch Job Message Request* if any of the following statements are true:

- 77968 • The batch server does not support sending messages to jobs.
- 77969 • The user of the batch client is not authorized to post a message to the designated job.
- 77970 • The designated job does not exist on the batch server.
- 77971 • The designated job is not in the RUNNING state.

77972 A batch server may reject a *Batch Job Message Request* for other implementation-defined reasons.  
77973 The method used to determine whether the user of a client is authorized to perform the  
77974 requested action is implementation-defined.

77975 A batch server that accepts a *Batch Job Message Request* shall write the message sent by the batch  
77976 client into the files indicated by the batch client.

77977 3.2.3.4 *Batch Job Status Request*

77978 A batch client can request that a batch server respond with the status and attributes of a batch  
77979 job. Such a request is called a *Batch Job Status Request*.

77980 A batch server shall reject a *Batch Job Status Request* if any of the following statements are true:

- 77981 • The user of the batch client is not authorized to query the status of the designated job.
- 77982 • The designated job is not managed by the batch server.

77983 A batch server may reject a *Batch Job Status Request* for other implementation-defined reasons.  
77984 The method used to determine whether the user of a client is authorized to perform the  
77985 requested action is implementation-defined.

77986 A batch server that accepts a *Batch Job Status Request* shall return a *Batch Job Status Message* to the  
77987 batch client.

77988 A batch server may return other information in response to a *Batch Job Status Request*.

77989 3.2.3.5 *Locate Batch Job Request*

77990 *Locate Batch Job Request* is an optional feature of batch servers. If an implementation supports  
77991 *Locate Batch Job Request*, the statements in this section apply and the configuration variable  
77992 POSIX2\_PBS\_LOCATE shall be set to 1.

77993 A batch client can ask a batch server to respond with the location of a batch job that was created  
77994 by the batch server. Such a request is called a *Locate Batch Job Request*.

77995 A batch server that accepts a *Locate Batch Job Request* shall return a *Batch Job Location Message* to  
77996 the batch client.

77997 A batch server may reject a *Locate Batch Job Request* for a batch job that was not created by that  
77998 server.

77999 A batch server may reject a *Locate Batch Job Request* for a batch job that is no longer managed by  
78000 that server; that is, for a batch job that is not in a queue owned by that server.

78001 A batch server may reject a *Locate Batch Job Request* for other implementation-defined reasons.

78002 3.2.3.6 *Modify Batch Job Request*

78003 Batch clients modify (alter) the attributes of a batch job by making a request to the server that  
78004 manages the batch job. Such a request is called a *Modify Batch Job Request*.

78005 A batch server shall reject a *Modify Batch Job Request* if any of the following statements are true:

- 78006 • The user of the batch client is not authorized to make the requested modification to the  
78007 batch job.
- 78008 • The designated job is not managed by the batch server.
- 78009 • The requested modification is inconsistent with the state of the batch job.
- 78010 • An unrecognized resource is requested for a batch job in an execution queue.

78011 A batch server may reject a *Modify Batch Job Request* for other implementation-defined reasons.  
78012 The method used to determine whether the user of a client is authorized to perform the  
78013 requested action is implementation-defined.

78014 A batch server that accepts a *Modify Batch Job Request* shall modify all the specified attributes of  
78015 the batch job. A batch server that rejects a *Modify Batch Job Request* shall modify none of the

78016 attributes of the batch job.

78017 If the servicing by a batch server of an otherwise valid request would result in no change, then  
78018 the batch server shall indicate successful completion of the request.

#### 78019 3.2.3.7 *Move Batch Job Request*

78020 A batch client can request that a batch server move a batch job to another destination. Such a  
78021 request is called a *Move Batch Job Request*.

78022 A batch server shall reject a *Move Batch Job Request* if any of the following statements are true:

- 78023 • The user of the batch client is not authorized to remove the designated job from the queue  
78024 in which the batch job resides.
- 78025 • The user of the batch client is not authorized to move the designated job to the destination.
- 78026 • The designated job is not managed by the batch server.
- 78027 • The designated job is in the EXITING state.
- 78028 • The destination is inaccessible.

78029 A batch server can reject a *Move Batch Job Request* for other implementation-defined reasons. The  
78030 method used to determine whether the user of a client is authorized to perform the requested  
78031 action is implementation-defined.

78032 A batch server that accepts a *Move Batch Job Request* shall perform the following services:

- 78033 • Queue the designated job at the destination.
- 78034 • Remove the designated job from the queue in which the batch job resides.

78035 If the destination resides on another batch server, the batch server shall queue the batch job at  
78036 the destination by sending a *Queue Batch Job Request* to the other server. If the *Queue Batch Job*  
78037 *Request* fails, the batch server shall reject the *Move Batch Job Request*. If the *Queue Batch Job*  
78038 *Request* succeeds, the batch server shall remove the batch job from its queue.

78039 The batch server shall not modify any attributes of the batch job.

#### 78040 3.2.3.8 *Queue Batch Job Request*

78041 A batch queue is controlled by one and only one batch server. A batch server is said to own the  
78042 queues that it controls. Batch clients make requests of batch servers to have jobs queued. Such a  
78043 request is called a *Queue Batch Job Request*.

78044 A batch server requested to queue a batch job for which the queue is not specified shall select an  
78045 implementation-defined queue for the batch job. Such a queue is called the “default queue” of  
78046 the batch server. The implementation shall provide the means for a batch administrator to  
78047 specify the default queue. The queue, whether specified or defaulted, is called the “target  
78048 queue”.

78049 A batch server shall reject a *Queue Batch Job Request* if any of the following statements are true:

- 78050 • The client is not authorized to create a batch job in the target queue.
- 78051 • The request specifies a queue that does not exist on the batch server.
- 78052 • The target queue is an execution queue and the batch server cannot satisfy a resource  
78053 requirement of the batch job.

- 78054 • The target queue is an execution queue and an unrecognized resource is requested.
- 78055 • The target queue is an execution queue, the batch server does not support checkpointing,
- 78056 and the value of the *Checkpoint* attribute of the batch job is not NO\_CHECKPOINT.
- 78057 • The job requires access to a user identifier that the batch client is not authorized to access.

78058 A batch server may reject a *Queue Batch Job Request* for other implementation-defined reasons.

78059 A batch server that accepts a *Queue Batch Job Request* for a batch job for which the  
78060 PBS\_O\_QUEUE value is missing from the value of the *Variable\_List* attribute of the batch job  
78061 shall add that variable to the list and set the value to the name of the target queue. Once set, no  
78062 server shall change the value of PBS\_O\_QUEUE, even if the batch job is moved to another  
78063 queue.

78064 A batch server that accepts a *Queue Batch Job Request* for a batch job for which the PBS\_JOBID  
78065 value is missing from the value of the *Variable\_List* attribute shall add that variable to the list and  
78066 set the value to the batch job identifier assigned by the server in the format:

78067 `sequence_number.server`

78068 A batch server that accepts a *Queue Batch Job Request* for a batch job for which the  
78069 PBS\_JOBNAME value is missing from the value of the *Variable\_List* attribute of the batch job  
78070 shall add that variable to the list and set the value to the *Job\_Name* attribute of the batch job.

#### 78071 3.2.3.9 *Batch Queue Status Request*

78072 A batch client can request that a batch server respond with the status and attributes of a queue.  
78073 Such a request is called a *Batch Queue Status Request*.

78074 A batch server shall reject a *Batch Queue Status Request* if any of the following statements are  
78075 true:

- 78076 • The user of the batch client is not authorized to query the status of the designated queue.
- 78077 • The designated queue does not exist on the batch server.

78078 A batch server may reject a *Batch Queue Status Request* for other implementation-defined reasons.  
78079 The method used to determine whether the user of a client is authorized to perform the  
78080 requested action is implementation-defined.

78081 A batch server that accepts a *Batch Queue Status Request* shall return a *Batch Queue Status Reply* to  
78082 the batch client.

#### 78083 3.2.3.10 *Release Batch Job Request*

78084 A batch client can request that the server remove one or more holds from a batch job. Such a  
78085 request is called a *Release Batch Job Request*.

78086 A batch server shall reject a *Release Batch Job Request* if any of the following statements are true:

- 78087 • The user of the batch client is not authorized to remove one or more of the requested holds
- 78088 from the batch job.
- 78089 • The batch server does not manage the specified job.

78090 A batch server may reject a *Release Batch Job Request* for other implementation-defined reasons.  
78091 The method used to determine whether the user of a client is authorized to perform the  
78092 requested action is implementation-defined.

78093 A batch server that accepts a *Release Batch Job Request* shall remove each type of hold listed in the

78094 *Release Batch Job Request*, that is present, from the value of the *Hold\_Types* attribute of the batch  
78095 job.

#### 78096 3.2.3.11 *Rerun Batch Job Request*

78097 To rerun a batch job is to kill the session leader of the batch job and leave the batch job eligible  
78098 for re-execution. A batch client can request that a batch server rerun a batch job. Such a request  
78099 is called *Rerun Batch Job Request*.

78100 A batch server shall reject a *Rerun Batch Job Request* if any of the following statements are true:

- 78101 • The user of the batch client is not authorized to rerun the designated job.
- 78102 • The *Rerunable* attribute of the designated job has the value FALSE.
- 78103 • The designated job is not in the RUNNING state.
- 78104 • The batch server does not manage the designated job.

78105 A batch server may reject a *Rerun Batch Job Request* for other implementation-defined reasons.  
78106 The method used to determine whether the user of a client is authorized to perform the  
78107 requested action is implementation-defined.

78108 A batch server that rejects a *Rerun Batch Job Request* shall in no way modify the execution of the  
78109 batch job.

78110 A batch server that accepts a request to rerun a batch job shall perform the following services:

- 78111 • Requeue the batch job in the execution queue in which it was executing.
- 78112 • Send a SIGKILL signal to the process group of the session leader of the batch job.

78113 An implementation may indicate to the batch job owner that the batch job has been rerun.  
78114 Whether and how the batch job owner is notified that a batch job is rerun is implementation-  
78115 defined.

78116 A batch server that reruns a batch job may send other implementation-defined signals to the  
78117 session leader of the batch job prior to sending the SIGKILL signal.

78118 A batch server may preferentially select a rerun job for execution. Whether rerun jobs shall be  
78119 selected for execution before other jobs is implementation-defined.

#### 78120 3.2.3.12 *Select Batch Jobs Request*

78121 A batch client can request from a batch server a list of jobs managed by that server that match a  
78122 list of selection criteria. Such a request is called a *Select Batch Jobs Request*. All the batch jobs  
78123 managed by the batch server that receives the request are candidates for selection.

78124 A batch server that accepts a *Select Batch Jobs Request* shall return a list of zero or more job  
78125 identifiers that correspond to jobs that meet the selection criteria.

78126 If the batch client is not authorized to query the status of a batch job, the batch server shall not  
78127 select the batch job.

78128 3.2.3.13 *Server Shutdown Request*

78129 A batch server is defined to have shut down when it does not respond to requests from clients  
78130 and does not perform deferred services for jobs. A batch client can request that a batch server  
78131 shut down. Such a request is called a *Server Shutdown Request*.

78132 A batch server shall reject a *Server Shutdown Request* from a client that is not authorized to shut  
78133 down the batch server. The method used to determine whether the user of a client is authorized  
78134 to perform the requested action is implementation-defined.

78135 A batch server may reject a *Server Shutdown Request* for other implementation-defined reasons.  
78136 The reasons for which a *Server Shutdown Request* may be rejected are implementation-defined.

78137 At server shutdown, a batch server shall do, in order of preference, one of the following:

- 78138 • If checkpointing is implemented and the batch job is checkpointable, then checkpoint the  
78139 batch job and requeue it.
- 78140 • If the batch job is rerunnable, then requeue the batch job to be rerun (restarted from the  
78141 beginning).
- 78142 • Abort the batch job.

78143 3.2.3.14 *Server Status Request*

78144 A batch client can request that a batch server respond with the status and attributes of the batch  
78145 server. Such a request is called a *Server Status Request*.

78146 A batch server shall reject a *Server Status Request* if the following statement is true:

- 78147 • The user of the batch client is not authorized to query the status of the designated server.

78148 A batch server may reject a *Server Status Request* for other implementation-defined reasons. The  
78149 method used to determine whether the user of a client is authorized to perform the requested  
78150 action is implementation-defined.

78151 A batch server that accepts a *Server Status Request* shall return a *Server Status Reply* to the batch  
78152 client.

78153 3.2.3.15 *Signal Batch Job Request*

78154 A batch client can request that a batch server signal the session leader of a batch job. Such a  
78155 request is called a *Signal Batch Job Request*.

78156 A batch server shall reject a *Signal Batch Job Request* if any of the following statements are true:

- 78157 • The user of the batch client is not authorized to signal the batch job.
- 78158 • The job is not in the RUNNING state.
- 78159 • The batch server does not manage the designated job.
- 78160 • The requested signal is not supported by the implementation.

78161 A batch server may reject a *Signal Batch Job Request* for other implementation-defined reasons.  
78162 The method used to determine whether the user of a client is authorized to perform the  
78163 requested action is implementation-defined.

78164 A batch server that accepts a request to signal a batch job shall send the signal requested by the  
78165 batch client to the process group of the session leader of the batch job.

78166 3.2.3.16 *Track Batch Job Request*

78167 *Track Batch Job Request* is an optional feature of batch servers. If an implementation supports  
 78168 *Track Batch Job Request*, the statements in this section apply and the configuration variable  
 78169 POSIX2\_PBS\_TRACK shall be set to 1.

78170 *Track Batch Job Request* provides a method for tracking the current location of a batch job. Clients  
 78171 may use the tracking information to determine the batch server that should receive a batch  
 78172 server request.

78173 If *Track Batch Job Request* is supported by a batch server, then when the batch server queues a  
 78174 batch job as a result of a *Queue Batch Job Request*, and the batch server is not the batch server that  
 78175 created the batch job, the batch server shall send a *Track Batch Job Request* to the batch server that  
 78176 created the job.

78177 If *Track Batch Job Request* is supported by a batch server, then the *Track Batch Job Request* may also  
 78178 be sent to other servers as a backup to the primary server. The method by which backup servers  
 78179 are specified is implementation-defined.

78180 If *Track Batch Job Request* is supported by a batch server that receives a *Track Batch Job Request*,  
 78181 then the batch server shall record the current location of the batch job as contained in the  
 78182 request.

78183 **3.3 Common Behavior for Batch Environment Utilities**78184 **3.3.1 Batch Job Identifier**

78185 A utility shall recognize *job\_identifiers* of the format:

78186 [ *sequence\_number* ] [ . *server\_name* ] [ @*server* ]

78187 where:

78188 *sequence\_number* An integer that, when combined with *server\_name*, provides a batch job  
 78189 identifier that is unique within the batch system.

78190 *server\_name* The name of the batch server to which the batch job was originally submitted.

78191 *server* The name of the batch server that is currently managing the batch job.

78192 If the application omits the batch *server\_name* portion of a batch job identifier, a utility shall use  
 78193 the name of a default batch server.

78194 If the application omits the batch *server* portion of a batch job identifier, a utility shall use:

- 78195 • The batch server indicated by *server\_name*, if present
- 78196 • The name of the default batch server
- 78197 • The name of the batch server that is currently managing the batch job

78198 If only @*server* is specified, then the status of all jobs owned by the user on the requested server  
 78199 is listed.

78200 The means by which a utility determines the default batch server is implementation-defined.

78201 If the application presents the batch *server* portion of a batch job identifier to a utility, the utility  
 78202 shall send the request to the specified server.

A strictly conforming application shall use the syntax described for the job identifier. Whenever a batch job identifier is specified whose syntax is not recognized by an implementation, then a message for each error that occurs shall be written to standard error and the utility shall exit with an exit status greater than zero.

When a batch job identifier is supplied as an argument to a batch utility and the *server\_name* portion of the batch job identifier is omitted, then the utility shall use the name of the default batch server.

