| 102269 | <i>TMPDIR</i>                                                                                                       | Determine the pathname that provides part of the default global extended header record file, as described for the <b>-o globexthdr=</b> keyword in the OPTIONS section.                                                                                                                                                                                                                 |
| 102270 |                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                         |

102271 *TZ* Determine the timezone used to calculate date and time strings when the *-v* option  
 102272 is specified. If *TZ* is unset or null, an unspecified default timezone shall be used.

## 102273 ASYNCHRONOUS EVENTS

102274 Default.

## 102275 STDOUT

102276 In **write** mode, if *-f* is not specified, the standard output shall be the archive formatted  
 102277 according to one of the specifications in the EXTENDED DESCRIPTION section, or some other  
 102278 implementation-defined format (see *-x format*).

102279 In **list** mode, when the *-olistopt=format* has been specified, the selected archive members shall  
 102280 be written to standard output using the format described under [List Mode Format Specifications](#)  
 102281 (on page 3065). In **list** mode without the *-olistopt=format* option, the table of contents of the  
 102282 selected archive members shall be written to standard output using the following format:

102283 "%s\n", <pathname>

102284 If the *-v* option is specified in **list** mode, the table of contents of the selected archive members  
 102285 shall be written to standard output using the following formats.

102286 For pathnames representing hard links to previous members of the archive:

102287 "%sΔ==Δ%s\n", <ls -l listing>, <linkname>

102288 For all other pathnames:

102289 "%s\n", <ls -l listing>

102290 where <ls -l listing> shall be the format specified by the *ls* utility with the *-l* option. When  
 102291 writing pathnames in this format, it is unspecified what is written for fields for which the  
 102292 underlying archive format does not have the correct information, although the correct number of  
 102293 <blank>-separated fields shall be written.

102294 In **list** mode, standard output shall not be buffered more than a pathname (plus any associated  
 102295 information and a <newline> terminator) at a time.

## 102296 STDERR

102297 If *-v* is specified in **read**, **write**, or **copy** modes, *pax* shall write the pathnames it processes to the  
 102298 standard error output using the following format:

102299 "%s\n", <pathname>

102300 These pathnames shall be written as soon as processing is begun on the file or archive member,  
 102301 and shall be flushed to standard error. The trailing <newline>, which shall not be buffered, is  
 102302 written when the file has been read or written.

102303 If the *-s* option is specified, and the replacement string has a trailing 'p', substitutions shall be  
 102304 written to standard error in the following format:

102305 "%sΔ>>Δ%s\n", <original pathname>, <new pathname>

102306 In all operating modes of *pax*, optional messages of unspecified format concerning the input  
 102307 archive format and volume number, the number of files, blocks, volumes, and media parts as  
 102308 well as other diagnostic messages may be written to standard error.

102309 In all formats, for both standard output and standard error, it is unspecified how non-printable  
 102310 characters in pathnames or link names are written.

102311 When using the *-xpax* archive format, if a filename, link name, group name, owner name, or any  
 102312 other field in an extended header record cannot be translated between the codeset in use for that

102313 extended header record and the character set of the current locale, *pax* shall write a diagnostic  
102314 message to standard error, shall process the file as described for the **-o invalid=** option, and then  
102315 shall continue processing with the next file.

## 102316 OUTPUT FILES

102317 In **read** mode, the extracted output files shall be of the archived file type. In **copy** mode, the  
102318 copied output files shall be the type of the file being copied. In either mode, existing files in the  
102319 destination hierarchy shall be overwritten only when all permission (**-p**), modification time (**-u**),  
102320 and invalid-value (**-o invalid=**) tests allow it.

102321 In **write** mode, the output file named by the **-f** option-argument shall be a file formatted  
102322 according to one of the specifications in the EXTENDED DESCRIPTION section, or some other  
102323 implementation-defined format.

## 102324 EXTENDED DESCRIPTION

### 102325 **pax Interchange Format**

102326 A *pax* archive tape or file produced in the **-xpax** format shall contain a series of blocks. The  
102327 physical layout of the archive shall be identical to the **ustar** format described in **ustar**  
102328 **Interchange Format** (on page 3075). Each file archived shall be represented by the following  
102329 sequence:

- 102330 • An optional header block with extended header records. This header block is of the form  
102331 described in **pax Header Block** (on page 3070), with a *typeflag* value of **x** or **g**. The  
102332 extended header records, described in **pax Extended Header** (on page 3071), shall be  
102333 included as the data for this header block.
- 102334 • A header block that describes the file. Any fields in the preceding optional extended  
102335 header shall override the associated fields in this header block for this file.
- 102336 • Zero or more blocks that contain the contents of the file.

102337 At the end of the archive file there shall be two 512-byte blocks filled with binary zeros,  
102338 interpreted as an end-of-archive indicator.

102339 A schematic of an example archive with global extended header records and two actual files is  
102340 shown in **Figure 4-1** (on page 3070). In the example, the second file in the archive has no  
102341 extended header preceding it, presumably because it has no need for extended attributes.

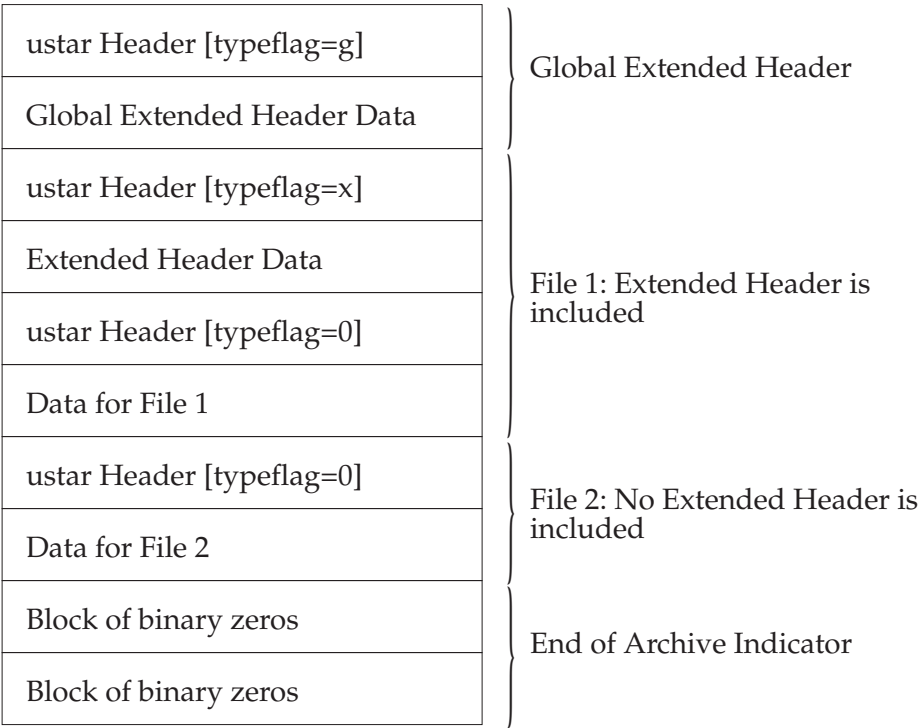

Figure 4-1 pax Format Archive Example

**pax Header Block**

The **pax** header block shall be identical to the **ustar** header block described in **ustar Interchange Format** (on page 3075), except that two additional *typeflag* values are defined:

- ⌘ Represents extended header records for the following file in the archive (which shall have its own **ustar** header block). The format of these extended header records shall be as described in **pax Extended Header** (on page 3071).
- g Represents global extended header records for the following files in the archive. The format of these extended header records shall be as described in **pax Extended Header** (on page 3071). Each value shall affect all subsequent files that do not override that value in their own extended header record and until another global extended header record is reached that provides another value for the same field. The *typeflag* **g** global headers should not be used with interchange media that could suffer partial data loss in transporting the archive.

For both of these types, the *size* field shall be the size of the extended header records in octets. The other fields in the header block are not meaningful to this version of the *pax* utility. However, if this archive is read by a *pax* utility conforming to the ISO POSIX-2: 1993 standard, the header block fields are used to create a regular file that contains the extended header records as data. Therefore, header block field values should be selected to provide reasonable file access to this regular file.

A further difference from the **ustar** header block is that data blocks for files of *typeflag* 1 (the digit one) (hard link) may be included, which means that the size field may be greater than zero. Archives created by *pax -o linkdata* shall include these data blocks with the hard links.

**pax Extended Header**

A **pax** extended header contains values that are inappropriate for the **ustar** header block because of limitations in that format: fields requiring a character encoding other than that described in the ISO/IEC 646:1991 standard, fields representing file attributes not described in the **ustar** header, and fields whose format or length do not fit the requirements of the **ustar** header. The values in an extended header add attributes to the following file (or files; see the description of the *typeflag* **g** header block) or override values in the following header block(s), as indicated in the following list of keywords.

An extended header shall consist of one or more records, each constructed as follows:

```
"%d %s=%s\n", <length>, <keyword>, <value>
```

The extended header records shall be encoded according to the ISO/IEC 10646-1:2000 standard UTF-8 encoding. The *<length>* field, *<blank>*, *<equals-sign>*, and *<newline>* shown shall be limited to the portable character set, as encoded in UTF-8. The *<keyword>* fields can be any UTF-8 characters. The *<length>* field shall be the decimal length of the extended header record in octets, including the trailing *<newline>*. If there is a **hdrcharset** extended header in effect for a file, the *value* field for any **gname**, **linkpath**, **path**, and **uname** extended header records shall be encoded using the character set specified by the **hdrcharset** extended header record; otherwise, the *value* field shall be encoded using UTF-8. The *value* field for all other keywords specified by POSIX.1-2008 shall be encoded using UTF-8.

The *<keyword>* field shall be one of the entries from the following list or a keyword provided as an implementation extension. Keywords consisting entirely of lowercase letters, digits, and periods are reserved for future standardization. A keyword shall not include an *<equals-sign>*. (In the following list, the notations “file(s)” or “block(s)” is used to acknowledge that a keyword affects the following single file after a *typeflag* **x** extended header, but possibly multiple files after *typeflag* **g**. Any requirements in the list for *pax* to include a record when in **write** or **copy** mode shall apply only when such a record has not already been provided through the use of the **-o** option. When used in **copy** mode, *pax* shall behave as if an archive had been created with applicable extended header records and then extracted.)

**atime** The file access time for the following file(s), equivalent to the value of the *st\_atime* member of the **stat** structure for a file, as described by the *stat()* function. The access time shall be restored if the process has appropriate privileges required to do so. The format of the *<value>* shall be as described in [pax Extended Header File Times](#) (on page 3074).

**charset** The name of the character set used to encode the data in the following file(s). The entries in the following table are defined to refer to known standards; additional names may be agreed on between the originator and recipient.

102418  
102419  
102420

The encoding is included in an extended header for information only; when *pax* is used as described in POSIX.1-2008, it shall not translate the file data into any other encoding. The **BINARY** entry indicates unencoded binary data.

102421  
102422

When used in **write** or **copy** mode, it is implementation-defined whether *pax* includes a **charset** extended header record for a file.

102423  
102424

**comment**

A series of characters used as a comment. All characters in the <value> field shall be ignored by *pax*.

102425  
102426  
102427  
102428  
102429

**gid**

The group ID of the group that owns the file, expressed as a decimal number using digits from the ISO/IEC 646: 1991 standard. This record shall override the *gid* field in the following header block(s). When used in **write** or **copy** mode, *pax* shall include a *gid* extended header record for each file whose group ID is greater than 2 097 151 (octal 7 777 777).

102435  
102436  
102437  
102438  
102439

**gname**

The group of the file(s), formatted as a group name in the group database. This record shall override the *gid* and *gname* fields in the following header block(s), and any *gid* extended header record. When used in **read**, **copy**, or **list** mode, *pax* shall translate the name from the encoding in the header record to the character set appropriate for the group database on the receiving system. If any of the characters cannot be translated, and if neither the **-oinvalid=UTF-8** option nor the **-oinvalid=binary** option is specified, the results are implementation-defined. When used in **write** or **copy** mode, *pax* shall include a **gname** extended header record for each file whose group name cannot be represented entirely with the letters and digits of the portable character set.

102440  
102441  
102442  
102443

**hdrcharset**

The name of the character set used to encode the value field of the **gname**, **linkpath**, **path**, and **uname** *pax* extended header records. The entries in the following table are defined to refer to known standards; additional names may be agreed between the originator and the recipient.

| 102447 |                     | If no <b>hdrcharset</b> extended header record is specified, the default character set used to encode all values in extended header records shall be the ISO/IEC 10646-1: 2000 standard UTF-8 encoding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 102448 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 102449 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 102450 |                     | The <b>BINARY</b> entry indicates that all values recorded in extended headers for affected files are unencoded binary data from the underlying system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 102451 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 102452 | <b>linkpath</b>     | The pathname of a link being created to another file, of any type, previously archived. This record shall override the <i>linkname</i> field in the following <b>ustar</b> header block(s). The following <b>ustar</b> header block shall determine the type of link created. If <i>typeflag</i> of the following header block is 1, it shall be a hard link. If <i>typeflag</i> is 2, it shall be a symbolic link and the <b>linkpath</b> value shall be the contents of the symbolic link. The <i>pax</i> utility shall translate the name of the link (contents of the symbolic link) from the encoding in the header to the character set appropriate for the local file system. When used in <b>write</b> or <b>copy</b> mode, <i>pax</i> shall include a <b>linkpath</b> extended header record for each link whose pathname cannot be represented entirely with the members of the portable character set other than NUL. |

| 102488 | <b>uname</b>        | The owner of the following file(s), formatted as a user name in the user database. This record shall override the <i>uid</i> and <i>uname</i> fields in the following header block(s), and any <i>uid</i> extended header record. When used in <b>read</b> , <b>copy</b> , or <b>list</b> mode, <i>pax</i> shall translate the name from the encoding in the header record to the character set appropriate for the user database on the receiving system. If any of the characters                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 102489 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 102490 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 102491 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 102492 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

cannot be translated, and if neither the **-oinvalid=UTF-8** option nor the **-oinvalid=binary** option is specified, the results are implementation-defined. When used in **write** or **copy** mode, *pax* shall include a **uname** extended header record for each file whose user name cannot be represented entirely with the letters and digits of the portable character set.

If the *<value>* field is zero length, it shall delete any header block field, previously entered extended header value, or global extended header value of the same name.

If a keyword in an extended header record (or in a **-o** option-argument) overrides or deletes a corresponding field in the **ustar** header block, *pax* shall ignore the contents of that header block field.

Unlike the **ustar** header block fields, NULs shall not delimit *<value>*s; all characters within the *<value>* field shall be considered data for the field. None of the length limitations of the **ustar** header block fields in Table 4-14 (on page 3075) shall apply to the extended header records.

### pax Extended Header Keyword Precedence

This section describes the precedence in which the various header records and fields and command line options are selected to apply to a file in the archive. When *pax* is used in **read** or **list** modes, it shall determine a file attribute in the following sequence:

1. If **-odelete=keyword-prefix** is used, the affected attributes shall be determined from step 7., if applicable, or ignored otherwise.
2. If **-okeyword:=** is used, the affected attributes shall be ignored.
3. If **-okeyword:=value** is used, the affected attribute shall be assigned the value.
4. If there is a *typeflag* **x** extended header record, the affected attribute shall be assigned the *<value>*. When extended header records conflict, the last one given in the header shall take precedence.
5. If **-okeyword=value** is used, the affected attribute shall be assigned the value.
6. If there is a *typeflag* **g** global extended header record, the affected attribute shall be assigned the *<value>*. When global extended header records conflict, the last one given in the global header shall take precedence.
7. Otherwise, the attribute shall be determined from the **ustar** header block.

### pax Extended Header File Times

The *pax* utility shall write an **mtime** record for each file in **write** or **copy** modes if the file's modification time cannot be represented exactly in the **ustar** header logical record described in *ustar Interchange Format* (on page 3075). This can occur if the time is out of **ustar** range, or if the file system of the underlying implementation supports non-integer time granularities and the time is not an integer. All of these time records shall be formatted as a decimal representation of the time in seconds since the Epoch. If a *<period>* ( ' . ' ) decimal point character is present, the digits to the right of the point shall represent the units of a subsecond timing granularity, where the first digit is tenths of a second and each subsequent digit is a tenth of the previous digit. In **read** or **copy** mode, the *pax* utility shall truncate the time of a file to the greatest value that is not greater than the input header file time. In **write** or **copy** mode, the *pax* utility shall output a time exactly if it can be represented exactly as a decimal number, and otherwise shall generate only enough digits so that the same time shall be recovered if the file is extracted on a system whose underlying implementation supports the same time granularity.

**ustar Interchange Format**

A **ustar** archive tape or file shall contain a series of logical records. Each logical record shall be a fixed-size logical record of 512 octets (see below). Although this format may be thought of as being stored on 9-track industry-standard 12.7 mm (0.5 in) magnetic tape, other types of transportable media are not excluded. Each file archived shall be represented by a header logical record that describes the file, followed by zero or more logical records that give the contents of the file. At the end of the archive file there shall be two 512-octet logical records filled with binary zeros, interpreted as an end-of-archive indicator.

The logical records may be grouped for physical I/O operations, as described under the **-bblocksize** and **-x ustar** options. Each group of logical records may be written with a single operation equivalent to the *write()* function. On magnetic tape, the result of this write shall be a single tape physical block. The last physical block shall always be the full size, so logical records after the two zero logical records may contain undefined data.

The header logical record shall be structured as shown in the following table. All lengths and offsets are in decimal.

**Table 4-14** ustar Header Block

| Field Name      | Octet Offset | Length (in Octets) |
|-----------------|--------------|--------------------|
| <i>name</i>     | 0            | 100                |
| <i>mode</i>     | 100          | 8                  |
| <i>uid</i>      | 108          | 8                  |
| <i>gid</i>      | 116          | 8                  |
| <i>size</i>     | 124          | 12                 |
| <i>mtime</i>    | 136          | 12                 |
| <i>chksum</i>   | 148          | 8                  |
| <i>typeflag</i> | 156          | 1                  |
| <i>linkname</i> | 157          | 100                |
| <i>magic</i>    | 257          | 6                  |
| <i>version</i>  | 263          | 2                  |
| <i>uname</i>    | 265          | 32                 |
| <i>gname</i>    | 297          | 32                 |
| <i>devmajor</i> | 329          | 8                  |
| <i>devminor</i> | 337          | 8                  |
| <i>prefix</i>   | 345          | 155                |

All characters in the header logical record shall be represented in the coded character set of the ISO/IEC 646: 1991 standard. For maximum portability between implementations, names should be selected from characters represented by the portable filename character set as octets with the most significant bit zero. If an implementation supports the use of characters outside of <slash> and the portable filename character set in names for files, users, and groups, one or more implementation-defined encodings of these characters shall be provided for interchange purposes.

However, the *pax* utility shall never create filenames on the local system that cannot be accessed via the procedures described in POSIX.1-2008. If a filename is found on the medium that would create an invalid filename, it is implementation-defined whether the data from the file is stored on the file hierarchy and under what name it is stored. The *pax* utility may choose to ignore these files as long as it produces an error indicating that the file is being ignored.

Each field within the header logical record is contiguous; that is, there is no padding used. Each

character on the archive medium shall be stored contiguously.

The fields *magic*, *uname*, and *gname* are character strings each terminated by a NUL character. The fields *name*, *linkname*, and *prefix* are NUL-terminated character strings except when all characters in the array contain non-NUL characters including the last character. The *version* field is two octets containing the characters "00" (zero-zero). The *typeflag* contains a single character. All other fields are leading zero-filled octal numbers using digits from the ISO/IEC 646:1991 standard IRV. Each numeric field is terminated by one or more <space> or NUL characters.

The *name* and the *prefix* fields shall produce the pathname of the file. A new pathname shall be formed, if *prefix* is not an empty string (its first character is not NUL), by concatenating *prefix* (up to the first NUL character), a <slash> character, and *name*; otherwise, *name* is used alone. In either case, *name* is terminated at the first NUL character. If *prefix* begins with a NUL character, it shall be ignored. In this manner, pathnames of at most 256 characters can be supported. If a pathname does not fit in the space provided, *pax* shall notify the user of the error, and shall not store any part of the file—header or data—on the medium.

The *linkname* field, described below, shall not use the *prefix* to produce a pathname. As such, a *linkname* is limited to 100 characters. If the name does not fit in the space provided, *pax* shall notify the user of the error, and shall not attempt to store the link on the medium.

The *mode* field provides 12 bits encoded in the ISO/IEC 646:1991 standard octal digit representation. The encoded bits shall represent the following values:

**Table 4-15** *ustar mode* Field

| Bit Value | POSIX.1-2008 Bit | Description                                     |
|-----------|------------------|-------------------------------------------------|
| 04 000    | S_ISUID          | Set UID on execution.                           |
| 02 000    | S_ISGID          | Set GID on execution.                           |
| 01 000    | <reserved>       | Reserved for future standardization.            |
| 00 400    | S_IRUSR          | Read permission for file owner class.           |
| 00 200    | S_IWUSR          | Write permission for file owner class.          |
| 00 100    | S_IXUSR          | Execute/search permission for file owner class. |
| 00 040    | S_IRGRP          | Read permission for file group class.           |
| 00 020    | S_IWGRP          | Write permission for file group class.          |
| 00 010    | S_IXGRP          | Execute/search permission for file group class. |
| 00 004    | S_IROTH          | Read permission for file other class.           |
| 00 002    | S_IWOTH          | Write permission for file other class.          |
| 00 001    | S_IXOTH          | Execute/search permission for file other class. |

When appropriate privileges are required to set one of these mode bits, and the user restoring the files from the archive does not have appropriate privileges, the mode bits for which the user does not have appropriate privileges shall be ignored. Some of the mode bits in the archive format are not mentioned elsewhere in this volume of POSIX.1-2008. If the implementation does not support those bits, they may be ignored.

The *uid* and *gid* fields are the user and group ID of the owner and group of the file, respectively.

The *size* field is the size of the file in octets. If the *typeflag* field is set to specify a file to be of type 1 (a link) or 2 (a symbolic link), the *size* field shall be specified as zero. If the *typeflag* field is set to specify a file of type 5 (directory), the *size* field shall be interpreted as described under the definition of that record type. No data logical records are stored for types 1, 2, or 5. If the *typeflag* field is set to 3 (character special file), 4 (block special file), or 6 (FIFO), the meaning of the *size* field is unspecified by this volume of POSIX.1-2008, and no data logical records shall be stored on the medium. Additionally, for type 6, the *size* field shall be ignored when reading. If the

- 102628        *typeflag* field is set to any other value, the number of logical records written following the header  
 102629        shall be  $(size+511)/512$ , ignoring any fraction in the result of the division.
- 102630        The *mtime* field shall be the modification time of the file at the time it was archived. It is the  
 102631        ISO/IEC 646:1991 standard representation of the octal value of the modification time obtained  
 102632        from the *stat()* function.
- 102633        The *chksum* field shall be the ISO/IEC 646:1991 standard IRV representation of the octal value of  
 102634        the simple sum of all octets in the header logical record. Each octet in the header shall be treated  
 102635        as an unsigned value. These values shall be added to an unsigned integer, initialized to zero, the  
 102636        precision of which is not less than 17 bits. When calculating the checksum, the *chksum* field is  
 102637        treated as if it were all <space> characters.
- 102638        The *typeflag* field specifies the type of file archived. If a particular implementation does not  
 102639        recognize the type, or the user does not have appropriate privileges to create that type, the file  
 102640        shall be extracted as if it were a regular file if the file type is defined to have a meaning for the  
 102641        *size* field that could cause data logical records to be written on the medium (see the previous  
 102642        description for *size*). If conversion to a regular file occurs, the *pax* utility shall produce an error  
 102643        indicating that the conversion took place. All of the *typeflag* fields shall be coded in the  
 102644        ISO/IEC 646:1991 standard IRV:
- |        |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 102645 | 0    | Represents a regular file. For backwards-compatibility, a <i>typeflag</i> value of binary zero (' $\backslash 0$ ') should be recognized as meaning a regular file when extracting files from the archive. Archives written with this version of the archive file format create regular files with a <i>typeflag</i> value of the ISO/IEC 646:1991 standard IRV ' $\backslash 0$ '.                                        |
| 102646 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102647 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102648 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102649 | 1    | Represents a file linked to another file, of any type, previously archived. Such files are identified by having the same device and file serial numbers, and pathnames that refer to different directory entries. All such files shall be archived as linked files. The linked-to name is specified in the <i>linkname</i> field with a NUL-character terminator if it is less than 100 octets in length.                  |
| 102650 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102651 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102652 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102653 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102654 | 2    | Represents a symbolic link. The contents of the symbolic link shall be stored in the <i>linkname</i> field.                                                                                                                                                                                                                                                                                                                |
| 102655 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102656 | 3, 4 | Represent character special files and block special files respectively. In this case the <i>devmajor</i> and <i>devminor</i> fields shall contain information defining the device, the format of which is unspecified by this volume of POSIX.1-2008. Implementations may map the device specifications to their own local specification or may ignore the entry.                                                          |
| 102657 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102658 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102659 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102660 | 5    | Specifies a directory or subdirectory. On systems where disk allocation is performed on a directory basis, the <i>size</i> field shall contain the maximum number of octets (which may be rounded to the nearest disk block allocation unit) that the directory may hold. A <i>size</i> field of zero indicates no such limiting. Systems that do not support limiting in this manner should ignore the <i>size</i> field. |
| 102661 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102662 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102663 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102664 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102665 | 6    | Specifies a FIFO special file. Note that the archiving of a FIFO file archives the existence of this file and not its contents.                                                                                                                                                                                                                                                                                            |
| 102666 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102667 | 7    | Reserved to represent a file to which an implementation has associated some high-performance attribute. Implementations without such extensions should treat this file as a regular file (type 0).                                                                                                                                                                                                                         |
| 102668 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102669 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102670 | A-Z  | The letters ' $\backslash A$ ' to ' $\backslash Z$ ', inclusive, are reserved for custom implementations. All other values are reserved for future versions of this standard.                                                                                                                                                                                                                                              |
| 102671 |      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
- 102672        It is unspecified whether files with pathnames that refer to the same directory entry are archived  
 102673        as linked files or as separate files. If they are archived as linked files, this means that attempting

to extract both pathnames from the resulting archive will always cause an error (unless the **-u** option is used) because the link cannot be created.

It is unspecified whether files with the same device and file serial numbers being appended to an archive are treated as linked files to members that were in the archive before the append.

Attempts to archive a socket shall produce a diagnostic message when **ustar** interchange format is used, but may be allowed when **pax** interchange format is used. Handling of other file types is implementation-defined.

The *magic* field is the specification that this archive was output in this archive format. If this field contains **ustar** (the five characters from the ISO/IEC 646:1991 standard IRV shown followed by NUL), the *uname* and *gname* fields shall contain the ISO/IEC 646:1991 standard IRV representation of the owner and group of the file, respectively (truncated to fit, if necessary). When the file is restored by a privileged, protection-preserving version of the utility, the user and group databases shall be scanned for these names. If found, the user and group IDs contained within these files shall be used rather than the values contained within the *uid* and *gid* fields.

### cpio Interchange Format

The octet-oriented **cpio** archive format shall be a series of entries, each comprising a header that describes the file, the name of the file, and then the contents of the file.

An archive may be recorded as a series of fixed-size blocks of octets. This blocking shall be used only to make physical I/O more efficient. The last group of blocks shall always be at the full size.

For the octet-oriented **cpio** archive format, the individual entry information shall be in the order indicated and described by the following table; see also the **<cpio.h>** header.

**Table 4-16** Octet-Oriented cpio Archive Entry

| Header Field Name    | Length (in Octets) | Interpreted as  |
|----------------------|--------------------|-----------------|
| <i>c_magic</i>       | 6                  | Octal number    |
| <i>c_dev</i>         | 6                  | Octal number    |
| <i>c_ino</i>         | 6                  | Octal number    |
| <i>c_mode</i>        | 6                  | Octal number    |
| <i>c_uid</i>         | 6                  | Octal number    |
| <i>c_gid</i>         | 6                  | Octal number    |
| <i>c_nlink</i>       | 6                  | Octal number    |
| <i>c_rdev</i>        | 6                  | Octal number    |
| <i>c_mtime</i>       | 11                 | Octal number    |
| <i>c_namesize</i>    | 6                  | Octal number    |
| <i>c_filesize</i>    | 11                 | Octal number    |
| Filename Field Name  | Length             | Interpreted as  |
| <i>c_name</i>        | <i>c_namesize</i>  | Pathname string |
| File Data Field Name | Length             | Interpreted as  |
| <i>c_filedata</i>    | <i>c_filesize</i>  | Data            |

**cpio Header**

For each file in the archive, a header as defined previously shall be written. The information in the header fields is written as streams of the ISO/IEC 646:1991 standard characters interpreted as octal numbers. The octal numbers shall be extended to the necessary length by appending the ISO/IEC 646:1991 standard IRV zeros at the most-significant-digit end of the number; the result is written to the most-significant digit of the stream of octets first. The fields shall be interpreted as follows:

- c\_magic* Identify the archive as being a transportable archive by containing the identifying value "070707".
- c\_dev, c\_ino* Contains values that uniquely identify the file within the archive (that is, no files contain the same pair of *c\_dev* and *c\_ino* values unless they are links to the same file). The values shall be determined in an unspecified manner.
- c\_mode* Contains the file type and access permissions as defined in the following table.

**Table 4-17** Values for cpio *c\_mode* Field

| File Permissions Name | Value    | Indicates              |
|-----------------------|----------|------------------------|
| C_IRUSR               | 000 400  | Read by owner          |
| C_IWUSR               | 000 200  | Write by owner         |
| C_IXUSR               | 000 100  | Execute by owner       |
| C_IRGRP               | 000 040  | Read by group          |
| C_IWGRP               | 000 020  | Write by group         |
| C_IXGRP               | 000 010  | Execute by group       |
| C_IROTH               | 000 004  | Read by others         |
| C_IWOTH               | 000 002  | Write by others        |
| C_IXOTH               | 000 001  | Execute by others      |
| C_ISUID               | 004 000  | Set <i>uid</i>         |
| C_ISGID               | 002 000  | Set <i>gid</i>         |
| C_ISVTX               | 001 000  | Reserved               |
| File Type Name        | Value    | Indicates              |
| C_ISDIR               | 040 000  | Directory              |
| C_ISFIFO              | 010 000  | FIFO                   |
| C_ISREG               | 0100 000 | Regular file           |
| C_ISLNK               | 0120 000 | Symbolic link          |
| C_ISBLK               | 060 000  | Block special file     |
| C_ISCHR               | 020 000  | Character special file |
| C_ISSOCK              | 0140 000 | Socket                 |
| C_ISCTG               | 0110 000 | Reserved               |

Directories, FIFOs, symbolic links, and regular files shall be supported on a system conforming to this volume of POSIX.1-2008; additional values defined previously are reserved for compatibility with existing systems. Additional file types may be supported; however, such files should not be written to archives intended to be transported to other systems.

- c\_uid* Contains the user ID of the owner.

|        |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 102756 | <i>c_gid</i>      | Contains the group ID of the group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 102757 | <i>c_nlink</i>    | Contains a number greater than or equal to the number of links in the archive referencing the file. If the <i>-a</i> option is used to append to a <i>cpio</i> archive, then the <i>pax</i> utility need not account for the files in the existing part of the archive when calculating the <i>c_nlink</i> values for the appended part of the archive, and need not alter the <i>c_nlink</i> values in the existing part of the archive if additional files with the same <i>c_dev</i> and <i>c_ino</i> values are appended to the archive. |
| 102758 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 102759 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 102760 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 102761 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 102762 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 102763 | <i>c_rdev</i>     | Contains implementation-defined information for character or block special files.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 102764 | <i>c_mtime</i>    | Contains the latest time of modification of the file at the time the archive was created.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 102765 |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 102766 | <i>c_namesize</i> | Contains the length of the pathname, including the terminating NUL character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 102767 | <i>c_filesiz</i>  | Contains the length in octets of the data section following the header structure.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 102768 **cpio Filename**

102769 The *c\_name* field shall contain the pathname of the file. The length of this field in octets is the  
102770 value of *c\_namesize*.

102771 If a filename is found on the medium that would create an invalid pathname, it is  
102772 implementation-defined whether the data from the file is stored on the file hierarchy and under  
102773 what name it is stored.

102774 All characters shall be represented in the ISO/IEC 646:1991 standard IRV. For maximum  
102775 portability between implementations, names should be selected from characters represented by  
102776 the portable filename character set as octets with the most significant bit zero. If an  
102777 implementation supports the use of characters outside the portable filename character set in  
102778 names for files, users, and groups, one or more implementation-defined encodings of these  
102779 characters shall be provided for interchange purposes. However, the *pax* utility shall never create  
102780 filenames on the local system that cannot be accessed via the procedures described previously in  
102781 this volume of POSIX.1-2008. If a filename is found on the medium that would create an invalid  
102782 filename, it is implementation-defined whether the data from the file is stored on the local file  
102783 system and under what name it is stored. The *pax* utility may choose to ignore these files as long  
102784 as it produces an error indicating that the file is being ignored.

## 102785 **cpio File Data**

102786 Following *c\_name*, there shall be *c\_filesiz* octets of data. Interpretation of such data occurs in a  
102787 manner dependent on the file. For regular files, the data shall consist of the contents of the file.  
102788 For symbolic links, the data shall consist of the contents of the symbolic link. If *c\_filesiz* is zero,  
102789 no data shall be contained in *c\_filedata*.

102790 When restoring from an archive:

- 102791 • If the user does not have appropriate privileges to create a file of the specified type, *pax*  
102792 shall ignore the entry and write an error message to standard error.
- 102793 • Only regular files and symbolic links have data to be restored. Presuming a regular file  
102794 meets any selection criteria that might be imposed on the format-reading utility by the  
102795 user, such data shall be restored.
- 102796 • If a user does not have appropriate privileges to set a particular mode flag, the flag shall be  
102797 ignored. Some of the mode flags in the archive format are not mentioned elsewhere in this  
102798 volume of POSIX.1-2008. If the implementation does not support those flags, they may be

102799 ignored.

## 102800 **cpio Special Entries**

102801 FIFO special files, directories, and the trailer shall be recorded with *c\_filesize* equal to zero.  
102802 Symbolic links shall be recorded with *c\_filesize* equal to the length of the contents of the symbolic  
102803 link. For other special files, *c\_filesize* is unspecified by this volume of POSIX.1-2008. The header  
102804 for the next file entry in the archive shall be written directly after the last octet of the file entry  
102805 preceding it. A header denoting the filename **TRAILER!!!** shall indicate the end of the archive;  
102806 the contents of octets in the last block of the archive following such a header are undefined.

## 102807 **EXIT STATUS**

102808 The following exit values shall be returned:

102809 0 All files were processed successfully.

102810 >0 An error occurred.

## 102811 **CONSEQUENCES OF ERRORS**

102812 If *pax* cannot create a file or a link when reading an archive or cannot find a file when writing an  
102813 archive, or cannot preserve the user ID, group ID, or file mode when the **-p** option is specified, a  
102814 diagnostic message shall be written to standard error and a non-zero exit status shall be  
102815 returned, but processing shall continue. In the case where *pax* cannot create a link to a file, *pax*  
102816 shall not, by default, create a second copy of the file.

102817 If the extraction of a file from an archive is prematurely terminated by a signal or error, *pax* may  
102818 have only partially extracted the file or (if the **-n** option was not specified) may have extracted a  
102819 file of the same name as that specified by the user, but which is not the file the user wanted.  
102820 Additionally, the file modes of extracted directories may have additional bits from the S\_IRWXU  
102821 mask set as well as incorrect modification and access times.

## 102822 **APPLICATION USAGE**

102823 Caution is advised when using the **-a** option to append to a *cpio* format archive. If any of the  
102824 files being appended happen to be given the same *c\_dev* and *c\_ino* values as a file in the existing  
102825 part of the archive, then they may be treated as links to that file on extraction. Thus, it is risky to  
102826 use **-a** with *cpio* format except when it is done on the same system that the original archive was  
102827 created on, and with the same *pax* utility, and in the knowledge that there has been little or no  
102828 file system activity since the original archive was created that could lead to any of the files  
102829 appended being given the same *c\_dev* and *c\_ino* values as an unrelated file in the existing part of  
102830 the archive. Also, when (intentionally) appending additional links to a file in the existing part of  
102831 the archive, the *c\_nlink* values in the modified archive can be smaller than the number of links to  
102832 the file in the archive, which may mean that the links are not preserved on extraction.

102833 The **-p** (privileges) option was invented to reconcile differences between historical *tar* and *cpio*  
102834 implementations. In particular, the two utilities use **-m** in diametrically opposed ways. The **-p**  
102835 option also provides a consistent means of extending the ways in which future file attributes can  
102836 be addressed, such as for enhanced security systems or high-performance files. Although it may  
102837 seem complex, there are really two modes that are most commonly used:

102838 **-p e** “Preserve everything”. This would be used by the historical superuser, someone with  
102839 all appropriate privileges, to preserve all aspects of the files as they are recorded in the  
102840 archive. The **e** flag is the sum of **o** and **p**, and other implementation-defined attributes.

102841 **-p p** “Preserve” the file mode bits. This would be used by the user with regular privileges  
102842 who wished to preserve aspects of the file other than the ownership. The file times are  
102843 preserved by default, but two other flags are offered to disable these and use the time  
102844 of extraction.

The one pathname per line format of standard input precludes pathnames containing <newline> characters. Although such pathnames violate the portable filename guidelines, they may exist and their presence may inhibit usage of *pax* within shell scripts. This problem is inherited from historical archive programs. The problem can be avoided by listing filename arguments on the command line instead of on standard input.

It is almost certain that appropriate privileges are required for *pax* to accomplish parts of this volume of POSIX.1-2008. Specifically, creating files of type block special or character special, restoring file access times unless the files are owned by the user (the **-t** option), or preserving file owner, group, and mode (the **-p** option) all probably require appropriate privileges.

In **read** mode, implementations are permitted to overwrite files when the archive has multiple members with the same name. This may fail if permissions on the first version of the file do not permit it to be overwritten.

The **cpio** and **ustar** formats can only support files up to 8 589 934 592 bytes ( $8 * 2^{30}$ ) in size.

When archives containing binary header information are listed, the filenames printed may cause strange behavior on some terminals.

When all of the following are true:

1. A file of type directory is being placed into an archive.
2. The **ustar** archive format is being used.
3. The pathname of the directory is less than or equal to 155 bytes long (it will fit in the *prefix* field in the **ustar** header block).
4. The last component of the pathname of the directory is longer than 100 bytes long (it will not fit in the *name* field in the **ustar** header block).

some implementations of the *pax* utility will place the entire directory pathname in the *prefix* field, set the *name* field to an empty string, and place the directory in the archive. Other implementations of the *pax* utility will give an error under these conditions because the *name* field is not large enough to hold the last component of the directory name. This standard allows either behavior. However, when extracting a directory from a **ustar** format archive, this standard requires that all implementations be able to extract a directory even if the *name* field contains an empty string as long as the *prefix* field does not also contain an empty string.

## EXAMPLES

The following command:

```
pax -w -f /dev/rmt/lm .
```

copies the contents of the current directory to tape drive 1, medium density (assuming historical System V device naming procedures—the historical BSD device name would be **/dev/rmt9**).

The following commands:

```
mkdir newdir
```

```
pax -rw olddir newdir
```

copy the *olddir* directory hierarchy to *newdir*.

```
pax -r -s ',^//*usr//*,,' -f a.pax
```

reads the archive **a.pax**, with all files rooted in **/usr** in the archive extracted relative to the current directory.

Using the option:

```

102887 -o listopt="%M %(atime)T %(size)D %(name)s"
102888 overrides the default output description in Standard Output and instead writes:
102889 -rw-rw--- Jan 12 15:53 2003 1492 /usr/foo/bar
102890 Using the options:
102891 -o listopt='%L\t%(size)D\n%.7' \
102892 -o listopt='(name)s\n%(atime)T\n%T'
102893 overrides the default output description in Standard Output and instead writes:
102894 /usr/foo/bar -> /tmp 1492
102895 /usr/fo
102896 Jan 12 15:53 1991
102897 Jan 31 15:53 2003

```

## 102898 RATIONALE

102899 The *pax* utility was new for the ISO POSIX-2:1993 standard. It represents a peaceful compromise  
 102900 between advocates of the historical *tar* and *cpio* utilities.

102901 A fundamental difference between *cpio* and *tar* was in the way directories were treated. The *cpio*  
 102902 utility did not treat directories differently from other files, and to select a directory and its  
 102903 contents required that each file in the hierarchy be explicitly specified. For *tar*, a directory  
 102904 matched every file in the file hierarchy it rooted.

102905 The *pax* utility offers both interfaces; by default, directories map into the file hierarchy they root.  
 102906 The **-d** option causes *pax* to skip any file not explicitly referenced, as *cpio* historically did. The *tar*  
 102907 **-style** behavior was chosen as the default because it was believed that this was the more  
 102908 common usage and because *tar* is the more commonly available interface, as it was historically  
 102909 provided on both System V and BSD implementations.

102910 The data interchange format specification in this volume of POSIX.1-2008 requires that processes  
 102911 with “appropriate privileges” shall always restore the ownership and permissions of extracted  
 102912 files exactly as archived. If viewed from the historic equivalence between superuser and  
 102913 “appropriate privileges”, there are two problems with this requirement. First, users running as  
 102914 superusers may unknowingly set dangerous permissions on extracted files. Second, it is  
 102915 needlessly limiting, in that superusers cannot extract files and own them as superuser unless the  
 102916 archive was created by the superuser. (It should be noted that restoration of ownerships and  
 102917 permissions for the superuser, by default, is historical practice in *cpio*, but not in *tar*.) In order to  
 102918 avoid these two problems, the *pax* specification has an additional “privilege” mechanism, the **-p**  
 102919 option. Only a *pax* invocation with the privileges needed, and which has the **-p** option set using  
 102920 the **e** specification character, has appropriate privileges to restore full ownership and permission  
 102921 information.

102922 Note also that this volume of POSIX.1-2008 requires that the file ownership and access  
 102923 permissions shall be set, on extraction, in the same fashion as the *creat()* function when provided  
 102924 with the mode stored in the archive. This means that the file creation mask of the user is applied  
 102925 to the file permissions.

102926 Users should note that directories may be created by *pax* while extracting files with permissions  
 102927 that are different from those that existed at the time the archive was created. When extracting  
 102928 sensitive information into a directory hierarchy that no longer exists, users are encouraged to set  
 102929 their file creation mask appropriately to protect these files during extraction.

102930 The table of contents output is written to standard output to facilitate pipeline processing.

102931 An early proposal had hard links displaying for all pathnames. This was removed because it

complicates the output of the case where `-v` is not specified and does not match historical *cpio* usage. The hard-link information is available in the `-v` display.

The description of the `-l` option allows implementations to make hard links to symbolic links. Earlier versions of this standard did not specify any way to create a hard link to a symbolic link, but many implementations provided this capability as an extension. If there are hard links to symbolic links when an archive is created, the implementation is required to archive the hard link in the archive (unless `-H` or `-L` is specified). When in **read** mode and in **copy** mode, implementations supporting hard links to symbolic links should use them when appropriate.

The archive formats inherited from the POSIX.1-1990 standard have certain restrictions that have been brought along from historical usage. For example, there are restrictions on the length of pathnames stored in the archive. When *pax* is used in **copy(-rw)** mode (copying directory hierarchies), the ability to use extensions from the **-xpax** format overcomes these restrictions.

The default *blocksize* value of 5120 bytes for *cpio* was selected because it is one of the standard block-size values for *cpio*, set when the `-B` option is specified. (The other default block-size value for *cpio* is 512 bytes, and this was considered to be too small.) The default block value of 10240 bytes for *tar* was selected because that is the standard block-size value for BSD *tar*. The maximum block size of 32768 bytes ( $2^{15}$ –512 bytes) is the largest multiple of 512 bytes that fits into a signed 16-bit tape controller transfer register. There are known limitations in some historical systems that would prevent larger blocks from being accepted. Historical values were chosen to improve compatibility with historical scripts using *dd* or similar utilities to manipulate archives. Also, default block sizes for any file type other than character special file has been deleted from this volume of POSIX.1-2008 as unimportant and not likely to affect the structure of the resulting archive.

Implementations are permitted to modify the block-size value based on the archive format or the device to which the archive is being written. This is to provide implementations with the opportunity to take advantage of special types of devices, and it should not be used without a great deal of consideration as it almost certainly decreases archive portability.

The intended use of the `-n` option was to permit extraction of one or more files from the archive without processing the entire archive. This was viewed by the standard developers as offering significant performance advantages over historical implementations. The `-n` option in early proposals had three effects; the first was to cause special characters in patterns to not be treated specially. The second was to cause only the first file that matched a pattern to be extracted. The third was to cause *pax* to write a diagnostic message to standard error when no file was found matching a specified pattern. Only the second behavior is retained by this volume of POSIX.1-2008, for many reasons. First, it is in general not acceptable for a single option to have multiple effects. Second, the ability to make pattern matching characters act as normal characters is useful for parts of *pax* other than file extraction. Third, a finer degree of control over the special characters is useful because users may wish to normalize only a single special character in a single filename. Fourth, given a more general escape mechanism, the previous behavior of the `-n` option can be easily obtained using the `-s` option or a *sed* script. Finally, writing a diagnostic message when a pattern specified by the user is unmatched by any file is useful behavior in all cases.

In this version, the `-n` was removed from the **copy** mode synopsis of *pax*; it is inapplicable because there are no pattern operands specified in this mode.

There is another method than *pax* for copying subtrees in POSIX.1-2008 described as part of the *cp* utility. Both methods are historical practice: *cp* provides a simpler, more intuitive interface, while *pax* offers a finer granularity of control. Each provides additional functionality to the other; in particular, *pax* maintains the hard-link structure of the hierarchy while *cp* does not. It is

the intention of the standard developers that the results be similar (using appropriate option combinations in both utilities). The results are not required to be identical; there seemed insufficient gain to applications to balance the difficulty of implementations having to guarantee that the results would be exactly identical.

A single archive may span more than one file. It is suggested that implementations provide informative messages to the user on standard error whenever the archive file is changed.

The **-d** option (do not create intermediate directories not listed in the archive) found in early proposals was originally provided as a complement to the historic **-d** option of *cpio*. It has been deleted.

The **-s** option in early proposals specified a subset of the substitution command from the *ed* utility. As there was no reason for only a subset to be supported, the **-s** option is now compatible with the current *ed* specification. Since the delimiter can be any non-null character, the following usage with single `<space>` characters is valid:

```
pax -s " foo bar " ...
```

The **-t** description is worded so as to note that this may cause the access time update caused by some other activity (which occurs while the file is being read) to be overwritten.

The default behavior of *pax* with regard to file modification times is the same as historical implementations of *tar*. It is not the historical behavior of *cpio*.

Because the **-i** option uses **/dev/tty**, utilities without a controlling terminal are not able to use this option.

The **-y** option, found in early proposals, has been deleted because a line containing a single `<period>` for the **-i** option has equivalent functionality. The special lines for the **-i** option (a single `<period>` and the empty line) are historical practice in *cpio*.

In early drafts, a **-echarmap** option was included to increase portability of files between systems using different coded character sets. This option was omitted because it was apparent that consensus could not be formed for it. In this version, the use of UTF-8 should be an adequate substitute.

The ISO POSIX-2:1993 standard and ISO POSIX-1 standard requirements for *pax*, however, made it very difficult to create a single archive containing files created using extended characters provided by different locales. This version adds the **hdrcharset** keyword to make it possible to archive files in these cases without dropping files due to translation errors.

Translating filenames and other attributes from a locale's encoding to UTF-8 and then back again can lose information, as the resulting filename might not be byte-for-byte equivalent to the original. To avoid this problem, users can specify the **-o hdrcharset=binary** option, which will cause the resulting archive to use binary format for all names and attributes. Such archives are not portable among hosts that use different native encodings (e.g., EBCDIC *versus* ASCII-based encodings), but they will allow interchange among the vast majority of POSIX file systems in practical use. Also, the **-o hdrcharset=binary** option will cause *pax* in **copy** mode to behave more like other standard utilities such as *cp*.

If the values specified by the **-o exthdr.name=value**, **-o globexthdr.name=value**, or by **\$TMPDIR** (if **-o globexthdr.name** is not specified) require a character encoding other than that described in the ISO/IEC 646:1991 standard, a **path** extended header record will have to be created for the file. If a **hdrcharset** extended header record is active for such headers, it will determine the codeset used for the value field in these extended **path** header records. These **path** extended header records always need to be created when writing an archive even if **hdrcharset=binary** has been specified and would contain the same (binary) data that appears in

the **ustar** header record prefix and *name* fields. (In other words, an extended header **path** record is always required to be generated if the *prefix* or *name* fields contain non-ASCII characters even when **hdrcharset=binary** is also in effect for that file.)

The **-k** option was added to address international concerns about the dangers involved in the character set transformations of **-e** (if the target character set were different from the source, the filenames might be transformed into names matching existing files) and also was made more general to protect files transferred between file systems with different {NAME\_MAX} values (truncating a filename on a smaller system might also inadvertently overwrite existing files). As stated, it prevents any overwriting, even if the target file is older than the source. This version adds more granularity of options to solve this problem by introducing the **-oinvalid=option**—specifically the **UTF-8** and **binary** actions. (Note that an existing file is still subject to overwriting in this case. The **-k** option closes that loophole.)

Some of the file characteristics referenced in this volume of POSIX.1-2008 might not be supported by some archive formats. For example, neither the **tar** nor **cpio** formats contain the file access time. For this reason, the *e* specification character has been provided, intended to cause all file characteristics specified in the archive to be retained.

It is required that extracted directories, by default, have their access and modification times and permissions set to the values specified in the archive. This has obvious problems in that the directories are almost certainly modified after being extracted and that directory permissions may not permit file creation. One possible solution is to create directories with the mode specified in the archive, as modified by the *umask* of the user, with sufficient permissions to allow file creation. After all files have been extracted, *pax* would then reset the access and modification times and permissions as necessary.

The list-mode formatting description borrows heavily from the one defined by the *printf* utility. However, since there is no separate operand list to get conversion arguments, the format was extended to allow specifying the name of the conversion argument as part of the conversion specification.

The *T* conversion specifier allows time fields to be displayed in any of the date formats. Unlike the *ls* utility, *pax* does not adjust the format when the date is less than six months in the past. This makes parsing the output more predictable.

The *D* conversion specifier handles the ability to display the major/minor or file size, as with *ls*, by using *%-8(size)D*.

The *L* conversion specifier handles the *ls* display for symbolic links.

Conversion specifiers were added to generate existing known types used for *ls*.

### pax Interchange Format

The new POSIX data interchange format was developed primarily to satisfy international concerns that the **ustar** and **cpio** formats did not provide for file, user, and group names encoded in characters outside a subset of the ISO/IEC 646:1991 standard. The standard developers realized that this new POSIX data interchange format should be very extensible because there were other requirements they foresaw in the near future:

- Support international character encodings and locale information
- Support security information (ACLs, and so on)
- Support future file types, such as realtime or contiguous files

- Include data areas for implementation use
- Support systems with words larger than 32 bits and timers with subsecond granularity

The following were not goals for this format because these are better handled by separate utilities or are inappropriate for a portable format:

- Encryption
- Compression
- Data translation between locales and codesets
- *inode* storage

The format chosen to support the goals is an extension of the **ustar** format. Of the two formats previously available, only the **ustar** format was selected for extensions because:

- It was easier to extend in an upwards-compatible way. It offered version flags and header block type fields with room for future standardization. The **cpio** format, while possessing a more flexible file naming methodology, could not be extended without breaking some theoretical implementation or using a dummy filename that could be a legitimate filename.
- Industry experience since the original “tar wars” fought in developing the ISO POSIX-1 standard has clearly been in favor of the **ustar** format, which is generally the default output format selected for *pax* implementations on new systems.

The new format was designed with one additional goal in mind: reasonable behavior when an older *tar* or *pax* utility happened to read an archive. Since the POSIX.1-1990 standard mandated that a “format-reading utility” had to treat unrecognized *typeflag* values as regular files, this allowed the format to include all the extended information in a pseudo-regular file that preceded each real file. An option is given that allows the archive creator to set up reasonable names for these files on the older systems. Also, the normative text suggests that reasonable file access values be used for this **ustar** header block. Making these header files inaccessible for convenient reading and deleting would not be reasonable. File permissions of 600 or 700 are suggested.

The **ustar** *typeflag* field was used to accommodate the additional functionality of the new format rather than magic or version because the POSIX.1-1990 standard (and, by reference, the previous version of *pax*), mandated the behavior of the format-reading utility when it encountered an unknown *typeflag*, but was silent about the other two fields.

Early proposals for the first version of this standard contained a proposed archive format that was based on compatibility with the standard for tape files (ISO 1001, similar to the format used historically on many mainframes and minicomputers). This format was overly complex and required considerable overhead in volume and header records. Furthermore, the standard developers felt that it would not be acceptable to the community of POSIX developers, so it was later changed to be a format more closely related to historical practice on POSIX systems.

The prefix and name split of pathnames in **ustar** was replaced by the single path extended header record for simplicity.

The concept of a global extended header (*typeflagg*) was controversial. If this were applied to an archive being recorded on magnetic tape, a few unreadable blocks at the beginning of the tape could be a serious problem; a utility attempting to extract as many files as possible from a damaged archive could lose a large percentage of file header information in this case. However, if the archive were on a reliable medium, such as a CD-ROM, the global extended header offers considerable potential size reductions by eliminating redundant information. Thus, the text warns against using the global method for unreliable media and provides a method for

implanting global information in the extended header for each file, rather than in the *typeflag* g records.

No facility for data translation or filtering on a per-file basis is included because the standard developers could not invent an interface that would allow this in an efficient manner. If a filter, such as encryption or compression, is to be applied to all the files, it is more efficient to apply the filter to the entire archive as a single file. The standard developers considered interfaces that would invoke a shell script for each file going into or out of the archive, but the system overhead in this approach was considered to be too high.

One such approach would be to have **filter=** records that give a pathname for an executable. When the program is invoked, the file and archive would be open for standard input/output and all the header fields would be available as environment variables or command-line arguments. The standard developers did discuss such schemes, but they were omitted from POSIX.1-2008 due to concerns about excessive overhead. Also, the program itself would need to be in the archive if it were to be used portably.

There is currently no portable means of identifying the character set(s) used for a file in the file system. Therefore, *pax* has not been given a mechanism to generate charset records automatically. The only portable means of doing this is for the user to write the archive using the **-ocharset=string** command line option. This assumes that all of the files in the archive use the same encoding. The “implementation-defined” text is included to allow for a system that can identify the encodings used for each of its files.

The table of standards that accompanies the charset record description is acknowledged to be very limited. Only a limited number of character set standards is reasonable for maximal interchange. Any character set is, of course, possible by prior agreement. It was suggested that EBCDIC be listed, but it was omitted because it is not defined by a formal standard. Formal standards, and then only those with reasonably large followings, can be included here, simply as a matter of practicality. The *<value>s* represent names of officially registered character sets in the format required by the ISO 2375:1985 standard.

The normal *<comma>* or *<blank>*-separated list rules are not followed in the case of keyword options to allow ease of argument parsing for *getopts*.

Further information on character encodings is in [pax Archive Character Set Encoding/Decoding](#) (on page 3090).

The standard developers have reserved keyword name space for vendor extensions. It is suggested that the format to be used is:

*VENDOR.keyword*

where *VENDOR* is the name of the vendor or organization in all uppercase letters. It is further suggested that the keyword following the *<period>* be named differently than any of the standard keywords so that it could be used for future standardization, if appropriate, by omitting the *VENDOR* prefix.

The *<length>* field in the extended header record was included to make it simpler to step through the records, even if a record contains an unknown format (to a particular *pax*) with complex interactions of special characters. It also provides a minor integrity checkpoint within the records to aid a program attempting to recover files from a damaged archive.

There are no extended header versions of the *devmajor* and *devminor* fields because the unspecified format **ustar** header field should be sufficient. If they are not, vendor-specific extended keywords (such as *VENDOR.devmajor*) should be used.

Device and *i*-number labeling of files was not adopted from *cpio*; files are interchanged strictly

on a symbolic name basis, as in **ustar**.

Just as with the **ustar** format descriptions, the new format makes no special arrangements for multi-volume archives. Each of the *pax* archive types is assumed to be inside a single POSIX file and splitting that file over multiple volumes (diskettes, tape cartridges, and so on), processing their labels, and mounting each in the proper sequence are considered to be implementation details that cannot be described portably.

The **pax** format is intended for interchange, not only for backup on a single (family of) systems. It is not as densely packed as might be possible for backup:

- It contains information as coded characters that could be coded in binary.
- It identifies extended records with name fields that could be omitted in favor of a fixed-field layout.
- It translates names into a portable character set and identifies locale-related information, both of which are probably unnecessary for backup.

The requirements on restoring from an archive are slightly different from the historical wording, allowing for non-monolithic privilege to bring forward as much as possible. In particular, attributes such as “high performance file” might be broadly but not universally granted while set-user-ID or *chown()* might be much more restricted. There is no implication in POSIX.1-2008 that the security information be honored after it is restored to the file hierarchy, in spite of what might be improperly inferred by the silence on that topic. That is a topic for another standard.

Links are recorded in the fashion described here because a link can be to any file type. It is desirable in general to be able to restore part of an archive selectively and restore all of those files completely. If the data is not associated with each link, it is not possible to do this. However, the data associated with a file can be large, and when selective restoration is not needed, this can be a significant burden. The archive is structured so that files that have no associated data can always be restored by the name of any link name of any link, and the user may choose whether data is recorded with each instance of a file that contains data. The format permits mixing of both types of links in a single archive; this can be done for special needs, and *pax* is expected to interpret such archives on input properly, despite the fact that there is no *pax* option that would force this mixed case on output. (When **-o linkdata** is used, the output must contain the duplicate data, but the implementation is free to include it or omit it when **-o linkdata** is not used.)

The time values are included as extended header records for those implementations needing more than the eleven octal digits allowed by the **ustar** format. Portable file timestamps cannot be negative. If *pax* encounters a file with a negative timestamp in **copy** or **write** mode, it can reject the file, substitute a non-negative timestamp, or generate a non-portable timestamp with a leading ‘-’. Even though some implementations can support finer file-time granularities than seconds, the normative text requires support only for seconds since the Epoch because the ISO POSIX-1 standard states them that way. The **ustar** format includes only *mtime*; the new format adds *atime* and *ctime* for symmetry. The *atime* access time restored to the file system will be affected by the **-p a** and **-p e** options. The *ctime* creation time (actually *inode* modification time) is described with appropriate privileges so that it can be ignored when writing to the file system. POSIX does not provide a portable means to change file creation time. Nothing is intended to prevent a non-portable implementation of *pax* from restoring the value.

The *gid*, *size*, and *uid* extended header records were included to allow expansion beyond the sizes specified in the regular *tar* header. New file system architectures are emerging that will exhaust the 12-digit size field. There are probably not many systems requiring more than 8 digits for user and group IDs, but the extended header values were included for completeness,

allowing overrides for all of the decimal values in the *tar* header.

The standard developers intended to describe the effective results of *pax* with regard to file ownerships and permissions; implementations are not restricted in timing or sequencing the restoration of such, provided the results are as specified.

Much of the text describing the extended headers refers to use in “**write** or **copy** modes”. The **copy** mode references are due to the normative text: “The effect of the copy shall be as if the copied files were written to an archive file and then subsequently extracted ...”. There is certainly no way to test whether *pax* is actually generating the extended headers in **copy** mode, but the effects must be as if it had.

### **pax Archive Character Set Encoding/Decoding**

There is a need to exchange archives of files between systems of different native codesets. Filenames, group names, and user names must be preserved to the fullest extent possible when an archive is read on the receiving platform. Translation of the contents of files is not within the scope of the *pax* utility.

There will also be the need to represent characters that are not available on the receiving platform. These unsupported characters cannot be automatically folded to the local set of characters due to the chance of collisions. This could result in overwriting previous extracted files from the archive or pre-existing files on the system.

For these reasons, the codeset used to represent characters within the extended header records of the *pax* archive must be sufficiently rich to handle all commonly used character sets. The fields requiring translation include, at a minimum, filenames, user names, group names, and link pathnames. Implementations may wish to have localized extended keywords that use non-portable characters.

The standard developers considered the following options:

- The archive creator specifies the well-defined name of the source codeset. The receiver must then recognize the codeset name and perform the appropriate translations to the destination codeset.
- The archive creator includes within the archive the character mapping table for the source codeset used to encode extended header records. The receiver must then read the character mapping table and perform the appropriate translations to the destination codeset.
- The archive creator translates the extended header records in the source codeset into a canonical form. The receiver must then perform the appropriate translations to the destination codeset.

The approach that incorporates the name of the source codeset poses the problem of codeset name registration, and makes the archive useless to *pax* archive decoders that do not recognize that codeset.

Because parts of an archive may be corrupted, the standard developers felt that including the character map of the source codeset was too fragile. The loss of this one key component could result in making the entire archive useless. (The difference between this and the global extended header decision was that the latter has a workaround—duplicating extended header records on unreliable media—but this would be too burdensome for large character set maps.)

Both of the above approaches also put an undue burden on the *pax* archive receiver to handle the cross-product of all source and destination codesets.

To simplify the translation from the source codeset to the canonical form and from the canonical form to the destination codeset, the standard developers decided that the internal representation should be a stateless encoding. A stateless encoding is one where each codepoint has the same meaning, without regard to the decoder being in a specific state. An example of a stateful encoding would be the Japanese Shift-JIS; an example of a stateless encoding would be the ISO/IEC 646: 1991 standard (equivalent to 7-bit ASCII).

For these reasons, the standard developers decided to adopt a canonical format for the representation of file information strings. The obvious, well-endorsed candidate is the ISO/IEC 10646-1: 2000 standard (based in part on Unicode), which can be used to represent the characters of virtually all standardized character sets. The standard developers initially agreed upon using UCS2 (16-bit Unicode) as the internal representation. This repertoire of characters provides a sufficiently rich set to represent all commonly-used codesets.

However, the standard developers found that the 16-bit Unicode representation had some problems. It forced the issue of standardizing byte ordering. The 2-byte length of each character made the extended header records twice as long for the case of strings coded entirely from historical 7-bit ASCII. For these reasons, the standard developers chose the UTF-8 defined in the ISO/IEC 10646-1: 2000 standard. This multi-byte representation encodes UCS2 or UCS4 characters reliably and deterministically, eliminating the need for a canonical byte ordering. In addition, NUL octets and other characters possibly confusing to POSIX file systems do not appear, except to represent themselves. It was realized that certain national codesets take up more space after the encoding, due to their placement within the UCS range; it was felt that the usefulness of the encoding of the names outweighs the disadvantage of size increase for file, user, and group names.

The encoding of UTF-8 is as follows:

| UCS4 Hex Encoding | UTF-8 Binary Encoding                                 |
|-------------------|-------------------------------------------------------|
| 00000000–0000007F | 0xxxxxxx                                              |
| 00000080–000007FF | 110xxxxx 10xxxxxx                                     |
| 00000800–0000FFFF | 1110xxxx 10xxxxxx 10xxxxxx                            |
| 00010000–001FFFFF | 11110xxx 10xxxxxx 10xxxxxx 10xxxxxx                   |
| 00200000–03FFFFFF | 111110xx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx          |
| 04000000–7FFFFFFF | 1111110x 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx |

where each 'x' represents a bit value from the character being translated.

### ustar Interchange Format

The description of the **ustar** format reflects numerous enhancements over pre-1988 versions of the historical *tar* utility. The goal of these changes was not only to provide the functional enhancements desired, but also to retain compatibility between new and old versions. This compatibility has been retained. Archives written using the old archive format are compatible with the new format.

Implementors should be aware that the previous file format did not include a mechanism to archive directory type files. For this reason, the convention of using a filename ending with <slash> was adopted to specify a directory on the archive.

The total size of the *name* and *prefix* fields have been set to meet the minimum requirements for {PATH\_MAX}. If a pathname will fit within the *name* field, it is recommended that the pathname be stored there without the use of the *prefix* field. Although the name field is known to be too small to contain {PATH\_MAX} characters, the value was not changed in this version of the archive file format to retain backwards-compatibility, and instead the prefix was introduced.

Also, because of the earlier version of the format, there is no way to remove the restriction on the *linkname* field being limited in size to just that of the *name* field.

The *size* field is required to be meaningful in all implementation extensions, although it could be zero. This is required so that the data blocks can always be properly counted.

It is suggested that if device special files need to be represented that cannot be represented in the standard format, that one of the extension types (**A-Z**) be used, and that the additional information for the special file be represented as data and be reflected in the *size* field.

Attempting to restore a special file type, where it is converted to ordinary data and conflicts with an existing filename, need not be specially detected by the utility. If run as an ordinary user, *pax* should not be able to overwrite the entries in, for example, */dev* in any case (whether the file is converted to another type or not). If run as a privileged user, it should be able to do so, and it would be considered a bug if it did not. The same is true of ordinary data files and similarly named special files; it is impossible to anticipate the needs of the user (who could really intend to overwrite the file), so the behavior should be predictable (and thus regular) and rely on the protection system as required.

The value 7 in the *typeflag* field is intended to define how contiguous files can be stored in a **ustar** archive. POSIX.1-2008 does not require the contiguous file extension, but does define a standard way of archiving such files so that all conforming systems can interpret these file types in a meaningful and consistent manner. On a system that does not support extended file types, the *pax* utility should do the best it can with the file and go on to the next.

The file protection modes are those conventionally used by the *ls* utility. This is extended beyond the usage in the ISO POSIX-2 standard to support the “shared text” or “sticky” bit. It is intended that the conformance document should not document anything beyond the existence of and support of such a mode. Further extensions are expected to these bits, particularly with overloading the set-user-ID and set-group-ID flags.

### **cpio Interchange Format**

The reference to appropriate privileges in the **cpio** format refers to an error on standard output; the **ustar** format does not make comparable statements.

The model for this format was the historical System V *cpio-c* data interchange format. This model documents the portable version of the **cpio** format and not the binary version. It has the flexibility to transfer data of any type described within POSIX.1-2008, yet is extensible to transfer data types specific to extensions beyond POSIX.1-2008 (for example, contiguous files). Because it describes existing practice, there is no question of maintaining upwards-compatibility.

### **cpio Header**

There has been some concern that the size of the *c\_ino* field of the header is too small to handle those systems that have very large *inode* numbers. However, the *c\_ino* field in the header is used strictly as a hard-link resolution mechanism for archives. It is not necessarily the same value as the *inode* number of the file in the location from which that file is extracted.

The name *c\_magic* is based on historical usage.

**cpio Filename**

For most historical implementations of the *cpio* utility, {PATH\_MAX} octets can be used to describe the pathname without the addition of any other header fields (the NUL character would be included in this count). {PATH\_MAX} is the minimum value for pathname size, documented as 256 bytes. However, an implementation may use *c\_namesize* to determine the exact length of the pathname. With the current description of the **<cpio.h>** header, this pathname size can be as large as a number that is described in six octal digits.

Two values are documented under the *c\_mode* field values to provide for extensibility for known file types:

**0110 000** Reserved for contiguous files. The implementation may treat the rest of the information for this archive like a regular file. If this file type is undefined, the implementation may create the file as a regular file.

This provides for extensibility of the **cpio** format while allowing for the ability to read old archives. Files of an unknown type may be read as “regular files” on some implementations. On a system that does not support extended file types, the *pax* utility should do the best it can with the file and go on to the next.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 4.

**Issue 5**

A note is added to the APPLICATION USAGE indicating that the **cpio** and **tar** formats can only support files up to 8 gigabytes in size.

**Issue 6**

The *pax* utility is aligned with the IEEE P1003.2b draft standard:

- Support has been added for symbolic links in the options and interchange formats.
- A new format has been devised, based on extensions to **ustar**.
- References to the “extended” **tar** and **cpio** formats derived from the POSIX.1-1990 standard have been changed to remove the “extended” adjective because this could cause confusion with the extended **tar** header added in this version. (All references to **tar** are actually to **ustar**.)

The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

IEEE PASC Interpretation 1003.2 #168 is applied, clarifying that *mkdir()* and *mkfifo()* calls can ignore an [EEXIST] error when extracting an archive.

IEEE PASC Interpretation 1003.2 #180 is applied, clarifying how extracted files are created when in **read** mode.

IEEE PASC Interpretation 1003.2 #181 is applied, clarifying the description of the **-t** option.

- 103378 IEEE PASC Interpretation 1003.2 #195 is applied.
- 103379 IEEE PASC Interpretation 1003.2 #206 is applied, clarifying the handling of links for the **-H**, **-L**,  
103380 and **-I** options.
- 103381 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/35 is applied, adding the process ID of  
103382 the *pax* process into certain fields. This change provides a method for the implementation to  
103383 ensure that different instances of *pax* extracting a file named */a/b/foo* will not collide when  
103384 processing the extended header information associated with **foo**.
- 103385 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/36 is applied, changing **-x B** to **-x pax** in  
103386 the OPTIONS section.
- 103387 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/20 is applied, updating the SYNOPSIS to  
103388 be consistent with the normative text.
- 103389 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/21 is applied, updating the  
103390 DESCRIPTION to describe the behavior when files to be linked are symbolic links and the  
103391 system is not capable of making hard links to symbolic links.
- 103392 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/22 is applied, updating the OPTIONS  
103393 section to describe the behavior for how multiple **-odelete=pattern** options are to be handled.
- 103394 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/23 is applied, updating the **write** option  
103395 within the OPTIONS section.
- 103396 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/24 is applied, adding a paragraph into  
103397 the OPTIONS section that states that specifying more than one of the mutually-exclusive options  
103398 (**-H** and **-L**) is not considered an error and that the last option specified will determine the  
103399 behavior of the utility.
- 103400 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/25 is applied, removing the *ctime*  
103401 paragraph within the EXTENDED DESCRIPTION. There is a contradiction in the definition of  
103402 the *ctime* keyword for the *pax* extended header, in that the *st\_ctime* member of the **stat** structure  
103403 does not refer to a file creation time. No field in the standard **stat** structure from **<sys/stat.h>**  
103404 includes a file creation time.
- 103405 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/26 is applied, making it clear that *typeflag*  
103406 1 (**ustar** Interchange Format) applies not only to files that are hard-linked, but also to files that  
103407 are aliased via symbolic links.
- 103408 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/27 is applied, clarifying the *cpio c\_nlink*  
103409 field.
- 103410 **Issue 7**
- 103411 Austin Group Interpretations 1003.1-2001 #011, #036, #086, and #109 are applied.
- 103412 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
103413 *LC\_MESSAGES* environment variable.
- 103414 SD5-XCU-ERN-2 is applied, making **-c** and **-n** mutually-exclusive in the SYNOPSIS.
- 103415 SD5-XCU-ERN-3 is applied, revising the default behavior of **-H** and **-L**.
- 103416 SD5-XCU-ERN-5, SD5-XCU-ERN-6, SD5-XCU-ERN-7, SD5-XCU-ERN-60 are applied.
- 103417 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 103418 The *pax* utility is no longer allowed to create separate identical symbolic links when extracting  
103419 linked symbolic links from an archive.

103420  
103421

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0128 [260], XCU/TC1-2008/0129 [261], XCU/TC1-2008/0130 [261], XCU/TC1-2008/0131 [313], and XCU/TC1-2008/0132 [233] are applied.