When a batch job identifier is supplied as an argument to a batch utility and the batch *server* portion of the batch job identifier is omitted, then the utility shall use either:

- The name of the default batch server
- or:
- The name of the batch server that is currently managing the batch job

When a batch job identifier is supplied as an argument to a batch utility and the batch *server* portion of the batch job identifier is specified, then the utility shall send the required *Batch Server Request* to the specified server.

### 3.3.2 Destination

The utility shall recognize a *destination* of the format:

[ *queue* ] [ @*server* ]

where:

*queue*            The name of a valid execution or routing queue at the batch server denoted by @*server*, defined as a string of up to 15 alphanumeric characters in the portable character set (see XBD [Section 6.1](#), on page 125) where the first character is alphabetic.

*server*           The name of a batch server, defined as a string of alphanumeric characters in the portable character set.

If the application omits the batch *server* portion of a destination, then the utility shall use either:

- The name of the default batch server
- or:
- The name of the batch server that is currently managing the batch job

The means by which a utility determines the default batch server is implementation-defined.

If the application omits the *queue* portion of a destination, then the utility shall use the name of the default queue at the batch server chosen. The means by which a batch server determines its default queue is implementation-defined. If a destination is specified in the *queue@server* form, then the utility shall use the specified queue at the specified server.

A strictly conforming application shall use the syntax described for a destination. Whenever a destination is specified whose syntax is not recognized by an implementation, then a message shall be written to standard error and the utility shall exit with an exit status greater than zero.

### 3.3.3 Multiple Keyword-Value Pairs

For each option that can have multiple keyword-value pair arguments, the following rules shall apply. Examples of options that can have list-oriented option-arguments are `-u value@keyword` and `-l keyword=value`.

1. If a batch utility is presented with a list-oriented option-argument for which a keyword has a corresponding value that begins with a single or double-quote, then the utility shall stop interpreting the input stream for delimiters until a second single or double-quote, respectively, is encountered. This feature allows some flexibility for a <comma> ( ' , ' ) or <equals-sign> ( ' = ' ) to be part of the value string for a particular keyword; for example:

```
keywd1='val1,val2',keywd2="val3,val4"
```

**Note:** This may require the user to escape the quotes as in the following command:

```
foo -xkeywd1=\'val1,val2\',keywd2=\"val3,val4\"
```

2. If a batch server is presented with a list-oriented attribute that has a keyword that was encountered earlier in the list, then the later entry for that keyword shall replace the earlier entry.
3. If a batch server is presented with a list-oriented attribute that has a keyword without any corresponding value of the form *keyword=* or *@keyword* and the same keyword was encountered earlier in the list, then the prior entry for that keyword shall be ignored by the batch server.
4. If a batch utility is expecting a list-oriented option-argument entry of the form *keyword=value*, but is presented with an entry of the form *keyword* without any corresponding *value*, then the entry shall be treated as though a default value of NULL was assigned (that is, *keyword=NULL*) for entry parsing purposes. The utility shall include only the keyword, not the NULL value, in the associated job attribute.
5. If a batch utility is expecting a list-oriented option-argument entry of the form *value@keyword*, but is presented with an entry of the form *value* without any corresponding *keyword*, then the entry shall be treated as though a keyword of NULL was assigned (that is, *value@NULL*) for entry parsing purposes. The utility shall include only the value, not the NULL keyword, in the associated job attribute.
6. A batch server shall accept a list-oriented attribute that has multiple occurrences of the same keyword, interpreting the keywords, in order, with the last value encountered taking precedence over prior instances of the same keyword. This rule allows, but does not require, a batch utility to preprocess the attribute to remove duplicate keywords.
7. If a batch utility is presented with multiple list-oriented option-arguments on the command line or in script directives, or both, for a single option, then the utility shall concatenate, in order, any command line keyword and value pairs to the end of any directive keyword and value pairs separated by a single <comma> to produce a single string that is an equivalent, valid option-argument. The resulting string shall be assigned to the associated attribute of the batch job (after optionally removing duplicate entries as described in item 6).

78281

*Chapter 4*

78282

# *Utilities*

78283

This chapter contains the definitions of the utilities, as follows:

78284

- Mandatory utilities that are present on every conformant system

78285

- Optional utilities that are present only on systems supporting the associated option; see [Section 1.7.1](#) (on page 7) for information on the options in this volume of POSIX.1-2008

78286

## 78287 NAME

78288 admin — create and administer SCCS files (DEVELOPMENT)

## 78289 SYNOPSIS

```

78290 XSI  admin -i[name] [-n] [-a login] [-d flag] [-e login] [-f flag]
78291         [-m mrlist] [-r rel] [-t[name] [-y[comment]] newfile
78292
78292         admin -n [-a login] [-d flag] [-e login] [-f flag] [-m mrlist]
78293         [-t[name]] [-y[comment]] newfile...
78294
78294         admin [-a login] [-d flag] [-m mrlist] [-r rel] [-t[name]] file...
78295
78295         admin -h file...
78296
78296         admin -z file...

```

## 78297 DESCRIPTION

78298 The *admin* utility shall create new SCCS files or change parameters of existing ones. If a named  
 78299 file does not exist, it shall be created, and its parameters shall be initialized according to the  
 78300 specified options. Parameters not initialized by an option shall be assigned a default value. If a  
 78301 named file does exist, parameters corresponding to specified options shall be changed, and other  
 78302 parameters shall be left as is.

78303 All SCCS filenames supplied by the application shall be of the form *s.filename*. New SCCS files  
 78304 shall be given read-only permission mode. Write permission in the parent directory is required  
 78305 to create a file. All writing done by *admin* shall be to a temporary *x-file*, named *x.filename* (see *get*)  
 78306 created with read-only mode if *admin* is creating a new SCCS file, or created with the same mode  
 78307 as that of the SCCS file if the file already exists. After successful execution of *admin*, the SCCS file  
 78308 shall be removed (if it exists), and the *x-file* shall be renamed with the name of the SCCS file. This  
 78309 ensures that changes are made to the SCCS file only if no errors occur.

78310 The *admin* utility shall also use a transient lock file (named *z.filename*), which is used to prevent  
 78311 simultaneous updates to the SCCS file; see *get*.

## 78312 OPTIONS

78313 The *admin* utility shall conform to XBD [Section 12.2](#) (on page 216), except that the *-i*, *-t*, and *-y*  
 78314 options have optional option-arguments. These optional option-arguments shall not be  
 78315 presented as separate arguments. The following options are supported:

78316 **-n** Create a new SCCS file. When *-n* is used without *-i*, the SCCS file shall be created  
 78317 with control information but without any file data.

78318 **-i[name]** Specify the *name* of a file from which the text for a new SCCS file shall be taken.  
 78319 The text constitutes the first delta of the file (see the *-r* option for the delta  
 78320 numbering scheme). If the *-i* option is used, but the *name* option-argument is  
 78321 omitted, the text shall be obtained by reading the standard input. If this option is  
 78322 omitted, the SCCS file shall be created with control information but without any  
 78323 file data. The *-i* option implies the *-n* option.

78324 **-r SID** Specify the SID of the initial delta to be inserted. This SID shall be a trunk SID; that  
 78325 is, the branch and sequence numbers shall be zero or missing. The level number is  
 78326 optional, and defaults to 1.

78327 **-t[name]** Specify the *name* of a file from which descriptive text for the SCCS file shall be  
 78328 taken. In the case of existing SCCS files (neither *-i* nor *-n* is specified):

|       |                |                                                                                                     |
|-------|----------------|-----------------------------------------------------------------------------------------------------|
| 78329 |                | • A <b>-t</b> option without a <i>name</i> option-argument shall cause the removal of               |
| 78330 |                | descriptive text (if any) currently in the SCCS file.                                               |
| 78331 |                | • A <b>-t</b> option with a <i>name</i> option-argument shall cause the text (if any) in the        |
| 78332 |                | named file to replace the descriptive text (if any) currently in the SCCS file.                     |
| 78333 | <b>-f flag</b> | Specify a <i>flag</i> , and, possibly, a value for the <i>flag</i> , to be placed in the SCCS file. |
| 78334 |                | Several <b>-f</b> options may be supplied on a single <i>admin</i> command line.                    |
| 78335 |                | Implementations shall recognize the following flags and associated values:                          |
| 78336 | <b>b</b>       | Allow use of the <b>-b</b> option on a <i>get</i> command to create branch deltas.                  |
| 78337 | <b>cceil</b>   | Specify the highest release (that is, ceiling), a number less than or equal to                      |
| 78338 |                | 9999, which may be retrieved by a <i>get</i> command for editing. The default                       |
| 78339 |                | value for an unspecified <b>c</b> flag shall be 9999.                                               |
| 78340 | <b>ffloor</b>  | Specify the lowest release (that is, floor), a number greater than 0 but less                       |
| 78341 |                | than 9999, which may be retrieved by a <i>get</i> command for editing. The                          |
| 78342 |                | default value for an unspecified <b>f</b> flag shall be 1.                                          |
| 78343 | <b>dSID</b>    | Specify the default delta number (SID) to be used by a <i>get</i> command.                          |
| 78344 | <b>istr</b>    | Treat the “No ID keywords” message issued by <i>get</i> or <i>delta</i> as a fatal error.           |
| 78345 |                | In the absence of this flag, the message is only a warning. The message is                          |
| 78346 |                | issued if no SCCS identification keywords (see <i>get</i> ) are found in the text                   |
| 78347 |                | retrieved or stored in the SCCS file. If a value is supplied, the application                       |
| 78348 |                | shall ensure that the keywords exactly match the given string; however,                             |
| 78349 |                | the string shall contain a keyword, and no embedded <newline>                                       |
| 78350 |                | characters.                                                                                         |
| 78351 | <b>j</b>       | Allow concurrent <i>get</i> commands for editing on the same SID of an SCCS                         |
| 78352 |                | file. This allows multiple concurrent updates to the same version of the                            |
| 78353 |                | SCCS file.                                                                                          |
| 78354 | <b>l list</b>  | Specify a <i>list</i> of releases to which deltas can no longer be made (that is, <i>get</i>        |
| 78355 |                | <b>-e</b> against one of these locked releases fails). Conforming applications                      |
| 78356 |                | shall use the following syntax to specify a <i>list</i> . Implementations may                       |
| 78357 |                | accept additional forms as an extension:                                                            |
| 78358 |                | <list> ::= a   <range-list>                                                                         |
| 78359 |                | <range-list> ::= <range>   <range-list>, <range>                                                    |
| 78360 |                | <range> ::= <SID>                                                                                   |
| 78361 |                | The character <i>a</i> in the <i>list</i> shall be equivalent to specifying all releases for        |
| 78362 |                | the named SCCS file. The non-terminal <SID> in range shall be the delta                             |
| 78363 |                | number of an existing delta associated with the SCCS file.                                          |
| 78364 | <b>n</b>       | Cause <i>delta</i> to create a null delta in each of those releases (if any) being                  |
| 78365 |                | skipped when a delta is made in a new release (for example, in making                               |
| 78366 |                | delta 5.1 after delta 2.7, releases 3 and 4 are skipped). These null deltas                         |
| 78367 |                | shall serve as anchor points so that branch deltas may later be created                             |
| 78368 |                | from them. The absence of this flag shall cause skipped releases to be                              |
| 78369 |                | nonexistent in the SCCS file, preventing branch deltas from being created                           |
| 78370 |                | from them in the future. During the initial creation of an SCCS file, the <b>n</b>                  |
| 78371 |                | flag may be ignored; that is, if the <b>-r</b> option is used to set the release                    |
| 78372 |                | number of the initial SID to a value greater than 1, null deltas need not be                        |
| 78373 |                | created for the “skipped” releases.                                                                 |

|       |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 78374 | <b>qtext</b>       | Substitute user-definable <i>text</i> for all occurrences of the %Q% keyword in the SCCS file text retrieved by <i>get</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 78375 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 78376 | <b>mmod</b>        | Specify the module name of the SCCS file substituted for all occurrences of the %M% keyword in the SCCS file text retrieved by <i>get</i> . If the <b>m</b> flag is not specified, the value assigned shall be the name of the SCCS file with the leading ' . ' removed.                                                                                                                                                                                                                                                                                                                      |
| 78377 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 78378 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 78379 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 78380 | <b>ttype</b>       | Specify the <i>type</i> of module in the SCCS file substituted for all occurrences of the %Y% keyword in the SCCS file text retrieved by <i>get</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 78381 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 78382 | <b>vpgm</b>        | Cause <i>delta</i> to prompt for modification request (MR) numbers as the reason for creating a delta. The optional value specifies the name of an MR number validation program. (If this flag is set when creating an SCCS file, the application shall ensure that the <b>m</b> option is also used even if its value is null.)                                                                                                                                                                                                                                                              |

| 78390 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 78391 | <b>-a login</b>    | Specify a <i>login</i> name, or numerical group ID, to be added to the list of users who may make deltas (changes) to the SCCS file. A group ID shall be equivalent to specifying all <i>login</i> names common to that group ID. Several <b>-a</b> options may be used on a single <i>admin</i> command line. As many <i>logins</i> , or numerical group IDs, as desired may be on the list simultaneously. If the list of users is empty, then anyone may add deltas. If <i>login</i> or group ID is preceded by a ' ! ', the users so specified shall be denied permission to make deltas. |

| 78409 | <b>-m mrlist</b>   | Insert the list of modification request (MR) numbers into the SCCS file as the reason for creating the initial delta in a manner identical to <i>delta</i> . The application shall ensure that the <b>v</b> flag is set and the MR numbers are validated if the <b>v</b> flag has a value (the name of an MR number validation program). A diagnostic message shall be written if the <b>v</b> flag is not set or MR validation fails.                                                                                                                                                        |
| 78410 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 78411 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 78412 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 78413 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 78414 | <b>-h</b>          | Check the structure of the SCCS file and compare the newly computed checksum with the checksum that is stored in the SCCS file. If the newly computed checksum does not match the checksum in the SCCS file, a diagnostic message shall be written.                                                                                                                                                                                                                                                                                                                                           |
| 78415 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 78416 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 78417 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

78418            **-z**            Recompute the SCCS file checksum and store it in the first line of the SCCS file (see  
 78419                            the **-h** option above). Note that use of this option on a truly corrupted file may  
 78420                            prevent future detection of the corruption.

## 78421 OPERANDS

78422            The following operands shall be supported:

78423            *file*            A pathname of an existing SCCS file or a directory. If *file* is a directory, the *admin*  
 78424                            utility shall behave as though each file in the directory were specified as a named  
 78425                            file, except that non-SCCS files (last component of the pathname does not begin  
 78426                            with **s**.) and unreadable files shall be silently ignored.

78427            *newfile*          A pathname of an SCCS file to be created.

78428            If exactly one *file* or *newfile* operand appears, and it is **'-'**, the standard input shall be read; each  
 78429                            line of the standard input shall be taken to be the name of an SCCS file to be processed. Non-  
 78430                            SCCS files and unreadable files shall be silently ignored.

## 78431 STDIN

78432            The standard input shall be a text file used only if **-i** is specified without an option-argument or  
 78433                            if a *file* or *newfile* operand is specified as **'-'**. If the first character of any standard input line is  
 78434                            <SOH> in the POSIX locale, the results are unspecified.

## 78435 INPUT FILES

78436            The existing SCCS files shall be text files of an unspecified format.

78437            The application shall ensure that the file named by the **-i** option's *name* option-argument shall  
 78438                            be a text file; if the first character of any line in this file is <SOH> in the POSIX locale, the results  
 78439                            are unspecified. If this file contains more than 99 999 lines, the number of lines recorded in the  
 78440                            header for this file shall be 99 999 for this delta.

## 78441 ENVIRONMENT VARIABLES

78442            The following environment variables shall affect the execution of *admin*:

78443            *LANG*            Provide a default value for the internationalization variables that are unset or null.  
 78444                            (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 78445                            variables used to determine the values of locale categories.)

78446            *LC\_ALL*            If set to a non-empty string value, override the values of all the other  
 78447                            internationalization variables.

78448            *LC\_CTYPE*          Determine the locale for the interpretation of sequences of bytes of text data as  
 78449                            characters (for example, single-byte as opposed to multi-byte characters in  
 78450                            arguments and input files).

78451            *LC\_MESSAGES*

78452                            Determine the locale that should be used to affect the format and contents of  
 78453                            diagnostic messages written to standard error and the contents of the default **-y**  
 78454                            comment.

78455            *NLSPATH*          Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 78456 ASYNCHRONOUS EVENTS

78457            Default.

## 78458 STDOUT

78459            Not used.

**78460 STDERR**

78461 The standard error shall be used only for diagnostic messages.

**78462 OUTPUT FILES**

78463 Any SCCS files created shall be text files of an unspecified format. During processing of a *file*, a  
78464 locking *z-file*, as described in *get* (on page 2812), may be created and deleted.

**78465 EXTENDED DESCRIPTION**

78466 None.

**78467 EXIT STATUS**

78468 The following exit values shall be returned:

78469 0 Successful completion.

78470 >0 An error occurred.

**78471 CONSEQUENCES OF ERRORS**

78472 Default.

**78473 APPLICATION USAGE**

78474 It is recommended that directories containing SCCS files be writable by the owner only, and that  
78475 SCCS files themselves be read-only. The mode of the directories should allow only the owner to  
78476 modify SCCS files contained in the directories. The mode of the SCCS files prevents any  
78477 modification at all except by SCCS commands.

**78478 EXAMPLES**

78479 None.

**78480 RATIONALE**

78481 None.

**78482 FUTURE DIRECTIONS**

78483 None.

78486 XBD Chapter 8 (on page 173), Section 12.2 (on page 216)

**78487 CHANGE HISTORY**

78488 First released in Issue 2.

**78489 Issue 6**

78490 The normative text is reworded to avoid use of the term “must” for application requirements,  
78491 and to emphasize the term “shall” for implementation requirements.

78492 The grammar is updated.

78493 The Open Group Base Resolution bwg2001-007 is applied, adding new text to the INPUT FILES  
78494 section warning that the maximum lines recorded in the file is 99 999.

78495 The Open Group Base Resolution bwg2001-009 is applied, amending the description of the **-h**  
78496 option.

78497 **NAME**

78498 alias — define or display aliases

78499 **SYNOPSIS**78500 alias [*alias-name*[=*string*]]...78501 **DESCRIPTION**

78502 The *alias* utility shall create or redefine alias definitions or write the values of existing alias  
 78503 definitions to standard output. An alias definition provides a string value that shall replace a  
 78504 command name when it is encountered; see [Section 2.3.1](#) (on page 2338).

78505 An alias definition shall affect the current shell execution environment and the execution  
 78506 environments of the subshells of the current shell. When used as specified by this volume of  
 78507 POSIX.1-2008, the alias definition shall not affect the parent process of the current shell nor any  
 78508 utility environment invoked by the shell; see [Section 2.12](#) (on page 2371).

78509 **OPTIONS**

78510 None.

78511 **OPERANDS**

78512 The following operands shall be supported:

78513 *alias-name* Write the alias definition to standard output.

78514 *alias-name=string*  
 78515 Assign the value of *string* to the alias *alias-name*.

78516 If no operands are given, all alias definitions shall be written to standard output.

78517 **STDIN**

78518 Not used.

78519 **INPUT FILES**

78520 None.

78521 **ENVIRONMENT VARIABLES**78522 The following environment variables shall affect the execution of *alias*:

78523 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 78524 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 78525 variables used to determine the values of locale categories.)

78526 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 78527 internationalization variables.

78528 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 78529 characters (for example, single-byte as opposed to multi-byte characters in  
 78530 arguments).

78531 *LC\_MESSAGES*  
 78532 Determine the locale that should be used to affect the format and contents of  
 78533 diagnostic messages written to standard error.

78534 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.78535 **ASYNCHRONOUS EVENTS**

78536 Default.

**STDOUT**

The format for displaying aliases (when no operands or only *name* operands are specified) shall be:

```
"%s=%s\n", name, value
```

The *value* string shall be written with appropriate quoting so that it is suitable for reinput to the shell. See the description of shell quoting in [Section 2.2](#) (on page 2336).

**STDERR**

The standard error shall be used only for diagnostic messages.

**OUTPUT FILES**

None.

**EXTENDED DESCRIPTION**

None.

**EXIT STATUS**

The following exit values shall be returned:

0 Successful completion.

>0 One of the *name* operands specified did not have an alias definition, or an error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

None.

**EXAMPLES**

1. Create a short alias for a commonly used *ls* command:

```
alias lf="ls -CF"
```

2. Create a simple “redo” command to repeat previous entries in the command history file:

```
alias r='fc -s'
```

3. Use 1K units for *du*:

```
alias du=du\ -k
```

4. Set up *nohup* so that it can deal with an argument that is itself an alias name:

```
alias nohup="nohup "
```

**RATIONALE**

The *alias* description is based on historical KornShell implementations. Known differences exist between that and the C shell. The KornShell version was adopted to be consistent with all the other KornShell features in this volume of POSIX.1-2008, such as command line editing.

Since *alias* affects the current shell execution environment, it is generally provided as a shell regular built-in.

Historical versions of the KornShell have allowed aliases to be exported to scripts that are invoked by the same shell. This is triggered by the *alias* *-x* flag; it is allowed by this volume of POSIX.1-2008 only when an explicit extension such as *-x* is used. The standard developers considered that aliases were of use primarily to interactive users and that they should normally not affect shell scripts called by those users; functions are available to such scripts.

78577 Historical versions of the KornShell had not written aliases in a quoted manner suitable for  
78578 reentry to the shell, but this volume of POSIX.1-2008 has made this a requirement for all similar  
78579 output. Therefore, consistency was chosen over this detail of historical practice.

78580 **FUTURE DIRECTIONS**

78581 None.

78585 **CHANGE HISTORY**

78586 First released in Issue 4.

78587 **Issue 6**

78588 This utility is marked as part of the User Portability Utilities option.

78589 The APPLICATION USAGE section is added.

78590 **Issue 7**

78591 The *alias* utility is moved from the User Portability Utilities option to the Base. User Portability  
78592 Utilities is now an option for interactive utilities.

78593 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

78594 The first example is changed to remove the creation of an alias for a standard utility that alters  
78595 its behavior to be non-conforming.

78596 **NAME**78597 **ar** — create and maintain library archives78598 **SYNOPSIS**78599 SD **ar -d [-v] archive file...**78600 XSI **ar -m [-v] archive file...**78601 **ar -m -a [-v] posname archive file...**78602 **ar -m -b [-v] posname archive file...**78603 **ar -m -i [-v] posname archive file...**78604 XSI **ar -p [-v] [-s] archive [file...]**78605 XSI **ar -q [-cv] archive file...**78606 **ar -r [-cuv] archive file...**78607 XSI **ar -r -a [-cuv] posname archive file...**78608 **ar -r -b [-cuv] posname archive file...**78609 **ar -r -i [-cuv] posname archive file...**78610 XSI **ar -t [-v] [-s] archive [file...]**78611 XSI **ar -x [-v] [-sCT] archive [file...]**78612 **DESCRIPTION**78613 The *ar* utility is part of the Software Development Utilities option.

78614 The *ar* utility can be used to create and maintain groups of files combined into an archive. Once  
 78615 an archive has been created, new files can be added, and existing files in an archive can be  
 78616 extracted, deleted, or replaced. When an archive consists entirely of valid object files, the  
 78617 implementation shall format the archive so that it is usable as a library for link editing (see *c99*  
 78618 and *fort77*). When some of the archived files are not valid object files, the suitability of the  
 78619 XSI archive for library use is undefined. If an archive consists entirely of printable files, the entire  
 78620 archive shall be printable.

78621 When *ar* creates an archive, it creates administrative information indicating whether a symbol  
 78622 table is present in the archive. When there is at least one object file that *ar* recognizes as such in  
 78623 the archive, an archive symbol table shall be created in the archive and maintained by *ar*; it is  
 78624 used by the link editor to search the archive. Whenever the *ar* utility is used to create or update  
 78625 the contents of such an archive, the symbol table shall be rebuilt. The *-s* option shall force the  
 78626 symbol table to be rebuilt.

78627 All *file* operands can be pathnames. However, files within archives shall be named by a filename,  
 78628 which is the last component of the pathname used when the file was entered into the archive.  
 78629 The comparison of *file* operands to the names of files in archives shall be performed by  
 78630 comparing the last component of the operand to the name of the file in the archive.

78631 It is unspecified whether multiple files in the archive may be identically named. In the case of  
 78632 XSI such files, however, each *file* and *posname* operand shall match only the first file in the archive  
 78633 having a name that is the same as the last component of the operand.

## 78634 OPTIONS

78635 The *ar* utility shall conform to XBD Section 12.2 (on page 216), except for Guideline 9.

78636 The following options shall be supported:

- |       |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------|-----|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 78637 | XSI | <b>-a</b> | Position new files in the archive after the file named by the <i>posname</i> operand.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 78638 | XSI | <b>-b</b> | Position new files in the archive before the file named by the <i>posname</i> operand.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 78639 |     | <b>-c</b> | Suppress the diagnostic message that is written to standard error by default when the archive <i>archive</i> is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 78640 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 78641 | XSI | <b>-C</b> | Prevent extracted files from replacing like-named files in the file system. This option is useful when <b>-T</b> is also used, to prevent truncated filenames from replacing files with the same prefix.                                                                                                                                                                                                                                                                                                                                                                                                       |
| 78642 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 78643 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 78644 |     | <b>-d</b> | Delete one or more <i>files</i> from <i>archive</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 78645 | XSI | <b>-i</b> | Position new files in the archive before the file in the archive named by the <i>posname</i> operand (equivalent to <b>-b</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 78646 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 78647 | XSI | <b>-m</b> | Move the named files in the archive. The <b>-a</b> , <b>-b</b> , or <b>-i</b> options with the <i>posname</i> operand indicate the position; otherwise, move the names files in the archive to the end of the archive.                                                                                                                                                                                                                                                                                                                                                                                         |
| 78648 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 78672 |     | <b>-u</b> | Update older files in the archive. When used with the <b>-r</b> option, files in the archive shall be replaced only if the corresponding <i>file</i> has a modification time that is at least as new as the modification time of the file in the archive.                                                                                                                                                                                                                                                                                                                                                      |
| 78673 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 78674 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

78675        **-v**            Give verbose output. When used with the option characters **-d**, **-r**, or **-x**, write a  
 78676 detailed file-by-file description of the archive creation and maintenance activity, as  
 78677 described in the STDOUT section.

78678                    When used with **-p**, write the name of the file in the archive to the standard output  
 78679 before writing the file in the archive itself to the standard output, as described in  
 78680 the STDOUT section.

78681                    When used with **-t**, include a long listing of information about the files in the  
 78682 archive, as described in the STDOUT section.

78683        **-x**            Extract the files in the archive named by the *file* operands from *archive*. The  
 78684 contents of the archive shall not be changed. If no *file* operands are given, all files  
 78685 in the archive shall be extracted. The modification time of each file extracted shall  
 78686 be set to the time the file is extracted from the archive.

## 78687 OPERANDS

78688            The following operands shall be supported:

78689        *archive*        A pathname of the archive.

78690        *file*            A pathname. Only the last component shall be used when comparing against the  
 78691 names of files in the archive. If two or more *file* operands have the same last  
 78692 pathname component (basename), the results are unspecified. The  
 78693 implementation's archive format shall not truncate valid filenames of files added  
 78694 to or replaced in the archive.

78695 XSI        *posname*        The name of a file in the archive, used for relative positioning; see options **-m** and  
 78696 **-r**.

## 78697 STDIN

78698            Not used.

## 78699 INPUT FILES

78700            The archive named by *archive* shall be a file in the format created by *ar -r*.

## 78701 ENVIRONMENT VARIABLES

78702            The following environment variables shall affect the execution of *ar*:

78703        *LANG*            Provide a default value for the internationalization variables that are unset or null.  
 78704 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 78705 variables used to determine the values of locale categories.)

78706        *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
 78707 internationalization variables.

78708        *LC\_CTYPE*        Determine the locale for the interpretation of sequences of bytes of text data as  
 78709 characters (for example, single-byte as opposed to multi-byte characters in  
 78710 arguments and input files).

78711        *LC\_MESSAGES*

78712                    Determine the locale that should be used to affect the format and contents of  
 78713 diagnostic messages written to standard error.

78714        *LC\_TIME*        Determine the format and content for date and time strings written by *ar -tv*.

78715 XSI        *NLSPATH*        Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

78716 *TMPDIR* Determine the pathname that overrides the default directory for temporary files, if  
78717 any.

78718 *TZ* Determine the timezone used to calculate date and time strings written by *ar -tv*.  
78719 If *TZ* is unset or null, an unspecified default timezone shall be used.

## 78720 ASYNCHRONOUS EVENTS

78721 Default.

## 78722 STDOUT

78723 If the *-d* option is used with the *-v* option, the standard output format shall be:

78724 "d - %s\n", <file>

78725 where *file* is the operand specified on the command line.

78726 If the *-p* option is used with the *-v* option, *ar* shall precede the contents of each file with:

78727 "\n<%s>\n\n", <file>

78728 where *file* is the operand specified on the command line, if *file* operands were specified, and the  
78729 name of the file in the archive if they were not.

78730 If the *-r* option is used with the *-v* option:

- 78731 • If *file* is already in the archive, the standard output format shall be:

78732 "r - %s\n", <file>

78733 where <file> is the operand specified on the command line.

- 78734 • If *file* is not already in the archive, the standard output format shall be:

78735 "a - %s\n", <file>

78736 where <file> is the operand specified on the command line.

78737 If the *-t* option is used, *ar* shall write the names of the files in the archive to the standard output  
78738 in the format:

78739 "%s\n", <file>

78740 where *file* is the operand specified on the command line, if *file* operands were specified, or the  
78741 name of the file in the archive if they were not.

78742 If the *-t* option is used with the *-v* option, the standard output format shall be:

78743 "%s %u/%u %u %s %d %d:%d %d %s\n", <member mode>, <user ID>,  
78744 <group ID>, <number of bytes in member>,  
78745 <abbreviated month>, <day-of-month>, <hour>,  
78746 <minute>, <year>, <file>

78747 where:

78748 <file> Shall be the operand specified on the command line, if *file* operands were specified,  
78749 or the name of the file in the archive if they were not.

78750 <member mode>

78751 Shall be formatted the same as the <file mode> string defined in the STDOUT  
78752 section of *ls*, except that the first character, the <entry type>, is not used; the string  
78753 represents the file mode of the file in the archive at the time it was added to or  
78754 replaced in the archive.

78755 The following represent the last-modification time of a file when it was most recently added to  
78756 or replaced in the archive:

78757 <*abbreviated month*>

78758 Equivalent to the format of the %b conversion specification format in *date*.

78759 <*day-of-month*>

78760 Equivalent to the format of the %e conversion specification format in *date*.

78761 <*hour*> Equivalent to the format of the %H conversion specification format in *date*.

78762 <*minute*> Equivalent to the format of the %M conversion specification format in *date*.

78763 <*year*> Equivalent to the format of the %Y conversion specification format in *date*.

78764 When *LC\_TIME* does not specify the POSIX locale, a different format and order of presentation  
78765 of these fields relative to each other may be used in a format appropriate in the specified locale.

78766 If the *-x* option is used with the *-v* option, the standard output format shall be:

78767 "x - %s\n", <*file*>

78768 where *file* is the operand specified on the command line, if *file* operands were specified, or the  
78769 name of the file in the archive if they were not.

## 78770 STDERR

78771 The standard error shall be used only for diagnostic messages. The diagnostic message about  
78772 creating a new archive when *-c* is not specified shall not modify the exit status.