103423 **NAME**103424 `pr` — print files103425 **SYNOPSIS**

103426 `pr [+page] [-column] [-adFmrt] [-e[char][gap]] [-h header] [-i[char][gap]]`  
 103427 XSI `[-l lines] [-n[char][width]] [-o offset] [-s[char]] [-w width] [ -fp]`  
 103428 `[file...]`

103429 **DESCRIPTION**

103430 The *pr* utility is a printing and pagination filter. If multiple input files are specified, each shall be  
 103431 read, formatted, and written to standard output. By default, the input shall be separated into  
 103432 66-line pages, each with:

- 103433 • A 5-line header that includes the page number, date, time, and the pathname of the file
- 103434 • A 5-line trailer consisting of blank lines

103435 If standard output is associated with a terminal, diagnostic messages shall be deferred until the  
 103436 *pr* utility has completed processing.

103437 When options specifying multi-column output are specified, output text columns shall be of  
 103438 equal width; input lines that do not fit into a text column shall be truncated. By default, text  
 103439 columns shall be separated with at least one <blank>.

103440 **OPTIONS**

103441 The *pr* utility shall conform to XBD [Section 12.2](#) (on page 216), except that: the *page* option has a  
 103442 '+' delimiter; *page* and *column* can be multi-digit numbers; some of the option-arguments are  
 103443 optional; and some of the option-arguments cannot be specified as separate arguments from the  
 103444 preceding option letter. In particular, the *-s* option does not allow the option letter to be  
 103445 separated from its argument, and the options *-e*, *-i*, and *-n* require that both arguments, if  
 103446 present, not be separated from the option letter.

103447 The following options shall be supported. In the following option descriptions, *column*, *lines*,  
 103448 *offset*, *page*, and *width* are positive decimal integers; *gap* is a non-negative decimal integer.

- 103449 **+page** Begin output at page number *page* of the formatted input.
- 103450 **-column** Produce multi-column output that is arranged in *column* columns (the default shall  
 103451 be 1) and is written down each column in the order in which the text is received  
 103452 from the input file. This option should not be used with *-m*. The options *-e* and *-i*  
 103453 shall be assumed for multiple text-column output. Whether or not text columns are  
 103454 produced with identical vertical lengths is unspecified, but a text column shall  
 103455 never exceed the length of the page (see the *-l* option). When used with *-t*, use the  
 103456 minimum number of lines to write the output.
- 103457 **-a** Modify the effect of the *-column* option so that the columns are filled across the  
 103458 page in a round-robin order (for example, when *column* is 2, the first input line  
 103459 heads column 1, the second heads column 2, the third is the second line in column  
 103460 1, and so on).
- 103461 **-d** Produce output that is double-spaced; append an extra <newline> following every  
 103462 <newline> found in the input.
- 103463 **-e[char][gap]**  
 103464 Expand each input <tab> to the next greater column position specified by the  
 103465 formula  $n*gap+1$ , where *n* is an integer > 0. If *gap* is zero or is omitted, it shall  
 103466 default to 8. All <tab> characters in the input shall be expanded into the  
 103467 appropriate number of <space> characters. If any non-digit character, *char*, is  
 103468 specified, it shall be used as the input <tab>. If the first character of the *-e* option-

|        |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|-----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 103469 |     | argument is a digit, the entire option-argument shall be assumed to be <i>gap</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 103470 | XSI | <b>-f</b> Use a <form-feed> for new pages, instead of the default behavior that uses a sequence of <newline> characters. Pause before beginning the first page if the standard output is associated with a terminal.                                                                                                                                                                                                                                                                                                                                                |
| 103471 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 103472 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 103473 |     | <b>-F</b> Use a <form-feed> for new pages, instead of the default behavior that uses a sequence of <newline> characters.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 103474 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 103475 |     | <b>-h header</b> Use the string <i>header</i> to replace the contents of the <i>file</i> operand in the page header.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 103476 |     | <b>-i[char][gap]</b> In output, replace <space> characters with <tab> characters wherever one or more adjacent <space> characters reach column positions <i>gap</i> +1, 2* <i>gap</i> +1, 3* <i>gap</i> +1, and so on. If <i>gap</i> is zero or is omitted, default tab settings at every eighth column position shall be assumed. If any non-digit character, <i>char</i> , is specified, it shall be used as the output <tab>. If the first character of the <b>-i</b> option-argument is a digit, the entire option-argument shall be assumed to be <i>gap</i> . |

| 103489 |     | <b>-n[char][width]</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 103490 |     | Provide <i>width</i> -digit line numbering (default for <i>width</i> shall be 5). The number shall occupy the first <i>width</i> column positions of each text column of default output or each line of <b>-m</b> output. If <i>char</i> (any non-digit character) is given, it shall be appended to the line number to separate it from whatever follows (default for <i>char</i> is a <tab>).                                                                                                                                                                     |
| 103491 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 103500 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 103501 |     | <b>-r</b> Write no diagnostic reports on failure to open files.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 103502 |     | <b>-s[char]</b> Separate text columns by the single character <i>char</i> instead of by the appropriate number of <space> characters (default for <i>char</i> shall be <tab>).                                                                                                                                                                                                                                                                                                                                                                                      |
| 103503 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 103504 |     | <b>-t</b> Write neither the five-line identifying header nor the five-line trailer usually supplied for each page. Quit writing after the last line of each file without spacing to the end of the page.                                                                                                                                                                                                                                                                                                                                                            |
| 103505 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 103506 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 103507 |     | <b>-w width</b> Set the width of the line to <i>width</i> column positions for multiple text-column output only. If the <b>-w</b> option is not specified and the <b>-s</b> option is not specified, the default width shall be 72. If the <b>-w</b> option is not specified and the <b>-s</b> option is specified, the default width shall be 512.                                                                                                                                                                                                                 |
| 103508 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 103509 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 103510 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 103511 |     | For single column output, input lines shall not be truncated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

103512 **OPERANDS**

103513 The following operand shall be supported:

103514 *file* A pathname of a file to be written. If no *file* operands are specified, or if a *file*  
 103515 operand is '-', the standard input shall be used.

103516 **STDIN**

103517 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
 103518 See the INPUT FILES section.

103519 **INPUT FILES**

103520 The input files shall be text files.

103521 The file `/dev/tty` shall be used to read responses required by the `-p` option.103522 **ENVIRONMENT VARIABLES**103523 The following environment variables shall affect the execution of *pr*:

103524 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 103525 (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
 103526 used to determine the values of locale categories.)

103527 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 103528 internationalization variables.

103529 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 103530 characters (for example, single-byte as opposed to multi-byte characters in  
 103531 arguments and input files) and which characters are defined as printable (character  
 103532 class **print**). Non-printable characters are still written to standard output, but are  
 103533 not counted for the purpose for column-width and line-length calculations.

103534 *LC\_MESSAGES*  
 103535 Determine the locale that should be used to affect the format and contents of  
 103536 diagnostic messages written to standard error.

103537 *LC\_TIME* Determine the format of the date and time for use in writing header lines.103538 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

103539 *TZ* Determine the timezone used to calculate date and time strings written in header  
 103540 lines. If *TZ* is unset or null, an unspecified default timezone shall be used.

103541 **ASYNCHRONOUS EVENTS**

103542 If *pr* receives an interrupt while writing to a terminal, it shall flush all accumulated error  
 103543 messages to the screen before terminating.

103544 **STDOUT**

103545 The *pr* utility output shall be a paginated version of the original file (or files). This pagination  
 103546 shall be accomplished using either <form-feed> characters or a sequence of <newline>  
 103547 XSI characters, as controlled by the `-F` or `-f` option. Page headers shall be generated unless the `-t`  
 103548 option is specified. The page headers shall be of the form:

103549 "`\n\n%s %s Page %d\n\n\n`", <output of date>, <file>, <page number>

103550 In the POSIX locale, the <output of date> field, representing the date and time of last modification  
 103551 of the input file (or the current date and time if the input file is standard input), shall be  
 103552 equivalent to the output of the following command as it would appear if executed at the given  
 103553 time:

103554 `date "+%b %e %H:%M %Y"`

103555 without the trailing <newline>, if the page being written is from standard input. If the page  
 103556 being written is not from standard input, in the POSIX locale, the same format shall be used, but  
 103557 the time used shall be the modification time of the file corresponding to *file* instead of the current  
 103558 time. When the *LC\_TIME* locale category is not set to the POSIX locale, a different format and  
 103559 order of presentation of this field may be used.

103560 If the standard input is used instead of a *file* operand, the <*file*> field shall be replaced by a null  
 103561 string.

103562 If the **-h** option is specified, the <*file*> field shall be replaced by the *header* argument.

#### 103563 **STDERR**

103564 The standard error shall be used for diagnostic messages and for alerting the terminal when **-p**  
 103565 is specified.

#### 103566 **OUTPUT FILES**

103567 None.

#### 103568 **EXTENDED DESCRIPTION**

103569 None.

#### 103570 **EXIT STATUS**

103571 The following exit values shall be returned:

103572 0 Successful completion.

103573 >0 An error occurred.

#### 103574 **CONSEQUENCES OF ERRORS**

103575 Default.

#### 103576 **APPLICATION USAGE**

103577 A conforming application must protect its first operand, if it starts with a <plus-sign>, by  
 103578 preceding it with the "--" argument that denotes the end of the options. For example, *pr+x*  
 103579 could be interpreted as an invalid page number or a *file* operand.

#### 103580 **EXAMPLES**

103581 1. Print a numbered list of all files in the current directory:

103582 `ls -a | pr -n -h "Files in $(pwd)."`

103583 2. Print **file1** and **file2** as a double-spaced, three-column listing headed by "file list":

103584 `pr -3d -h "file list" file1 file2`

103585 3. Write **file1** on **file2**, expanding tabs to columns 10, 19, 28, ...:

103586 `pr -e9 -t <file1 >file2`

#### 103587 **RATIONALE**

103588 This utility is one of those that does not follow the Utility Syntax Guidelines because of its  
 103589 historical origins. The standard developers could have added new options that obeyed the  
 103590 guidelines (and marked the old options obsolescent) or devised an entirely new utility; there are  
 103591 examples of both actions in this volume of POSIX.1-2008. Because of its widespread use by  
 103592 historical applications, the standard developers decided to exempt this version of *pr* from many  
 103593 of the guidelines.

103594 Implementations are required to accept option-arguments to the **-h**, **-l**, **-o**, and **-w** options  
 103595 whether presented as part of the same argument or as a separate argument to *pr*, as suggested by  
 103596 the Utility Syntax Guidelines. The **-n** and **-s** options, however, are specified as in historical

practice because they are frequently specified without their optional arguments. If a <blank> were allowed before the option-argument in these cases, a *file* operand could mistakenly be interpreted as an option-argument in historical applications.

The text about the minimum number of lines in multi-column output was included to ensure that a best effort is made in balancing the length of the columns. There are known historical implementations in which, for example, 60-line files are listed by *pr* -2 as one column of 56 lines and a second of 4. Although this is not a problem when a full page with headers and trailers is produced, it would be relatively useless when used with -t.

Historical implementations of the *pr* utility have differed in the action taken for the -f option. BSD uses it as described here for the -F option; System V uses it to change trailing <newline> characters on each page to a <form-feed> and, if standard output is a TTY device, sends an <alert> to standard error and reads a line from /dev/tty before the first page. There were strong arguments from both sides of this issue concerning historical practice and as a result the -F option was added. XSI-conformant systems support the System V historical actions for the -f option.

The <output of date> field in the -l format is specified only for the POSIX locale. As noted, the format can be different in other locales. No mechanism for defining this is present in this volume of POSIX.1-2008, as the appropriate vehicle is a message catalog; that is, the format should be specified as a “message”.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

*expand*, *lp*

#### CHANGE HISTORY

First released in Issue 2.

#### Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The -p option is added.

The normative text is reworded to avoid use of the term “must” for application requirements.

#### Issue 7

PASC Interpretation 1003.2-92 #151 (SD5-XCU-ERN-44) is applied.

Austin Group Interpretation 1003.1-2001 #093 is applied.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

103632 **NAME**

103633       printf — write formatted output

103634 **SYNOPSIS**103635       printf *format* [*argument...*]103636 **DESCRIPTION**

103637       The *printf* utility shall write formatted operands to the standard output. The *argument* operands  
 103638       shall be formatted under control of the *format* operand.

103639 **OPTIONS**

103640       None.

103641 **OPERANDS**

103642       The following operands shall be supported:

103643       *format*       A string describing the format to use to write the remaining operands. See the  
 103644       EXTENDED DESCRIPTION section.

103645       *argument*   The strings to be written to standard output, under the control of *format*. See the  
 103646       EXTENDED DESCRIPTION section.

103647 **STDIN**

103648       Not used.

103649 **INPUT FILES**

103650       None.

103651 **ENVIRONMENT VARIABLES**103652       The following environment variables shall affect the execution of *printf*:

103653       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 103654       (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
 103655       used to determine the values of locale categories.)

103656       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 103657       internationalization variables.

103658       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 103659       characters (for example, single-byte as opposed to multi-byte characters in  
 103660       arguments).

103661       *LC\_MESSAGES*

103662       Determine the locale that should be used to affect the format and contents of  
 103663       diagnostic messages written to standard error.

103664       *LC\_NUMERIC*

103665       Determine the locale for numeric formatting. It shall affect the format of numbers  
 103666       written using the e, E, f, g, and G conversion specifier characters (if supported).

103667 XSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

103668 **ASYNCHRONOUS EVENTS**

103669       Default.

103670 **STDOUT**

103671       See the EXTENDED DESCRIPTION section.

103672 **STDERR**

103673 The standard error shall be used only for diagnostic messages.

103674 **OUTPUT FILES**

103675 None.

103676 **EXTENDED DESCRIPTION**

103677 The *format* operand shall be used as the *format* string described in XBD Chapter 5 (on page 121)  
103678 with the following exceptions:

- 103679 1. A <space> in the format string, in any context other than a flag of a conversion  
103680 specification, shall be treated as an ordinary character that is copied to the output.
- 103681 2. A 'Δ' character in the format string shall be treated as a 'Δ' character, not as a <space>.
- 103682 3. In addition to the escape sequences shown in XBD Chapter 5 (on page 121) ('\\', '\a',  
103683 '\b', '\f', '\n', '\r', '\t', '\v'), "\ddd", where *ddd* is a one, two, or three-digit  
103684 octal number, shall be written as a byte with the numeric value specified by the octal  
103685 number.
- 103686 4. The implementation shall not precede or follow output from the d or u conversion  
103687 specifiers with <blank> characters not specified by the *format* operand.
- 103688 5. The implementation shall not precede output from the o conversion specifier with zeros  
103689 not specified by the *format* operand.
- 103690 6. The a, A, e, E, f, F, g, and G conversion specifiers need not be supported.
- 103691 7. An additional conversion specifier character, b, shall be supported as follows. The  
103692 argument shall be taken to be a string that can contain <backslash>-escape sequences. |  
103693 The following <backslash>-escape sequences shall be supported:
  - 103694 — The escape sequences listed in XBD Chapter 5 (on page 121) ('\\', '\a', '\b',  
103695 '\f', '\n', '\r', '\t', '\v'), which shall be converted to the characters they  
103696 represent
  - 103697 — "\0ddd", where *ddd* is a zero, one, two, or three-digit octal number that shall be  
103698 converted to a byte with the numeric value specified by the octal number
  - 103699 — '\c', which shall not be written and shall cause *printf* to ignore any remaining  
103700 characters in the string operand containing it, any remaining string operands, and  
103701 any additional characters in the *format* operand

103702 The interpretation of a <backslash> followed by any other sequence of characters is  
103703 unspecified.

103704 Bytes from the converted string shall be written until the end of the string or the number  
103705 of bytes indicated by the precision specification is reached. If the precision is omitted, it  
103706 shall be taken to be infinite, so all bytes up to the end of the converted string shall be  
103707 written.

- 103708 8. For each conversion specification that consumes an argument, the next *argument* operand |  
103709 shall be evaluated and converted to the appropriate type for the conversion as specified  
103710 below.
- 103711 9. The *format* operand shall be reused as often as necessary to satisfy the *argument* operands. |  
103712 Any extra b, c, or s conversion specifiers shall be evaluated as if a null string argument  
103713 were supplied; other extra conversion specifications shall be evaluated as if a zero  
103714 argument were supplied. If the *format* operand contains no conversion specifications and  
103715 *argument* operands are present, the results are unspecified.

10. If a character sequence in the *format* operand begins with a '%' character, but does not form a valid conversion specification, the behavior is unspecified.
11. The argument to the *c* conversion specifier can be a string containing zero or more bytes. If it contains one or more bytes, the first byte shall be written and any additional bytes shall be ignored. If the argument is an empty string, it is unspecified whether nothing is written or a null byte is written.

The *argument* operands shall be treated as strings if the corresponding conversion specifier is *b*, *c*, or *s*, and shall be evaluated as if by the *strtod()* function if the corresponding conversion specifier is *a*, *A*, *e*, *E*, *f*, *F*, *g*, or *G*. Otherwise, they shall be evaluated as unsuffixed C integer constants, as described by the ISO C standard, with the following extensions:

- A leading <plus-sign> or <hyphen-minus> shall be allowed.
- If the leading character is a single-quote or double-quote, the value shall be the numeric value in the underlying codeset of the character following the single-quote or double-quote.
- Suffixed integer constants may be allowed.

If an *argument* operand cannot be completely converted into an internal value appropriate to the corresponding conversion specification, a diagnostic message shall be written to standard error and the utility shall not exit with a zero exit status, but shall continue processing any remaining operands and shall write the value accumulated at the time the error was detected to standard output.

It shall not be considered an error if an *argument* operand is not completely used for a *b*, *c*, or *s* conversion.

## EXIT STATUS

The following exit values shall be returned:

- 0 Successful completion.
- >0 An error occurred.

## CONSEQUENCES OF ERRORS

Default.

## APPLICATION USAGE

The floating-point formatting conversion specifications of *printf()* are not required because all arithmetic in the shell is integer arithmetic. The *awk* utility performs floating-point calculations and provides its own **printf** function. The *bc* utility can perform arbitrary-precision floating-point arithmetic, but does not provide extensive formatting capabilities. (This *printf* utility cannot really be used to format *bc* output; it does not support arbitrary precision.) Implementations are encouraged to support the floating-point conversions as an extension.

Note that this *printf* utility, like the *printf()* function defined in the System Interfaces volume of POSIX.1-2008 on which it is based, makes no special provision for dealing with multi-byte characters when using the *%c* conversion specification or when a precision is specified in a *%b* or *%s* conversion specification. Applications should be extremely cautious using either of these features when there are multi-byte characters in the character set.

No provision is made in this volume of POSIX.1-2008 which allows field widths and precisions to be specified as '\*' since the '\*' can be replaced directly in the *format* operand using shell variable substitution. Implementations can also provide this feature as an extension if they so choose.

Hexadecimal character constants as defined in the ISO C standard are not recognized in the *format* operand because there is no consistent way to detect the end of the constant. Octal character constants are limited to, at most, three octal digits, but hexadecimal character constants are only terminated by a non-hex-digit character. In the ISO C standard, the "##" concatenation operator can be used to terminate a constant and follow it with a hexadecimal character to be written. In the shell, concatenation occurs before the *printf* utility has a chance to parse the end of the hexadecimal constant.

The %b conversion specification is not part of the ISO C standard; it has been added here as a portable way to process <backslash>-escapes expanded in string operands as provided by the *echo* utility. See also the APPLICATION USAGE section of *echo* (on page 2663) for ways to use *printf* as a replacement for all of the traditional versions of the *echo* utility.

If an argument cannot be parsed correctly for the corresponding conversion specification, the *printf* utility is required to report an error. Thus, overflow and extraneous characters at the end of an argument being used for a numeric conversion shall be reported as errors.

## EXAMPLES

To alert the user and then print and read a series of prompts:

```
printf "\aPlease fill in the following: \nName: "
read name
printf "Phone number: "
read phone
```

To read out a list of right and wrong answers from a file, calculate the percentage correctly, and print them out. The numbers are right-justified and separated by a single <tab>. The percentage is written to one decimal place of accuracy:

```
while read right wrong ; do
    percent=$(echo "scale=1;($right*100)/($right+$wrong)" | bc)
    printf "%2d right\t%2d wrong\t(%s%%)\n" \
        $right $wrong $percent
done < database_file
```

The command:

```
printf "%5d%4d\n" 1 21 321 4321 54321
```

produces:

```
      1  21
     3214321
    54321   0
```

Note that the *format* operand is used three times to print all of the given strings and that a '0' was supplied by *printf* to satisfy the last %4d conversion specification.

The *printf* utility is required to notify the user when conversion errors are detected while producing numeric output; thus, the following results would be expected on an implementation with 32-bit twos-complement integers when %d is specified as the *format* operand:

| Argument    | Standard Output | Diagnostic Output                                |
|-------------|-----------------|--------------------------------------------------|
| 5a          | 5               | <b>printf: "5a" not completely converted</b>     |
| 9999999999  | 2147483647      | <b>printf: "9999999999" arithmetic overflow</b>  |
| -9999999999 | -2147483648     | <b>printf: "-9999999999" arithmetic overflow</b> |
| ABC         | 0               | <b>printf: "ABC" expected numeric value</b>      |

The diagnostic message format is not specified, but these examples convey the type of information that should be reported. Note that the value shown on standard output is what would be expected as the return value from the *strtol()* function as defined in the System Interfaces volume of POSIX.1-2008. A similar correspondence exists between %u and *strtoul()* and %e, %f, and %g (if the implementation supports floating-point conversions) and *strtod()*.

In a locale using the ISO/IEC 646: 1991 standard as the underlying codeset, the command:

```
printf "%d\n" 3 +3 -3 \'3 \"+3 "'-3"
```

produces:

```
3    Numeric value of constant 3
```

```
3    Numeric value of constant 3
```

```
-3   Numeric value of constant -3
```

```
51   Numeric value of the character '3' in the ISO/IEC 646: 1991 standard codeset
```

```
43   Numeric value of the character '+' in the ISO/IEC 646: 1991 standard codeset
```

```
45   Numeric value of the character '-' in the ISO/IEC 646: 1991 standard codeset
```

Note that in a locale with multi-byte characters, the value of a character is intended to be the value of the equivalent of the **wchar\_t** representation of the character as described in the System Interfaces volume of POSIX.1-2008.

## RATIONALE

The *printf* utility was added to provide functionality that has historically been provided by *echo*. However, due to irreconcilable differences in the various versions of *echo* extant, the version has few special features, leaving those to this new *printf* utility, which is based on one in the Ninth Edition system.

The EXTENDED DESCRIPTION section almost exactly matches the *printf()* function in the ISO C standard, although it is described in terms of the file format notation in XBD [Chapter 5](#) (on page 121).

Earlier versions of this standard specified that arguments for all conversions other than b, c, and s were evaluated in the same way (as C constants, but with stated exceptions). For implementations supporting the floating-point conversions it was not clear whether integer conversions need only accept integer constants and floating-point conversions need only accept floating-point constants, or whether both types of conversions should accept both types of constants. Also by not distinguishing between them, the requirement relating to a leading single-quote or double-quote applied to floating-point conversions even though this provided no useful functionality to applications that was not already available through the integer conversions. The current standard clarifies the situation by specifying that the arguments for floating-point conversions are evaluated as if by *strtod()*, and the arguments for integer conversions are evaluated as C integer constants, with the special treatment of leading single-quote and double-quote applying only to integer conversions.

103842 **FUTURE DIRECTIONS**

103843 None.

103844 **SEE ALSO**103845 *awk, bc, echo*103846 XBD [Chapter 5](#) (on page 121), [Chapter 8](#) (on page 173)103847 XSH *fprintf()*, *strtod()*103848 **CHANGE HISTORY**

103849 First released in Issue 4.

103850 **Issue 7**

103851 Austin Group Interpretations 1003.1-2001 #175 and #177 are applied.

103852 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

103853 **NAME**103854        **prs** — print an SCCS file (**DEVELOPMENT**)103855 **SYNOPSIS**

```
103856 XSI      prs [-a] [-d dataspec] [-r[SID]] file...
103857          prs [-e|-l] -c cutoff [-d dataspec] file...
103858          prs [-e|-l] -r[SID] [-d dataspec] file...
```

103859 **DESCRIPTION**

103860        The *prs* utility shall write to standard output parts or all of an SCCS file in a user-supplied  
 103861        format.

103862 **OPTIONS**

103863        The *prs* utility shall conform to XBD [Section 12.2](#) (on page 216), except that the **-r** option has an  
 103864        optional option-argument. This optional option-argument cannot be presented as a separate  
 103865        argument. The following options shall be supported:

103866        **-d *dataspec***    Specify the output data specification. The *dataspec* shall be a string consisting of  
 103867        SCCS file *data keywords* (see [Data Keywords](#), on page 3108) interspersed with  
 103868        optional user-supplied text.

103869        **-r[*SID*]**        Specify the SCCS identification string (SID) of a delta for which information is  
 103870        desired. If no *SID* option-argument is specified, the SID of the most recently  
 103871        created delta shall be assumed.

103872        **-e**                Request information for all deltas created earlier than and including the delta  
 103873        designated via the **-r** option or the date-time given by the **-c** option.

103874        **-l**                Request information for all deltas created later than and including the delta  
 103875        designated via the **-r** option or the date-time given by the **-c** option.

103876        **-c *cutoff***        Indicate the *cutoff* date-time, in the form:

103877        YY[MM[DD[HH[MM[SS]]]]]

103878        For the YY component, values in the range [69,99] shall refer to years 1969 to 1999  
 103879        inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.

103880        **Note:**        It is expected that in a future version of this standard the default century inferred  
 103881        from a 2-digit year will change. (This would apply to all commands accepting a  
 103882        2-digit year as input.)

103883        No changes (deltas) to the SCCS file that were created after the specified *cutoff*  
 103884        date-time shall be included in the output. Units omitted from the date-time default  
 103885        to their maximum possible values; for example, **-c 7502** is equivalent to  
 103886        **-c 750228235959**.

103887        **-a**                Request writing of information for both removed—that is, *delta type=R* (see  
 103888        [rmDEL](#))—and existing—that is, *delta type=D*,—deltas. If the **-a** option is not  
 103889        specified, information for existing deltas only shall be provided.

103890 **OPERANDS**

103891        The following operand shall be supported:

103892        *file*            A pathname of an existing SCCS file or a directory. If *file* is a directory, the *prs*  
 103893        utility shall behave as though each file in the directory were specified as a named  
 103894        file, except that non-SCCS files (last component of the pathname does not begin  
 103895        with **s**.) and unreadable files shall be silently ignored.

103896 If exactly one *file* operand appears, and it is *'-'*, the standard input shall be read;  
 103897 each line of the standard input shall be taken to be the name of an SCCS file to be  
 103898 processed. Non-SCCS files and unreadable files shall be silently ignored.

#### 103899 **STDIN**

103900 The standard input shall be a text file used only when the *file* operand is specified as *'-'*. Each  
 103901 line of the text file shall be interpreted as an SCCS pathname.

#### 103902 **INPUT FILES**

103903 Any SCCS files displayed are files of an unspecified format.

#### 103904 **ENVIRONMENT VARIABLES**

103905 The following environment variables shall affect the execution of *prs*:

103906 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 103907 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 103908 used to determine the values of locale categories.)

103909 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 103910 internationalization variables.

103911 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 103912 characters (for example, single-byte as opposed to multi-byte characters in  
 103913 arguments and input files).

103914 *LC\_MESSAGES*

103915 Determine the locale that should be used to affect the format and contents of  
 103916 diagnostic messages written to standard error.

103917 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 103918 **ASYNCHRONOUS EVENTS**

103919 Default.

#### 103920 **STDOUT**

103921 The standard output shall be a text file whose format is dependent on the data keywords  
 103922 specified with the *-d* option.

#### 103923 **Data Keywords**

103924 Data keywords specify which parts of an SCCS file shall be retrieved and output. All parts of an  
 103925 SCCS file have an associated data keyword. A data keyword may appear in a *dataspec* multiple  
 103926 times.

103927 The information written by *prs* shall consist of:

- 103928 1. The user-supplied text
- 103929 2. Appropriate values (extracted from the SCCS file) substituted for the recognized data  
 103930 keywords in the order of appearance in the *dataspec*

103931 The format of a data keyword value shall either be simple (*'S'*), in which keyword substitution  
 103932 is direct, or multi-line (*'M'*).

103933 User-supplied text shall be any text other than recognized data keywords. A <tab> shall be  
 103934 specified by *'\t'* and <newline> by *'\n'*. When the *-r* option is not specified, the default  
 103935 *dataspec* shall be:

103936 *:PN::\n\n*

103937 and the following *dataspec* shall be used for each selected delta:

103997

\* :Dt::DT: :I: :D: :T: :P: :DS: :DP:

103998

\*\* :R::L::B::S: if the delta is a branch delta (:BF:= =yes)

103999

:R::L: if the delta is not a branch delta (:BF:= =no)

104000

\*\*\* The line statistics are capped at 99 999. For example, if 100 000 lines were unchanged in a certain revision, :Lu: shall produce the value 99 999.

104001

104002 **STDERR**

104003

The standard error shall be used only for diagnostic messages.

104004 **OUTPUT FILES**

104005

None.

104006 **EXTENDED DESCRIPTION**

104007

None.

104008 **EXIT STATUS**

104009

The following exit values shall be returned:

104010

0 Successful completion.

104011

&gt;0 An error occurred.

104012 **CONSEQUENCES OF ERRORS**

104013

Default.

104014 **APPLICATION USAGE**

104015

None.

104016 **EXAMPLES**

104017

1. The following example:

104018

prs -d "User Names for :F: are:\n:UN:" s.file

104019

might write to standard output:

104020

User Names for s.file are:

104021

xyz

104022

131

104023

abc

104024

2. The following example:

104025

prs -d "Delta for pgm :M:: :I: - :D: By :P:" -r s.file

104026

might write to standard output:

104027

Delta for pgm main.c: 3.7 - 77/12/01 By cas

104028 3. As a special case:  
104029 prs s.file  
104030 might write to standard output:  
104031 s.file:  
104032 <blank line>  
104033 D 1.1 77/12/01 00:00:00 cas 1 000000/00000/00000  
104034 MRS:  
104035 b178-12345  
104036 b179-54321  
104037 COMMENTS:  
104038 this is the comment line for s.file initial delta  
104039 <blank line>  
  
104040 for each delta table entry of the **D** type. The only option allowed to be used with this  
104041 special case is the **-a** option.  
  
104042 **RATIONALE**  
104043 None.  
  
104044 **FUTURE DIRECTIONS**  
104045 None.

104048 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)  
  
104049 **CHANGE HISTORY**  
104050 First released in Issue 2.  
  
104051 **Issue 5**  
104052 The phrase “in which keyword substitution is followed by a <newline>” is deleted from the end  
104053 of the second paragraph of [Data Keywords](#) (on page 3108).  
  
104054 The interpretation of the YY component of the **-c cutoff** argument is noted.  
  
104055 **Issue 6**  
104056 The normative text is reworded to emphasize the term “shall” for implementation requirements.  
104057 The Open Group Base Resolution bwg2001-007 is applied, updating the table in STDOUT with a  
104058 note that line statistics are capped at 99 999 for the **:Li:**, **:Ld:**, **:Lu:**, and **:DL:** keywords.  
  
104059 The Open Group Interpretation PIN4C.00009 is applied.  
  
104060 **Issue 7**  
104061 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104062 **NAME**

104063       ps — report process status

104064 **SYNOPSIS**

```

104065 XSI      ps [-aA] [-defl] [-g grouplist] [-G grouplist]
104066          [-n namelist] [-o format]... [-p proclist] [-t termlist]
104067          [-u userlist] [-U userlist]

```

104068 **DESCRIPTION**

104069       The *ps* utility shall write information about processes, subject to having appropriate privileges to  
 104070       obtain information about those processes.

104071       By default, *ps* shall select all processes with the same effective user ID as the current user and the  
 104072       same controlling terminal as the invoker.

104073 **OPTIONS**

104074       The *ps* utility shall conform to XBD [Section 12.2](#) (on page 216).

104075       The following options shall be supported:

104076       **-a**       Write information for all processes associated with terminals. Implementations  
 104077       may omit session leaders from this list.

104078       **-A**       Write information for all processes.

104079 XSI       **-d**       Write information for all processes, except session leaders.

104080 XSI       **-e**       Write information for all processes. (Equivalent to **-A**.)

104081 XSI       **-f**       Generate a **full** listing. (See the STDOUT section for the contents of a **full** listing.)

104082 XSI       **-g grouplist** Write information for processes whose session leaders are given in *grouplist*. The  
 104083       application shall ensure that the *grouplist* is a single argument in the form of a  
 104084       <blank> or <comma>-separated list.

104085       **-G grouplist** Write information for processes whose real group ID numbers are given in  
 104086       *grouplist*. The application shall ensure that the *grouplist* is a single argument in the  
 104087       form of a <blank> or <comma>-separated list.

104088 XSI       **-l**       Generate a **long** listing. (See STDOUT for the contents of a **long** listing.)

104089 XSI       **-n namelist** Specify the name of an alternative system *namelist* file in place of the default. The  
 104090       name of the default file and the format of a *namelist* file are unspecified.

104091       **-o format**   Write information according to the format specification given in *format*. This is  
 104092       fully described in the STDOUT section. Multiple **-o** options can be specified; the  
 104093       format specification shall be interpreted as the <space>-separated concatenation of  
 104094       all the *format* option-arguments.

104095       **-p proclist** Write information for processes whose process ID numbers are given in *proclist*.  
 104096       The application shall ensure that the *proclist* is a single argument in the form of a  
 104097       <blank> or <comma>-separated list.

104098       **-t termlist** Write information for processes associated with terminals given in *termlist*. The  
 104099       application shall ensure that the *termlist* is a single argument in the form of a  
 104100       <blank> or <comma>-separated list. Terminal identifiers shall be given in an  
 104101 XSI       implementation-defined format. On XSI-conformant systems, they shall be given  
 104102       in one of two forms: the device's filename (for example, **tty04**) or, if the device's  
 104103       filename starts with **tty**, just the identifier following the characters **tty** (for example,  
 104104       "04").

|--------|-----|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 104105 | XSI | <b>-u <i>userlist</i></b>    | Write information for processes whose user ID numbers or login names are given in <i>userlist</i> . The application shall ensure that the <i>userlist</i> is a single argument in the form of a <blank> or <comma>-separated list. In the listing, the numerical user ID shall be written unless the <b>-f</b> option is used, in which case the login name shall be written. |

| 104143 |     | <b>ASYNCHRONOUS EVENTS</b>   |                                                                                                                                                                                                                                                                                                                                                                               |
| 104144 |     |                              | Default.                                                                                                                                                                                                                                                                                                                                                                      |

104145 **STDOUT**

104146 When the **-o** option is not specified, the standard output format is unspecified.

104147 XSI On XSI-conformant systems, the output format shall be as follows. The column headings and  
 104148 descriptions of the columns in a *ps* listing are given below. The precise meanings of these fields  
 104149 are implementation-defined. The letters 'f' and 'l' (below) indicate the option (**full** or **long**)  
 104150 that shall cause the corresponding heading to appear; **all** means that the heading always  
 104151 appears. Note that these two options determine only what information is provided for a process;  
 104152 they do not determine which processes are listed.

|        |              |       |                                                                                                      |
|--------|--------------|-------|------------------------------------------------------------------------------------------------------|
| 104153 | <b>F</b>     | (l)   | Flags (octal and additive) associated with the process.                                              |
| 104154 | <b>S</b>     | (l)   | The state of the process.                                                                            |
| 104155 | <b>UID</b>   | (f,l) | The user ID number of the process owner; the login name is printed<br>under the <b>-f</b> option.    |
| 104157 | <b>PID</b>   | (all) | The process ID of the process; it is possible to kill a process if this<br>datum is known.           |
| 104159 | <b>PPID</b>  | (f,l) | The process ID of the parent process.                                                                |
| 104160 | <b>C</b>     | (f,l) | Processor utilization for scheduling.                                                                |
| 104161 | <b>PRI</b>   | (l)   | The priority of the process; higher numbers mean lower priority.                                     |
| 104162 | <b>NI</b>    | (l)   | Nice value; used in priority computation.                                                            |
| 104163 | <b>ADDR</b>  | (l)   | The address of the process.                                                                          |
| 104164 | <b>SZ</b>    | (l)   | The size in blocks of the core image of the process.                                                 |
| 104165 | <b>WCHAN</b> | (l)   | The event for which the process is waiting or sleeping; if blank, the<br>process is running.         |
| 104167 | <b>STIME</b> | (f)   | Starting time of the process.                                                                        |
| 104168 | <b>TTY</b>   | (all) | The controlling terminal for the process.                                                            |
| 104169 | <b>TIME</b>  | (all) | The cumulative execution time for the process.                                                       |
| 104170 | <b>CMD</b>   | (all) | The command name; the full command name and its arguments are<br>written under the <b>-f</b> option. |

104172 A process that has exited and has a parent, but has not yet been waited for by the parent, shall be  
 104173 marked **defunct**.

104174 Under the option **-f**, *ps* tries to determine the command name and arguments given when the  
 104175 process was created by examining memory or the swap area. Failing this, the command name, as  
 104176 it would appear without the option **-f**, is written in square brackets.

104177 The **-o** option allows the output format to be specified under user control.

104178 The application shall ensure that the format specification is a list of names presented as a single  
 104179 argument, <blank> or <comma>-separated. Each variable has a default header. The default  
 104180 header can be overridden by appending an <equals-sign> and the new text of the header. The  
 104181 rest of the characters in the argument shall be used as the header text. The fields specified shall  
 104182 be written in the order specified on the command line, and should be arranged in columns in the  
 104183 output. The field widths shall be selected by the system to be at least as wide as the header text  
 104184 (default or overridden value). If the header text is null, such as **-o user=**, the field width shall be  
 104185 at least as wide as the default header text. If all header text fields are null, no header line shall  
 104186 be written.

104187 The following names are recognized in the POSIX locale:

104188 **ruser** The real user ID of the process. This shall be the textual user ID, if it can be obtained  
 104189 and the field width permits, or a decimal representation otherwise.

|        |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 104190 | <b>user</b>   | The effective user ID of the process. This shall be the textual user ID, if it can be obtained and the field width permits, or a decimal representation otherwise.                                                                                                                                                                                                                                                                                                                                                                                       |
| 104191 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 104192 | <b>rgroup</b> | The real group ID of the process. This shall be the textual group ID, if it can be obtained and the field width permits, or a decimal representation otherwise.                                                                                                                                                                                                                                                                                                                                                                                          |
| 104193 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 104194 | <b>group</b>  | The effective group ID of the process. This shall be the textual group ID, if it can be obtained and the field width permits, or a decimal representation otherwise.                                                                                                                                                                                                                                                                                                                                                                                     |

| 104214 | <b>comm</b>   | The name of the command being executed ( <i>argv</i> [0] value) as a string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 104215 | <b>args</b>   | The command with all its arguments as a string. The implementation may truncate this value to the field width; it is implementation-defined whether any further truncation occurs. It is unspecified whether the string represented is a version of the argument list as it was passed to the command when it started, or is a version of the arguments as they may have been modified by the application. Applications cannot depend on being able to modify their argument list and having that modification be reflected in the output of <i>ps</i> . |

| 104226 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 104227 |               | The following table specifies the default header to be used in the POSIX locale corresponding to each format specifier.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 104228 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 4-18 Variable Names and Default Headers in *ps*

| Format Specifier | Default Header | Format Specifier | Default Header |
|------------------|----------------|------------------|----------------|
| <b>args</b>      | <b>COMMAND</b> | <b>ppid</b>      | <b>PPID</b>    |
| <b>comm</b>      | <b>COMMAND</b> | <b>rgroup</b>    | <b>RGROUP</b>  |
| <b>etime</b>     | <b>ELAPSED</b> | <b>ruser</b>     | <b>RUSER</b>   |
| <b>group</b>     | <b>GROUP</b>   | <b>time</b>      | <b>TIME</b>    |
| <b>nice</b>      | <b>NI</b>      | <b>tty</b>       | <b>TT</b>      |
| <b>pcpu</b>      | <b>%CPU</b>    | <b>user</b>      | <b>USER</b>    |
| <b>pgid</b>      | <b>PGID</b>    | <b>vsz</b>       | <b>VSZ</b>     |
| <b>pid</b>       | <b>PID</b>     |                  |                |

**STDERR**

The standard error shall be used only for diagnostic messages.

**OUTPUT FILES**

None.

**EXTENDED DESCRIPTION**

None.

**EXIT STATUS**

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

Things can change while *ps* is running; the snapshot it gives is only true for an instant, and might not be accurate by the time it is displayed.

The **args** format specifier is allowed to produce a truncated version of the command arguments. In some implementations, this information is no longer available when the *ps* utility is executed.

If the field width is too narrow to display a textual ID, the system may use a numeric version. Normally, the system would be expected to choose large enough field widths, but if a large number of fields were selected to write, it might squeeze fields to their minimum sizes to fit on one line. One way to ensure adequate width for the textual IDs is to override the default header for a field to make it larger than most or all user or group names.

There is no special quoting mechanism for header text. The header text is the rest of the argument. If multiple header changes are needed, multiple **-o** options can be used, such as:

```
ps -o "user=User Name" -o pid=Process\ ID
```

On some implementations, especially multi-level secure systems, *ps* may be severely restricted and produce information only about child processes owned by the user.

**EXAMPLES**

The command:

```
ps -o user,pid,ppid=MOM -o args
```

writes at least the following in the POSIX locale:

```
USER    PID    MOM    COMMAND
```

104271 helene 34 12 ps -o uid,pid,ppid=MOM -o args

104272 The contents of the **COMMAND** field need not be the same in all implementations, due to  
104273 possible truncation.

#### 104274 RATIONALE

104275 There is very little commonality between BSD and System V implementations of *ps*. Many  
104276 options conflict or have subtly different usages. The standard developers attempted to select a  
104277 set of options for the base standard that were useful on a wide range of systems and selected  
104278 options that either can be implemented on both BSD and System V-based systems without  
104279 breaking the current implementations or where the options are sufficiently similar that any  
104280 changes would not be unduly problematic for users or implementors.

104281 It is recognized that on some implementations, especially multi-level secure systems, *ps* may be  
104282 nearly useless. The default output has therefore been chosen such that it does not break  
104283 historical implementations and also is likely to provide at least some useful information on most  
104284 systems.

104285 The major change is the addition of the format specification capability. The motivation for this  
104286 invention is to provide a mechanism for users to access a wider range of system information, if  
104287 the system permits it, in a portable manner. The fields chosen to appear in this volume of  
104288 POSIX.1-2008 were arrived at after considering what concepts were likely to be both reasonably  
104289 useful to the “average” user and had a reasonable chance of being implemented on a wide range  
104290 of systems. Again it is recognized that not all systems are able to provide all the information  
104291 and, conversely, some may wish to provide more. It is hoped that the approach adopted will be  
104292 sufficiently flexible and extensible to accommodate most systems. Implementations may be  
104293 expected to introduce new format specifiers.

104294 The default output should consist of a short listing containing the process ID, terminal name,  
104295 cumulative execution time, and command name of each process.

104296 The preference of the standard developers would have been to make the format specification an  
104297 operand of the *ps* command. Unfortunately, BSD usage precluded this.

104298 At one time a format was included to display the environment array of the process. This was  
104299 deleted because there is no portable way to display it.

104300 The **-A** option is equivalent to the BSD **-g** and the SVID **-e**. Because the two systems differed, a  
104301 mnemonic compromise was selected.

104302 The **-a** option is described with some optional behavior because the SVID omits session leaders,  
104303 but BSD does not.

104304 In an early proposal, format specifiers appeared for priority and start time. The former was not  
104305 defined adequately in this volume of POSIX.1-2008 and was removed in deference to the defined  
104306 nice value; the latter because elapsed time was considered to be more useful.

104307 In a new BSD version of *ps*, a **-O** option can be used to write all of the default information,  
104308 followed by additional format specifiers. This was not adopted because the default output is  
104309 implementation-defined. Nevertheless, this is a useful option that should be reserved for that  
104310 purpose. In the **-o** option for the POSIX Shell and Utilities *ps*, the format is the concatenation of  
104311 each **-o**. Therefore, the user can have an alias or function that defines the beginning of their  
104312 desired format and add more fields to the end of the output in certain cases where that would be  
104313 useful.

104314 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
104315 require that they all use the same format.

104316 The **pcpu** field indicates that the CPU time available is determined in an unspecified manner.  
104317 This is because it is difficult to express an algorithm that is useful across all possible machine  
104318 architectures. Historical counterparts to this value have attempted to show percentage of use in  
104319 the recent past, such as the preceding minute. Frequently, these values for all processes did not  
104320 add up to 100%. Implementations are encouraged to provide data in this field to users that will  
104321 help them identify processes currently affecting the performance of the system.

104322 **FUTURE DIRECTIONS**

104323 None.

104327 **CHANGE HISTORY**

104328 First released in Issue 2.

104329 **Issue 6**

104330 This utility is marked as part of the User Portability Utilities option.

104331 The normative text is reworded to avoid use of the term “must” for application requirements.

104332 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

104333 **Issue 7**

104334 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104335 SD5-XCU-ERN-148 is applied, updating the OPTIONS section.

104336 **NAME**104337        `pwd` — return working directory name104338 **SYNOPSIS**104339        `pwd [-L|-P]`104340 **DESCRIPTION**

104341        The *pwd* utility shall write to standard output an absolute pathname of the current working  
 104342        directory, which does not contain the filenames dot or dot-dot.

104343 **OPTIONS**104344        The *pwd* utility shall conform to XBD [Section 12.2](#) (on page 216).

104345        The following options shall be supported by the implementation:

104346        **-L**        If the *PWD* environment variable contains an absolute pathname of the current |  
 104347        directory and the pathname does not contain any components that are dot or dot- |  
 104348        dot, *pwd* shall write this pathname to standard output, except that if the *PWD* |  
 104349        environment variable is longer than {PATH\_MAX} bytes including the terminating |  
 104350        null, it is unspecified whether *pwd* writes this pathname to standard output or |  
 104351        behaves as if the **-P** option had been specified. Otherwise, the **-L** option shall |  
 104352        behave as the **-P** option.

104353        **-P**        The pathname written to standard output shall not contain any components that  
 104354        refer to files of type symbolic link. If there are multiple pathnames that the *pwd*  
 104355        utility could write to standard output, one beginning with a single <slash>  
 104356        character and one or more beginning with two <slash> characters, then it shall  
 104357        write the pathname beginning with a single <slash> character. The pathname shall  
 104358        not contain any unnecessary <slash> characters after the leading one or two  
 104359        <slash> characters.

104360        If both **-L** and **-P** are specified, the last one shall apply. If neither **-L** nor **-P** is specified, the *pwd*  
 104361        utility shall behave as if **-L** had been specified.

104362 **OPERANDS**

104363        None.

104364 **STDIN**

104365        Not used.

104366 **INPUT FILES**

104367        None.

104368 **ENVIRONMENT VARIABLES**104369        The following environment variables shall affect the execution of *pwd*:

104370        *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 104371        (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 104372        used to determine the values of locale categories.)

104373        *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
 104374        internationalization variables.

104375        *LC\_MESSAGES*

104376        Determine the locale that should be used to affect the format and contents of  
 104377        diagnostic messages written to standard error.

104378 *XSI*        *NLSPATH*        Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

104379 *PWD* An absolute pathname of the current working directory. If an application sets or  
104380 unsets the value of *PWD*, the behavior of *pwd* is unspecified.

#### 104381 **ASYNCHRONOUS EVENTS**

104382 Default.

#### 104383 **STDOUT**

104384 The *pwd* utility output is an absolute pathname of the current working directory:

104385 "%s\n", <directory pathname>

#### 104386 **STDERR**

104387 The standard error shall be used only for diagnostic messages.

#### 104388 **OUTPUT FILES**

104389 None.

#### 104390 **EXTENDED DESCRIPTION**

104391 None.

#### 104392 **EXIT STATUS**

104393 The following exit values shall be returned:

104394 0 Successful completion.

104395 >0 An error occurred.

#### 104396 **CONSEQUENCES OF ERRORS**

104397 If an error is detected, output shall not be written to standard output, a diagnostic message shall  
104398 be written to standard error, and the exit status is not zero.

#### 104399 **APPLICATION USAGE**

104400 If the pathname obtained from *pwd* is longer than {PATH\_MAX} bytes, it could produce an error  
104401 if passed to *cd*. Therefore, in order to return to that directory it may be necessary to break the  
104402 pathname into sections shorter than {PATH\_MAX} and call *cd* on each section in turn (the first  
104403 section being an absolute pathname and subsequent sections being relative pathnames).

#### 104404 **EXAMPLES**

104405 None.

#### 104406 **RATIONALE**

104407 Some implementations have historically provided *pwd* as a shell special built-in command.

104408 In most utilities, if an error occurs, partial output may be written to standard output. This does  
104409 not happen in historical implementations of *pwd*. Because *pwd* is frequently used in historical  
104410 shell scripts without checking the exit status, it is important that the historical behavior is  
104411 required here; therefore, the CONSEQUENCES OF ERRORS section specifically disallows any  
104412 partial output being written to standard output.

104413 An earlier version of this standard stated that the *PWD* environment variable was affected when  
104414 the *-P* option was in effect. This was incorrect; conforming implementations do not do this.

#### 104415 **FUTURE DIRECTIONS**

104416 None.

#### 104417 **SEE ALSO**

104421 **CHANGE HISTORY**

104422 First released in Issue 2.

104423 **Issue 6**104424 The **-P** and **-L** options are added to describe actions relating to symbolic links as specified in the  
104425 IEEE P1003.2b draft standard.104426 **Issue 7**

104427 Austin Group Interpretation 1003.1-2001 #097 is applied.

104428 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104429 Changes to the *pwd* utility and *PWD* environment variable have been made to match the  
104430 changes to the *getcwd()* function made for Austin Group Interpretation 1003.1-2001 #140.

## 104431 NAME

104432 qalter — alter batch job

## 104433 SYNOPSIS

```
104434 OB BE qalter [-a date_time] [-A account_string] [-c interval] [-e path_name]
104435          [-h hold_list] [-j join_list] [-k keep_list] [-l resource_list]
104436          [-m mail_options] [-M mail_list] [-N name] [-o path_name]
104437          [-p priority] [-r y|n] [-S path_name_list] [-u user_list]
104438          job_identifier...
```

## 104439 DESCRIPTION

104440 The attributes of a batch job are altered by a request to the batch server that manages the batch  
 104441 job. The *qalter* utility is a user-accessible batch client that requests the alteration of the attributes  
 104442 of one or more batch jobs.

104443 The *qalter* utility shall alter the attributes of those batch jobs, and only those batch jobs, for which  
 104444 a batch *job\_identifier* is presented to the utility.

104445 The *qalter* utility shall alter the attributes of batch jobs in the order in which the batch  
 104446 *job\_identifiers* are presented to the utility.

104447 If the *qalter* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 104448 process the remaining batch *job\_identifiers*, if any.

104449 For each batch *job\_identifier* for which the *qalter* utility succeeds, each attribute of the identified  
 104450 batch job shall be altered as indicated by all the options presented to the utility.

104451 For each identified batch job for which the *qalter* utility fails, the utility shall not alter any  
 104452 attribute of the batch job.

104453 For each batch job that the *qalter* utility processes, the utility shall not modify any attribute other  
 104454 than those required by the options and option-arguments presented to the utility.

104455 The *qalter* utility shall alter batch jobs by sending a *Modify Job Request* to the batch server that  
 104456 manages each batch job. At the time the *qalter* utility exits, it shall have modified the batch job  
 104457 corresponding to each successfully processed batch *job\_identifier*. An attempt to alter the  
 104458 attributes of a batch job in the RUNNING state is implementation-defined.

## 104459 OPTIONS

104460 The *qalter* utility shall conform to XBD [Section 12.2](#) (on page 216).

104461 The following options shall be supported by the implementation:

104462 **-a date\_time** Redefine the time at which the batch job becomes eligible for execution.

104463 The *date\_time* argument shall be in the same form and represent the same time as  
 104464 for the *touch* utility. The time so represented shall be set into the *Execution\_Time*  
 104465 attribute of the batch job. If the time specified is earlier than the current time, the  
 104466 **-a** option shall have no effect.

104467 **-A account\_string**

104468 Redefine the account to which the resource consumption of the batch job should be  
 104469 charged.

104470 The syntax of the *account\_string* option-argument is unspecified.

104471 The *qalter* utility shall set the *Account\_Name* attribute of the batch job to the value  
 104472 of the *account\_string* option-argument.

|        |                     |                                                                                                          |
|--------|---------------------|----------------------------------------------------------------------------------------------------------|
| 104473 | <b>-c interval</b>  | Redefine whether the batch job should be checkpointed, and if so, how often.                             |
| 104474 |                     | The <i>qalter</i> utility shall accept a value for the interval option-argument that is one of           |
| 104475 |                     | the following:                                                                                           |
| 104476 | n                   | No checkpointing is to be performed on the batch job                                                     |
| 104477 |                     | (NO_CHECKPOINT).                                                                                         |
| 104478 | s                   | Checkpointing is to be performed only when the batch server is shut                                      |
| 104479 |                     | down (CHECKPOINT_AT_SHUTDOWN).                                                                           |
| 104480 | c                   | Automatic periodic checkpointing is to be performed at the                                               |
| 104481 |                     | <i>Minimum_Cpu_Interval</i> attribute of the batch queue, in units of CPU                                |
| 104482 |                     | minutes (CHECKPOINT_AT_MIN_CPU_INTERVAL).                                                                |
| 104483 | c=minutes           | Automatic periodic checkpointing is to be performed every <i>minutes</i>                                 |
| 104484 |                     | of CPU time, or every <i>Minimum_Cpu_Interval</i> minutes, whichever is                                  |
| 104485 |                     | greater. The <i>minutes</i> argument shall conform to the syntax for                                     |
| 104486 |                     | unsigned integers and shall be greater than zero.                                                        |
| 104487 |                     | An implementation may define other checkpoint intervals. The conformance                                 |
| 104488 |                     | document for an implementation shall describe any alternative checkpoint                                 |
| 104489 |                     | intervals, how they are specified, their internal behavior, and how they affect the                      |
| 104490 |                     | behavior of the utility.                                                                                 |
| 104491 |                     | The <i>qalter</i> utility shall set the <i>Checkpoint</i> attribute of the batch job to the value of the |
| 104492 |                     | <i>interval</i> option-argument.                                                                         |
| 104493 | <b>-e path_name</b> |                                                                                                          |
| 104494 |                     | Redefine the path to be used for the standard error stream of the batch job.                             |
| 104495 |                     | The <i>qalter</i> utility shall accept a <i>path_name</i> option-argument that conforms to the           |
| 104496 |                     | syntax of the <i>path_name</i> element defined in the System Interfaces volume of                        |
| 104497 |                     | POSIX.1-2008, which can be preceded by a host name element of the form                                   |
| 104498 |                     | <i>hostname</i> ..                                                                                       |
| 104499 |                     | If the <i>path_name</i> option-argument constitutes an absolute pathname, the <i>qalter</i>              |
| 104500 |                     | utility shall set the <i>Error_Path</i> attribute of the batch job to the value of the                   |
| 104501 |                     | <i>path_name</i> option-argument, including the host name element, if present.                           |
| 104502 |                     | If the <i>path_name</i> option-argument constitutes a relative pathname and no host                      |
| 104503 |                     | name element is specified, the <i>qalter</i> utility shall set the <i>Error_Path</i> attribute of the    |
| 104504 |                     | batch job to the value of the absolute pathname derived by expanding the                                 |
| 104505 |                     | <i>path_name</i> option-argument relative to the current directory of the process that                   |
| 104506 |                     | executes the <i>qalter</i> utility.                                                                      |
| 104507 |                     | If the <i>path_name</i> option-argument constitutes a relative pathname and a host name                  |
| 104508 |                     | element is specified, the <i>qalter</i> utility shall set the <i>Error_Path</i> attribute of the batch   |
| 104509 |                     | job to the value of the option-argument without expansion.                                               |
| 104510 |                     | If the <i>path_name</i> option-argument does not include a host name element, the <i>qalter</i>          |
| 104511 |                     | utility shall prefix the pathname in the <i>Error_Path</i> attribute with <i>hostname</i> ., where       |
| 104512 |                     | <i>hostname</i> is the name of the host upon which the <i>qalter</i> utility is being executed.          |
| 104513 | <b>-h hold_list</b> | Redefine the types of holds, if any, on the batch job. The <i>qalter</i> <b>-h</b> option shall          |
| 104514 |                     | accept a value for the <i>hold_list</i> option-argument that is a string of alphanumeric                 |
| 104515 |                     | characters in the portable character set.                                                                |
| 104516 |                     | The <i>qalter</i> utility shall accept a value for the <i>hold_list</i> option-argument that is a        |

104517 string of one or more of the characters 'u', 's', or 'o', or the single character  
 104518 'n'. For each unique character in the *hold\_list* option-argument, the *qalter* utility  
 104519 shall add a value to the *Hold\_Types* attribute of the batch job as follows, each  
 104520 representing a different hold type:

- 104521 u USER
- 104522 s SYSTEM
- 104523 o OPERATOR

104524 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 104525 duplicates shall be ignored. An existing *Hold\_Types* attribute can be cleared by the  
 104526 hold type:

- 104527 n NO\_HOLD

104528 The *qalter* utility shall consider it an error if any hold type other than 'n' is  
 104529 combined with hold type 'n'. Strictly conforming applications shall not repeat  
 104530 any of the characters 'u', 's', 'o', or 'n' within the *hold\_list* option-argument.  
 104531 The *qalter* utility shall permit the repetition of characters, but shall not assign  
 104532 additional meaning to the repeated characters. An implementation may define  
 104533 other hold types. The conformance document for an implementation shall describe  
 104534 any additional hold types, how they are specified, their internal behavior, and how  
 104535 they affect the behavior of the utility.

104536 *-j join\_list* Redefine which streams of the batch job are to be merged. The *qalter -j* option shall  
 104537 accept a value for the *join\_list* option-argument that is a string of alphanumeric  
 104538 characters in the portable character set.

104539 The *qalter* utility shall accept a *join\_list* option-argument that consists of one or  
 104540 more of the characters 'e' and 'o', or the single character 'n'.

104541 All of the other batch job output streams specified shall be merged into the output  
 104542 stream represented by the character listed first in the *join\_list* option-argument.

104543 For each unique character in the *join\_list* option-argument, the *qalter* utility shall  
 104544 add a value to the *Join\_Path* attribute of the batch job as follows, each representing  
 104545 a different batch job stream to join:

- 104546 e The standard error of the batch job (JOIN\_STD\_ERROR).
- 104547 o The standard output of the batch job (JOIN\_STD\_OUTPUT).

104548 An existing *Join\_Path* attribute can be cleared by the join type:

- 104549 n NO\_JOIN

104550 If 'n' is specified, then no files are joined. The *qalter* utility shall consider it an  
 104551 error if any join type other than 'n' is combined with join type 'n'.

104552 Strictly conforming applications shall not repeat any of the characters 'e', 'o', or  
 104553 'n' within the *join\_list* option-argument. The *qalter* utility shall permit the  
 104554 repetition of characters, but shall not assign additional meaning to the repeated  
 104555 characters.

104556 An implementation may define other join types. The conformance document for an  
 104557 implementation shall describe any additional batch job streams, how they are  
 104558 specified, their internal behavior, and how they affect the behavior of the utility.

104559       **-k keep\_list**   Redefine which output of the batch job to retain on the execution host.

104560               The *qalter* **-k** option shall accept a value for the *keep\_list* option-argument that is a

104561               string of alphanumeric characters in the portable character set.

104562               The *qalter* utility shall accept a *keep\_list* option-argument that consists of one or

104563               more of the characters 'e' and 'o', or the single character 'n'.

104564               For each unique character in the *keep\_list* option-argument, the *qalter* utility shall

104565               add a value to the *Keep\_Files* attribute of the batch job as follows, each representing

104566               a different batch job stream to keep:

104567               e    The standard error of the batch job (KEEP\_STD\_ERROR).

104568               o    The standard output of the batch job (KEEP\_STD\_OUTPUT).

104569               If both 'e' and 'o' are specified, then both files are retained. An existing

104570               *Keep\_Files* attribute can be cleared by the keep type:

104571               n    NO\_KEEP

104572               If 'n' is specified, then no files are retained. The *qalter* utility shall consider it an

104573               error if any keep type other than 'n' is combined with keep type 'n'.

104574               Strictly conforming applications shall not repeat any of the characters 'e', 'o', or

104575               'n' within the *keep\_list* option-argument. The *qalter* utility shall permit the

104576               repetition of characters, but shall not assign additional meaning to the repeated

104577               characters. An implementation may define other keep types. The conformance

104578               document for an implementation shall describe any additional keep types, how

104579               they are specified, their internal behavior, and how they affect the behavior of the

104580               utility.

104581       **-l resource\_list**   Redefine the resources that are allowed or required by the batch job.

104582               The *qalter* utility shall accept a *resource\_list* option-argument that conforms to the

104583               following syntax:

104584               resource=value[, resource=value, ...]

104585               The *qalter* utility shall set one entry in the value of the *Resource\_List* attribute of the

104586               batch job for each resource listed in the *resource\_list* option-argument.

104587               Because the list of supported resource names might vary by batch server, the *qalter*

104588               utility shall rely on the batch server to validate the resource names and associated

104589               values. See [Section 3.3.3](#) (on page 2441) for a means of removing *keyword=value*

104590               (and *value@keyword*) pairs and other general rules for list-oriented batch job

104591               attributes.

104592               

104593       **-m mail\_options**   Redefine the points in the execution of the batch job at which the batch server is to

104594               send mail about a change in the state of the batch job.

104595               

104596               The *qalter* **-m** option shall accept a value for the *mail\_options* option-argument that

104597               is a string of alphanumeric characters in the portable character set.

104598               The *qalter* utility shall accept a value for the *mail\_options* option-argument that is a

104599               string of one or more of the characters 'e', 'b', and 'a', or the single character

104600               'n'. For each unique character in the *mail\_options* option-argument, the *qalter*

104601               utility shall add a value to the *Mail\_Users* attribute of the batch job as follows, each

104602 representing a different time during the life of a batch job at which to send mail:

104603 e MAIL\_AT\_EXIT

104604 b MAIL\_AT\_BEGINNING

104605 a MAIL\_AT\_ABORT

104606 If any of these characters are duplicated in the *mail\_options* option-argument, the

104607 duplicates shall be ignored.

104608 An existing *Mail\_Points* attribute can be cleared by the mail type:

104609 n NO\_MAIL

104610 If 'n' is specified, then mail is not sent. The *qalter* utility shall consider it an error

104611 if any mail type other than 'n' is combined with mail type 'n'. Strictly

104612 conforming applications shall not repeat any of the characters 'e', 'b', 'a', or

104613 'n' within the *mail\_options* option-argument. The *qalter* utility shall permit the

104614 repetition of characters but shall not assign additional meaning to the repeated

104615 characters.

104616 An implementation may define other mail types. The conformance document for

104617 an implementation shall describe any additional mail types, how they are

104618 specified, their internal behavior, and how they affect the behavior of the utility.

104619 **-M *mail\_list*** Redefine the list of users to which the batch server that executes the batch job is to

104620 send mail, if the batch server sends mail about the batch job.

104621 The syntax of the *mail\_list* option-argument is unspecified. If the implementation

104622 of the *qalter* utility uses a name service to locate users, the utility shall accept the

104623 syntax used by the name service.

104624 If the implementation of the *qalter* utility does not use a name service to locate

104625 users, the implementation shall accept the following syntax for user names:

104626 *mail\_address*[ , *mail\_address* , ... ]

104627 The interpretation of *mail\_address* is implementation-defined.

104628 The *qalter* utility shall set the *Mail\_Users* attribute of the batch job to the value of

104629 the *mail\_list* option-argument.

104630 **-N *name*** Redefine the name of the batch job.

104631 The *qalter* -N option shall accept a value for the *name* option-argument that is a

104632 string of up to 15 alphanumeric characters in the portable character set where the

104633 first character is alphabetic.

104634 The syntax of the *name* option-argument is unspecified.

104635 The *qalter* utility shall set the *Job\_Name* attribute of the batch job to the value of the

104636 *name* option-argument.

104637 **-o *path\_name***

104638 Redefine the path for the standard output of the batch job.

104639 The *qalter* utility shall accept a *path\_name* option-argument that conforms to the

104640 syntax of the *path\_name* element defined in the System Interfaces volume of

104641 POSIX.1-2008, which can be preceded by a host name element of the form

104642 *hostname*::.

|        |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 104643 |                          | If the <i>path_name</i> option-argument constitutes an absolute pathname, the <i>qalter</i> utility shall set the <i>Output_Path</i> attribute of the batch job to the value of the <i>path_name</i> option-argument.                                                                                                                                                             |
| 104644 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104645 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104646 |                          | If the <i>path_name</i> option-argument constitutes a relative pathname and no host name element is specified, the <i>qalter</i> utility shall set the <i>Output_Path</i> attribute of the batch job to the absolute pathname derived by expanding the <i>path_name</i> option-argument relative to the current directory of the process that executes the <i>qalter</i> utility. |
| 104647 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104648 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104649 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104650 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104651 |                          | If the <i>path_name</i> option-argument constitutes a relative pathname and a host name element is specified, the <i>qalter</i> utility shall set the <i>Output_Path</i> attribute of the batch job to the value of the <i>path_name</i> option-argument without any expansion of the pathname.                                                                                   |
| 104652 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104653 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104654 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104655 |                          | If the <i>path_name</i> option-argument does not include a host name element, the <i>qalter</i> utility shall prefix the pathname in the <i>Output_Path</i> attribute with <i>hostname:</i> , where <i>hostname</i> is the name of the host upon which the <i>qalter</i> utility is being executed.                                                                               |

| 104672 |                          | Redefine the shell that interprets the script at the destination system.                                                                                                                                                                                                                                                                                                          |
| 104673 |                          | The <i>qalter</i> utility shall accept a <i>path_name_list</i> option-argument that conforms to the following syntax:                                                                                                                                                                                                                                                             |
| 104674 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104675 |                          | pathname[@host] [ , pathname[@host] , . . . ]                                                                                                                                                                                                                                                                                                                                     |
| 104676 |                          | The <i>qalter</i> utility shall accept only one pathname that is missing a corresponding host name. The <i>qalter</i> utility shall allow only one pathname per named host.                                                                                                                                                                                                       |
| 104677 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104678 |                          | The <i>qalter</i> utility shall add a value to the <i>Shell_Path_List</i> attribute of the batch job for each entry in the <i>path_name_list</i> option-argument. See <a href="#">Section 3.3.3</a> (on page 2441) for a means of removing <i>keyword=value</i> (and <i>value@keyword</i> ) pairs and other general rules for list-oriented batch job attributes.                 |
| 104679 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104680 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104681 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104682 | <b>-u user_list</b>      | Redefine the user name under which the batch job is to run at the destination system.                                                                                                                                                                                                                                                                                             |
| 104683 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |
| 104684 |                          | The <i>qalter</i> utility shall accept a <i>user_list</i> option-argument that conforms to the following syntax:                                                                                                                                                                                                                                                                  |
| 104685 |                          |                                                                                                                                                                                                                                                                                                                                                                                   |

104686 username[@host][, , username[@host], , . . .]

104687 The *qalter* utility shall accept only one user name that is missing a corresponding  
104688 host name. The *qalter* utility shall accept only one user name per named host.

104689 The *qalter* utility shall add a value to the *User\_List* attribute of the batch job for each  
104690 entry in the *user\_list* option-argument. See [Section 3.3.3](#) (on page 2441) for a means  
104691 of removing *keyword=value* (and *value@keyword*) pairs and other general rules for  
104692 list-oriented batch job attributes.

#### 104693 OPERANDS

104694 The *qalter* utility shall accept one or more operands that conform to the syntax for a batch  
104695 *job\_identifier* (see [Section 3.3.1](#), on page 2439).

#### 104696 STDIN

104697 Not used.

#### 104698 INPUT FILES

104699 None.

#### 104700 ENVIRONMENT VARIABLES

104701 The following environment variables shall affect the execution of *qalter*:

104702 *LANG* Provide a default value for the internationalization variables that are unset or null.  
104703 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
104704 used to determine the values of locale categories.)

104705 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
104706 internationalization variables.

104707 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
104708 characters (for example, single-byte as opposed to multi-byte characters in  
104709 arguments).

104710 *LC\_MESSAGES*

104711 Determine the locale that should be used to affect the format and contents of  
104712 diagnostic messages written to standard error.

104713 *LOGNAME* Determine the login name of the user.

104714 *TZ* Determine the timezone used to interpret the *date-time* option-argument. If *TZ* is  
104715 unset or null, an unspecified default timezone shall be used.

#### 104716 ASYNCHRONOUS EVENTS

104717 Default.

#### 104718 STDOUT

104719 None.

#### 104720 STDERR

104721 The standard error shall be used only for diagnostic messages.

#### 104722 OUTPUT FILES

104723 None.

#### 104724 EXTENDED DESCRIPTION

104725 None.

**104726 EXIT STATUS**

104727 The following exit values shall be returned:

104728 0 Successful completion.

104729 >0 An error occurred.

**104730 CONSEQUENCES OF ERRORS**

104731 In addition to the default behavior, the *qalter* utility shall not be required to write a diagnostic  
104732 message to standard error when the error reply received from a batch server indicates that the  
104733 batch *job\_identifier* does not exist on the server. Whether or not the *qalter* utility attempts to locate  
104734 the batch job on other batch servers is implementation-defined.

**104735 APPLICATION USAGE**

104736 None.

**104737 EXAMPLES**

104738 None.

**104739 RATIONALE**

104740 The *qalter* utility allows users to change the attributes of a batch job.

104741 As a means of altering a queued job, the *qalter* utility is superior to deleting and requeuing the  
104742 batch job insofar as an altered job retains its place in the queue with some traditional selection  
104743 algorithms. In addition, the *qalter* utility is both shorter and simpler than a sequence of *qdel* and  
104744 *qsub* utilities.

104745 The result of an attempt on the part of a user to alter a batch job in a RUNNING state is  
104746 implementation-defined because a batch job in the RUNNING state will already have opened its  
104747 output files and otherwise performed any actions indicated by the options in effect at the time  
104748 the batch job began execution.

104749 The options processed by the *qalter* utility are identical to those of the *qsub* utility, with a few  
104750 exceptions: *-V*, *-v*, and *-q*. The *-V* and *-v* are inappropriate for the *qalter* utility, since they  
104751 capture potentially transient environment information from the submitting process. The *-q*  
104752 option would specify a new queue, which would largely negate the previously stated advantage  
104753 of using *qalter*; furthermore, the *qmove* utility provides a superior means of moving jobs.

104754 Each of the following paragraphs provides the rationale for a *qalter* option.

104755 Additional rationale concerning these options can be found in the rationale for the *qsub* utility.

104756 The *-a* option allows users to alter the date and time at which a batch job becomes eligible to  
104757 run.

104758 The *-A* option allows users to change the account that will be charged for the resources  
104759 consumed by the batch job. Support for the *-A* option is mandatory for conforming  
104760 implementations of *qalter*, even though support of accounting is optional for servers. Whether or  
104761 not to support accounting is left to the implementor of the server, but mandatory support of the  
104762 *-A* option assures users of a consistent interface and allows them to control accounting on  
104763 servers that support accounting.

104764 The *-c* option allows users to alter the checkpointing interval of a batch job. A checkpointing  
104765 system, which is not defined by POSIX.1-2008, allows recovery of a batch job at the most recent  
104766 checkpoint in the event of a crash. Checkpointing is typically used for jobs that consume  
104767 expensive computing time or must meet a critical schedule. Users should be allowed to make  
104768 the tradeoff between the overhead of checkpointing and the risk to the timely completion of the  
104769 batch job; therefore, this volume of POSIX.1-2008 provides the checkpointing interval option.  
104770 Support for checkpointing is optional for servers.

The **-e** option allows users to alter the name and location of the standard error stream written by a batch job. However, the path of the standard error stream is meaningless if the value of the *Join\_Path* attribute of the batch job is TRUE.

The **-h** option allows users to set the hold type in the *Hold\_Types* attribute of a batch job. The *qhold* and *qrls* utilities add or remove hold types to the *Hold\_Types* attribute, respectively. The **-h** option has been modified to allow for implementation-defined hold types.

The **-j** option allows users to alter the decision to join (merge) the standard error stream of the batch job with the standard output stream of the batch job.

The **-l** option allows users to change the resource limits imposed on a batch job.

The **-m** option allows users to modify the list of points in the life of a batch job at which the designated users will receive mail notification.

The **-M** option allows users to alter the list of users who will receive notification about events in the life of a batch job.

The **-N** option allows users to change the name of a batch job.

The **-o** option allows users to alter the name and path to which the standard output stream of the batch job will be written.

The **-P** option allows users to modify the priority of a batch job. Support for priority is optional for batch servers.

The **-r** option allows users to alter the rerunability status of a batch job.

The **-S** option allows users to change the name and location of the shell image that will be invoked to interpret the script of the batch job. This option has been modified to allow a list of shell name and locations associated with different hosts.

The **-u** option allows users to change the user identifier under which the batch job will execute.

The *job\_identifier* operand syntax is provided so that the user can differentiate between the originating and destination (or executing) batch server. These may or may not be the same. The *.server\_name* portion identifies the originating batch server, while the *@server* portion identifies the destination batch server.

Historically, the *qalter* utility has been a component of the Network Queuing System (NQS), the existing practice from which this utility has been derived.

#### FUTURE DIRECTIONS

The *qalter* utility may be removed in a future version.

#### CHANGE HISTORY

Derived from IEEE Std 1003.2d-1994.

#### Issue 6

The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

IEEE PASC Interpretation 1003.2 #182 is applied, clarifying the description of the **-a** option.

104810 **Issue 7**104811 The *qalter* utility is marked obsolescent.

104812 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104813 **NAME**

104814 qdel — delete batch jobs

104815 **SYNOPSIS**104816 OB BE `qdel job_identifier...`104817 **DESCRIPTION**

104818 A batch job is deleted by sending a request to the batch server that manages the batch job. A  
 104819 batch job that has been deleted is no longer subject to management by batch services.

104820 The *qdel* utility is a user-accessible client of batch services that requests the deletion of one or  
 104821 more batch jobs.

104822 The *qdel* utility shall request a batch server to delete those batch jobs for which a batch  
 104823 *job\_identifier* is presented to the utility.

104824 The *qdel* utility shall delete batch jobs in the order in which their batch *job\_identifiers* are  
 104825 presented to the utility.

104826 If the *qdel* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed to  
 104827 process the remaining batch *job\_identifiers*, if any.

104828 The *qdel* utility shall delete each batch job by sending a *Delete Job Request* to the batch server that  
 104829 manages the batch job.

104830 The *qdel* utility shall not exit until the batch job corresponding to each successfully processed  
 104831 batch *job\_identifier* has been deleted.

104832 **OPTIONS**

104833 None.

104834 **OPERANDS**

104835 The *qdel* utility shall accept one or more operands that conform to the syntax for a batch  
 104836 *job\_identifier* (see [Section 3.3.1](#), on page 2439).

104837 **STDIN**

104838 Not used.

104839 **INPUT FILES**

104840 None.

104841 **ENVIRONMENT VARIABLES**104842 The following environment variables shall affect the execution of *qdel*:

104843 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 104844 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 104845 used to determine the values of locale categories.)

104846 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 104847 internationalization variables.

104848 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 104849 characters (for example, single-byte as opposed to multi-byte characters in  
 104850 arguments).

104851 *LC\_MESSAGES*

104852 Determine the locale that should be used to affect the format and contents of  
 104853 diagnostic messages written to standard error.

104854 *LOGNAME* Determine the login name of the user.

104855 **ASYNCHRONOUS EVENTS**

104856 Default.

104857 **STDOUT**

104858 An implementation of the *qdel* utility may write informative messages to standard output.

104859 **STDERR**

104860 The standard error shall be used only for diagnostic messages.

104861 **OUTPUT FILES**

104862 None.

104863 **EXTENDED DESCRIPTION**

104864 None.

104865 **EXIT STATUS**

104866 The following exit values shall be returned:

104867 0 Successful completion.

104868 >0 An error occurred.

104869 **CONSEQUENCES OF ERRORS**

104870 In addition to the default behavior, the *qdel* utility shall not be required to write a diagnostic  
104871 message to standard error when the error reply received from a batch server indicates that the  
104872 batch *job\_identifier* does not exist on the server. Whether or not the *qdel* utility waits to output the  
104873 diagnostic message while attempting to locate the job on other servers is implementation-  
104874 defined.

104875 **APPLICATION USAGE**

104876 None.

104877 **EXAMPLES**

104878 None.

104879 **RATIONALE**

104880 The *qdel* utility allows users and administrators to delete jobs.

104881 The *qdel* utility provides functionality that is not otherwise available. For example, the *kill* utility  
104882 of the operating system does not suffice. First, to use the *kill* utility, the user might have to log in  
104883 on a remote node, because the *kill* utility does not operate across the network. Second, unlike  
104884 *qdel*, *kill* cannot remove jobs from queues. Lastly, the arguments of the *qdel* utility are job  
104885 identifiers rather than process identifiers, and so this utility can be passed the output of the  
104886 *qselect* utility, thus providing users with a means of deleting a list of jobs.

104887 Because a set of jobs can be selected using the *qselect* utility, the *qdel* utility has not been  
104888 complicated with options that provide for selection of jobs. Instead, the batch jobs to be deleted  
104889 are identified individually by their job identifiers.

104890 Historically, the *qdel* utility has been a component of NQS, the existing practice on which it is  
104891 based. However, the *qdel* utility defined in this volume of POSIX.1-2008 does not provide an  
104892 option for specifying a signal number to send to the batch job prior to the killing of the process;  
104893 that capability has been subsumed by the *qsig* utility.

104894 A discussion was held about the delays of networking and the possibility that the batch server  
104895 may never respond, due to a down router, down batch server, or other network mishap. The  
104896 DESCRIPTION records this under the words “fails to process any job identifier”. In the broad  
104897 sense, the network problem is also an error, which causes the failure to process the batch job

104898 identifier.

104899 **FUTURE DIRECTIONS**

104900 The *qdel* utility may be removed in a future version.

104901 **SEE ALSO**

104902 [Chapter 3](#) (on page 2417), *kill*, *qselect*, *qsig*

104903 XBD [Chapter 8](#) (on page 173)

104904 **CHANGE HISTORY**

104905 Derived from IEEE Std 1003.2d-1994.

104906 **Issue 6**

104907 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

104908 **Issue 7**

104909 The *qdel* utility is marked obsolescent.

104910 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104911 **NAME**

104912 qhold — hold batch jobs

104913 **SYNOPSIS**104914 OB BE `qhold [-h hold_list] job_identifier...`104915 **DESCRIPTION**

104916 A hold is placed on a batch job by a request to the batch server that manages the batch job. A  
 104917 batch job that has one or more holds is not eligible for execution. The *qhold* utility is a user-  
 104918 accessible client of batch services that requests one or more types of hold to be placed on one or  
 104919 more batch jobs.

104920 The *qhold* utility shall place holds on those batch jobs for which a batch *job\_identifier* is presented  
 104921 to the utility.

104922 The *qhold* utility shall place holds on batch jobs in the order in which their batch *job\_identifiers*  
 104923 are presented to the utility. If the *qhold* utility fails to process any batch *job\_identifier* successfully,  
 104924 the utility shall proceed to process the remaining batch *job\_identifiers*, if any.

104925 The *qhold* utility shall place holds on each batch job by sending a *Hold Job Request* to the batch  
 104926 server that manages the batch job.

104927 The *qhold* utility shall not exit until holds have been placed on the batch job corresponding to  
 104928 each successfully processed batch *job\_identifier*.

104929 **OPTIONS**

104930 The *qhold* utility shall conform to XBD [Section 12.2](#) (on page 216).

104931 The following option shall be supported by the implementation:

104932 **-h *hold\_list*** Define the types of holds to be placed on the batch job.

104933 The *qhold* **-h** option shall accept a value for the *hold\_list* option-argument that is a  
 104934 string of alphanumeric characters in the portable character set (see XBD [Section](#)  
 104935 [6.1](#), on page 125).

104936 The *qhold* utility shall accept a value for the *hold\_list* option-argument that is a  
 104937 string of one or more of the characters 'u', 's', or 'o', or the single character  
 104938 'n'.

104939 For each unique character in the *hold\_list* option-argument, the *qhold* utility shall  
 104940 add a value to the *Hold\_Types* attribute of the batch job as follows, each  
 104941 representing a different hold type:

104942 u USER

104943 s SYSTEM

104944 o OPERATOR

104945 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 104946 duplicates shall be ignored.

104947 An existing *Hold\_Types* attribute can be cleared by the following hold type:

104948 n NO\_HOLD

104949 The *qhold* utility shall consider it an error if any hold type other than 'n' is  
 104950 combined with hold type 'n'.

104951 Strictly conforming applications shall not repeat any of the characters 'u', 's',

104952 'o', or 'n' within the *hold\_list* option-argument. The *qhold* utility shall permit the  
 104953 repetition of characters, but shall not assign additional meaning to the repeated  
 104954 characters.

104955 An implementation may define other hold types. The conformance document for  
 104956 an implementation shall describe any additional hold types, how they are  
 104957 specified, their internal behavior, and how they affect the behavior of the utility.

104958 If the **-h** option is not presented to the *qhold* utility, the implementation shall set  
 104959 the *Hold\_Types* attribute to USER.

#### 104960 OPERANDS

104961 The *qhold* utility shall accept one or more operands that conform to the syntax for a batch  
 104962 *job\_identifier* (see [Section 3.3.1](#), on page 2439).

#### 104963 STDIN

104964 Not used.

#### 104965 INPUT FILES

104966 None.

#### 104967 ENVIRONMENT VARIABLES

104968 The following environment variables shall affect the execution of *qhold*:

104969 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 104970 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 104971 used to determine the values of locale categories.)

104972 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 104973 internationalization variables.

104974 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 104975 characters (for example, single-byte as opposed to multi-byte characters in  
 104976 arguments).

104977 *LC\_MESSAGES*  
 104978 Determine the locale that should be used to affect the format and contents of  
 104979 diagnostic messages written to standard error.

104980 *LOGNAME* Determine the login name of the user.

#### 104981 ASYNCHRONOUS EVENTS

104982 Default.

#### 104983 STDOUT

104984 None.

#### 104985 STDERR

104986 The standard error shall be used only for diagnostic messages.

#### 104987 OUTPUT FILES

104988 None.

#### 104989 EXTENDED DESCRIPTION

104990 None.

#### 104991 EXIT STATUS

104992 The following exit values shall be returned:

104993 0 Successful completion.

104994 >0 An error occurred.

#### 104995 CONSEQUENCES OF ERRORS

104996 In addition to the default behavior, the *qhold* utility shall not be required to write a diagnostic  
104997 message to standard error when the error reply received from a batch server indicates that the  
104998 batch *job\_identifier* does not exist on the server. Whether or not the *qhold* utility waits to output  
104999 the diagnostic message while attempting to locate the job on other servers is implementation-  
105000 defined.

#### 105001 APPLICATION USAGE

105002 None.

#### 105003 EXAMPLES

105004 None.

#### 105005 RATIONALE

105006 The *qhold* utility allows users to place a hold on one or more jobs. A hold makes a batch job  
105007 ineligible for execution.

105008 The *qhold* utility has options that allow the user to specify the type of hold. Should the user wish  
105009 to place a hold on a set of jobs that meet a selection criteria, such a list of jobs can be acquired  
105010 using the *qselect* utility.

105011 The *-h* option allows the user to specify the type of hold that is to be placed on the job. This  
105012 option allows for USER, SYSTEM, OPERATOR, and implementation-defined hold types. The  
105013 USER and OPERATOR holds are distinct. The batch server that manages the batch job will verify  
105014 that the user is authorized to set the specified hold for the batch job.

105015 Mail is not required on hold because the administrator has the tools and libraries to build this  
105016 option if he or she wishes.

105017 Historically, the *qhold* utility has been a part of some existing batch systems, although it has not  
105018 traditionally been a part of the NQS.

#### 105019 FUTURE DIRECTIONS

105020 The *qhold* utility may be removed in a future version.

#### 105021 SEE ALSO

105022 [Chapter 3](#) (on page 2417), *qselect*

105023 [XBD Section 6.1](#) (on page 125), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

#### 105024 CHANGE HISTORY

105025 Derived from IEEE Std 1003.2d-1994.

#### 105026 Issue 6

105027 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

#### 105028 Issue 7

105029 The *qhold* utility is marked obsolescent.

105030 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105031 **NAME**

105032 qmove — move batch jobs

105033 **SYNOPSIS**105034 OB BE `qmove destination job_identifier...`105035 **DESCRIPTION**

105036 To move a batch job is to remove the batch job from the batch queue in which it resides and  
 105037 instantiate the batch job in another batch queue. A batch job is moved by a request to the batch  
 105038 server that manages the batch job. The *qmove* utility is a user-accessible batch client that requests  
 105039 the movement of one or more batch jobs.

105040 The *qmove* utility shall move those batch jobs, and only those batch jobs, for which a batch  
 105041 *job\_identifier* is presented to the utility.

105042 The *qmove* utility shall move batch jobs in the order in which the corresponding batch  
 105043 *job\_identifiers* are presented to the utility.

105044 If the *qmove* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 105045 process the remaining batch *job\_identifiers*, if any.

105046 The *qmove* utility shall move batch jobs by sending a *Move Job Request* to the batch server that  
 105047 manages each batch job. The *qmove* utility shall not exit before the batch jobs corresponding to all  
 105048 successfully processed batch *job\_identifiers* have been moved.

105049 **OPTIONS**

105050 None.

105051 **OPERANDS**

105052 The *qmove* utility shall accept one operand that conforms to the syntax for a destination (see  
 105053 [Section 3.3.2](#), on page 2440).

105054 The *qmove* utility shall accept one or more operands that conform to the syntax for a batch  
 105055 *job\_identifier* (see [Section 3.3.1](#), on page 2439).

105056 **STDIN**

105057 Not used.

105058 **INPUT FILES**

105059 None.

105060 **ENVIRONMENT VARIABLES**105061 The following environment variables shall affect the execution of *qmove*:

105062 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 105063 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 105064 used to determine the values of locale categories.)

105065 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 105066 internationalization variables.

105067 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 105068 characters (for example, single-byte as opposed to multi-byte characters in  
 105069 arguments).

105070 *LC\_MESSAGES*

105071 Determine the locale that should be used to affect the format and contents of  
 105072 diagnostic messages written to standard error.

105073 *LOGNAME* Determine the login name of the user.

105074 **ASYNCHRONOUS EVENTS**

105075 Default.

105076 **STDOUT**

105077 None.

105078 **STDERR**

105079 The standard error shall be used only for diagnostic messages.

105080 **OUTPUT FILES**

105081 None.

105082 **EXTENDED DESCRIPTION**

105083 None.

105084 **EXIT STATUS**

105085 The following exit values shall be returned:

105086 0 Successful completion.

105087 >0 An error occurred.

105088 **CONSEQUENCES OF ERRORS**

105089 In addition to the default behavior, the *qmove* utility shall not be required to write a diagnostic  
105090 message to standard error when the error reply received from a batch server indicates that the  
105091 batch *job\_identifier* does not exist on the server. Whether or not the *qmove* utility waits to output  
105092 the diagnostic message while attempting to locate the job on other servers is implementation-  
105093 defined.

105094 **APPLICATION USAGE**

105095 None.

105096 **EXAMPLES**

105097 None.

105098 **RATIONALE**

105099 The *qmove* utility allows users to move jobs between queues.

105100 The alternative to using the *qmove* utility—deleting the batch job and requeuing it—entails  
105101 considerably more typing.

105102 Since the means of selecting jobs based on attributes has been encapsulated in the *qselect* utility,  
105103 the only option of the *qmove* utility concerns authorization. The **-u** option provides the user with  
105104 the convenience of changing the user identifier under which the batch job will execute.  
105105 Minimalism and consistency have taken precedence over convenience; the **-u** option has been  
105106 deleted because the equivalent capability exists with the **-u** option of the *qalter* utility.

105107 **FUTURE DIRECTIONS**

105108 The *qmove* utility may be removed in a future version.

105109 **SEE ALSO**

105110 Chapter 3 (on page 2417), *qalter*, *qselect*

105111 XBD Chapter 8 (on page 173)

105112 **CHANGE HISTORY**

105113 Derived from IEEE Std 1003.2d-1994.

105114 **Issue 6**

105115 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

105116 **Issue 7**

105117 The *qmove* utility is marked obsolescent.

105118 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105119 **NAME**

105120 qmsg — send message to batch jobs

105121 **SYNOPSIS**105122 OB BE `qmsg [-EO] message_string job_identifier...`105123 **DESCRIPTION**

105124 To send a message to a batch job is to request that a server write a message string into one or  
 105125 more output files of the batch job. A message is sent to a batch job by a request to the batch  
 105126 server that manages the batch job. The *qmsg* utility is a user-accessible batch client that requests  
 105127 the sending of messages to one or more batch jobs.

105128 The *qmsg* utility shall write messages into the files of batch jobs by sending a *Job Message Request*  
 105129 to the batch server that manages the batch job. The *qmsg* utility shall not directly write the  
 105130 message into the files of the batch job.

105131 The *qmsg* utility shall send a *Job Message Request* for those batch jobs, and only those batch jobs,  
 105132 for which a batch *job\_identifier* is presented to the utility.

105133 The *qmsg* utility shall send *Job Message Requests* for batch jobs in the order in which their batch  
 105134 *job\_identifiers* are presented to the utility.

105135 If the *qmsg* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed to  
 105136 process the remaining batch *job\_identifiers*, if any.

105137 The *qmsg* utility shall not exit before a *Job Message Request* has been sent to the server that  
 105138 manages the batch job that corresponds to each successfully processed batch *job\_identifier*.

105139 **OPTIONS**

105140 The *qmsg* utility shall conform to XBD [Section 12.2](#) (on page 216).

105141 The following options shall be supported by the implementation:

105142 **-E** Specify that the message is written to the standard error of each batch job.

105143 The *qmsg* utility shall write the message into the standard error of the batch job.

105144 **-O** Specify that the message is written to the standard output of each batch job.

105145 The *qmsg* utility shall write the message into the standard output of the batch job.

105146 If neither the **-O** nor the **-E** option is presented to the *qmsg* utility, the utility shall write the  
 105147 message into an implementation-defined file. The conformance document for the  
 105148 implementation shall describe the name and location of the implementation-defined file. If both  
 105149 the **-O** and the **-E** options are presented to the *qmsg* utility, then the utility shall write the  
 105150 messages to both standard output and standard error.

105151 **OPERANDS**

105152 The *qmsg* utility shall accept a minimum of two operands, *message\_string* and one or more batch  
 105153 *job\_identifiers*.

105154 The *message\_string* operand shall be the string to be written to one or more output files of the  
 105155 batch job followed by a <newline>. If the string contains <blank> characters, then the  
 105156 application shall ensure that the string is quoted. The *message\_string* shall be encoded in the  
 105157 portable character set (see XBD [Section 6.1](#), on page 125).

105158 All remaining operands are batch *job\_identifiers* that conform to the syntax for a batch  
 105159 *job\_identifier* (see [Section 3.3.1](#), on page 2439).

105160 **STDIN**

105161 Not used.

105162 **INPUT FILES**

105163 None.

105164 **ENVIRONMENT VARIABLES**105165 The following environment variables shall affect the execution of *qmsg*:

105166 *LANG* Provide a default value for the internationalization variables that are unset or null.  
105167 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
105168 used to determine the values of locale categories.)

105169 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
105170 internationalization variables.

105171 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
105172 characters (for example, single-byte as opposed to multi-byte characters in  
105173 arguments).

105174 *LC\_MESSAGES*

105175 Determine the locale that should be used to affect the format and contents of  
105176 diagnostic messages written to standard error.

105177 *LOGNAME* Determine the login name of the user.105178 **ASYNCHRONOUS EVENTS**

105179 Default.

105180 **STDOUT**

105181 None.

105182 **STDERR**

105183 The standard error shall be used only for diagnostic messages.

105184 **OUTPUT FILES**

105185 None.

105186 **EXTENDED DESCRIPTION**

105187 None.

105188 **EXIT STATUS**

105189 The following exit values shall be returned:

105190 0 Successful completion.

105191 &gt;0 An error occurred.

105192 **CONSEQUENCES OF ERRORS**

105193 In addition to the default behavior, the *qmsg* utility shall not be required to write a diagnostic  
105194 message to standard error when the error reply received from a batch server indicates that the  
105195 batch *job\_identifier* does not exist on the server. Whether or not the *qmsg* utility waits to output  
105196 the diagnostic message while attempting to locate the job on other servers is implementation-  
105197 defined.

**105198 APPLICATION USAGE**

105199 None.

**105200 EXAMPLES**

105201 None.

**105202 RATIONALE**

105203 The *qmsg* utility allows users to write messages into the output files of running jobs. Users,  
105204 including operators and administrators, have a number of occasions when they want to place  
105205 messages in the output files of a batch job. For example, if a disk that is being used by a batch job  
105206 is showing errors, the operator might note this in the standard error stream of the batch job.

105207 The options of the *qmsg* utility provide users with the means of placing the message in the  
105208 output stream of their choice. The default output stream for the message—if the user does not  
105209 designate an output stream—is implementation-defined, since many implementations will  
105210 provide, as an extension to this volume of POSIX.1-2008, a log file that shows the history of  
105211 utility execution.

105212 If users wish to send a message to a set of jobs that meet a selection criteria, the *qselect* utility can  
105213 be used to acquire the appropriate list of job identifiers.

105214 The **-E** option allows users to place the message in the standard error stream of the batch job.

105215 The **-O** option allows users to place the message in the standard output stream of the batch job.

105216 Historically, the *qmsg* utility is an existing practice in the offerings of one or more implementors  
105217 of an NQS-derived batch system. The utility has been found to be useful enough that it deserves  
105218 to be included in this volume of POSIX.1-2008.

**105219 FUTURE DIRECTIONS**

105220 The *qmsg* utility may be removed in a future version.

**105221 SEE ALSO**

105222 [Chapter 3](#) (on page 2417), *qselect*

105223 XBD [Section 6.1](#) (on page 125), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

**105224 CHANGE HISTORY**

105225 Derived from IEEE Std 1003.2d-1994.

**105226 Issue 6**

105227 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

**105228 Issue 7**

105229 The *qmsg* utility is marked obsolescent.

105230 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105231 **NAME**

105232 qrerun — rerun batch jobs

105233 **SYNOPSIS**105234 OB BE `qrerun job_identifier...`105235 **DESCRIPTION**

105236 To rerun a batch job is to terminate the session leader of the batch job, delete any associated  
 105237 checkpoint files, and return the batch job to the batch queued state. A batch job is rerun by a  
 105238 request to the batch server that manages the batch job. The *qrerun* utility is a user-accessible  
 105239 batch client that requests the rerunning of one or more batch jobs.

105240 The *qrerun* utility shall rerun those batch jobs for which a batch *job\_identifier* is presented to the  
 105241 utility.

105242 The *qrerun* utility shall rerun batch jobs in the order in which their batch *job\_identifiers* are  
 105243 presented to the utility.

105244 If the *qrerun* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed to  
 105245 process the remaining batch *job\_identifiers*, if any.

105246 The *qrerun* utility shall rerun batch jobs by sending a *Rerun Job Request* to the batch server that  
 105247 manages each batch job.

105248 For each successfully processed batch *job\_identifier*, the *qrerun* utility shall have rerun the  
 105249 corresponding batch job at the time the utility exits.

105250 **OPTIONS**

105251 None.

105252 **OPERANDS**

105253 The *qrerun* utility shall accept one or more operands that conform to the syntax for a batch  
 105254 *job\_identifier* (see [Section 3.3.1](#), on page 2439).

105255 **STDIN**

105256 Not used.

105257 **INPUT FILES**

105258 None.

105259 **ENVIRONMENT VARIABLES**105260 The following environment variables shall affect the execution of *qrerun*:

105261 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 105262 (See [XBD Section 8.2](#) (on page 174) the precedence of internationalization variables  
 105263 used to determine the values of locale categories.)

105264 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 105265 internationalization variables.

105266 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 105267 characters (for example, single-byte as opposed to multi-byte characters in  
 105268 arguments).

105269 *LC\_MESSAGES*

105270 Determine the locale that should be used to affect the format and contents of  
 105271 diagnostic messages written to standard error.

105272 **LOGNAME** Determine the login name of the user.

105273 **ASYNCHRONOUS EVENTS**

105274 Default.

105275 **STDOUT**

105276 None.

105277 **STDERR**

105278 The standard error shall be used only for diagnostic messages.

105279 **OUTPUT FILES**

105280 None.

105281 **EXTENDED DESCRIPTION**

105282 None.

105283 **EXIT STATUS**

105284 The following exit values shall be returned:

105285 0 Successful completion.

105286 >0 An error occurred.

105287 **CONSEQUENCES OF ERRORS**

105288 In addition to the default behavior, the *qrerun* utility shall not be required to write a diagnostic  
105289 message to standard error when the error reply received from a batch server indicates that the  
105290 batch *job\_identifier* does not exist on the server. Whether or not the *qrerun* utility waits to output  
105291 the diagnostic message while attempting to locate the job on other servers is implementation-  
105292 defined.

105293 **APPLICATION USAGE**

105294 None.

105295 **EXAMPLES**

105296 None.

105297 **RATIONALE**

105298 The *qrerun* utility allows users to cause jobs in the running state to exit and rerun.

105299 The *qrerun* utility is a new utility, *vis-a-vis* existing practice, that has been defined in this volume  
105300 of POSIX.1-2008 to correct user-perceived deficiencies in the existing practice.

105301 **FUTURE DIRECTIONS**

105302 The *qrerun* utility may be removed in a future version.

105303 **SEE ALSO**

105304 [Chapter 3](#) (on page 2417)

105305 XBD [Chapter 8](#) (on page 173)

105306 **CHANGE HISTORY**

105307 Derived from IEEE Std 1003.2d-1994.

105308 **Issue 6**

105309 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

105310 **Issue 7**

105311 The *qrerun* utility is marked obsolescent.

105312 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105313 **NAME**

105314 qrln — release batch jobs

105315 **SYNOPSIS**105316 OB BE `qrln [-h hold_list] job_identifier...`105317 **DESCRIPTION**

105318 A batch job might have one or more holds, which prevent the batch job from executing. A batch  
 105319 job from which all the holds have been removed becomes eligible for execution and is said to  
 105320 have been released. A batch job hold is removed by sending a request to the batch server that  
 105321 manages the batch job. The *qrln* utility is a user-accessible client of batch services that requests  
 105322 holds be removed from one or more batch jobs.

105323 The *qrln* utility shall remove one or more holds from those batch jobs for which a batch  
 105324 *job\_identifier* is presented to the utility.

105325 The *qrln* utility shall remove holds from batch jobs in the order in which their batch *job\_identifiers*  
 105326 are presented to the utility.

105327 If the *qrln* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 105328 process the remaining batch *job\_identifiers*, if any.

105329 The *qrln* utility shall remove holds on each batch job by sending a *Release Job Request* to the batch  
 105330 server that manages the batch job.

105331 The *qrln* utility shall not exit until the holds have been removed from the batch job  
 105332 corresponding to each successfully processed batch *job\_identifier*.

105333 **OPTIONS**

105334 The *qrln* utility shall conform to XBD [Section 12.2](#) (on page 216).

105335 The following option shall be supported by the implementation:

105336 **-h *hold\_list*** Define the types of holds to be removed from the batch job.

105337 The *qrln* **-h** option shall accept a value for the *hold\_list* option-argument that is a  
 105338 string of alphanumeric characters in the portable character set (see XBD [Section](#)  
 105339 [6.1](#), on page 125).

105340 The *qrln* utility shall accept a value for the *hold\_list* option-argument that is a string  
 105341 of one or more of the characters 'u', 's', or 'o', or the single character 'n'.

105342 For each unique character in the *hold\_list* option-argument, the *qrln* utility shall add  
 105343 a value to the *Hold\_Types* attribute of the batch job as follows, each representing a  
 105344 different hold type:

105345 u USER

105346 s SYSTEM

105347 o OPERATOR

105348 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 105349 duplicates shall be ignored.

105350 An existing *Hold\_Types* attribute can be cleared by the following hold type:

105351 n NO\_HOLD

105352 The *qrln* utility shall consider it an error if any hold type other than 'n' is  
 105353 combined with hold type 'n'.

105354 Strictly conforming applications shall not repeat any of the characters 'u', 's',  
 105355 'o', or 'n' within the *hold\_list* option-argument. The *qrIs* utility shall permit the  
 105356 repetition of characters, but shall not assign additional meaning to the repeated  
 105357 characters.

105358 An implementation may define other hold types. The conformance document for  
 105359 an implementation shall describe any additional hold types, how they are  
 105360 specified, their internal behavior, and how they affect the behavior of the utility.

105361 If the **-h** option is not presented to the *qrIs* utility, the implementation shall remove  
 105362 the USER hold in the *Hold\_Types* attribute.

#### 105363 OPERANDS

105364 The *qrIs* utility shall accept one or more operands that conform to the syntax for a batch  
 105365 *job\_identifier* (see [Section 3.3.1](#), on page 2439).

#### 105366 STDIN

105367 Not used.

#### 105368 INPUT FILES

105369 None.

#### 105370 ENVIRONMENT VARIABLES

105371 The following environment variables shall affect the execution of *qrIs*:

105372 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 105373 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 105374 used to determine the values of locale categories.)

105375 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 105376 internationalization variables.

105377 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 105378 characters (for example, single-byte as opposed to multi-byte characters in  
 105379 arguments).

105380 *LC\_MESSAGES*

105381 Determine the locale that should be used to affect the format and contents of  
 105382 diagnostic messages written to standard error.

105383 *LOGNAME* Determine the login name of the user.

#### 105384 ASYNCHRONOUS EVENTS

105385 Default.

#### 105386 STDOUT

105387 None.

#### 105388 STDERR

105389 The standard error shall be used only for diagnostic messages.

#### 105390 OUTPUT FILES

105391 None.

#### 105392 EXTENDED DESCRIPTION

105393 None.

**105394 EXIT STATUS**

105395 The following exit values shall be returned:

105396 0 Successful completion.

105397 >0 An error occurred.

**105398 CONSEQUENCES OF ERRORS**

105399 In addition to the default behavior, the *qrsl* utility shall not be required to write a diagnostic  
105400 message to standard error when the error reply received from a batch server indicates that the  
105401 batch *job\_identifier* does not exist on the server. Whether or not the *qrsl* utility waits to output the  
105402 diagnostic message while attempting to locate the job on other servers is implementation-  
105403 defined.

**105404 APPLICATION USAGE**

105405 None.

**105406 EXAMPLES**

105407 None.

**105408 RATIONALE**

105409 The *qrsl* utility allows users, operators, and administrators to remove holds from jobs.

105410 The *qrsl* utility does not support any job selection options or wildcard arguments. Users may  
105411 acquire a list of jobs selected by attributes using the *qselect* utility. For example, a user could  
105412 select all of their held jobs.

105413 The **-h** option allows the user to specify the type of hold that is to be removed. This option  
105414 allows for USER, SYSTEM, OPERATOR, and implementation-defined hold types. The batch  
105415 server that manages the batch job will verify whether the user is authorized to remove the  
105416 specified hold for the batch job. If more than one type of hold has been placed on the batch job, a  
105417 user may wish to remove only some of them.

105418 Mail is not required on release because the administrator has the tools and libraries to build this  
105419 option if required.

105420 The *qrsl* utility is a new utility *vis-a-vis* existing practice; it has been defined in this volume of  
105421 POSIX.1-2008 as the natural complement to the *qhold* utility.

**105422 FUTURE DIRECTIONS**

105423 The *qrsl* utility may be removed in a future version.

**105424 SEE ALSO**

105425 [Chapter 3](#) (on page 2417), *qhold*, *qselect*

105426 [XBD Section 6.1](#) (on page 125), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

**105427 CHANGE HISTORY**

105428 Derived from IEEE Std 1003.2d-1994.

**105429 Issue 6**

105430 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

**105431 Issue 7**

105432 The *qrsl* utility is marked obsolescent.

105433 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105434 **NAME**

105435 qselect — select batch jobs

105436 **SYNOPSIS**

```
105437 OB BE qselect [-a [op]date_time] [-A account_string] [-c [op]interval]
105438           [-h hold_list] [-l resource_list] [-N name] [-p [op]priority]
105439           [-q destination] [-r y|n] [-s states] [-u user_list]
```

105440 **DESCRIPTION**

105441 To select a set of batch jobs is to return the batch *job\_identifiers* for each batch job that meets a list  
 105442 of selection criteria. A set of batch jobs is selected by a request to a batch server. The *qselect* utility  
 105443 is a user-accessible batch client that requests the selection of batch jobs.

105444 Upon successful completion, the *qselect* utility shall have returned a list of zero or more batch  
 105445 *job\_identifiers* that meet the criteria specified by the options and option-arguments presented to  
 105446 the utility.

105447 The *qselect* utility shall select batch jobs by sending a *Select Jobs Request* to a batch server. The  
 105448 *qselect* utility shall not exit until the server replies to each request generated.

105449 For each option presented to the *qselect* utility, the utility shall restrict the set of selected batch  
 105450 jobs as described in the OPTIONS section.

105451 The *qselect* utility shall not restrict selection of batch jobs except by authorization and as required  
 105452 by the options presented to the utility.

105453 When an option is specified with a mandatory or optional *op* component to the option-  
 105454 argument, then *op* shall specify a relation between the value of a certain batch job attribute and  
 105455 the *value* component of the option-argument. If an *op* is allowable on an option, then the  
 105456 description of the option letter indicates the *op* as either mandatory or optional. Acceptable  
 105457 strings for the *op* component, and the relation the string indicates, are shown in the following  
 105458 list:

105459 .eq. The value represented by the attribute of the batch job is equal to the value represented  
 105460 by the option-argument.

105461 .ge. The value represented by the attribute of the batch job is greater than or equal to the  
 105462 value represented by the option-argument.

105463 .gt. The value represented by the attribute of the batch job is greater than the value  
 105464 represented by the option-argument.

105465 .lt. The value represented by the attribute of the batch job is less than the value represented  
 105466 by the option-argument.

105467 .le. The value represented by the attribute of the batch job is less than or equal to the value  
 105468 represented by the option-argument.

105469 .ne. The value represented by the attribute of the batch job is not equal to the value  
 105470 represented by the option-argument.

105471 **OPTIONS**

105472 The *qselect* utility shall conform to XBD [Section 12.2](#) (on page 216).

105473 The following options shall be supported by the implementation:

105474 **-a [op]date\_time**

105475 Restrict selection to a specific time, or a range of times.

105476 The *qselect* utility shall select only batch jobs for which the value of the

105477 *Execution\_Time* attribute is related to the Epoch equivalent of the local time  
 105478 expressed by the value of the *date\_time* component of the option-argument in the  
 105479 manner indicated by the value of the *op* component of the option-argument.

105480 The *qselect* utility shall accept a *date\_time* component of the option-argument that  
 105481 conforms to the syntax of the *time* operand of the *touch* utility.

105482 If the *op* component of the option-argument is not presented to the *qselect* utility,  
 105483 the utility shall select batch jobs for which the *Execution\_Time* attribute is equal to  
 105484 the *date\_time* component of the option-argument.

105485 When comparing times, the *qselect* utility shall use the following definitions for the  
 105486 *op* component of the option-argument:

105487 .eq. The time represented by value of the *Execution\_Time* attribute of the batch  
 105488 job is equal to the time represented by the *date\_time* component of the  
 105489 option-argument.

105490 .ge. The time represented by value of the *Execution\_Time* attribute of the batch  
 105491 job is after or equal to the time represented by the *date\_time* component of  
 105492 the option-argument.

105493 .gt. The time represented by value of the *Execution\_Time* attribute of the batch  
 105494 job is after the time represented by the *date\_time* component of the option-  
 105495 argument.

105496 .lt. The time represented by value of the *Execution\_Time* attribute of the batch  
 105497 job is before the time represented by the *date\_time* component of the  
 105498 option-argument.

105499 .le. The time represented by value of the *Execution\_Time* attribute of the batch  
 105500 job is before or equal to the time represented by the *date\_time* component  
 105501 of the option-argument.

105502 .ne. The time represented by value of the *Execution\_Time* attribute of the batch  
 105503 job is not equal to the time represented by the *date\_time* component of the  
 105504 option-argument.

105505 The *qselect* utility shall accept the defined character strings for the *op* component of  
 105506 the option-argument.

105507 **-A** *account\_string*

105508 Restrict selection to the batch jobs charging a specified account.

105509 The *qselect* utility shall select only batch jobs for which the value of the  
 105510 *Account\_Name* attribute of the batch job matches the value of the *account\_string*  
 105511 option-argument.

105512 The syntax of the *account\_string* option-argument is unspecified.

105513 **-c** [*op*]*interval*

105514 Restrict selection to batch jobs within a range of checkpoint intervals.

105515 The *qselect* utility shall select only batch jobs for which the value of the *Checkpoint*  
 105516 attribute relates to the value of the *interval* component of the option-argument in  
 105517 the manner indicated by the value of the *op* component of the option-argument.

105518 If the *op* component of the option-argument is omitted, the *qselect* utility shall select  
 105519 batch jobs for which the value of the *Checkpoint* attribute is equal to the value of the  
 105520 *interval* component of the option-argument.

105521 When comparing checkpoint intervals, the *qselect* utility shall use the following  
 105522 definitions for the *op* component of the option-argument:

105523 .eq. The value of the *Checkpoint* attribute of the batch job equals the value of  
 105524 the *interval* component of the option-argument.

105525 .ge. The value of the *Checkpoint* attribute of the batch job is greater than or  
 105526 equal to the value of the *interval* component option-argument.

105527 .gt. The value of the *Checkpoint* attribute of the batch job is greater than the  
 105528 value of the *interval* component option-argument.

105529 .lt. The value of the *Checkpoint* attribute of the batch job is less than the value  
 105530 of the *interval* component option-argument.

105531 .le. The value of the *Checkpoint* attribute of the batch job is less than or equal  
 105532 to the value of the *interval* component option-argument.

105533 .ne. The value of the *Checkpoint* attribute of the batch job does not equal the  
 105534 value of the *interval* component option-argument.

105535 The *qselect* utility shall accept the defined character strings for the *op* component of  
 105536 the option-argument.

105537 The ordering relationship for the values of the interval option-argument is defined  
 105538 to be:

105539 'n' .gt. 's' .gt. 'c=minutes' .ge. 'c'

105540 When comparing *Checkpoint* attributes with an interval having the value of the  
 105541 single character 'u', only equality or inequality are valid comparisons.

105542 **-h hold\_list** Restrict selection to batch jobs that have a specific type of hold.

105543 The *qselect* utility shall select only batch jobs for which the value of the *Hold\_Types*  
 105544 attribute matches the value of the *hold\_list* option-argument.

105545 The *qselect* **-h** option shall accept a value for the *hold\_list* option-argument that is a  
 105546 string of alphanumeric characters in the portable character set (see XBD [Section 6.1](#), on page 125).  
 105547

105548 The *qselect* utility shall accept a value for the *hold\_list* option-argument that is a  
 105549 string of one or more of the characters 'u', 's', or 'o', or the single character  
 105550 'n'.

105551 Each unique character in the *hold\_list* option-argument of the *qselect* utility is  
 105552 defined as follows, each representing a different hold type:

105553 u USER  
 105554 s SYSTEM  
 105555 o OPERATOR

105556 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 105557 duplicates shall be ignored.

105558 The *qselect* utility shall consider it an error if any hold type other than 'n' is  
 105559 combined with hold type 'n'.

105560 Strictly conforming applications shall not repeat any of the characters 'u', 's',  
 105561 'o', or 'n' within the *hold\_list* option-argument. The *qselect* utility shall permit

105562 the repetition of characters, but shall not assign additional meaning to the repeated  
105563 characters.

105564 An implementation may define other hold types. The conformance document for  
105565 an implementation shall describe any additional hold types, how they are  
105566 specified, their internal behavior, and how they affect the behavior of the utility.

105567 **-I resource\_list**

105568 Restrict selection to batch jobs with specified resource limits and attributes.

105569 The *qselect* utility shall accept a *resource\_list* option-argument with the following  
105570 syntax:

105571 *resource\_name op value [, , resource\_name op value, , ...]*

105572 When comparing resource values, the *qselect* utility shall use the following  
105573 definitions for the *op* component of the option-argument:

105574 .eq. The value of the resource of the same name in the *Resource\_List* attribute  
105575 of the batch job equals the value of the value component of the option-  
105576 argument.

105577 .ge. The value of the resource of the same name in the *Resource\_List* attribute  
105578 of the batch job is greater than or equal to the value of the *value*  
105579 component of the option-argument.

105580 .gt. The value of the resource of the same name in the *Resource\_List* attribute  
105581 of the batch job is greater than the value of the value component of the  
105582 option-argument.

105583 .lt. The value of the resource of the same name in the *Resource\_List* attribute  
105584 of the batch job is less than the value of the value component of the  
105585 option-argument.

105586 .ne. The value of the resource of the same name in the *Resource\_List* attribute  
105587 of the batch job does not equal the value of the value component of the  
105588 option-argument.

105589 .le. The value of the resource of the same name in the *Resource\_List* attribute  
105590 of the batch job is less than or equal to the value of the *value* component of  
105591 the option-argument.

105592 When comparing the limit of a *Resource\_List* attribute with the *value* component of  
105593 the option-argument, if the limit, the value, or both are non-numeric, only equality  
105594 or inequality are valid comparisons.

105595 The *qselect* utility shall select only batch jobs for which the values of the  
105596 *resource\_names* listed in the *resource\_list* option-argument match the corresponding  
105597 limits of the *Resource\_List* attribute of the batch job.

105598 Limits of *resource\_names* present in the *Resource\_List* attribute of the batch job that  
105599 have no corresponding values in the *resource\_list* option-argument shall not be  
105600 considered when selecting batch jobs.

105601 **-N name** Restrict selection to batch jobs with a specified name.

105602 The *qselect* utility shall select only batch jobs for which the value of the *Job\_Name*  
105603 attribute matches the value of the *name* option-argument. The string specified in  
105604 the *name* option-argument shall be passed, uninterpreted, to the server. This allows  
105605 an implementation to match “wildcard” patterns against batch job names.

105606 An implementation shall describe in the conformance document the format it  
105607 supports for matching against the *Job\_Name* attribute.

105608 **-p** [*op*]*priority*

105609 Restrict selection to batch jobs of the specified priority or range of priorities.

105610 The *qselect* utility shall select only batch jobs for which the value of the *Priority*  
105611 attribute of the batch job relates to the value of the *priority* component of the  
105612 option-argument in the manner indicated by the value of the *op* component of the  
105613 option-argument.

105614 If the *op* component of the option-argument is omitted, the *qselect* utility shall select  
105615 batch jobs for which the value of the *Priority* attribute of the batch job is equal to  
105616 the value of the *priority* component of the option-argument.

105617 When comparing priority values, the *qselect* utility shall use the following  
105618 definitions for the *op* component of the option-argument:

105619 .eq. The value of the *Priority* attribute of the batch job equals the value of the  
105620 *priority* component of the option-argument.

105621 .ge. The value of the *Priority* attribute of the batch job is greater than or equal  
105622 to the value of the *priority* component option-argument.

105623 .gt. The value of the *Priority* attribute of the batch job is greater than the value  
105624 of the *priority* component option-argument.

105625 .lt. The value of the *Priority* attribute of the batch job is less than the value of  
105626 the *priority* component option-argument.

105627 .lte. The value of the *Priority* attribute of the batch job is less than or equal to  
105628 the value of the *priority* component option-argument.

105629 .ne. The value of the *Priority* attribute of the batch job does not equal the value  
105630 of the *priority* component option-argument.

105631 **-q** *destination*

105632 Restrict selection to the specified batch queue or server, or both.

105633 The *qselect* utility shall select only batch jobs that are located at the destination  
105634 indicated by the value of the *destination* option-argument.

105635 The destination defines a batch queue, a server, or a batch queue at a server.

105636 The *qselect* utility shall accept an option-argument for the **-q** option that conforms  
105637 to the syntax for a destination. If the **-q** option is not presented to the *qselect* utility,  
105638 the utility shall select batch jobs from all batch queues at the default batch server.

105639 If the option-argument describes only a batch queue, the *qselect* utility shall select  
105640 only batch jobs from the batch queue of the specified name at the default batch  
105641 server. The means by which *qselect* determines the default server is  
105642 implementation-defined.

105643 If the option-argument describes only a batch server, the *qselect* utility shall select  
105644 batch jobs from all the batch queues at that batch server.

105645 If the option-argument describes both a batch queue and a batch server, the *qselect*  
105646 utility shall select only batch jobs from the specified batch queue at the specified  
105647 server.

|        |                              |                                                                                                                                                                                                                                                      |
|--------|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 105648 | <b>-r y   n</b>              | Restrict selection to batch jobs with the specified rerunability status.                                                                                                                                                                             |
| 105649 |                              | The <i>qselect</i> utility shall select only batch jobs for which the value of the <i>Rerunable</i> attribute of the batch job matches the value of the option-argument.                                                                             |
| 105650 |                              |                                                                                                                                                                                                                                                      |
| 105651 |                              | The <i>qselect</i> utility shall accept a value for the option-argument that consists of either the single character 'y' or the single character 'n'. The character 'y' represents the value TRUE, and the character 'n' represents the value FALSE. |
| 105652 |                              |                                                                                                                                                                                                                                                      |
| 105653 |                              |                                                                                                                                                                                                                                                      |
| 105654 | <b>-s states</b>             | Restrict selection to batch jobs in the specified states.                                                                                                                                                                                            |
| 105655 |                              | The <i>qselect</i> utility shall accept an option-argument that consists of any combination of the characters 'e', 'q', 'r', 'w', 'h', and 't'.                                                                                                      |
| 105656 |                              |                                                                                                                                                                                                                                                      |
| 105657 |                              | Conforming applications shall not repeat any character in the option-argument.                                                                                                                                                                       |
| 105658 |                              | The <i>qselect</i> utility shall permit the repetition of characters in the option-argument, but shall not assign additional meaning to repeated characters.                                                                                         |
| 105659 |                              |                                                                                                                                                                                                                                                      |
| 105660 |                              | The <i>qselect</i> utility shall interpret the characters in the <i>states</i> option-argument as follows:                                                                                                                                           |
| 105661 |                              |                                                                                                                                                                                                                                                      |
| 105662 | e                            | Represents the EXITING state.                                                                                                                                                                                                                        |
| 105663 | q                            | Represents the QUEUED state.                                                                                                                                                                                                                         |
| 105664 | r                            | Represents the RUNNING state.                                                                                                                                                                                                                        |
| 105665 | t                            | Represents the TRANSITING state.                                                                                                                                                                                                                     |
| 105666 | h                            | Represents the HELD state.                                                                                                                                                                                                                           |
| 105667 | w                            | Represents the WAITING state.                                                                                                                                                                                                                        |
| 105668 |                              | For each character in the <i>states</i> option-argument, the <i>qselect</i> utility shall select batch jobs in the corresponding state.                                                                                                              |
| 105669 |                              |                                                                                                                                                                                                                                                      |
| 105670 | <b>-u user_list</b>          | Restrict selection to batch jobs owned by the specified user names.                                                                                                                                                                                  |
| 105671 |                              | The <i>qselect</i> utility shall select only the batch jobs of those users specified in the <i>user_list</i> option-argument.                                                                                                                        |
| 105672 |                              |                                                                                                                                                                                                                                                      |

| 105700 | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                                                                                                                                                                |
| 105701 |                               | Default.                                                                                                                                                                                                                                       |
| 105702 | <b>STDOUT</b>                 |                                                                                                                                                                                                                                                |
| 105703 |                               | The <i>qselect</i> utility shall write zero or more batch <i>job_identifiers</i> to standard output.                                                                                                                                           |
| 105704 |                               | The <i>qselect</i> utility shall separate the batch <i>job_identifiers</i> written to standard output by white space.                                                                                                                          |
| 105705 |                               |                                                                                                                                                                                                                                                |
| 105706 |                               | The <i>qselect</i> utility shall write batch <i>job_identifiers</i> in the following format:                                                                                                                                                   |
| 105707 |                               | <i>sequence_number.server_name@server</i>                                                                                                                                                                                                      |
| 105708 | <b>STDERR</b>                 |                                                                                                                                                                                                                                                |
| 105709 |                               | The standard error shall be used only for diagnostic messages.                                                                                                                                                                                 |
| 105710 | <b>OUTPUT FILES</b>           |                                                                                                                                                                                                                                                |
| 105711 |                               | None.                                                                                                                                                                                                                                          |
| 105712 | <b>EXTENDED DESCRIPTION</b>   |                                                                                                                                                                                                                                                |
| 105713 |                               | None.                                                                                                                                                                                                                                          |
| 105714 | <b>EXIT STATUS</b>            |                                                                                                                                                                                                                                                |
| 105715 |                               | The following exit values shall be returned:                                                                                                                                                                                                   |
| 105716 | 0                             | Successful completion.                                                                                                                                                                                                                         |
| 105717 | >0                            | An error occurred.                                                                                                                                                                                                                             |
| 105718 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                                                                                                                |
| 105719 |                               | Default.                                                                                                                                                                                                                                       |

105720 **APPLICATION USAGE**

105721 None.

105722 **EXAMPLES**

105723 The following example shows how a user might use the *qselect* utility in conjunction with the  
105724 *qdel* utility to delete all of his or her jobs in the queued state without affecting any jobs that are  
105725 already running:

105726 `qdel $(qselect -s q)`

105727 or:

105728 `qselect -s q || xargs qdel`105729 **RATIONALE**

105730 The *qselect* utility allows users to acquire a list of job identifiers that match user-specified  
105731 selection criteria. The list of identifiers returned by the *qselect* utility conforms to the syntax of  
105732 the batch job identifier list processed by a utility such as *qmove*, *qdel*, and *qrls*. The *qselect* utility  
105733 is thus a powerful tool for causing another batch system utility to act upon a set of jobs that  
105734 match a list of selection criteria.

105735 The options of the *qselect* utility let the user apply a number of useful filters for selecting jobs.  
105736 Each option further restricts the selection of jobs. Many of the selection options allow the  
105737 specification of a relational operator. The FORTRAN-like syntax of the operator—that is,  
105738 ".lt."—was chosen rather than the C-like "<=" meta-characters.

105739 The **-a** option allows users to restrict the selected jobs to those that have been submitted (or  
105740 altered) to wait until a particular time. The time period is determined by the argument of this  
105741 option, which includes both a time and an operator—it is thus possible to select jobs waiting  
105742 until a specific time, jobs waiting until after a certain time, or those waiting for a time before the  
105743 specified time.

105744 The **-A** option allows users to restrict the selected jobs to those that have been submitted (or  
105745 altered) to charge a particular account.

105746 The **-c** option allows users to restrict the selected jobs to those whose checkpointing interval  
105747 falls within the specified range.

105748 The **-l** option allows users to select those jobs whose resource limits fall within the range  
105749 indicated by the value of the option. For example, a user could select those jobs for which the  
105750 CPU time limit is greater than two hours.

105751 The **-N** option allows users to select jobs by job name. For instance, all the parts of a task that  
105752 have been divided in parallel jobs might be given the same name, and thus manipulated as a  
105753 group by means of this option.

105754 The **-q** option allows users to select jobs in a specified queue.

105755 The **-r** option allows users to select only those jobs with a specified rerun criteria. For instance, a  
105756 user might select only those jobs that can be rerun for use with the *qrerun* utility.

105757 The **-s** option allows users to select only those jobs that are in a certain state.

105758 The **-u** option allows users to select jobs that have been submitted to execute under a particular  
105759 account.

105760 The selection criteria provided by the options of the *qselect* utility allow users to select jobs based  
105761 on all the appropriate attributes that can be assigned to jobs by the *qsub* utility.

105762 Historically, the *qselect* utility has not been a part of existing practice; it is an improvement that

105763 has been introduced in this volume of POSIX.1-2008.

105764 **FUTURE DIRECTIONS**

105765 The *qselect* utility may be removed in a future version.

105769 **CHANGE HISTORY**

105770 Derived from IEEE Std 1003.2d-1994.

105771 **Issue 7**

105772 The *qselect* utility is marked obsolescent.

105773 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105774 **NAME**

105775           qsig — signal batch jobs

105776 **SYNOPSIS**105777 OB BE   qsig [-s *signal*] *job\_identifier*...105778 **DESCRIPTION**

105779       To signal a batch job is to send a signal to the session leader of the batch job. A batch job is  
 105780       signaled by sending a request to the batch server that manages the batch job. The *qsig* utility is a  
 105781       user-accessible batch client that requests the signaling of a batch job.

105782       The *qsig* utility shall signal those batch jobs for which a batch *job\_identifier* is presented to the  
 105783       utility. The *qsig* utility shall not signal any batch jobs whose batch *job\_identifiers* are not  
 105784       presented to the utility.

105785       The *qsig* utility shall signal batch jobs in the order in which the corresponding batch  
 105786       *job\_identifiers* are presented to the utility. If the *qsig* utility fails to process a batch *job\_identifier*  
 105787       successfully, the utility shall proceed to process the remaining batch *job\_identifiers*, if any.

105788       The *qsig* utility shall signal batch jobs by sending a *Signal Job Request* to the batch server that  
 105789       manages the batch job.

105790       For each successfully processed batch *job\_identifier*, the *qsig* utility shall have received a  
 105791       completion reply to each *Signal Job Request* sent to a batch server at the time the utility exits.

105792 **OPTIONS**105793       The *qsig* utility shall conform to XBD [Section 12.2](#) (on page 216).

105794       The following option shall be supported by the implementation:

105795       -s *signal*     Define the signal to be sent to the batch job.

105796               The *qsig* utility shall accept a *signal* option-argument that is either a symbolic signal  
 105797               name or an unsigned integer signal number (see the POSIX.1-1990 standard,  
 105798               Section 3.3.1.1). The *qsig* utility shall accept signal names for which the SIG prefix  
 105799               has been omitted.

105800               If the *signal* option-argument is a signal name, the *qsig* utility shall send that name.

105801               If the *signal* option-argument is a number, the *qsig* utility shall send the signal  
 105802               value represented by the number.

105803               If the -s option is not presented to the *qsig* utility, the utility shall send the signal  
 105804               SIGTERM to each signaled batch job.

105805 **OPERANDS**

105806       The *qsig* utility shall accept one or more operands that conform to the syntax for a batch  
 105807       *job\_identifier* (see [Section 3.3.1](#), on page 2439).

105808 **STDIN**

105809       Not used.

105810 **INPUT FILES**

105811       None.

105812 **ENVIRONMENT VARIABLES**105813       The following environment variables shall affect the execution of *qsig*:

|        |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 105841 |                               | In addition to the default behavior, the <i>qsig</i> utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch <i>job_identifier</i> does not exist on the server. Whether or not the <i>qsig</i> utility waits to output the diagnostic message while attempting to locate the batch job on other servers is implementation-defined. |

| 105849 |                               | None.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 105850 | <b>RATIONALE</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 105851 |                               | The <i>qsig</i> utility allows users to signal batch jobs.                                                                                                                                                                                                                                                                                                                                                                           |
| 105852 |                               | A user may be unable to signal a batch job with the <i>kill</i> utility of the operating system for a number of reasons. First, the process ID of the batch job may be unknown to the user. Second, the processes of the batch job may be on a remote node. However, by virtue of communication between batch nodes, the <i>qsig</i> utility can arrange for the signaling of a process.                                             |
| 105853 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 105854 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 105855 |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 105856 |                               | Because a batch job that is not running cannot be signaled, and because the signal may not                                                                                                                                                                                                                                                                                                                                           |

- 105857 terminate the batch job, the *qsig* utility is not a substitute for the *qdel* utility.
- 105858 The options of the *qsig* utility allow the user to specify the signal that is to be sent to the batch  
105859 job.
- 105860 The *-s* option allows users to specify a signal by name or by number, and thus override the  
105861 default signal. The POSIX.1-1990 standard defines signals by both name and number.
- 105862 The *qsig* utility is a new utility, *vis-a-vis* existing practice; it has been defined in this volume of  
105863 POSIX.1-2008 in response to user-perceived shortcomings in existing practice.
- 105864 **FUTURE DIRECTIONS**
- 105865 The *qsig* utility may be removed in a future version.

- 105870 Derived from IEEE Std 1003.2d-1994.
- 105871 **Issue 6**
- 105872 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.
- 105873 **Issue 7**
- 105874 The *qsig* utility is marked obsolescent.
- 105875 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105876 **NAME**

105877       qstat — show status of batch jobs

105878 **SYNOPSIS**105879 OB BE     qstat [-f] *job\_identifier...*105880             qstat -Q [-f] *destination...*105881             qstat -B [-f] *server\_name...*105882 **DESCRIPTION**

105883       The status of a batch job, batch queue, or batch server is obtained by a request to the server. The  
 105884       *qstat* utility is a user-accessible batch client that requests the status of one or more batch jobs,  
 105885       batch queues, or servers, and writes the status information to standard output.

105886       For each successfully processed batch *job\_identifier*, the *qstat* utility shall display information  
 105887       about the corresponding batch job.

105888       For each successfully processed destination, the *qstat* utility shall display information about the  
 105889       corresponding batch queue.

105890       For each successfully processed server name, the *qstat* utility shall display information about the  
 105891       corresponding server.

105892       The *qstat* utility shall acquire batch job status information by sending a *Job Status Request* to a  
 105893       batch server. The *qstat* utility shall acquire batch queue status information by sending a *Queue*  
 105894       *Status Request* to a batch server. The *qstat* utility shall acquire server status information by  
 105895       sending a *Server Status Request* to a batch server.

105896 **OPTIONS**105897       The *qstat* utility shall conform to XBD [Section 12.2](#) (on page 216).

105898       The following options shall be supported by the implementation:

105899       **-f**           Specify that a full display is produced.

105900                    The minimum contents of a full display are specified in the STDOUT section.

105901                    Additional contents and format of a full display are implementation-defined.

105902       **-Q**           Specify that the operand is a destination.

105903                    The *qstat* utility shall display information about each batch queue at each  
 105904                    destination identified as an operand.

105905       **-B**           Specify that the operand is a server name.

105906                    The *qstat* utility shall display information about each server identified as an  
 105907                    operand.

105908 **OPERANDS**

105909       If the **-Q** option is presented to the *qstat* utility, the utility shall accept one or more operands that  
 105910       conform to the syntax for a destination (see [Section 3.3.2](#), on page 2440).

105911       If the **-B** option is presented to the *qstat* utility, the utility shall accept one or more *server\_name*  
 105912       operands.

105913       If neither the **-B** nor the **-Q** option is presented to the *qstat* utility, the utility shall accept one or  
 105914       more operands that conform to the syntax for a batch *job\_identifier* (see [Section 3.3.1](#), on page  
 105915       2439).

105916 **STDIN**

105917 Not used.

105918 **INPUT FILES**

105919 None.

105920 **ENVIRONMENT VARIABLES**105921 The following environment variables shall affect the execution of *qstat*:105922 *HOME* Determine the pathname of the user's home directory.

105923 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 105924 (See XBD [Section 8.2](#) (on page 174) the precedence of internationalization variables  
 105925 used to determine the values of locale categories.)

105926 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 105927 internationalization variables.

105928 *LC\_COLLATE*

105929 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 105930 character collating elements within regular expressions.

105931 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 105932 characters (for example, single-byte as opposed to multi-byte characters in  
 105933 arguments).

105934 *LC\_MESSAGES*

105935 Determine the locale that should be used to affect the format and contents of  
 105936 diagnostic messages written to standard error.

105937 *LC\_NUMERIC*

105938 Determine the locale for selecting the radix character used when writing floating-  
 105939 point formatted output.

105940 **ASYNCHRONOUS EVENTS**

105941 Default.

105942 **STDOUT**

105943 If an operand presented to the *qstat* utility is a batch *job\_identifier* and the *-f* option is not  
 105944 specified, the *qstat* utility shall display the following items on a single line, in the stated order,  
 105945 with white space between each item, for each successfully processed operand:

- 105946 • The batch *job\_identifier*
- 105947 • The batch job name
- 105948 • The *Job\_Owner* attribute
- 105949 • The CPU time used by the batch job
- 105950 • The batch job state
- 105951 • The batch job location

105952 If an operand presented to the *qstat* utility is a batch *job\_identifier* and the *-f* option is specified,  
 105953 the *qstat* utility shall display the following items for each success fully processed operand:

- 105954 • The batch *job\_identifier*
- 105955 • The batch job name

- 105956 • The *Job\_Owner* attribute
  - 105957 • The execution user ID
  - 105958 • The CPU time used by the batch job
  - 105959 • The batch job state
  - 105960 • The batch job location
  - 105961 • Additional implementation-defined information, if any, about the batch job or batch queue
- 105962 If an operand presented to the *qstat* utility is a destination, the **-Q** option is specified, and the **-f**  
 105963 option is not specified, the *qstat* utility shall display the following items on a single line, in the  
 105964 stated order, with white space between each item, for each successfully processed operand:
- 105965 • The batch queue name
  - 105966 • The maximum number of batch jobs that shall be run in the batch queue concurrently
  - 105967 • The total number of batch jobs in the batch queue
  - 105968 • The status of the batch queue
  - 105969 • For each state, the number of batch jobs in that state in the batch queue and the name of  
 105970 the state
  - 105971 • The type of batch queue (execution or routing)
- 105972 If the operands presented to the *qstat* utility are destinations, the **-Q** option is specified, and the  
 105973 **-f** option is specified, the *qstat* utility shall display the following items for each successfully  
 105974 processed operand:
- 105975 • The batch queue name
  - 105976 • The maximum number of batch jobs that shall be run in the batch queue concurrently
  - 105977 • The total number of batch jobs in the batch queue
  - 105978 • The status of the batch queue
  - 105979 • For each state, the number of batch jobs in that state in the batch queue and the name of  
 105980 the state
  - 105981 • The type of batch queue (execution or routing)
  - 105982 • Additional implementation-defined information, if any, about the batch queue
- 105983 If the operands presented to the *qstat* utility are batch server names, the **-B** option is specified,  
 105984 and the **-f** option is not specified, the *qstat* utility shall display the following items on a single  
 105985 line, in the stated order, with white space between each item, for each successfully processed  
 105986 operand:
- 105987 • The batch server name
  - 105988 • The maximum number of batch jobs that shall be run in the batch queue concurrently
  - 105989 • The total number of batch jobs managed by the batch server
  - 105990 • The status of the batch server
  - 105991 • For each state, the number of batch jobs in that state and the name of the state
- 105992 If the operands presented to the *qstat* utility are server names, the **-B** option is specified, and the  
 105993 **-f** option is specified, the *qstat* utility shall display the following items for each successfully

105994 processed operand:

- 105995 • The server name
- 105996 • The maximum number of batch jobs that shall be run in the batch queue concurrently
- 105997 • The total number of batch jobs managed by the server
- 105998 • The status of the server
- 105999 • For each state, the number of batch jobs in that state and the name of the state
- 106000 • Additional implementation-defined information, if any, about the server

106001 **STDERR**

106002 The standard error shall be used only for diagnostic messages.

106003 **OUTPUT FILES**

106004 None.

106005 **EXTENDED DESCRIPTION**

106006 None.

106007 **EXIT STATUS**

106008 The following exit values shall be returned:

106009 0 Successful completion.

106010 >0 An error occurred.

106011 **CONSEQUENCES OF ERRORS**

106012 In addition to the default behavior, the *qstat* utility shall not be required to write a diagnostic

106013 message to standard error when the error reply received from a batch server indicates that the

106014 batch *job\_identifier* does not exist on the server. Whether or not the *qstat* utility waits to output

106015 the diagnostic message while attempting to locate the batch job on other servers is

106016 implementation-defined.

106017 **APPLICATION USAGE**

106018 None.

106019 **EXAMPLES**

106020 None.

106021 **RATIONALE**

106022 The *qstat* utility allows users to display the status of jobs and list the batch jobs in queues.

106023 The operands of the *qstat* utility may be either job identifiers, queues (specified as destination

106024 identifiers), or batch server names. The **-Q** and **-B** options, or absence thereof, indicate the

106025 nature of the operands.

106026 The other options of the *qstat* utility allow the user to control the amount of information

106027 displayed and the format in which it is displayed. Should a user wish to display the status of a

106028 set of jobs that match a selection criteria, the *qselect* utility may be used to acquire such a list.

106029 The **-f** option allows users to request a “full” display in an implementation-defined format.

106030 Historically, the *qstat* utility has been a part of the NQS and its derivatives, the existing practice

106031 on which it is based.

106032 **FUTURE DIRECTIONS**

106033       The *qstat* utility may be removed in a future version.

106034 **SEE ALSO**

106035       [Chapter 3](#) (on page 2417), [qselect](#)

106036       XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

106037 **CHANGE HISTORY**

106038       Derived from IEEE Std 1003.2d-1994.

106039 **Issue 6**

106040       IEEE PASC Interpretation 1003.2 #191 is applied, removing the following ENVIRONMENT  
106041       VARIABLES listed as affecting *qstat*: *COLUMNS*, *LINES*, *LOGNAME*, *TERM*, and *TZ*.

106042       The *LC\_TIME* entry is also removed from the ENVIRONMENT VARIABLES section.

106043 **Issue 7**

106044       The *qstat* utility is marked obsolescent.

106045       SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

106046 **NAME**

106047       qsub — submit a script

106048 **SYNOPSIS**

```

106049 OB BE  qsub [-a date_time] [-A account_string] [-c interval]
106050          [-C directive_prefix] [-e path_name] [-h] [-j join_list]
106051          [-k keep_list] [-m mail_options] [-M mail_list] [-N name]
106052          [-o path_name] [-p priority] [-q destination] [-r y|n]
106053          [-S path_name_list] [-u user_list] [-v variable_list] [-V]
106054          [-z] [script]

```

106055 **DESCRIPTION**

106056       To submit a script is to create a batch job that executes the script. A script is submitted by a  
 106057       request to a batch server. The *qsub* utility is a user-accessible batch client that submits a script.

106058       Upon successful completion, the *qsub* utility shall have created a batch job that will execute the  
 106059       submitted script.

106060       The *qsub* utility shall submit a script by sending a *Queue Job Request* to a batch server.

106061       The *qsub* utility shall place the value of the following environment variables in the *Variable\_List*  
 106062       attribute of the batch job: *HOME*, *LANG*, *LOGNAME*, *PATH*, *MAIL*, *SHELL*, and *TZ*. The name  
 106063       of the environment variable shall be the current name prefixed with the string *PBS\_O\_*.

106064       **Note:**     If the current value of the *HOME* variable in the environment space of the *qsub* utility is  
 106065       */aa/bb/cc*, then *qsub* shall place *PBS\_O\_HOME=/aa/bb/cc* in the *Variable\_List* attribute of the  
 106066       batch job.

106067       In addition to the variables described above, the *qsub* utility shall add the following variables  
 106068       with the indicated values to the variable list:

106069       *PBS\_O\_WORKDIR*   The absolute path of the current working directory of the *qsub* utility  
 106070       process.

106071       *PBS\_O\_HOST*     The name of the host on which the *qsub* utility is running.

106072 **OPTIONS**

106073       The *qsub* utility shall conform to XBD [Section 12.2](#) (on page 216).

106074       The following options shall be supported by the implementation:

106075       **-a date\_time**   Define the time at which a batch job becomes eligible for execution.

106076                       The *qsub* utility shall accept an option-argument that conforms to the syntax of the  
 106077       *time* operand of the *touch* utility.

106078

**Table 4-19** Environment Variable Values (Utilities)

106079

106080

106081

106082

106083

106084

106085

106086

106087

106088

| Variable Name        | Value at qsub Time        |
|----------------------|---------------------------|
| <i>PBS_O_HOME</i>    | <i>HOME</i>               |
| <i>PBS_O_HOST</i>    | Client host name          |
| <i>PBS_O_LANG</i>    | <i>LANG</i>               |
| <i>PBS_O_LOGNAME</i> | <i>LOGNAME</i>            |
| <i>PBS_O_PATH</i>    | <i>PATH</i>               |
| <i>PBS_O_MAIL</i>    | <i>MAIL</i>               |
| <i>PBS_O_SHELL</i>   | <i>SHELL</i>              |
| <i>PBS_O_TZ</i>      | <i>TZ</i>                 |
| <i>PBS_O_WORKDIR</i> | Current working directory |

106089

106090

**Note:** The server that initiates execution of the batch job will add other variables to the batch job's environment; see [Section 3.2.2.1](#) (on page 2423).

106091

106092

106093

106094

The *qsub* utility shall set the *Execution\_Time* attribute of the batch job to the number of seconds since the Epoch that is equivalent to the local time expressed by the value of the *date\_time* option-argument. The Epoch is defined in XBD [Section 3.150](#) (on page 57).

106095

106096

106097

If the *-a* option is not presented to the *qsub* utility, the utility shall set the *Execution\_Time* attribute of the batch job to a time (number of seconds since the Epoch) that is earlier than the time at which the utility exits.

106098

*-A account\_string*

106099

106100

Define the account to which the resource consumption of the batch job should be charged.

106101

The syntax of the *account\_string* option-argument is unspecified.

106102

106103

The *qsub* utility shall set the *Account\_Name* attribute of the batch job to the value of the *account\_string* option-argument.

106104

106105

If the *-A* option is not presented to the *qsub* utility, the utility shall omit the *Account\_Name* attribute from the attributes of the batch job.

106106

*-c interval*

Define whether the batch job should be checkpointed, and if so, how often.

106107

106108

The *qsub* utility shall accept a value for the interval option-argument that is one of the following:

106109

106110

*n* No checkpointing shall be performed on the batch job (NO\_CHECKPOINT).

106111

106112

*s* Checkpointing shall be performed only when the batch server is shut down (CHECKPOINT\_AT\_SHUTDOWN).

106113

106114

106115

*c* Automatic periodic checkpointing shall be performed at the *Minimum\_Cpu\_Interval* attribute of the batch queue, in units of CPU minutes (CHECKPOINT\_AT\_MIN\_CPU\_INTERVAL).

106116

106117

106118

106119

*c=minutes* Automatic periodic checkpointing shall be performed every *minutes* of CPU time, or every *Minimum\_Cpu\_Interval* minutes, whichever is greater. The *minutes* argument shall conform to the syntax for unsigned integers and shall be greater than zero.