## 78773 OUTPUT FILES

78774 Archives are files with unspecified formats.

## 78775 EXTENDED DESCRIPTION

78776 None.

## 78777 EXIT STATUS

78778 The following exit values shall be returned:

78779 0 Successful completion.

78780 >0 An error occurred.

## 78781 CONSEQUENCES OF ERRORS

78782 Default.

## 78783 APPLICATION USAGE

78784 None.

## 78785 EXAMPLES

78786 None.

## 78787 RATIONALE

78788 The archive format is not described. It is recognized that there are several known *ar* formats,  
78789 which are not compatible. The *ar* utility is included, however, to allow creation of archives that  
78790 are intended for use only on one machine. The archive is specified as a file, and it can be moved  
78791 as a file. This does allow an archive to be moved from one machine to another machine that uses  
78792 the same implementation of *ar*.

78793 Utilities such as *pax* (and its forebears *tar* and *cpio*) also provide portable “archives”. This is a not  
78794 a duplication; the *ar* utility is included to provide an interface primarily for *make* and the  
78795 compilers, based on a historical model.

In historical implementations, the `-q` option (available on XSI-conforming systems) is known to execute quickly because *ar* does not check on whether the added members are already in the archive. This is useful to bypass the searching otherwise done when creating a large archive piece-by-piece. These remarks may but need not remain true for a brand new implementation of this utility; hence, these remarks have been moved into the RATIONALE.

BSD implementations historically required applications to provide the `-s` option whenever the archive was supposed to contain a symbol table. As in this volume of POSIX.1-2008, System V historically creates or updates an archive symbol table whenever an object file is removed from, added to, or updated in the archive.

The OPERANDS section requires what might seem to be true without specifying it: the archive cannot truncate the filenames below `{NAME_MAX}`. Some historical implementations do so, however, causing unexpected results for the application. Therefore, this volume of POSIX.1-2008 makes the requirement explicit to avoid misunderstandings.

According to the System V documentation, the options `-dmpqrtx` are not required to begin with a `<hyphen-minus>` ('-'). This volume of POSIX.1-2008 requires that a conforming application use the leading `<hyphen-minus>`.

The archive format used by the 4.4 BSD implementation is documented in this RATIONALE as an example:

A file created by *ar* begins with the “magic” string `!<arch>\n`. The rest of the archive is made up of objects, each of which is composed of a header for a file, a possible filename, and the file contents. The header is portable between machine architectures, and, if the file contents are printable, the archive is itself printable.

The header is made up of six ASCII fields, followed by a two-character trailer. The fields are the object name (16 characters), the file last modification time (12 characters), the user and group IDs (each 6 characters), the file mode (8 characters), and the file size (10 characters). All numeric fields are in decimal, except for the file mode, which is in octal.

The modification time is the file `st_mtime` field. The user and group IDs are the file `st_uid` and `st_gid` fields. The file mode is the file `st_mode` field. The file size is the file `st_size` field. The two-byte trailer is the string `"<newline>"`.

Only the name field has any provision for overflow. If any filename is more than 16 characters in length or contains an embedded space, the string `"#1/"` followed by the ASCII length of the name is written in the name field. The file size (stored in the archive header) is incremented by the length of the name. The name is then written immediately following the archive header.

Any unused characters in any of these fields are written as `<space>` characters. If any fields are their particular maximum number of characters in length, there is no separation between the fields.

Objects in the archive are always an even number of bytes long; files that are an odd number of bytes long are padded with a `<newline>`, although the size in the header does not reflect this.

The *ar* utility description requires that (when all its members are valid object files) *ar* produce an object code library, which the linkage editor can use to extract object modules. If the linkage editor needs a symbol table to permit random access to the archive, *ar* must provide it; however, *ar* does not require a symbol table.

The BSD `-o` option was omitted. It is a rare conforming application that uses *ar* to extract object

code from a library with concern for its modification time, since this can only be of importance to *make*. Hence, since this functionality is not deemed important for applications portability, the modification time of the extracted files is set to the current time.

There is at least one known implementation (for a small computer) that can accommodate only object files for that system, disallowing mixed object and other files. The ability to handle any type of file is not only historical practice for most implementations, but is also a reasonable expectation.

Consideration was given to changing the output format of *ar -tv* to the same format as the output of *ls -l*. This would have made parsing the output of *ar* the same as that of *ls*. This was rejected in part because the current *ar* format is commonly used and changes would break historical usage. Second, *ar* gives the user ID and group ID in numeric format separated by a `<slash>`. Changing this to be the user name and group name would not be correct if the archive were moved to a machine that contained a different user database. Since *ar* cannot know whether the archive was generated on the same machine, it cannot tell what to report.

The text on the *-ur* option combination is historical practice—since one filename can easily represent two different files (for example, */a/foo* and */b/foo*), it is reasonable to replace the file in the archive even when the modification time in the archive is identical to that in the file system.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 2.

### Issue 5

The FUTURE DIRECTIONS section is added.

### Issue 6

This utility is marked as part of the Software Development Utilities option.

The STDOUT description is changed for the *-v* option to align with the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

IEEE PASC Interpretation 1003.2 #198 is applied, changing the description to consistently use “file” to refer to a file in the file system hierarchy, “archive” to refer to the archive being operated upon by the *ar* utility, and “file in the archive” to refer to a copy of a file that is contained in the archive.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/10 is applied, making corrections to the SYNOPSIS. The change was needed since the *-a*, *-b*, and *-i* options are mutually-exclusive, and *posname* is required if any of these options is specified.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/11 is applied, correcting the description of the two-byte trailer in RATIONALE which had missed out a backquote. The correct trailer is a backquote followed by a `<newline>`.

78884 **Issue 7**

78885 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
78886 apply.

78887 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

78888 The description of the `-t` option is changed to say “Only the files specified ...”.

78889 **NAME**

78890       asa — interpret carriage-control characters

78891 **SYNOPSIS**78892 FR       asa [*file...*]78893 **DESCRIPTION**78894       The *asa* utility shall write its input files to standard output, mapping carriage-control characters  
78895       from the text files to line-printer control sequences in an implementation-defined manner.78896       The first character of every line shall be removed from the input, and the following actions are  
78897       performed.

78898       If the character removed is:

78899       &lt;space&gt;       The rest of the line is output without change.

78900       0            A &lt;newline&gt; is output, then the rest of the input line.

78901       1            One or more implementation-defined characters that causes an advance to the next  
78902       page shall be output, followed by the rest of the input line.78903       +            The <newline> of the previous line shall be replaced with one or more  
78904       implementation-defined characters that causes printing to return to column  
78905       position 1, followed by the rest of the input line. If the '+' is the first character in  
78906       the input, it shall be equivalent to <space>.78907       The action of the *asa* utility is unspecified upon encountering any character other than those  
78908       listed above as the first character in a line.78909 **OPTIONS**

78910       None.

78911 **OPERANDS**78912       *file*        A pathname of a text file used for input. If no *file* operands are specified, the  
78913       standard input shall be used.78914 **STDIN**78915       The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
78916       operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
78917       the standard input shall not be used. See the INPUT FILES section.78918 **INPUT FILES**

78919       The input files shall be text files.

78920 **ENVIRONMENT VARIABLES**78921       The following environment variables shall affect the execution of *asa*:78922       LANG        Provide a default value for the internationalization variables that are unset or null.  
78923       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
78924       variables used to determine the values of locale categories.)78925       LC\_ALL       If set to a non-empty string value, override the values of all the other  
78926       internationalization variables.78927       LC\_CTYPE    Determine the locale for the interpretation of sequences of bytes of text data as  
78928       characters (for example, single-byte as opposed to multi-byte characters in  
78929       arguments and input files).

78930 **LC\_MESSAGES**

78931 Determine the locale that should be used to affect the format and contents of  
 78932 diagnostic messages written to standard error.

78933 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

78934 **ASYNCHRONOUS EVENTS**

78935 Default.

78936 **STDOUT**

78937 The standard output shall be the text from the input file modified as described in the  
 78938 DESCRIPTION section.

78939 **STDERR**

78940 None.

78941 **OUTPUT FILES**

78942 None.

78943 **EXTENDED DESCRIPTION**

78944 None.

78945 **EXIT STATUS**

78946 The following exit values shall be returned:

78947 0 All input files were output successfully.

78948 >0 An error occurred.

78949 **CONSEQUENCES OF ERRORS**

78950 Default.

78951 **APPLICATION USAGE**

78952 None.

78953 **EXAMPLES**

78954 1. The following command:

78955 *asa file*

78956 permits the viewing of *file* (created by a program using FORTRAN-style carriage-control  
 78957 characters) on a terminal.

78958 2. The following command:

78959 *a.out | asa | lp*

78960 formats the FORTRAN output of **a.out** and directs it to the printer.

78961 **RATIONALE**

78962 The *asa* utility is needed to map “standard” FORTRAN 77 output into a form acceptable to  
 78963 contemporary printers. Usually, *asa* is used to pipe data to the *lp* utility; see *lp*.

78964 This utility is generally used only by FORTRAN programs. The standard developers decided to  
 78965 retain *asa* to avoid breaking the historical large base of FORTRAN applications that put carriage-  
 78966 control characters in their output files. There is no requirement that a system have a FORTRAN  
 78967 compiler in order to run applications that need *asa*.

78968 Historical implementations have used an ASCII <form-feed> in response to a 1 and an ASCII  
 78969 <carriage-return> in response to a '+'. It is suggested that implementations treat characters  
 78970 other than 0, 1, and '+' as <space> in the absence of any compelling reason to do otherwise.

78971 However, the action is listed here as “unspecified”, permitting an implementation to provide  
78972 extensions to access fast multiple-line slewing and channel seeking in a non-portable manner.

78973 **FUTURE DIRECTIONS**

78974 None.

78975 **SEE ALSO**

78976 *fort77, lp*

78977 XBD *Chapter 8* (on page 173)

78978 **CHANGE HISTORY**

78979 First released in Issue 4.

78980 **Issue 6**

78981 This utility is marked as part of the FORTRAN Runtime Utilities option.

78982 The normative text is reworded to avoid use of the term “must” for application requirements.

78983 **Issue 7**

78984 Austin Group Interpretation 1003.1-2001 #092 is applied.

78985 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

78986 **NAME**78987 `at` — execute commands at a later time78988 **SYNOPSIS**78989 `at [-m] [-f file] [-q queuenam] -t time_arg`78990 `at [-m] [-f file] [-q queuenam] timespec...`78991 `at -r at_job_id...`78992 `at -l -q queuenam`78993 `at -l [at_job_id...]`78994 **DESCRIPTION**78995 The *at* utility shall read commands from standard input and group them together as an *at-job*, to  
78996 be executed at a later time.78997 The *at-job* shall be executed in a separate invocation of the shell, running in a separate process  
78998 group with no controlling terminal, except that the environment variables, current working  
78999 directory, file creation mask, and other implementation-defined execution-time attributes in  
79000 effect when the *at* utility is executed shall be retained and used when the *at-job* is executed.79001 When the *at-job* is submitted, the *at\_job\_id* and scheduled time shall be written to standard error.  
79002 The *at\_job\_id* is an identifier that shall be a string consisting solely of alphanumeric characters  
79003 and the <period> character. The *at\_job\_id* shall be assigned by the system when the job is  
79004 scheduled such that it uniquely identifies a particular job.79005 User notification and the processing of the job's standard output and standard error are  
79006 described under the **-m** option.79007 XSI Users shall be permitted to use *at* if their name appears in the file **at.allow** which is located in an  
79008 implementation-defined directory. If that file does not exist, the file **at.deny**, which is located in  
79009 an implementation-defined directory, shall be checked to determine whether the user shall be  
79010 denied access to *at*. If neither file exists, only a process with appropriate privileges shall be  
79011 allowed to submit a job. If only **at.deny** exists and is empty, global usage shall be permitted. The  
79012 **at.allow** and **at.deny** files shall consist of one user name per line.79013 **OPTIONS**79014 The *at* utility shall conform to XBD [Section 12.2](#) (on page 216).

79015 The following options shall be supported:

79016 **-f *file*** Specify the pathname of a file to be used as the source of the *at-job*, instead of  
79017 standard input.79018 **-l** (The letter ell.) Report all jobs scheduled for the invoking user if no *at\_job\_id*  
79019 operands are specified. If *at\_job\_ids* are specified, report only information for these  
79020 jobs. The output shall be written to standard output.79021 **-m** Send mail to the invoking user after the *at-job* has run, announcing its completion.  
79022 Standard output and standard error produced by the *at-job* shall be mailed to the  
79023 user as well, unless redirected elsewhere. Mail shall be sent even if the job  
79024 produces no output.79025 If **-m** is not used, the job's standard output and standard error shall be provided to  
79026 the user by means of mail, unless they are redirected elsewhere; if there is no such  
79027 output to provide, the implementation need not notify the user of the job's  
79028 completion.

|       |                            |                                                                                                            |
|-------|----------------------------|------------------------------------------------------------------------------------------------------------|
| 79029 | <b>-q</b> <i>queuename</i> |                                                                                                            |
| 79030 |                            | Specify in which queue to schedule a job for submission. When used with the <b>-l</b>                      |
| 79031 |                            | option, limit the search to that particular queue. By default, at-jobs shall be                            |
| 79032 |                            | scheduled in queue <i>a</i> . In contrast, queue <i>b</i> shall be reserved for batch jobs; see            |
| 79033 |                            | <i>batch</i> . The meanings of all other <i>queuenames</i> are implementation-defined. If <b>-q</b> is     |
| 79034 |                            | specified along with either of the <b>-t</b> <i>time_arg</i> or <i>timespec</i> arguments, the results are |
| 79035 |                            | unspecified.                                                                                               |
| 79036 | <b>-r</b>                  | Remove the jobs with the specified <i>at_job_id</i> operands that were previously                          |
| 79037 |                            | scheduled by the <i>at</i> utility.                                                                        |
| 79038 | <b>-t</b> <i>time_arg</i>  | Submit the job to be run at the time specified by the <i>time</i> option-argument, which                   |
| 79039 |                            | the application shall ensure has the format as specified by the <i>touch -t time</i> utility.              |

## 79040 OPERANDS

79041 The following operands shall be supported:

|       |                  |                                                                                              |
|-------|------------------|----------------------------------------------------------------------------------------------|
| 79042 | <i>at_job_id</i> | The name reported by a previous invocation of the <i>at</i> utility at the time the job was  |
| 79043 |                  | scheduled.                                                                                   |
| 79044 | <i>timespec</i>  | Submit the job to be run at the date and time specified. All of the <i>timespec</i> operands |
| 79045 |                  | are interpreted as if they were separated by <space> characters and concatenated,            |
| 79046 |                  | and shall be parsed as described in the grammar at the end of this section. The date         |
| 79047 |                  | and time shall be interpreted as being in the timezone of the user (as determined            |
| 79048 |                  | by the <i>TZ</i> variable), unless a timezone name appears as part of <i>time</i> , below.   |
| 79049 |                  | In the POSIX locale, the following describes the three parts of the time specification       |
| 79050 |                  | string. All of the values from the <i>LC_TIME</i> categories in the POSIX locale shall be    |
| 79051 |                  | recognized in a case-insensitive manner.                                                     |
| 79052 | <i>time</i>      | The time can be specified as one, two, or four digits. One-digit and                         |
| 79053 |                  | two-digit numbers shall be taken to be hours; four-digit numbers to                          |
| 79054 |                  | be hours and minutes. The time can alternatively be specified as two                         |
| 79055 |                  | numbers separated by a <colon>, meaning <i>hour:minute</i> . An AM/PM                        |
| 79056 |                  | indication (one of the values from the <b>am_pm</b> keywords in the                          |
| 79057 |                  | <i>LC_TIME</i> locale category) can follow the time; otherwise, a 24-hour                    |
| 79058 |                  | clock time shall be understood. A timezone name can also follow to                           |
| 79059 |                  | further qualify the time. The acceptable timezone names are                                  |
| 79060 |                  | implementation-defined, except that they shall be case-insensitive                           |
| 79061 |                  | and the string <b>utc</b> is supported to indicate the time is in Coordinated                |
| 79062 |                  | Universal Time. In the POSIX locale, the <i>time</i> field can also be one of                |
| 79063 |                  | the following tokens:                                                                        |
| 79064 | <b>midnight</b>  | Indicates the time 12:00 am (00:00).                                                         |
| 79065 | <b>noon</b>      | Indicates the time 12:00 pm.                                                                 |
| 79066 | <b>now</b>       | Indicates the current day and time. Invoking <i>at &lt;now&gt;</i>                           |
| 79067 |                  | shall submit an at-job for potentially immediate                                             |
| 79068 |                  | execution (that is, subject only to unspecified                                              |
| 79069 |                  | scheduling delays).                                                                          |
| 79070 | <i>date</i>      | An optional <i>date</i> can be specified as either a month name (one of the                  |
| 79071 |                  | values from the <b>mon</b> or <b>abmon</b> keywords in the <i>LC_TIME</i> locale             |
| 79072 |                  | category) followed by a day number (and possibly year number                                 |
| 79073 |                  | preceded by a comma), or a day of the week (one of the values from                           |
| 79074 |                  | the <b>day</b> or <b>abday</b> keywords in the <i>LC_TIME</i> locale category). In the       |

79075 POSIX locale, two special days shall be recognized:

79076 **today** Indicates the current day.