106120

The *qsub* utility shall set the *Checkpoint* attribute of the batch job to the value of the

106121 *interval* option-argument.

106122 If the `-c` option is not presented to the *qsub* utility, the utility shall set the *Checkpoint*  
 106123 attribute of the batch job to the single character 'u'  
 106124 (CHECKPOINT\_UNSPECIFIED).

106125 **-C** *directive\_prefix*  
 106126 Define the prefix that declares a directive to the *qsub* utility within the script.

106127 The *directive\_prefix* is not a batch job attribute; it affects the behavior of the *qsub*  
 106128 utility.

106129 If the `-C` option is presented to the *qsub* utility, and the value of the *directive\_prefix*  
 106130 option-argument is the null string, the utility shall not scan the script file for  
 106131 directives. If the `-C` option is not presented to the *qsub* utility, then the value of the  
 106132 *PBS\_DPREFIX* environment variable is used. If the environment variable is not  
 106133 defined, then #PBS encoded in the portable character set is the default.

106134 **-e** *path\_name*  
 106135 Define the path to be used for the standard error stream of the batch job.

106136 The *qsub* utility shall accept a *path\_name* option-argument which can be preceded  
 106137 by a host name element of the form *hostname:*.

106138 If the *path\_name* option-argument constitutes an absolute pathname, the *qsub* utility  
 106139 shall set the *Error\_Path* attribute of the batch job to the value of the *path\_name*  
 106140 option-argument.

106141 If the *path\_name* option-argument constitutes a relative pathname and no host  
 106142 name element is specified, the *qsub* utility shall set the *Error\_Path* attribute of the  
 106143 batch job to the value of the absolute pathname derived by expanding the  
 106144 *path\_name* option-argument relative to the current directory of the process  
 106145 executing *qsub*.

106146 If the *path\_name* option-argument constitutes a relative pathname and a host name  
 106147 element is specified, the *qsub* utility shall set the *Error\_Path* attribute of the batch  
 106148 job to the value of the *path\_name* option-argument without expansion. The host  
 106149 name element shall be included.

106150 If the *path\_name* option-argument does not include a host name element, the *qsub*  
 106151 utility shall prefix the pathname with *hostname:*, where *hostname* is the name of the  
 106152 host upon which the *qsub* utility is being executed.

106153 If the `-e` option is not presented to the *qsub* utility, the utility shall set the  
 106154 *Error\_Path* attribute of the batch job to the host name and path of the current  
 106155 directory of the submitting process and the default filename.

106156 The default filename for standard error has the following format:  
 106157 *job\_name.esquence\_number*

106158 **-h** Specify that a USER hold is applied to the batch job.

106159 The *qsub* utility shall set the value of the *Hold\_Types* attribute of the batch job to the  
 106160 value USER.

106161 If the `-h` option is not presented to the *qsub* utility, the utility shall set the  
 106162 *Hold\_Types* attribute of the batch job to the value NO\_HOLD.

106163        **-j** *join\_list*    Define which streams of the batch job are to be merged. The *qsub* **-j** option shall  
 106164                            accept a value for the *join\_list* option-argument that is a string of alphanumeric  
 106165                            characters in the portable character set (see XBD [Section 6.1](#), on page 125).

106166                            The *qsub* utility shall accept a *join\_list* option-argument that consists of one or more  
 106167                            of the characters 'e' and 'o', or the single character 'n'.

106168                            All of the other batch job output streams specified will be merged into the output  
 106169                            stream represented by the character listed first in the *join\_list* option-argument.

106170                            For each unique character in the *join\_list* option-argument, the *qsub* utility shall  
 106171                            add a value to the *Join\_Path* attribute of the batch job as follows, each representing  
 106172                            a different batch job stream to join:

106173                            e    The standard error of the batch job (JOIN\_STD\_ERROR).  
 106174                            o    The standard output of the batch job (JOIN\_STD\_OUTPUT).

106175                            An existing *Join\_Path* attribute can be cleared by the following join type:

106176                            n    NO\_JOIN

106177                            If 'n' is specified, then no files are joined. The *qsub* utility shall consider it an error  
 106178                            if any join type other than 'n' is combined with join type 'n'.

106179                            Strictly conforming applications shall not repeat any of the characters 'e', 'o', or  
 106180                            'n' within the *join\_list* option-argument. The *qsub* utility shall permit the  
 106181                            repetition of characters, but shall not assign additional meaning to the repeated  
 106182                            characters.

106183                            An implementation may define other join types. The conformance document for an  
 106184                            implementation shall describe any additional batch job streams, how they are  
 106185                            specified, their internal behavior, and how they affect the behavior of the utility.

106186                            If the **-j** option is not presented to the *qsub* utility, the utility shall set the value of  
 106187                            the *Join\_Path* attribute of the batch job to NO\_JOIN.

106188        **-k** *keep\_list*    Define which output of the batch job to retain on the execution host.

106189                            The *qsub* **-k** option shall accept a value for the *keep\_list* option-argument that is a  
 106190                            string of alphanumeric characters in the portable character set (see XBD [Section](#)  
 106191                            [6.1](#), on page 125).

106192                            The *qsub* utility shall accept a *keep\_list* option-argument that consists of one or  
 106193                            more of the characters 'e' and 'o', or the single character 'n'.

106194                            For each unique character in the *keep\_list* option-argument, the *qsub* utility shall  
 106195                            add a value to the *Keep\_Files* attribute of the batch job as follows, each representing  
 106196                            a different batch job stream to keep:

106197                            e    The standard error of the batch job (KEEP\_STD\_ERROR).  
 106198                            o    The standard output of the batch job (KEEP\_STD\_OUTPUT).

106199                            If both 'e' and 'o' are specified, then both files are retained. An existing  
 106200                            *Keep\_Files* attribute can be cleared by the following keep type:

106201                            n    NO\_KEEP

106202                            If 'n' is specified, then no files are retained. The *qsub* utility shall consider it an  
 106203                            error if any keep type other than 'n' is combined with keep type 'n'.

106204 Strictly conforming applications shall not repeat any of the characters 'e', 'o', or  
 106205 'n' within the *keep\_list* option-argument. The *qsub* utility shall permit the  
 106206 repetition of characters, but shall not assign additional meaning to the repeated  
 106207 characters.

106208 An implementation may define other keep types. The conformance document for  
 106209 an implementation shall describe any additional keep types, how they are  
 106210 specified, their internal behavior, and how they affect the behavior of the utility. If  
 106211 the **-k** option is not presented to the *qsub* utility, the utility shall set the *Keep\_Files*  
 106212 attribute of the batch job to the value NO\_KEEP.

106213 **-m** *mail\_options*

106214 Define the points in the execution of the batch job at which the batch server that  
 106215 manages the batch job shall send mail about a change in the state of the batch job.

106216 The *qsub* **-m** option shall accept a value for the *mail\_options* option-argument that  
 106217 is a string of alphanumeric characters in the portable character set (see XBD [Section](#)  
 106218 [6.1](#), on page 125).

106219 The *qsub* utility shall accept a value for the *mail\_options* option-argument that is a  
 106220 string of one or more of the characters 'e', 'b', and 'a', or the single character  
 106221 'n'.

106222 For each unique character in the *mail\_options* option-argument, the *qsub* utility shall  
 106223 add a value to the *Mail\_Users* attribute of the batch job as follows, each  
 106224 representing a different time during the life of a batch job at which to send mail:

106225 e MAIL\_AT\_EXIT

106226 b MAIL\_AT\_BEGINNING

106227 a MAIL\_AT\_ABORT

106228 If any of these characters are duplicated in the *mail\_options* option-argument, the  
 106229 duplicates shall be ignored.

106230 An existing *Mail\_Points* attribute can be cleared by the following mail type:

106231 n NO\_MAIL

106232 If 'n' is specified, then mail is not sent. The *qsub* utility shall consider it an error if  
 106233 any mail type other than 'n' is combined with mail type 'n'.

106234 Strictly conforming applications shall not repeat any of the characters 'e', 'b',  
 106235 'a', or 'n' within the *mail\_options* option-argument.

106236 The *qsub* utility shall permit the repetition of characters, but shall not assign  
 106237 additional meaning to the repeated characters. An implementation may define  
 106238 other mail types. The conformance document for an implementation shall describe  
 106239 any additional mail types, how they are specified, their internal behavior, and how  
 106240 they affect the behavior of the utility.

106241 If the **-m** option is not presented to the *qsub* utility, the utility shall set the  
 106242 *Mail\_Points* attribute to the value MAIL\_AT\_ABORT.

106243 **-M** *mail\_list* Define the list of users to which a batch server that executes the batch job shall  
 106244 send mail, if the server sends mail about the batch job.

106245 The syntax of the *mail\_list* option-argument is unspecified.

106246 If the implementation of the *qsub* utility uses a name service to locate users, the

utility should accept the syntax used by the name service.

If the implementation of the *qsub* utility does not use a name service to locate users, the implementation should accept the following syntax for user names:

*mail\_address*[ , , *mail\_address* , , . . . ]

The interpretation of *mail\_address* is implementation-defined.

The *qsub* utility shall set the *Mail\_Users* attribute of the batch job to the value of the *mail\_list* option-argument.

If the **-M** option is not presented to the *qsub* utility, the utility shall place only the user name and host name for the current process in the *Mail\_Users* attribute of the batch job.

**-N name** Define the name of the batch job.

The *qsub* **-N** option shall accept a value for the *name* option-argument that is a string of up to 15 alphanumeric characters in the portable character set (see XBD Section 6.1, on page 125) where the first character is alphabetic.

The *qsub* utility shall set the value of the *Job\_Name* attribute of the batch job to the value of the *name* option-argument.

If the **-N** option is not presented to the *qsub* utility, the utility shall set the *Job\_Name* attribute of the batch job to the name of the *script* argument from which the directory specification if any, has been removed.

If the **-N** option is not presented to the *qsub* utility, and the script is read from standard input, the utility shall set the *Job\_Name* attribute of the batch job to the value STDIN.

**-o path\_name**

Define the path for the standard output of the batch job.

The *qsub* utility shall accept a *path\_name* option-argument that conforms to the syntax of the *path\_name* element defined in the System Interfaces volume of POSIX.1-2008, which can be preceded by a host name element of the form *hostname*..

If the *path\_name* option-argument constitutes an absolute pathname, the *qsub* utility shall set the *Output\_Path* attribute of the batch job to the value of the *path\_name* option-argument without expansion.

If the *path\_name* option-argument constitutes a relative pathname and no host name element is specified, the *qsub* utility shall set the *Output\_Path* attribute of the batch job to the pathname derived by expanding the value of the *path\_name* option-argument relative to the current directory of the process executing the *qsub*.

If the *path\_name* option-argument constitutes a relative pathname and a host name element is specified, the *qsub* utility shall set the *Output\_Path* attribute of the batch job to the value of the *path\_name* option-argument without expansion.

If the *path\_name* option-argument does not specify a host name element, the *qsub* utility shall prefix the pathname with *hostname*., where *hostname* is the name of the host upon which the *qsub* utility is executing.

If the **-o** option is not presented to the *qsub* utility, the utility shall set the *Output\_Path* attribute of the batch job to the host name and path of the current

|        |                          |                                                                                                                                                                                                                                      |
|--------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 106290 |                          | directory of the submitting process and the default filename.                                                                                                                                                                        |
| 106291 |                          | The default filename for standard output has the following format:                                                                                                                                                                   |
| 106292 |                          | <i>job_name.osequence_number</i>                                                                                                                                                                                                     |
| 106293 | <b>-p priority</b>       | Define the priority the batch job should have relative to other batch jobs owned by the batch server.                                                                                                                                |
| 106294 |                          |                                                                                                                                                                                                                                      |
| 106295 |                          | The <i>qsub</i> utility shall set the <i>Priority</i> attribute of the batch job to the value of the <i>priority</i> option-argument.                                                                                                |
| 106296 |                          |                                                                                                                                                                                                                                      |
| 106297 |                          | If the <b>-p</b> option is not presented to the <i>qsub</i> utility, the value of the <i>Priority</i> attribute is implementation-defined.                                                                                           |
| 106298 |                          |                                                                                                                                                                                                                                      |
| 106299 |                          | The <i>qsub</i> utility shall accept a value for the <i>priority</i> option-argument that conforms to the syntax for signed decimal integers, and which is not less than -1 024 and not greater than 1 023.                          |
| 106300 |                          |                                                                                                                                                                                                                                      |
| 106301 |                          |                                                                                                                                                                                                                                      |
| 106302 | <b>-q destination</b>    | Define the destination of the batch job.                                                                                                                                                                                             |
| 106303 |                          |                                                                                                                                                                                                                                      |
| 106304 |                          | The destination is not a batch job attribute; it determines the batch server, and possibly the batch queue, to which the <i>qsub</i> utility batch queues the batch job.                                                             |
| 106305 |                          |                                                                                                                                                                                                                                      |
| 106306 |                          | The <i>qsub</i> utility shall submit the script to the batch server named by the <i>destination</i> option-argument or the server that owns the batch queue named in the <i>destination</i> option-argument.                         |
| 106307 |                          |                                                                                                                                                                                                                                      |
| 106308 |                          |                                                                                                                                                                                                                                      |
| 106309 |                          | The <i>qsub</i> utility shall accept an option-argument for the <b>-q</b> option that conforms to the syntax for a destination (see <a href="#">Section 3.3.2</a> , on page 2440).                                                   |
| 106310 |                          |                                                                                                                                                                                                                                      |
| 106311 |                          | If the <b>-q</b> option is not presented to the <i>qsub</i> utility, the <i>qsub</i> utility shall submit the batch job to the default destination. The mechanism for determining the default destination is implementation-defined. |
| 106312 |                          |                                                                                                                                                                                                                                      |
| 106313 |                          |                                                                                                                                                                                                                                      |
| 106314 | <b>-r y   n</b>          | Define whether the batch job is rerunnable.                                                                                                                                                                                          |
| 106315 |                          | If the value of the option-argument is <i>y</i> , the <i>qsub</i> utility shall set the <i>Rerunable</i> attribute of the batch job to TRUE.                                                                                         |
| 106316 |                          |                                                                                                                                                                                                                                      |
| 106317 |                          | If the value of the option-argument is <i>n</i> , the <i>qsub</i> utility shall set the <i>Rerunable</i> attribute of the batch job to FALSE.                                                                                        |
| 106318 |                          |                                                                                                                                                                                                                                      |
| 106319 |                          | If the <b>-r</b> option is not presented to the <i>qsub</i> utility, the utility shall set the <i>Rerunable</i> attribute of the batch job to TRUE.                                                                                  |
| 106320 |                          |                                                                                                                                                                                                                                      |
| 106321 | <b>-S path_name_list</b> | Define the pathname to the shell under which the batch job is to execute.                                                                                                                                                            |
| 106322 |                          |                                                                                                                                                                                                                                      |
| 106323 |                          | The <i>qsub</i> utility shall accept a <i>path_name_list</i> option-argument that conforms to the following syntax:                                                                                                                  |
| 106324 |                          |                                                                                                                                                                                                                                      |
| 106325 |                          | <i>pathname</i> [ <i>@host</i> ][ <i>,</i> <i>,</i> <i>pathname</i> [ <i>@host</i> ] <i>,</i> <i>,</i> . . . ]                                                                                                                       |
| 106326 |                          | The <i>qsub</i> utility shall allow only one pathname for a given host name. The <i>qsub</i> utility shall allow only one pathname that is missing a corresponding host name.                                                        |
| 106327 |                          |                                                                                                                                                                                                                                      |
| 106328 |                          | The <i>qsub</i> utility shall add a value to the <i>Shell_Path_List</i> attribute of the batch job for each entry in the <i>path_name_list</i> option-argument.                                                                      |
| 106329 |                          |                                                                                                                                                                                                                                      |
| 106330 |                          | If the <b>-S</b> option is not presented to the <i>qsub</i> utility, the utility shall set the                                                                                                                                       |

106331 *Shell\_Path\_List* attribute of the batch job to the null string.

106332 The conformance document for an implementation shall describe the mechanism  
 106333 used to set the default shell and determine the current value of the default shell.  
 106334 An implementation shall provide a means for the installation to set the default  
 106335 shell to the login shell of the user under which the batch job is to execute. See  
 106336 [Section 3.3.3](#) (on page 2441) for a means of removing *keyword=value* (and  
 106337 *value@keyword*) pairs and other general rules for list-oriented batch job attributes.

106338 **-u *user\_list*** Define the user name under which the batch job is to execute.

106339 The *qsub* utility shall accept a *user\_list* option-argument that conforms to the  
 106340 following syntax:

106341 *username[@host][, ,username[@host], , ...]*

106342 The *qsub* utility shall accept only one user name that is missing a corresponding  
 106343 host name. The *qsub* utility shall accept only one user name per named host.

106344 The *qsub* utility shall add a value to the *User\_List* attribute of the batch job for each  
 106345 entry in the *user\_list* option-argument.

106346 If the **-u** option is not presented to the *qsub* utility, the utility shall set the *User\_List*  
 106347 attribute of the batch job to the user name from which the utility is executing. See  
 106348 [Section 3.3.3](#) (on page 2441) for a means of removing *keyword=value* (and  
 106349 *value@keyword*) pairs and other general rules for list-oriented batch job attributes.

106350 **-v *variable\_list***

106351 Add to the list of variables that are exported to the session leader of the batch job.

106352 A *variable\_list* is a set of strings of either the form *<variable>* or *<variable=value>*,  
 106353 delimited by *<comma>* characters.

106354 If the **-v** option is presented to the *qsub* utility, the utility shall also add, to the  
 106355 environment *Variable\_List* attribute of the batch job, every variable named in the  
 106356 environment *variable\_list* option-argument and, optionally, values of specified  
 106357 variables.

106358 If a value is not provided on the command line, the *qsub* utility shall set the value  
 106359 of each variable in the environment *Variable\_List* attribute of the batch job to the  
 106360 value of the corresponding environment variable for the process in which the  
 106361 utility is executing; see [Table 4-19](#) (on page 3168).

106362 A conforming application shall not repeat a variable in the environment  
 106363 *variable\_list* option-argument.

106364 The *qsub* utility shall not repeat a variable in the environment *Variable\_List* attribute  
 106365 of the batch job. See [Section 3.3.3](#) (on page 2441) for a means of removing  
 106366 *keyword=value* (and *value@keyword*) pairs and other general rules for list-oriented  
 106367 batch job attributes.

106368 **-V** Specify that all of the environment variables of the process are exported to the  
 106369 context of the batch job.

106370 The *qsub* utility shall place every environment variable in the process in which the  
 106371 utility is executing in the list and shall set the value of each variable in the attribute  
 106372 to the value of that variable in the process.

106373            **-z**            Specify that the utility does not write the batch *job\_identifier* of the created batch job  
106374            to standard output.

106375            If the **-z** option is presented to the *qsub* utility, the utility shall not write the batch  
106376            *job\_identifier* of the created batch job to standard output.

106377            If the **-z** option is not presented to the *qsub* utility, the utility shall write the  
106378            identifier of the created batch job to standard output.

#### 106379 OPERANDS

106380            The *qsub* utility shall accept a *script* operand that indicates the path to the script of the batch job.

106381            If the *script* operand is not presented to the *qsub* utility, or if the operand is the single-character  
106382            string *'-'*, the utility shall read the script from standard input.

106383            If the script represents a partial path, the *qsub* utility shall expand the path relative to the current  
106384            directory of the process executing the utility.

#### 106385 STDIN

106386            The *qsub* utility reads the script of the batch job from standard input if the script operand is  
106387            omitted or is the single character *'-'*.

#### 106388 INPUT FILES

106389            In addition to binding the file indicated by the *script* operand to the batch job, the *qsub* utility  
106390            reads the script file and acts on directives in the script.

#### 106391 ENVIRONMENT VARIABLES

106392            The following environment variables shall affect the execution of *qsub*:

106393            *LANG*            Provide a default value for the internationalization variables that are unset or null.  
106394            (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
106395            used to determine the values of locale categories.)

106396            *LC\_ALL*            If set to a non-empty string value, override the values of all the other  
106397            internationalization variables.

106398            *LC\_CTYPE*          Determine the locale for the interpretation of sequences of bytes of text data as  
106399            characters (for example, single-byte as opposed to multi-byte characters in  
106400            arguments).

106401            *LC\_MESSAGES*

106402            Determine the locale that should be used to affect the format and contents of  
106403            diagnostic messages written to standard error.

106404            *LOGNAME*          Determine the login name of the user.

106405            *PBS\_DPREFIX*

106406            Determine the default prefix for directives within the script.

106407            *SHELL*            Determine the pathname of the preferred command language interpreter of the  
106408            user.

106409            *TZ*                Determine the timezone used to interpret the *date-time* option-argument. If *TZ* is  
106410            unset or null, an unspecified default timezone shall be used.

#### 106411 ASYNCHRONOUS EVENTS

106412            Once created, a batch job exists until it exits, aborts, or is deleted.

106413            After a batch job is created by the *qsub* utility, batch servers might route, execute, modify, or  
106414            delete the batch job.

106415 **STDOUT**

106416 The *qsub* utility writes the batch *job\_identifier* assigned to the batch job to standard output, unless  
106417 the **-z** option is specified.

106418 **STDERR**

106419 The standard error shall be used only for diagnostic messages.

106420 **OUTPUT FILES**

106421 None.

106422 **EXTENDED DESCRIPTION**106423 **Script Preservation**

106424 The *qsub* utility shall make the script available to the server executing the batch job in such a  
106425 way that the server executes the script as it exists at the time of submission.

106426 The *qsub* utility can send a copy of the script to the server with the *Queue Job Request* or store a  
106427 temporary copy of the script in a location specified to the server.

106428 **Option Specification**

106429 A script can contain directives to the *qsub* utility.

106430 The *qsub* utility shall scan the lines of the script for directives, skipping blank lines, until the first  
106431 line that begins with a string other than the directive string; if directives occur on subsequent  
106432 lines, the utility shall ignore those directives.

106433 Lines are separated by a <newline>. If the first line of the script begins with "#!" or a <colon>  
106434 (' : '), then it is skipped. The *qsub* utility shall process a line in the script as a directive if and  
106435 only if the string of characters from the first non-white-space character on the line until the first  
106436 <space> or <tab> on the line match the directive prefix. If a line in the script contains a directive  
106437 and the final characters of the line are <backslash> and <newline>, then the next line shall be  
106438 interpreted as a continuation of that directive.

106439 The *qsub* utility shall process the options and option-arguments contained on the directive prefix  
106440 line using the same syntax as if the options were input on the *qsub* utility.

106441 The *qsub* utility shall continue to process a directive prefix line until after a <newline> is  
106442 encountered. An implementation may ignore lines which, according to the syntax of the shell  
106443 that will interpret the script, are comments. An implementation shall describe in the  
106444 conformance document the format of any shell comments that it will recognize.

106445 If an option is present in both a directive and the arguments to the *qsub* utility, the utility shall  
106446 ignore the option and the corresponding option-argument, if any, in the directive.

106447 If an option that is present in the directive is not present in the arguments to the *qsub* utility, the  
106448 utility shall process the option and the option-argument, if any.

106449 In order of preference, the *qsub* utility shall select the directive prefix from one of the following  
106450 sources:

- 106451 • If the **-C** option is presented to the utility, the value of the *directive\_prefix* option-argument
- 106452 • If the environment variable *PBS\_DPPREFIX* is defined, the value of that variable
- 106453 • The four-character string "#PBS" encoded in the portable character set

106454 If the **-C** option is present in the script file it shall be ignored.

**106455 EXIT STATUS**

106456 The following exit values shall be returned:

106457 0 Successful completion.

106458 >0 An error occurred.

**106459 CONSEQUENCES OF ERRORS**

106460 Default.

**106461 APPLICATION USAGE**

106462 None.

**106463 EXAMPLES**

106464 None.

**106465 RATIONALE**

106466 The *qsub* utility allows users to create a batch job that will process the script specified as the  
106467 operand of the utility.

106468 The options of the *qsub* utility allow users to control many aspects of the queuing and execution  
106469 of a batch job.

106470 The **-a** option allows users to designate the time after which the batch job will become eligible to  
106471 run. By specifying an execution time, users can take advantage of resources at off-peak hours,  
106472 synchronize jobs with chronologically predictable events, and perhaps take advantage of off-  
106473 peak pricing of computing time. For these reasons and others, a timing option is existing  
106474 practice on the part of almost every batch system, including NQS.

106475 The **-A** option allows users to specify the account that will be charged for the batch job. Support  
106476 for account is not mandatory for conforming batch servers.

106477 The **-C** option allows users to prescribe the prefix for directives within the script file. The default  
106478 prefix "**#PBS**" may be inappropriate if the script will be interpreted with an alternate shell, as  
106479 specified by the **-S** option.

106480 The **-c** option allows users to establish the checkpointing interval for their jobs. A checkpointing  
106481 system, which is not defined by this volume of POSIX.1-2008, allows recovery of a batch job at  
106482 the most recent checkpoint in the event of a crash. Checkpointing is typically used for jobs that  
106483 consume expensive computing time or must meet a critical schedule. Users should be allowed to  
106484 make the tradeoff between the overhead of checkpointing and the risk to the timely completion  
106485 of the batch job; therefore, this volume of POSIX.1-2008 provides the checkpointing interval  
106486 option. Support for checkpointing is optional for batch servers.

106487 The **-e** option allows users to redirect the standard error streams of their jobs to a non-default  
106488 path. For example, if the submitted script generally produces a great deal of useless error  
106489 output, a user might redirect the standard error output to the null device. Or, if the file system  
106490 holding the default location (the home directory of the user) has too little free space, the user  
106491 might redirect the standard error stream to a file in another file system.

106492 The **-h** option allows users to create a batch job that is held until explicitly released. The ability  
106493 to create a held job is useful when some external event must complete before the batch job can  
106494 execute. For example, the user might submit a held job and release it when the system load has  
106495 dropped.

106496 The **-j** option allows users to merge the standard error of a batch job into its standard output  
106497 stream, which has the advantage of showing the sequential relationship between output and  
106498 error messages.

The **-m** option allows users to designate those points in the execution of a batch job at which mail will be sent to the submitting user, or to the account(s) indicated by the **-M** option. By requesting mail notification at points of interest in the life of a job, the submitting user, or other designated users, can track the progress of a batch job.

The **-N** option allows users to associate a name with the batch job. The job name in no way affects the processing of the batch job, but rather serves as a mnemonic handle for users. For example, the batch job name can help the user distinguish between multiple jobs listed by the *qstat* utility.

The **-o** option allows users to redirect the standard output stream. A user might, for example, wish to redirect to the null device the standard output stream of a job that produces copious yet superfluous output.

The **-P** option allows users to designate the relative priority of a batch job for selection from a queue.

The **-q** option allows users to specify an initial queue for the batch job. If the user specifies a routing queue, the batch server routes the batch job to another queue for execution or further routing. If the user specifies a non-routing queue, the batch server of the queue eventually executes the batch job.

The **-r** option allows users to control whether the submitted job will be rerun if the controlling batch node fails during execution of the batch job. The **-r** option likewise allows users to indicate whether or not the batch job is eligible to be rerun by the *qrerun* utility. Some jobs cannot be correctly rerun because of changes they make in the state of databases or other aspects of their environment. This volume of POSIX.1-2008 specifies that the default, if the **-r** option is not presented to the utility, will be that the batch job cannot be rerun, since the result of rerunning a non-rerunnable job might be catastrophic.

The **-S** option allows users to specify the program (usually a shell) that will be invoked to process the script of the batch job. This option has been modified to allow a list of shell names and locations associated with different hosts.

The **-u** option is useful when the submitting user is authorized to use more than one account on a given host, in which case the **-u** option allows the user to select from among those accounts. The option-argument is a list of user-host pairs, so that the submitting user can provide different user identifiers for different nodes in the event the batch job is routed. The **-u** option provides a lot of flexibility to accommodate sites with complex account structures. Users that have the same user identifier on all the hosts they are authorized to use will not need to use the **-u** option.

The **-V** option allows users to export all their current environment variables, as of the time the batch job is submitted, to the context of the processes of the batch job.

The **-v** option allows users to export specific environment variables from their current process to the processes of the batch job.

The **-z** option allows users to suppress the writing of the batch job identifier to standard output. The **-z** option is an existing NQS practice that has been standardized.

Historically, the *qsub* utility has served the batch job-submission function in the NQS system, the existing practice on which it is based. Some changes and additions have been made to the *qsub* utility in this volume of POSIX.1-2008, *vis-a-vis* NQS, as a result of the growing pool of experience with distributed batch systems.

The set of features of the *qsub* utility as defined in this volume of POSIX.1-2008 appears to incorporate all the common existing practice on potentially conforming platforms.

106544 **FUTURE DIRECTIONS**

106545       The *qsub* utility may be removed in a future version.

106546 **SEE ALSO**

106547       Chapter 3 (on page 2417), *qrerun*, *qstat*, *touch*

106548       XBD Section 3.150 (on page 57), Section 6.1 (on page 125), Chapter 8 (on page 173), Section 12.2  
106549       (on page 216)

106550 **CHANGE HISTORY**

106551       Derived from IEEE Std 1003.2d-1994.

106552 **Issue 6**

106553       The *-I* option has been removed as there is no portable description of the resources that are  
106554       allowed or required by the batch job.

106555 **Issue 7**

106556       The *qsub* utility is marked obsolescent.

106557       SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

106558 **NAME**106559 `read` — read from standard input into shell variables |106560 **SYNOPSIS**106561 `read [-r] var...`106562 **DESCRIPTION**106563 The *read* utility shall read a single logical line from standard input into one or more shell |  
106564 variables.106565 By default, unless the `-r` option is specified, `<backslash>` shall act as an escape character. An  
106566 unescaped `<backslash>` shall preserve the literal value of the following character, with the  
106567 exception of a `<newline>`. If a `<newline>` follows the `<backslash>`, the *read* utility shall interpret  
106568 this as line continuation. The `<backslash>` and `<newline>` shall be removed before splitting the  
106569 input into fields. All other unescaped `<backslash>` characters shall be removed after splitting the  
106570 input into fields.106571 If standard input is a terminal device and the invoking shell is interactive, *read* shall prompt for a  
106572 continuation line when it reads an input line ending with a `<backslash>` `<newline>`, unless the  
106573 `-r` option is specified.106574 The terminating `<newline>` (if any) shall be removed from the input and the results shall be split  
106575 into fields as in the shell for the results of parameter expansion (see [Section 2.6.5](#), on page 2349);  
106576 the first field shall be assigned to the first variable *var*, the second field to the second variable  
106577 *var*, and so on. If there are fewer fields than there are *var* operands, the remaining *vars* shall be  
106578 set to empty strings. If there are fewer *vars* than fields, the last *var* shall be set to a value  
106579 comprising the following elements:

- 106580
- The field that corresponds to the last *var* in the normal assignment sequence described  
106581 above
  - The delimiter(s) that follow the field corresponding to the last *var*
  - The remaining fields and their delimiters, with trailing *IFS* white space ignored

106584 The setting of variables specified by the *var* operands shall affect the current shell execution  
106585 environment; see [Section 2.12](#) (on page 2371). If it is called in a subshell or separate utility  
106586 execution environment, such as one of the following:106587 

```
(read foo)
```

  
106588 

```
nohup read ...
```

  
106589 

```
find . -exec read ... \;
```

106590 it shall not affect the shell variables in the caller's environment.

106591 **OPTIONS**106592 The *read* utility shall conform to XBD [Section 12.2](#) (on page 216).

106593 The following option is supported:

106594 `-r` Do not treat a `<backslash>` character in any special way. Consider each  
106595 `<backslash>` to be part of the input line.106596 **OPERANDS**

106597 The following operand shall be supported:

106598 *var* The name of an existing or nonexisting shell variable.

106599 **STDIN**

106600 The standard input shall be a text file.

106601 **INPUT FILES**

106602 None.

106603 **ENVIRONMENT VARIABLES**106604 The following environment variables shall affect the execution of *read*:

106605 *IFS* Determine the internal field separators used to delimit fields; see [Section 2.5.3](#) (on  
106606 page 2341).

106607 *LANG* Provide a default value for the internationalization variables that are unset or null.  
106608 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
106609 variables used to determine the values of locale categories.)

106610 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
106611 internationalization variables.

106612 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
106613 characters (for example, single-byte as opposed to multi-byte characters in  
106614 arguments).

106615 *LC\_MESSAGES*

106616 Determine the locale that should be used to affect the format and contents of  
106617 diagnostic messages written to standard error.

106618 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

106619 *PS2* Provide the prompt string that an interactive shell shall write to standard error  
106620 when a line ending with a <backslash> <newline> is read and the *-r* option was  
106621 not specified.

106622 **ASYNCHRONOUS EVENTS**

106623 Default.

106624 **STDOUT**

106625 Not used.

106626 **STDERR**

106627 The standard error shall be used for diagnostic messages and prompts for continued input.

106628 **OUTPUT FILES**

106629 None.

106630 **EXTENDED DESCRIPTION**

106631 None.

106632 **EXIT STATUS**

106633 The following exit values shall be returned:

106634 0 Successful completion.

106635 &gt;0 End-of-file was detected or an error occurred.

106636 **CONSEQUENCES OF ERRORS**

106637 Default.

**APPLICATION USAGE**

The `-r` option is included to enable *read* to subsume the purpose of the *line* utility, which is not included in POSIX.1-2008.

**EXAMPLES**

The following command:

```
while read -r xx yy
do
    printf "%s %s\n" "$yy" "$xx"
done < input_file
```

prints a file with the first field of each line moved to the end of the line.

**RATIONALE**

The *read* utility historically has been a shell built-in. It was separated off into its own utility to take advantage of the richer description of functionality introduced by this volume of POSIX.1-2008.

Since *read* affects the current shell execution environment, it is generally provided as a shell regular built-in. If it is called in a subshell or separate utility execution environment, such as one of the following:

```
(read foo)
nohup read ...
find . -exec read ... \;
```

it does not affect the shell variables in the environment of the caller.

Although the standard input is required to be a text file, and therefore will always end with a `<newline>` (unless it is an empty file), the processing of continuation lines when the `-r` option is not used can result in the input not ending with a `<newline>`. This occurs if the last line of the input file ends with a `<backslash>` `<newline>`. It is for this reason that “if any” is used in “The terminating `<newline>` (if any) shall be removed from the input” in the description. It is not a relaxation of the requirement for standard input to be a text file.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

[Chapter 2](#) (on page 2335)

XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

**CHANGE HISTORY**

First released in Issue 2.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #194 is applied, clarifying the handling of the `<backslash>` escape character.

SD5-XCU-ERN-126 is applied, clarifying that input lines end with a `<newline>`.

The description of here-documents is removed from the *read* reference page.

106677 **NAME**106678        *renice* — set nice values of running processes106679 **SYNOPSIS**106680        *renice* [-g|-p|-u] -n *increment ID...*106681 **DESCRIPTION**

106682        The *renice* utility shall request that the nice values (see XBD [Section 3.244](#), on page 72) of one or  
 106683        more running processes be changed. By default, the applicable processes are specified by their  
 106684        process IDs. When a process group is specified (see -g), the request shall apply to all processes  
 106685        in the process group.

106686        The nice value shall be bounded in an implementation-defined manner. If the requested  
 106687        *increment* would raise or lower the nice value of the executed utility beyond implementation-  
 106688        defined limits, then the limit whose value was exceeded shall be used.

106689        When a user is *reniced*, the request applies to all processes whose saved set-user-ID matches the  
 106690        user ID corresponding to the user.

106691        Regardless of which options are supplied or any other factor, *renice* shall not alter the nice values  
 106692        of any process unless the user requesting such a change has appropriate privileges to do so for  
 106693        the specified process. If the user lacks appropriate privileges to perform the requested action, the  
 106694        utility shall return an error status.

106695        The saved set-user-ID of the user's process shall be checked instead of its effective user ID when  
 106696        *renice* attempts to determine the user ID of the process in order to determine whether the user  
 106697        has appropriate privileges.

106698 **OPTIONS**106699        The *renice* utility shall conform to XBD [Section 12.2](#) (on page 216), except for Guideline 9.

106700        The following options shall be supported:

106701        -g        Interpret the following operands as unsigned decimal integer process group IDs.

106702        -n *increment* Specify how the nice value of the specified process or processes is to be adjusted.  
 106703        The *increment* option-argument is a positive or negative decimal integer that shall  
 106704        be used to modify the nice value of the specified process or processes.

106705        Positive *increment* values shall cause a lower nice value. Negative *increment* values  
 106706        may require appropriate privileges and shall cause a higher nice value.

106707        -p        Interpret the following operands as unsigned decimal integer process IDs. The -p  
 106708        option is the default if no options are specified.

106709        -u        Interpret the following operands as users. If a user exists with a user name equal to  
 106710        the operand, then the user ID of that user is used in further processing. Otherwise,  
 106711        if the operand represents an unsigned decimal integer, it shall be used as the  
 106712        numeric user ID of the user.

106713 **OPERANDS**

106714        The following operands shall be supported:

106715        ID        A process ID, process group ID, or user name/user ID, depending on the option  
 106716        selected.

106717 **STDIN**

106718        Not used.

106719 **INPUT FILES**

106720 None.

106721 **ENVIRONMENT VARIABLES**106722 The following environment variables shall affect the execution of *renice*:

106723 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 106724 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 106725 variables used to determine the values of locale categories.)

106726 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 106727 internationalization variables.

106728 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 106729 characters (for example, single-byte as opposed to multi-byte characters in  
 106730 arguments).

106731 *LC\_MESSAGES*

106732 Determine the locale that should be used to affect the format and contents of  
 106733 diagnostic messages written to standard error.

106734 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

106735 **ASYNCHRONOUS EVENTS**

106736 Default.

106737 **STDOUT**

106738 Not used.

106739 **STDERR**

106740 The standard error shall be used only for diagnostic messages.

106741 **OUTPUT FILES**

106742 None.

106743 **EXTENDED DESCRIPTION**

106744 None.

106745 **EXIT STATUS**

106746 The following exit values shall be returned:

106747 0 Successful completion.

106748 &gt;0 An error occurred.

106749 **CONSEQUENCES OF ERRORS**

106750 Default.

106751 **APPLICATION USAGE**

106752 None.

106753 **EXAMPLES**

106754 1. Adjust the nice value so that process IDs 987 and 32 would have a lower nice value:

106755 `renice -n 5 -p 987 32`

106756 2. Adjust the nice value so that group IDs 324 and 76 would have a higher nice value, if the  
 106757 user has appropriate privileges to do so:

106758 `renice -n -4 -g 324 76`

3. Adjust the nice value so that numeric user ID 8 and user **sas** would have a lower nice value:

```
renice -n 4 -u 8 sas
```

Useful nice value increments on historical systems include 19 or 20 (the affected processes run only when nothing else in the system attempts to run) and any negative number (to make processes run faster).

#### RATIONALE

The *gid*, *pid*, and *user* specifications do not fit either the definition of operand or option-argument. However, for clarity, they have been included in the OPTIONS section, rather than the OPERANDS section.

The definition of nice value is not intended to suggest that all processes in a system have priorities that are comparable. Scheduling policy extensions such as the realtime priorities in the System Interfaces volume of POSIX.1-2008 make the notion of a single underlying priority for all scheduling policies problematic. Some implementations may implement the *nice*-related features to affect all processes on the system, others to affect just the general time-sharing activities implied by this volume of POSIX.1-2008, and others may have no effect at all. Because of the use of “implementation-defined” in *nice* and *renice*, a wide range of implementation strategies are possible.

Originally, this utility was written in the historical manner, using the term “nice value”. This was always a point of concern with users because it was never intuitively obvious what this meant. With a newer version of *renice*, which used the term “system scheduling priority”, it was hoped that novice users could better understand what this utility was meant to do. Also, it would be easier to document what the utility was meant to do. Unfortunately, the addition of the POSIX realtime scheduling capabilities introduced the concepts of process and thread scheduling priorities that were totally unaffected by the *nice/renice* utilities or the *nice()/setpriority()* functions. Continuing to use the term “system scheduling priority” would have incorrectly suggested that these utilities and functions were indeed affecting these realtime priorities. It was decided to revert to the historical term “nice value” to reference this unrelated process attribute.

Although this utility has use by system administrators (and in fact appears in the system administration portion of the BSD documentation), the standard developers considered that it was very useful for individual end users to control their own processes.

Earlier versions of this standard allowed the following forms in the SYNOPSIS:

```
renice nice_value[-p] pid...[-g gid...][-p pid...][-u user...]  
renice nice_value -g gid...[-g gid...]-p pid...[-u user...]  
renice nice_value -u user...[-g gid...]-p pid...[-u user...]
```

These forms are no longer specified by POSIX.1-2008 but may be present in some implementations.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

*nice*

XBD [Section 3.244](#) (on page 72), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

106802 **CHANGE HISTORY**

106803 First released in Issue 4.

106804 **Issue 5**

106805 In the SYNOPSIS, an ellipsis is added to the **-u** option in all three obsolescent forms.

106806 **Issue 6**

106807 This utility is marked as part of the User Portability Utilities option.

106808 The APPLICATION USAGE section is added.

106809 The obsolescent forms of the SYNOPSIS are removed.

106810 Text previously conditional on POSIX\_SAVED\_IDS is mandatory in this version. This is a FIPS  
106811 requirement.

106812 **Issue 7**

106813 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that Guideline 9 of the Utility  
106814 Syntax Guidelines does not apply.

106815 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

106816 The *renice* utility is moved from the User Portability Utilities option to the Base. User Portability  
106817 Utilities is now an option for interactive utilities.

106818 **NAME**106819 `rm` — remove directory entries106820 **SYNOPSIS**106821 `rm [-iRr] file...` |106822 `rm -f [-iRr] [file...]` |106823 **DESCRIPTION**106824 The *rm* utility shall remove the directory entry specified by each *file* argument.

106825 If either of the files dot or dot-dot are specified as the basename portion of an operand (that is,  
 106826 the final pathname component) or if an operand resolves to the root directory, *rm* shall write a  
 106827 diagnostic message to standard error and do nothing more with such operands.

106828 For each *file* the following steps shall be taken:106829 1. If the *file* does not exist:

106830 a. If the `-f` option is not specified, *rm* shall write a diagnostic message to standard  
 106831 error.

106832 b. Go on to any remaining *files*.106833 2. If *file* is of type directory, the following steps shall be taken:

106834 a. If neither the `-R` option nor the `-r` option is specified, *rm* shall write a diagnostic  
 106835 message to standard error, do nothing more with *file*, and go on to any remaining  
 106836 files.

106837 b. If *file* is an empty directory, *rm* may skip to step 2d. If the `-f` option is not specified, +  
 106838 and either the permissions of *file* do not permit writing and the standard input is a  
 106839 terminal or the `-i` option is specified, *rm* shall write a prompt to standard error and  
 106840 read a line from the standard input. If the response is not affirmative, *rm* shall do  
 106841 nothing more with the current file and go on to any remaining files.

106842 c. For each entry contained in *file*, other than dot or dot-dot, the four steps listed here  
 106843 (1 to 4) shall be taken with the entry as if it were a *file* operand. The *rm* utility shall  
 106844 not traverse directories by following symbolic links into other parts of the  
 106845 hierarchy, but shall remove the links themselves.

106846 d. If the `-i` option is specified, *rm* shall write a prompt to standard error and read a  
 106847 line from the standard input. If the response is not affirmative, *rm* shall do nothing  
 106848 more with the current file, and go on to any remaining files.

106849 3. If *file* is not of type directory, the `-f` option is not specified, and either the permissions of  
 106850 *file* do not permit writing and the standard input is a terminal or the `-i` option is specified,  
 106851 *rm* shall write a prompt to the standard error and read a line from the standard input. If  
 106852 the response is not affirmative, *rm* shall do nothing more with the current file and go on  
 106853 to any remaining files.

106854 4. If the current file is a directory, *rm* shall perform actions equivalent to the *rmdir()* function  
 106855 defined in the System Interfaces volume of POSIX.1-2008 called with a pathname of the  
 106856 current file used as the *path* argument. If the current file is not a directory, *rm* shall  
 106857 perform actions equivalent to the *unlink()* function defined in the System Interfaces  
 106858 volume of POSIX.1-2008 called with a pathname of the current file used as the *path*  
 106859 argument.

106860 If this fails for any reason, *rm* shall write a diagnostic message to standard error, do  
 106861 nothing more with the current file, and go on to any remaining files.

106862 The *rm* utility shall be able to descend to arbitrary depths in a file hierarchy, and shall not fail  
 106863 due to path length limitations (unless an operand specified by the user exceeds system  
 106864 limitations).

#### 106865 OPTIONS

106866 The *rm* utility shall conform to XBD [Section 12.2](#) (on page 216).

106867 The following options shall be supported:

- 106868 **-f** Do not prompt for confirmation. Do not write diagnostic messages or modify the |  
 106869 exit status in the case of no file operands, or in the case of operands that do not |  
 106870 exist. Any previous occurrences of the **-i** option shall be ignored.
- 106871 **-i** Prompt for confirmation as described previously. Any previous occurrences of the  
 106872 **-f** option shall be ignored.
- 106873 **-R** Remove file hierarchies. See the DESCRIPTION.
- 106874 **-r** Equivalent to **-R**.

#### 106875 OPERANDS

106876 The following operand shall be supported:

- 106877 *file* A pathname of a directory entry to be removed.

#### 106878 STDIN

106879 The standard input shall be used to read an input line in response to each prompt specified in  
 106880 the STDOUT section. Otherwise, the standard input shall not be used.

#### 106881 INPUT FILES

106882 None.

#### 106883 ENVIRONMENT VARIABLES

106884 The following environment variables shall affect the execution of *rm*:

- 106885 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 106886 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 106887 variables used to determine the values of locale categories.)
- 106888 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 106889 internationalization variables.
- 106890 **LC\_COLLATE**  
 106891 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 106892 character collating elements used in the extended regular expression defined for  
 106893 the **yesexpr** locale keyword in the **LC\_MESSAGES** category.
- 106894 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 106895 characters (for example, single-byte as opposed to multi-byte characters in  
 106896 arguments) and the behavior of character classes within regular expressions used  
 106897 in the extended regular expression defined for the **yesexpr** locale keyword in the  
 106898 **LC\_MESSAGES** category.
- 106899 **LC\_MESSAGES**  
 106900 Determine the locale used to process affirmative responses, and the locale used to  
 106901 affect the format and contents of diagnostic messages and prompts written to  
 106902 standard error.

|        |     |                               |                                                                                                               |
|--------|-----|-------------------------------|---------------------------------------------------------------------------------------------------------------|
| 106903 | XSI | <b>NLSPATH</b>                | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                         |
| 106904 |     | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                               |
| 106905 |     |                               | Default.                                                                                                      |
| 106906 |     | <b>STDOUT</b>                 |                                                                                                               |
| 106907 |     |                               | Not used.                                                                                                     |
| 106908 |     | <b>STDERR</b>                 |                                                                                                               |
| 106909 |     |                               | Prompts shall be written to standard error under the conditions specified in the <b>DESCRIPTION</b>           |
| 106910 |     |                               | and <b>OPTIONS</b> sections. The prompts shall contain the <i>file</i> pathname, but their format is          |
| 106911 |     |                               | otherwise unspecified. The standard error also shall be used for diagnostic messages.                         |
| 106912 |     | <b>OUTPUT FILES</b>           |                                                                                                               |
| 106913 |     |                               | None.                                                                                                         |
| 106914 |     | <b>EXTENDED DESCRIPTION</b>   |                                                                                                               |
| 106915 |     |                               | None.                                                                                                         |
| 106916 |     | <b>EXIT STATUS</b>            |                                                                                                               |
| 106917 |     |                               | The following exit values shall be returned:                                                                  |
| 106918 |     | 0                             | Each directory entry was successfully removed, unless its removal was canceled by a non-                      |
| 106919 |     |                               | affirmative response to a prompt for confirmation.                                                            |
| 106920 |     | >0                            | An error occurred.                                                                                            |
| 106921 |     | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                               |
| 106922 |     |                               | Default.                                                                                                      |
| 106923 |     | <b>APPLICATION USAGE</b>      |                                                                                                               |
| 106924 |     |                               | The <i>rm</i> utility is forbidden to remove the names <i>dot</i> and <i>dot-dot</i> in order to avoid the    |
| 106925 |     |                               | consequences of inadvertently doing something like:                                                           |
| 106926 |     | <code>rm -r .*</code>         |                                                                                                               |
| 106927 |     |                               | Some implementations do not permit the removal of the last link to an executable binary file that             |
| 106928 |     |                               | is being executed; see the [EBUSY] error in the <i>unlink()</i> function defined in the System Interfaces     |
| 106929 |     |                               | volume of POSIX.1-2008. Thus, the <i>rm</i> utility can fail to remove such files.                            |
| 106930 |     |                               | The <i>-i</i> option causes <i>rm</i> to prompt and read the standard input even if the standard input is not |
| 106931 |     |                               | a terminal, but in the absence of <i>-i</i> the mode prompting is not done when the standard input is         |
| 106932 |     |                               | not a terminal.                                                                                               |
| 106933 |     | <b>EXAMPLES</b>               |                                                                                                               |
| 106934 |     | 1.                            | The following command:                                                                                        |
| 106935 |     |                               | <code>rm a.out core</code>                                                                                    |
| 106936 |     |                               | removes the directory entries: <b>a.out</b> and <b>core</b> .                                                 |
| 106937 |     | 2.                            | The following command:                                                                                        |
| 106938 |     |                               | <code>rm -Rf junk</code>                                                                                      |
| 106939 |     |                               | removes the directory <b>junk</b> and all its contents, without prompting.                                    |
| 106940 |     | <b>RATIONALE</b>              |                                                                                                               |
| 106941 |     |                               | For absolute clarity, paragraphs (2b) and (3) in the <b>DESCRIPTION</b> of <i>rm</i> describing the behavior  |
| 106942 |     |                               | when prompting for confirmation, should be interpreted in the following manner:                               |
| 106943 |     |                               | <code>if ((NOT f_option) AND</code>                                                                           |

106944           ((not\_writable AND input\_is\_terminal) OR i\_option))

106945       The exact format of the interactive prompts is unspecified. Only the general nature of the  
106946 contents of prompts are specified because implementations may desire more descriptive  
106947 prompts than those used on historical implementations. Therefore, an application not using the  
106948 `-f` option, or using the `-i` option, relies on the system to provide the most suitable dialog directly  
106949 with the user, based on the behavior specified.

106950       The `-r` option is historical practice on all known systems. The synonym `-R` option is provided  
106951 for consistency with the other utilities in this volume of POSIX.1-2008 that provide options  
106952 requesting recursive descent through the file hierarchy.

106953       The behavior of the `-f` option in historical versions of *rm* is inconsistent. In general, along with  
106954 “forcing” the unlink without prompting for permission, it always causes diagnostic messages to  
106955 be suppressed and the exit status to be unmodified for nonexistent operands and files that  
106956 cannot be unlinked. In some versions, however, the `-f` option suppresses usage messages and  
106957 system errors as well. Suppressing such messages is not a service to either shell scripts or users.

106958       It is less clear that error messages regarding files that cannot be unlinked (removed) should be  
106959 suppressed. Although this is historical practice, this volume of POSIX.1-2008 does not permit the  
106960 `-f` option to suppress such messages.

106961       When given the `-r` and `-i` options, historical versions of *rm* prompt the user twice for each  
106962 directory, once before removing its contents and once before actually attempting to delete the  
106963 directory entry that names it. This allows the user to “prune” the file hierarchy walk. Historical  
106964 versions of *rm* were inconsistent in that some did not do the former prompt for directories  
106965 named on the command line and others had obscure prompting behavior when the `-i` option  
106966 was specified and the permissions of the file did not permit writing. The POSIX Shell and  
106967 Utilities *rm* differs little from historic practice, but does require that prompts be consistent.  
106968 Historical versions of *rm* were also inconsistent in that prompts were done to both standard  
106969 output and standard error. This volume of POSIX.1-2008 requires that prompts be done to  
106970 standard error, for consistency with *cp* and *mv*, and to allow historical extensions to *rm* that  
106971 provide an option to list deleted files on standard output.

106972       The *rm* utility is required to descend to arbitrary depths so that any file hierarchy may be  
106973 deleted. This means, for example, that the *rm* utility cannot run out of file descriptors during its  
106974 descent (that is, if the number of file descriptors is limited, *rm* cannot be implemented in the  
106975 historical fashion where one file descriptor is used per directory level). Also, *rm* is not permitted  
106976 to fail because of path length restrictions, unless an operand specified by the user is longer than  
106977 {PATH\_MAX}.

106978       The *rm* utility removes symbolic links themselves, not the files they refer to, as a consequence of  
106979 the dependence on the *unlink()* functionality, per the DESCRIPTION. When removing  
106980 hierarchies with `-r` or `-R`, the prohibition on following symbolic links has to be made explicit.

106988 First released in Issue 2.

106989 **Issue 5**

106990 The FUTURE DIRECTIONS section is added.

106991 **Issue 6**106992 Text is added to clarify actions relating to symbolic links as specified in the IEEE P1003.2b draft  
106993 standard.106994 **Issue 7**

106995 Austin Group Interpretations 1003.1-2001 #019 and #091 are applied.

106996 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
106997 `LC_MESSAGES` environment variable.

106998 **NAME**106999        rmdel — remove a delta from an SCCS file (**DEVELOPMENT**)107000 **SYNOPSIS**107001 XSI        `rmdel -r SID file...`107002 **DESCRIPTION**

107003        The *rmdel* utility shall remove the delta specified by the SID from each named SCCS file. The  
 107004        delta to be removed shall be the most recent delta in its branch in the delta chain of each named  
 107005        SCCS file. In addition, the application shall ensure that the SID specified is not that of a version  
 107006        being edited for the purpose of making a delta; that is, if a *p-file* (see *get*) exists for the named  
 107007        SCCS file, the SID specified shall not appear in any entry of the *p-file*.

107008        Removal of a delta shall be restricted to:

- 107009            1. The user who made the delta
- 107010            2. The owner of the SCCS file
- 107011            3. The owner of the directory containing the SCCS file

107012 **OPTIONS**107013        The *rmdel* utility shall conform to XBD [Section 12.2](#) (on page 216).

107014        The following option shall be supported:

107015        **-r SID**        Specify the SCCS identification string (*SID*) of the delta to be deleted.107016 **OPERANDS**

107017        The following operand shall be supported:

107018        *file*            A pathname of an existing SCCS file or a directory. If *file* is a directory, the *rmdel*  
 107019        utility shall behave as though each file in the directory were specified as a named  
 107020        file, except that non-SCCS files (last component of the pathname does not begin  
 107021        with **s.**) and unreadable files shall be silently ignored.

107022        If exactly one *file* operand appears, and it is **'-'**, the standard input shall be read;  
 107023        each line of the standard input is taken to be the name of an SCCS file to be  
 107024        processed. Non-SCCS files and unreadable files shall be silently ignored.

107025 **STDIN**

107026        The standard input shall be a text file used only when the *file* operand is specified as **'-'**. Each  
 107027        line of the text file shall be interpreted as an SCCS pathname.

107028 **INPUT FILES**

107029        The SCCS files shall be files of unspecified format.

107030 **ENVIRONMENT VARIABLES**107031        The following environment variables shall affect the execution of *rmdel*:

107032        **LANG**            Provide a default value for the internationalization variables that are unset or null.  
 107033        (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 107034        variables used to determine the values of locale categories.)

107035        **LC\_ALL**           If set to a non-empty string value, override the values of all the other  
 107036        internationalization variables.

107037        **LC\_CTYPE**        Determine the locale for the interpretation of sequences of bytes of text data as  
 107038        characters (for example, single-byte as opposed to multi-byte characters in  
 107039        arguments and input files).

107040 *LC\_MESSAGES*  
107041 Determine the locale that should be used to affect the format and contents of  
107042 diagnostic messages written to standard error.

107043 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

107044 **ASYNCHRONOUS EVENTS**  
107045 Default.

107046 **STDOUT**  
107047 Not used.

107048 **STDERR**  
107049 The standard error shall be used only for diagnostic messages.

107050 **OUTPUT FILES**  
107051 The SCCS files shall be files of unspecified format. During processing of a *file*, a temporary *x-file*,  
107052 as described in *admin*, may be created and deleted; a locking *z-file*, as described in *get*, may be  
107053 created and deleted.

107054 **EXTENDED DESCRIPTION**  
107055 None.

107056 **EXIT STATUS**  
107057 The following exit values shall be returned:  
107058 0 Successful completion.  
107059 >0 An error occurred.

107060 **CONSEQUENCES OF ERRORS**  
107061 Default.

107062 **APPLICATION USAGE**  
107063 None.

107064 **EXAMPLES**  
107065 None.

107066 **RATIONALE**  
107067 None.

107068 **FUTURE DIRECTIONS**  
107069 None.

107070 **SEE ALSO**

107072 XBD Chapter 8 (on page 173), Section 12.2 (on page 216)

107073 **CHANGE HISTORY**  
107074 First released in Issue 2.

107075 **Issue 6**  
107076 The normative text is reworded to avoid use of the term “must” for application requirements.

107077 **NAME**

107078       rmdir — remove directories

107079 **SYNOPSIS**107080       rmdir [-p] *dir*...107081 **DESCRIPTION**107082       The *rmdir* utility shall remove the directory entry specified by each *dir* operand.107083       For each *dir* operand, the *rmdir* utility shall perform actions equivalent to the *rmdir()* function  
107084       called with the *dir* operand as its only argument.107085       Directories shall be processed in the order specified. If a directory and a subdirectory of that  
107086       directory are specified in a single invocation of the *rmdir* utility, the application shall specify the  
107087       subdirectory before the parent directory so that the parent directory will be empty when the  
107088       *rmdir* utility tries to remove it.107089 **OPTIONS**107090       The *rmdir* utility shall conform to XBD [Section 12.2](#) (on page 216).

107091       The following option shall be supported:

107092       **-p**           Remove all directories in a pathname. For each *dir* operand:

- 107093                   1. The directory entry it names shall be removed.
- 
- 107094                   2. If the
- dir*
- operand includes more than one pathname component, effects
- 
- 107095                   equivalent to the following command shall occur:

107096                   rmdir -p \$(dirname *dir*)107097 **OPERANDS**

107098       The following operand shall be supported:

107099       *dir*           A pathname of an empty directory to be removed.107100 **STDIN**

107101       Not used.

107102 **INPUT FILES**

107103       None.

107104 **ENVIRONMENT VARIABLES**107105       The following environment variables shall affect the execution of *rmdir*:107106       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
107107       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
107108       variables used to determine the values of locale categories.)107109       **LC\_ALL**      If set to a non-empty string value, override the values of all the other  
107110       internationalization variables.107111       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
107112       characters (for example, single-byte as opposed to multi-byte characters in  
107113       arguments).107114       **LC\_MESSAGES**107115       Determine the locale that should be used to affect the format and contents of  
107116       diagnostic messages written to standard error.

- 107117 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 107118 **ASYNCHRONOUS EVENTS**
- 107119 Default.
- 107120 **STDOUT**
- 107121 Not used.
- 107122 **STDERR**
- 107123 The standard error shall be used only for diagnostic messages.
- 107124 **OUTPUT FILES**
- 107125 None.
- 107126 **EXTENDED DESCRIPTION**
- 107127 None.
- 107128 **EXIT STATUS**
- 107129 The following exit values shall be returned:
- 107130 0 Each directory entry specified by a *dir* operand was removed successfully.
- 107131 >0 An error occurred.
- 107132 **CONSEQUENCES OF ERRORS**
- 107133 Default.
- 107134 **APPLICATION USAGE**
- 107135 The definition of an empty directory is one that contains, at most, directory entries for dot and
- 107136 dot-dot.
- 107137 **EXAMPLES**
- 107138 If a directory **a** in the current directory is empty except it contains a directory **b** and **a/b** is empty
- 107139 except it contains a directory **c**:
- 107140 `rmdir -p a/b/c`
- 107141 removes all three directories.
- 107142 **RATIONALE**
- 107143 On historical System V systems, the **-p** option also caused a message to be written to the
- 107144 standard output. The message indicated whether the whole path was removed or whether part
- 107145 of the path remained for some reason. The **STDERR** section requires this diagnostic when the
- 107146 entire path specified by a *dir* operand is not removed, but does not allow the status message
- 107147 reporting success to be written as a diagnostic.
- 107148 The *rmdir* utility on System V also included a **-s** option that suppressed the informational
- 107149 message output by the **-p** option. This option has been omitted because the informational
- 107150 message is not specified by this volume of POSIX.1-2008.
- 107151 **FUTURE DIRECTIONS**
- 107152 None.
- 107153 **SEE ALSO**
- 107154 *rm*
- 107155 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)
- 107156 XSH *remove()*, *rmdir()*, *unlink()*

107157 **CHANGE HISTORY**

107158 First released in Issue 2.

107159 **Issue 6**

107160 The normative text is reworded to avoid use of the term “must” for application requirements.

107161 **NAME**107162       sact — print current SCCS file-editing activity (**DEVELOPMENT**)107163 **SYNOPSIS**107164 XSI       sact *file...*107165 **DESCRIPTION**

107166       The *sact* utility shall inform the user of any impending deltas to a named SCCS file by writing a  
 107167       list to standard output. This situation occurs when *get -e* has been executed previously without  
 107168       a subsequent execution of *delta*, *unget*, or *sccs unedit*.

107169 **OPTIONS**

107170       None.

107171 **OPERANDS**

107172       The following operand shall be supported:

107173       *file*       A pathname of an existing SCCS file or a directory. If *file* is a directory, the *sact*  
 107174       utility shall behave as though each file in the directory were specified as a named  
 107175       file, except that non-SCCS files (last component of the pathname does not begin  
 107176       with **s**.) and unreadable files shall be silently ignored.

107177       If exactly one *file* operand appears, and it is *'-'*, the standard input shall be read;  
 107178       each line of the standard input shall be taken to be the name of an SCCS file to be  
 107179       processed. Non-SCCS files and unreadable files shall be silently ignored.

107180 **STDIN**

107181       The standard input shall be a text file used only when the *file* operand is specified as *'-'*. Each  
 107182       line of the text file shall be interpreted as an SCCS pathname.

107183 **INPUT FILES**

107184       Any SCCS files interrogated are files of an unspecified format.

107185 **ENVIRONMENT VARIABLES**107186       The following environment variables shall affect the execution of *sact*:

107187       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 107188       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 107189       variables used to determine the values of locale categories.)

107190       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 107191       internationalization variables.

107192       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 107193       characters (for example, single-byte as opposed to multi-byte characters in  
 107194       arguments and input files).

107195       *LC\_MESSAGES*

107196       Determine the locale that should be used to affect the format and contents of  
 107197       diagnostic messages written to standard error.

107198       *NLSPATH*    Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

107199 **ASYNCHRONOUS EVENTS**

107200       Default.

**107201 STDOUT**

107202 The output for each named file shall consist of a line in the following format:

107203 "%sΔ%sΔ%sΔ%sΔ%s\n", <SID>, <new SID>, <login>, <date>, <time>

107204 <SID> Specifies the SID of a delta that currently exists in the SCCS file to which changes  
107205 are made to make the new delta.

107206 <new SID> Specifies the SID for the new delta to be created.

107207 <login> Contains the login name of the user who makes the delta (that is, who executed a  
107208 *get* for editing).

107209 <date> Contains the date that *get -e* was executed, in the format used by the *prs :D:* data  
107210 keyword.

107211 <time> Contains the time that *get -e* was executed, in the format used by the *prs :T:* data  
107212 keyword.

107213 If there is more than one named file or if a directory or standard input is named, each pathname  
107214 shall be written before each of the preceding lines:

107215 "\n%s:\n", <pathname>

**107216 STDERR**

107217 The standard error shall be used only for optional informative messages concerning SCCS files  
107218 with no impending deltas, and for diagnostic messages.

**107219 OUTPUT FILES**

107220 None.

**107221 EXTENDED DESCRIPTION**

107222 None.

**107223 EXIT STATUS**

107224 The following exit values shall be returned:

107225 0 Successful completion.

107226 >0 An error occurred.

**107227 CONSEQUENCES OF ERRORS**

107228 Default.

**107229 APPLICATION USAGE**

107230 None.

**107231 EXAMPLES**

107232 None.

**107233 RATIONALE**

107234 None.

**107235 FUTURE DIRECTIONS**

107236 None.

**107237 SEE ALSO**

107239 XBD Chapter 8 (on page 173)

107240 **CHANGE HISTORY**  
107241 First released in Issue 2.

## 107242 NAME

107243 sccs — front end for the SCCS subsystem (DEVELOPMENT)

## 107244 SYNOPSIS

107245 XSI `sccs [-r] [-d path] [-p path] command [options...] [operands...]`

## 107246 DESCRIPTION

107247 The *sccs* utility is a front end to the SCCS programs. It also includes the capability to run set-  
107248 user-id to another user to provide additional protection.107249 The *sccs* utility shall invoke the specified *command* with the specified *options* and *operands*. By  
107250 default, each of the *operands* shall be modified by prefixing it with the string "SCCS/s. ".107251 The *command* can be the name of one of the SCCS utilities in this volume of POSIX.1-2008 (*admin*,  
107252 *delta*, *get*, *prs*, *rmDEL*, *sact*, *unget*, *val*, or *what*) or one of the pseudo-utilities listed in the  
107253 EXTENDED DESCRIPTION section.

## 107254 OPTIONS

107255 The *sccs* utility shall conform to XBD [Section 12.2](#) (on page 216), except that *options* operands are  
107256 actually options to be passed to the utility named by *command*. When the portion of the  
107257 command:107258 `command [options ...] [operands ...]`107259 is considered, all of the pseudo-utilities used as *command* shall support the Utility Syntax  
107260 Guidelines. Any of the other SCCS utilities that can be invoked in this manner support the  
107261 Guidelines to the extent indicated by their individual OPTIONS sections.107262 The following options shall be supported preceding the *command* operand:107263 **-d path** A pathname of a directory to be used as a root directory for the SCCS files. The  
107264 default shall be the current directory. The **-d** option shall take precedence over the  
107265 *PROJECTDIR* variable. See **-p**.107266 **-p path** A pathname of a directory in which the SCCS files are located. The default shall be  
107267 the **SCCS** directory.107268 The **-p** option differs from the **-d** option in that the **-d** option-argument shall be  
107269 prefixed to the entire pathname and the **-p** option-argument shall be inserted  
107270 before the final component of the pathname. For example:107271 `sccs -d /x -p y get a/b`

107272 converts to:

107273 `get /x/a/y/s.b`

107274 This allows the creation of aliases such as:

107275 `alias syssccs="sccs -d /usr/src"`

107276 which is used as:

107277 `syssccs get cmd/who.c`107278 **-r** Invoke *command* with the real user ID of the process, not any effective user ID that  
107279 the *sccs* utility is set to. Certain commands (*admin*, **check**, **clean**, **diffs**, **info**, *rmDEL*,  
107280 and **tell**) cannot be run set-user-ID by all users, since this would allow anyone to  
107281 change the authorizations. These commands are always run as the real user.

**107282 OPERANDS**

107283 The following operands shall be supported:

107284 *command* An SCCS utility name or the name of one of the pseudo-utilities listed in the  
107285 EXTENDED DESCRIPTION section.

107286 *options* An option or option-argument to be passed to *command*.

107287 *operands* An operand to be passed to *command*.

**107288 STDIN**

107289 See the utility description for the specified *command*.

**107290 INPUT FILES**

107291 See the utility description for the specified *command*.

**107292 ENVIRONMENT VARIABLES**

107293 The following environment variables shall affect the execution of *sccs*:

107294 *LANG* Provide a default value for the internationalization variables that are unset or null.  
107295 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
107296 variables used to determine the values of locale categories.)

107297 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
107298 internationalization variables.

107299 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
107300 characters (for example, single-byte as opposed to multi-byte characters in  
107301 arguments and input files).

107302 *LC\_MESSAGES*

107303 Determine the locale that should be used to affect the format and contents of  
107304 diagnostic messages written to standard error.

107305 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

107306 *PROJECTDIR*

107307 Provide a default value for the *-d path* option. If the value of *PROJECTDIR* begins  
107308 with a <slash>, it shall be considered an absolute pathname; otherwise, the value  
107309 of *PROJECTDIR* is treated as a user name and that user's initial working directory  
107310 shall be examined for a subdirectory *src* or *source*. If such a directory is found, it  
107311 shall be used. Otherwise, the value shall be used as a relative pathname.

107312 Additional environment variable effects may be found in the utility description for the specified  
107313 *command*.

**107314 ASYNCHRONOUS EVENTS**

107315 Default.

**107316 STDOUT**

107317 See the utility description for the specified *command*.

**107318 STDERR**

107319 See the utility description for the specified *command*.

**107320 OUTPUT FILES**

107321 See the utility description for the specified *command*.

## 107322 EXTENDED DESCRIPTION

107323 The following pseudo-utilities shall be supported as *command* operands. All options referred to  
 107324 in the following list are values given in the *options* operands following *command*.

107325 **check** Equivalent to **info**, except that nothing shall be printed if nothing is being edited, and a  
 107326 non-zero exit status shall be returned if anything is being edited. The intent is to have  
 107327 this included in an “install” entry in a makefile to ensure that everything is included  
 107328 into the SCCS file before a version is installed.

107329 **clean** Remove everything from the current directory that can be recreated from SCCS files,  
 107330 but do not remove any files being edited. If the **-b** option is given, branches shall be  
 107331 ignored in the determination of whether they are being edited; this is dangerous if  
 107332 branches are kept in the same directory.

107333 **create** Create an SCCS file, taking the initial contents from the file of the same name. Any  
 107334 options to *admin* are accepted. If the creation is successful, the original files shall be  
 107335 renamed by prefixing the basenames with a comma. These renamed files should be  
 107336 removed after it has been verified that the SCCS files have been created successfully.

107337 **delget** Perform a *delta* on the named files and then *get* new versions. The new versions shall  
 107338 have ID keywords expanded and shall not be editable. Any **-m**, **-p**, **-r**, **-s**, and **-y**  
 107339 options shall be passed to *delta*, and any **-b**, **-c**, **-e**, **-i**, **-k**, **-l**, **-s**, and **-x** options shall be  
 107340 passed to *get*.

107341 **deledit** Equivalent to **delget**, except that the *get* phase shall include the **-e** option. This option is  
 107342 useful for making a checkpoint of the current editing phase. The same options shall be  
 107343 passed to *delta* as described above, and all the options listed for *get* above except **-e**  
 107344 shall be passed to **edit**.

107345 **diffs** Write a difference listing between the current version of the files checked out for editing  
 107346 and the versions in SCCS format. Any **-r**, **-c**, **-i**, **-x**, and **-t** options shall be passed to  
 107347 *get*; any **-l**, **-s**, **-e**, **-f**, **-h**, and **-b** options shall be passed to *diff*. A **-C** option shall be  
 107348 passed to *diff* as **-c**.

107349 **edit** Equivalent to *get -e*.

107350 **fix** Remove the named delta, but leave a copy of the delta with the changes that were in it.  
 107351 It is useful for fixing small compiler bugs, and so on. The application shall ensure that it  
 107352 is followed by a **-r** *SID* option. Since **fix** does not leave audit trails, it should be used  
 107353 carefully.

107354 **info** Write a listing of all files being edited. If the **-b** option is given, branches (that is, SIDs  
 107355 with two or fewer components) shall be ignored. If a **-u** *user* option is given, then only  
 107356 files being edited by the named user shall be listed. A **-U** option shall be equivalent to  
 107357 **-u***<current user>*.

107358 **print** Write out verbose information about the named files, equivalent to *sccs prs*.

107359 **tell** Write a <newline>-separated list of the files being edited to standard output. Takes the  
 107360 **-b**, **-u**, and **-U** options like **info** and **check**.

107361 **unedit** This is the opposite of an **edit** or a *get -e*. It should be used with caution, since any  
 107362 changes made since the *get* are lost.

107363 **EXIT STATUS**

107364 The following exit values shall be returned:

107365 0 Successful completion.

107366 &gt;0 An error occurred.

107367 **CONSEQUENCES OF ERRORS**

107368 Default.

107369 **APPLICATION USAGE**

107370 Many of the SCCS utilities take directory names as operands as well as specific filenames. The  
 107371 pseudo-utilities supported by *sccs* are not described as having this capability, but are not  
 107372 prohibited from doing so.

107373 **EXAMPLES**

107374 1. To get a file for editing, edit it and produce a new delta:

107375 `sccs get -e file.c`107376 `ex file.c`107377 `sccs delta file.c`

107378 2. To get a file from another directory:

107379 `sccs -p /usr/src/sccs/s. get cc.c`

107380 or:

107381 `sccs get /usr/src/sccs/s.cc.c`

107382 3. To make a delta of a large number of files in the current directory:

107383 `sccs delta *.c`

107384 4. To get a list of files being edited that are not on branches:

107385 `sccs info -b`

107386 5. To delta everything being edited by the current user:

107387 `sccs delta $(sccs tell -U)`

107388 6. In a makefile, to get source files from an SCCS file if it does not already exist:

107389 `SRCS = <list of source files>`107390 `$(SRCS):`107391 `sccs get $(REL) $@`107392 **RATIONALE**

107393 *sccs* and its associated utilities are part of the XSI Development Utilities option within the XSI  
 107394 option.

107395 SCCS is an abbreviation for Source Code Control System. It is a maintenance and enhancement  
 107396 tracking tool. When a file is put under SCCS, the source code control system maintains the file  
 107397 and, when changes are made, identifies and stores them in the file with the original source code  
 107398 and/or documentation. As other changes are made, they too are identified and retained in the  
 107399 file.

107400 Retrieval of the original and any set of changes is possible. Any version of the file as it develops  
 107401 can be reconstructed for inspection or additional modification. History data can be stored with  
 107402 each version, documenting why the changes were made, who made them, and when they were  
 107403 made.

107404 **FUTURE DIRECTIONS**

107405 None.

107406 **SEE ALSO**107407 *admin, delta, get, make, prs, rmdel, sact, unget, val, what*107408 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)107409 **CHANGE HISTORY**

107410 First released in Issue 4.

107411 **Issue 6**

107412 In the ENVIRONMENT VARIABLES section, the *PROJECTDIR* description is updated from  
107413 “otherwise, the home directory of a user of that name is examined” to “otherwise, the value of  
107414 *PROJECTDIR* is treated as a user name and that user’s initial working directory is examined”.

107415 The normative text is reworded to avoid use of the term “must” for application requirements.

107416 **Issue 7**

107417 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107418 **NAME**

107419       sed — stream editor

107420 **SYNOPSIS**107421       sed [-n] *script* [*file...*]107422       sed [-n] -e *script* [-e *script*]... [-f *script\_file*]... [*file...*]107423       sed [-n] [-e *script*]... -f *script\_file* [-f *script\_file*]... [*file...*]107424 **DESCRIPTION**

107425       The *sed* utility is a stream editor that shall read one or more text files, make editing changes  
 107426       according to a script of editing commands, and write the results to standard output. The script  
 107427       shall be obtained from either the *script* operand string or a combination of the option-arguments  
 107428       from the -e *script* and -f *script\_file* options.

107429 **OPTIONS**

107430       The *sed* utility shall conform to XBD [Section 12.2](#) (on page 216), except that the order of  
 107431       presentation of the -e and -f options is significant.

107432       The following options shall be supported:

107433       -e *script*     Add the editing commands specified by the *script* option-argument to the end of  
 107434       the script of editing commands.

107435       -f *script\_file* Add the editing commands in the file *script\_file* to the end of the script of editing  
 107436       commands.

107437       -n            Suppress the default output (in which each line, after it is examined for editing, is  
 107438       written to standard output). Only lines explicitly selected for output are written.

107439       If any -e or -f options are specified, the script of editing commands shall initially be empty. The  
 107440       commands specified by each -e or -f option shall be added to the script in the order specified.  
 107441       When each addition is made, if the previous addition (if any) was from a -e option, a <newline>  
 107442       shall be inserted before the new addition. The resulting script shall have the same properties as  
 107443       the *script* operand, described in the OPERANDS section.

107444 **OPERANDS**

107445       The following operands shall be supported:

107446       *file*         A pathname of a file whose contents are read and edited. If multiple *file* operands  
 107447       are specified, the named files shall be read in the order specified and the  
 107448       concatenation shall be edited. If no *file* operands are specified, the standard input  
 107449       shall be used.

107450       *script*       A string to be used as the script of editing commands. The application shall not  
 107451       present a *script* that violates the restrictions of a text file except that the final  
 107452       character need not be a <newline>.

107453 **STDIN**

107454       The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 107455       operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 107456       the standard input shall not be used. See the INPUT FILES section.

107457 **INPUT FILES**

107458       The input files shall be text files. The *script\_files* named by the -f option shall consist of editing  
 107459       commands.

107460 **ENVIRONMENT VARIABLES**

107461 The following environment variables shall affect the execution of *sed*:

107462 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 107463 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 107464 variables used to determine the values of locale categories.)

107465 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 107466 internationalization variables.

107467 *LC\_COLLATE*  
 107468 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 107469 character collating elements within regular expressions.

107470 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 107471 characters (for example, single-byte as opposed to multi-byte characters in  
 107472 arguments and input files), and the behavior of character classes within regular  
 107473 expressions.

107474 *LC\_MESSAGES*  
 107475 Determine the locale that should be used to affect the format and contents of  
 107476 diagnostic messages written to standard error.

107477 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

107478 **ASYNCHRONOUS EVENTS**

107479 Default.

107480 **STDOUT**

107481 The input files shall be written to standard output, with the editing commands specified in the  
 107482 script applied. If the *-n* option is specified, only those input lines selected by the script shall be  
 107483 written to standard output.

107484 **STDERR**

107485 The standard error shall be used only for diagnostic and warning messages. |

107486 **OUTPUT FILES**

107487 The output files shall be text files whose formats are dependent on the editing commands given.

107488 **EXTENDED DESCRIPTION**

107489 The *script* shall consist of editing commands of the following form:

107490 `[address[, address]]function`

107491 where *function* represents a single-character command verb from the list in [Editing Commands](#)  
 107492 [in sed](#) (on page 3207), followed by any applicable arguments.

107493 The command can be preceded by <blank> characters and/or <semicolon> characters. The  
 107494 function can be preceded by <blank> characters. These optional characters shall have no effect.

107495 In default operation, *sed* cyclically shall append a line of input, less its terminating <newline>  
 107496 character, into the pattern space. Reading from input shall be skipped if a <newline> was in the  
 107497 pattern space prior to a **D** command ending the previous cycle. The *sed* utility shall then apply in  
 107498 sequence all commands whose addresses select that pattern space, until a command starts the  
 107499 next cycle or quits. If no commands explicitly started a new cycle, then at the end of the script  
 107500 the pattern space shall be copied to standard output (except when *-n* is specified) and the  
 107501 pattern space shall be deleted. Whenever the pattern space is written to standard output or a  
 107502 named file, *sed* shall immediately follow it with a <newline>.

107503 Some of the editing commands use a hold space to save all or part of the pattern space for

subsequent retrieval. The pattern and hold spaces shall each be able to hold at least 8 192 bytes.

#### Addresses in sed

An address is either a decimal number that counts input lines cumulatively across files, a '\$' character that addresses the last line of input, or a context address (which consists of a BRE, as described in [Regular Expressions in sed](#), preceded and followed by a delimiter, usually a <slash>).

An editing command with no addresses shall select every pattern space.

An editing command with one address shall select each pattern space that matches the address.

An editing command with two addresses shall select the inclusive range from the first pattern space that matches the first address through the next pattern space that matches the second. (If the second address is a number less than or equal to the line number first selected, only one line shall be selected.) Starting at the first line following the selected range, *sed* shall look again for the first address. Thereafter, the process shall be repeated. Omitting either or both of the address components in the following form produces undefined results:

```
[address[ , address]]
```

#### Regular Expressions in sed

The *sed* utility shall support the BREs described in XBD [Section 9.3](#) (on page 183), with the following additions:

- In a context address, the construction "`\cBREc`", where *c* is any character other than <backslash> or <newline>, shall be identical to "`/BRE/`". If the character designated by *c* appears following a <backslash>, then it shall be considered to be that literal character, which shall not terminate the BRE. For example, in the context address "`\xabc\xdefx`", the second *x* stands for itself, so that the BRE is "`abcxdef`".
- The escape sequence '`\n`' shall match a <newline> embedded in the pattern space. A literal <newline> shall not be used in the BRE of a context address or in the substitute function.
- If an RE is empty (that is, no pattern is specified) *sed* shall behave as if the last RE used in the last command applied (either as an address or as part of a substitute command) was specified.

#### Editing Commands in sed

In the following list of editing commands, the maximum number of permissible addresses for each function is indicated by [*0addr*], [*1addr*], or [*2addr*], representing zero, one, or two addresses.

The argument *text* shall consist of one or more lines. Each embedded <newline> in the text shall be preceded by a <backslash>. Other <backslash> characters in text shall be removed, and the following character shall be treated literally.

The **r** and **w** command verbs, and the *w* flag to the **s** command, take an *rfile* (or *wfile*) parameter, separated from the command verb letter or flag by one or more <blank> characters; implementations may allow zero separation as an extension.

The argument *rfile* or the argument *wfile* shall terminate the editing command. Each *wfile* shall be created before processing begins. Implementations shall support at least ten *wfile* arguments in the script; the actual number (greater than or equal to 10) that is supported by the

107546 implementation is unspecified. The use of the *wfile* parameter shall cause that file to be initially  
107547 created, if it does not exist, or shall replace the contents of an existing file.

107548 The **b**, **r**, **s**, **t**, **w**, **y**, and **:** command verbs shall accept additional arguments. The following  
107549 synopses indicate which arguments shall be separated from the command verbs by a single  
107550 <space>.

107551 The **a** and **r** commands schedule text for later output. The text specified for the **a** command, and  
107552 the contents of the file specified for the **r** command, shall be written to standard output just  
107553 before the next attempt to fetch a line of input when executing the **N** or **n** commands, or when  
107554 reaching the end of the script. If written when reaching the end of the script, and the **-n** option  
107555 was not specified, the text shall be written after copying the pattern space to standard output.  
107556 The contents of the file specified for the **r** command shall be as of the time the output is written,  
107557 not the time the **r** command is applied. The text shall be output in the order in which the **a** and **r**  
107558 commands were applied to the input.

107559 Editing commands other than {...}, **a**, **b**, **c**, **i**, **r**, **t**, **w**, **:**, and **#** can be followed by a <semicolon>, |  
107560 optional <blank> characters, and another editing command. However, when an **s** editing |  
107561 command is used with the *w* flag, following it with another command in this manner produces  
107562 undefined results.

107563 A function can be preceded by a '!' character, in which case the function shall be applied if the |  
107564 addresses do not select the pattern space. Zero or more <blank> characters shall be accepted |  
107565 before the '!' character. It is unspecified whether <blank> characters can follow the '!' |  
107566 character, and conforming applications shall not follow the '!' character with <blank> |  
107567 characters.

107568 If a *label* argument (to a **b**, **t**, or **:** command) contains characters outside of the portable filename +  
107569 character set, or if a *label* is longer than 8 bytes, the behavior is unspecified. The implementation +  
107570 shall support *label* arguments recognized as unique up to at least 8 bytes; the actual length +  
107571 (greater than or equal to 8) supported by the implementation is unspecified. It is unspecified +  
107572 whether exceeding the maximum supported label length causes an error or a silent truncation.

107573 [2addr] {editing command

107574 editing command

107575 ...

107576 } Execute a list of *sed* editing commands only when the pattern space is selected. The  
107577 list of *sed* editing commands shall be surrounded by braces. The braces can be |  
107578 preceded or followed by <blank> characters. The <right-brace> shall be preceded |  
107579 by a <newline> or <semicolon> (before any optional <blank> characters preceding |  
107580 the <right-brace>).

107581 Each command in the list of commands shall be terminated by a <newline> |  
107582 character, or by a <semicolon> character if permitted when the command is used |  
107583 outside the braces. The editing commands can be preceded by <blank> characters, |  
107584 but shall not be followed by <blank> characters.

107585 [1addr]a\

107586 text Write text to standard output as described previously.

107587 [2addr]b [label]

107588 Branch to the **:** command verb bearing the *label* argument. If *label* is not specified, |  
107589 branch to the end of the script.

107590 [2addr]c\

107591 text Delete the pattern space. With a 0 or 1 address or at the end of a 2-address range,  
107592 place *text* on the output and start the next cycle.

|        |                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 107606 | [2addr] <b>l</b>                                         | (The letter ell.) Write the pattern space to standard output in a visually unambiguous form. The characters listed in XBD Table 5-1 (on page 121) ('\\', '\a', '\b', '\f', '\r', '\t', '\v') shall be written as the corresponding escape sequence; the '\n' in that table is not applicable. Non-printable characters not in that table shall be written as one three-digit octal number (with a preceding <backslash>) for each byte in the character (most significant byte first). |

| 107632 |                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 107633 | [2addr] <b>s</b> /BRE/ <i>replacement</i> / <i>flags</i> | Substitute the replacement string for instances of the BRE in the pattern space. Any character other than <backslash> or <newline> can be used instead of a <slash> to                                                                                                                                                                                                                                                                                                                 |
| 107634 |                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 107635 |                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

107636                   delimit the BRE and the replacement. Within the BRE and the replacement, the  
 107637                   BRE delimiter itself can be used as a literal character if it is preceded by a  
 107638                   <backslash>.

107639                   The replacement string shall be scanned from beginning to end. An <ampersand>  
 107640                   (' & ') appearing in the replacement shall be replaced by the string matching the  
 107641                   BRE. The special meaning of ' & ' in this context can be suppressed by preceding it  
 107642                   by a <backslash>. The characters "\n", where *n* is a digit, shall be replaced by the  
 107643                   text matched by the corresponding back-reference expression. If the corresponding  
 107644                   back-reference expression does not match, then the characters "\n" shall be  
 107645                   replaced by the empty string. The special meaning of "\n" where *n* is a digit in  
 107646                   this context, can be suppressed by preceding it by a <backslash>. For each other  
 107647                   <backslash> encountered, the following character shall lose its special meaning (if  
 107648                   any). |

107649                   A line can be split by substituting a <newline> into it. The application shall escape  
 107650                   the <newline> in the replacement by preceding it by a <backslash>.

107651                   The meaning of an unescaped <backslash> immediately followed by any character +  
 107652                   other than ' & ', <backslash>, a digit, <newline>, or the delimiter character used for +  
 107653                   this command, is unspecified. +

107654                   A substitution shall be considered to have been performed even if the replacement  
 107655                   string is identical to the string that it replaces. Any <backslash> used to alter the  
 107656                   default meaning of a subsequent character shall be discarded from the BRE or the  
 107657                   replacement before evaluating the BRE or using the replacement.

107658                   The value of *flags* shall be zero or more of:

107659                   *n*                   Substitute for the *n*th occurrence only of the BRE found within the  
 107660                   pattern space.

107661                   *g*                   Globally substitute for all non-overlapping instances of the BRE  
 107662                   rather than just the first one. If both *g* and *n* are specified, the results  
 107663                   are unspecified.

107664                   *p*                   Write the pattern space to standard output if a replacement was  
 107665                   made.

107666                   *w wfile*           Write. Append the pattern space to *wfile* if a replacement was made.  
 107667                   A conforming application shall precede the *wfile* argument with one  
 107668                   or more <blank> characters. If the *w* flag is not the last flag value  
 107669                   given in a concatenation of multiple flag values, the results are  
 107670                   undefined.

107671                   [2addr]*t [label]*  
 107672                   Test. Branch to the : command verb bearing the *label* if any substitutions have been  
 107673                   made since the most recent reading of an input line or execution of a *t*. If *label* is  
 107674                   not specified, branch to the end of the script.

107675                   [2addr]*w wfile*  
 107676                   Append (write) the pattern space to *wfile*.

107677                   [2addr]*x*           Exchange the contents of the pattern and hold spaces.

107678                   [2addr]*y/string1/string2/*  
 107679                   Replace all occurrences of characters in *string1* with the corresponding characters  
 107680                   in *string2*. If a <backslash> followed by an 'n' appear in *string1* or *string2*, the two

characters shall be handled as a single <newline>. If the number of characters in *string1* and *string2* are not equal, or if any of the characters in *string1* appear more than once, the results are undefined. Any character other than <backslash> or <newline> can be used instead of <slash> to delimit the strings. If the delimiter is not 'n', within *string1* and *string2*, the delimiter itself can be used as a literal character if it is preceded by a <backslash>. If a <backslash> character is immediately followed by a <backslash> character in *string1* or *string2*, the two <backslash> characters shall be counted as a single literal <backslash> character. The meaning of a <backslash> followed by any character that is not 'n', a <backslash>, or the delimiter character is undefined.

[0addr]:label Do nothing. This command bears a *label* to which the **b** and **t** commands branch.

[1addr]= Write the following to standard output:

"%d\n", <current line number>

[0addr] Ignore this empty command.

[0addr]# Ignore the '#' and the remainder of the line (treat them as a comment), with the single exception that if the first two characters in the script are "#n", the default output shall be suppressed; this shall be the equivalent of specifying **-n** on the command line.

## 107699 EXIT STATUS

107700 The following exit values shall be returned:

107701 0 Successful completion.

107702 >0 An error occurred.

## 107703 CONSEQUENCES OF ERRORS

107704 Default.

## 107705 APPLICATION USAGE

Regular expressions match entire strings, not just individual lines, but a <newline> is matched by '\n' in a *sed* RE; a <newline> is not allowed by the general definition of regular expression in POSIX.1-2008. Also note that '\n' cannot be used to match a <newline> at the end of an arbitrary input line; <newline> characters appear in the pattern space as a result of the **N** editing command.

When using *sed* to process pathnames, it is recommended that LC\_ALL, or at least LC\_CTYPE and LC\_COLLATE, are set to POSIX or C in the environment, since pathnames can contain byte sequences that do not form valid characters in some locales, in which case the utility's behavior would be undefined. In the POSIX locale each byte is a valid single-byte character, and therefore this problem is avoided.

## 107716 EXAMPLES

107717 This *sed* script simulates the BSD *cat -s* command, squeezing excess empty lines from standard input.

```
107719 sed -n '
107720 # Write non-empty lines.
107721 ./ {
107722     p
107723     d
107724 }
107725 # Write a single empty line, then look for more empty lines.
```

```

107726 /^$/      p
107727 # Get next line, discard the held <newline> (empty line),
107728 # and look for more empty lines.
107729 :Empty
107730 /^$/      {
107731     N
107732     s/.//
107733     b Empty
107734 }
107735 # Write the non-empty line before going back to search
107736 # for the first in a set of empty lines.
107737 p
107738 '

```

107739 The following *sed* command is a much simpler method of squeezing empty lines, although it is  
 107740 not quite the same as *cat -s* since it removes any initial empty lines:

```

107741 sed -n '/./,/^$/p'

```

#### 107742 RATIONALE

107743 This volume of POSIX.1-2008 requires implementations to support at least ten distinct *wfiles*,  
 107744 matching historical practice on many implementations. Implementations are encouraged to  
 107745 support more, but conforming applications should not exceed this limit.

107746 The exit status codes specified here are different from those in System V. System V returns 2 for  
 107747 garbled *sed* commands, but returns zero with its usage message or if the input file could not be  
 107748 opened. The standard developers considered this to be a bug.

107749 The manner in which the *l* command writes non-printable characters was changed to avoid the  
 107750 historical backspace-overstrike method, and other requirements to achieve unambiguous output  
 107751 were added. See the RATIONALE for *ed* for details of the format chosen, which is the same as  
 107752 that chosen for *sed*.

107753 This volume of POSIX.1-2008 requires implementations to provide pattern and hold spaces of at  
 107754 least 8 192 bytes, larger than the 4 000 bytes spaces used by some historical implementations, but  
 107755 less than the 20 480 bytes limit used in an early proposal. Implementations are encouraged to  
 107756 allocate dynamically larger pattern and hold spaces as needed.

107757 The requirements for acceptance of <blank> and <space> characters in command lines has been  
 107758 made more explicit than in early proposals to describe clearly the historical practice and to  
 107759 remove confusion about the phrase “protect initial blanks [*sic*] and tabs from the stripping that is  
 107760 done on every script line” that appears in much of the historical documentation of the *sed* utility  
 107761 description of text. (Not all implementations are known to have stripped <blank> characters  
 107762 from text lines, although they all have allowed leading <blank> characters preceding the address  
 107763 on a command line.)

107764 The treatment of ‘#’ comments differs from the SVID which only allows a comment as the first  
 107765 line of the script, but matches BSD-derived implementations. The comment character is treated  
 107766 as a command, and it has the same properties in terms of being accepted with leading <blank>  
 107767 characters; the BSD implementation has historically supported this.

107768 Early proposals required that a *script\_file* have at least one non-comment line. Some historical  
 107769 implementations have behaved in unexpected ways if this were not the case. The standard  
 107770 developers considered that this was incorrect behavior and that application developers should  
 107771 not have to avoid this feature. A correct implementation of this volume of POSIX.1-2008 shall  
 107772 permit *script\_files* that consist only of comment lines.

Early proposals indicated that if **-e** and **-f** options were intermixed, all **-e** options were processed before any **-f** options. This has been changed to process them in the order presented because it matches historical practice and is more intuitive.

The treatment of the **p** flag to the **s** command differs between System V and BSD-based systems when the default output is suppressed. In the two examples:

```
echo a | sed 's/a/A/p'
echo a | sed -n 's/a/A/p'
```

this volume of POSIX.1-2008, BSD, System V documentation, and the SVID indicate that the first example should write two lines with **A**, whereas the second should write one. Some System V systems write the **A** only once in both examples because the **p** flag is ignored if the **-n** option is not specified.

This is a case of a diametrical difference between systems that could not be reconciled through the compromise of declaring the behavior to be unspecified. The SVID/BSD/System V documentation behavior was adopted for this volume of POSIX.1-2008 because:

- No known documentation for any historic system describes the interaction between the **p** flag and the **-n** option.
- The selected behavior is more correct as there is no technical justification for any interaction between the **p** flag and the **-n** option. A relationship between **-n** and the **p** flag might imply that they are only used together, but this ignores valid scripts that interrupt the cyclical nature of the processing through the use of the **D**, **d**, **q**, or branching commands. Such scripts rely on the **p** suffix to write the pattern space because they do not make use of the default output at the “bottom” of the script.
- Because the **-n** option makes the **p** flag unnecessary, any interaction would only be useful if *sed* scripts were written to run both with and without the **-n** option. This is believed to be unlikely. It is even more unlikely that programmers have coded the **p** flag expecting it to be unnecessary. Because the interaction was not documented, the likelihood of a programmer discovering the interaction and depending on it is further decreased.
- Finally, scripts that break under the specified behavior produce too much output instead of too little, which is easier to diagnose and correct.

The form of the substitute command that uses the **n** suffix was limited to the first 512 matches in an early proposal. This limit has been removed because there is no reason an editor processing lines of {LINE\_MAX} length should have this restriction. The command **s/a/A/2047** should be able to substitute the 2047th occurrence of **a** on a line.

The **b**, **t**, and **:** commands are documented to ignore leading white space, but no mention is made of trailing white space. Historical implementations of *sed* assigned different locations to the labels **'x'** and **"x "**. This is not useful, and leads to subtle programming errors, but it is historical practice, and changing it could theoretically break working scripts. Implementors are encouraged to provide warning messages about labels that are never referenced by a **b** or **t** command, jumps to labels that do not exist, and label arguments that are subject to truncation.

Earlier versions of this standard allowed for implementations with bytes other than eight bits, but this has been modified in this version.

## FUTURE DIRECTIONS

None.

107816 **SEE ALSO**107817 *awk, ed, grep*

107818 XBD Table 5-1 (on page 121), Chapter 8 (on page 173), Section 9.3 (on page 183), Section 12.2 (on  
107819 page 216)

107820 **CHANGE HISTORY**

107821 First released in Issue 2.

107822 **Issue 5**

107823 The FUTURE DIRECTIONS section is added.

107824 **Issue 6**

107825 The following new requirements on POSIX implementations derive from alignment with the  
107826 Single UNIX Specification:

- 107827 • Implementations are required to support at least ten *wfile* arguments in an editing  
107828 command.

107829 The EXTENDED DESCRIPTION is changed to align with the IEEE P1003.2b draft standard.

107830 IEEE PASC Interpretation 1003.2 #190 is applied.

107831 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the meaning of the  
107832 <backslash>-escape sequences in a replacement string for a BRE.

107833 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/28 is applied, removing text describing  
107834 behavior on systems with bytes consisting of more than eight bits.

107835 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/29 is applied, making an editorial  
107836 correction within the Editing Commands in *sed* section.

107837 **Issue 7**

107838 Austin Group Interpretations 1003.1-2001 #006, #036, and #092 are applied.

107839 SD5-XCU-ERN-97 and SD5-XCU-ERN-123 are applied, updating the SYNOPSIS.

107840 A second example is added.

107841 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0133 [262], XCU/TC1-2008/0134  
107842 [282,431], XCU/TC1-2008/0135 [269], and XCU/TC1-2008/0136 [282,431] are applied.

107843 **NAME**107844 `sh` — shell, the standard command language interpreter107845 **SYNOPSIS**107846 `sh` [`-abCefhimnuvx`] [`-o option`]... [`+abCefhimnuvx`] [`+o option`]...  
107847 [`command_file` [`argument...`]]107848 `sh -c` [`-abCefhimnuvx`] [`-o option`]... [`+abCefhimnuvx`] [`+o option`]...  
107849 `command_string` [`command_name` [`argument...`]]107850 `sh -s` [`-abCefhimnuvx`] [`-o option`]... [`+abCefhimnuvx`] [`+o option`]...  
107851 [`argument...`]107852 **DESCRIPTION**107853 The `sh` utility is a command language interpreter that shall execute commands read from a  
107854 command line string, the standard input, or a specified file. The application shall ensure that the  
107855 commands to be executed are expressed in the language described in [Chapter 2](#) (on page 2335).

107856 Pathname expansion shall not fail due to the size of a file.

107857 Shell input and output redirections have an implementation-defined offset maximum that is  
107858 established in the open file description.107859 **OPTIONS**107860 The `sh` utility shall conform to XBD [Section 12.2](#) (on page 216), with an extension for support of a  
107861 leading <plus-sign> ('+') as noted below.107862 The `-a`, `-b`, `-C`, `-e`, `-f`, `-m`, `-n`, `-o option`, `-u`, `-v`, and `-x` options are described as part of the `set`  
107863 utility in [Section 2.14](#) (on page 2374). The option letters derived from the `set` special built-in shall  
107864 also be accepted with a leading <plus-sign> ('+') instead of a leading <hyphen-minus>  
107865 (meaning the reverse case of the option as described in this volume of POSIX.1-2008).

107866 The following additional options shall be supported:

107867 `-c` Read commands from the `command_string` operand. Set the value of special  
107868 parameter 0 (see [Section 2.5.2](#), on page 2340) from the value of the `command_name`  
107869 operand and the positional parameters (\$1, \$2, and so on) in sequence from the  
107870 remaining `argument` operands. No commands shall be read from the standard  
107871 input.107872 `-i` Specify that the shell is *interactive*; see below. An implementation may treat  
107873 specifying the `-i` option as an error if the real user ID of the calling process does  
107874 not equal the effective user ID or if the real group ID does not equal the effective  
107875 group ID.107876 `-s` Read commands from the standard input.107877 If there are no operands and the `-c` option is not specified, the `-s` option shall be assumed.107878 If the `-i` option is present, or if there are no operands and the shell's standard input and  
107879 standard error are attached to a terminal, the shell is considered to be *interactive*.107880 **OPERANDS**

107881 The following operands shall be supported:

107882 `-` A single <hyphen-minus> shall be treated as the first operand and then ignored. If  
107883 both `'-'` and `"--"` are given as arguments, or if other operands precede the single  
107884 <hyphen-minus>, the results are undefined.

107885 *argument* The positional parameters (\$1, \$2, and so on) shall be set to *arguments*, if any.

107886 *command\_file* The pathname of a file containing commands. If the pathname contains one or  
 107887 more <slash> characters, the implementation attempts to read that file; the file  
 107888 need not be executable. If the pathname does not contain a <slash> character:

- The implementation shall attempt to read that file from the current working  
 107889 directory; the file need not be executable.
- If the file is not in the current working directory, the implementation may  
 107890 perform a search for an executable file using the value of *PATH*, as described  
 107891 in [Section 2.9.1.1](#) (on page 2357).

107892  
 107893  
 107894 Special parameter 0 (see [Section 2.5.2](#), on page 2340) shall be set to the value of  
 107895 *command\_file*. If *sh* is called using a synopsis form that omits *command\_file*, special  
 107896 parameter 0 shall be set to the value of the first argument passed to *sh* from its  
 107897 parent (for example, *argv*[0] for a C program), which is normally a pathname used  
 107898 to execute the *sh* utility.

107899 *command\_name*  
 107900 A string assigned to special parameter 0 when executing the commands in  
 107901 *command\_string*. If *command\_name* is not specified, special parameter 0 shall be set  
 107902 to the value of the first argument passed to *sh* from its parent (for example, *argv*[0]  
 107903 for a C program), which is normally a pathname used to execute the *sh* utility.

107904 *command\_string*  
 107905 A string that shall be interpreted by the shell as one or more commands, as if the  
 107906 string were the argument to the *system()* function defined in the System Interfaces  
 107907 volume of POSIX.1-2008. If the *command\_string* operand is an empty string, *sh* shall  
 107908 exit with a zero exit status.

107909 **STDIN**

107910 The standard input shall be used only if one of the following is true:

- The *-s* option is specified.
- The *-c* option is not specified and no operands are specified.
- The script executes one or more commands that require input from standard input (such as  
 107913 a *read* command that does not redirect its input).

107914  
 107915 See the INPUT FILES section.

107916 When the shell is using standard input and it invokes a command that also uses standard input,  
 107917 the shell shall ensure that the standard input file pointer points directly after the command it has  
 107918 read when the command begins execution. It shall not read ahead in such a manner that any  
 107919 characters intended to be read by the invoked command are consumed by the shell (whether  
 107920 interpreted by the shell or not) or that characters that are not read by the invoked command are  
 107921 not seen by the shell. When the command expecting to read standard input is started  
 107922 asynchronously by an interactive shell, it is unspecified whether characters are read by the  
 107923 command or interpreted by the shell.

107924 If the standard input to *sh* is a FIFO or terminal device and is set to non-blocking reads, then *sh*  
 107925 shall enable blocking reads on standard input. This shall remain in effect when the command  
 107926 completes.

107927 **INPUT FILES**

107928 The input file shall be a text file, except that line lengths shall be unlimited. If the input file  
 107929 consists solely of zero or more blank lines and comments, *sh* shall exit with a zero exit status.

107930 **ENVIRONMENT VARIABLES**

107931 The following environment variables shall affect the execution of *sh*:

107932 UP **ENV** This variable, when and only when an interactive shell is invoked, shall be  
 107933 subjected to parameter expansion (see [Section 2.6.2](#), on page 2344) by the shell, and  
 107934 the resulting value shall be used as a pathname of a file containing shell  
 107935 commands to execute in the current environment. The file need not be executable.  
 107936 If the expanded value of *ENV* is not an absolute pathname, the results are  
 107937 unspecified. *ENV* shall be ignored if the real and effective user IDs or real and  
 107938 effective group IDs of the process are different.

107939 UP **FCEDIT** This variable, when expanded by the shell, shall determine the default value for  
 107940 the *-e editor* option's *editor* option-argument. If *FCEDIT* is null or unset, *ed* shall be  
 107941 used as the editor.

107942 UP **HISTFILE** Determine a pathname naming a command history file. If the *HISTFILE* variable is  
 107943 not set, the shell may attempt to access or create a file *.sh\_history* in the directory  
 107944 referred to by the *HOME* environment variable. If the shell cannot obtain both read  
 107945 and write access to, or create, the history file, it shall use an unspecified  
 107946 mechanism that allows the history to operate properly. (References to history  
 107947 "file" in this section shall be understood to mean this unspecified mechanism in  
 107948 such cases.) An implementation may choose to access this variable only when  
 107949 initializing the history file; this initialization shall occur when *fc* or *sh* first attempt  
 107950 to retrieve entries from, or add entries to, the file, as the result of commands issued  
 107951 by the user, the file named by the *ENV* variable, or implementation-defined system  
 107952 start-up files. Implementations may choose to disable the history list mechanism  
 107953 for users with appropriate privileges who do not set *HISTFILE*; the specific  
 107954 circumstances under which this occurs are implementation-defined. If more than  
 107955 one instance of the shell is using the same history file, it is unspecified how  
 107956 updates to the history file from those shells interact. As entries are deleted from the  
 107957 history file, they shall be deleted oldest first. It is unspecified when history file  
 107958 entries are physically removed from the history file.

107959 **HISTSIZE** Determine a decimal number representing the limit to the number of previous  
 107960 commands that are accessible. If this variable is unset, an unspecified default  
 107961 greater than or equal to 128 shall be used. The maximum number of commands in  
 107962 the history list is unspecified, but shall be at least 128. An implementation may  
 107963 choose to access this variable only when initializing the history file, as described  
 107964 under *HISTFILE*. Therefore, it is unspecified whether changes made to *HISTSIZE*  
 107965 after the history file has been initialized are effective.

107966 UP **HOME** Determine the pathname of the user's home directory. The contents of *HOME* are  
 107967 used in tilde expansion as described in [Section 2.6.1](#) (on page 2344).

107968 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 107969 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 107970 variables used to determine the values of locale categories.)

107971 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 107972 internationalization variables.

|        |     |                                                                                                                                |                                                                                                   |

| 107973 |     | <b>LC_COLLATE</b>                                                                                                              |                                                                                                   |
| 107974 |     | Determine the behavior of range expressions, equivalence classes, and multi-                                                   |                                                                                                   |
| 107975 |     | character collating elements within pattern matching.                                                                          |                                                                                                   |
| 107976 |     | <b>LC_CTYPE</b>                                                                                                                | Determine the locale for the interpretation of sequences of bytes of text data as                 |
| 107977 |     | characters (for example, single-byte as opposed to multi-byte characters in                                                    |                                                                                                   |
| 107978 |     | arguments and input files), which characters are defined as letters (character class                                           |                                                                                                   |
| 107979 |     | <b>alpha</b> ), and the behavior of character classes within pattern matching.                                                 |                                                                                                   |
| 107980 |     | <b>LC_MESSAGES</b>                                                                                                             |                                                                                                   |
| 107981 |     | Determine the locale that should be used to affect the format and contents of                                                  |                                                                                                   |
| 107982 |     | diagnostic messages written to standard error.                                                                                 |                                                                                                   |
| 107983 | UP  | <b>MAIL</b>                                                                                                                    | Determine a pathname of the user's mailbox file for purposes of incoming mail                     |
| 107984 |     | notification. If this variable is set, the shell shall inform the user if the file named                                       |                                                                                                   |
| 107985 |     | by the variable is created or if its modification time has changed. Informing the                                              |                                                                                                   |
| 107986 |     | user shall be accomplished by writing a string of unspecified format to standard                                               |                                                                                                   |
| 107987 |     | error prior to the writing of the next primary prompt string. Such check shall be                                              |                                                                                                   |
| 107988 |     | performed only after the completion of the interval defined by the <b>MAILCHECK</b>                                            |                                                                                                   |
| 107989 |     | variable after the last such check. The user shall be informed only if <b>MAIL</b> is set                                      |                                                                                                   |
| 107990 |     | and <b>MAILPATH</b> is not set.                                                                                                |                                                                                                   |
| 107991 | UP  | <b>MAILCHECK</b>                                                                                                               |                                                                                                   |
| 107992 |     | Establish a decimal integer value that specifies how often (in seconds) the shell                                              |                                                                                                   |
| 107993 |     | shall check for the arrival of mail in the files specified by the <b>MAILPATH</b> or <b>MAIL</b>                               |                                                                                                   |
| 107994 |     | variables. The default value shall be 600 seconds. If set to zero, the shell shall check                                       |                                                                                                   |
| 107995 |     | before issuing each primary prompt.                                                                                            |                                                                                                   |
| 107996 | UP  | <b>MAILPATH</b>                                                                                                                | Provide a list of pathnames and optional messages separated by <colon>                            |
| 107997 |     | characters. If this variable is set, the shell shall inform the user if any of the files                                       |                                                                                                   |
| 107998 |     | named by the variable are created or if any of their modification times change. (See                                           |                                                                                                   |
| 107999 |     | the preceding entry for <b>MAIL</b> for descriptions of mail arrival and user informing.)                                      |                                                                                                   |
| 108000 |     | Each pathname can be followed by ' % ' and a string that shall be subjected to                                                 |                                                                                                   |
| 108001 |     | parameter expansion and written to standard error when the modification time                                                   |                                                                                                   |
| 108002 |     | changes. If a ' % ' character in the pathname is preceded by a <backslash>, it shall                                           |                                                                                                   |
| 108003 |     | be treated as a literal ' % ' in the pathname. The default message is unspecified.                                             |                                                                                                   |
| 108004 |     | The <b>MAILPATH</b> environment variable takes precedence over the <b>MAIL</b> variable.                                       |                                                                                                   |
| 108005 | XSI | <b>NLSPATH</b>                                                                                                                 | Determine the location of message catalogs for the processing of <b>LC_MESSAGES</b> .             |
| 108006 |     | <b>PATH</b>                                                                                                                    | Establish a string formatted as described in XBD <a href="#">Chapter 8</a> (on page 173), used to |
| 108007 |     | effect command interpretation; see <a href="#">Section 2.9.1.1</a> (on page 2357).                                             |                                                                                                   |
| 108008 |     | <b>PWD</b>                                                                                                                     | This variable shall represent an absolute pathname of the current working                         |
| 108009 |     | directory. Assignments to this variable may be ignored.                                                                        |                                                                                                   |
| 108010 |     | <b>ASYNCHRONOUS EVENTS</b>                                                                                                     |                                                                                                   |
| 108011 |     | The <b>sh</b> utility shall take the standard action for all signals (see <a href="#">Section 1.4</a> , on page 2326) with the |                                                                                                   |
| 108012 |     | following exceptions.                                                                                                          |                                                                                                   |
| 108013 |     | If the shell is interactive, SIGINT signals received during command line editing shall be handled                              |                                                                                                   |
| 108014 |     | as described in the EXTENDED DESCRIPTION, and SIGINT signals received at other times                                           |                                                                                                   |
| 108015 |     | shall be caught but no action performed.                                                                                       |                                                                                                   |
| 108016 |     | If the shell is interactive:                                                                                                   |                                                                                                   |

- 108017 • SIGQUIT and SIGTERM signals shall be ignored.
  - 108018 • If the `-m` option is in effect, SIGTTIN, SIGTTOU, and SIGTSTP signals shall be ignored.
  - 108019 • If the `-m` option is not in effect, it is unspecified whether SIGTTIN, SIGTTOU, and
  - 108020 SIGTSTP signals are ignored, set to the default action, or caught. If they are caught, the
  - 108021 shell shall, in the signal-catching function, set the signal to the default action and raise the
  - 108022 signal (after taking any appropriate steps, such as restoring terminal settings).
- 108023 The standard actions, and the actions described above for interactive shells, can be overridden
- 108024 by use of the *trap* special built-in utility (see *trap* (on page 2410) and [Section 2.11](#), on page 2371).

## 108025 STDOUT

108026 See the STDERR section.

## 108027 STDERR

108028 Except as otherwise stated (by the descriptions of any invoked utilities or in interactive mode),

108029 standard error shall be used only for diagnostic messages.

## 108030 OUTPUT FILES

108031 None.

## 108032 EXTENDED DESCRIPTION

108033 UP See [Chapter 2](#). The functionality described in the rest of the EXTENDED DESCRIPTION section

108034 shall be provided on implementations that support the User Portability Utilities option (and the

108035 rest of this section is not further shaded for this option).

## 108036 Command History List

108037 When the *sh* utility is being used interactively, it shall maintain a list of commands previously

108038 entered from the terminal in the file named by the *HISTFILE* environment variable. The type,

108039 size, and internal format of this file are unspecified. Multiple *sh* processes can share access to the

108040 file for a user, if file access permissions allow this; see the description of the *HISTFILE*

108041 environment variable.

## 108042 Command Line Editing

108043 When *sh* is being used interactively from a terminal, the current command and the command

108044 history (see *fc*) can be edited using *vi*-mode command line editing. This mode uses commands,

108045 described below, similar to a subset of those described in the *vi* utility. Implementations may

108046 offer other command line editing modes corresponding to other editing utilities.

108047 The command `set -o vi` shall enable *vi*-mode editing and place *sh* into *vi* insert mode (see

108048 [Command Line Editing \(vi-mode\)](#), on page 3220). This command also shall disable any other

108049 editing mode that the implementation may provide. The command `set +o vi` disables *vi*-mode

108050 editing.

108051 Certain block-mode terminals may be unable to support shell command line editing. If a

108052 terminal is unable to provide either edit mode, it need not be possible to `set -o vi` when using the

108053 shell on this terminal.

108054 In the following sections, the characters *erase*, *interrupt*, *kill*, and *end-of-file* are those set by the

108055 *stty* utility.

## Command Line Editing (vi-mode)

In *vi* editing mode, there shall be a distinguished line, the edit line. All the editing operations which modify a line affect the edit line. The edit line is always the newest line in the command history buffer.

With *vi*-mode enabled, *sh* can be switched between insert mode and command mode.

When in insert mode, an entered character shall be inserted into the command line, except as noted in [vi Line Editing Insert Mode](#). Upon entering *sh* and after termination of the previous command, *sh* shall be in insert mode.

Typing an escape character shall switch *sh* into command mode (see [vi Line Editing Command Mode](#), on page 3221). In command mode, an entered character shall either invoke a defined operation, be used as part of a multi-character operation, or be treated as an error. A character that is not recognized as part of an editing command shall terminate any specific editing command and shall alert the terminal. If *sh* receives a SIGINT signal in command mode (whether generated by typing the *interrupt* character or by other means), it shall terminate command line editing on the current command line, reissue the prompt on the next line of the terminal, and reset the command history (see *fc*) so that the most recently executed command is the previous command (that is, the command that was being edited when it was interrupted is not re-entered into the history).

In the following sections, the phrase “move the cursor to the beginning of the word” shall mean “move the cursor to the first character of the current word” and the phrase “move the cursor to the end of the word” shall mean “move the cursor to the last character of the current word”. The phrase “beginning of the command line” indicates the point between the end of the prompt string issued by the shell (or the beginning of the terminal line, if there is no prompt string) and the first character of the command text.

## vi Line Editing Insert Mode

While in insert mode, any character typed shall be inserted in the current command line, unless it is from the following set.

**<newline>** Execute the current command line. If the current command line is not empty, this line shall be entered into the command history (see *fc*).

**erase** Delete the character previous to the current cursor position and move the current cursor position back one character. In insert mode, characters shall be erased from both the screen and the buffer when backspacing.

**interrupt** If *sh* receives a SIGINT signal in insert mode (whether generated by typing the *interrupt* character or by other means), it shall terminate command line editing with the same effects as described for interrupting command mode; see [Command Line Editing \(vi-mode\)](#).

**kill** Clear all the characters from the input line.

**<control>-V** Insert the next character input, even if the character is otherwise a special insert mode character.

**<control>-W** Delete the characters from the one preceding the cursor to the preceding word boundary. The word boundary in this case is the closer to the cursor of either the beginning of the line or a character that is in neither the **blank** nor **punct** character classification of the current locale.

108099 *end-of-file* Interpreted as the end of input in *sh*. This interpretation shall occur only at the  
 108100 beginning of an input line. If *end-of-file* is entered other than at the beginning of the  
 108101 line, the results are unspecified.

108102 <ESC> Place *sh* into command mode.

### 108103 **vi Line Editing Command Mode**

108104 In command mode for the command line editing feature, decimal digits not beginning with 0  
 108105 that precede a command letter shall be remembered. Some commands use these decimal digits  
 108106 as a count number that affects the operation.

108107 The term *motion command* represents one of the commands:

108108 <space> 0 b F l W ^ \$ ; E f T w | , B e h t

108109 If the current line is not the edit line, any command that modifies the current line shall cause the  
 108110 content of the current line to replace the content of the edit line, and the current line shall  
 108111 become the edit line. This replacement cannot be undone (see the **u** and **U** commands below).  
 108112 The modification requested shall then be performed to the edit line. When the current line is the  
 108113 edit line, the modification shall be done directly to the edit line.

108114 Any command that is preceded by *count* shall take a count (the numeric value of any preceding  
 108115 decimal digits). Unless otherwise noted, this count shall cause the specified operation to repeat  
 108116 by the number of times specified by the count. Also unless otherwise noted, a *count* that is out  
 108117 of range is considered an error condition and shall alert the terminal, but neither the cursor  
 108118 position, nor the command line, shall change.

108119 The terms *word* and *bigword* are used as defined in the *vi* description. The term *save buffer*  
 108120 corresponds to the term *unnamed buffer* in *vi*.

108121 The following commands shall be recognized in command mode:

108122 <newline> Execute the current command line. If the current command line is not empty, this  
 108123 line shall be entered into the command history (see *fc*).

108124 <control>-L Redraw the current command line. Position the cursor at the same location on the  
 108125 redrawn line.

108126 # Insert the character '#' at the beginning of the current command line and treat the  
 108127 resulting edit line as a comment. This line shall be entered into the command  
 108128 history; see *fc*.

108129 = Display the possible shell word expansions (see [Section 2.6](#), on page 2343) of the  
 108130 bigword at the current command line position.

108131 **Note:** This does not modify the content of the current line, and therefore does not cause  
 108132 the current line to become the edit line.

108133 These expansions shall be displayed on subsequent terminal lines. If the bigword  
 108134 contains none of the characters '?', '\*', or '[', an <asterisk> ('\*') shall be  
 108135 implicitly assumed at the end. If any directories are matched, these expansions  
 108136 shall have a '/' character appended. After the expansion, the line shall be  
 108137 redrawn, the cursor repositioned at the current cursor position, and *sh* shall be  
 108138 placed in command mode.

108139 \ Perform pathname expansion (see [Section 2.6.6](#), on page 2350) on the current  
 108140 bigword, up to the largest set of characters that can be matched uniquely. If the  
 108141 bigword contains none of the characters '?', '\*', or '[', an <asterisk> ('\*')  
 108142 shall be implicitly assumed at the end. This maximal expansion then shall replace

|        |                |                                                                                                        |
|--------|----------------|--------------------------------------------------------------------------------------------------------|
| 108143 |                | the original bigword in the command line, and the cursor shall be placed after this                    |
| 108144 |                | expansion. If the resulting bigword completely and uniquely matches a directory, a                     |
| 108145 |                | '/' character shall be inserted directly after the bigword. If some other file is                      |
| 108146 |                | completely matched, a single <space> shall be inserted after the bigword. After                        |
| 108147 |                | this operation, <i>sh</i> shall be placed in insert mode.                                              |
| 108148 | *              | Perform pathname expansion on the current bigword and insert all expansions                            |
| 108149 |                | into the command to replace the current bigword, with each expansion separated                         |
| 108150 |                | by a single <space>. If at the end of the line, the current cursor position shall be                   |
| 108151 |                | moved to the first column position following the expansions and <i>sh</i> shall be placed              |
| 108152 |                | in insert mode. Otherwise, the current cursor position shall be the last column                        |
| 108153 |                | position of the first character after the expansions and <i>sh</i> shall be placed in insert           |
| 108154 |                | mode. If the current bigword contains none of the characters '?', '*', or '[',                         |
| 108155 |                | before the operation, an <asterisk> ('*') shall be implicitly assumed at the end.                      |
| 108156 | @letter        | Insert the value of the alias named <i>_letter</i> . The symbol <i>letter</i> represents a single      |
| 108157 |                | alphabetic character from the portable character set; implementations may support                      |
| 108158 |                | additional characters as an extension. If the alias <i>_letter</i> contains other editing              |
| 108159 |                | commands, these commands shall be performed as part of the insertion. If no alias                      |
| 108160 |                | <i>_letter</i> is enabled, this command shall have no effect.                                          |
| 108161 | [count]~       | Convert, if the current character is a lowercase letter, to the equivalent uppercase                   |
| 108162 |                | letter and <i>vice versa</i> , as prescribed by the current locale. The current cursor position        |
| 108163 |                | then shall be advanced by one character. If the cursor was positioned on the last                      |
| 108164 |                | character of the line, the case conversion shall occur, but the cursor shall not                       |
| 108165 |                | advance. If the '~' command is preceded by a <i>count</i> , that number of characters                  |
| 108166 |                | shall be converted, and the cursor shall be advanced to the character position after                   |
| 108167 |                | the last character converted. If the <i>count</i> is larger than the number of characters              |
| 108168 |                | after the cursor, this shall not be considered an error; the cursor shall advance to                   |
| 108169 |                | the last character on the line.                                                                        |
| 108170 | [count].       | Repeat the most recent non-motion command, even if it was executed on an earlier                       |
| 108171 |                | command line. If the previous command was preceded by a <i>count</i> , and no count is                 |
| 108172 |                | given on the '.' command, the count from the previous command shall be                                 |
| 108173 |                | included as part of the repeated command. If the '.' command is preceded by a                          |
| 108174 |                | <i>count</i> , this shall override any <i>count</i> argument to the previous command. The <i>count</i> |
| 108175 |                | specified in the '.' command shall become the count for subsequent '.'                                 |
| 108176 |                | commands issued without a count.                                                                       |
| 108177 | [number]v      | Invoke the <i>vi</i> editor to edit the current command line in a temporary file. When the             |
| 108178 |                | editor exits, the commands in the temporary file shall be executed and placed in                       |
| 108179 |                | the command history. If a <i>number</i> is included, it specifies the command number in                |
| 108180 |                | the command history to be edited, rather than the current command line.                                |
| 108181 | [count]l (ell) |                                                                                                        |
| 108182 | [count]<space> |                                                                                                        |
| 108183 |                | Move the current cursor position to the next character position. If the cursor was                     |
| 108184 |                | positioned on the last character of the line, the terminal shall be alerted and the                    |
| 108185 |                | cursor shall not be advanced. If the <i>count</i> is larger than the number of characters              |
| 108186 |                | after the cursor, this shall not be considered an error; the cursor shall advance to                   |
| 108187 |                | the last character on the line.                                                                        |
| 108188 | [count]h       | Move the current cursor position to the <i>count</i> th (default 1) previous character                 |
| 108189 |                | position. If the cursor was positioned on the first character of the line, the terminal                |
| 108190 |                | shall be alerted and the cursor shall not be moved. If the count is larger than the                    |

|        |                  |                                                                                               |
|--------|------------------|-----------------------------------------------------------------------------------------------|
| 108191 |                  | number of characters before the cursor, this shall not be considered an error; the            |
| 108192 |                  | cursor shall move to the first character on the line.                                         |
| 108193 | <b>[count]w</b>  | Move to the start of the next word. If the cursor was positioned on the last                  |
| 108194 |                  | character of the line, the terminal shall be alerted and the cursor shall not be              |
| 108195 |                  | advanced. If the <i>count</i> is larger than the number of words after the cursor, this shall |
| 108196 |                  | not be considered an error; the cursor shall advance to the last character on the             |
| 108197 |                  | line.                                                                                         |
| 108198 | <b>[count]W</b>  | Move to the start of the next bigword. If the cursor was positioned on the last               |
| 108199 |                  | character of the line, the terminal shall be alerted and the cursor shall not be              |
| 108200 |                  | advanced. If the <i>count</i> is larger than the number of bigwords after the cursor, this    |
| 108201 |                  | shall not be considered an error; the cursor shall advance to the last character on           |
| 108202 |                  | the line.                                                                                     |
| 108203 | <b>[count]e</b>  | Move to the end of the current word. If at the end of a word, move to the end of              |
| 108204 |                  | the next word. If the cursor was positioned on the last character of the line, the            |
| 108205 |                  | terminal shall be alerted and the cursor shall not be advanced. If the <i>count</i> is larger |
| 108206 |                  | than the number of words after the cursor, this shall not be considered an error; the         |
| 108207 |                  | cursor shall advance to the last character on the line.                                       |
| 108208 | <b>[count]E</b>  | Move to the end of the current bigword. If at the end of a bigword, move to the               |
| 108209 |                  | end of the next bigword. If the cursor was positioned on the last character of the            |
| 108210 |                  | line, the terminal shall be alerted and the cursor shall not be advanced. If the <i>count</i> |
| 108211 |                  | is larger than the number of bigwords after the cursor, this shall not be considered          |
| 108212 |                  | an error; the cursor shall advance to the last character on the line.                         |
| 108213 | <b>[count]b</b>  | Move to the beginning of the current word. If at the beginning of a word, move to             |
| 108214 |                  | the beginning of the previous word. If the cursor was positioned on the first                 |
| 108215 |                  | character of the line, the terminal shall be alerted and the cursor shall not be              |
| 108216 |                  | moved. If the <i>count</i> is larger than the number of words preceding the cursor, this      |
| 108217 |                  | shall not be considered an error; the cursor shall return to the first character on the       |
| 108218 |                  | line.                                                                                         |
| 108219 | <b>[count]B</b>  | Move to the beginning of the current bigword. If at the beginning of a bigword,               |
| 108220 |                  | move to the beginning of the previous bigword. If the cursor was positioned on the            |
| 108221 |                  | first character of the line, the terminal shall be alerted and the cursor shall not be        |
| 108222 |                  | moved. If the <i>count</i> is larger than the number of bigwords preceding the cursor,        |
| 108223 |                  | this shall not be considered an error; the cursor shall return to the first character on      |
| 108224 |                  | the line.                                                                                     |
| 108225 | <b>^</b>         | Move the current cursor position to the first character on the input line that is not a       |
| 108226 |                  | <blank>.                                                                                      |
| 108227 | <b>\$</b>        | Move to the last character position on the current command line.                              |
| 108228 | <b>0</b>         | (Zero.) Move to the first character position on the current command line.                     |
| 108229 | <b>[count] l</b> | Move to the <i>count</i> th character position on the current command line. If no number      |
| 108230 |                  | is specified, move to the first position. The first character position shall be               |
| 108231 |                  | numbered 1. If the count is larger than the number of characters on the line, this            |
| 108232 |                  | shall not be considered an error; the cursor shall be placed on the last character on         |
| 108233 |                  | the line.                                                                                     |
| 108234 | <b>[count]fc</b> | Move to the first occurrence of the character 'c' that occurs after the current               |
| 108235 |                  | cursor position. If the cursor was positioned on the last character of the line, the          |
| 108236 |                  | terminal shall be alerted and the cursor shall not be advanced. If the character 'c'          |

|        |                       |                                                                                                          |
|--------|-----------------------|----------------------------------------------------------------------------------------------------------|
| 108237 |                       | does not occur in the line after the current cursor position, the terminal shall be                      |
| 108238 |                       | alerted and the cursor shall not be moved.                                                               |
| 108239 | <b>[count]Fc</b>      | Move to the first occurrence of the character 'c' that occurs before the current                         |
| 108240 |                       | cursor position. If the cursor was positioned on the first character of the line, the                    |
| 108241 |                       | terminal shall be alerted and the cursor shall not be moved. If the character 'c'                        |
| 108242 |                       | does not occur in the line before the current cursor position, the terminal shall be                     |
| 108243 |                       | alerted and the cursor shall not be moved.                                                               |
| 108244 | <b>[count]tc</b>      | Move to the character before the first occurrence of the character 'c' that occurs                       |
| 108245 |                       | after the current cursor position. If the cursor was positioned on the last character                    |
| 108246 |                       | of the line, the terminal shall be alerted and the cursor shall not be advanced. If the                  |
| 108247 |                       | character 'c' does not occur in the line after the current cursor position, the                          |
| 108248 |                       | terminal shall be alerted and the cursor shall not be moved.                                             |
| 108249 | <b>[count]Tc</b>      | Move to the character after the first occurrence of the character 'c' that occurs                        |
| 108250 |                       | before the current cursor position. If the cursor was positioned on the first                            |
| 108251 |                       | character of the line, the terminal shall be alerted and the cursor shall not be                         |
| 108252 |                       | moved. If the character 'c' does not occur in the line before the current cursor                         |
| 108253 |                       | position, the terminal shall be alerted and the cursor shall not be moved.                               |
| 108254 | <b>[count];</b>       | Repeat the most recent <b>f</b> , <b>F</b> , <b>t</b> , or <b>T</b> command. Any number argument on that |
| 108255 |                       | previous command shall be ignored. Errors are those described for the repeated                           |
| 108256 |                       | command.                                                                                                 |
| 108257 | <b>[count],</b>       | Repeat the most recent <b>f</b> , <b>F</b> , <b>t</b> , or <b>T</b> command. Any number argument on that |
| 108258 |                       | previous command shall be ignored. However, reverse the direction of that                                |
| 108259 |                       | command.                                                                                                 |
| 108260 | <b>a</b>              | Enter insert mode after the current cursor position. Characters that are entered                         |
| 108261 |                       | shall be inserted before the next character.                                                             |
| 108262 | <b>A</b>              | Enter insert mode after the end of the current command line.                                             |
| 108263 | <b>i</b>              | Enter insert mode at the current cursor position. Characters that are entered shall                      |
| 108264 |                       | be inserted before the current character.                                                                |
| 108265 | <b>I</b>              | Enter insert mode at the beginning of the current command line.                                          |
| 108266 | <b>R</b>              | Enter insert mode, replacing characters from the command line beginning at the                           |
| 108267 |                       | current cursor position.                                                                                 |
| 108268 | <b>[count]cmotion</b> |                                                                                                          |
| 108269 |                       | Delete the characters between the current cursor position and the cursor position                        |
| 108270 |                       | that would result from the specified motion command. Then enter insert mode                              |
| 108271 |                       | before the first character following any deleted characters. If <i>count</i> is specified, it            |
| 108272 |                       | shall be applied to the motion command. A <i>count</i> shall be ignored for the following                |
| 108273 |                       | motion commands:                                                                                         |
| 108274 |                       | 0      ^      \$      c                                                                                  |
| 108275 |                       | If the motion command is the character 'c', the current command line shall be                            |
| 108276 |                       | cleared and insert mode shall be entered. If the motion command would move the                           |
| 108277 |                       | current cursor position toward the beginning of the command line, the character                          |
| 108278 |                       | under the current cursor position shall not be deleted. If the motion command                            |
| 108279 |                       | would move the current cursor position toward the end of the command line, the                           |
| 108280 |                       | character under the current cursor position shall be deleted. If the <i>count</i> is larger              |
| 108281 |                       | than the number of characters between the current cursor position and the end of                         |

|        |                       |                                                                                                   |
|--------|-----------------------|---------------------------------------------------------------------------------------------------|
| 108282 |                       | the command line toward which the motion command would move the cursor, this                      |
| 108283 |                       | shall not be considered an error; all of the remaining characters in the                          |
| 108284 |                       | aforementioned range shall be deleted and insert mode shall be entered. If the                    |
| 108285 |                       | motion command is invalid, the terminal shall be alerted, the cursor shall not be                 |
| 108286 |                       | moved, and no text shall be deleted.                                                              |
| 108287 | <b>C</b>              | Delete from the current character to the end of the line and enter insert mode at the             |
| 108288 |                       | new end-of-line.                                                                                  |
| 108289 | <b>S</b>              | Clear the entire edit line and enter insert mode.                                                 |
| 108290 | <b>[count]rc</b>      | Replace the current character with the character 'c'. With a number <i>count</i> ,                |
| 108291 |                       | replace the current and the following <i>count</i> –1 characters. After this command, the         |
| 108292 |                       | current cursor position shall be on the last character that was changed. If the <i>count</i>      |
| 108293 |                       | is larger than the number of characters after the cursor, this shall not be considered            |
| 108294 |                       | an error; all of the remaining characters shall be changed.                                       |
| 108295 | <b>[count]_</b>       | Append a <space> after the current character position and then append the last                    |
| 108296 |                       | bigword in the previous input line after the <space>. Then enter insert mode after                |
| 108297 |                       | the last character just appended. With a number <i>count</i> , append the <i>count</i> th bigword |
| 108298 |                       | in the previous line.                                                                             |
| 108299 | <b>[count]x</b>       | Delete the character at the current cursor position and place the deleted characters              |
| 108300 |                       | in the save buffer. If the cursor was positioned on the last character of the line, the           |
| 108301 |                       | character shall be deleted and the cursor position shall be moved to the previous                 |
| 108302 |                       | character (the new last character). If the <i>count</i> is larger than the number of              |
| 108303 |                       | characters after the cursor, this shall not be considered an error; all the characters            |
| 108304 |                       | from the cursor to the end of the line shall be deleted.                                          |
| 108305 | <b>[count]X</b>       | Delete the character before the current cursor position and place the deleted                     |
| 108306 |                       | characters in the save buffer. The character under the current cursor position shall              |
| 108307 |                       | not change. If the cursor was positioned on the first character of the line, the                  |
| 108308 |                       | terminal shall be alerted, and the X command shall have no effect. If the line                    |
| 108309 |                       | contained a single character, the X command shall have no effect. If the line                     |
| 108310 |                       | contained no characters, the terminal shall be alerted and the cursor shall not be                |
| 108311 |                       | moved. If the <i>count</i> is larger than the number of characters before the cursor, this        |
| 108312 |                       | shall not be considered an error; all the characters from before the cursor to the                |
| 108313 |                       | beginning of the line shall be deleted.                                                           |
| 108314 | <b>[count]dmotion</b> |                                                                                                   |
| 108315 |                       | Delete the characters between the current cursor position and the character                       |
| 108316 |                       | position that would result from the motion command. A number <i>count</i> repeats the             |
| 108317 |                       | motion command <i>count</i> times. If the motion command would move toward the                    |
| 108318 |                       | beginning of the command line, the character under the current cursor position                    |
| 108319 |                       | shall not be deleted. If the motion command is <b>d</b> , the entire current command line         |
| 108320 |                       | shall be cleared. If the <i>count</i> is larger than the number of characters between the         |
| 108321 |                       | current cursor position and the end of the command line toward which the motion                   |
| 108322 |                       | command would move the cursor, this shall not be considered an error; all of the                  |
| 108323 |                       | remaining characters in the aforementioned range shall be deleted. The deleted                    |
| 108324 |                       | characters shall be placed in the save buffer.                                                    |
| 108325 | <b>D</b>              | Delete all characters from the current cursor position to the end of the line. The                |
| 108326 |                       | deleted characters shall be placed in the save buffer.                                            |

|        |                                |                                                                                                 |
|--------|--------------------------------|-------------------------------------------------------------------------------------------------|
| 108327 | <b>[count]ymotion</b>          |                                                                                                 |
| 108328 |                                | Yank (that is, copy) the characters from the current cursor position to the position            |
| 108329 |                                | resulting from the motion command into the save buffer. A number <i>count</i> shall be          |
| 108330 |                                | applied to the motion command. If the motion command would move toward the                      |
| 108331 |                                | beginning of the command line, the character under the current cursor position                  |
| 108332 |                                | shall not be included in the set of yanked characters. If the motion command is <b>y</b> ,      |
| 108333 |                                | the entire current command line shall be yanked into the save buffer. The current               |
| 108334 |                                | cursor position shall be unchanged. If the <i>count</i> is larger than the number of            |
| 108335 |                                | characters between the current cursor position and the end of the command line                  |
| 108336 |                                | toward which the motion command would move the cursor, this shall not be                        |
| 108337 |                                | considered an error; all of the remaining characters in the aforementioned range                |
| 108338 |                                | shall be yanked.                                                                                |
| 108339 | <b>Y</b>                       | Yank the characters from the current cursor position to the end of the line into the            |
| 108340 |                                | save buffer. The current character position shall be unchanged.                                 |
| 108341 | <b>[count]p</b>                | Put a copy of the current contents of the save buffer after the current cursor                  |
| 108342 |                                | position. The current cursor position shall be advanced to the last character put               |
| 108343 |                                | from the save buffer. A <i>count</i> shall indicate how many copies of the save buffer          |
| 108344 |                                | shall be put.                                                                                   |
| 108345 | <b>[count]P</b>                | Put a copy of the current contents of the save buffer before the current cursor                 |
| 108346 |                                | position. The current cursor position shall be moved to the last character put from             |
| 108347 |                                | the save buffer. A <i>count</i> shall indicate how many copies of the save buffer shall be      |
| 108348 |                                | put.                                                                                            |
| 108349 | <b>u</b>                       | Undo the last command that changed the edit line. This operation shall not undo                 |
| 108350 |                                | the copy of any command line to the edit line.                                                  |
| 108351 | <b>U</b>                       | Undo all changes made to the edit line. This operation shall not undo the copy of               |
| 108352 |                                | any command line to the edit line.                                                              |
| 108353 | <b>[count]k</b>                |                                                                                                 |
| 108354 | <b>[count]–</b>                | Set the current command line to be the <i>count</i> th previous command line in the shell       |
| 108355 |                                | command history. If <i>count</i> is not specified, it shall default to 1. The cursor shall be   |
| 108356 |                                | positioned on the first character of the new command. If a <b>k</b> or <b>–</b> command would   |
| 108357 |                                | retreat past the maximum number of commands in effect for this shell (affected by               |
| 108358 |                                | the <i>HISTSIZE</i> environment variable), the terminal shall be alerted, and the               |
| 108359 |                                | command shall have no effect.                                                                   |
| 108360 | <b>[count]j</b>                |                                                                                                 |
| 108361 | <b>[count]+</b>                | Set the current command line to be the <i>count</i> th next command line in the shell           |
| 108362 |                                | command history. If <i>count</i> is not specified, it shall default to 1. The cursor shall be   |
| 108363 |                                | positioned on the first character of the new command. If a <b>j</b> or <b>+</b> command         |
| 108364 |                                | advances past the edit line, the current command line shall be restored to the edit             |
| 108365 |                                | line and the terminal shall be alerted.                                                         |
| 108366 | <b>[number]G</b>               | Set the current command line to be the oldest command line stored in the shell                  |
| 108367 |                                | command history. With a number <i>number</i> , set the current command line to be the           |
| 108368 |                                | command line <i>number</i> in the history. If command line <i>number</i> does not exist, the    |
| 108369 |                                | terminal shall be alerted and the command line shall not be changed.                            |
| 108370 | <b>/pattern&lt;newline&gt;</b> |                                                                                                 |
| 108371 |                                | Move backwards through the command history, searching for the specified                         |
| 108372 |                                | pattern, beginning with the previous command line. Patterns use the pattern                     |
| 108373 |                                | matching notation described in <a href="#">Section 2.13</a> (on page 2372), except that the ‘^’ |

108374 character shall have special meaning when it appears as the first character of  
 108375 *pattern*. In this case, the '^' is discarded and the characters after the '^' shall be  
 108376 matched only at the beginning of a line. Commands in the command history shall  
 108377 be treated as strings, not as filenames. If the pattern is not found, the current  
 108378 command line shall be unchanged and the terminal shall be alerted. If it is found in  
 108379 a previous line, the current command line shall be set to that line and the cursor  
 108380 shall be set to the first character of the new command line.

108381 If *pattern* is empty, the last non-empty pattern provided to / or ? shall be used. If  
 108382 there is no previous non-empty pattern, the terminal shall be alerted and the  
 108383 current command line shall remain unchanged.

108384 ?*pattern*<newline>

108385 Move forwards through the command history, searching for the specified pattern,  
 108386 beginning with the next command line. Patterns use the pattern matching notation  
 108387 described in [Section 2.13](#) (on page 2372), except that the '^' character shall have  
 108388 special meaning when it appears as the first character of *pattern*. In this case, the  
 108389 '^' is discarded and the characters after the '^' shall be matched only at the  
 108390 beginning of a line. Commands in the command history shall be treated as strings,  
 108391 not as filenames. If the pattern is not found, the current command line shall be  
 108392 unchanged and the terminal shall be alerted. If it is found in a following line, the  
 108393 current command line shall be set to that line and the cursor shall be set to the first  
 108394 character of the new command line.

108395 If *pattern* is empty, the last non-empty pattern provided to / or ? shall be used. If  
 108396 there is no previous non-empty pattern, the terminal shall be alerted and the  
 108397 current command line shall remain unchanged.

108398 **n** Repeat the most recent / or ? command. If there is no previous / or ?, the terminal  
 108399 shall be alerted and the current command line shall remain unchanged.

108400 **N** Repeat the most recent / or ? command, reversing the direction of the search. If  
 108401 there is no previous / or ?, the terminal shall be alerted and the current command  
 108402 line shall remain unchanged.

## 108403 EXIT STATUS

108404 The following exit values shall be returned:

108405 0 The script to be executed consisted solely of zero or more blank lines or comments, or  
 108406 both.

108407 1-125 A non-interactive shell detected an error other than *command\_file* not found or  
 108408 executable, including but not limited to syntax, redirection, or variable assignment  
 108409 errors.

108410 126 A specified *command\_file* could not be executed due to an [ENOEXEC] error (see [Section](#)  
 108411 [2.9.1.1](#) (on page 2357), item 2).

108412 127 A specified *command\_file* could not be found by a non-interactive shell.

108413 Otherwise, the shell shall return the exit status of the last command it invoked or attempted to  
 108414 invoke (see also the *exit* utility in [Section 2.14](#), on page 2374).

## 108415 CONSEQUENCES OF ERRORS

108416 See [Section 2.8.1](#) (on page 2353).

## APPLICATION USAGE

Standard input and standard error are the files that determine whether a shell is interactive when `-i` is not specified. For example:

```
sh > file
```

and:

```
sh 2> file
```

create interactive and non-interactive shells, respectively. Although both accept terminal input, the results of error conditions are different, as described in [Section 2.8.1](#) (on page 2353); in the second example a redirection error encountered by a special built-in utility aborts the shell.

A conforming application must protect its first operand, if it starts with a `<plus-sign>`, by preceding it with the `--` argument that denotes the end of the options.

Applications should note that the standard *PATH* to the shell cannot be assumed to be either `/bin/sh` or `/usr/bin/sh`, and should be determined by interrogation of the *PATH* returned by *getconf PATH*, ensuring that the returned pathname is an absolute pathname and not a shell built-in.