79077 **tomorrow** Indicates the day following the current day.

79078 If no *date* is given, **today** shall be assumed if the given time is greater

79079 than the current time, and **tomorrow** shall be assumed if it is less. If

79080 the given month is less than the current month (and no year is given),

79081 next year shall be assumed.

79082 *increment* The optional *increment* shall be a number preceded by a <plus-sign>

79083 ('+') and suffixed by one of the following: **minutes**, **hours**, **days**,

79084 **weeks**, **months**, or **years**. (The singular forms shall also be accepted.)

79085 The keyword **next** shall be equivalent to an increment number of +1.

79086 For example, the following are equivalent commands:

79087 at 2pm + 1 week

79088 at 2pm next week

79089 The following grammar describes the precise format of *timespec* in the POSIX locale. The general

79090 conventions for this style of grammar are described in [Section 1.3](#) (on page 2325). This formal

79091 syntax shall take precedence over the preceding text syntax description. The longest possible

79092 token or delimiter shall be recognized at a given point. When used in a *timespec*, white space

79093 shall also delimit tokens.

79094 %token hr24clock\_hr\_min

79095 %token hr24clock\_hour

79096 /\*

79097 An hr24clock\_hr\_min is a one, two, or four-digit number. A one-digit

79098 or two-digit number constitutes an hr24clock\_hour. An hr24clock\_hour

79099 may be any of the single digits [0,9], or may be double digits, ranging

79100 from [00,23]. If an hr24clock\_hr\_min is a four-digit number, the

79101 first two digits shall be a valid hr24clock\_hour, while the last two

79102 represent the number of minutes, from [00,59].

79103 \*/

79104 %token wallclock\_hr\_min

79105 %token wallclock\_hour

79196                        ;

```

## 79197 STDIN

79198 The standard input shall be a text file consisting of commands acceptable to the shell command  
 79199 language described in [Chapter 2](#) (on page 2335). The standard input shall only be used if no `-f`  
 79200 *file* option is specified.

## 79201 INPUT FILES

79202 See the STDIN section.

79203 XSI The text files **at.allow** and **at.deny**, which are located in an implementation-defined directory,  
 79204 shall contain zero or more user names, one per line, of users who are, respectively, authorized or  
 79205 denied access to the *at* and *batch* utilities.

## 79206 ENVIRONMENT VARIABLES

79207 The following environment variables shall affect the execution of *at*:

|                         |                 |                                                                                                                                                                                                                                                          |
|-------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 79208<br>79209<br>79210 | <b>LANG</b>     | Provide a default value for the internationalization variables that are unset or null.<br>(See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization<br>variables used to determine the values of locale categories.) |
| 79211<br>79212          | <b>LC_ALL</b>   | If set to a non-empty string value, override the values of all the other<br>internationalization variables.                                                                                                                                              |
| 79213<br>79214<br>79215 | <b>LC_CTYPE</b> | Determine the locale for the interpretation of sequences of bytes of text data as<br>characters (for example, single-byte as opposed to multi-byte characters in<br>arguments and input files).                                                          |

|       |     |                             |                                                                                                              |
|-------|-----|-----------------------------|--------------------------------------------------------------------------------------------------------------|
| 79216 |     | <b>LC_MESSAGES</b>          |                                                                                                              |
| 79217 |     |                             | Determine the locale that should be used to affect the format and contents of                                |
| 79218 |     |                             | diagnostic messages written to standard error and informative messages written to                            |
| 79219 |     |                             | standard output.                                                                                             |
| 79220 | XSI | <b>NLSPATH</b>              | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                        |
| 79221 |     | <b>LC_TIME</b>              | Determine the format and contents for date and time strings written and accepted                             |
| 79222 |     |                             | by <i>at</i> .                                                                                               |
| 79223 |     | <b>SHELL</b>                | Determine a name of a command interpreter to be used to invoke the at-job. If the                            |
| 79224 |     |                             | variable is unset or null, <i>sh</i> shall be used. If it is set to a value other than a name for            |
| 79225 |     |                             | <i>sh</i> , the implementation shall do one of the following: use that shell; use <i>sh</i> ; use the        |
| 79226 |     |                             | login shell from the user database; or any of the preceding accompanied by a                                 |
| 79227 |     |                             | warning diagnostic about which was chosen.                                                                   |
| 79228 |     | <b>TZ</b>                   | Determine the timezone. The job shall be submitted for execution at the time                                 |
| 79229 |     |                             | specified by <i>timespec</i> or <i>-t time</i> relative to the timezone specified by the <i>TZ</i>           |
| 79230 |     |                             | variable. If <i>timespec</i> specifies a timezone, it shall override <i>TZ</i> . If <i>timespec</i> does not |
| 79231 |     |                             | specify a timezone and <i>TZ</i> is unset or null, an unspecified default timezone shall                     |
| 79232 |     |                             | be used.                                                                                                     |
| 79233 |     | <b>ASYNCHRONOUS EVENTS</b>  |                                                                                                              |
| 79234 |     |                             | Default.                                                                                                     |
| 79235 |     | <b>STDOUT</b>               |                                                                                                              |
| 79236 |     |                             | When standard input is a terminal, prompts of unspecified format for each line of the user input             |
| 79237 |     |                             | described in the STDIN section may be written to standard output.                                            |
| 79238 |     |                             | In the POSIX locale, the following shall be written to the standard output for each job when jobs            |
| 79239 |     |                             | are listed in response to the <i>-l</i> option:                                                              |
| 79240 |     |                             | "%s\t%s\n", <i>at_job_id</i> , < <i>date</i> >                                                               |
| 79241 |     |                             | where <i>date</i> shall be equivalent in format to the output of:                                            |
| 79242 |     |                             | date +"%a %b %e %T %Y"                                                                                       |
| 79243 |     |                             | The date and time written shall be adjusted so that they appear in the timezone of the user (as              |
| 79244 |     |                             | determined by the <i>TZ</i> variable).                                                                       |
| 79245 |     | <b>STDERR</b>               |                                                                                                              |
| 79246 |     |                             | In the POSIX locale, the following shall be written to standard error when a job has been                    |
| 79247 |     |                             | successfully submitted:                                                                                      |
| 79248 |     |                             | "job %s at %s\n", <i>at_job_id</i> , < <i>date</i> >                                                         |
| 79249 |     |                             | where <i>date</i> has the same format as that described in the STDOUT section. Neither this, nor             |
| 79250 |     |                             | warning messages concerning the selection of the command interpreter, shall be considered a                  |
| 79251 |     |                             | diagnostic that changes the exit status.                                                                     |
| 79252 |     |                             | Diagnostic messages, if any, shall be written to standard error.                                             |
| 79253 |     | <b>OUTPUT FILES</b>         |                                                                                                              |
| 79254 |     |                             | None.                                                                                                        |
| 79255 |     | <b>EXTENDED DESCRIPTION</b> |                                                                                                              |
| 79256 |     |                             | None.                                                                                                        |

**EXIT STATUS**

The following exit values shall be returned:

- 0 The *at* utility successfully submitted, removed, or listed a job or jobs.
- >0 An error occurred.

**CONSEQUENCES OF ERRORS**

The job shall not be scheduled, removed, or listed.

**APPLICATION USAGE**

The format of the *at* command line shown here is guaranteed only for the POSIX locale. Other cultures may be supported with substantially different interfaces, although implementations are encouraged to provide comparable levels of functionality.

Since the commands run in a separate shell invocation, running in a separate process group with no controlling terminal, open file descriptors, traps, and priority inherited from the invoking environment are lost.

Some implementations do not allow substitution of different shells using *SHELL*. System V systems, for example, have used the login shell value for the user in */etc/passwd*. To select reliably another command interpreter, the user must include it as part of the script, such as:

```
$ at 1800
myshell myscript
EOT
job ... at ...
$
```

**EXAMPLES**

1. This sequence can be used at a terminal:

```
at -m 0730 tomorrow
sort < file >outfile
EOT
```

2. This sequence, which demonstrates redirecting standard error to a pipe, is useful in a command procedure (the sequence of output redirection specifications is significant):

```
at now + 1 hour <<!
diff file1 file2 2>&1 >outfile | mailx mygroup
!
```

3. To have a job reschedule itself, *at* can be invoked from within the *at*-job. For example, this daily processing script named **my.daily** runs every day (although *crontab* is a more appropriate vehicle for such work):

```
# my.daily runs every day
daily processing
at now tomorrow < my.daily
```

4. The spacing of the three portions of the POSIX locale *timespec* is quite flexible as long as there are no ambiguities. Examples of various times and operand presentation include:

```
at 0815am Jan 24
at 8 :15amjan24
at now "+ 1day"
at 5 pm FRIday
at '17
```

```
79301         utc+
79302         30minutes'
```

## 79303 RATIONALE

79304 The *at* utility reads from standard input the commands to be executed at a later time. It may be  
79305 useful to redirect standard output and standard error within the specified commands.

79306 The *-t time* option was added as a new capability to support an internationalized way of  
79307 specifying a time for execution of the submitted job.

79308 Early proposals added a “jobname” concept as a way of giving submitted jobs names that are  
79309 meaningful to the user submitting them. The historical, system-specified *at\_job\_id* gives no  
79310 indication of what the job is. Upon further reflection, it was decided that the benefit of this was  
79311 not worth the change in historical interface. The *at* functionality is useful in simple  
79312 environments, but in large or complex situations, the functionality provided by the Batch  
79313 Services option is more suitable.

79314 The *-q* option historically has been an undocumented option, used mainly by the *batch* utility.

79315 The System V *-m* option was added to provide a method for informing users that an *at*-job had  
79316 completed. Otherwise, users are only informed when output to standard error or standard  
79317 output are not redirected.

79318 The behavior of *at <now>* was changed in an early proposal from being unspecified to  
79319 submitting a job for potentially immediate execution. Historical BSD *at* implementations support  
79320 this. Historical System V implementations give an error in that case, but a change to the System  
79321 V versions should have no backwards-compatibility ramifications.

79322 On BSD-based systems, a *-u user* option has allowed those with appropriate privileges to access  
79323 the work of other users. Since this is primarily a system administration feature and is not  
79324 universally implemented, it has been omitted. Similarly, a specification for the output format for  
79325 a user with appropriate privileges viewing the queues of other users has been omitted.

79326 The *-f file* option from System V is used instead of the BSD method of using the last operand as  
79327 the pathname. The BSD method is ambiguous—does:

```
79328 at 1200 friday
```

79329 mean the same thing if there is a file named **friday** in the current directory?

79330 The *at\_job\_id* is composed of a limited character set in historical practice, and it is mandated here  
79331 to invalidate systems that might try using characters that require shell quoting or that could not  
79332 be easily parsed by shell scripts.

79333 The *at* utility varies between System V and BSD systems in the way timezones are used. On  
79334 System V systems, the *TZ* variable affects the *at*-job submission times and the times displayed  
79335 for the user. On BSD systems, *TZ* is not taken into account. The BSD behavior is easily achieved  
79336 with the current specification. If the user wishes to have the timezone default to that of the  
79337 system, they merely need to issue the *at* command immediately following an unsetting or null  
79338 assignment to *TZ*. For example:

```
79339 TZ= at noon ...
```

79340 gives the desired BSD result.

79341 While the *yacc*-like grammar specified in the OPERANDS section is lexically unambiguous with  
79342 respect to the digit strings, a lexical analyzer would probably be written to look for and return  
79343 digit strings in those cases. The parser could then check whether the digit string returned is a  
79344 valid *day\_number*, *year\_number*, and so on, based on the context.

79345 **FUTURE DIRECTIONS**

79346 None.

79347 **SEE ALSO**79348 *batch, crontab*79349 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)79350 **CHANGE HISTORY**

79351 First released in Issue 2.

79352 **Issue 6**

79353 This utility is marked as part of the User Portability Utilities option.

79354 The following new requirements on POSIX implementations derive from alignment with the  
79355 Single UNIX Specification:

- 79356
- If **-m** is not used, the job's standard output and standard error are provided to the user by
- 
- 79357 mail.

79358 The effects of using the **-q** and **-t** options as defined in the IEEE P1003.2b draft standard are  
79359 specified.

79360 The normative text is reworded to avoid use of the term “must” for application requirements.

79361 **Issue 7**79362 The *at* utility is moved from the User Portability Utilities option to the Base. User Portability  
79363 Utilities is now an option for interactive utilities.79364 SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced  
79365 by the *at* utility.

79366 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**NAME**

awk — pattern scanning and processing language

**SYNOPSIS**

awk [-F *sepstring*] [-v *assignment*]... *program* [*argument*...]

awk [-F *sepstring*] -f *progfile* [-f *progfile*]... [-v *assignment*]...  
[*argument*...]

**DESCRIPTION**

The *awk* utility shall execute programs written in the *awk* programming language, which is specialized for textual data manipulation. An *awk* program is a sequence of patterns and corresponding actions. When input is read that matches a pattern, the action associated with that pattern is carried out.

Input shall be interpreted as a sequence of records. By default, a record is a line, less its terminating <newline>, but this can be changed by using the **RS** built-in variable. Each record of input shall be matched in turn against each pattern in the program. For each pattern matched, the associated action shall be executed.

The *awk* utility shall interpret each input record as a sequence of fields where, by default, a field is a string of non-<blank> non-<newline> characters. This default <blank> and <newline> field delimiter can be changed by using the **FS** built-in variable or the **-F *sepstring*** option. The *awk* utility shall denote the first field in a record \$1, the second \$2, and so on. The symbol \$0 shall refer to the entire record; setting any other field causes the re-evaluation of \$0. Assigning to \$0 shall reset the values of all other fields and the **NF** built-in variable.

**OPTIONS**

The *awk* utility shall conform to XBD [Section 12.2](#) (on page 216).

The following options shall be supported:

**-F *sepstring*** Define the input field separator. This option shall be equivalent to:

**-v FS=*sepstring***

except that if **-F *sepstring*** and **-v FS=*sepstring*** are both used, it is unspecified whether the **FS** assignment resulting from **-F *sepstring*** is processed in command line order or is processed after the last **-v FS=*sepstring***. See the description of the **FS** built-in variable, and how it is used, in the EXTENDED DESCRIPTION section.

**-f *progfile*** Specify the pathname of the file *progfile* containing an *awk* program. A pathname of '-' shall denote the standard input. If multiple instances of this option are specified, the concatenation of the files specified as *progfile* in the order specified shall be the *awk* program. The *awk* program can alternatively be specified in the command line as a single argument.

**-v *assignment***

The application shall ensure that the *assignment* argument is in the same form as an *assignment* operand. The specified variable assignment shall occur prior to executing the *awk* program, including the actions associated with **BEGIN** patterns (if any). Multiple occurrences of this option can be specified.

**OPERANDS**

The following operands shall be supported:

*program* If no **-f** option is specified, the first operand to *awk* shall be the text of the *awk* program. The application shall supply the *program* operand as a single argument to *awk*. If the text does not end in a <newline>, *awk* shall interpret the text as if it did.

79412 *argument* Either of the following two types of *argument* can be intermixed:

79413 *file* A pathname of a file that contains the input to be read, which is

79414 matched against the set of patterns in the program. If no *file* operands

79415 are specified, or if a *file* operand is *'-'*, the standard input shall be

79416 used.

79417 *assignment* An operand that begins with an <underscore> or alphabetic

79418 character from the portable character set (see the table in XBD [Section](#)

79419 [6.1](#), on page 125), followed by a sequence of underscores, digits, and

79420 alphabetic characters from the portable character set, followed by the *'='*

79421 character, shall specify a variable assignment rather than a pathname.

79422 The characters before the *'='* represent the name of an *awk* variable;

79423 if that name is an *awk* reserved word (see [Grammar](#), on page 2490)

79424 the behavior is undefined. The characters following the <equals-

79425 sign> shall be interpreted as if they appeared in the *awk* program

79426 preceded and followed by a double-quote (*'"*) character, as a

79427 **STRING** token (see [Grammar](#), on page 2490), except that if the last

79428 character is an unescaped <backslash>, it shall be interpreted as a

79429 literal <backslash> rather than as the first character of the sequence

79430 *"\"*. The variable shall be assigned the value of that **STRING**

79431 token and, if appropriate, shall be considered a *numeric string* (see

79432 [Expressions in awk](#), on page 2475), the variable shall also be assigned

79433 its numeric value. Each such variable assignment shall occur just

79434 prior to the processing of the following *file*, if any. Thus, an

79435 assignment before the first *file* argument shall be executed after the

79436 **BEGIN** actions (if any), while an assignment after the last *file*

79437 argument shall occur before the **END** actions (if any). If there are no

79438 *file* arguments, assignments shall be executed before processing the

79439 standard input.

#### 79440 STDIN

79441 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*,

79442 or if a *progfile* option-argument is *'-'*; see the INPUT FILES section. If the *awk* program contains

79443 no actions and no patterns, but is otherwise a valid *awk* program, standard input and any *file*

79444 operands shall not be read and *awk* shall exit with a return status of zero.

#### 79445 INPUT FILES

79446 Input files to the *awk* program from any of the following sources shall be text files:

- 79447 • Any *file* operands or their equivalents, achieved by modifying the *awk* variables **ARGV**
- 79448 and **ARGC**
- 79449 • Standard input in the absence of any *file* operands
- 79450 • Arguments to the **getline** function

79451 Whether the variable **RS** is set to a value other than a <newline> or not, for these files,

79452 implementations shall support records terminated with the specified separator up to

79453 {**LINE\_MAX**} bytes and may support longer records.

79454 If *-f progfile* is specified, the application shall ensure that the files named by each of the *progfile*

79455 option-arguments are text files and their concatenation, in the same order as they appear in the

79456 arguments, is an *awk* program.

**ENVIRONMENT VARIABLES**

The following environment variables shall affect the execution of *awk*:

**LANG** Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)

**LC\_ALL** If set to a non-empty string value, override the values of all the other internationalization variables.

**LC\_COLLATE**

Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements within regular expressions and in comparisons of string values.

**LC\_CTYPE**

Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files), the behavior of character classes within regular expressions, the identification of characters as letters, and the mapping of uppercase and lowercase characters for the **toupper** and **tolower** functions.

**LC\_MESSAGES**

Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

**LC\_NUMERIC**

Determine the radix character used when interpreting numeric input, performing conversions between numeric and string values, and formatting numeric output. Regardless of locale, the <period> character (the decimal-point character of the POSIX locale) is the decimal-point character recognized in processing *awk* programs (including assignments in command line arguments).

**NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

**PATH** Determine the search path when looking for commands executed by *system(expr)*, or input and output pipes; see XBD [Chapter 8](#) (on page 173).

In addition, all environment variables shall be visible via the *awk* variable **ENVIRON**.

**ASYNCHRONOUS EVENTS**

Default.

**STDOUT**

The nature of the output files depends on the *awk* program.

**STDERR**

The standard error shall be used only for diagnostic messages.

**OUTPUT FILES**

The nature of the output files depends on the *awk* program.

## EXTENDED DESCRIPTION

## Overall Program Structure

An *awk* program is composed of pairs of the form:

```
pattern { action }
```

Either the pattern or the action (including the enclosing brace characters) can be omitted.

A missing pattern shall match any record of input, and a missing action shall be equivalent to:

```
{ print }
```

Execution of the *awk* program shall start by first executing the actions associated with all **BEGIN** patterns in the order they occur in the program. Then each *file* operand (or standard input if no files were specified) shall be processed in turn by reading data from the file until a record separator is seen (<newline> by default). Before the first reference to a field in the record is evaluated, the record shall be split into fields, according to the rules in [Regular Expressions](#) (on page 2481), using the value of **FS** that was current at the time the record was read. Each pattern in the program then shall be evaluated in the order of occurrence, and the action associated with each pattern that matches the current record executed. The action for a matching pattern shall be executed before evaluating subsequent patterns. Finally, the actions associated with all **END** patterns shall be executed in the order they occur in the program.

## Expressions in awk

Expressions describe computations used in *patterns* and *actions*. In the following table, valid expression operations are given in groups from highest precedence first to lowest precedence last, with equal-precedence operators grouped between horizontal lines. In expression evaluation, where the grammar is formally ambiguous, higher precedence operators shall be evaluated before lower precedence operators. In this table *expr*, *expr1*, *expr2*, and *expr3* represent any expression, while *lvalue* represents any entity that can be assigned to (that is, on the left side of an assignment operator). The precise syntax of expressions is given in [Grammar](#) (on page 2490).

Table 4-1 Expressions in Decreasing Precedence in *awk*

| Syntax                    | Name            | Type of Result      | Associativity |
|---------------------------|-----------------|---------------------|---------------|
| ( <i>expr</i> )           | Grouping        | Type of <i>expr</i> | N/A           |
| <i>\$expr</i>             | Field reference | String              | N/A           |
| <i>lvalue</i> ++          | Post-increment  | Numeric             | N/A           |
| <i>lvalue</i> --          | Post-decrement  | Numeric             | N/A           |
| ++ <i>lvalue</i>          | Pre-increment   | Numeric             | N/A           |
| -- <i>lvalue</i>          | Pre-decrement   | Numeric             | N/A           |
| <i>expr</i> ^ <i>expr</i> | Exponentiation  | Numeric             | Right         |
| ! <i>expr</i>             | Logical not     | Numeric             | N/A           |
| + <i>expr</i>             | Unary plus      | Numeric             | N/A           |
| - <i>expr</i>             | Unary minus     | Numeric             | N/A           |
| <i>expr</i> * <i>expr</i> | Multiplication  | Numeric             | Left          |
| <i>expr</i> / <i>expr</i> | Division        | Numeric             | Left          |
| <i>expr</i> % <i>expr</i> | Modulus         | Numeric             | Left          |

| Syntax                                     | Name                             | Type of Result                                   | Associativity |
|--------------------------------------------|----------------------------------|--------------------------------------------------|---------------|
| <i>expr</i> + <i>expr</i>                  | Addition                         | Numeric                                          | Left          |
| <i>expr</i> - <i>expr</i>                  | Subtraction                      | Numeric                                          | Left          |
| <i>expr</i> <i>expr</i>                    | String concatenation             | String                                           | Left          |
| <i>expr</i> < <i>expr</i>                  | Less than                        | Numeric                                          | None          |
| <i>expr</i> <= <i>expr</i>                 | Less than or equal to            | Numeric                                          | None          |
| <i>expr</i> != <i>expr</i>                 | Not equal to                     | Numeric                                          | None          |
| <i>expr</i> == <i>expr</i>                 | Equal to                         | Numeric                                          | None          |
| <i>expr</i> > <i>expr</i>                  | Greater than                     | Numeric                                          | None          |
| <i>expr</i> >= <i>expr</i>                 | Greater than or equal to         | Numeric                                          | None          |
| <i>expr</i> ~ <i>expr</i>                  | ERE match                        | Numeric                                          | None          |
| <i>expr</i> !~ <i>expr</i>                 | ERE non-match                    | Numeric                                          | None          |
| <i>expr</i> in array                       | Array membership                 | Numeric                                          | Left          |
| ( <i>index</i> ) in array                  | Multi-dimension array membership | Numeric                                          | Left          |
| <i>expr</i> && <i>expr</i>                 | Logical AND                      | Numeric                                          | Left          |
| <i>expr</i>    <i>expr</i>                 | Logical OR                       | Numeric                                          | Left          |
| <i>expr1</i> ? <i>expr2</i> : <i>expr3</i> | Conditional expression           | Type of selected<br><i>expr2</i> or <i>expr3</i> | Right         |
| <i>lvalue</i> ^= <i>expr</i>               | Exponentiation assignment        | Numeric                                          | Right         |
| <i>lvalue</i> %= <i>expr</i>               | Modulus assignment               | Numeric                                          | Right         |
| <i>lvalue</i> *= <i>expr</i>               | Multiplication assignment        | Numeric                                          | Right         |
| <i>lvalue</i> /= <i>expr</i>               | Division assignment              | Numeric                                          | Right         |
| <i>lvalue</i> += <i>expr</i>               | Addition assignment              | Numeric                                          | Right         |
| <i>lvalue</i> -= <i>expr</i>               | Subtraction assignment           | Numeric                                          | Right         |
| <i>lvalue</i> = <i>expr</i>                | Assignment                       | Type of <i>expr</i>                              | Right         |

Each expression shall have either a string value, a numeric value, or both. Except as stated for specific contexts, the value of an expression shall be implicitly converted to the type needed for the context in which it is used. A string value shall be converted to a numeric value either by the equivalent of the following calls to functions defined by the ISO C standard:

```
setlocale(LC_NUMERIC, "");
numeric_value = atof(string_value);
```

or by converting the initial portion of the string to type **double** representation as follows:

The input string is decomposed into two parts: an initial, possibly empty, sequence of white-space characters (as specified by *isspace()*) and a subject sequence interpreted as a floating-point constant.

The expected form of the subject sequence is an optional '+' or '-' sign, then a non-empty sequence of digits optionally containing a <period>, then an optional exponent part. An exponent part consists of 'e' or 'E', followed by an optional sign, followed by one or more decimal digits.

The sequence starting with the first digit or the <period> (whichever occurs first) is interpreted as a floating constant of the C language, and if neither an exponent part nor a <period> appears, a <period> is assumed to follow the last digit in the string. If the subject sequence begins with a <hyphen-minus>, the value resulting from the conversion is negated.

A numeric value that is exactly equal to the value of an integer (see [Section 1.1.2](#), on page 2321)

shall be converted to a string by the equivalent of a call to the **sprintf** function (see [String Functions](#), on page 2487) with the string "%d" as the *fmt* argument and the numeric value being converted as the first and only *expr* argument. Any other numeric value shall be converted to a string by the equivalent of a call to the **sprintf** function with the value of the variable **CONVFMT** as the *fmt* argument and the numeric value being converted as the first and only *expr* argument. The result of the conversion is unspecified if the value of **CONVFMT** is not a floating-point format specification. This volume of POSIX.1-2008 specifies no explicit conversions between numbers and strings. An application can force an expression to be treated as a number by adding zero to it, or can force it to be treated as a string by concatenating the null string (" ") to it.

A string value shall be considered a *numeric string* if it comes from one of the following:

1. Field variables
2. Input from the *getline()* function
3. **FILENAME**
4. **ARGV** array elements
5. **ENVIRON** array elements
6. Array elements created by the *split()* function
7. A command line variable assignment
8. Variable assignment from another numeric string variable

and an implementation-dependent condition corresponding to either case (a) or (b) below is met.

- a. After the equivalent of the following calls to functions defined by the ISO C standard, *string\_value\_end* would differ from *string\_value*, and any characters before the terminating null character in *string\_value\_end* would be <blank> characters:

```
char *string_value_end;
setlocale(LC_NUMERIC, "");
numeric_value = strtod (string_value, &string_value_end);
```

- b. After all the following conversions have been applied, the resulting string would lexically be recognized as a **NUMBER** token as described by the lexical conventions in [Grammar](#) (on page 2490):

- All leading and trailing <blank> characters are discarded.
- If the first non-<blank> is '+' or '-', it is discarded.
- Each occurrence of the decimal point character from the current locale is changed to a <period>.

In case (a) the numeric value of the *numeric string* shall be the value that would be returned by the *strtod()* call. In case (b) if the first non-<blank> is '-', the numeric value of the *numeric string* shall be the negation of the numeric value of the recognized **NUMBER** token; otherwise, the numeric value of the *numeric string* shall be the numeric value of the recognized **NUMBER** token. Whether or not a string is a *numeric string* shall be relevant only in contexts where that term is used in this section.

When an expression is used in a Boolean context, if it has a numeric value, a value of zero shall be treated as false and any other value shall be treated as true. Otherwise, a string value of the null string shall be treated as false and any other value shall be treated as true. A Boolean

context shall be one of the following:

- The first subexpression of a conditional expression
- An expression operated on by logical NOT, logical AND, or logical OR
- The second expression of a **for** statement
- The expression of an **if** statement
- The expression of the **while** clause in either a **while** or **do...while** statement
- An expression used as a pattern (as in Overall Program Structure)

All arithmetic shall follow the semantics of floating-point arithmetic as specified by the ISO C standard (see [Section 1.1.2](#), on page 2321).

The value of the expression:

```
expr1 ^ expr2
```

shall be equivalent to the value returned by the ISO C standard function call:

```
pow(expr1, expr2)
```

The expression:

```
lvalue ^= expr
```

shall be equivalent to the ISO C standard expression:

```
lvalue = pow(lvalue, expr)
```

except that lvalue shall be evaluated only once. The value of the expression:

```
expr1 % expr2
```

shall be equivalent to the value returned by the ISO C standard function call:

```
fmod(expr1, expr2)
```

The expression:

```
lvalue %= expr
```

shall be equivalent to the ISO C standard expression:

```
lvalue = fmod(lvalue, expr)
```

except that lvalue shall be evaluated only once.

Variables and fields shall be set by the assignment statement:

```
lvalue = expression
```

and the type of *expression* shall determine the resulting variable type. The assignment includes the arithmetic assignments ("**+=**", "**-=**", "**\*=**", "**/=**", "**%=**", "**^=**", "**++**", "**--**") all of which shall produce a numeric result. The left-hand side of an assignment and the target of increment and decrement operators can be one of a variable, an array with index, or a field selector.

The *awk* language supplies arrays that are used for storing numbers or strings. Arrays need not be declared. They shall initially be empty, and their sizes shall change dynamically. The subscripts, or element identifiers, are strings, providing a type of associative array capability. An array name followed by a subscript within square brackets can be used as an lvalue and thus as an expression, as described in the grammar; see [Grammar](#) (on page 2490). Unsubscripted array names can be used in only the following contexts:

- A parameter in a function definition or function call
- The **NAME** token following any use of the keyword **in** as specified in the grammar (see [Grammar](#), on page 2490); if the name used in this context is not an array name, the behavior is undefined

A valid array *index* shall consist of one or more <comma>-separated expressions, similar to the way in which multi-dimensional arrays are indexed in some programming languages. Because *awk* arrays are really one-dimensional, such a <comma>-separated list shall be converted to a single string by concatenating the string values of the separate expressions, each separated from the other by the value of the **SUBSEP** variable. Thus, the following two index operations shall be equivalent:

```
var[expr1, expr2, ... exprn]
```

```
var[expr1 SUBSEP expr2 SUBSEP ... SUBSEP exprn]
```

The application shall ensure that a multi-dimensioned *index* used with the **in** operator is parenthesized. The **in** operator, which tests for the existence of a particular array element, shall not cause that element to exist. Any other reference to a nonexistent array element shall automatically create it.

Comparisons (with the '<', '<=', '!=', '==', '>', and '>=' operators) shall be made numerically if both operands are numeric, if one is numeric and the other has a string value that is a numeric string, or if one is numeric and the other has the uninitialized value. Otherwise, operands shall be converted to strings as required and a string comparison shall be made as follows:

- For the '!=' and '==' operators, the strings should be compared to check if they are identical but may be compared using the locale-specific collation sequence to check if they collate equally.
- For the other operators, the strings shall be compared using the locale-specific collation sequence.

The value of the comparison expression shall be 1 if the relation is true, or 0 if the relation is false.

## Variables and Special Variables

Variables can be used in an *awk* program by referencing them. With the exception of function parameters (see [User-Defined Functions](#), on page 2489), they are not explicitly declared. Function parameter names shall be local to the function; all other variable names shall be global. The same name shall not be used as both a function parameter name and as the name of a function or a special *awk* variable. The same name shall not be used both as a variable name with global scope and as the name of a function. The same name shall not be used within the same scope both as a scalar variable and as an array. Uninitialized variables, including scalar variables, array elements, and field variables, shall have an uninitialized value. An uninitialized value shall have both a numeric value of zero and a string value of the empty string. Evaluation of variables with an uninitialized value, to either string or numeric, shall be determined by the context in which they are used.

Field variables shall be designated by a '\$' followed by a number or numerical expression. The effect of the field number *expression* evaluating to anything other than a non-negative integer is unspecified; uninitialized variables or string values need not be converted to numeric values in this context. New field variables can be created by assigning a value to them. References to nonexistent fields (that is, fields after \$NF), shall evaluate to the uninitialized value. Such

references shall not create new fields. However, assigning to a nonexistent field (for example,  $\$(NF+2)=5$ ) shall increase the value of **NF**; create any intervening fields with the uninitialized value; and cause the value of **\$0** to be recomputed, with the fields being separated by the value of **OFS**. Each field variable shall have a string value or an uninitialized value when created. Field variables shall have the uninitialized value when created from **\$0** using **FS** and the variable does not contain any characters. If appropriate, the field variable shall be considered a numeric string (see [Expressions in awk](#), on page 2475).

Implementations shall support the following other special variables that are set by *awk*:

**ARGC** The number of elements in the **ARGV** array.

**ARGV** An array of command line arguments, excluding options and the *program* argument, numbered from zero to **ARGC**–1.

The arguments in **ARGV** can be modified or added to; **ARGC** can be altered. As each input file ends, *awk* shall treat the next non-null element of **ARGV**, up to the current value of **ARGC**–1, inclusive, as the name of the next input file. Thus, setting an element of **ARGV** to null means that it shall not be treated as an input file. The name ‘–’ indicates the standard input. If an argument matches the format of an *assignment* operand, this argument shall be treated as an *assignment* rather than a *file* argument.

**CONVFMT** The **printf** format for converting numbers to strings (except for output statements, where **OFMT** is used); “%.6g” by default.

**ENVIRON** An array representing the value of the environment, as described in the *exec* functions defined in the System Interfaces volume of POSIX.1-2008. The indices of the array shall be strings consisting of the names of the environment variables, and the value of each array element shall be a string consisting of the value of that variable. If appropriate, the environment variable shall be considered a *numeric string* (see [Expressions in awk](#), on page 2475); the array element shall also have its numeric value.

In all cases where the behavior of *awk* is affected by environment variables (including the environment of any commands that *awk* executes via the **system** function or via pipeline redirections with the **print** statement, the **printf** statement, or the **getline** function), the environment used shall be the environment at the time *awk* began executing; it is implementation-defined whether any modification of **ENVIRON** affects this environment.

**FILENAME** A pathname of the current input file. Inside a **BEGIN** action the value is undefined. Inside an **END** action the value shall be the name of the last input file processed.

**FNR** The ordinal number of the current record in the current file. Inside a **BEGIN** action the value shall be zero. Inside an **END** action the value shall be the number of the last record processed in the last file processed.

**FS** Input field separator regular expression; a <space> by default.

**NF** The number of fields in the current record. Inside a **BEGIN** action, the use of **NF** is undefined unless a **getline** function without a *var* argument is executed previously. Inside an **END** action, **NF** shall retain the value it had for the last record read, unless a subsequent, redirected, **getline** function without a *var* argument is performed prior to entering the **END** action.

|       |                |                                                                                                      |
|-------|----------------|------------------------------------------------------------------------------------------------------|
| 79752 | <b>NR</b>      | The ordinal number of the current record from the start of input. Inside a <b>BEGIN</b>              |
| 79753 |                | action the value shall be zero. Inside an <b>END</b> action the value shall be the number            |
| 79754 |                | of the last record processed.                                                                        |
| 79755 | <b>OFMT</b>    | The <b>printf</b> format for converting numbers to strings in output statements (see                 |
| 79756 |                | <a href="#">Output Statements</a> , on page 2485); "% . 6g" by default. The result of the conversion |
| 79757 |                | is unspecified if the value of <b>OFMT</b> is not a floating-point format specification.             |
| 79758 | <b>OFS</b>     | The <b>print</b> statement output field separator; <space> by default.                               |
| 79759 | <b>ORS</b>     | The <b>print</b> statement output record separator; a <newline> by default.                          |
| 79760 | <b>RLENGTH</b> | The length of the string matched by the <b>match</b> function.                                       |
| 79761 | <b>RS</b>      | The first character of the string value of <b>RS</b> shall be the input record separator; a          |
| 79762 |                | <newline> by default. If <b>RS</b> contains more than one character, the results are                 |
| 79763 |                | unspecified. If <b>RS</b> is null, then records are separated by sequences consisting of a           |
| 79764 |                | <newline> plus one or more blank lines, leading or trailing blank lines shall not                    |
| 79765 |                | result in empty records at the beginning or end of the input, and a <newline> shall                  |
| 79766 |                | always be a field separator, no matter what the value of <b>FS</b> is.                               |
| 79767 | <b>RSTART</b>  | The starting position of the string matched by the <b>match</b> function, numbering from             |
| 79768 |                | 1. This shall always be equivalent to the return value of the <b>match</b> function.                 |
| 79769 | <b>SUBSEP</b>  | The subscript separator string for multi-dimensional arrays; the default value is                    |
| 79770 |                | implementation-defined.                                                                              |

#### 79771 **Regular Expressions**

79772 The *awk* utility shall make use of the extended regular expression notation (see XBD [Section 9.4](#),  
 79773 on page 188) except that it shall allow the use of C-language conventions for escaping special  
 79774 characters within the EREs, as specified in the table in XBD [Chapter 5](#) (on page 121) ('\\',  
 79775 '\\a', '\\b', '\\f', '\\n', '\\r', '\\t', '\\v') and the following table; these escape sequences  
 79776 shall be recognized both inside and outside bracket expressions. Note that records need not be  
 79777 separated by <newline> characters and string constants can contain <newline> characters, so  
 79778 even the "\\n" sequence is valid in *awk* EREs. Using a <slash> character within an ERE requires  
 79779 the escaping shown in the following table.

Table 4-2 Escape Sequences in *awk*

| Escape Sequence | Description                                                                                                                                                                                                             | Meaning                                                                                                                                                                                                                         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \ "             | <backslash> <quotation-mark>                                                                                                                                                                                            | <quotation-mark> character                                                                                                                                                                                                      |
| \ /             | <backslash> <slash>                                                                                                                                                                                                     | <slash> character                                                                                                                                                                                                               |
| \ ddd           | A <backslash> character followed by the longest sequence of one, two, or three octal-digit characters (01234567). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined. | The character whose encoding is represented by the one, two, or three-digit octal integer. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading <backslash> for each byte. |
| \ c             | A <backslash> character followed by any character not described in this table or in the table in XBD Chapter 5 (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v').                                          | Undefined                                                                                                                                                                                                                       |

A regular expression can be matched against a specific field or string by using one of the two regular expression matching operators, '~' and '!~'. These operators shall interpret their right-hand operand as a regular expression and their left-hand operand as a string. If the regular expression matches the string, the '~' expression shall evaluate to a value of 1, and the '!~' expression shall evaluate to a value of 0. (The regular expression matching operation is as defined by the term matched in XBD Section 9.1 (on page 181), where a match occurs on any part of the string unless the regular expression is limited with the <circumflex> or <dollar-sign> special characters.) If the regular expression does not match the string, the '~' expression shall evaluate to a value of 0, and the '!~' expression shall evaluate to a value of 1. If the right-hand operand is any expression other than the lexical token **ERE**, the string value of the expression shall be interpreted as an extended regular expression, including the escape conventions described above. Note that these same escape conventions shall also be applied in determining the value of a string literal (the lexical token **STRING**), and thus shall be applied a second time when a string literal is used in this context.

When an **ERE** token appears as an expression in any context other than as the right-hand of the '~' or '!~' operator or as one of the built-in function arguments described below, the value of the resulting expression shall be the equivalent of:

```
$0 ~ /ere/
```

The *ere* argument to the **gsub**, **match**, **sub** functions, and the *fs* argument to the **split** function (see [String Functions](#), on page 2487) shall be interpreted as extended regular expressions. These can be either **ERE** tokens or arbitrary expressions, and shall be interpreted in the same manner as the right-hand side of the '~' or '!~' operator.

An extended regular expression can be used to separate fields by assigning a string containing the expression to the built-in variable **FS**, either directly or as a consequence of using the **-F sepstring** option. The default value of the **FS** variable shall be a single <space>. The following describes **FS** behavior:

1. If **FS** is a null string, the behavior is unspecified.

2. If **FS** is a single character:

- a. If **FS** is <space>, skip leading and trailing <blank> and <newline> characters; fields shall be delimited by sets of one or more <blank> or <newline> characters.
- b. Otherwise, if **FS** is any other character *c*, fields shall be delimited by each single occurrence of *c*.

3. Otherwise, the string value of **FS** shall be considered to be an extended regular expression. Each occurrence of a sequence matching the extended regular expression shall delimit fields.

Except for the '*~*' and '!~' operators, and in the **gsub**, **match**, **split**, and **sub** built-in functions, ERE matching shall be based on input records; that is, record separator characters (the first character of the value of the variable **RS**, <newline> by default) cannot be embedded in the expression, and no expression shall match the record separator character. If the record separator is not <newline>, <newline> characters embedded in the expression can be matched. For the '*~*' and '!~' operators, and in those four built-in functions, ERE matching shall be based on text strings; that is, any character (including <newline> and the record separator) can be embedded in the pattern, and an appropriate pattern shall match any character. However, in all *awk* ERE matching, the use of one or more NUL characters in the pattern, input record, or text string produces undefined results.

## Patterns

A *pattern* is any valid *expression*, a range specified by two expressions separated by a comma, or one of the two special patterns **BEGIN** or **END**.

## Special Patterns

The *awk* utility shall recognize two special patterns, **BEGIN** and **END**. Each **BEGIN** pattern shall be matched once and its associated action executed before the first record of input is read—except possibly by use of the **getline** function (see [Input/Output and General Functions](#), on page 2488) in a prior **BEGIN** action—and before command line assignment is done. Each **END** pattern shall be matched once and its associated action executed after the last record of input has been read. These two patterns shall have associated actions.

**BEGIN** and **END** shall not combine with other patterns. Multiple **BEGIN** and **END** patterns shall be allowed. The actions associated with the **BEGIN** patterns shall be executed in the order specified in the program, as are the **END** actions. An **END** pattern can precede a **BEGIN** pattern in a program.

If an *awk* program consists of only actions with the pattern **BEGIN**, and the **BEGIN** action contains no **getline** function, *awk* shall exit without reading its input when the last statement in the last **BEGIN** action is executed. If an *awk* program consists of only actions with the pattern **END** or only actions with the patterns **BEGIN** and **END**, the input shall be read before the statements in the **END** actions are executed.

## Expression Patterns

An expression pattern shall be evaluated as if it were an expression in a Boolean context. If the result is true, the pattern shall be considered to match, and the associated action (if any) shall be executed. If the result is false, the action shall not be executed.

## Pattern Ranges

A pattern range consists of two expressions separated by a comma; in this case, the action shall be performed for all records between a match of the first expression and the following match of the second expression, inclusive. At this point, the pattern range can be repeated starting at input records subsequent to the end of the matched range.

## Actions

An action is a sequence of statements as shown in the grammar in [Grammar](#) (on page 2490). Any single statement can be replaced by a statement list enclosed in curly braces. The application shall ensure that statements in a statement list are separated by <newline> or <semicolon> characters. Statements in a statement list shall be executed sequentially in the order that they appear.

The *expression* acting as the conditional in an **if** statement shall be evaluated and if it is non-zero or non-null, the following statement shall be executed; otherwise, if **else** is present, the statement following the **else** shall be executed.

The **if**, **while**, **do...while**, **for**, **break**, and **continue** statements are based on the ISO C standard (see [Section 1.1.2](#), on page 2321), except that the Boolean expressions shall be treated as described in [Expressions in awk](#) (on page 2475), and except in the case of:

```
for (variable in array)
```

which shall iterate, assigning each *index* of *array* to *variable* in an unspecified order. The results of adding new elements to *array* within such a **for** loop are undefined. If a **break** or **continue** statement occurs outside of a loop, the behavior is undefined.

The **delete** statement shall remove an individual array element. Thus, the following code deletes an entire array:

```
for (index in array)  
    delete array[index]
```

The **next** statement shall cause all further processing of the current input record to be abandoned. The behavior is undefined if a **next** statement appears or is invoked in a **BEGIN** or **END** action.

The **exit** statement shall invoke all **END** actions in the order in which they occur in the program source and then terminate the program without reading further input. An **exit** statement inside an **END** action shall terminate the program without further execution of **END** actions. If an expression is specified in an **exit** statement, its numeric value shall be the exit status of *awk*, unless subsequent errors are encountered or a subsequent **exit** statement with an expression is executed.

## Output Statements

Both **print** and **printf** statements shall write to standard output by default. The output shall be written to the location specified by *output\_redirection* if one is supplied, as follows:

```
> expression
>> expression
| expression
```

In all cases, the *expression* shall be evaluated to produce a string that is used as a pathname into which to write (for '*>*' or "*>>*") or as a command to be executed (for '*|*'). Using the first two forms, if the file of that name is not currently open, it shall be opened, creating it if necessary and using the first form, truncating the file. The output then shall be appended to the file. As long as the file remains open, subsequent calls in which *expression* evaluates to the same string value shall simply append output to the file. The file remains open until the **close** function (see [Input/Output and General Functions](#), on page 2488) is called with an expression that evaluates to the same string value.

The third form shall write output onto a stream piped to the input of a command. The stream shall be created if no stream is currently open with the value of *expression* as its command name. The stream created shall be equivalent to one created by a call to the *popen()* function defined in the System Interfaces volume of POSIX.1-2008 with the value of *expression* as the *command* argument and a value of *w* as the *mode* argument. As long as the stream remains open, subsequent calls in which *expression* evaluates to the same string value shall write output to the existing stream. The stream shall remain open until the **close** function (see [Input/Output and General Functions](#), on page 2488) is called with an expression that evaluates to the same string value. At that time, the stream shall be closed as if by a call to the *pclose()* function defined in the System Interfaces volume of POSIX.1-2008.

As described in detail by the grammar in [Grammar](#) (on page 2490), these output statements shall take a <comma>-separated list of *expressions* referred to in the grammar by the non-terminal symbols **expr\_list**, **print\_expr\_list**, or **print\_expr\_list\_opt**. This list is referred to here as the *expression list*, and each member is referred to as an *expression argument*.

The **print** statement shall write the value of each expression argument onto the indicated output stream separated by the current output field separator (see variable **OFS** above), and terminated by the output record separator (see variable **ORS** above). All expression arguments shall be taken as strings, being converted if necessary; this conversion shall be as described in [Expressions in awk](#) (on page 2475), with the exception that the **printf** format in **OFMT** shall be used instead of the value in **CONVFMT**. An empty expression list shall stand for the whole input record (\$0).

The **printf** statement shall produce output based on a notation similar to the File Format Notation used to describe file formats in this volume of POSIX.1-2008 (see XBD [Chapter 5](#), on page 121). Output shall be produced as specified with the first *expression* argument as the string *format* and subsequent *expression* arguments as the strings *arg1* to *argn*, inclusive, with the following exceptions:

1. The *format* shall be an actual character string rather than a graphical representation. Therefore, it cannot contain empty character positions. The <space> in the *format* string, in any context other than a *flag* of a conversion specification, shall be treated as an ordinary character that is copied to the output.
2. If the character set contains a 'Δ' character and that character appears in the *format* string, it shall be treated as an ordinary character that is copied to the output.

3. The *escape sequences* beginning with a <backslash> character shall be treated as sequences of ordinary characters that are copied to the output. Note that these same sequences shall be interpreted lexically by *awk* when they appear in literal strings, but they shall not be treated specially by the **printf** statement.
4. A *field width* or *precision* can be specified as the ' \* ' character instead of a digit string. In this case the next argument from the expression list shall be fetched and its numeric value taken as the field width or precision.
5. The implementation shall not precede or follow output from the d or u conversion specifier characters with <blank> characters not specified by the *format* string.
6. The implementation shall not precede output from the o conversion specifier character with leading zeros not specified by the *format* string.
7. For the c conversion specifier character: if the argument has a numeric value, the character whose encoding is that value shall be output. If the value is zero or is not the encoding of any character in the character set, the behavior is undefined. If the argument does not have a numeric value, the first character of the string value shall be output; if the string does not contain any characters, the behavior is undefined.
8. For each conversion specification that consumes an argument, the next expression argument shall be evaluated. With the exception of the c conversion specifier character, the value shall be converted (according to the rules specified in [Expressions in awk](#), on page 2475) to the appropriate type for the conversion specification.
9. If there are insufficient expression arguments to satisfy all the conversion specifications in the *format* string, the behavior is undefined.
10. If any character sequence in the *format* string begins with a ' % ' character, but does not form a valid conversion specification, the behavior is unspecified.

Both **print** and **printf** can output at least {LINE\_MAX} bytes.

## Functions

The *awk* language has a variety of built-in functions: arithmetic, string, input/output, and general.

### Arithmetic Functions

The arithmetic functions, except for **int**, shall be based on the ISO C standard (see [Section 1.1.2](#), on page 2321). The behavior is undefined in cases where the ISO C standard specifies that an error be returned or that the behavior is undefined. Although the grammar (see [Grammar](#), on page 2490) permits built-in functions to appear with no arguments or parentheses, unless the argument or parentheses are indicated as optional in the following list (by displaying them within the " [ ] " brackets), such use is undefined.

- |                                      |                                                                                  |
|--------------------------------------|----------------------------------------------------------------------------------|
| <b>atan2</b> ( <i>y</i> , <i>x</i> ) | Return arctangent of <i>y</i> / <i>x</i> in radians in the range $[-\pi, \pi]$ . |
| <b>cos</b> ( <i>x</i> )              | Return cosine of <i>x</i> , where <i>x</i> is in radians.                        |
| <b>sin</b> ( <i>x</i> )              | Return sine of <i>x</i> , where <i>x</i> is in radians.                          |
| <b>exp</b> ( <i>x</i> )              | Return the exponential function of <i>x</i> .                                    |
| <b>log</b> ( <i>x</i> )              | Return the natural logarithm of <i>x</i> .                                       |

79985        **sqrt**(*x*)        Return the square root of *x*.

79986        **int**(*x*)        Return the argument truncated to an integer. Truncation shall be toward 0 when  
79987                    *x*>0.

79988        **rand**()        Return a random number *n*, such that  $0 \leq n < 1$ .

79989        **srand**(*[expr]*) Set the seed value for *rand* to *expr* or use the time of day if *expr* is omitted. The  
79990                    previous seed value shall be returned.

## 79991        **String Functions**

79992        The string functions in the following list shall be supported. Although the grammar (see  
79993        [Grammar](#), on page 2490) permits built-in functions to appear with no arguments or parentheses,  
79994        unless the argument or parentheses are indicated as optional in the following list (by displaying  
79995        them within the "[ ]" brackets), such use is undefined.

79996        **gsub**(*ere, repl[, in]*)  
79997                    Behave like **sub** (see below), except that it shall replace all occurrences of the  
79998                    regular expression (like the *ed* utility global substitute) in *\$0* or in the *in* argument,  
79999                    when specified.

80000        **index**(*s, t*)        Return the position, in characters, numbering from 1, in string *s* where string *t* first  
80001                    occurs, or zero if it does not occur at all.

80002        **length**(*[(*s*)]*)        Return the length, in characters, of its argument taken as a string, or of the whole  
80003                    record, *\$0*, if there is no argument.

80004        **match**(*s, ere*)        Return the position, in characters, numbering from 1, in string *s* where the  
80005                    extended regular expression *ere* occurs, or zero if it does not occur at all. RSTART  
80006                    shall be set to the starting position (which is the same as the returned value), zero  
80007                    if no match is found; RLENGTH shall be set to the length of the matched string, -1  
80008                    if no match is found.

80009        **split**(*s, a[, fs ]*)  
80010                    Split the string *s* into array elements *a*[1], *a*[2], ..., *a*[*n*], and return *n*. All elements  
80011                    of the array shall be deleted before the split is performed. The separation shall be  
80012                    done with the ERE *fs* or with the field separator **FS** if *fs* is not given. Each array  
80013                    element shall have a string value when created and, if appropriate, the array  
80014                    element shall be considered a numeric string (see [Expressions in awk](#), on page  
80015                    2475). The effect of a null string as the value of *fs* is unspecified.

80016        **sprintf**(*fnt, expr, expr, ...*)  
80017                    Format the expressions according to the **printf** format given by *fnt* and return the  
80018                    resulting string.

80019        **sub**(*ere, repl[, in ]*)  
80020                    Substitute the string *repl* in place of the first instance of the extended regular  
80021                    expression *ERE* in string *in* and return the number of substitutions. An  
80022                    <ampersand> ('&') appearing in the string *repl* shall be replaced by the string  
80023                    from *in* that matches the ERE. An <ampersand> preceded with a <backslash> shall  
80024                    be interpreted as the literal <ampersand> character. An occurrence of two  
80025                    consecutive <backslash> characters shall be interpreted as just a single literal  
80026                    <backslash> character. Any other occurrence of a <backslash> (for example,  
80027                    preceding any other character) shall be treated as a literal <backslash> character.  
80028                    Note that if *repl* is a string literal (the lexical token **STRING**; see [Grammar](#), on page  
80029                    2490), the handling of the <ampersand> character occurs after any lexical

processing, including any lexical <backslash>-escape sequence processing. If *in* is specified and it is not an lvalue (see [Expressions in awk](#), on page 2475), the behavior is undefined. If *in* is omitted, *awk* shall use the current record (\$0) in its place.

**substr**(*s*, *m* [, *n* ])

Return the at most *n*-character substring of *s* that begins at position *m*, numbering from 1. If *n* is omitted, or if *n* specifies more characters than are left in the string, the length of the substring shall be limited by the length of the string *s*.

**tolower**(*s*) Return a string based on the string *s*. Each character in *s* that is an uppercase letter specified to have a **tolower** mapping by the *LC\_CTYPE* category of the current locale shall be replaced in the returned string by the lowercase letter specified by the mapping. Other characters in *s* shall be unchanged in the returned string.

**toupper**(*s*) Return a string based on the string *s*. Each character in *s* that is a lowercase letter specified to have a **toupper** mapping by the *LC\_CTYPE* category of the current locale is replaced in the returned string by the uppercase letter specified by the mapping. Other characters in *s* are unchanged in the returned string.

All of the preceding functions that take *ERE* as a parameter expect a pattern or a string valued expression that is a regular expression as defined in [Regular Expressions](#) (on page 2481).

## Input/Output and General Functions

The input/output and general functions are:

**close**(*expression*)

Close the file or pipe opened by a **print** or **printf** statement or a call to **getline** with the same string-valued *expression*. The limit on the number of open *expression* arguments is implementation-defined. If the close was successful, the function shall return zero; otherwise, it shall return non-zero.

*expression* | **getline** [*var*]

Read a record of input from a stream piped from the output of a command. The stream shall be created if no stream is currently open with the value of *expression* as its command name. The stream created shall be equivalent to one created by a call to the *popen*() function with the value of *expression* as the *command* argument and a value of *r* as the *mode* argument. As long as the stream remains open, subsequent calls in which *expression* evaluates to the same string value shall read subsequent records from the stream. The stream shall remain open until the **close** function is called with an expression that evaluates to the same string value. At that time, the stream shall be closed as if by a call to the *pclose*() function. If *var* is omitted, \$0 and **NF** shall be set; otherwise, *var* shall be set and, if appropriate, it shall be considered a numeric string (see [Expressions in awk](#), on page 2475).

The **getline** operator can form ambiguous constructs when there are unparenthesized operators (including concatenate) to the left of the ' | ' (to the beginning of the expression containing **getline**). In the context of the '\$' operator, ' | ' shall behave as if it had a lower precedence than '\$'. The result of evaluating other operators is unspecified, and conforming applications shall parenthesize properly all such usages.

**getline** Set \$0 to the next input record from the current input file. This form of **getline** shall set the **NF**, **NR**, and **FNR** variables.

**getline** *var* Set variable *var* to the next input record from the current input file and, if appropriate, *var* shall be considered a numeric string (see [Expressions in awk](#), on page 2475). This form of **getline** shall set the **FNR** and **NR** variables.

**getline** [*var*] < *expression*

Read the next record of input from a named file. The *expression* shall be evaluated to produce a string that is used as a pathname. If the file of that name is not currently open, it shall be opened. As long as the stream remains open, subsequent calls in which *expression* evaluates to the same string value shall read subsequent records from the file. The file shall remain open until the **close** function is called with an expression that evaluates to the same string value. If *var* is omitted, **\$0** and **NF** shall be set; otherwise, *var* shall be set and, if appropriate, it shall be considered a numeric string (see [Expressions in awk](#), on page 2475).

The **getline** operator can form ambiguous constructs when there are unparenthesized binary operators (including concatenate) to the right of the '**<**' (up to the end of the expression containing the **getline**). The result of evaluating such a construct is unspecified, and conforming applications shall parenthesize properly all such usages.

**system**(*expression*)

Execute the command given by *expression* in a manner equivalent to the *system()* function defined in the System Interfaces volume of POSIX.1-2008 and return the exit status of the command.

All forms of **getline** shall return 1 for successful input, zero for end-of-file, and -1 for an error.

Where strings are used as the name of a file or pipeline, the application shall ensure that the strings are textually identical. The terminology “same string value” implies that “equivalent strings”, even those that differ only by <space> characters, represent different files.

## User-Defined Functions

The *awk* language also provides user-defined functions. Such functions can be defined as:

```
function name([parameter, ...]) { statements }
```

A function can be referred to anywhere in an *awk* program; in particular, its use can precede its definition. The scope of a function is global.

Function parameters, if present, can be either scalars or arrays; the behavior is undefined if an array name is passed as a parameter that the function uses as a scalar, or if a scalar expression is passed as a parameter that the function uses as an array. Function parameters shall be passed by value if scalar and by reference if array name.

The number of parameters in the function definition need not match the number of parameters in the function call. Excess formal parameters can be used as local variables. If fewer arguments are supplied in a function call than are in the function definition, the extra parameters that are used in the function body as scalars shall evaluate to the uninitialized value until they are otherwise initialized, and the extra parameters that are used in the function body as arrays shall be treated as uninitialized arrays where each element evaluates to the uninitialized value until otherwise initialized.

When invoking a function, no white space can be placed between the function name and the opening parenthesis. Function calls can be nested and recursive calls can be made upon functions. Upon return from any nested or recursive function call, the values of all of the calling function's parameters shall be unchanged, except for array parameters passed by reference. The

**return** statement can be used to return a value. If a **return** statement appears outside of a function definition, the behavior is undefined.

In the function definition, <newline> characters shall be optional before the opening brace and after the closing brace. Function definitions can appear anywhere in the program where a *pattern-action* pair is allowed.

## Grammar

The grammar in this section and the lexical conventions in the following section shall together describe the syntax for *awk* programs. The general conventions for this style of grammar are described in [Section 1.3](#) (on page 2325). A valid program can be represented as the non-terminal symbol *program* in the grammar. This formal syntax shall take precedence over the preceding text syntax description.

This grammar has several ambiguities that shall be resolved as follows:

- Operator precedence and associativity shall be as described in [Table 4-1](#) (on page 2475).
- In case of ambiguity, an **else** shall be associated with the most immediately preceding **if** that would satisfy the grammar.
- In some contexts, a `<slash>` (`'/'`) that is used to surround an ERE could also be the division operator. This shall be resolved in such a way that wherever the division operator could appear, a `<slash>` is assumed to be the division operator. (There is no unary division operator.)

Each expression in an *awk* program shall conform to the precedence and associativity rules, even when this is not needed to resolve an ambiguity. For example, because `'$'` has higher precedence than `'++'`, the string `"$x++--"` is not a valid *awk* expression, even though it is unambiguously parsed by the grammar as `"$(x++)--"`.

One convention that might not be obvious from the formal grammar is where `<newline>` characters are acceptable. There are several obvious placements such as terminating a statement, and a `<backslash>` can be used to escape `<newline>` characters between any lexical tokens. In addition, `<newline>` characters without `<backslash>` characters can follow a comma, an open brace, logical AND operator (`"&&"`), logical OR operator (`"||"`), the **do** keyword, the **else** keyword, and the closing parenthesis of an **if**, **for**, or **while** statement. For example:

```

80432 { print $1,
80433       $2 }

```

## Lexical Conventions

The lexical conventions for *awk* programs, with respect to the preceding grammar, shall be as follows:

1. Except as noted, *awk* shall recognize the longest possible token or delimiter beginning at a given point.
2. A comment shall consist of any characters beginning with the `<number-sign>` character and terminated by, but excluding the next occurrence of, a `<newline>`. Comments shall have no effect, except to delimit lexical tokens.
3. The `<newline>` shall be recognized as the token **NEWLINE**.
4. A `<backslash>` character immediately followed by a `<newline>` shall have no effect.
5. The token **STRING** shall represent a string constant. A string constant shall begin with the character `'`. Within a string constant, a `<backslash>` character shall be considered to begin an escape sequence as specified in the table in [XBD Chapter 5](#) (on page 121) (`'\\'`, `'\a'`, `'\b'`, `'\f'`, `'\n'`, `'\r'`, `'\t'`, `'\v'`). In addition, the escape sequences in [Table 4-2](#) (on page 2482) shall be recognized. A `<newline>` shall not occur within a string constant. A string constant shall be terminated by the first unescaped occurrence of

the character ' ' ' after the one that begins the string constant. The value of the string shall be the sequence of all unescaped characters and values of escape sequences between, but not including, the two delimiting ' ' ' characters.

6. The token **ERE** represents an extended regular expression constant. An ERE constant shall begin with the <slash> character. Within an ERE constant, a <backslash> character shall be considered to begin an escape sequence as specified in the table in XBD Chapter 5 (on page 121). In addition, the escape sequences in Table 4-2 (on page 2482) shall be recognized. The application shall ensure that a <newline> does not occur within an ERE constant. An ERE constant shall be terminated by the first unescaped occurrence of the <slash> character after the one that begins the ERE constant. The extended regular expression represented by the ERE constant shall be the sequence of all unescaped characters and values of escape sequences between, but not including, the two delimiting <slash> characters.

7. A <blank> shall have no effect, except to delimit lexical tokens or within **STRING** or **ERE** tokens.