For example, to determine the location of the standard *sh* utility:

```
command -v sh
```

On some implementations this might return:

```
/usr/xpg4/bin/sh
```

Furthermore, on systems that support executable scripts (the `"#!"` construct), it is recommended that applications using executable scripts install them using *getconf PATH* to determine the shell pathname and update the `"#!"` script appropriately as it is being installed (for example, with *sed*). For example:

```
#
# Installation time script to install correct POSIX shell pathname
#
# Get list of paths to check
#
Sifs=$IFS
Sifs_set=${IFS+y}
IFS=:
set -- $(getconf PATH)
if [ "$Sifs_set" = y ]
then
    IFS=$Sifs
else
    unset IFS
fi
#
# Check each path for 'sh'
#
for i
do
    if [ -x "${i}"/sh ]
    then
        Pshell=${i}/sh
```

```

108463         fi
108464     done
108465     #
108466     # This is the list of scripts to update. They should be of the
108467     # form '${name}.source' and will be transformed to '${name}'.
108468     # Each script should begin:
108469     #
108470     # #!INSTALLSHELLPATH
108471     #
108472     scripts="a b c"
108473     #
108474     # Transform each script
108475     #
108476     for i in ${scripts}
108477     do
108478         sed -e "s|INSTALLSHELLPATH|${Pshell}|" < ${i}.source > ${i}
108479     done

```

#### 108480 EXAMPLES

- 108481 1. Execute a shell command from a string:
- 108482 `sh -c "cat myfile"`
- 108483 2. Execute a shell script from a file in the current directory:
- 108484 `sh my_shell_cmds`

#### 108485 RATIONALE

108486 The *sh* utility and the *set* special built-in utility share a common set of options.

108487 The name *IFS* was originally an abbreviation of “Input Field Separators”; however, this name is  
 108488 misleading as the *IFS* characters are actually used as field terminators. One justification for  
 108489 ignoring the contents of *IFS* upon entry to the script, beyond security considerations, is to assist  
 108490 possible future shell compilers. Allowing *IFS* to be imported from the environment prevents  
 108491 many optimizations that might otherwise be performed via dataflow analysis of the script itself.

108492 The text in the STDIN section about non-blocking reads concerns an instance of *sh* that has been  
 108493 invoked, probably by a C-language program, with standard input that has been opened using  
 108494 the `O_NONBLOCK` flag; see `open()` in the System Interfaces volume of POSIX.1-2008. If the shell  
 108495 did not reset this flag, it would immediately terminate because no input data would be available  
 108496 yet and that would be considered the same as end-of-file.

108497 The options associated with a *restricted shell* (command name *rsh* and the `-r` option) were  
 108498 excluded because the standard developers considered that the implied level of security could  
 108499 not be achieved and they did not want to raise false expectations.

108500 On systems that support set-user-ID scripts, a historical trapdoor has been to link a script to the  
 108501 name `-i`. When it is called by a sequence such as:

108502 `sh -`

108503 or by:

108504 `#! usr/bin/sh -`

108505 the historical systems have assumed that no option letters follow. Thus, this volume of  
 108506 POSIX.1-2008 allows the single `<hyphen-minus>` to mark the end of the options, in addition to  
 108507 the use of the regular `--` argument, because it was considered that the older practice was so

pervasive. An alternative approach is taken by the KornShell, where real and effective user/group IDs must match for an interactive shell; this behavior is specifically allowed by this volume of POSIX.1-2008.

**Note:** There are other problems with set-user-ID scripts that the two approaches described here do not resolve.

The initialization process for the history file can be dependent on the system start-up files, in that they may contain commands that effectively preempt the user's settings of *HISTFILE* and *HISTSIZE*. For example, function definition commands are recorded in the history file, unless the *set -o nolog* option is set. If the system administrator includes function definitions in some system start-up file called before the *ENV* file, the history file is initialized before the user gets a chance to influence its characteristics. In some historical shells, the history file is initialized just after the *ENV* file has been processed. Therefore, it is implementation-defined whether changes made to *HISTFILE* after the history file has been initialized are effective.

The default messages for the various *MAIL*-related messages are unspecified because they vary across implementations. Typical messages are:

```
"you have mail\n"
```

or:

```
"you have new mail\n"
```

It is important that the descriptions of command line editing refer to the same shell as that in POSIX.1-2008 so that interactive users can also be application programmers without having to deal with programmatic differences in their two environments. It is also essential that the utility name *sh* be specified because this explicit utility name is too firmly rooted in historical practice of application programs for it to change.

Consideration was given to mandating a diagnostic message when attempting to set *vi*-mode on terminals that do not support command line editing. However, it is not historical practice for the shell to be cognizant of all terminal types and thus be able to detect inappropriate terminals in all cases. Implementations are encouraged to supply diagnostics in this case whenever possible, rather than leaving the user in a state where editing commands work incorrectly.

In early proposals, the KornShell-derived *emacs* mode of command line editing was included, even though the *emacs* editor itself was not. The community of *emacs* proponents was adamant that the full *emacs* editor not be standardized because they were concerned that an attempt to standardize this very powerful environment would encourage vendors to ship strictly conforming versions lacking the extensibility required by the community. The author of the original *emacs* program also expressed his desire to omit the program. Furthermore, there were a number of historical systems that did not include *emacs*, or included it without supporting it, but there were very few that did not include and support *vi*. The shell *emacs* command line editing mode was finally omitted because it became apparent that the KornShell version and the editor being distributed with the GNU system had diverged in some respects. The author of *emacs* requested that the POSIX *emacs* mode either be deleted or have a significant number of unspecified conditions. Although the KornShell author agreed to consider changes to bring the shell into alignment, the standard developers decided to defer specification at that time. At the time, it was assumed that convergence on an acceptable definition would occur for a subsequent draft, but that has not happened, and there appears to be no impetus to do so. In any case, implementations are free to offer additional command line editing modes based on the exact models of editors their users are most comfortable with.

Early proposals had the following list entry in [vi Line Editing Insert Mode](#) (on page 3220):

108554 \ If followed by the *erase* or *kill* character, that character shall be inserted into the input line.  
 108555 Otherwise, the <backslash> itself shall be inserted into the input line.

108556 However, this is not actually a feature of *sh* command line editing insert mode, but one of some  
 108557 historical terminal line drivers. Some conforming implementations continue to do this when the  
 108558 *stty ixten* flag is set.

108559 In interactive shells, SIGTERM is ignored so that *kill 0* does not kill the shell, and SIGINT is  
 108560 caught so that *wait* is interruptible. If the shell does not ignore SIGTTIN, SIGTTOU, and  
 108561 SIGTSTP signals when it is interactive and the *-m* option is not in effect, these signals suspend  
 108562 the shell if it is not a session leader. If it is a session leader, the signals are discarded if they  
 108563 would stop the process, as required by XSH Section 2.4.3 (on page 490) for orphaned process  
 108564 groups.

#### 108565 FUTURE DIRECTIONS

108566 None.

#### 108572 CHANGE HISTORY

108573 First released in Issue 2.

#### 108574 Issue 5

108575 The FUTURE DIRECTIONS section is added.

108576 Text is added to the DESCRIPTION for the Large File Summit proposal.

#### 108577 Issue 6

108578 The Open Group Corrigendum U029/2 is applied, correcting the second SYNOPSIS.

108579 The Open Group Corrigendum U027/3 is applied, correcting a typographical error.

108580 The following new requirements on POSIX implementations derive from alignment with the  
 108581 Single UNIX Specification:

- 108582 • The option letters derived from the *set* special built-in are also accepted with a leading  
 108583 <plus-sign> ('+').

- 108584 • Large file extensions are added:

- 108585 — Pathname expansion does not fail due to the size of a file.

- 108586 — Shell input and output redirections have an implementation-defined offset maximum  
 108587 that is established in the open file description.

108588 In the ENVIRONMENT VARIABLES section, the text “user’s home directory” is updated to  
 108589 “directory referred to by the *HOME* environment variable”.

108590 Descriptions for the *ENV* and *PWD* environment variables are included to align with the  
 108591 IEEE P1003.2b draft standard.

108592 The normative text is reworded to avoid use of the term “must” for application requirements.

108593 **Issue 7**

108594 Austin Group Interpretation 1003.1-2001 #098 is applied, changing the definition of *IFS*.

108595 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108596 Changes to the *pwd* utility and *PWD* environment variable have been made to match the  
108597 changes to the *getcwd()* function made for Austin Group Interpretation 1003.1-2001 #140.

108598 Minor editorial changes are made to the User Portability Utilities option shading. No normative  
108599 changes are implied.

108600 Minor changes are made to the install script example in the APPLICATION USAGE section.

108601 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0137 [152], XCU/TC1-2008/0138  
108602 [347], XCU/TC1-2008/0139 [347], XCU/TC1-2008/0140 [347], XCU/TC1-2008/0141 [299], and  
108603 XCU/TC1-2008/0142 [347] are applied.

108604 **NAME**

108605           sleep — suspend execution for an interval

108606 **SYNOPSIS**108607           sleep *time*108608 **DESCRIPTION**

108609           The *sleep* utility shall suspend execution for at least the integral number of seconds specified by

108610           the *time* operand.

108611 **OPTIONS**

108612           None.

108613 **OPERANDS**

108614           The following operand shall be supported:

108615           *time*           A non-negative decimal integer specifying the number of seconds for which to

108616                           suspend execution.

108617 **STDIN**

108618           Not used.

108619 **INPUT FILES**

108620           None.

108621 **ENVIRONMENT VARIABLES**108622           The following environment variables shall affect the execution of *sleep*:

108623           *LANG*           Provide a default value for the internationalization variables that are unset or null.

108624                           (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization

108625                           variables used to determine the values of locale categories.)

108626           *LC\_ALL*       If set to a non-empty string value, override the values of all the other

108627                           internationalization variables.

108628           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as

108629                           characters (for example, single-byte as opposed to multi-byte characters in

108630                           arguments).

108631           *LC\_MESSAGES*

108632                           Determine the locale that should be used to affect the format and contents of

108633                           diagnostic messages written to standard error.

108634 XSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

108635 **ASYNCHRONOUS EVENTS**108636           If the *sleep* utility receives a SIGALRM signal, one of the following actions shall be taken:

- 108637           1. Terminate normally with a zero exit status.
- 108638           2. Effectively ignore the signal.
- 108639           3. Provide the default behavior for signals described in the ASYNCHRONOUS EVENTS
- 108640               section of [Section 1.4](#) (on page 2326). This could include terminating with a non-zero exit
- 108641               status.

108642           The *sleep* utility shall take the standard action for all other signals.

**108643 STDOUT**

108644 Not used.

**108645 STDERR**

108646 The standard error shall be used only for diagnostic messages.

**108647 OUTPUT FILES**

108648 None.

**108649 EXTENDED DESCRIPTION**

108650 None.

**108651 EXIT STATUS**

108652 The following exit values shall be returned:

108653 0 The execution was successfully suspended for at least *time* seconds, or a SIGALRM signal  
108654 was received. See the ASYNCHRONOUS EVENTS section.

108655 >0 An error occurred.

**108656 CONSEQUENCES OF ERRORS**

108657 Default.

**108658 APPLICATION USAGE**

108659 None.

**108660 EXAMPLES**

108661 The *sleep* utility can be used to execute a command after a certain amount of time, as in:

108662 (*sleep 105; command*) &

108663 or to execute a command every so often, as in:

```
108664 while true  
108665 do  
108666     command  
108667     sleep 37  
108668 done
```

**108669 RATIONALE**

108670 The exit status is allowed to be zero when *sleep* is interrupted by the SIGALRM signal because  
108671 most implementations of this utility rely on the arrival of that signal to notify them that the  
108672 requested finishing time has been successfully attained. Such implementations thus do not  
108673 distinguish this situation from the successful completion case. Other implementations are  
108674 allowed to catch the signal and go back to sleep until the requested time expires or to provide  
108675 the normal signal termination procedures.

108676 As with all other utilities that take integral operands and do not specify subranges of allowed  
108677 values, *sleep* is required by this volume of POSIX.1-2008 to deal with *time* requests of up to  
108678 2 147 483 647 seconds. This may mean that some implementations have to make multiple calls to  
108679 the delay mechanism of the underlying operating system if its argument range is less than this.

**108680 FUTURE DIRECTIONS**

108681 None.

**108682 SEE ALSO**

108683 *wait*

108684 XBD Chapter 8 (on page 173)

108685 XSH *alarm()*, *sleep()*

|        |                            |
|--------|----------------------------|
| 108686 | <b>CHANGE HISTORY</b>      |
| 108687 | First released in Issue 2. |

108688 **NAME**108689 `sort` — sort, merge, or sequence check text files108690 **SYNOPSIS**108691 `sort [-m] [-o output] [-bdfinru] [-t char] [-k keydef]... [file...]`108692 `sort [-c|-C] [-bdfinru] [-t char] [-k keydef] [file]`108693 **DESCRIPTION**108694 The `sort` utility shall perform one of the following functions:

- 108695 1. Sort lines of all the named files together and write the result to the specified output.
- 108696 2. Merge lines of all the named (presorted) files together and write the result to the specified output.
- 108697 3. Check that a single input file is correctly presorted.

108699 Comparisons shall be based on one or more sort keys extracted from each line of input (or, if no  
 108700 sort keys are specified, the entire line up to, but not including, the terminating <newline>), and  
 108701 shall be performed using the collating sequence of the current locale. If this collating sequence  
 108702 does not have a total ordering of all characters (see XBD [Section 7.3.2](#), on page 147), any lines of  
 108703 input that collate equally should be further compared byte-by-byte using the collating sequence  
 108704 for the POSIX locale.

108705 **OPTIONS**

108706 The `sort` utility shall conform to XBD [Section 12.2](#) (on page 216), except for Guideline 9, and the  
 108707 `-k keydef` option should follow the `-b`, `-d`, `-f`, `-i`, `-n`, and `-r` options. In addition, `'+'` may be  
 108708 recognized as an option delimiter as well as `'-'`.

108709 The following options shall be supported:

- 108710 `-c` Check that the single input file is ordered as specified by the arguments and the  
 108711 collating sequence of the current locale. Output shall not be sent to standard  
 108712 output. The exit code shall indicate whether or not disorder was detected or an  
 108713 error occurred. If disorder (or, with `-u`, a duplicate key) is detected, a warning  
 108714 message shall be sent to standard error indicating where the disorder or duplicate  
 108715 key was found.
- 108716 `-C` Same as `-c`, except that a warning message shall not be sent to standard error if  
 108717 disorder or, with `-u`, a duplicate key is detected.
- 108718 `-m` Merge only; the input file shall be assumed to be already sorted.
- 108719 `-o output` Specify the name of an output file to be used instead of the standard output. This  
 108720 file can be the same as one of the input *files*.
- 108721 `-u` Unique: suppress all but one in each set of lines having equal keys. If used with  
 108722 the `-c` option, check that there are no lines with duplicate keys, in addition to  
 108723 checking that the input file is sorted.

108724 The following options shall override the default ordering rules. When ordering options appear  
 108725 independent of any key field specifications, the requested field ordering rules shall be applied  
 108726 globally to all sort keys. When attached to a specific key (see `-k`), the specified ordering options  
 108727 shall override all global ordering options for that key.

- 108728 `-d` Specify that only <blank> characters and alphanumeric characters, according to  
 108729 the current setting of `LC_CTYPE`, shall be significant in comparisons. The behavior  
 108730 is undefined for a sort key to which `-i` or `-n` also applies.

- 108731        **-f**        Consider all lowercase characters that have uppercase equivalents, according to  
 108732        the current setting of *LC\_CTYPE*, to be the uppercase equivalent for the purposes  
 108733        of comparison.
- 108734        **-i**        Ignore all characters that are non-printable, according to the current setting of  
 108735        *LC\_CTYPE*. The behavior is undefined for a sort key for which **-n** also applies.
- 108736        **-n**        Restrict the sort key to an initial numeric string, consisting of optional <blank>  
 108737        characters, optional <hyphen-minus> character, and zero or more digits with an  
 108738        optional radix character and thousands separators (as defined in the current  
 108739        locale), which shall be sorted by arithmetic value. An empty digit string shall be  
 108740        treated as zero. Leading zeros and signs on zeros shall not affect ordering.
- 108741        **-r**        Reverse the sense of comparisons.
- 108742        The treatment of field separators can be altered using the options:
- 108743        **-b**        Ignore leading <blank> characters when determining the starting and ending  
 108744        positions of a restricted sort key. If the **-b** option is specified before the first **-k**  
 108745        option, it shall be applied to all **-k** options. Otherwise, the **-b** option can be  
 108746        attached independently to each **-k** *field\_start* or *field\_end* option-argument (see  
 108747        below).
- 108748        **-t char**    Use *char* as the field separator character; *char* shall not be considered to be part of a  
 108749        field (although it can be included in a sort key). Each occurrence of *char* shall be  
 108750        significant (for example, <*char*><*char*> delimits an empty field). If **-t** is not  
 108751        specified, <blank> characters shall be used as default field separators; each  
 108752        maximal non-empty sequence of <blank> characters that follows a non-<blank>  
 108753        shall be a field separator.
- 108754        Sort keys can be specified using the options:
- 108755        **-k keydef**    The *keydef* argument is a restricted sort key field definition. The format of this  
 108756        definition is:
- 108757        *field\_start*[*type*][,*field\_end*[*type*]]
- 108758        where *field\_start* and *field\_end* define a key field restricted to a portion of the line  
 108759        (see the EXTENDED DESCRIPTION section), and *type* is one or more modifiers  
 108760        from the list of characters 'b', 'd', 'f', 'i', 'n', 'r'. The 'b' modifier shall  
 108761        behave like the **-b** option, but shall apply only to the *field\_start* or *field\_end* to  
 108762        which it is attached. The other modifiers shall behave like the corresponding  
 108763        options, but shall apply only to the key field to which they are attached; they shall  
 108764        have this effect if specified with *field\_start*, *field\_end*, or both. If any modifier is  
 108765        attached to a *field\_start* or to a *field\_end*, no option shall apply to either.  
 108766        Implementations shall support at least nine occurrences of the **-k** option, which  
 108767        shall be significant in command line order. If no **-k** option is specified, a default  
 108768        sort key of the entire line shall be used.
- 108769        When there are multiple key fields, later keys shall be compared only after all  
 108770        earlier keys compare equal. Except when the **-u** option is specified, lines that  
 108771        otherwise compare equal shall be ordered as if none of the options **-d**, **-f**, **-i**, **-n**, or  
 108772        **-k** were present (but with **-r** still in effect, if it was specified) and with all bytes in  
 108773        the lines significant to the comparison. The order in which lines that still compare  
 108774        equal are written is unspecified.

108775 **OPERANDS**

108776 The following operand shall be supported:

108777 *file* A pathname of a file to be sorted, merged, or checked. If no *file* operands are  
 108778 specified, or if a *file* operand is '-', the standard input shall be used. If *sort* |  
 108779 encounters an error when opening or reading a *file* operand, it may exit without |  
 108780 writing any output to standard output or processing later operands.

108781 **STDIN**

108782 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
 108783 See the INPUT FILES section.

108784 **INPUT FILES**

108785 The input files shall be text files, except that the *sort* utility shall add a <newline> to the end of a  
 108786 file ending with an incomplete last line.

108787 **ENVIRONMENT VARIABLES**108788 The following environment variables shall affect the execution of *sort*:

108789 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 108790 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 108791 variables used to determine the values of locale categories.)

108792 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 108793 internationalization variables.

108794 *LC\_COLLATE*  
 108795 Determine the locale for ordering rules.

108796 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 108797 characters (for example, single-byte as opposed to multi-byte characters in  
 108798 arguments and input files) and the behavior of character classification for the *-b*,  
 108799 *-d*, *-f*, *-i*, and *-n* options.

108800 *LC\_MESSAGES*  
 108801 Determine the locale that should be used to affect the format and contents of  
 108802 diagnostic messages written to standard error.

108803 *LC\_NUMERIC*  
 108804 Determine the locale for the definition of the radix character and thousands  
 108805 separator for the *-n* option.

108806 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

108807 **ASYNCHRONOUS EVENTS**

108808 Default.

108809 **STDOUT**108810 Unless the *-o* or *-c* options are in effect, the standard output shall contain the sorted input.108811 **STDERR**

108812 The standard error shall be used for diagnostic messages. When *-c* is specified, if disorder is  
 108813 detected (or if *-u* is also specified and a duplicate key is detected), a message shall be written to  
 108814 the standard error which identifies the input line at which disorder (or a duplicate key) was  
 108815 detected. A warning message about correcting an incomplete last line of an input file may be  
 108816 generated, but need not affect the final exit status.

108817 **OUTPUT FILES**

108818 If the **-o** option is in effect, the sorted input shall be written to the file *output*.

108819 **EXTENDED DESCRIPTION**

108820 The notation:

108821 `-k field_start[type][,field_end[type]]`

108822 shall define a key field that begins at *field\_start* and ends at *field\_end* inclusive, unless *field\_start*  
 108823 falls beyond the end of the line or after *field\_end*, in which case the key field is empty. A missing  
 108824 *field\_end* shall mean the last character of the line.

108825 A field comprises a maximal sequence of non-separating characters and, in the absence of option  
 108826 **-t**, any preceding field separator.

108827 The *field\_start* portion of the *keydef* option-argument shall have the form:

108828 `field_number[.first_character]`

108829 Fields and characters within fields shall be numbered starting with 1. The *field\_number* and  
 108830 *first\_character* pieces, interpreted as positive decimal integers, shall specify the first character to  
 108831 be used as part of a sort key. If *first\_character* is omitted, it shall refer to the first character of the  
 108832 field.

108833 The *field\_end* portion of the *keydef* option-argument shall have the form:

108834 `field_number[.last_character]`

108835 The *field\_number* shall be as described above for *field\_start*. The *last\_character* piece, interpreted  
 108836 as a non-negative decimal integer, shall specify the last character to be used as part of the sort  
 108837 key. If *last\_character* evaluates to zero or *last\_character* is omitted, it shall refer to the last  
 108838 character of the field specified by *field\_number*.

108839 If the **-b** option or **b** type modifier is in effect, characters within a field shall be counted from the  
 108840 first non-`<blank>` in the field. (This shall apply separately to *first\_character* and *last\_character*.)

108841 **EXIT STATUS**

108842 The following exit values shall be returned:

108843 0 All input files were output successfully, or **-c** was specified and the input file was correctly  
 108844 sorted.

108845 1 Under the **-c** option, the file was not ordered as specified, or if the **-c** and **-u** options were  
 108846 both specified, two input lines were found with equal keys.

108847 >1 An error occurred.

108848 **CONSEQUENCES OF ERRORS**

108849 The default requirements shall apply, except that if *sort* encounters an error when opening or  
 108850 reading a *file* operand, it may exit without writing any output to standard output or processing  
 108851 later operands.

APPLICATION USAGE

The default value for `-t`, `<blank>`, has different properties from, for example, `-t"<space>"`. If a line contains:

`<space><space>foo`

the following treatment would occur with default separation as opposed to specifically selecting a `<space>`:

| Field | Default                                    | <code>-t "&lt;space&gt;"</code> |
|-------|--------------------------------------------|---------------------------------|
| 1     | <code>&lt;space&gt;&lt;space&gt;foo</code> | <i>empty</i>                    |
| 2     | <i>empty</i>                               | <i>empty</i>                    |
| 3     | <i>empty</i>                               | foo                             |

The leading field separator itself is included in a field when `-t` is not used. For example, this command returns an exit status of zero, meaning the input was already sorted:

```
sort -c -k 2 <<eof
y<tab>b
x<space>a
eof
```

(assuming that a `<tab>` precedes the `<space>` in the current collating sequence). The field separator is not included in a field when it is explicitly set via `-t`. This is historical practice and allows usage such as:

```
sort -t "|" -k 2n <<eof
Atlanta|425022|Georgia
Birmingham|284413|Alabama
Columbia|100385|South Carolina
eof
```

where the second field can be correctly sorted numerically without regard to the non-numeric field separator.

The wording in the OPTIONS section clarifies that the `-b`, `-d`, `-f`, `-i`, `-n`, and `-r` options have to come before the first sort key specified if they are intended to apply to all specified keys. The way it is described in this volume of POSIX.1-2008 matches historical practice, not historical documentation. The results are unspecified if these options are specified after a `-k` option.

The `-f` option might not work as expected in locales where there is not a one-to-one mapping between an uppercase and a lowercase letter.

When using *sort* to process pathnames, it is recommended that `LC_ALL`, or at least `LC_CTYPE` and `LC_COLLATE`, are set to `POSIX` or `C` in the environment, since pathnames can contain byte sequences that do not form valid characters in some locales, in which case the utility's behavior would be undefined. In the `POSIX` locale each byte is a valid single-byte character, and therefore this problem is avoided.

If the collating sequence of the current locale does not have a total ordering of all characters, this can affect the behavior of *sort* in the following ways:

- As *sort* `-u` suppresses lines with duplicate keys, it suppresses lines that collate equally but are not identical.
- The output of *sort* (without `-u`) can contain identical lines that are not adjacent, if it does not implement the recommended further byte-by-byte comparison of lines that collate equally. This affects the use of *sort* with *comm* and *uniq*; see the APPLICATION USAGE for

108896 those utilities. +

## 108897 EXAMPLES

- 108898 1. The following command sorts the contents of **infile** with the second field as the sort key:  
 108899 `sort -k 2,2 infile`
- 108900 2. The following command sorts, in reverse order, the contents of **infile1** and **infile2**,  
 108901 placing the output in **outfile** and using the second character of the second field as the sort  
 108902 key (assuming that the first character of the second field is the field separator):  
 108903 `sort -r -o outfile -k 2.2,2.2 infile1 infile2`
- 108904 3. The following command sorts the contents of **infile1** and **infile2** using the second  
 108905 non-<blank> of the second field as the sort key:  
 108906 `sort -k 2.2b,2.2b infile1 infile2`
- 108907 4. The following command prints the System V password file (user database) sorted by the  
 108908 numeric user ID (the third <colon>-separated field):  
 108909 `sort -t : -k 3,3n /etc/passwd`
- 108910 5. The following command prints the lines of the already sorted file **infile**, suppressing all  
 108911 but one occurrence of lines having the same third field:  
 108912 `sort -um -k 3.1,3.0 infile`

## 108913 RATIONALE

108914 Examples in some historical documentation state that options **-um** with one input file keep the  
 108915 first in each set of lines with equal keys. This behavior was deemed to be an implementation  
 108916 artifact and was not standardized.

108917 The **-z** option was omitted; it is not standard practice on most systems and is inconsistent with  
 108918 using *sort* to sort several files individually and then merge them together. The text concerning **-z**  
 108919 in historical documentation appeared to require implementations to determine the proper buffer  
 108920 length during the sort phase of operation, but not during the merge.

108921 The **-y** option was omitted because of non-portability. The **-M** option, present in System V, was  
 108922 omitted because of non-portability in international usage.

108923 An undocumented **-T** option exists in some implementations. It is used to specify a directory for  
 108924 intermediate files. Implementations are encouraged to support the use of the *TMPDIR*  
 108925 environment variable instead of adding an option to support this functionality.

108926 The **-k** option was added to satisfy two objections. First, the zero-based counting used by *sort* is  
 108927 not consistent with other utility conventions. Second, it did not meet syntax guideline  
 108928 requirements.

108929 Historical documentation indicates that “setting **-n** implies **-b**”. The description of **-n** already  
 108930 states that optional leading <blank>s are tolerated in doing the comparison. If **-b** is enabled,  
 108931 rather than implied, by **-n**, this has unusual side-effects. When a character offset is used in a  
 108932 column of numbers (for example, to sort modulo 100), that offset is measured relative to the  
 108933 most significant digit, not to the column. Based upon a recommendation from the author of the  
 108934 original *sort* utility, the **-b** implication has been omitted from this volume of POSIX.1-2008, and  
 108935 an application wishing to achieve the previously mentioned side-effects has to code the **-b** flag  
 108936 explicitly.

108937 Earlier versions of this standard allowed the **-o** option to appear after operands. Historical  
 108938 practice allowed all options to be interspersed with operands. This version of the standard

allows implementations to accept options after operands but conforming applications should not use this form.

Earlier versions of this standard also allowed the *-number* and *+number* options. These options are no longer specified by POSIX.1-2008 but may be present in some implementations.

Historical implementations produced a message on standard error when *-c* was specified and disorder was detected, and when *-c* and *-u* were specified and a duplicate key was detected. An earlier version of this standard contained wording that did not make it clear that this message was allowed and some implementations removed this message to be sure that they conformed to the standard's requirements. Confronted with this difference in behavior, interactive users that wanted to be sure that they got visual feedback instead of just exit code 1 could have used a command like:

```
sort -c file || echo disorder
```

whether or not the *sort* utility provided a message in this case. But, it was not easy for a user to find where the disorder or duplicate key occurred on implementations that do not produce a message, especially when some parts of the input line were not part of the key and when one or more of the *-b*, *-d*, *-f*, *-i*, *-n*, or *-r* options or *keydef* type modifiers were in use. POSIX.1-2008 requires a message to be produced in this case. POSIX.1-2008 also contains the *-C* option giving users the ability to choose either behavior.

When a disorder or duplicate is found when the *-c* option is specified, some implementations print a message containing the first line that is out of order or contains a duplicate key; others print a message specifying the line number of the offending line. This standard allows either type of message.

Implementations are encouraged to perform the recommended further byte-by-byte comparison of lines that collate equally, even though this may affect efficiency. The impact on efficiency can be mitigated by only performing the additional comparison if the current locale's collating sequence does not have a total ordering of all characters (if the implementation provides a way to query this) or by only performing the additional comparison if the locale name associated with the LC\_COLLATE category has an '@' modifier in the name (since locales without an '@' modifier should have a total ordering of all characters — see XBD [Section 7.3.2](#), on page 147). Note that if the implementation provides a *stable sort* option as an extension (usually *-s*), the additional comparison should not be performed when this option has been specified.

## FUTURE DIRECTIONS

A future version of this standard may require that if the collating sequence of the current locale does not have a total ordering of all characters, any lines of input that collate equally when comparing them as whole lines are further compared byte-by-byte using the collating sequence for the POSIX locale.

## CHANGE HISTORY

First released in Issue 2.

108981 **Issue 6**

108982 IEEE PASC Interpretation 1003.2 #174 is applied, updating the DESCRIPTION of comparisons.

108983 IEEE PASC Interpretation 1003.2 #168 is applied.

108984 **Issue 7**

108985 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that Guideline 9 of the Utility  
108986 Syntax Guidelines does not apply and noting that '+' may be recognized as an option delimiter.

108987 Austin Group Interpretation 1003.1-2001 #120 is applied, clarifying the use of the -c option and  
108988 introducing the -C option.

108989 XCU-ERN-81 is applied, modifying the description of the -i option.

108990 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108991 **NAME**108992 `split` — split a file into pieces |108993 **SYNOPSIS**108994 `split [-l line_count] [-a suffix_length] [file [name]]` |108995 `split -b n[k|m] [-a suffix_length] [file [name]]` |108996 **DESCRIPTION**

108997 The *split* utility shall read an input file and write zero or more output files. The default size of  
 108998 each output file shall be 1 000 lines. The size of the output files can be modified by specification  
 108999 of the `-b` or `-l` options. Each output file shall be created with a unique suffix. The suffix shall  
 109000 consist of exactly *suffix\_length* lowercase letters from the POSIX locale. The letters of the suffix  
 109001 shall be used as if they were a base-26 digit system, with the first suffix to be created consisting  
 109002 of all 'a' characters, the second with a 'b' replacing the last 'a', and so on, until a name of all  
 109003 'z' characters is created. By default, the names of the output files shall be 'x', followed by a  
 109004 two-character suffix from the character set as described above, starting with "aa", "ab", "ac",  
 109005 and so on, and continuing until the suffix "zz", for a maximum of 676 files.

109006 If the number of files required exceeds the maximum allowed by the suffix length provided,  
 109007 such that the last allowable file would be larger than the requested size, the *split* utility shall fail  
 109008 after creating the last file with a valid suffix; *split* shall not delete the files it created with valid  
 109009 suffixes. If the file limit is not exceeded, the last file created shall contain the remainder of the  
 109010 input file, and may be smaller than the requested size. If the input is an empty file, no output file  
 109011 shall be created and this shall not be considered to be an error.

109012 **OPTIONS**109013 The *split* utility shall conform to XBD [Section 12.2](#) (on page 216).

109014 The following options shall be supported:

109015 `-a suffix_length`

109016 Use *suffix\_length* letters to form the suffix portion of the filenames of the split file. If  
 109017 `-a` is not specified, the default suffix length shall be two. If the sum of the *name*  
 109018 operand and the *suffix\_length* option-argument would create a filename exceeding  
 109019 {NAME\_MAX} bytes, an error shall result; *split* shall exit with a diagnostic message  
 109020 and no files shall be created.

109021 `-b n` Split a file into pieces *n* bytes in size.109022 `-b nk` Split a file into pieces *n*\*1 024 bytes in size.109023 `-b nm` Split a file into pieces *n*\*1 048 576 bytes in size.

109024 `-l line_count` Specify the number of lines in each resulting file piece. The *line\_count* argument is  
 109025 an unsigned decimal integer. The default is 1 000. If the input does not end with a  
 109026 <newline>, the partial line shall be included in the last output file.

109027 **OPERANDS**

109028 The following operands shall be supported:

109029 *file* The pathname of the ordinary file to be split. If no input file is given or *file* is '-',  
 109030 the standard input shall be used.

109031 *name* The prefix to be used for each of the files resulting from the split operation. If no  
 109032 *name* argument is given, 'x' shall be used as the prefix of the output files. The  
 109033 combined length of the basename of *prefix* and *suffix\_length* cannot exceed  
 109034 {NAME\_MAX} bytes. See the OPTIONS section.

**109035 STDIN**

109036 See the INPUT FILES section.

**109037 INPUT FILES**

109038 Any file can be used as input.

**109039 ENVIRONMENT VARIABLES**

109040 The following environment variables shall affect the execution of *split*:

109041 *LANG* Provide a default value for the internationalization variables that are unset or null.  
109042 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
109043 variables used to determine the values of locale categories.)

109044 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
109045 internationalization variables.

109046 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
109047 characters (for example, single-byte as opposed to multi-byte characters in  
109048 arguments and input files).

109049 *LC\_MESSAGES*

109050 Determine the locale that should be used to affect the format and contents of  
109051 diagnostic messages written to standard error.

109052 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**109053 ASYNCHRONOUS EVENTS**

109054 Default.

**109055 STDOUT**

109056 Not used.

**109057 STDERR**

109058 The standard error shall be used only for diagnostic messages.

**109059 OUTPUT FILES**

109060 The output files contain portions of the original input file; otherwise, unchanged.

**109061 EXTENDED DESCRIPTION**

109062 None.

**109063 EXIT STATUS**

109064 The following exit values shall be returned:

109065 0 Successful completion.

109066 >0 An error occurred.

**109067 CONSEQUENCES OF ERRORS**

109068 Default.

**109069 APPLICATION USAGE**

109070 None.

**109071 EXAMPLES**

109072 In the following examples **foo** is a text file that contains 5 000 lines.

109073 1. Create five files, **xaa**, **xab**, **xac**, **xad**, and **xae**:

109074 `split foo`

109075 2. Create five files, but the suffixed portion of the created files consists of three letters, **xaaa**,  
109076 **xaab**, **xaac**, **xaad**, and **xaae**:

109077 `split -a 3 foo`

109078 3. Create three files with four-letter suffixes and a supplied prefix, **bar\_aaaa**, **bar\_aaab**, and  
109079 **bar\_aaac**:

109080 `split -a 4 -l 2000 foo bar_`

109081 4. Create as many files as are necessary to contain at most 20\*1 024 bytes, each with the  
109082 default prefix of **x** and a five-letter suffix:

109083 `split -a 5 -b 20k foo`

**109084 RATIONALE**

109085 The **-b** option was added to provide a mechanism for splitting files other than by lines. While  
109086 most uses of the **-b** option are for transmitting files over networks, some believed it would have  
109087 additional uses.

109088 The **-a** option was added to overcome the limitation of being able to create only 676 files.

109089 Consideration was given to deleting this utility, using the rationale that the functionality  
109090 provided by this utility is available via the *csplit* utility (see *csplit*). Upon reconsideration of the  
109091 purpose of the User Portability Utilities option, it was decided to retain both this utility and the  
109092 *csplit* utility because users use both utilities and have historical expectations of their behavior.  
109093 Furthermore, the splitting on byte boundaries in *split* cannot be duplicated with the historical  
109094 *csplit*.

109095 The text “*split* shall not delete the files it created with valid suffixes” would normally be  
109096 assumed, but since the related utility, *csplit*, does delete files under some circumstances, the  
109097 historical behavior of *split* is made explicit to avoid misinterpretation.

109098 Earlier versions of this standard allowed a *-line\_count* option. This form is no longer specified by  
109099 POSIX.1-2008 but may be present in some implementations.

**109100 FUTURE DIRECTIONS**

109101 None.

**109102 SEE ALSO**

109103 *csplit*

109104 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

**109105 CHANGE HISTORY**

109106 First released in Issue 2.

**109107 Issue 6**

109108 This utility is marked as part of the User Portability Utilities option.

109109 The APPLICATION USAGE section is added.

- 109110 The obsolescent SYNOPSIS is removed.
- 109111 **Issue 7**
- 109112 Austin Group Interpretation 1003.1-2001 #027 is applied.
- 109113 The *split* utility is moved from the User Portability Utilities option to the Base. User Portability
- 109114 Utilities is now an option for interactive utilities.
- 109115 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109116 **NAME**

109117 strings — find printable strings in files

109118 **SYNOPSIS**109119 strings [-a] [-t *format*] [-n *number*] [*file...*]109120 **DESCRIPTION**

109121 The *strings* utility shall look for printable strings in regular files and shall write those strings to  
109122 standard output. A printable string is any sequence of four (by default) or more printable  
109123 characters terminated by a <newline> or NUL character. Additional implementation-defined  
109124 strings may be written; see *localedef*.

109125 If the first argument is '-', the results are unspecified.

109126 **OPTIONS**109127 The *strings* utility shall conform to XBD [Section 12.2](#) (on page 216), except for the unspecified  
109128 usage of '-'.

109129 The following options shall be supported:

109130 -a Scan files in their entirety. If -a is not specified, it is implementation-defined what  
109131 portion of each file is scanned for strings.

109132 -n *number* Specify the minimum string length, where the *number* argument is a positive  
109133 decimal integer. The default shall be 4.

109134 -t *format* Write each string preceded by its byte offset from the start of the file. The format  
109135 shall be dependent on the single character used as the *format* option-argument:

109136 d The offset shall be written in decimal.

109137 o The offset shall be written in octal.

109138 x The offset shall be written in hexadecimal.

109139 **OPERANDS**

109140 The following operand shall be supported:

109141 *file* A pathname of a regular file to be used as input. If no *file* operand is specified, the  
109142 *strings* utility shall read from the standard input.

109143 **STDIN**

109144 See the INPUT FILES section.

109145 **INPUT FILES**

109146 The input files named by the utility arguments or the standard input shall be regular files of any  
109147 format.

109148 **ENVIRONMENT VARIABLES**109149 The following environment variables shall affect the execution of *strings*:

109150 LANG Provide a default value for the internationalization variables that are unset or null.  
109151 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
109152 variables used to determine the values of locale categories.)

109153 LC\_ALL If set to a non-empty string value, override the values of all the other  
109154 internationalization variables.

109155 LC\_CTYPE Determine the locale for the interpretation of sequences of bytes of text data as  
109156 characters (for example, single-byte as opposed to multi-byte characters in  
109157 arguments and input files) and to identify printable strings.

109158 **LC\_MESSAGES**

109159 Determine the locale that should be used to affect the format and contents of  
 109160 diagnostic messages written to standard error.

109161 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

109162 **ASYNCHRONOUS EVENTS**

109163 Default.

109164 **STDOUT**

109165 Strings found shall be written to the standard output, one per line.

109166 When the **-t** option is not specified, the format of the output shall be:

109167 "%s", <string>

109168 With the **-t o** option, the format of the output shall be:

109169 "%o %s", <byte offset>, <string>

109170 With the **-t x** option, the format of the output shall be:

109171 "%x %s", <byte offset>, <string>

109172 With the **-t d** option, the format of the output shall be:

109173 "%d %s", <byte offset>, <string>

109174 **STDERR**

109175 The standard error shall be used only for diagnostic messages.

109176 **OUTPUT FILES**

109177 None.

109178 **EXTENDED DESCRIPTION**

109179 None.

109180 **EXIT STATUS**

109181 The following exit values shall be returned:

109182 0 Successful completion.

109183 >0 An error occurred.

109184 **CONSEQUENCES OF ERRORS**

109185 Default.

109186 **APPLICATION USAGE**

109187 By default the data area (as opposed to the text, "bss", or header areas) of a binary executable  
 109188 file is scanned. Implementations document which areas are scanned.

109189 Some historical implementations do not require NUL or <newline> terminators for strings to  
 109190 permit those languages that do not use NUL as a string terminator to have their strings written.

109191 **EXAMPLES**

109192 None.

109193 **RATIONALE**

109194 Apart from rationalizing the option syntax and slight difficulties with object and executable  
 109195 binary files, *strings* is specified to match historical practice closely. The **-a** and **-n** options were  
 109196 introduced to replace the non-conforming **-** and **-number** options. These options are no longer  
 109197 specified by POSIX.1-2008 but may be present in some implementations.

- 109198 The `-o` option historically means different things on different implementations. Some use it to  
109199 mean “*offset* in decimal”, while others use it as “*offset* in octal”. Instead of trying to decide which  
109200 way would be least objectionable, the `-t` option was added. It was originally named `-O` to mean  
109201 “*offset*”, but was changed to `-t` to be consistent with *od*.
- 109202 The ISO C standard function *isprint()* is restricted to a domain of **unsigned char**. This volume of  
109203 POSIX.1-2008 requires implementations to write strings as defined by the current locale.
- 109204 **FUTURE DIRECTIONS**
- 109205 None.
- 109206 **SEE ALSO**

- 109209 **CHANGE HISTORY**
- 109210 First released in Issue 4.
- 109211 **Issue 6**
- 109212 This utility is marked as part of the User Portability Utilities option.
- 109213 The obsolescent SYNOPSIS is removed.
- 109214 The normative text is reworded to avoid use of the term “must” for application requirements.
- 109215 **Issue 7**
- 109216 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first  
109217 argument is ‘-’.
- 109218 The *strings* utility is moved from the User Portability Utilities option to the Base. User  
109219 Portability Utilities is now an option for interactive utilities.
- 109220 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109221 **NAME**109222 strip — remove unnecessary information from strippable files (**DEVELOPMENT**)109223 **SYNOPSIS**

109224 SD strip file...

109225 **DESCRIPTION**

109226 XSI A strippable file is defined as a relocatable, object, or executable file. On XSI-conformant  
 109227 systems, a strippable file can also be an archive of object or relocatable files.

109228 The *strip* utility shall remove from strippable files named by the *file* operands any information  
 109229 the implementor deems unnecessary for execution of those files. The nature of that information  
 109230 is unspecified. The effect of *strip* on object and executable files shall be similar to the use of the  
 109231 XSI *-s* option to *c99* or *fort77*. The effect of *strip* on an archive of object files shall be similar to the  
 109232 use of the *-s* option to *c99* or *fort77* for each object file in the archive.

109233 **OPTIONS**

109234 None.

109235 **OPERANDS**

109236 The following operand shall be supported:

109237 *file* A pathname referring to a strippable file.

109238 **STDIN**

109239 Not used.

109240 **INPUT FILES**

109241 The input files shall be in the form of strippable files successfully produced by any compiler  
 109242 XSI defined by this volume of POSIX.1-2008 or produced by creating or updating an archive of such  
 109243 files using the *ar* utility.

109244 **ENVIRONMENT VARIABLES**109245 The following environment variables shall affect the execution of *strip*:

109246 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 109247 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 109248 variables used to determine the values of locale categories.)

109249 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 109250 internationalization variables.

109251 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 109252 characters (for example, single-byte as opposed to multi-byte characters in  
 109253 arguments).

109254 *LC\_MESSAGES*

109255 Determine the locale that should be used to affect the format and contents of  
 109256 diagnostic messages written to standard error.

109257 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

109258 **ASYNCHRONOUS EVENTS**

109259 Default.

109260 **STDOUT**

109261 Not used.

**109262 STDERR**

109263 The standard error shall be used only for diagnostic messages.

**109264 OUTPUT FILES**

109265 The *strip* utility shall produce strippable files of unspecified format.

**109266 EXTENDED DESCRIPTION**

109267 None.

**109268 EXIT STATUS**

109269 The following exit values shall be returned:

109270 0 Successful completion.

109271 >0 An error occurred.

**109272 CONSEQUENCES OF ERRORS**

109273 Default.

**109274 APPLICATION USAGE**

109275 None.

**109276 EXAMPLES**

109277 None.

**109278 RATIONALE**

109279 Historically, this utility has been used to remove the symbol table from a strippable file. It was  
109280 included since it is known that the amount of symbolic information can amount to several  
109281 megabytes; the ability to remove it in a portable manner was deemed important, especially for  
109282 smaller systems.

109283 The behavior of *strip* on object and executable files is said to be the same as the *-s* option to a  
109284 compiler. While the end result is essentially the same, it is not required to be identical.

109285 XSI-conformant systems support use of *strip* on archive files containing object files or relocatable  
109286 files.

**109287 FUTURE DIRECTIONS**

109288 None.

**109289 SEE ALSO**

109290 *ar*, *c99*, *fort77*

109291 XBD Chapter 8 (on page 173)

**109292 CHANGE HISTORY**

109293 First released in Issue 2.

**109294 Issue 6**

109295 This utility is marked as part of the Software Development Utilities option.

**109296 Issue 7**

109297 Austin Group Interpretation 1003.1-2001 #103 is applied.

109298 **NAME**

109299       stty — set the options for a terminal

109300 **SYNOPSIS**

109301       stty [-a|-g]

109302       stty operand...

109303 **DESCRIPTION**

109304       The *stty* utility shall set or report on terminal I/O characteristics for the device that is its  
 109305       standard input. Without options or operands specified, it shall report the settings of certain  
 109306       characteristics, usually those that differ from implementation-defined defaults. Otherwise, it  
 109307       shall modify the terminal state according to the specified operands. Detailed information about  
 109308       the modes listed in the first five groups below are described in XBD [Chapter 11](#) (on page 199).  
 109309       Operands in the Combination Modes group (see [Combination Modes](#), on page 3258) are  
 109310       implemented using operands in the previous groups. Some combinations of operands are  
 109311       mutually-exclusive on some terminal types; the results of using such combinations are  
 109312       unspecified.

109313       Typical implementations of this utility require a communications line configured to use the  
 109314       **termios** interface defined in the System Interfaces volume of POSIX.1-2008. On systems where  
 109315       none of these lines are available, and on lines not currently configured to support the **termios**  
 109316       interface, some of the operands need not affect terminal characteristics.

109317 **OPTIONS**109318       The *stty* utility shall conform to XBD [Section 12.2](#) (on page 216).

109319       The following options shall be supported:

109320       **-a**           Write to standard output all the current settings for the terminal.

109321       **-g**           Write to standard output all the current settings in an unspecified form that can be  
 109322       used as arguments to another invocation of the *stty* utility on the same system. The  
 109323       form used shall not contain any characters that would require quoting to avoid  
 109324       word expansion by the shell; see [Section 2.6](#) (on page 2343).

109325 **OPERANDS**

109326       The following operands shall be supported to set the terminal characteristics.

109327       **Control Modes**

109328       **parenb** (**-parenb**) Enable (disable) parity generation and detection. This shall have the effect of  
 109329       setting (not setting) PARENB in the **termios** *c\_flag* field, as defined in XBD  
 109330       [Chapter 11](#) (on page 199).

109331       **parodd** (**-parodd**) Select odd (even) parity. This shall have the effect of setting (not setting)  
 109332       PARODD in the **termios** *c\_flag* field, as defined in XBD [Chapter 11](#) (on page  
 109333       199).  
 109334

109335       **cs5 cs6 cs7 cs8** Select character size, if possible. This shall have the effect of setting CS5, CS6,  
 109336       CS7, and CS8, respectively, in the **termios** *c\_flag* field, as defined in XBD  
 109337       [Chapter 11](#) (on page 199).

109338       **number**       Set terminal baud rate to the number given, if possible. If the baud rate is set  
 109339       to zero, the modem control lines shall no longer be asserted. This shall have  
 109340       the effect of setting the input and output **termios** baud rate values as defined  
 109341       in XBD [Chapter 11](#) (on page 199).

- 109342 **ispeed** *number* Set terminal input baud rate to the number given, if possible. If the input baud  
 109343 rate is set to zero, the input baud rate shall be specified by the value of the  
 109344 output baud rate. This shall have the effect of setting the input **termios** baud  
 109345 rate values as defined in XBD [Chapter 11](#) (on page 199).
- 109346 **ospeed** *number* Set terminal output baud rate to the number given, if possible. If the output  
 109347 baud rate is set to zero, the modem control lines shall no longer be asserted.  
 109348 This shall have the effect of setting the output **termios** baud rate values as  
 109349 defined in XBD [Chapter 11](#) (on page 199).
- 109350 **hupcl** (**-hupcl**) Stop asserting modem control lines (do not stop asserting modem control  
 109351 lines) on last close. This shall have the effect of setting (not setting) HUPCL in  
 109352 the **termios** *c\_cflag* field, as defined in XBD [Chapter 11](#) (on page 199).
- 109353 **hup** (**-hup**) Equivalent to **hupcl**(**-hupcl**).
- 109354 **cstopb** (**-cstopb**) Use two (one) stop bits per character. This shall have the effect of setting (not  
 109355 setting) CSTOPB in the **termios** *c\_cflag* field, as defined in XBD [Chapter 11](#) (on  
 109356 page 199).
- 109357 **cread** (**-cread**) Enable (disable) the receiver. This shall have the effect of setting (not setting)  
 109358 CREAD in the **termios** *c\_cflag* field, as defined in XBD [Chapter 11](#) (on page  
 109359 199).
- 109360 **clocal** (**-clocal**) Assume a line without (with) modem control. This shall have the effect of  
 109361 setting (not setting) CLOCAL in the **termios** *c\_cflag* field, as defined in XBD  
 109362 [Chapter 11](#) (on page 199).

109363 It is unspecified whether *stty* shall report an error if an attempt to set a Control Mode fails.

#### 109364 Input Modes

- 109365 **ignbrk** (**-ignbrk**) Ignore (do not ignore) break on input. This shall have the effect of setting (not  
 109366 setting) IGNBRK in the **termios** *c\_iflag* field, as defined in XBD [Chapter 11](#) (on  
 109367 page 199).
- 109368 **brkint** (**-brkint**) Signal (do not signal) INTR on break. This shall have the effect of setting (not  
 109369 setting) BRKINT in the **termios** *c\_iflag* field, as defined in XBD [Chapter 11](#) (on  
 109370 page 199).
- 109371 **ignpar** (**-ignpar**) Ignore (do not ignore) bytes with parity errors. This shall have the effect of  
 109372 setting (not setting) IGNPAR in the **termios** *c\_iflag* field, as defined in XBD  
 109373 [Chapter 11](#) (on page 199).
- 109374 **parmrk** (**-parmrk**)  
 109375 Mark (do not mark) parity errors. This shall have the effect of setting (not  
 109376 setting) PARMRK in the **termios** *c\_iflag* field, as defined in XBD [Chapter 11](#) (on  
 109377 page 199).
- 109378 **inpck** (**-inpck**) Enable (disable) input parity checking. This shall have the effect of setting (not  
 109379 setting) INPCK in the **termios** *c\_iflag* field, as defined in XBD [Chapter 11](#) (on  
 109380 page 199).
- 109381 **istrip** (**-istrip**) Strip (do not strip) input characters to seven bits. This shall have the effect of  
 109382 setting (not setting) ISTRIP in the **termios** *c\_iflag* field, as defined in XBD  
 109383 [Chapter 11](#) (on page 199).

|        |                                |                                                                                                  |
|--------|--------------------------------|--------------------------------------------------------------------------------------------------|
| 109384 | <b>inlcr</b> ( <b>-inlcr</b> ) | Map (do not map) NL to CR on input. This shall have the effect of setting (not                   |
| 109385 |                                | setting) INLCR in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD Chapter 11 (on      |
| 109386 |                                | page 199).                                                                                       |
| 109387 | <b>igncr</b> ( <b>-igncr</b> ) | Ignore (do not ignore) CR on input. This shall have the effect of setting (not                   |
| 109388 |                                | setting) IGNCR in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD Chapter 11 (on      |
| 109389 |                                | page 199).                                                                                       |
| 109390 | <b>icrnl</b> ( <b>-icrnl</b> ) | Map (do not map) CR to NL on input. This shall have the effect of setting (not                   |
| 109391 |                                | setting) ICRNL in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD Chapter 11 (on      |
| 109392 |                                | page 199).                                                                                       |
| 109393 | <b>ixon</b> ( <b>-ixon</b> )   | Enable (disable) START/STOP output control. Output from the system is                            |
| 109394 |                                | stopped when the system receives STOP and started when the system receives                       |
| 109395 |                                | START. This shall have the effect of setting (not setting) IXON in the <b>termios</b>            |
| 109396 |                                | <i>c_iflag</i> field, as defined in XBD Chapter 11 (on page 199).                                |
| 109397 | <b>ixany</b> ( <b>-ixany</b> ) | Allow any character to restart output. This shall have the effect of setting (not                |
| 109398 |                                | setting) IXANY in the <b>termios</b> <i>c_iflag</i> field, as defined in XBD Chapter 11 (on      |
| 109399 |                                | page 199).                                                                                       |
| 109400 | <b>ixoff</b> ( <b>-ixoff</b> ) | Request that the system send (not send) STOP characters when the input                           |
| 109401 |                                | queue is nearly full and START characters to resume data transmission. This                      |
| 109402 |                                | shall have the effect of setting (not setting) IXOFF in the <b>termios</b> <i>c_iflag</i> field, |
| 109403 |                                | as defined in XBD Chapter 11 (on page 199).                                                      |

#### Output Modes

|            |                                  |                                                                                                |
|------------|----------------------------------|------------------------------------------------------------------------------------------------|
| 109404     | <b>opost</b> ( <b>-opost</b> )   | Post-process output (do not post-process output; ignore all other output                       |
| 109405     |                                  | modes). This shall have the effect of setting (not setting) OPOST in the <b>termios</b>        |
| 109406     |                                  | <i>c_oflag</i> field, as defined in XBD Chapter 11 (on page 199).                              |
| 109407     |                                  |                                                                                                |
| 109408 XSI | <b>onlcr</b> ( <b>-onlcr</b> )   | Map (do not map) NL to CR-NL on output. This shall have the effect of setting +                |
| 109409     |                                  | (not setting) ONLCR in the <b>termios</b> <i>c_oflag</i> field, as defined in XBD Chapter 11 + |
| 109410     |                                  | (on page 199).                                                                                 |
| 109411 XSI | <b>ocrnl</b> ( <b>-ocrnl</b> )   | Map (do not map) CR to NL on output. This shall have the effect of setting                     |
| 109412     |                                  | (not setting) OCRNL in the <b>termios</b> <i>c_oflag</i> field, as defined in XBD Chapter 11   |
| 109413     |                                  | (on page 199).                                                                                 |
| 109414 XSI | <b>onocr</b> ( <b>-onocr</b> )   | Do not (do) output CR at column zero. This shall have the effect of setting (not               |
| 109415     |                                  | setting) ONOCR in the <b>termios</b> <i>c_oflag</i> field, as defined in XBD Chapter 11 (on    |
| 109416     |                                  | page 199).                                                                                     |
| 109417 XSI | <b>onlret</b> ( <b>-onlret</b> ) | The terminal newline key performs (does not perform) the CR function. This                     |
| 109418     |                                  | shall have the effect of setting (not setting) ONLRET in the <b>termios</b> <i>c_oflag</i>     |
| 109419     |                                  | field, as defined in XBD Chapter 11 (on page 199).                                             |
| 109420 XSI | <b>ofill</b> ( <b>-ofill</b> )   | Use fill characters (use timing) for delays. This shall have the effect of setting             |
| 109421     |                                  | (not setting) OFILL in the <b>termios</b> <i>c_oflag</i> field, as defined in XBD Chapter 11   |
| 109422     |                                  | (on page 199).                                                                                 |
| 109423 XSI | <b>ofdel</b> ( <b>-ofdel</b> )   | Fill characters are DELs (NULs). This shall have the effect of setting (not                    |
| 109424     |                                  | setting) OFDEL in the <b>termios</b> <i>c_oflag</i> field, as defined in XBD Chapter 11 (on    |
| 109425     |                                  | page 199).                                                                                     |

|        |     |                            |                                                                                                                                                                                                                                                                                                                                     |
|--------|-----|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 109426 | XSI | <b>cr0 cr1 cr2 cr3</b>     | Select the style of delay for CRs. This shall have the effect of setting CRDLY to CR0, CR1, CR2, or CR3, respectively, in the <b>termios</b> <i>c_oflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                      |
| 109427 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 109428 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 109429 | XSI | <b>nl0 nl1</b>             | Select the style of delay for NL. This shall have the effect of setting NLDLY to NL0 or NL1, respectively, in the <b>termios</b> <i>c_oflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                                  |

| 109465 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 109466 |     | <b>echok (-echok)</b>      | Echo (do not echo) NL after KILL character. This shall have the effect of setting (not setting) ECHOK in the <b>termios</b> <i>c_lflag</i> field, as defined in XBD <a href="#">Chapter 11</a> (on page 199).                                                                                                                       |
| 109467 |     |                            |                                                                                                                                                                                                                                                                                                                                     |
| 109468 |     |                            |                                                                                                                                                                                                                                                                                                                                     |

**echonl** (**-echonl**) Echo (do not echo) NL, even if **echo** is disabled. This shall have the effect of setting (not setting) ECHONL in the **termios** *c\_lflag* field, as defined in XBD Chapter 11 (on page 199).

**noflsh** (**-noflsh**) Disable (enable) flush after INTR, QUIT, SUSP. This shall have the effect of setting (not setting) NOFLSH in the **termios** *c\_lflag* field, as defined in XBD Chapter 11 (on page 199).

**tostop** (**-tostop**) Send SIGTTOU for background output. This shall have the effect of setting (not setting) TOSTOP in the **termios** *c\_lflag* field, as defined in XBD Chapter 11 (on page 199).

## Special Control Character Assignments

*<control>-character string*

Set *<control>-character* to *string*. If *<control>-character* is one of the character sequences in the first column of the following table, the corresponding XBD Chapter 11 (on page 199) control character from the second column shall be recognized. This has the effect of setting the corresponding element of the **termios** *c\_cc* array (see XBD Chapter 13 (on page 219), **<termios.h>**).

**Table 4-20** Control Character Names in *stty*

| Control Character | c_cc Subscript | Description     |
|-------------------|----------------|-----------------|
| <b>eof</b>        | VEOF           | EOF character   |
| <b>eol</b>        | VEOL           | EOL character   |
| <b>erase</b>      | VERASE         | ERASE character |
| <b>intr</b>       | VINTR          | INTR character  |
| <b>kill</b>       | VKILL          | KILL character  |
| <b>quit</b>       | VQUIT          | QUIT character  |
| <b>susp</b>       | VSUSP          | SUSP character  |
| <b>start</b>      | VSTART         | START character |
| <b>stop</b>       | VSTOP          | STOP character  |

If *string* is a single character, the control character shall be set to that character. If *string* is the two-character sequence "**^**-" or the string *undef*, the control character shall be set to **\_POSIX\_VDISABLE**, if it is in effect for the device; if **\_POSIX\_VDISABLE** is not in effect for the device, it shall be treated as an error. In the POSIX locale, if *string* is a two-character sequence beginning with **<circumflex>** (**' ^ '**), and the second character is one of those listed in the "**^c**" column of the following table, the control character shall be set to the corresponding character value in the Value column of the table.

**Table 4-21** Circumflex Control Characters in *stty*

109514  
109515

| <b>^c</b> | <b>Value</b> | <b>^c</b> | <b>Value</b> | <b>^c</b> | <b>Value</b> |
|-----------|--------------|-----------|--------------|-----------|--------------|
| a, A      | <SOH>        | l, L      | <FF>         | w, W      | <ETB>        |
| b, B      | <STX>        | m, M      | <CR>         | x, X      | <CAN>        |
| c, C      | <ETX>        | n, N      | <SO>         | y, Y      | <EM>         |
| d, D      | <EOT>        | o, O      | <SI>         | z, Z      | <SUB>        |
| e, E      | <ENQ>        | p, P      | <DLE>        | [         | <ESC>        |
| f, F      | <ACK>        | q, Q      | <DC1>        | \         | <FS>         |
| g, G      | <BEL>        | r, R      | <DC2>        | ]         | <GS>         |
| h, H      | <BS>         | s, S      | <DC3>        | ^         | <RS>         |
| i, I      | <HT>         | t, T      | <DC4>        | _         | <US>         |
| j, J      | <LF>         | u, U      | <NAK>        | ?         | <DEL>        |
| k, K      | <VT>         | v, V      | <SYN>        |           |              |

109516  
109517  
109518  
  
109519  
109520  
109521

**min number**

Set the value of MIN to *number*. MIN is used in non-canonical mode input processing (**icanon**).

**time number**

Set the value of TIME to *number*. TIME is used in non-canonical mode input processing (**icanon**).

109522

**Combination Modes**

109523  
109524

**saved settings**

Set the current terminal characteristics to the saved settings produced by the **-g** option.

109525  
109526

**evenp or parity**

Enable **parenb** and **cs7**; disable **parodd**.

109527  
109528

**oddp**

Enable **parenb**, **cs7**, and **parodd**.

109529  
109530

**-parity, -evenp, or -oddp**

Disable **parenb**, and set **cs8**.

109531 XSI  
109532  
  
109533  
109534

**raw (-raw or cooked)**

Enable (disable) raw input and output. Raw mode shall be equivalent to setting:

```
stty cs8 erase ^- kill ^- intr ^- \  
quit ^- eof ^- eol ^- -post -inpck
```

109535  
109536  
  
109537  
  
109538  
109539

**nl (-nl)**

Disable (enable) **icrnl**. In addition, **-nl** unsets **inlcr** and **igncr**.

**ek** Reset ERASE and KILL characters back to system defaults.

**sane**

Reset all modes to some reasonable, unspecified, values.

109540 **STDIN**

109541  
109542

Although no input is read from standard input, standard input shall be used to get the current terminal I/O characteristics and to set new terminal I/O characteristics.

109543 **INPUT FILES**

109544       None.

109545 **ENVIRONMENT VARIABLES**109546       The following environment variables shall affect the execution of *stty*:

109547       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 109548                   (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 109549                   variables used to determine the values of locale categories.)

109550       **LC\_ALL**     If set to a non-empty string value, override the values of all the other  
 109551                   internationalization variables.

109552       **LC\_CTYPE**   This variable determines the locale for the interpretation of sequences of bytes of  
 109553                   text data as characters (for example, single-byte as opposed to multi-byte  
 109554                   characters in arguments) and which characters are in the class **print**.

109555       **LC\_MESSAGES**

109556                   Determine the locale that should be used to affect the format and contents of  
 109557                   diagnostic messages written to standard error.

109558 XSI       **NLSPATH**   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

109559 **ASYNCHRONOUS EVENTS**

109560       Default.

109561 **STDOUT**

109562       If operands are specified, no output shall be produced.

109563       If the **-g** option is specified, *stty* shall write to standard output the current settings in a form that  
 109564       can be used as arguments to another instance of *stty* on the same system.

109565       If the **-a** option is specified, all of the information as described in the OPERANDS section shall  
 109566       be written to standard output. Unless otherwise specified, this information shall be written as  
 109567       <space>-separated tokens in an unspecified format, on one or more lines, with an unspecified  
 109568       number of tokens per line. Additional information may be written.

109569       If no options or operands are specified, an unspecified subset of the information written for the  
 109570       **-a** option shall be written.

109571       If speed information is written as part of the default output, or if the **-a** option is specified and if  
 109572       the terminal input speed and output speed are the same, the speed information shall be written  
 109573       as follows:

109574       "speed %d baud;", &lt;speed&gt;

109575       Otherwise, speeds shall be written as:

109576       "ispeed %d baud; ospeed %d baud;", &lt;ispeed&gt;, &lt;ospeed&gt;

109577       In locales other than the POSIX locale, the word **baud** may be changed to something more  
 109578       appropriate in those locales.

109579       If control characters are written as part of the default output, or if the **-a** option is specified,  
 109580       control characters shall be written as:

109581       "%s = %s;", &lt;control-character name&gt;, &lt;value&gt;

109582       where <value> is either the character, or some visual representation of the character if it is non-  
 109583       printable, or the string *undef* if the character is disabled.

109584 **STDERR**

109585 The standard error shall be used only for diagnostic messages.

109586 **OUTPUT FILES**

109587 None.

109588 **EXTENDED DESCRIPTION**

109589 None.

109590 **EXIT STATUS**

109591 The following exit values shall be returned:

109592 0 The terminal options were read or set successfully.

109593 >0 An error occurred.

109594 **CONSEQUENCES OF ERRORS**

109595 Default.

109596 **APPLICATION USAGE**

109597 The **-g** flag is designed to facilitate the saving and restoring of terminal state from the shell level.

109598 For example, a program may:

```
109599 saveterm="$(stty -g)"          # save terminal state
109600 stty (new settings)           # set new state
109601 ...                           # ...
109602 stty $saveterm               # restore terminal state
```

109603 Since the format is unspecified, the saved value is not portable across systems.

109604 Since the **-a** format is so loosely specified, scripts that save and restore terminal settings should  
109605 use the **-g** option.

109606 **EXAMPLES**

109607 None.

109608 **RATIONALE**

109609 The original *stty* description was taken directly from System V and reflected the System V  
109610 terminal driver **termio**. It has been modified to correspond to the terminal driver **termios**.

109611 Output modes are specified only for XSI-conformant systems. All implementations are expected  
109612 to provide *stty* operands corresponding to all of the output modes they support.

109613 The *stty* utility is primarily used to tailor the user interface of the terminal, such as selecting the  
109614 preferred ERASE and KILL characters. As an application programming utility, *stty* can be used  
109615 within shell scripts to alter the terminal settings for the duration of the script.

109616 The **termios** section states that individual disabling of control characters is possible through the  
109617 option **\_POSIX\_VDISABLE**. If enabled, two conventions currently exist for specifying this:  
109618 System V uses "**^-**", and BSD uses *undef*. Both are accepted by *stty* in this volume of  
109619 POSIX.1-2008. The other BSD convention of using the letter '**u**' was rejected because it conflicts  
109620 with the actual letter '**u**', which is an acceptable value for a control character.

109621 Early proposals did not specify the mapping of "**^c**" to control characters because the control  
109622 characters were not specified in the POSIX locale character set description file requirements. The  
109623 control character set is now specified in XBD [Chapter 3](#) (on page 33), so the historical mapping is  
109624 specified. Note that although the mapping corresponds to control-character key assignments on  
109625 many terminals that use the ISO/IEC 646:1991 standard (or ASCII) character encodings, the  
109626 mapping specified here is to the control characters, not their keyboard encodings.

109627 Since **termios** supports separate speeds for input and output, two new options were added to  
109628 specify each distinctly.

109629 Some historical implementations use standard input to get and set terminal characteristics;  
109630 others use standard output. Since input from a login TTY is usually restricted to the owner while  
109631 output to a TTY is frequently open to anyone, using standard input provides fewer chances of  
109632 accidentally (or maliciously) altering the terminal settings of other users. Using standard input  
109633 also allows *stty -a* and *stty -g* output to be redirected for later use. Therefore, usage of standard  
109634 input is required by this volume of POSIX.1-2008.

#### 109635 FUTURE DIRECTIONS

109636 None.

#### 109637 SEE ALSO

109638 [Chapter 2](#) (on page 2335)

109639 XBD [Chapter 8](#) (on page 173), [Chapter 11](#) (on page 199), [Section 12.2](#) (on page 216), [<termios.h>](#)

#### 109640 CHANGE HISTORY

109641 First released in Issue 2.

#### 109642 Issue 5

109643 The description of **tabs** is clarified.

109644 The FUTURE DIRECTIONS section is added.

#### 109645 Issue 6

109646 The LEGACY items **iuclic(-iuclic)**, **xcase**, **olcuc(-olcuc)**, **lcase(-lcase)**, and **LCASE(-LCASE)** are  
109647 removed.

109648 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/37 is applied, applying IEEE PASC  
109649 Interpretation 1003.2 #133, fixing an error in the OPERANDS section for the Combination Modes  
109650 **nl(-nl)**.

#### 109651 Issue 7

109652 Austin Group Interpretation 1003.1-2001 #144 is applied, moving functionality relating to the  
109653 **IXANY** symbol from the **XSI** option to the Base.

109654 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109655 **NAME**

109656 tabs — set terminal tabs

109657 **SYNOPSIS**

109658 XSI tabs [-n|-a|-a2|-c|-c2|-c3|-f|-p|-s|-u] [-T type]

109659 tabs [-T type] n[[sep][+]*n*]. . .]

109660 **DESCRIPTION**

109661 The *tabs* utility shall display a series of characters that first clears the hardware terminal tab  
109662 XSI settings and then initializes the tab stops at the specified positions and optionally adjusts the  
109663 margin.

109664 The phrase “tab-stop position *N*” shall be taken to mean that, from the start of a line of output,  
109665 tabbing to position *N* shall cause the next character output to be in the (*N*+1)th column position  
109666 on that line. The maximum number of tab stops allowed is terminal-dependent.

109667 It need not be possible to implement *tabs* on certain terminals. If the terminal type obtained from  
109668 the *TERM* environment variable or *-T* option represents such a terminal, an appropriate  
109669 diagnostic message shall be written to standard error and *tabs* shall exit with a status greater  
109670 than zero.

109671 **OPTIONS**

109672 XSI The *tabs* utility shall conform to XBD Section 12.2 (on page 216), except for various extensions:  
109673 the options *-a2*, *-c2*, and *-c3* are multi-character.

109674 The following options shall be supported:

109675 *-n* Specify repetitive tab stops separated by a uniform number of column positions, *n*,  
109676 where *n* is a single-digit decimal number. The default usage of *tabs* with no  
109677 arguments shall be equivalent to *tabs -8*. When *-0* is used, the tab stops shall be  
109678 cleared and no new ones set.

109679 XSI *-a* 1,10,16,36,72  
109680 Assembler, applicable to some mainframes.

109681 XSI *-a2* 1,10,16,40,72  
109682 Assembler, applicable to some mainframes.

109683 XSI *-c* 1,8,12,16,20,55  
109684 COBOL, normal format.

109685 XSI *-c2* 1,6,10,14,49  
109686 COBOL, compact format (columns 1 to 6 omitted).

109687 XSI *-c3* 1,6,10,14,18,22,26,30,34,38,42,46,50,54,58,62,67  
109688 COBOL compact format (columns 1 to 6 omitted), with more tabs than *-c2*.

109689 XSI *-f* 1,7,11,15,19,23  
109690 FORTRAN

109691 XSI *-p* 1,5,9,13,17,21,25,29,33,37,41,45,49,53,57,61  
109692 PL/1

109693 XSI *-s* 1,10,55  
109694 SNOBOL

109695 XSI *-u* 1,12,20,44  
109696 Assembler, applicable to some mainframes.

109697        **-T type**        Indicate the type of terminal. If this option is not supplied and the *TERM* variable  
 109698                               is unset or null, an unspecified default terminal type shall be used. The setting of  
 109699                               *type* shall take precedence over the value in *TERM*.

#### 109700 **OPERANDS**

109701        The following operand shall be supported:

109702        *n*[[*sep*[+]*n*]...] A single command line argument that consists of one or more tab-stop values (*n*)  
 109703                               separated by a separator character (*sep*) which is either a <comma> or a <blank>  
 109704                               character. The application shall ensure that the tab-stop values are positive decimal  
 109705                               integers in strictly ascending order. If any tab-stop value (except the first one) is  
 109706                               preceded by a <plus-sign>, it is taken as an increment to be added to the previous  
 109707                               value. For example, the tab lists 1,10,20,30 and "1 10 +10 +10" are considered  
 109708                               to be identical.

#### 109709 **STDIN**

109710        Not used.

#### 109711 **INPUT FILES**

109712        None.

#### 109713 **ENVIRONMENT VARIABLES**

109714        The following environment variables shall affect the execution of *tabs*:

109715        *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 109716                               (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 109717                               variables used to determine the values of locale categories.)

109718        *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 109719                               internationalization variables.

109720        *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 109721                               characters (for example, single-byte as opposed to multi-byte characters in  
 109722                               arguments).

109723        *LC\_MESSAGES*

109724                               Determine the locale that should be used to affect the format and contents of  
 109725                               diagnostic messages written to standard error.

109726 XSI        *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

109727        *TERM*        Determine the terminal type. If this variable is unset or null, and if the *-T* option is  
 109728                               not specified, an unspecified default terminal type shall be used.

#### 109729 **ASYNCHRONOUS EVENTS**

109730        Default.

#### 109731 **STDOUT**

109732        If standard output is a terminal, the appropriate sequence to clear and set the tab stops may be  
 109733        written to standard output in an unspecified format. If standard output is not a terminal,  
 109734        undefined results occur.

#### 109735 **STDERR**

109736        The standard error shall be used only for diagnostic messages.

#### 109737 **OUTPUT FILES**

109738        None.

109739 **EXTENDED DESCRIPTION**

109740 None.

109741 **EXIT STATUS**

109742 The following exit values shall be returned:

109743 0 Successful completion.

109744 &gt;0 An error occurred.

109745 **CONSEQUENCES OF ERRORS**

109746 Default.

109747 **APPLICATION USAGE**109748 This utility makes use of the terminal's hardware tabs and the *stty tabs* option.

109749 This utility is not recommended for application use.

109750 Some integrated display units might not have escape sequences to set tab stops, but may be set  
109751 by internal system calls. On these terminals, *tabs* works if standard output is directed to the  
109752 terminal; if output is directed to another file, however, *tabs* fails.

109753 **EXAMPLES**

109754 None.

109755 **RATIONALE**

109756 Consideration was given to having the *tput* utility handle all of the functions described in *tabs*.  
109757 However, the separate *tabs* utility was retained because it seems more intuitive to use a  
109758 command named *tabs* than *tput* with a new option. The *tput* utility does not support setting or  
109759 clearing tabs, and no known historical version of *tabs* supports the capability of setting arbitrary  
109760 tab stops.

109761 The System V *tabs* interface is very complex; the version in this volume of POSIX.1-2008 has a  
109762 reduced feature list, but many of the features omitted were restored as part of the XSI option  
109763 even though the supported languages and coding styles are primarily historical.

109764 There was considerable sentiment for specifying only a means of resetting the tabs back to a  
109765 known state—presumably the “standard” of tabs every eight positions. The following features  
109766 were omitted:

- 109767 • Setting tab stops via the first line in a file, using *–file*. Since even the SVID has no  
109768 complete explanation of this feature, it is doubtful that it is in widespread use.

109769 In an early proposal, a *–t tablist* option was added for consistency with *expand*; this was later  
109770 removed when inconsistencies with the historical list of tabs were identified.

109771 Consideration was given to adding a *–p* option that would output the current tab settings so  
109772 that they could be saved and then later restored. This was not accepted because querying the tab  
109773 stops of the terminal is not a capability in historical *terminfo* or *termcap* facilities and might not be  
109774 supported on a wide range of terminals.

109775 **FUTURE DIRECTIONS**

109776 None.

109777 **SEE ALSO**109778 *expand*, *stty*, *tput*, *unexpand*

109780 **CHANGE HISTORY**

109781 First released in Issue 2.

109782 **Issue 6**

109783 This utility is marked as part of the User Portability Utilities option.

109784 The normative text is reworded to avoid use of the term “must” for application requirements.

109785 **Issue 7**109786 The *tabs* utility is removed from the User Portability Utilities option. User Portability Utilities is now an option for interactive utilities.

109788 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109789 The SYNOPSIS and OPERANDS sections are updated.

109790 **NAME**

109791 tail — copy the last part of a file

109792 **SYNOPSIS**109793 tail [-f] [-c *number*|-n *number*] [*file*]109794 **DESCRIPTION**109795 The *tail* utility shall copy its input file to the standard output beginning at a designated place.

109796 Copying shall begin at the point in the file indicated by the *-c number* or *-n number* options. The  
 109797 option-argument *number* shall be counted in units of lines or bytes, according to the options *-n*  
 109798 and *-c*. Both line and byte counts start from 1.

109799 Tails relative to the end of the file may be saved in an internal buffer, and thus may be limited in  
 109800 length. Such a buffer, if any, shall be no smaller than {LINE\_MAX}\*10 bytes.

109801 **OPTIONS**

109802 The *tail* utility shall conform to XBD Section 12.2 (on page 216), except that '+' may be  
 109803 recognized as an option delimiter as well as '-'.

109804 The following options shall be supported:

109805 *-c number* The application shall ensure that the *number* option-argument is a decimal integer,  
 109806 optionally including a sign. The sign shall affect the location in the file, measured  
 109807 in bytes, to begin the copying:

| Sign        | Copying Starts                         |
|-------------|----------------------------------------|
| +           | Relative to the beginning of the file. |
| -           | Relative to the end of the file.       |
| <i>none</i> | Relative to the end of the file.       |

109812 The application shall ensure that if the sign of the *number* option-argument is '+',  
 109813 the *number* option-argument is a non-zero decimal integer.

109814 The origin for counting shall be 1; that is, *-c +1* represents the first byte of the file,  
 109815 *-c -1* the last.

109816 *-f* If the input file is a regular file or if the *file* operand specifies a FIFO, do not  
 109817 terminate after the last line of the input file has been copied, but read and copy  
 109818 further bytes from the input file when they become available. If no *file* operand is  
 109819 specified and standard input is a pipe or FIFO, the *-f* option shall be ignored. If the  
 109820 input file is not a FIFO, pipe, or regular file, it is unspecified whether or not the *-f*  
 109821 option shall be ignored.

109822 *-n number* This option shall be equivalent to *-c number*, except the starting location in the file  
 109823 shall be measured in lines instead of bytes. The origin for counting shall be 1; that  
 109824 is, *-n +1* represents the first line of the file, *-n -1* the last.

109825 If neither *-c* nor *-n* is specified, *-n 10* shall be assumed.109826 **OPERANDS**

109827 The following operand shall be supported:

109828 *file* A pathname of an input file. If no *file* operand is specified, the standard input shall  
 109829 be used.

**109830 STDIN**

109831 The standard input shall be used if no *file* operand is specified, and shall be used if the *file*  
 109832 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 109833 the standard input shall not be used. See the INPUT FILES section.

**109834 INPUT FILES**

109835 If the -c option is specified, the input file can contain arbitrary data; otherwise, the input file  
 109836 shall be a text file.

**109837 ENVIRONMENT VARIABLES**

109838 The following environment variables shall affect the execution of *tail*:

109839 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 109840 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 109841 variables used to determine the values of locale categories.)

109842 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 109843 internationalization variables.

109844 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 109845 characters (for example, single-byte as opposed to multi-byte characters in  
 109846 arguments and input files).

109847 *LC\_MESSAGES*

109848 Determine the locale that should be used to affect the format and contents of  
 109849 diagnostic messages written to standard error.

109850 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**109851 ASYNCHRONOUS EVENTS**

109852 Default.

**109853 STDOUT**

109854 The designated portion of the input file shall be written to standard output.

**109855 STDERR**

109856 The standard error shall be used only for diagnostic messages.

**109857 OUTPUT FILES**

109858 None.

**109859 EXTENDED DESCRIPTION**

109860 None.

**109861 EXIT STATUS**

109862 The following exit values shall be returned:

109863 0 Successful completion.

109864 >0 An error occurred.

**109865 CONSEQUENCES OF ERRORS**

109866 Default.

**APPLICATION USAGE**

The `-c` option should be used with caution when the input is a text file containing multi-byte characters; it may produce output that does not start on a character boundary.

Although the input file to *tail* can be any type, the results might not be what would be expected on some character special device files or on file types not described by the System Interfaces volume of POSIX.1-2008. Since this volume of POSIX.1-2008 does not specify the block size used when doing input, *tail* need not read all of the data from devices that only perform block transfers.

When using *tail* to process pathnames, and the `-c` option is not specified, it is recommended that `LC_ALL`, or at least `LC_CTYPE` and `LC_COLLATE`, are set to `POSIX` or `C` in the environment, since pathnames can contain byte sequences that do not form valid characters in some locales, in which case the utility's behavior would be undefined. In the `POSIX` locale each byte is a valid single-byte character, and therefore this problem is avoided.

**EXAMPLES**

The `-f` option can be used to monitor the growth of a file that is being written by some other process. For example, the command:

```
tail -f fred
```

prints the last ten lines of the file **fred**, followed by any lines that are appended to **fred** between the time *tail* is initiated and killed. As another example, the command:

```
tail -f -c 15 fred
```

prints the last 15 bytes of the file **fred**, followed by any bytes that are appended to **fred** between the time *tail* is initiated and killed.

**RATIONALE**

This version of *tail* was created to allow conformance to the Utility Syntax Guidelines. The historical `-b` option was omitted because of the general non-portability of block-sized units of text. The `-c` option historically meant "characters", but this volume of POSIX.1-2008 indicates that it means "bytes". This was selected to allow reasonable implementations when multi-byte characters are possible; it was not named `-b` to avoid confusion with the historical `-b`.

The origin of counting both lines and bytes is 1, matching all widespread historical implementations. Hence *tail -n +0* is not conforming usage because it attempts to output line zero; but note that *tail -n 0* does conform, and outputs nothing.

Earlier versions of this standard allowed the following forms in the SYNOPSIS:

```
tail -[number][b|c|l][f] [file]
tail +[number][b|c|l][f] [file]
```

These forms are no longer specified by POSIX.1-2008, but may be present in some implementations.

The restriction on the internal buffer is a compromise between the historical System V implementation of 4096 bytes and the BSD 32768 bytes.

The `-f` option has been implemented as a loop that sleeps for 1 second and copies any bytes that are available. This is sufficient, but if more efficient methods of determining when new data are available are developed, implementations are encouraged to use them.

Historical documentation indicates that *tail* ignores the `-f` option if the input file is a pipe (pipe and FIFO on systems that support FIFOs). On BSD-based systems, this has been true; on System V-based systems, this was true when input was taken from standard input, but it did not ignore

109911 the `-f` flag if a FIFO was named as the *file* operand. Since the `-f` option is not useful on pipes and  
109912 all historical implementations ignore `-f` if no *file* operand is specified and standard input is a  
109913 pipe, this volume of POSIX.1-2008 requires this behavior. However, since the `-f` option is useful  
109914 on a FIFO, this volume of POSIX.1-2008 also requires that if a FIFO is named, the `-f` option shall  
109915 not be ignored. Earlier versions of this standard did not state any requirement for the case where  
109916 no *file* operand is specified and standard input is a FIFO. The standard has been updated to  
109917 reflect current practice which is to treat this case the same as a pipe on standard input. Although  
109918 historical behavior does not ignore the `-f` option for other file types, this is unspecified so that  
109919 implementations are allowed to ignore the `-f` option if it is known that the file cannot be  
109920 extended.

#### 109921 FUTURE DIRECTIONS

109922 None.

#### 109923 SEE ALSO

109925 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

#### 109926 CHANGE HISTORY

109927 First released in Issue 2.

#### 109928 Issue 6

109929 The obsolescent SYNOPSIS lines and associated text are removed.

109930 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 109931 Issue 7

109932 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that ‘+’ may be recognized  
109933 as an option delimiter in the OPTIONS section.

109934 Austin Group Interpretation 1003.1-2001 #092 is applied.

109935 Austin Group Interpretation 1003.1-2001 #100 is applied, adding the requirement on applications  
109936 that if the sign of the option-argument *number* is ‘+’, the *number* option-argument is a non-zero  
109937 decimal integer.

109938 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

109939 SD5-XCU-ERN-114 is applied, updating the OPTIONS section (the `-f` option).

109940 SD5-XCU-ERN-149 is applied.

109941 **NAME**

109942 talk — talk to another user

109943 **SYNOPSIS**109944 UP `talk address [terminal]`109945 **DESCRIPTION**109946 The *talk* utility is a two-way, screen-oriented communication program.109947 When first invoked, *talk* shall send a message similar to:

```
109948 Message from <unspecified string>
109949 talk: connection requested by your_address
109950 talk: respond with: talk your_address
```

109951 to the specified *address*. At this point, the recipient of the message can reply by typing:109952 `talk your_address`109953 Once communication is established, the two parties can type simultaneously, with their output  
109954 displayed in separate regions of the screen. Characters shall be processed as follows:

- 109955 • Typing the <alert> character shall alert the recipient's terminal.
- 109956 • Typing <control>-L shall cause the sender's screen regions to be refreshed.
- 109957 • Typing the erase and kill characters shall affect the sender's terminal in the manner  
109958 described by the **termios** interface in XBD [Chapter 11](#) (on page 199).
- 109959 • Typing the interrupt or end-of-file characters shall terminate the local *talk* utility. Once the  
109960 *talk* session has been terminated on one side, the other side of the *talk* session shall be  
109961 notified that the *talk* session has been terminated and shall be able to do nothing except  
109962 exit.
- 109963 • Typing characters from *LC\_CTYPE* classifications **print** or **space** shall cause those  
109964 characters to be sent to the recipient's terminal.
- 109965 • When and only when the *stty iexten* local mode is enabled, the existence and processing of  
109966 additional special control characters and multi-byte or single-byte functions shall be  
109967 implementation-defined.
- 109968 • Typing other non-printable characters shall cause implementation-defined sequences of  
109969 printable characters to be sent to the recipient's terminal.

109970 Permission to be a recipient of a *talk* message can be denied or granted by use of the *mesg* utility.  
109971 However, a user's privilege may further constrain the domain of accessibility of other users'  
109972 terminals. The *talk* utility shall fail when the user lacks appropriate privileges to perform the  
109973 requested action.

109974 Certain block-mode terminals do not have all the capabilities necessary to support the  
109975 simultaneous exchange of messages required for *talk*. When this type of exchange cannot be  
109976 supported on such terminals, the implementation may support an exchange with reduced levels  
109977 of simultaneous interaction or it may report an error describing the terminal-related deficiency.

109978 **OPTIONS**

109979 None.

109980 **OPERANDS**

109981 The following operands shall be supported:

109982 *address* The recipient of the *talk* session. One form of *address* is the *<user name>*, as returned  
 109983 by the *who* utility. Other address formats and how they are handled are  
 109984 unspecified.

109985 *terminal* If the recipient is logged in more than once, the *terminal* argument can be used to  
 109986 indicate the appropriate terminal name. If *terminal* is not specified, the *talk* message  
 109987 shall be displayed on one or more accessible terminals in use by the recipient. The  
 109988 format of *terminal* shall be the same as that returned by the *who* utility.

109989 **STDIN**

109990 Characters read from standard input shall be copied to the recipient's terminal in an unspecified  
 109991 manner. If standard input is not a terminal, *talk* shall write a diagnostic message and exit with a  
 109992 non-zero status.

109993 **INPUT FILES**

109994 None.

109995 **ENVIRONMENT VARIABLES**109996 The following environment variables shall affect the execution of *talk*:

109997 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 109998 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 109999 variables used to determine the values of locale categories.)

110000 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 110001 internationalization variables.

110002 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 110003 characters (for example, single-byte as opposed to multi-byte characters in  
 110004 arguments and input files). If the recipient's locale does not use an *LC\_CTYPE*  
 110005 equivalent to the sender's, the results are undefined.

110006 *LC\_MESSAGES*

110007 Determine the locale that should be used to affect the format and contents of  
 110008 diagnostic messages written to standard error and informative messages written to  
 110009 standard output.

110010 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

110011 *TERM* Determine the name of the invoker's terminal type. If this variable is unset or null,  
 110012 an unspecified default terminal type shall be used.

110013 **ASYNCHRONOUS EVENTS**

110014 When the *talk* utility receives a SIGINT signal, the utility shall terminate and exit with a zero  
 110015 status. It shall take the standard action for all other signals.

110016 **STDOUT**

110017 If standard output is a terminal, characters copied from the recipient's standard input may be  
 110018 written to standard output. Standard output also may be used for diagnostic messages. If  
 110019 standard output is not a terminal, *talk* shall exit with a non-zero status.

110020 **STDERR**

110021 None.

110022 **OUTPUT FILES**

110023 None.

110024 **EXTENDED DESCRIPTION**

110025 None.

110026 **EXIT STATUS**

110027 The following exit values shall be returned:

110028 0 Successful completion.

110029 >0 An error occurred or *talk* was invoked on a terminal incapable of supporting it.110030 **CONSEQUENCES OF ERRORS**

110031 Default.

110032 **APPLICATION USAGE**

110033 Because the handling of non-printable, non-`<space>` characters is tied to the *stty* description of  
110034 *ixten*, implementation extensions within the terminal driver can be accessed. For example,  
110035 some implementations provide line editing functions with certain control character sequences.

110036 **EXAMPLES**

110037 None.

110038 **RATIONALE**

110039 The *write* utility was included in this volume of POSIX.1-2008 since it can be implemented on all  
110040 terminal types. The *talk* utility, which cannot be implemented on certain terminals, was  
110041 considered to be a “better” communications interface. Both of these programs are in widespread  
110042 use on historical implementations. Therefore, both utilities have been specified.

110043 All references to networking abilities (*talking* to a user on another system) were removed as  
110044 being outside the scope of this volume of POSIX.1-2008.

110045 Historical BSD and System V versions of *talk* terminate both of the conversations when either  
110046 user breaks out of the session. This can lead to adverse consequences if a user unwittingly  
110047 continues to enter text that is interpreted by the shell when the other terminates the session.  
110048 Therefore, the version of *talk* specified by this volume of POSIX.1-2008 requires both users to  
110049 terminate their end of the session explicitly.

110050 Only messages sent to the terminal of the invoking user can be internationalized in any way:

- 110051 • The original “Message from `<unspecified string>` ...” message sent to the terminal of the  
110052 recipient cannot be internationalized because the environment of the recipient is as yet  
110053 inaccessible to the *talk* utility. The environment of the invoking party is irrelevant.
- 110054 • Subsequent communication between the two parties cannot be internationalized because  
110055 the two parties may specify different languages in their environment (and non-portable  
110056 characters cannot be mapped from one language to another).
- 110057 • Neither party can be required to communicate in a language other than C and/or the one  
110058 specified by their environment because unavailable terminal hardware support (for  
110059 example, fonts) may be required.

110060 The text in the STDOUT section reflects the usage of the verb “display” in this section; some *talk*  
110061 implementations actually use standard output to write to the terminal, but this volume of  
110062 POSIX.1-2008 does not require that to be the case.

110063 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
110064 require that they all use or accept the same format.

110065 The handling of non-printable characters is partially implementation-defined because the details  
110066 of mapping them to printable sequences is not needed by the user. Historical implementations,  
110067 for security reasons, disallow the transmission of non-printable characters that may send  
110068 commands to the other terminal.

110069 **FUTURE DIRECTIONS**

110070 None.

110071 **SEE ALSO**

110072 *mesg, stty, who, write*

110073 XBD [Chapter 8](#) (on page 173), [Chapter 11](#) (on page 199)

110074 **CHANGE HISTORY**

110075 First released in Issue 4.

110076 **Issue 6**

110077 This utility is marked as part of the User Portability Utilities option.

110078 **NAME**

110079       tee — duplicate standard input

110080 **SYNOPSIS**110081       tee [-ai] [*file*...]110082 **DESCRIPTION**110083       The *tee* utility shall copy standard input to standard output, making a copy in zero or more files.110084       The *tee* utility shall not buffer output.110085       If the **-a** option is not specified, output files shall be written (see [Section 1.1.1.4](#) (on page 2318)).110086 **OPTIONS**110087       The *tee* utility shall conform to XBD [Section 12.2](#) (on page 216).

110088       The following options shall be supported:

110089       **-a**           Append the output to the files.110090       **-i**           Ignore the SIGINT signal.110091 **OPERANDS**

110092       The following operands shall be supported:

110093       *file*           A pathname of an output file. If a *file* operand is '-', it shall refer to a file named  
 110094       -; implementations shall not treat it as meaning standard output. Processing of at  
 110095       least 13 *file* operands shall be supported.

110096 **STDIN**

110097       The standard input can be of any type.

110098 **INPUT FILES**

110099       None.

110100 **ENVIRONMENT VARIABLES**110101       The following environment variables shall affect the execution of *tee*:

110102       **LANG**           Provide a default value for the internationalization variables that are unset or null.  
 110103                       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 110104                       variables used to determine the values of locale categories.)

110105       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 110106                       internationalization variables.

110107       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
 110108                       characters (for example, single-byte as opposed to multi-byte characters in  
 110109                       arguments).

110110       **LC\_MESSAGES**

110111                       Determine the locale that should be used to affect the format and contents of  
 110112                       diagnostic messages written to standard error.

110113 **XSI**       **NLSPATH**   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.110114 **ASYNCHRONOUS EVENTS**110115       Default, except that if the **-i** option was specified, SIGINT shall be ignored.110116 **STDOUT**

110117       The standard output shall be a copy of the standard input.

**110118 STDERR**

110119 The standard error shall be used only for diagnostic messages.

**110120 OUTPUT FILES**

110121 If any *file* operands are specified, the standard input shall be copied to each named file.

**110122 EXTENDED DESCRIPTION**

110123 None.

**110124 EXIT STATUS**

110125 The following exit values shall be returned:

110126 0 The standard input was successfully copied to all output files.

110127 >0 An error occurred.

**110128 CONSEQUENCES OF ERRORS**

110129 If a write to any successfully opened *file* operand fails, writes to other successfully opened *file*  
110130 operands and standard output shall continue, but the exit status shall be non-zero. Otherwise,  
110131 the default actions specified in [Section 1.4](#) (on page 2326) apply.

**110132 APPLICATION USAGE**

110133 The *tee* utility is usually used in a pipeline, to make a copy of the output of some utility.

110134 The *file* operand is technically optional, but *tee* is no more useful than *cat* when none is specified.

**110135 EXAMPLES**

110136 Save an unsorted intermediate form of the data in a pipeline:

110137 `... | tee unsorted | sort > sorted`

**110138 RATIONALE**

110139 The buffering requirement means that *tee* is not allowed to use ISO C standard fully buffered or  
110140 line-buffered writes. It does not mean that *tee* has to do 1-byte reads followed by 1-byte writes.

110141 It should be noted that early versions of BSD ignore any invalid options and accept a single `'-'`  
110142 as an alternative to `-i`. They also print a message if unable to open a file:

110143 `"tee: cannot access %s\n", <pathname>`

110144 Historical implementations ignore write errors. This is explicitly not permitted by this volume of  
110145 POSIX.1-2008.

110146 Some historical implementations use `O_APPEND` when providing append mode; others use the  
110147 `lseek()` function to seek to the end-of-file after opening the file without `O_APPEND`. This volume  
110148 of POSIX.1-2008 requires functionality equivalent to using `O_APPEND`; see [Section 1.1.1.4](#) (on  
110149 page 2318).

**110150 FUTURE DIRECTIONS**

110151 None.

110156 **CHANGE HISTORY**

110157 First released in Issue 2.

110158 **Issue 6**

110159 IEEE PASC Interpretation 1003.2 #168 is applied.

110160 **Issue 7**

110161 Austin Group Interpretation 1003.1-2001 #092 is applied.

110162 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

110163 **NAME**

110164 test — evaluate expression

110165 **SYNOPSIS**110166 test [*expression*]110167 [ [*expression*] ]110168 **DESCRIPTION**

110169 The *test* utility shall evaluate the *expression* and indicate the result of the evaluation by its exit  
 110170 status. An exit status of zero indicates that the expression evaluated as true and an exit status of  
 110171 1 indicates that the expression evaluated as false.

110172 In the second form of the utility, where the utility name used is *[* rather than *test*, the application  
 110173 shall ensure that the closing square bracket is a separate argument. The *test* and *[* utilities may be  
 110174 implemented as a single linked utility which examines the basename of the zeroth command  
 110175 line argument to determine whether to behave as the *test* or *[* variant. Applications using the  
 110176 *exec()* family of functions to execute these utilities shall ensure that the argument passed in *arg0*  
 110177 or *argv[0]* is ' *[* ' when executing the *[* utility and has a basename of "test" when executing the  
 110178 *test* utility.

110179 **OPTIONS**

110180 The *test* utility shall not recognize the "--" argument in the manner specified by Guideline 10 in  
 110181 XBD [Section 12.2](#) (on page 216).

110182 No options shall be supported.

110183 **OPERANDS**

110184 The application shall ensure that all operators and elements of primaries are presented as  
 110185 separate arguments to the *test* utility.

110186 The following primaries can be used to construct *expression*:

110187 **-b *pathname*** True if *pathname* resolves to an existing directory entry for a block special file. False  
 110188 if *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 110189 for a file that is not a block special file.

110190 **-c *pathname*** True if *pathname* resolves to an existing directory entry for a character special file.  
 110191 False if *pathname* cannot be resolved, or if *pathname* resolves to an existing directory  
 110192 entry for a file that is not a character special file.

110193 **-d *pathname*** True if *pathname* resolves to an existing directory entry for a directory. False if  
 110194 *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 110195 for a file that is not a directory.

110196 **-e *pathname*** True if *pathname* resolves to an existing directory entry. False if *pathname* cannot be  
 110197 resolved.

110198 **-f *pathname*** True if *pathname* resolves to an existing directory entry for a regular file. False if  
 110199 *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 110200 for a file that is not a regular file.

110201 **-g *pathname*** True if *pathname* resolves to an existing directory entry for a file that has its set-  
 110202 group-ID flag set. False if *pathname* cannot be resolved, or if *pathname* resolves to an  
 110203 existing directory entry for a file that does not have its set-group-ID flag set.

110204 **-h *pathname*** True if *pathname* resolves to an existing directory entry for a symbolic link. False if  
 110205 *pathname* cannot be resolved, or if *pathname* resolves to an existing directory entry  
 110206 for a file that is not a symbolic link. If the final component of *pathname* is a  
 110207 symbolic link, that symbolic link is not followed.

|        |                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 110208 | <b>-L</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a symbolic link. False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to an existing directory entry for a file that is not a symbolic link. If the final component of <i>pathname</i> is a symbolic link, that symbolic link is not followed.                                                                                               |
| 110209 |                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 110210 |                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 110211 |                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 110212 | <b>-n</b> <i>string</i>          | True if the length of <i>string</i> is non-zero; otherwise, false.                                                                                                                                                                                                                                                                                                                                                                      |
| 110213 | <b>-p</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a FIFO. False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to an existing directory entry for a file that is not a FIFO.                                                                                                                                                                                                                   |
| 110214 |                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 110215 |                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 110216 | <b>-r</b> <i>pathname</i>        | True if <i>pathname</i> resolves to an existing directory entry for a file for which permission to read from the file will be granted, as defined in <a href="#">Section 1.1.1.4</a> (on page 2318). False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to an existing directory entry for a file for which permission to read from the file will not be granted.                                              |
| 110217 |                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 110244 |                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 110245 | <b>-z</b> <i>string</i>          | True if the length of string <i>string</i> is zero; otherwise, false.                                                                                                                                                                                                                                                                                                                                                                   |
| 110246 | <i>string</i>                    | True if the string <i>string</i> is not the null string; otherwise, false.                                                                                                                                                                                                                                                                                                                                                              |
| 110247 | <i>s1</i> = <i>s2</i>            | True if the strings <i>s1</i> and <i>s2</i> are identical; otherwise, false.                                                                                                                                                                                                                                                                                                                                                            |
| 110248 | <i>s1</i> != <i>s2</i>           | True if the strings <i>s1</i> and <i>s2</i> are not identical; otherwise, false.                                                                                                                                                                                                                                                                                                                                                        |
| 110249 | <i>n1</i> <b>-eq</b> <i>n2</i>   | True if the integers <i>n1</i> and <i>n2</i> are algebraically equal; otherwise, false.                                                                                                                                                                                                                                                                                                                                                 |

- 110250 *n1 -ne n2* True if the integers *n1* and *n2* are not algebraically equal; otherwise, false.
- 110251 *n1 -gt n2* True if the integer *n1* is algebraically greater than the integer *n2*; otherwise, false.
- 110252 *n1 -ge n2* True if the integer *n1* is algebraically greater than or equal to the integer *n2*;  
110253 otherwise, false.
- 110254 *n1 -lt n2* True if the integer *n1* is algebraically less than the integer *n2*; otherwise, false.
- 110255 *n1 -le n2* True if the integer *n1* is algebraically less than or equal to the integer *n2*; otherwise,  
110256 false.
- 110257 OB XSI *expression1 -a expression2*  
110258 True if both *expression1* and *expression2* are true; otherwise, false. The *-a* binary  
110259 primary is left associative. It has a higher precedence than *-o*.
- 110260 OB XSI *expression1 -o expression2*  
110261 True if either *expression1* or *expression2* is true; otherwise, false. The *-o* binary  
110262 primary is left associative.
- 110263 With the exception of the *-h pathname* and *-L pathname* primaries, if a *pathname* argument is a  
110264 symbolic link, *test* shall evaluate the expression by resolving the symbolic link and using the file  
110265 referenced by the link.
- 110266 These primaries can be combined with the following operators:
- 110267 *! expression* True if *expression* is false. False if *expression* is true.
- 110268 OB XSI *( expression )* True if *expression* is true. False if *expression* is false. The parentheses can be used to  
110269 alter the normal precedence and associativity.
- 110270 The primaries with two elements of the form:
- 110271 *-primary\_operator primary\_operand*
- 110272 are known as *unary primaries*. The primaries with three elements in either of the two forms:
- 110273 *primary\_operand -primary\_operator primary\_operand*  
110274 *primary\_operand primary\_operator primary\_operand*
- 110275 are known as *binary primaries*. Additional implementation-defined operators and  
110276 *primary\_operators* may be provided by implementations. They shall be of the form *-operator*  
110277 where the first character of *operator* is not a digit.
- 110278 The algorithm for determining the precedence of the operators and the return value that shall be  
110279 generated is based on the number of arguments presented to *test*. (However, when using the  
110280 "[...]" form, the <right-square-bracket> final argument shall not be counted in this  
110281 algorithm.)
- 110282 In the following list, \$1, \$2, \$3, and \$4 represent the arguments presented to *test*:
- 110283 0 arguments: Exit false (1).
- 110284 1 argument: Exit true (0) if \$1 is not null; otherwise, exit false.
- 110285 2 arguments:
- If \$1 is '!', exit true if \$2 is null, false if \$2 is not null.
  - If \$1 is a unary primary, exit true if the unary test is true, false if the  
110286 unary test is false.
  - 110287

| 110294 |                              | • Otherwise, produce unspecified results.                                                     |
| 110295 | 4 arguments:                 | • If \$1 is ' ! ', negate the three-argument test of \$2, \$3, and \$4.                       |
| 110296 | OB XSI                       | • If \$1 is ' ( ' and \$4 is ' ) ', perform the two-argument test of \$2 and \$3.             |
| 110297 |                              | On systems that do not support the XSI option, the results are                                |
| 110298 |                              | unspecified if \$1 is ' ( ' and \$4 is ' ) '.                                                 |
| 110299 |                              | • Otherwise, the results are unspecified.                                                     |
| 110300 | >4 arguments:                | The results are unspecified.                                                                  |
| 110301 | OB XSI                       | On XSI-conformant systems, combinations of primaries and operators shall be                   |
| 110302 |                              | evaluated using the precedence and associativity rules described previously.                  |
| 110303 |                              | In addition, the string comparison binary primaries ' = ' and ' != ' shall have               |
| 110304 |                              | a higher precedence than any unary primary.                                                   |
| 110305 | <b>STDIN</b>                 |                                                                                               |
| 110306 |                              | Not used.                                                                                     |
| 110307 | <b>INPUT FILES</b>           |                                                                                               |
| 110308 |                              | None.                                                                                         |
| 110309 | <b>ENVIRONMENT VARIABLES</b> |                                                                                               |
| 110310 |                              | The following environment variables shall affect the execution of <i>test</i> :               |
| 110311 | <i>LANG</i>                  | Provide a default value for the internationalization variables that are unset or null.        |
| 110312 |                              | (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization |
| 110313 |                              | variables used to determine the values of locale categories.)                                 |
| 110314 | <i>LC_ALL</i>                | If set to a non-empty string value, override the values of all the other                      |
| 110315 |                              | internationalization variables.                                                               |
| 110316 | <i>LC_CTYPE</i>              | Determine the locale for the interpretation of sequences of bytes of text data as             |
| 110317 |                              | characters (for example, single-byte as opposed to multi-byte characters in                   |
| 110318 |                              | arguments).                                                                                   |
| 110319 | <i>LC_MESSAGES</i>           |                                                                                               |
| 110320 |                              | Determine the locale that should be used to affect the format and contents of                 |
| 110321 |                              | diagnostic messages written to standard error.                                                |
| 110322 | XSI <i>NLSPATH</i>           | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .         |
| 110323 | <b>ASYNCHRONOUS EVENTS</b>   |                                                                                               |
| 110324 |                              | Default.                                                                                      |
| 110325 | <b>STDOUT</b>                |                                                                                               |
| 110326 |                              | Not used.                                                                                     |

110327 **STDERR**

110328 The standard error shall be used only for diagnostic messages.

110329 **OUTPUT FILES**

110330 None.

110331 **EXTENDED DESCRIPTION**

110332 None.

110333 **EXIT STATUS**

110334 The following exit values shall be returned:

110335 0 *expression* evaluated to true.

110336 1 *expression* evaluated to false or *expression* was missing.

110337 >1 An error occurred.

110338 **CONSEQUENCES OF ERRORS**

110339 Default.

110340 **APPLICATION USAGE**

110341 The XSI extensions specifying the **-a** and **-o** binary primaries and the **'( ' and ' )'** operators  
 110342 have been marked obsolescent. (Many expressions using them are ambiguously defined by the  
 110343 grammar depending on the specific expressions being evaluated.) Scripts using these  
 110344 expressions should be converted to the forms given below. Even though many implementations  
 110345 will continue to support these obsolescent forms, scripts should be extremely careful when  
 110346 dealing with user-supplied input that could be confused with these and other primaries and  
 110347 operators. Unless the application developer knows all the cases that produce input to the script,  
 110348 invocations like:

110349 `test "$1" -a "$2"`

110350 should be written as:

110351 `test "$1" && test "$2"`

110352 to avoid problems if a user supplied values such as \$1 set to **'!'** and \$2 set to the null string.  
 110353 That is, in cases where maximal portability is of concern, replace:

110354 `test expr1 -a expr2`

110355 with:

110356 `test expr1 && test expr2`

110357 and replace:

110358 `test expr1 -o expr2`

110359 with:

110360 `test expr1 || test expr2`

110361 but note that, in *test*, **-a** has higher precedence than **-o** while **"&&"** and **"||"** have equal  
 110362 precedence in the shell.

110363 Parentheses or braces can be used in the shell command language to effect grouping.

110364 Parentheses must be escaped when using *sh*; for example:

110365 `test \( expr1 -a expr2 \) -o expr3`

110366 This command is not always portable even on XSI-conformant systems depending on the

expressions specified by *expr1*, *expr2*, and *expr3*. The following form can be used instead:

```
( test expr1 && test expr2 ) || test expr3
```

The two commands:

```
test "$1"
test ! "$1"
```

could not be used reliably on some historical systems. Unexpected results would occur if such a *string* expression were used and \$1 expanded to '!', '(', or a known unary primary. Better constructs are:

```
test -n "$1"
test -z "$1"
```

respectively.

Historical systems have also been unreliable given the common construct:

```
test "$response" = "expected string"
```

One of the following is a more reliable form:

```
test "X$response" = "Xexpected string"
test "expected string" = "$response"
```

Note that the second form assumes that *expected string* could not be confused with any unary primary. If *expected string* starts with '-', '(', '!', or even '=', the first form should be used instead. Using the preceding rules without the XSI marked extensions, any of the three comparison forms is reliable, given any input. (However, note that the strings are quoted in all cases.)

Because the string comparison binary primaries, '=' and '!=', have a higher precedence than any unary primary in the greater than 4 argument case, unexpected results can occur if arguments are not properly prepared. For example, in:

```
test -d $1 -o -d $2
```

If \$1 evaluates to a possible directory name of '=', the first three arguments are considered a string comparison, which shall cause a syntax error when the second -d is encountered. One of the following forms prevents this; the second is preferred:

```
test \( -d "$1" \) -o \( -d "$2" \)
test -d "$1" || test -d "$2"
```

Also in the greater than 4 argument case:

```
test "$1" = "bat" -a "$2" = "ball"
```

syntax errors occur if \$1 evaluates to '(' or '!'. One of the following forms prevents this; the third is preferred:

```
test "X$1" = "Xbat" -a "X$2" = "Xball"
test "$1" = "bat" && test "$2" = "ball"
test "X$1" = "Xbat" && test "X$2" = "Xball"
```

Note that none of the following examples are permitted by the syntax described:

```
[-f file]
[-f file ]
[ -f file]
```

+

+

+

+

```

110408 [ -f file +
110409 test -f file ] +
110410 In the first two cases, if a utility named [ -f exists, that utility would be invoked, and not test. In +
110411 the remaining cases, the brackets are mismatched, and the behavior is unspecified. However: +
110412 test ! ] +
110413 does have a defined meaning, and must exit with status 1. Similarly: +
110414 test ] +
110415 must exit with status 0.

```

#### 110416 EXAMPLES

```

110417 1. Exit if there are not two or three arguments (two variations):
110418     if [ $# -ne 2 ] && [ $# -ne 3 ]; then exit 1; fi
110419     if [ $# -lt 2 ] || [ $# -gt 3 ]; then exit 1; fi
110420 2. Perform a mkdir if a directory does not exist:
110421     test ! -d tempdir && mkdir tempdir
110422 3. Wait for a file to become non-readable:
110423     while test -r thefile
110424     do
110425         sleep 30
110426     done
110427     echo "thefile" is no longer readable'
110428 4. Perform a command if the argument is one of three strings (two variations):
110429     if [ "$1" = "pear" ] || [ "$1" = "grape" ] || [ "$1" = "apple" ]
110430     then
110431         command
110432     fi
110433     case "$1" in
110434         pear|grape|apple) command ;;
110435     esac

```

#### 110436 RATIONALE

```

110437 The KornShell-derived conditional command (double bracket [[ ]] was removed from the shell
110438 command language description in an early proposal. Objections were raised that the real
110439 problem is misuse of the test command (!), and putting it into the shell is the wrong way to fix
110440 the problem. Instead, proper documentation and a new shell reserved word (!) are sufficient.
110441 Tests that require multiple test operations can be done at the shell level using individual
110442 invocations of the test command and shell logicals, rather than using the error-prone -o flag of
110443 test.
110444 XSI-conformant systems support more than four arguments.
110445 XSI-conformant systems support the combining of primaries with the following constructs:
110446 expression1 -a expression2
110447 True if both expression1 and expression2 are true.

```

*expression1 -o expression2*

True if at least one of *expression1* and *expression2* are true.

*( expression )*

True if *expression* is true.

In evaluating these more complex combined expressions, the following precedence rules are used:

- The unary primaries have higher precedence than the algebraic binary primaries.
- The unary primaries have lower precedence than the string binary primaries.
- The unary and binary primaries have higher precedence than the unary *string* primary.
- The **!** operator has higher precedence than the **-a** operator, and the **-a** operator has higher precedence than the **-o** operator.
- The **-a** and **-o** operators are left associative.
- The parentheses can be used to alter the normal precedence and associativity.

The BSD and System V versions of **-f** are not the same. The BSD definition was:

**-f file** True if *file* exists and is not a directory.

The SVID version (true if the file exists and is a regular file) was chosen for this volume of POSIX.1-2008 because its use is consistent with the **-b**, **-c**, **-d**, and **-p** operands (*file* exists and is a specific file type).

The **-e** primary, possessing similar functionality to that provided by the C shell, was added because it provides the only way for a shell script to find out if a file exists without trying to open the file. Since implementations are allowed to add additional file types, a portable script cannot use:

```
test -b foo -o -c foo -o -d foo -o -f foo -o -p foo
```

to find out if **foo** is an existing file. On historical BSD systems, the existence of a file could be determined by:

```
test -f foo -o -d foo
```

but there was no easy way to determine that an existing file was a regular file. An early proposal used the KornShell **-a** primary (with the same meaning), but this was changed to **-e** because there were concerns about the high probability of humans confusing the **-a** primary with the **-a** binary operator.

The following options were not included in this volume of POSIX.1-2008, although they are provided by some implementations. These operands should not be used by new implementations for other purposes:

**-k file** True if *file* exists and its sticky bit is set.

**-C file** True if *file* is a contiguous file.

**-V file** True if *file* is a version file.

The following option was not included because it was undocumented in most implementations, has been removed from some implementations (including System V), and the functionality is provided by the shell (see [Section 2.6.2](#) (on page 2344)).

- 110487        **-l string**        The length of the string *string*.
- 110488        The **-b**, **-c**, **-g**, **-p**, **-u**, and **-x** operands are derived from the SVID; historical BSD does not  
110489        provide them. The **-k** operand is derived from System V; historical BSD does not provide it.
- 110490        On historical BSD systems, *test -w directory* always returned false because *test* tried to open the  
110491        directory for writing, which always fails.
- 110492        Some additional primaries newly invented or from the KornShell appeared in an early proposal  
110493        as part of the conditional command ([[]]): *s1 > s2*, *s1 < s2*, *str = pattern*, *str != pattern*, *f1 -nt f2*, *f1*  
110494        *-ot f2*, and *f1 -ef f2*. They were not carried forward into the *test* utility when the conditional  
110495        command was removed from the shell because they have not been included in the *test* utility  
110496        built into historical implementations of the *sh* utility.
- 110497        The **-t file\_descriptor** primary is shown with a mandatory argument because the grammar is  
110498        ambiguous if it can be omitted. Historical implementations have allowed it to be omitted,  
110499        providing a default of 1.
- 110500        It is noted that ' [ ' is not part of the portable filename character set; however, since it is required  
110501        to be encoded by a single byte, and is part of the portable character set, the name of this utility  
110502        forms a character string across all supported locales.
- 110503        **FUTURE DIRECTIONS**
- 110504        None.
- 110505        **SEE ALSO**
- 110506        [Section 1.1.1.4](#) (on page 2318), *find*
- 110507        [XBD Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)
- 110508        **CHANGE HISTORY**
- 110509        First released in Issue 2.
- 110510        **Issue 5**
- 110511        The FUTURE DIRECTIONS section is added.
- 110512        **Issue 6**
- 110513        The **-h** operand is added for symbolic links, and access permission requirements are clarified for  
110514        the **-r**, **-w**, and **-x** operands to align with the IEEE P1003.2b draft standard.
- 110515        The normative text is reworded to avoid use of the term “must” for application requirements.
- 110516        The **-L** and **-S** operands are added for symbolic links and sockets.
- 110517        IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/38 is applied, adding XSI margin  
110518        marking and shading to a line in the OPERANDS section referring to the use of parentheses as  
110519        arguments to the *test* utility.
- 110520        IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/30 is applied, rewording the existence  
110521        primaries for the *test* utility.
- 110522        **Issue 7**
- 110523        Austin Group Interpretation 1003.1-2001 #107 is applied.
- 110524        POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0143 [291] is applied.

110525 **NAME**

110526       time — time a simple command

110527 **SYNOPSIS**110528       time [-p] *utility* [*argument...*]110529 **DESCRIPTION**

110530       The *time* utility shall invoke the utility named by the *utility* operand with arguments supplied as  
 110531       the *argument* operands and write a message to standard error that lists timing statistics for the  
 110532       utility. The message shall include the following information:

- 110533       • The elapsed (real) time between invocation of *utility* and its termination.
- 110534       • The User CPU time, equivalent to the sum of the *tms\_utime* and *tms\_cutime* fields returned  
 110535       by the *times()* function defined in the System Interfaces volume of POSIX.1-2008 for the  
 110536       process in which *utility* is executed.
- 110537       • The System CPU time, equivalent to the sum of the *tms\_stime* and *tms\_cstime* fields  
 110538       returned by the *times()* function for the process in which *utility* is executed.

110539       The precision of the timing shall be no less than the granularity defined for the size of the clock  
 110540       tick unit on the system, but the results shall be reported in terms of standard time units (for  
 110541       example, 0.02 seconds, 00:00:00.02, 1m33.75s, 365.21 seconds), not numbers of clock ticks.

110542       When *time* is used as part of a pipeline, the times reported are unspecified, except when it is the  
 110543       sole command within a grouping command (see [Section 2.9.4.1](#), on page 2361) in that pipeline.  
 110544       For example, the commands on the left are unspecified; those on the right report on utilities **a**  
 110545       and **c**, respectively:

```
110546       time a | b | c       { time a; } | b | c
110547       a | b | time c       a | b | (time c)
```

110548 **OPTIONS**110549       The *time* utility shall conform to XBD [Section 12.2](#) (on page 216).

110550       The following option shall be supported:

110551       **-p**       Write the timing output to standard error in the format shown in the STDERR  
 110552       section.

110553 **OPERANDS**

110554       The following operands shall be supported:

110555       *utility*       The name of a utility that is to be invoked. If the *utility* operand names any of the  
 110556       special built-in utilities in [Section 2.14](#) (on page 2374), the results are undefined.

110557       *argument*   Any string to be supplied as an argument when invoking the utility named by the  
 110558       *utility* operand.

110559 **STDIN**

110560       Not used.

110561 **INPUT FILES**

110562       None.

110563 **ENVIRONMENT VARIABLES**110564       The following environment variables shall affect the execution of *time*:

110565       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 110566       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 110567       variables used to determine the values of locale categories.)

|        |                             |                                                                                                                                                                           |
|--------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 110568 | <i>LC_ALL</i>               | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                  |
| 110569 |                             |                                                                                                                                                                           |
| 110570 | <i>LC_CTYPE</i>             | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments). |
| 110571 |                             |                                                                                                                                                                           |
| 110572 |                             |                                                                                                                                                                           |
| 110573 | <i>LC_MESSAGES</i>          |                                                                                                                                                                           |
| 110574 |                             | Determine the locale that should be used to affect the format and contents of diagnostic and informative messages written to standard error.                              |
| 110575 |                             |                                                                                                                                                                           |
| 110576 | <i>LC_NUMERIC</i>           |                                                                                                                                                                           |
| 110577 |                             | Determine the locale for numeric formatting.                                                                                                                              |
| 110578 | XSI <i>NLSPATH</i>          | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                                                     |
| 110579 | <i>PATH</i>                 | Determine the search path that shall be used to locate the utility to be invoked; see XBD Chapter 8 (on page 173).                                                        |
| 110580 |                             |                                                                                                                                                                           |
| 110581 | <b>ASYNCHRONOUS EVENTS</b>  |                                                                                                                                                                           |
| 110582 |                             | Default.                                                                                                                                                                  |
| 110583 | <b>STDOUT</b>               |                                                                                                                                                                           |
| 110584 |                             | Not used.                                                                                                                                                                 |
| 110585 | <b>STDERR</b>               |                                                                                                                                                                           |
| 110586 |                             | If the <i>utility</i> utility is invoked, the standard error shall be used to write the timing statistics and                                                             |
| 110587 |                             | may be used to write a diagnostic message if the utility terminates abnormally; otherwise, the                                                                            |
| 110588 |                             | standard error shall be used to write diagnostic messages and may also be used to write the                                                                               |
| 110589 |                             | timing statistics.                                                                                                                                                        |
| 110590 |                             | If <b>-p</b> is specified, the following format shall be used for the timing statistics in the POSIX locale:                                                              |
| 110591 |                             | "real %f\nuser %f\nsys %f\n", <i>&lt;real seconds&gt;</i> , <i>&lt;user seconds&gt;</i> ,                                                                                 |
| 110592 |                             | <i>&lt;system seconds&gt;</i>                                                                                                                                             |
| 110593 |                             | where each floating-point number shall be expressed in seconds. The precision used may be less                                                                            |
| 110594 |                             | than the default six digits of %f, but shall be sufficiently precise to accommodate the size of the                                                                       |
| 110595 |                             | clock tick on the system (for example, if there were 60 clock ticks per second, at least two digits                                                                       |
| 110596 |                             | shall follow the radix character). The number of digits following the radix character shall be no                                                                         |
| 110597 |                             | less than one, even if this always results in a trailing zero. The implementation may append                                                                              |
| 110598 |                             | white space and additional information following the format shown here. The implementation                                                                                |
| 110599 |                             | may also prepend a single empty line before the format shown here.                                                                                                        |
| 110600 | <b>OUTPUT FILES</b>         |                                                                                                                                                                           |
| 110601 |                             | None.                                                                                                                                                                     |
| 110602 | <b>EXTENDED DESCRIPTION</b> |                                                                                                                                                                           |
| 110603 |                             | None.                                                                                                                                                                     |
| 110604 | <b>EXIT STATUS</b>          |                                                                                                                                                                           |
| 110605 |                             | If the <i>utility</i> utility is invoked, the exit status of <i>time</i> shall be the exit status of <i>utility</i> ; otherwise,                                          |
| 110606 |                             | the <i>time</i> utility shall exit with one of the following values:                                                                                                      |
| 110607 | 1-125                       | An error occurred in the <i>time</i> utility.                                                                                                                             |
| 110608 | 126                         | The utility specified by <i>utility</i> was found but could not be invoked.                                                                                               |

110609           127    The utility specified by *utility* could not be found.

## 110610 CONSEQUENCES OF ERRORS

110611           Default.

## 110612 APPLICATION USAGE

110613           The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
110614           an error occurs so that applications can distinguish “failure to find a utility” from “invoked  
110615           utility exited with an error indication”. The value 127 was chosen because it is not commonly  
110616           used for other meanings; most utilities use small values for “normal error conditions” and the  
110617           values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
110618           chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
110619           scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
110620           between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
110621           *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
110622           any other reason.

## 110623 EXAMPLES

110624           It is frequently desirable to apply *time* to pipelines or lists of commands. This can be done by  
110625           placing pipelines and command lists in a single file; this file can then be invoked as a utility, and  
110626           the *time* applies to everything in the file.

110627           Alternatively, the following command can be used to apply *time* to a complex command:

110628           time sh -c 'complex-command-line'

## 110629 RATIONALE

110630           When the *time* utility was originally proposed to be included in the ISO POSIX-2:1993 standard,  
110631           questions were raised about its suitability for inclusion on the grounds that it was not useful for  
110632           conforming applications, specifically:

- 110633           • The underlying CPU definitions from the System Interfaces volume of POSIX.1-2008 are  
110634           vague, so the numeric output could not be compared accurately between systems or even  
110635           between invocations.
- 110636           • The creation of portable benchmark programs was outside the scope this volume of  
110637           POSIX.1-2008.

110638           However, *time* does fit in the scope of user portability. Human judgement can be applied to the  
110639           analysis of the output, and it could be very useful in hands-on debugging of applications or in  
110640           providing subjective measures of system performance. Hence it has been included in this  
110641           volume of POSIX.1-2008.

110642           The default output format has been left unspecified because historical implementations differ  
110643           greatly in their style of depicting this numeric output. The **-p** option was invented to provide  
110644           scripts with a common means of obtaining this information.

110645           In the KornShell, *time* is a shell reserved word that can be used to time an entire pipeline, rather  
110646           than just a simple command. The POSIX definition has been worded to allow this  
110647           implementation. Consideration was given to invalidating this approach because of the historical  
110648           model from the C shell and System V shell. However, since the System V *time* utility historically  
110649           has not produced accurate results in pipeline timing (because the constituent processes are not  
110650           all owned by the same parent process, as allowed by POSIX), it did not seem worthwhile to  
110651           break historical KornShell usage.

110652           The term *utility* is used, rather than *command*, to highlight the fact that shell compound  
110653           commands, pipelines, special built-ins, and so on, cannot be used directly. However, *utility*  
110654           includes user application programs and shell scripts, not just the standard utilities.

110655 **FUTURE DIRECTIONS**

110656 None.

110657 **SEE ALSO**110658 [Chapter 2](#) (on page 2335), *sh*110659 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)110660 XSH *times()*110661 **CHANGE HISTORY**

110662 First released in Issue 2.

110663 **Issue 6**

110664 This utility is marked as part of the User Portability Utilities option.

110665 **Issue 7**110666 The *time* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

110668 SD5-XCU-ERN-115 is applied, updating the example in the DESCRIPTION.

110669 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0144 [266] is applied.

110670 **NAME**

110671 touch — change file access and modification times

110672 **SYNOPSIS**110673 touch [-acm] [-r *ref\_file*|-t *time*|-d *date\_time*] *file*...110674 **DESCRIPTION**110675 The *touch* utility shall change the last data modification timestamps, the last data access  
110676 timestamps, or both.110677 The time used can be specified by the -t *time* option-argument, the corresponding *time* fields of  
110678 the file referenced by the -r *ref\_file* option-argument, or the -d *date\_time* option-argument, as  
110679 specified in the following sections. If none of these are specified, *touch* shall use the current time.110680 For each *file* operand, *touch* shall perform actions equivalent to the following functions defined  
110681 in the System Interfaces volume of POSIX.1-2008:

- 110682 1. If *file* does not exist:
  - 110683 a. The *creat()* function is called with the following arguments:
    - 110684 — The *file* operand is used as the *path* argument.
    - 110685 — The value of the bitwise-inclusive OR of S\_IRUSR, S\_IWUSR, S\_IRGRP,  
110686 S\_IWGRP, S\_IROTH, and S\_IWOTH is used as the *mode* argument.
  - 110687 b. The *futimens()* function is called with the following arguments:
    - 110688 — The file descriptor opened in step 1a.
    - 110689 — The access time and the modification time, set as described in the OPTIONS  
110690 section, are used as the first and second elements of the *times* array argument,  
110691 respectively.
- 110692 2. If *file* exists, the *utimensat()* function is called with the following arguments:
  - 110693 a. The AT\_FDCWD special value is used as the *fd* argument.
  - 110694 b. The *file* operand is used as the *path* argument.
  - 110695 c. The access time and the modification time, set as described in the OPTIONS  
110696 section, are used as the first and second elements of the *times* array argument,  
110697 respectively.
  - 110698 d. The *flag* argument is set to zero.

110699 **OPTIONS**110700 The *touch* utility shall conform to XBD [Section 12.2](#) (on page 216).

110701 The following options shall be supported:

- 110702 -a Change the access time of *file*. Do not change the modification time unless -m is  
110703 also specified.
- 110704 -c Do not create a specified *file* if it does not exist. Do not write any diagnostic  
110705 messages concerning this condition.
- 110706 -d *date\_time* Use the specified *date\_time* instead of the current time. The option-argument shall  
110707 be a string of the form:  
110708 YYYY-MM-DDThh:mm:ss[.frac][tz]  
110709 or:

110710 `YYYY-MM-DDThh:mm:ss[ ,frac][tz]`

110711 where:

- 110712 • YYYY are at least four decimal digits giving the year.
- 110713 • MM, DD, hh, mm, and SS are as with `-t time`.
- 110714 • T is the time designator, and can be replaced by a single <space>.
- 110715 • [ ,frac] and [ ,frac] are either empty, or a <period> ( ' . ' ) or a <comma>
- 110716 ( ' , ' ) respectively, followed by one or more decimal digits, specifying a
- 110717 fractional second.
- 110718 • [tz] is either empty, signifying local time, or the letter ' Z ', signifying UTC.
- 110719 If [tz] is empty, the resulting time shall be affected by the value of the TZ
- 110720 environment variable.

110721 If the resulting time precedes the Epoch, the behavior is implementation-defined. If

110722 the time cannot be represented as the file's timestamp, *touch* shall exit immediately

110723 with an error status.

110724 **-m** Change the modification time of *file*. Do not change the access time unless **-a** is

110725 also specified.

110726 **-r ref\_file** Use the corresponding time of the file named by the pathname *ref\_file* instead of

110727 the current time.

110728 **-t time** Use the specified *time* instead of the current time. The option-argument shall be a

110729 decimal number of the form:

110730 `[ [CC]YY]MMDDhhmm[ .SS]`

110731 where each two digits represents the following:

|        |    |                                                 |
|--------|----|-------------------------------------------------|
| 110732 | MM | The month of the year [01,12].                  |
| 110733 | DD | The day of the month [01,31].                   |
| 110734 | hh | The hour of the day [00,23].                    |
| 110735 | mm | The minute of the hour [00,59].                 |
| 110736 | CC | The first two digits of the year (the century). |
| 110737 | YY | The second two digits of the year.              |
| 110738 | SS | The second of the minute [00,60].               |

110739 Both CC and YY shall be optional. If neither is given, the current year shall be

110740 assumed. If YY is specified, but CC is not, CC shall be derived as follows:

|        |                  |                    |
|--------|------------------|--------------------|
| 110741 | <b>If YY is:</b> | <b>CC becomes:</b> |
| 110742 | [69,99]          | 19                 |
| 110743 | [00,68]          | 20                 |

110744 **Note:** It is expected that in a future version of this standard the default century inferred

110745 from a 2-digit year will change. (This would apply to all commands accepting a

110746 2-digit year as input.)

110747 The resulting time shall be affected by the value of the TZ environment variable. If

110748 the resulting time value precedes the Epoch, the behavior is implementation-

110749 defined. If the time is out of range for the file's timestamp, *touch* shall exit

110750 immediately with an error status. The range of valid times past the Epoch is  
 110751 implementation-defined, but it shall extend to at least the time 0 hours, 0 minutes,  
 110752 0 seconds, January 1, 2038, Coordinated Universal Time. Some implementations  
 110753 may not be able to represent dates beyond January 18, 2038, because they use  
 110754 **signed int** as a time holder.

110755 The range for *SS* is [00,60] rather than [00,59] because of leap seconds. If *SS* is 60,  
 110756 and the resulting time, as affected by the *TZ* environment variable, does not refer  
 110757 to a leap second, the resulting time shall be one second after a time where *SS* is 59.  
 110758 If *SS* is not given a value, it is assumed to be zero.

110759 If neither the **-a** nor **-m** options were specified, *touch* shall behave as if both the **-a** and **-m**  
 110760 options were specified.

#### 110761 OPERANDS

110762 The following operands shall be supported:

110763 *file* A pathname of a file whose times shall be modified.

#### 110764 STDIN

110765 Not used.

#### 110766 INPUT FILES

110767 None.

#### 110768 ENVIRONMENT VARIABLES

110769 The following environment variables shall affect the execution of *touch*:

110770 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 110771 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 110772 variables used to determine the values of locale categories.)

110773 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 110774 internationalization variables.

110775 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 110776 characters (for example, single-byte as opposed to multi-byte characters in  
 110777 arguments).

110778 *LC\_MESSAGES*

110779 Determine the locale that should be used to affect the format and contents of  
 110780 diagnostic messages written to standard error.

110781 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

110782 *TZ* Determine the timezone to be used for interpreting the *time* option-argument. If *TZ*  
 110783 is unset or null, an unspecified default timezone shall be used.

#### 110784 ASYNCHRONOUS EVENTS

110785 Default.

#### 110786 STDOUT

110787 Not used.

#### 110788 STDERR

110789 The standard error shall be used only for diagnostic messages.

110790 **OUTPUT FILES**

110791 None.

110792 **EXTENDED DESCRIPTION**

110793 None.

110794 **EXIT STATUS**

110795 The following exit values shall be returned:

110796 0 The utility executed successfully and all requested changes were made.

110797 &gt;0 An error occurred.

110798 **CONSEQUENCES OF ERRORS**

110799 Default.

110800 **APPLICATION USAGE**

110801 The interpretation of time is taken to be *seconds since the Epoch* (see XBD [Section 4.16](#), on page  
 110802 113). It should be noted that implementations conforming to the System Interfaces volume of  
 110803 POSIX.1-2008 do not take leap seconds into account when computing seconds since the Epoch.  
 110804 When *SS=60* is used, the resulting time always refers to 1 plus *seconds since the Epoch* for a time  
 110805 when *SS=59*.

110806 Although the *-t time* option-argument specifies values in 1969, the access time and modification  
 110807 time fields are defined in terms of seconds since the Epoch (00:00:00 on 1 January 1970 UTC).  
 110808 Therefore, depending on the value of *TZ* when *touch* is run, there is never more than a few valid  
 110809 hours in 1969 and there need not be any valid times in 1969.

110810 If the *T* time designator is replaced by a <space> for the *-d date\_time* option-argument, the  
 110811 <space> must be quoted to prevent the shell from splitting the argument.

110812 **EXAMPLES**

110813 Create or update a file called **dwc**; the resulting file has both the last data modification and last  
 110814 data access timestamps set to November 12, 2007 at 10:15:30 local time:

110815 `touch -d 2007-11-12T10:15:30 dwc`

110816 Create or update a file called **nick**; the resulting file has both the last data modification and last  
 110817 data access timestamps set to November 12, 2007 at 10:15:30 UTC:

110818 `touch -d 2007-11-12T10:15:30Z nick`

110819 Create or update a file called **gwc**; the resulting file has both the last data modification and last  
 110820 data access timestamps set to November 12, 2007 at 10:15:30 local time with a fractional second  
 110821 timestamp of .002 seconds:

110822 `touch -d 2007-11-12T10:15:30.002 gwc`

110823 Create or update a file called **ajosey**; the resulting file has both the last data modification and  
 110824 last data access timestamps set to November 12, 2007 at 10:15:30 UTC with a fractional second  
 110825 timestamp of .002 seconds:

110826 `touch -d "2007-11-12 10:15:30.002Z" ajosey`

110827 Create or update a file called **cathy**; the resulting file has both the last data modification and last  
 110828 data access timestamps set to November 12, 2007 at 10:15:00 local time:

110829 `touch -t 200711121015 cathy`

110830 Create or update a file called **drepper**; the resulting file has both the last data modification and  
 110831 last data access timestamps set to November 12, 2007 at 10:15:30 local time:

110832 touch -t 200711121015.30 drepper

110833 Create or update a file called **ebb9**; the resulting file has both the last data modification and last  
110834 data access timestamps set to November 12, 2007 at 10:15:30 local time:

110835 touch -t 0711121015.30 ebb9

110836 Create or update a file called **eggert**; the resulting file has the last data access timestamp set to  
110837 the corresponding time of the file named **mark** instead of the current time. If the file exists, the  
110838 last data modification time is not changed:

110839 touch -a -r mark eggert

#### 110840 RATIONALE

110841 The functionality of *touch* is described almost entirely through references to functions in the  
110842 System Interfaces volume of POSIX.1-2008. In this way, there is no duplication of effort required  
110843 for describing such side-effects as the relationship of user IDs to the user database, permissions,  
110844 and so on.

110845 There are some significant differences between the *touch* utility in this volume of POSIX.1-2008  
110846 and those in System V and BSD systems. They are upwards-compatible for historical  
110847 applications from both implementations:

110848 1. In System V, an ambiguity exists when a pathname that is a decimal number leads the  
110849 operands; it is treated as a time value. In BSD, no *time* value is allowed; files may only be  
110850 *touched* to the current time. The **-t** *time* construct solves these problems for future  
110851 conforming applications (note that the **-t** option is not historical practice).

110852 2. The inclusion of the century digits, *CC*, is also new. Note that a ten-digit *time* value is  
110853 treated as if *YY*, and not *CC*, were specified. The caveat about the range of dates  
110854 following the Epoch was included as recognition that some implementations are not able  
110855 to represent dates beyond 18 January 2038 because they use **signed int** as a time holder.

110856 The **-r** option was added because several comments requested this capability. This option was  
110857 named **-f** in an early proposal, but was changed because the **-f** option is used in the BSD  
110858 version of *touch* with a different meaning.

110859 At least one historical implementation of *touch* incremented the exit code if **-c** was specified and  
110860 the file did not exist. This volume of POSIX.1-2008 requires exit status zero if no errors occur.

110861 In previous version of the standard, if at least two operands are specified, and the first operand  
110862 is an eight or ten-digit decimal integer, the first operand was assumed to be a *date\_time* operand.  
110863 This usage was removed in this version of the standard since it had been marked obsolescent  
110864 previously.

110865 The **-d** *date\_time* format is an ISO 8601:2004 standard complete representation of date and time  
110866 extended format with an optional decimal point or <comma> followed by a string of digits  
110867 following the seconds portion to specify fractions of a second. It is not necessary to recognize  
110868 "[+/-]hh:mm" and "[+/-]hh" to specify timezones other than local time and UTC. The *T*  
110869 time designator in the ISO 8601:2004 standard extended format may be replaced by <space>.

#### 110870 FUTURE DIRECTIONS

110871 None.

#### 110872 SEE ALSO

110873 *date*

110874 XBD [Section 4.16](#) (on page 113), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216), [<sys/stat.h>](#)

**CHANGE HISTORY**

110876 First released in Issue 2.

**Issue 6**

110879 The obsolescent *date\_time* operand is removed.

110880 The Open Group Corrigendum U027/1 is applied. This extends the range of valid time past the  
110881 Epoch to at least the time 0 hours, 0 minutes, 0 seconds, January 1, 2038, Coordinated Universal  
110882 Time. This is a new requirement on POSIX implementations.

110883 The range for seconds is changed from [00,61] to [00,60] to align with the ISO/IEC 9899:1999  
110884 standard, and to allow for positive leap seconds.

**Issue 7**

110886 Austin Group Interpretation 1003.1-2001 #118 is applied.

110887 Austin Group Interpretation 1003.1-2001 #193 is applied, adding support for subsecond  
110888 timestamps.

110889 SD5-XCU-ERN-45 is applied, adding a new paragraph to the RATIONALE.

110890 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

110891 SD5-XCU-ERN-110 is applied, updating the OPTIONS section.

110892 Changes are made related to support for finegrained timestamps.

110893 **NAME**

110894       tput — change terminal characteristics

110895 **SYNOPSIS**110896       tput [-T *type*] *operand*...110897 **DESCRIPTION**

110898       The *tput* utility shall display terminal-dependent information. The manner in which this  
 110899       information is retrieved is unspecified. The information displayed shall clear the terminal  
 110900       screen, initialize the user's terminal, or reset the user's terminal, depending on the operand  
 110901       given. The exact consequences of displaying this information are unspecified.

110902 **OPTIONS**110903       The *tput* utility shall conform to XBD [Section 12.2](#) (on page 216).

110904       The following option shall be supported:

110905       -T *type*       Indicate the type of terminal. If this option is not supplied and the *TERM* variable  
 110906       is unset or null, an unspecified default terminal type shall be used. The setting of  
 110907       *type* shall take precedence over the value in *TERM*.

110908 **OPERANDS**

110909       The following strings shall be supported as operands by the implementation in the POSIX locale:

110910       **clear**       Display the clear-screen sequence.

110911       **init**       Display the sequence that initializes the user's terminal in an implementation-  
 110912       defined manner.

110913       **reset**       Display the sequence that resets the user's terminal in an implementation-defined  
 110914       manner.

110915       If a terminal does not support any of the operations described by these operands, this shall not  
 110916       be considered an error condition.

110917 **STDIN**

110918       Not used.

110919 **INPUT FILES**

110920       None.

110921 **ENVIRONMENT VARIABLES**110922       The following environment variables shall affect the execution of *tput*:

110923       LANG       Provide a default value for the internationalization variables that are unset or null.  
 110924       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 110925       variables used to determine the values of locale categories.)

110926       LC\_ALL       If set to a non-empty string value, override the values of all the other  
 110927       internationalization variables.

110928       LC\_CTYPE     Determine the locale for the interpretation of sequences of bytes of text data as  
 110929       characters (for example, single-byte as opposed to multi-byte characters in  
 110930       arguments).

110931       LC\_MESSAGES

110932       Determine the locale that should be used to affect the format and contents of  
 110933       diagnostic messages written to standard error.

|        |     |                               |                                                                                                           |
|--------|-----|-------------------------------|-----------------------------------------------------------------------------------------------------------|
| 110934 | XSI | <b>NLSPATH</b>                | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                     |
| 110935 |     | <b>TERM</b>                   | Determine the terminal type. If this variable is unset or null, and if the <b>-T</b> option is            |
| 110936 |     |                               | not specified, an unspecified default terminal type shall be used.                                        |
| 110937 |     | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                           |
| 110938 |     |                               | Default.                                                                                                  |
| 110939 |     | <b>STDOUT</b>                 |                                                                                                           |
| 110940 |     |                               | If standard output is a terminal device, it may be used for writing the appropriate sequence to           |
| 110941 |     |                               | clear the screen or reset or initialize the terminal. If standard output is not a terminal device,        |
| 110942 |     |                               | undefined results occur.                                                                                  |
| 110943 |     | <b>STDERR</b>                 |                                                                                                           |
| 110944 |     |                               | The standard error shall be used only for diagnostic messages.                                            |
| 110945 |     | <b>OUTPUT FILES</b>           |                                                                                                           |
| 110946 |     |                               | None.                                                                                                     |
| 110947 |     | <b>EXTENDED DESCRIPTION</b>   |                                                                                                           |
| 110948 |     |                               | None.                                                                                                     |
| 110949 |     | <b>EXIT STATUS</b>            |                                                                                                           |
| 110950 |     |                               | The following exit values shall be returned:                                                              |
| 110951 |     | 0                             | The requested string was written successfully.                                                            |
| 110952 |     | 1                             | Unspecified.                                                                                              |
| 110953 |     | 2                             | Usage error.                                                                                              |
| 110954 |     | 3                             | No information is available about the specified terminal type.                                            |
| 110955 |     | 4                             | The specified operand is invalid.                                                                         |
| 110956 |     | >4                            | An error occurred.                                                                                        |
| 110957 |     | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                           |
| 110958 |     |                               | If one of the operands is not available for the terminal, <i>tput</i> continues processing the remaining  |
| 110959 |     |                               | operands.                                                                                                 |
| 110960 |     | <b>APPLICATION USAGE</b>      |                                                                                                           |
| 110961 |     |                               | The difference between resetting and initializing a terminal is left unspecified, as they vary            |
| 110962 |     |                               | greatly based on hardware types. In general, resetting is a more severe action.                           |
| 110963 |     |                               | Some terminals use control characters to perform the stated functions, and on such terminals it           |
| 110964 |     |                               | might make sense to use <i>tput</i> to store the initialization strings in a file or environment variable |
| 110965 |     |                               | for later use. However, because other terminals might rely on system calls to do this work, the           |
| 110966 |     |                               | standard output cannot be used in a portable manner, such as the following non-portable                   |
| 110967 |     |                               | constructs:                                                                                               |
| 110968 |     |                               | ClearVar='tput clear'                                                                                     |
| 110969 |     |                               | tput reset   mailx -s "Wake Up" ddg                                                                       |
| 110970 |     | <b>EXAMPLES</b>               |                                                                                                           |
| 110971 |     | 1.                            | Initialize the terminal according to the type of terminal in the environmental variable                   |
| 110972 |     |                               | <i>TERM</i> . This command can be included in a <b>.profile</b> file.                                     |
| 110973 |     |                               | tput init                                                                                                 |

110974           2.   Reset a 450 terminal.  
110975           tput -T 450 reset

#### 110976 **RATIONALE**

110977           The list of operands was reduced to a minimum for the following reasons:

- 110978           • The only features chosen were those that were likely to be used by human users interacting  
110979           with a terminal.
- 110980           • Specifying the full *terminfo* set was not considered desirable, but the standard developers  
110981           did not want to select among operands.
- 110982           • This volume of POSIX.1-2008 does not attempt to provide applications with sophisticated  
110983           terminal handling capabilities, as that falls outside of its assigned scope and intersects with  
110984           the responsibilities of other standards bodies.

110985           The difference between resetting and initializing a terminal is left unspecified as this varies  
110986           greatly based on hardware types. In general, resetting is a more severe action.

110987           The exit status of 1 is historically reserved for finding out if a Boolean operand is not set.  
110988           Although the operands were reduced to a minimum, the exit status of 1 should still be reserved  
110989           for the Boolean operands, for those sites that wish to support them.

#### 110990 **FUTURE DIRECTIONS**

110991           None.

#### 110995 **CHANGE HISTORY**

110996           First released in Issue 4.

#### 110997 **Issue 6**

110998           This utility is marked as part of the User Portability Utilities option.

#### 110999 **Issue 7**

111000           The *tput* utility is moved from the User Portability Utilities option to the Base. User Portability  
111001           Utilities is now an option for interactive utilities.

111002 **NAME**111003 `tr` — translate characters111004 **SYNOPSIS**111005 `tr [-c|-C] [-s] string1 string2`111006 `tr -s [-c|-C] string1`111007 `tr -d [-c|-C] string1`111008 `tr -ds [-c|-C] string1 string2`111009 **DESCRIPTION**

111010 The *tr* utility shall copy the standard input to the standard output with substitution or deletion  
 111011 of selected characters. The options specified and the *string1* and *string2* operands shall control  
 111012 translations that occur while copying characters and single-character collating elements.

111013 **OPTIONS**111014 The *tr* utility shall conform to XBD [Section 12.2](#) (on page 216).

111015 The following options shall be supported:

111016 **-c** Complement the set of values specified by *string1*. See the EXTENDED  
 111017 DESCRIPTION section.

111018 **-C** Complement the set of characters specified by *string1*. See the EXTENDED  
 111019 DESCRIPTION section.

111020 **-d** Delete all occurrences of input characters that are specified by *string1*.

111021 **-s** Replace instances of repeated characters with a single character, as described in the  
 111022 EXTENDED DESCRIPTION section.

111023 **OPERANDS**

111024 The following operands shall be supported:

111025 *string1, string2*

111026 Translation control strings. Each string shall represent a set of characters to be  
 111027 converted into an array of characters used for the translation. For a detailed  
 111028 description of how the strings are interpreted, see the EXTENDED DESCRIPTION  
 111029 section.

111030 **STDIN**

111031 The standard input can be any type of file.

111032 **INPUT FILES**

111033 None.

111034 **ENVIRONMENT VARIABLES**111035 The following environment variables shall affect the execution of *tr*:

111036 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 111037 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 111038 variables used to determine the values of locale categories.)

111039 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 111040 internationalization variables.

111041 **LC\_COLLATE**

111042 Determine the locale for the behavior of range expressions and equivalence classes.

|        |                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 111059 | The operands <i>string1</i> and <i>string2</i> (if specified) define two arrays of characters. The constructs in the following list can be used to specify characters or single-character collating elements. If any of the constructs result in multi-character collating elements, <i>tr</i> shall exclude, without a diagnostic, those multi-character elements from the resulting array. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 111064 | <i>\octal</i>                                                                                                                                                                                                                                                                                                                                                                                | Octal sequences can be used to represent characters with specific coded values. An octal sequence shall consist of a <backslash> followed by the longest sequence of one, two, or three-octal-digit characters (01234567). The sequence shall cause the value whose encoding is represented by the one, two, or three-digit octal integer to be placed into the array. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading <backslash> for each byte.                                                                                                                                    |

The characters or collating elements in the range shall be placed in the array in ascending collation sequence. If the second endpoint precedes the starting endpoint in the collation sequence, it is unspecified whether the range of collating elements is empty, or this construct is treated as invalid. In locales other than the POSIX locale, this construct has unspecified behavior. |

| 111092 |                                             | those locales where the <i>name</i> keyword has been given a <b>charclass</b> definition in the                     |
| 111093 |                                             | <i>LC_CTYPE</i> category.                                                                                           |
| 111094 |                                             | When both the <b>-d</b> and <b>-s</b> options are specified, any of the character class names                       |
| 111095 |                                             | shall be accepted in <i>string2</i> . Otherwise, only character class names <b>lower</b> or <b>upper</b>            |
| 111096 |                                             | are valid in <i>string2</i> and then only if the corresponding character class ( <b>upper</b> and                   |
| 111097 |                                             | <b>lower</b> , respectively) is specified in the same relative position in <i>string1</i> . Such a                  |
| 111098 |                                             | specification shall be interpreted as a request for case conversion. When <i>[:lower:]</i>                          |
| 111099 |                                             | appears in <i>string1</i> and <i>[:upper:]</i> appears in <i>string2</i> , the arrays shall contain the             |
| 111100 |                                             | characters from the <b>toupper</b> mapping in the <i>LC_CTYPE</i> category of the current                           |
| 111101 |                                             | locale. When <i>[:upper:]</i> appears in <i>string1</i> and <i>[:lower:]</i> appears in <i>string2</i> , the arrays |
| 111102 |                                             | shall contain the characters from the <b>tolower</b> mapping in the <i>LC_CTYPE</i> category                        |
| 111103 |                                             | of the current locale. The first character from each mapping pair shall be in the                                   |
| 111104 |                                             | array for <i>string1</i> and the second character from each mapping pair shall be in the                            |
| 111105 |                                             | array for <i>string2</i> in the same relative position.                                                             |
| 111106 |                                             | Except for case conversion, the characters specified by a character class expression                                |
| 111107 |                                             | shall be placed in the array in an unspecified order.                                                               |
| 111108 |                                             | If the name specified for <i>class</i> does not define a valid character class in the current                       |
| 111109 |                                             | locale, the behavior is undefined.                                                                                  |
| 111110 | [=equiv=]                                   | Represents all characters or collating elements belonging to the same equivalence                                   |
| 111111 |                                             | class as <i>equiv</i> , as defined by the current setting of the <i>LC_COLLATE</i> locale category.                 |
| 111112 |                                             | An equivalence class expression shall be allowed only in <i>string1</i> , or in <i>string2</i> when                 |
| 111113 |                                             | it is being used by the combined <b>-d</b> and <b>-s</b> options. The characters belonging to                       |
| 111114 |                                             | the equivalence class shall be placed in the array in an unspecified order.                                         |
| 111115 | [x*n]                                       | Represents <i>n</i> repeated occurrences of the character <i>x</i> . Because this expression is                     |
| 111116 |                                             | used to map multiple characters to one, it is only valid when it occurs in <i>string2</i> . If                      |
| 111117 |                                             | <i>n</i> is omitted or is zero, it shall be interpreted as large enough to extend the                               |
| 111118 |                                             | <i>string2</i> -based sequence to the length of the <i>string1</i> -based sequence. If <i>n</i> has a               |
| 111119 |                                             | leading zero, it shall be interpreted as an octal value. Otherwise, it shall be                                     |
| 111120 |                                             | interpreted as a decimal value.                                                                                     |
| 111121 | When the <b>-d</b> option is not specified: |                                                                                                                     |
| 111122 | •                                           | If <i>string2</i> is present, each input character found in the array specified by <i>string1</i> shall be          |
| 111123 |                                             | replaced by the character in the same relative position in the array specified by <i>string2</i> . If               |
| 111124 |                                             | the array specified by <i>string2</i> is shorter than the one specified by <i>string1</i> , or if a character       |
| 111125 |                                             | occurs more than once in <i>string1</i> , the results are unspecified.                                              |
| 111126 | •                                           | If the <b>-C</b> option is specified, the complements of the characters specified by <i>string1</i> (the set        |
| 111127 |                                             | of all characters in the current character set, as defined by the current setting of <i>LC_CTYPE</i> ,              |
| 111128 |                                             | except for those actually specified in the <i>string1</i> operand) shall be placed in the array in                  |
| 111129 |                                             | ascending collation sequence, as defined by the current setting of <i>LC_COLLATE</i> .                              |

- 111130 • If the **-c** option is specified, the complement of the values specified by *string1* shall be
- 111131 placed in the array in ascending order by binary value.
- 111132 • Because the order in which characters specified by character class expressions or
- 111133 equivalence class expressions is undefined, such expressions should only be used if the
- 111134 intent is to map several characters into one. An exception is case conversion, as described
- 111135 previously.

111136 When the **-d** option is specified:

- 111137 • Input characters found in the array specified by *string1* shall be deleted.
- 111138 • When the **-C** option is specified with **-d**, all characters except those specified by *string1*
- 111139 shall be deleted. The contents of *string2* are ignored, unless the **-s** option is also specified.
- 111140 • When the **-c** option is specified with **-d**, all values except those specified by *string1* shall
- 111141 be deleted. The contents of *string2* shall be ignored, unless the **-s** option is also specified.
- 111142 • The same string cannot be used for both the **-d** and the **-s** option; when both options are
- 111143 specified, both *string1* (used for deletion) and *string2* (used for squeezing) shall be
- 111144 required.

111145 When the **-s** option is specified, after any deletions or translations have taken place, repeated

111146 sequences of the same character shall be replaced by one occurrence of the same character, if the

111147 character is found in the array specified by the last operand. If the last operand contains a

111148 character class, such as the following example:

111149 `tr -s '[:space:]'`

111150 the last operand's array shall contain all of the characters in that character class. However, in a

111151 case conversion, as described previously, such as:

111152 `tr -s '[:upper:]' '[:lower:]'`

111153 the last operand's array shall contain only those characters defined as the second characters in

111154 each of the **toupper** or **tolower** character pairs, as appropriate.

111155 An empty string used for *string1* or *string2* produces undefined results.

## 111156 EXIT STATUS

111157 The following exit values shall be returned:

- 111158 0 All input was processed successfully.
- 111159 >0 An error occurred.

## 111160 CONSEQUENCES OF ERRORS

111161 Default.

## 111162 APPLICATION USAGE

111163 If necessary, *string1* and *string2* can be quoted to avoid pattern matching by the shell.

111164 If an ordinary digit (representing itself) is to follow an octal sequence, the octal sequence must

111165 use the full three digits to avoid ambiguity.

111166 When *string2* is shorter than *string1*, a difference results between historical System V and BSD

111167 systems. A BSD system pads *string2* with the last character found in *string2*. Thus, it is possible

111168 to do the following:

111169 `tr 0123456789 d`

111170 which would translate all digits to the letter 'd'. Since this area is specifically unspecified in

this volume of POSIX.1-2008, both the BSD and System V behaviors are allowed, but a conforming application cannot rely on the BSD behavior. It would have to code the example in the following way:

```
tr 0123456789 '[d*]'
```

It should be noted that, despite similarities in appearance, the string operands used by *tr* are not regular expressions.

Unlike some historical implementations, this definition of the *tr* utility correctly processes NUL characters in its input stream. NUL characters can be stripped by using:

```
tr -d '\000'
```

## EXAMPLES

1. The following example creates a list of all words in **file1** one per line in **file2**, where a word is taken to be a maximal string of letters.

```
tr -cs "[:alpha:]" "[\n*]" <file1 >file2
```

2. The next example translates all lowercase characters in **file1** to uppercase and writes the results to standard output.

```
tr "[:lower:]" "[:upper:]" <file1
```

3. This example uses an equivalence class to identify accented variants of the base character 'e' in **file1**, which are stripped of diacritical marks and written to **file2**.

```
tr "[=e]" "[e*]" <file1 >file2
```

## RATIONALE

In some early proposals, an explicit option **-n** was added to disable the historical behavior of stripping NUL characters from the input. It was considered that automatically stripping NUL characters from the input was not correct functionality. However, the removal of **-n** in a later proposal does not remove the requirement that *tr* correctly process NUL characters in its input stream. NUL characters can be stripped by using *tr -d '\000'*.

Historical implementations of *tr* differ widely in syntax and behavior. For example, the BSD version has not needed the bracket characters for the repetition sequence. The *tr* utility syntax is based more closely on the System V and XPG3 model while attempting to accommodate historical BSD implementations. In the case of the short *string2* padding, the decision was to unspecify the behavior and preserve System V and XPG3 scripts, which might find difficulty with the BSD method. The assumption was made that BSD users of *tr* have to make accommodations to meet the syntax defined here. Since it is possible to use the repetition sequence to duplicate the desired behavior, whereas there is no simple way to achieve the System V method, this was the correct, if not desirable, approach.

The use of octal values to specify control characters, while having historical precedents, is not portable. The introduction of escape sequences for control characters should provide the necessary portability. It is recognized that this may cause some historical scripts to break.

An early proposal included support for multi-character collating elements. It was pointed out that, while *tr* does employ some syntactical elements from REs, the aim of *tr* is quite different; ranges, for example, do not have a similar meaning ("any of the chars in the range matches", *versus* "translate each character in the range to the output counterpart"). As a result, the previously included support for multi-character collating elements has been removed. What remains are ranges in current collation order (to support, for example, accented characters), character classes, and equivalence classes.

In XPG3 the `[class:]` and `[equiv=]` conventions are shown with double brackets, as in RE syntax. However, *tr* does not implement RE principles; it just borrows part of the syntax. Consequently, `[class:]` and `[equiv=]` should be regarded as syntactical elements on a par with `[x*n]`, which is not an RE bracket expression.

The standard developers will consider changes to *tr* that allow it to translate characters between different character encodings, or they will consider providing a new utility to accomplish this.

On historical System V systems, a range expression requires enclosing square-brackets, such as:

```
tr '[a-z]' '[A-Z]'
```

However, BSD-based systems did not require the brackets, and this convention is used here to avoid breaking large numbers of BSD scripts:

```
tr a-z A-Z
```

The preceding System V script will continue to work because the brackets, treated as regular characters, are translated to themselves. However, any System V script that relied on "a-z" representing the three characters 'a', '-', and 'z' have to be rewritten as "az-".

The ISO POSIX-2:1993 standard had a `-c` option that behaved similarly to the `-C` option, but did not supply functionality equivalent to the `-c` option specified in POSIX.1-2008.

The earlier version also said that octal sequences referred to collating elements and could be placed adjacent to each other to specify multi-byte characters. However, it was noted that this caused ambiguities because *tr* would not be able to tell whether adjacent octal sequences were intending to specify multi-byte characters or multiple single byte characters. POSIX.1-2008 specifies that octal sequences always refer to single byte binary values when used to specify an endpoint of a range of collating elements.

Earlier versions of this standard allowed for implementations with bytes other than eight bits, but this has been modified in this version.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 2.

## Issue 6

The `-C` operand is added, and the description of the `-c` operand is changed to align with the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term "must" for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/31 is applied, removing text describing behavior on systems with bytes consisting of more than eight bits.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/32 is applied, updating an example in the EXAMPLES section to avoid using unspecified behavior.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/33 is applied, making a correction to the RATIONALE.

111256 **Issue 7**

111257 SD5-XCU-ERN-30 is applied.

111258 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

111259 Austin Group Interpretation 1003.1-2001 #132 is applied, adding rationale to the *\character*  
111260 construct.

111261 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0145 [325] is applied.

111262 **NAME**

111263 true — return true value

111264 **SYNOPSIS**

111265 true

111266 **DESCRIPTION**111267 The *true* utility shall return with exit code zero.111268 **OPTIONS**

111269 None.

111270 **OPERANDS**

111271 None.

111272 **STDIN**

111273 Not used.

111274 **INPUT FILES**

111275 None.

111276 **ENVIRONMENT VARIABLES**

111277 None.

111278 **ASYNCHRONOUS EVENTS**

111279 Default.

111280 **STDOUT**

111281 Not used.

111282 **STDERR**

111283 Not used.

111284 **OUTPUT FILES**

111285 None.

111286 **EXTENDED DESCRIPTION**

111287 None.

111288 **EXIT STATUS**

111289 Zero.

111290 **CONSEQUENCES OF ERRORS**

111291 None.

111292 **APPLICATION USAGE**111293 This utility is typically used in shell scripts, as shown in the EXAMPLES section. The special  
111294 built-in utility `:` is sometimes more efficient than *true*.111295 **EXAMPLES**

111296 This command is executed forever:

111297 while true

111298 do

111299 command

111300 done

111301 **RATIONALE**

111302 The *true* utility has been retained in this volume of POSIX.1-2008, even though the shell special  
111303 built-in : provides similar functionality, because *true* is widely used in historical scripts and is  
111304 less cryptic to novice script readers.

111305 **FUTURE DIRECTIONS**

111306 None.

111307 **SEE ALSO**

111308 [Section 2.9](#) (on page 2355), *false*

111309 **CHANGE HISTORY**

111310 First released in Issue 2.

111311 **Issue 6**

111312 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/39 is applied, replacing the terms “None”  
111313 and “Default” from the STDERR and EXIT STATUS sections, respectively, with terms as defined  
111314 in [Section 1.4](#) (on page 2326).

111315 **NAME**

111316           tsort — topological sort

111317 **SYNOPSIS**111318           tsort [*file*]111319 **DESCRIPTION**111320           The *tsort* utility shall write to standard output a totally ordered list of items consistent with a  
111321           partial ordering of items contained in the input.111322           The application shall ensure that the input consists of pairs of items (non-empty strings)  
111323           separated by <blank> characters. Pairs of different items indicate ordering. Pairs of identical  
111324           items indicate presence, but not ordering.111325 **OPTIONS**

111326           None.

111327 **OPERANDS**

111328           The following operand shall be supported:

111329           *file*           A pathname of a text file to order. If no *file* operand is given, the standard input  
111330           shall be used.111331 **STDIN**111332           The standard input shall be used if no *file* operand is specified, and shall be used if the *file*  
111333           operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
111334           the standard input shall not be used. See the INPUT FILES section.111335 **INPUT FILES**

111336           The input file shall be a text file.

111337 **ENVIRONMENT VARIABLES**111338           The following environment variables shall affect the execution of *tsort*:111339           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
111340           (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
111341           variables used to determine the values of locale categories.)111342           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
111343           internationalization variables.111344           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
111345           characters (for example, single-byte as opposed to multi-byte characters in  
111346           arguments and input files).111347           *LC\_MESSAGES*111348           Determine the locale that should be used to affect the format and contents of  
111349           diagnostic messages written to standard error.111350 *XSI*           *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.111351 **ASYNCHRONOUS EVENTS**

111352           Default.

111353 **STDOUT**111354           The standard output shall be a text file consisting of the order list produced from the partially  
111355           ordered input.

**111356 STDERR**

111357 The standard error shall be used only for diagnostic messages.

**111358 OUTPUT FILES**

111359 None.

**111360 EXTENDED DESCRIPTION**

111361 None.

**111362 EXIT STATUS**

111363 The following exit values shall be returned:

111364 0 Successful completion.

111365 >0 An error occurred.

**111366 CONSEQUENCES OF ERRORS**

111367 Default.

**111368 APPLICATION USAGE**

111369 The *LC\_COLLATE* variable need not affect the actions of *tsort*. The output ordering is not  
111370 lexicographic, but depends on the pairs of items given as input.

**111371 EXAMPLES**

111372 The command:

```
111373 tsort <<EOF
111374 a b c c d e
111375 g g
111376 f g e f
111377 h h
111378 EOF
```

111379 produces the output:

```
111380 a
111381 b
111382 c
111383 d
111384 e
111385 f
111386 g
111387 h
```

**111388 RATIONALE**

111389 None.

**111390 FUTURE DIRECTIONS**

111391 None.

**111392 SEE ALSO**

111393 XBD [Chapter 8](#) (on page 173)

**111394 CHANGE HISTORY**

111395 First released in Issue 2.

111396 **Issue 6**

111397 The normative text is reworded to avoid use of the term “must” for application requirements.

111398 **Issue 7**

111399 Austin Group Interpretation 1003.1-2001 #092 is applied.

111400 The *tsort* utility is moved from the XSI option to the Base.

111401 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0146 [241] is applied.

111402 **NAME**111403        `tty` — return user's terminal name111404 **SYNOPSIS**111405        `tty`111406 **DESCRIPTION**

111407        The `tty` utility shall write to the standard output the name of the terminal that is open as  
 111408        standard input. The name that is used shall be equivalent to the string that would be returned by  
 111409        the `ttyname()` function defined in the System Interfaces volume of POSIX.1-2008.

111410 **OPTIONS**111411        The `tty` utility shall conform to XBD [Section 12.2](#) (on page 216).111412 **OPERANDS**

111413        None.

111414 **STDIN**

111415        While no input is read from standard input, standard input shall be examined to determine  
 111416        whether or not it is a terminal, and, if so, to determine the name of the terminal.

111417 **INPUT FILES**

111418        None.

111419 **ENVIRONMENT VARIABLES**111420        The following environment variables shall affect the execution of `tty`:

111421        `LANG`        Provide a default value for the internationalization variables that are unset or null.  
 111422                      (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 111423                      variables used to determine the values of locale categories.)

111424        `LC_ALL`      If set to a non-empty string value, override the values of all the other  
 111425                      internationalization variables.

111426        `LC_CTYPE`   Determine the locale for the interpretation of sequences of bytes of text data as  
 111427                      characters (for example, single-byte as opposed to multi-byte characters in  
 111428                      arguments).

111429        `LC_MESSAGES`

111430                      Determine the locale that should be used to affect the format and contents of  
 111431                      diagnostic messages written to standard error and informative messages written to  
 111432                      standard output.

111433        `XSI`        `NLSPATH`   Determine the location of message catalogs for the processing of `LC_MESSAGES`.

111434 **ASYNCHRONOUS EVENTS**

111435        Default.

111436 **STDOUT**

111437        If standard input is a terminal device, a pathname of the terminal as specified by the `ttyname()`  
 111438        function defined in the System Interfaces volume of POSIX.1-2008 shall be written in the  
 111439        following format:

111440        `"%s\n", <terminal name>`

111441        Otherwise, a message shall be written indicating that standard input is not connected to a  
 111442        terminal. In the POSIX locale, the `tty` utility shall use the format:

111443        `"not a tty\n"`

**111444 STDERR**

111445 The standard error shall be used only for diagnostic messages.

**111446 OUTPUT FILES**

111447 None.

**111448 EXTENDED DESCRIPTION**

111449 None.

**111450 EXIT STATUS**

111451 The following exit values shall be returned:

111452 0 Standard input is a terminal.

111453 1 Standard input is not a terminal.

111454 >1 An error occurred.

**111455 CONSEQUENCES OF ERRORS**

111456 Default.

**111457 APPLICATION USAGE**

111458 This utility checks the status of the file open as standard input against that of an  
111459 implementation-defined set of files. It is possible that no match can be found, or that the match  
111460 found need not be the same file as that which was opened for standard input (although they are  
111461 the same device).

**111462 EXAMPLES**

111463 None.

**111464 RATIONALE**

111465 None.

**111466 FUTURE DIRECTIONS**

111467 None.

**111468 SEE ALSO**

111469 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

111470 XSH [isatty\(\)](#), [ttyname\(\)](#)

**111471 CHANGE HISTORY**

111472 First released in Issue 2.

**111473 Issue 5**

111474 The SYNOPSIS is changed to indicate two forms of the command, with the second form marked  
111475 as obsolete. This is a clarification and does not change the functionality published in previous  
111476 issues.

**111477 Issue 6**

111478 The obsolescent `-s` option is removed.

111479 **NAME**

111480           type — write a description of command type

111481 **SYNOPSIS**

111482 XSI        type name...

111483 **DESCRIPTION**111484           The *type* utility shall indicate how each argument would be interpreted if used as a command  
111485           name.111486 **OPTIONS**

111487           None.

111488 **OPERANDS**

111489           The following operand shall be supported:

111490        name        A name to be interpreted.

111491 **STDIN**

111492           Not used.

111493 **INPUT FILES**

111494           None.

111495 **ENVIRONMENT VARIABLES**111496           The following environment variables shall affect the execution of *type*:111497        LANG        Provide a default value for the internationalization variables that are unset or null.  
111498                      (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
111499                      variables used to determine the values of locale categories.)111500        LC\_ALL       If set to a non-empty string value, override the values of all the other  
111501                      internationalization variables.111502        LC\_CTYPE     Determine the locale for the interpretation of sequences of bytes of text data as  
111503                      characters (for example, single-byte as opposed to multi-byte characters in  
111504                      arguments).111505        LC\_MESSAGES           Determine the locale that should be used to affect the format and contents of  
111506                                diagnostic messages written to standard error.  
111507111508        NLSPATH       Determine the location of message catalogs for the processing of *LC\_MESSAGES*.111509        PATH         Determine the location of *name*, as described in XBD [Chapter 8](#) (on page 173).111510 **ASYNCHRONOUS EVENTS**

111511           Default.

111512 **STDOUT**111513           The standard output of *type* contains information about each operand in an unspecified format.111514           The information provided typically identifies the operand as a shell built-in, function, alias, or  
111515           keyword, and where applicable, may display the operand's pathname.111516 **STDERR**

111517           The standard error shall be used only for diagnostic messages.

**111518 OUTPUT FILES**

111519       None.

**111520 EXTENDED DESCRIPTION**

111521       None.

**111522 EXIT STATUS**

111523       The following exit values shall be returned:

111524       0   Successful completion.

111525       >0   An error occurred.

**111526 CONSEQUENCES OF ERRORS**

111527       Default.

**111528 APPLICATION USAGE**

111529       Since *type* must be aware of the contents of the current shell execution environment (such as the  
111530       lists of commands, functions, and built-ins processed by *hash*), it is always provided as a shell  
111531       regular built-in. If it is called in a separate utility execution environment, such as one of the  
111532       following:

111533       nohup type writer

111534       find . -type f | xargs type

111535       it might not produce accurate results.

**111536 EXAMPLES**

111537       None.

**111538 RATIONALE**

111539       None.

**111540 FUTURE DIRECTIONS**

111541       None.

**111542 SEE ALSO**

111543       *command*, *hash*

111544       XBD Chapter 8 (on page 173)

**111545 CHANGE HISTORY**

111546       First released in Issue 2.

111547 **NAME**

111548           ulimit — set or report file size limit

111549 **SYNOPSIS**111550 XSI        ulimit [-f] [*blocks*]111551 **DESCRIPTION**

111552       The *ulimit* utility shall set or report the file-size writing limit imposed on files written by the  
 111553       shell and its child processes (files of any size may be read). Only a process with appropriate  
 111554       privileges can increase the limit.

111555 **OPTIONS**111556       The *ulimit* utility shall conform to XBD [Section 12.2](#) (on page 216).

111557       The following option shall be supported:

111558       -f           Set (or report, if no *blocks* operand is present), the file size limit in blocks. The -f  
 111559       option shall also be the default case.

111560 **OPERANDS**

111561       The following operand shall be supported:

111562       *blocks*       The number of 512-byte blocks to use as the new file size limit.111563 **STDIN**

111564       Not used.

111565 **INPUT FILES**

111566       None.

111567 **ENVIRONMENT VARIABLES**111568       The following environment variables shall affect the execution of *ulimit*:

111569       LANG        Provide a default value for the internationalization variables that are unset or null.  
 111570                   (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 111571                   variables used to determine the values of locale categories.)

111572       LC\_ALL      If set to a non-empty string value, override the values of all the other  
 111573                   internationalization variables.

111574       LC\_CTYPE    Determine the locale for the interpretation of sequences of bytes of text data as  
 111575                   characters (for example, single-byte as opposed to multi-byte characters in  
 111576                   arguments).

111577       LC\_MESSAGES

111578                   Determine the locale that should be used to affect the format and contents of  
 111579                   diagnostic messages written to standard error.

111580       NLSPATH     Determine the location of message catalogs for the processing of LC\_MESSAGES.

111581 **ASYNCHRONOUS EVENTS**

111582       Default.

111583 **STDOUT**

111584       The standard output shall be used when no *blocks* operand is present. If the current number of  
 111585       blocks is limited, the number of blocks in the current limit shall be written in the following  
 111586       format:

111587       "%d\n", &lt;number of 512-byte blocks&gt;

111588       If there is no current limit on the number of blocks, in the POSIX locale the following format

111589           shall be used:

111590           "unlimited\n"

#### 111591 **STDERR**

111592           The standard error shall be used only for diagnostic messages.

#### 111593 **OUTPUT FILES**

111594           None.

#### 111595 **EXTENDED DESCRIPTION**

111596           None.

#### 111597 **EXIT STATUS**

111598           The following exit values shall be returned:

111599           0   Successful completion.

111600           >0  A request for a higher limit was rejected or an error occurred.

#### 111601 **CONSEQUENCES OF ERRORS**

111602           Default.

#### 111603 **APPLICATION USAGE**

111604           Since *ulimit* affects the current shell execution environment, it is always provided as a shell regular built-in. If it is called in a separate utility execution environment, such as one of the following:

111607           nohup ulimit -f 10000

111608           env ulimit 10000

111609           it does not affect the file size limit of the caller's environment.

111610           Once a limit has been decreased by a process, it cannot be increased (unless appropriate privileges are involved), even back to the original system limit.

#### 111612 **EXAMPLES**

111613           Set the file size limit to 51 200 bytes:

111614           ulimit -f 100

#### 111615 **RATIONALE**

111616           None.

#### 111617 **FUTURE DIRECTIONS**

111618           None.

#### 111619 **SEE ALSO**

111620           XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

111621           XSH [ulimit\(\)](#)

#### 111622 **CHANGE HISTORY**

111623           First released in Issue 2.

#### 111624 **Issue 7**

111625           SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

111626 **NAME**

111627       umask — get or set the file mode creation mask

111628 **SYNOPSIS**111629       umask [-S] [*mask*]111630 **DESCRIPTION**

111631       The *umask* utility shall set the file mode creation mask of the current shell execution environment  
 111632       (see [Section 2.12](#), on page 2371) to the value specified by the *mask* operand. This mask shall affect  
 111633       the initial value of the file permission bits of subsequently created files. If *umask* is called in a  
 111634       subshell or separate utility execution environment, such as one of the following:

```
111635       (umask 002)
111636       nohup umask ...
111637       find . -exec umask ... \;
```

111638       it shall not affect the file mode creation mask of the caller's environment.

111639       If the *mask* operand is not specified, the *umask* utility shall write to standard output the value of  
 111640       the file mode creation mask of the invoking process.

111641 **OPTIONS**111642       The *umask* utility shall conform to XBD [Section 12.2](#) (on page 216).

111643       The following option shall be supported:

111644       -S       Produce symbolic output.

111645       The default output style is unspecified, but shall be recognized on a subsequent invocation of  
 111646       *umask* on the same system as a *mask* operand to restore the previous file mode creation mask.

111647 **OPERANDS**

111648       The following operand shall be supported:

111649       *mask*       A string specifying the new file mode creation mask. The string is treated in the  
 111650       same way as the *mode* operand described in the EXTENDED DESCRIPTION  
 111651       section for *chmod*.

111652       For a *symbolic\_mode* value, the new value of the file mode creation mask shall be  
 111653       the logical complement of the file permission bits portion of the file mode specified  
 111654       by the *symbolic\_mode* string.

111655       In a *symbolic\_mode* value, the permissions *op* characters '+' and '-' shall be  
 111656       interpreted relative to the current file mode creation mask; '+' shall cause the bits  
 111657       for the indicated permissions to be cleared in the mask; '-' shall cause the bits for  
 111658       the indicated permissions to be set in the mask.

111659       The interpretation of *mode* values that specify file mode bits other than the file  
 111660       permission bits is unspecified.

111661       In the octal integer form of *mode*, the specified bits are set in the file mode creation  
 111662       mask.

111663       The file mode creation mask shall be set to the resulting numeric value.

111664       The default output of a prior invocation of *umask* on the same system with no  
 111665       operand also shall be recognized as a *mask* operand.

111666 **STDIN**

111667 Not used.

111668 **INPUT FILES**

111669 None.

111670 **ENVIRONMENT VARIABLES**111671 The following environment variables shall affect the execution of *umask*:

111672 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 111673 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 111674 variables used to determine the values of locale categories.)

111675 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 111676 internationalization variables.

111677 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 111678 characters (for example, single-byte as opposed to multi-byte characters in  
 111679 arguments).

111680 *LC\_MESSAGES*

111681 Determine the locale that should be used to affect the format and contents of  
 111682 diagnostic messages written to standard error.

111683 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

111684 **ASYNCHRONOUS EVENTS**

111685 Default.

111686 **STDOUT**

111687 When the *mask* operand is not specified, the *umask* utility shall write a message to standard  
 111688 output that can later be used as a *umask mask* operand.

111689 If *-S* is specified, the message shall be in the following format:

111690 "u=%s,g=%s,o=%s\n", <owner permissions>, <group permissions>,  
 111691 <other permissions>

111692 where the three values shall be combinations of letters from the set {*r*, *w*, *x*}; the presence of a  
 111693 letter shall indicate that the corresponding bit is clear in the file mode creation mask.

111694 If a *mask* operand is specified, there shall be no output written to standard output.111695 **STDERR**

111696 The standard error shall be used only for diagnostic messages.

111697 **OUTPUT FILES**

111698 None.

111699 **EXTENDED DESCRIPTION**

111700 None.

111701 **EXIT STATUS**

111702 The following exit values shall be returned:

111703 0 The file mode creation mask was successfully changed, or no *mask* operand was supplied.

111704 &gt;0 An error occurred.

111705 **CONSEQUENCES OF ERRORS**

111706 Default.

111707 **APPLICATION USAGE**

111708 Since *umask* affects the current shell execution environment, it is generally provided as a shell  
 111709 regular built-in.

111710 In contrast to the negative permission logic provided by the file mode creation mask and the  
 111711 octal number form of the *mask* argument, the symbolic form of the *mask* argument specifies those  
 111712 permissions that are left alone.

111713 **EXAMPLES**

111714 Either of the commands:

111715 `umask a=rX,ug+w`111716 `umask 002`

111717 sets the mode mask so that subsequently created files have their S\_IWOTH bit cleared.

111718 After setting the mode mask with either of the above commands, the *umask* command can be  
 111719 used to write out the current value of the mode mask:

111720 `$ umask`111721 `0002`

111722 (The output format is unspecified, but historical implementations use the octal integer mode  
 111723 format.)

111724 `$ umask -S`111725 `u=rwx,g=rwx,o=rX`

111726 Either of these outputs can be used as the mask operand to a subsequent invocation of the *umask*  
 111727 utility.

111728 Assuming the mode mask is set as above, the command:

111729 `umask g-w`

111730 sets the mode mask so that subsequently created files have their S\_IWGRP and S\_IWOTH bits  
 111731 cleared.

111732 The command:

111733 `umask -- -w`

111734 sets the mode mask so that subsequently created files have all their write bits cleared. Note that  
 111735 *mask* operands `-r`, `-w`, `-x` or anything beginning with a <hyphen-minus>, must be preceded by  
 111736 `--` to keep it from being interpreted as an option.

111737 **RATIONALE**

111738 Since *umask* affects the current shell execution environment, it is generally provided as a shell  
 111739 regular built-in. If it is called in a subshell or separate utility execution environment, such as one  
 111740 of the following:

111741 `(umask 002)`111742 `nohup umask ...`111743 `find . -exec umask ... \;`

111744 it does not affect the file mode creation mask of the environment of the caller.

111745 The description of the historical utility was modified to allow it to use the symbolic modes of

111746 *chmod*. The `-s` option used in early proposals was changed to `-S` because `-s` could be confused  
111747 with a *symbolic\_mode* form of mask referring to the `S_ISUID` and `S_ISGID` bits.

111748 The default output style is unspecified to permit implementors to provide migration to the new  
111749 symbolic style at the time most appropriate to their users. A `-o` flag to force octal mode output  
111750 was omitted because the octal mode may not be sufficient to specify all of the information that  
111751 may be present in the file mode creation mask when more secure file access permission checks  
111752 are implemented.

111753 It has been suggested that trusted systems developers might appreciate ameliorating the  
111754 requirement that the mode mask “affects” the file access permissions, since it seems access  
111755 control lists might replace the mode mask to some degree. The wording has been changed to say  
111756 that it affects the file permission bits, and it leaves the details of the behavior of how they affect  
111757 the file access permissions to the description in the System Interfaces volume of POSIX.1-2008.

#### 111758 FUTURE DIRECTIONS

111759 None.

#### 111760 SEE ALSO

111761 [Chapter 2](#) (on page 2335), *chmod*

111762 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

111763 XSH *umask()*

#### 111764 CHANGE HISTORY

111765 First released in Issue 2.

#### 111766 Issue 6

111767 The following new requirements on POSIX implementations derive from alignment with the  
111768 Single UNIX Specification:

- 111769 • The octal mode is supported.

111770 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/34 is applied, making a correction to the  
111771 RATIONALE.

#### 111772 Issue 7

111773 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

111774 **NAME**

111775 unalias — remove alias definitions

111776 **SYNOPSIS**111777 unalias *alias-name*...

111778 unalias -a

111779 **DESCRIPTION**

111780 The *unalias* utility shall remove the definition for each alias name specified. See [Section 2.3.1](#) (on  
 111781 page 2338). The aliases shall be removed from the current shell execution environment; see  
 111782 [Section 2.12](#) (on page 2371).

111783 **OPTIONS**111784 The *unalias* utility shall conform to XBD [Section 12.2](#) (on page 216).

111785 The following option shall be supported:

111786 -a Remove all alias definitions from the current shell execution environment.

111787 **OPERANDS**

111788 The following operand shall be supported:

111789 *alias-name* The name of an alias to be removed.111790 **STDIN**

111791 Not used.

111792 **INPUT FILES**

111793 None.

111794 **ENVIRONMENT VARIABLES**111795 The following environment variables shall affect the execution of *unalias*:

111796 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 111797 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 111798 variables used to determine the values of locale categories.)

111799 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 111800 internationalization variables.

111801 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 111802 characters (for example, single-byte as opposed to multi-byte characters in  
 111803 arguments).

111804 *LC\_MESSAGES*

111805 Determine the locale that should be used to affect the format and contents of  
 111806 diagnostic messages written to standard error.

111807 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.111808 **ASYNCHRONOUS EVENTS**

111809 Default.

111810 **STDOUT**

111811 Not used.

111812 **STDERR**

111813 The standard error shall be used only for diagnostic messages.

**111814 OUTPUT FILES**

111815 None.

**111816 EXTENDED DESCRIPTION**

111817 None.

**111818 EXIT STATUS**

111819 The following exit values shall be returned:

111820 0 Successful completion.

111821 >0 One of the *alias-name* operands specified did not represent a valid alias definition, or an  
111822 error occurred.

**111823 CONSEQUENCES OF ERRORS**

111824 Default.

**111825 APPLICATION USAGE**

111826 Since *unalias* affects the current shell execution environment, it is generally provided as a shell  
111827 regular built-in.

**111828 EXAMPLES**

111829 None.

**111830 RATIONALE**

111831 The *unalias* description is based on that from historical KornShell implementations. Known  
111832 differences exist between that and the C shell. The KornShell version was adopted to be  
111833 consistent with all the other KornShell features in this volume of POSIX.1-2008, such as  
111834 command line editing.

111835 The *-a* option is the equivalent of the *unalias \** form of the C shell and is provided to address  
111836 security concerns about unknown aliases entering the environment of a user (or application)  
111837 through the allowable implementation-defined predefined alias route or as a result of an *ENV*  
111838 file. (Although *unalias* could be used to simplify the “secure” shell script shown in the *command*  
111839 rationale, it does not obviate the need to quote all command names. An initial call to *unalias -a*  
111840 would have to be quoted in case there was an alias for *unalias*.)

**111841 FUTURE DIRECTIONS**

111842 None.

**111843 SEE ALSO**

111844 [Chapter 2](#) (on page 2335), *alias*

111845 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

**111846 CHANGE HISTORY**

111847 First released in Issue 4.

**111848 Issue 6**

111849 This utility is marked as part of the User Portability Utilities option.

**111850 Issue 7**

111851 The *unalias* utility is moved from the User Portability Utilities option to the Base. User  
111852 Portability Utilities is now an option for interactive utilities.

**111853 NAME**

111854        `uname` — return system name

**111855 SYNOPSIS**

111856        `uname [-amnrsv]`

**111857 DESCRIPTION**

111858        By default, the *uname* utility shall write the operating system name to standard output. When  
111859        options are specified, symbols representing one or more system characteristics shall be written to  
111860        the standard output. The format and contents of the symbols are implementation-defined. On  
111861        systems conforming to the System Interfaces volume of POSIX.1-2008, the symbols written shall  
111862        be those supported by the *uname()* function as defined in the System Interfaces volume of  
111863        POSIX.1-2008.

**111864 OPTIONS**

111865        The *uname* utility shall conform to XBD [Section 12.2](#) (on page 216).

111866        The following options shall be supported:

- |        |           |                                                                                |
|--------|-----------|--------------------------------------------------------------------------------|
| 111867 | <b>-a</b> | Behave as though all of the options <b>-mnrsv</b> were specified.              |
| 111868 | <b>-m</b> | Write the name of the hardware type on which the system is running to standard |
| 111869 |           | output.                                                                        |
| 111870 | <b>-n</b> | Write the name of this node within an implementation-defined communications    |
| 111871 |           | network.                                                                       |
| 111872 | <b>-r</b> | Write the current release level of the operating system implementation.        |
| 111873 | <b>-s</b> | Write the name of the implementation of the operating system.                  |
| 111874 | <b>-v</b> | Write the current version level of this release of the operating system        |
| 111875 |           | implementation.                                                                |

111876        If no options are specified, the *uname* utility shall write the operating system name, as if the **-s**  
111877        option had been specified.

**111878 OPERANDS**

111879        None.

**111880 STDIN**

111881        Not used.

**111882 INPUT FILES**

111883        None.

**111884 ENVIRONMENT VARIABLES**

111885        The following environment variables shall affect the execution of *uname*:

- |        |                 |                                                                                                                                                                                                                                                                                      |
|--------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 111886 | <b>LANG</b>     | Provide a default value for the internationalization variables that are unset or null.<br>111887        (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization<br>111888        variables used to determine the values of locale categories.) |
| 111889 | <b>LC_ALL</b>   | If set to a non-empty string value, override the values of all the other<br>111890        internationalization variables.                                                                                                                                                            |
| 111891 | <b>LC_CTYPE</b> | Determine the locale for the interpretation of sequences of bytes of text data as<br>111892        characters (for example, single-byte as opposed to multi-byte characters in<br>111893        arguments).                                                                          |

111894 **LC\_MESSAGES**

111895 Determine the locale that should be used to affect the format and contents of  
111896 diagnostic messages written to standard error.

111897 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

111898 **ASYNCHRONOUS EVENTS**

111899 Default.

111900 **STDOUT**

111901 By default, the output shall be a single line of the following form:

111902 "%s\n", <sysname>

111903 If the **-a** option is specified, the output shall be a single line of the following form:

111904 "%s %s %s %s %s\n", <sysname>, <nodename>, <release>,  
111905 <version>, <machine>

111906 Additional implementation-defined symbols may be written; all such symbols shall be written at  
111907 the end of the line of output before the <newline>.

111908 If options are specified to select different combinations of the symbols, only those symbols shall  
111909 be written, in the order shown above for the **-a** option. If a symbol is not selected for writing, its  
111910 corresponding trailing <blank> characters also shall not be written.

111911 **STDERR**

111912 The standard error shall be used only for diagnostic messages.

111913 **OUTPUT FILES**

111914 None.

111915 **EXTENDED DESCRIPTION**

111916 None.

111917 **EXIT STATUS**

111918 The following exit values shall be returned:

111919 0 The requested information was successfully written.

111920 >0 An error occurred.

111921 **CONSEQUENCES OF ERRORS**

111922 Default.

111923 **APPLICATION USAGE**

111924 Note that any of the symbols could include embedded <space> characters, which may affect  
111925 parsing algorithms if multiple options are selected for output.

111926 The node name is typically a name that the system uses to identify itself for inter-system  
111927 communication addressing.

111928 **EXAMPLES**

111929 The following command:

111930 `uname -sr`

111931 writes the operating system name and release level, separated by one or more <blank>  
111932 characters.

111933 **RATIONALE**

111934 It was suggested that this utility cannot be used portably since the format of the symbols is  
111935 implementation-defined. The POSIX.1 working group could not achieve consensus on defining  
111936 these formats in the underlying *uname()* function, and there was no expectation that this volume  
111937 of POSIX.1-2008 would be any more successful. Some applications may still find this historical  
111938 utility of value. For example, the symbols could be used for system log entries or for comparison  
111939 with operator or user input.

111940 **FUTURE DIRECTIONS**

111941 None.

111942 **SEE ALSO**

111943 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

111944 XSH [uname\(\)](#)

111945 **CHANGE HISTORY**

111946 First released in Issue 2.

111947 **NAME**

111948 uncompress — expand compressed data

111949 **SYNOPSIS**111950 XSI `uncompress [-cfv] [file...]`111951 **DESCRIPTION**

111952 The *uncompress* utility shall restore files to their original state after they have been compressed  
 111953 using the *compress* utility. If no files are specified, the standard input shall be uncompressed to  
 111954 the standard output. If the invoking process has appropriate privileges, the ownership, modes,  
 111955 access time, and modification time of the original file shall be preserved.

111956 This utility shall support the uncompressing of any files produced by the *compress* utility on the  
 111957 same implementation. For files produced by *compress* on other systems, *uncompress* supports 9 to  
 111958 14-bit compression (see *compress*, **-b**); it is implementation-defined whether values of **-b** greater  
 111959 than 14 are supported.

111960 **OPTIONS**

111961 The *uncompress* utility shall conform to XBD [Section 12.2](#) (on page 216), except that Guideline 1  
 111962 does apply since the utility name has ten letters.

111963 The following options shall be supported:

- 111964 **-c** Write to standard output; no files are changed.
- 111965 **-f** Do not prompt for overwriting files. Except when run in the background, if **-f** is  
 111966 not given the user shall be prompted as to whether an existing file should be  
 111967 overwritten. If the standard input is not a terminal and **-f** is not given, *uncompress*  
 111968 shall write a diagnostic message to standard error and exit with a status greater  
 111969 than zero.
- 111970 **-v** Write messages to standard error concerning the expansion of each file.

111971 **OPERANDS**

111972 The following operand shall be supported:

- 111973 *file* A pathname of a file. If *file* already has the **.Z** suffix specified, it shall be used as the  
 111974 input file and the output file shall be named **file** with the **.Z** suffix removed.  
 111975 Otherwise, *file* shall be used as the name of the output file and **file** with the **.Z**  
 111976 suffix appended shall be used as the input file.

111977 **STDIN**

111978 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is **'-'**.

111979 **INPUT FILES**

111980 Input files shall be in the format produced by the *compress* utility.

111981 **ENVIRONMENT VARIABLES**

111982 The following environment variables shall affect the execution of *uncompress*:

- 111983 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 111984 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 111985 variables used to determine the values of locale categories.)
- 111986 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 111987 internationalization variables.

- 111988 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 111989 characters (for example, single-byte as opposed to multi-byte characters in  
 111990 arguments).
- 111991 **LC\_MESSAGES**  
 111992 Determine the locale that should be used to affect the format and contents of  
 111993 diagnostic messages written to standard error.
- 111994 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 111995 **ASYNCHRONOUS EVENTS**
- 111996 Default.
- 111997 **STDOUT**  
 111998 When there are no *file* operands or the *-c* option is specified, the uncompressed output is written  
 111999 to standard output.
- 112000 **STDERR**  
 112001 Prompts shall be written to the standard error output under the conditions specified in the  
 112002 DESCRIPTION and OPTIONS sections. The prompts shall contain the *file* pathname, but their  
 112003 format is otherwise unspecified. Otherwise, the standard error output shall be used only for  
 112004 diagnostic messages.
- 112005 **OUTPUT FILES**  
 112006 Output files are the same as the respective input files to *compress*.
- 112007 **EXTENDED DESCRIPTION**  
 112008 None.
- 112009 **EXIT STATUS**  
 112010 The following exit values shall be returned:  
 112011 0 Successful completion.  
 112012 >0 An error occurred.
- 112013 **CONSEQUENCES OF ERRORS**  
 112014 The input file remains unmodified.
- 112015 **APPLICATION USAGE**  
 112016 The limit of 14 on the *compress -b bits* argument is to achieve portability to all systems (within  
 112017 the restrictions imposed by the lack of an explicit published file format). Some implementations  
 112018 based on 16-bit architectures cannot support 15 or 16-bit uncompression.
- 112019 **EXAMPLES**  
 112020 None.
- 112021 **RATIONALE**  
 112022 None.
- 112023 **FUTURE DIRECTIONS**  
 112024 None.
- 112025 **SEE ALSO**  
 112026 *compress, zcat*  
 112027 XBD Chapter 8 (on page 173), Section 12.2 (on page 216)

112028 **CHANGE HISTORY**

112029 First released in Issue 4.

112030 **Issue 6**

112031 The normative text is reworded to avoid use of the term “must” for application requirements.

112032 **Issue 7**112033 SD5-XCU-ERN-26 is applied, clarifying that this utility is allowed to break the Utility Syntax  
112034 Guidelines by having ten letters in its name.

112035 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

112036 **NAME**

112037 unexpand — convert spaces to tabs

112038 **SYNOPSIS**112039 unexpand [-a|-t *tablist*] [*file*...]112040 **DESCRIPTION**

112041 The *unexpand* utility shall copy files or standard input to standard output, converting <blank>  
 112042 characters at the beginning of each line into the maximum number of <tab> characters followed  
 112043 by the minimum number of <space> characters needed to fill the same column positions  
 112044 originally filled by the translated <blank> characters. By default, tabstops shall be set at every  
 112045 eighth column position. Each <backspace> shall be copied to the output, and shall cause the  
 112046 column position count for tab calculations to be decremented; the count shall never be  
 112047 decremented to a value less than one.

112048 **OPTIONS**112049 The *unexpand* utility shall conform to XBD [Section 12.2](#) (on page 216).

112050 The following options shall be supported:

112051 **-a** In addition to translating <blank> characters at the beginning of each line,  
 112052 translate all sequences of two or more <blank> characters immediately preceding a  
 112053 tab stop to the maximum number of <tab> characters followed by the minimum  
 112054 number of <space> characters needed to fill the same column positions originally  
 112055 filled by the translated <blank> characters.

112056 **-t *tablist*** Specify the tab stops. The application shall ensure that the *tablist* option-argument  
 112057 is a single argument consisting of a single positive decimal integer or multiple  
 112058 positive decimal integers, separated by <blank> or <comma> characters, in  
 112059 ascending order. If a single number is given, tabs shall be set *tablist* column  
 112060 positions apart instead of the default 8. If multiple numbers are given, the tabs  
 112061 shall be set at those specific column positions.

112062 The application shall ensure that each tab-stop position *N* is an integer value  
 112063 greater than zero, and the list shall be in strictly ascending order. This is taken to  
 112064 mean that, from the start of a line of output, tabbing to position *N* shall cause the  
 112065 next character output to be in the (*N*+1)th column position on that line. When the  
 112066 **-t** option is not specified, the default shall be the equivalent of specifying **-t 8**  
 112067 (except for the interaction with **-a**, described below).

112068 No <space>-to-<tab> conversions shall occur for characters at positions beyond  
 112069 the last of those specified in a multiple tab-stop list.

112070 When **-t** is specified, the presence or absence of the **-a** option shall be ignored;  
 112071 conversion shall not be limited to the processing of leading <blank> characters.

112072 **OPERANDS**

112073 The following operand shall be supported:

112074 *file* A pathname of a text file to be used as input.

112075 **STDIN**

112076 See the INPUT FILES section.

112077 **INPUT FILES**

112078 The input files shall be text files.

112079 **ENVIRONMENT VARIABLES**

112080 The following environment variables shall affect the execution of *unexpand*:

112081 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 112082 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 112083 variables used to determine the values of locale categories.)

112084 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 112085 internationalization variables.

112086 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 112087 characters (for example, single-byte as opposed to multi-byte characters in  
 112088 arguments and input files), the processing of <tab> and <space> characters, and  
 112089 for the determination of the width in column positions each character would  
 112090 occupy on an output device.

112091 *LC\_MESSAGES*

112092 Determine the locale that should be used to affect the format and contents of  
 112093 diagnostic messages written to standard error.

112094 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

112095 **ASYNCHRONOUS EVENTS**

112096 Default.

112097 **STDOUT**

112098 The standard output shall be equivalent to the input files with the specified <space>-to-<tab>  
 112099 conversions.

112100 **STDERR**

112101 The standard error shall be used only for diagnostic messages.

112102 **OUTPUT FILES**

112103 None.

112104 **EXTENDED DESCRIPTION**

112105 None.

112106 **EXIT STATUS**

112107 The following exit values shall be returned:

112108 0 Successful completion.

112109 >0 An error occurred.

112110 **CONSEQUENCES OF ERRORS**

112111 Default.

112112 **APPLICATION USAGE**

112113 One non-intuitive aspect of *unexpand* is its restriction to leading <space> characters when neither  
 112114 *-a* nor *-t* is specified. Users who always want to convert all <space> characters in a file can  
 112115 easily alias *unexpand* to use the *-a* or *-t 8* option.

112116 **EXAMPLES**

112117 None.

112118 **RATIONALE**

112119 On several occasions, consideration was given to adding a *-t* option to the *unexpand* utility to  
 112120 complement the *-t* in *expand* (see *expand*). The historical intent of *unexpand* was to translate  
 112121 multiple <blank> characters into tab stops, where tab stops were a multiple of eight column

112122 positions on most UNIX systems. An early proposal omitted `-t` because it seemed outside the  
112123 scope of the User Portability Utilities option; it was not described in any of the base documents  
112124 for IEEE Std 1003.2-1992. However, hard-coding tab stops every eight columns was not suitable  
112125 for the international community and broke historical precedents for some vendors in the  
112126 FORTRAN community, so `-t` was restored in conjunction with the list of valid extension  
112127 categories considered by the standard developers. Thus, *unexpand* is now the logical converse of  
112128 *expand*.

#### 112129 FUTURE DIRECTIONS

112130 None.

#### 112131 SEE ALSO

112132 *expand*, *tabs*

112133 XBD Chapter 8 (on page 173), Section 12.2 (on page 216)

#### 112134 CHANGE HISTORY

112135 First released in Issue 4.

#### 112136 Issue 6

112137 This utility is marked as part of the User Portability Utilities option.

112138 The definition of the `LC_CTYPE` environment variable is changed to align with the  
112139 IEEE P1003.2b draft standard.

112140 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 112141 Issue 7

112142 The *unexpand* utility is moved from the User Portability Utilities option to the Base. User  
112143 Portability Utilities is now an option for interactive utilities.

112144 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

112145 **NAME**112146 unget — undo a previous get of an SCCS file (**DEVELOPMENT**)112147 **SYNOPSIS**112148 XSI unget [-ns] [-r *SID*] *file*...112149 **DESCRIPTION**112150 The *unget* utility shall reverse the effect of a *get* -e done prior to creating the intended new delta.112151 **OPTIONS**112152 The *unget* utility shall conform to XBD [Section 12.2](#) (on page 216).

112153 The following options shall be supported:

112154 -r *SID* Uniquely identify which delta is no longer intended. (This would have been  
 112155 specified by *get* as the new delta.) The use of this option is necessary only if two or  
 112156 more outstanding *get* commands for editing on the same SCCS file were done by  
 112157 the same person (login name).

112158 -s Suppress the writing to standard output of the intended delta's SID.

112159 -n Retain the file that was obtained by *get*, which would normally be removed from  
 112160 the current directory.

112161 **OPERANDS**

112162 The following operands shall be supported:

112163 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *unget*  
 112164 utility shall behave as though each file in the directory were specified as a named  
 112165 file, except that non-SCCS files (last component of the pathname does not begin  
 112166 with s.) and unreadable files shall be silently ignored.

112167 If exactly one *file* operand appears, and it is '-', the standard input shall be read;  
 112168 each line of the standard input shall be taken to be the name of an SCCS file to be  
 112169 processed. Non-SCCS files and unreadable files shall be silently ignored.

112170 **STDIN**

112171 The standard input shall be a text file used only when the *file* operand is specified as '-'. Each  
 112172 line of the text file shall be interpreted as an SCCS pathname.

112173 **INPUT FILES**

112174 Any SCCS files processed shall be files of an unspecified format.

112175 **ENVIRONMENT VARIABLES**112176 The following environment variables shall affect the execution of *unget*:

112177 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 112178 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 112179 variables used to determine the values of locale categories.)

112180 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 112181 internationalization variables.

112182 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 112183 characters (for example, single-byte as opposed to multi-byte characters in  
 112184 arguments and input files).

112185 *LC\_MESSAGES*

112186 Determine the locale that should be used to affect the format and contents of  
 112187 diagnostic messages written to standard error.

- 112188 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 112189 **ASYNCHRONOUS EVENTS**
- 112190 Default.
- 112191 **STDOUT**
- 112192 The standard output shall consist of a line for each file, in the following format:
- 112193 "%s\n", *<SID removed from file>*
- 112194 If there is more than one named file or if a directory or standard input is named, each pathname
- 112195 shall be written before each of the preceding lines:
- 112196 "\n%s:\n", *<pathname>*
- 112197 **STDERR**
- 112198 The standard error shall be used only for diagnostic messages.
- 112199 **OUTPUT FILES**
- 112200 Any SCCS files updated shall be files of an unspecified format. During processing of a *file*, a
- 112201 locking *z-file*, as described in *get*, and a *q-file* (a working copy of the *p-file*), may be created and
- 112202 deleted. The *p-file* and *g-file*, as described in *get*, shall be deleted.
- 112203 **EXTENDED DESCRIPTION**
- 112204 None.
- 112205 **EXIT STATUS**
- 112206 The following exit values shall be returned:
- 112207 0 Successful completion.
- 112208 >0 An error occurred.
- 112209 **CONSEQUENCES OF ERRORS**
- 112210 Default.
- 112211 **APPLICATION USAGE**
- 112212 None.
- 112213 **EXAMPLES**
- 112214 None.
- 112215 **RATIONALE**
- 112216 None.
- 112217 **FUTURE DIRECTIONS**
- 112218 None.

- 112222 **CHANGE HISTORY**
- 112223 First released in Issue 2.
- 112224 **Issue 6**
- 112225 The normative text is reworded to avoid use of the term “must” for application requirements.

112226 **Issue 7**  
112227

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

112228 **NAME**112229        `uniq` — report or filter out repeated lines in a file112230 **SYNOPSIS**112231        `uniq [-c|-d|-u] [-f fields] [-s char] [input_file [output_file]]`112232 **DESCRIPTION**

112233        The *uniq* utility shall read an input file comparing adjacent lines, and write one copy of each  
 112234        input line on the output. The second and succeeding copies of repeated adjacent input lines shall  
 112235        not be written. The trailing <newline> of each line in the input shall be ignored when doing  
 112236        comparisons.

112237        Repeated lines in the input shall not be detected if they are not adjacent.

112238 **OPTIONS**

112239        The *uniq* utility shall conform to XBD [Section 12.2](#) (on page 216), except that '+' may be  
 112240        recognized as an option delimiter as well as '-'.

112241        The following options shall be supported:

112242        **-c**        Precede each output line with a count of the number of times the line occurred in  
 112243        the input.

112244        **-d**        Suppress the writing of lines that are not repeated in the input.

112245        **-f *fields***    Ignore the first *fields* fields on each input line when doing comparisons, where  
 112246        *fields* is a positive decimal integer. A field is the maximal string matched by the  
 112247        basic regular expression:

112248        `[[[:blank:]]*[^[:blank:]]*]`

112249        If the *fields* option-argument specifies more fields than appear on an input line, a  
 112250        null string shall be used for comparison.

112251        **-s *chars***    Ignore the first *chars* characters when doing comparisons, where *chars* shall be a  
 112252        positive decimal integer. If specified in conjunction with the **-f** option, the first  
 112253        *chars* characters after the first *fields* fields shall be ignored. If the *chars* option-  
 112254        argument specifies more characters than remain on an input line, a null string shall  
 112255        be used for comparison.

112256        **-u**        Suppress the writing of lines that are repeated in the input.

112257 **OPERANDS**

112258        The following operands shall be supported:

112259        *input\_file*    A pathname of the input file. If the *input\_file* operand is not specified, or if the  
 112260        *input\_file* is '-', the standard input shall be used.

112261        *output\_file*    A pathname of the output file. If the *output\_file* operand is not specified, the  
 112262        standard output shall be used. The results are unspecified if the file named by  
 112263        *output\_file* is the file named by *input\_file*.

112264 **STDIN**112265        The standard input shall be used only if no *input\_file* operand is specified or if *input\_file* is '-'.

112266        See the INPUT FILES section.

112267 **INPUT FILES**

112268        The input file shall be a text file.

## 112269 ENVIRONMENT VARIABLES

112270 The following environment variables shall affect the execution of *uniq*:

112271 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 112272 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 112273 variables used to determine the values of locale categories.)

112274 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 112275 internationalization variables.

112276 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 112277 characters (for example, single-byte as opposed to multi-byte characters in  
 112278 arguments and input files) and which characters constitute a <blank> in the  
 112279 current locale.

112280 *LC\_MESSAGES*

112281 Determine the locale that should be used to affect the format and contents of  
 112282 diagnostic messages written to standard error.

112283 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 112284 ASYNCHRONOUS EVENTS

112285 Default.

## 112286 STDOUT

112287 The standard output shall be used if no *output\_file* operand is specified, and shall be used if the  
 112288 *output\_file* operand is '-' and the implementation treats the '-' as meaning standard output.  
 112289 Otherwise, the standard output shall not be used. See the OUTPUT FILES section.

## 112290 STDERR

112291 The standard error shall be used only for diagnostic messages.

## 112292 OUTPUT FILES

112293 If the -c option is specified, the output file shall be empty or each line shall be of the form:

112294 "%d %s", <number of duplicates>, <line>

112295 otherwise, the output file shall be empty or each line shall be of the form:

112296 "%s", <line>

## 112297 EXTENDED DESCRIPTION

112298 None.

## 112299 EXIT STATUS

112300 The following exit values shall be returned:

112301 0 The utility executed successfully.

112302 >0 An error occurred.

## 112303 CONSEQUENCES OF ERRORS

112304 Default.

**APPLICATION USAGE**

If the collating sequence of the current locale has a total ordering of all characters, the *sort* utility can be used to cause repeated lines to be adjacent in the input file. If the collating sequence does not have a total ordering of all characters, the *sort* utility should still do this but it might not. To ensure that all duplicate lines are eliminated, and have the output sorted according the collating sequence of the current locale, applications should use:

```
LC_ALL=C sort -u | sort
```

instead of:

```
sort | uniq
```

To remove duplicate lines based on whether they collate equally instead of whether they are identical, applications should use:

```
sort -u
```

instead of:

```
sort | uniq
```

When using *uniq* to process pathnames, it is recommended that *LC\_ALL*, or at least *LC\_CTYPE* and *LC\_COLLATE*, are set to POSIX or C in the environment, since pathnames can contain byte sequences that do not form valid characters in some locales, in which case the utility's behavior would be undefined. In the POSIX locale each byte is a valid single-byte character, and therefore this problem is avoided.

**EXAMPLES**

The following input file data (but flushed left) was used for a test series on *uniq*:

```
#01 foo0 bar0 fool bar1
#02 bar0 fool bar1 fool
#03 foo0 bar0 fool bar1
#04
#05 foo0 bar0 fool bar1
#06 foo0 bar0 fool bar1
#07 bar0 fool bar1 foo0
```

What follows is a series of test invocations of the *uniq* utility that use a mixture of *uniq* options against the input file data. These tests verify the meaning of *adjacent*. The *uniq* utility views the input data as a sequence of strings delimited by '\n'. Accordingly, for the *fields* member of the sequence, *uniq* interprets unique or repeated adjacent lines strictly relative to the *fields*+1th member.

1. This first example tests the line counting option, comparing each line of the input file data starting from the second field:

```
uniq -c -f 1 uniq_0I.t
1 #01 foo0 bar0 fool bar1
1 #02 bar0 fool bar1 fool
1 #03 foo0 bar0 fool bar1
1 #04
2 #05 foo0 bar0 fool bar1
1 #07 bar0 fool bar1 foo0
```

The number '2', prefixing the fifth line of output, signifies that the *uniq* utility detected a pair of repeated lines. Given the input data, this can only be true when *uniq* is run using the *-f 1* option (which shall cause *uniq* to ignore the first field on each input line).

- 112350 2. The second example tests the option to suppress unique lines, comparing each line of the  
112351 input file data starting from the second field:
- ```
112352      uniq -d -f 1 uniq_0I.t
112353      #05 foo0 bar0 fool bar1
```
- 112354 3. This test suppresses repeated lines, comparing each line of the input file data starting  
112355 from the second field:
- ```
112356      uniq -u -f 1 uniq_0I.t
112357      #01 foo0 bar0 fool bar1
112358      #02 bar0 fool bar1 fool
112359      #03 foo0 bar0 fool bar1
112360      #04
112361      #07 bar0 fool bar1 foo0
```
- 112362 4. This suppresses unique lines, comparing each line of the input file data starting from the  
112363 third character:
- ```
112364      uniq -d -s 2 uniq_0I.t
```
- 112365 In the last example, the *uniq* utility found no input matching the above criteria.

#### 112366 RATIONALE

112367 Some historical implementations have limited lines to be 1 080 bytes in length, which does not  
112368 meet the implied {LINE\_MAX} limit.

112369 Earlier versions of this standard allowed the *-number* and *+number* options. These options are no  
112370 longer specified by POSIX.1-2008 but may be present in some implementations.

#### 112371 FUTURE DIRECTIONS

112372 None.

#### 112373 SEE ALSO

112374 *comm*, *sort*

112375 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

#### 112376 CHANGE HISTORY

112377 First released in Issue 2.

#### 112378 Issue 6

112379 The obsolescent SYNOPSIS and associated text are removed.

112380 The normative text is reworded to avoid use of the term “must” for application requirements.

112381 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/40 is applied, adding *LC\_COLLATE* to the  
112382 ENVIRONMENT VARIABLES section, and changing “the application shall ensure that” in the  
112383 OUTPUT FILES section.

#### 112384 Issue 7

112385 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that ‘+’ may be recognized  
112386 as an option delimiter in the OPTIONS section.

112387 Austin Group Interpretation 1003.1-2001 #092 is applied.

112388 Austin Group Interpretation 1003.1-2001 #133 is applied, clarifying the behavior of the trailing  
112389 <newline>.

112390 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

112391 SD5-XCU-ERN-141 is applied, updating the EXAMPLES section.

112392 **NAME**

112393 unlink — call the *unlink()* function

112394 **SYNOPSIS**

112395 XSI `unlink file`

112396 **DESCRIPTION**

112397 The *unlink* utility shall perform the function call:

112398 `unlink(file);`

112399 A user may need appropriate privileges to invoke the *unlink* utility.

112400 **OPTIONS**

112401 None.

112402 **OPERANDS**

112403 The following operands shall be supported:

112404 *file* The pathname of an existing file.

112405 **STDIN**

112406 Not used.

112407 **INPUT FILES**

112408 Not used.

112409 **ENVIRONMENT VARIABLES**

112410 The following environment variables shall affect the execution of *unlink*:

112411 *LANG* Provide a default value for the internationalization variables that are unset or null.  
112412 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
112413 variables used to determine the values of locale categories.)

112414 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
112415 internationalization variables.

112416 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
112417 characters (for example, single-byte as opposed to multi-byte characters in  
112418 arguments).

112419 *LC\_MESSAGES*  
112420 Determine the locale that should be used to affect the format and contents of  
112421 diagnostic messages written to standard error.

112422 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

112423 **ASYNCHRONOUS EVENTS**

112424 Default.

112425 **STDOUT**

112426 None.

112427 **STDERR**

112428 The standard error shall be used only for diagnostic messages.

112429 **OUTPUT FILES**

112430 None.

112431 **EXTENDED DESCRIPTION**

112432       None.

112433 **EXIT STATUS**

112434       The following exit values shall be returned:

112435       0   Successful completion.

112436       &gt;0   An error occurred.

112437 **CONSEQUENCES OF ERRORS**

112438       Default.

112439 **APPLICATION USAGE**

112440       None.

112441 **EXAMPLES**

112442       None.

112443 **RATIONALE**

112444       None.

112445 **FUTURE DIRECTIONS**

112446       None.

112447 **SEE ALSO**112448       [link](#), [rm](#)112449       XBD [Chapter 8](#) (on page 173)112450       XSH [unlink\(\)](#)112451 **CHANGE HISTORY**

112452       First released in Issue 5.

112453 **NAME**

112454       uucp — system-to-system copy

112455 **SYNOPSIS**112456 UU       uucp [-cCdfjmr] [-n *user*] *source-file*... *destination-file*112457 **DESCRIPTION**

112458       The *uucp* utility shall copy files named by the *source-file* argument to the *destination-file* argument.  
 112459       The files named can be on local or remote systems.

112460       The *uucp* utility cannot guarantee support for all character encodings in all circumstances. For  
 112461       example, transmission data may be restricted to 7 bits by the underlying network, 8-bit data and  
 112462       filenames need not be portable to non-internationalized systems, and so on. Under these  
 112463       circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991  
 112464       standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used,  
 112465       and that only characters defined in the portable filename character set be used for naming files.  
 112466       The protocol for transfer of files is unspecified by POSIX.1-2008.

112467       Typical implementations of this utility require a communications line configured to use XBD  
 112468       Chapter 11 (on page 199), but other communications means may be used. On systems where  
 112469       there are no available communications means (either temporarily or permanently), this utility  
 112470       shall write an error message describing the problem and exit with a non-zero exit status.

112471 **OPTIONS**112472       The *uucp* utility shall conform to XBD Section 12.2 (on page 216).

112473       The following options shall be supported:

- 112474       -c       Do not copy local file to the spool directory for transfer to the remote machine
- 112475       (default).
- 112476       -C       Force the copy of local files to the spool directory for transfer.
- 112477       -d       Make all necessary directories for the file copy (default).
- 112478       -f       Do not make intermediate directories for the file copy.
- 112479       -j       Write the job identification string to standard output. This job identification can be
- 112480       used by *uustat* to obtain the status or terminate a job.
- 112481       -m       Send mail to the requester when the copy is completed.
- 112482       -n *user*   Notify *user* on the remote system that a file was sent.
- 112483       -r       Do not start the file transfer; just queue the job.

112484 **OPERANDS**

112485       The following operands shall be supported:

112486       *destination-file*, *source-file*

112487       A pathname of a file to be copied to, or from, respectively. Either name can be a  
 112488       pathname on the local machine, or can have the form:

112489       *system-name*!*pathname*

112490       where *system-name* is taken from a list of system names that *uucp* knows about.  
 112491       The destination *system-name* can also be a list of names such as:

112492       *system-name*!*system-name*! . . . !*system-name*!*pathname*

112493       in which case, an attempt is made to send the file via the specified route to the

112494 destination. Care should be taken to ensure that intermediate nodes in the route  
112495 are willing to forward information.

112496 The shell pattern matching notation characters '?', '\*', and "[...]" appearing  
112497 in *pathname* shall be expanded on the appropriate system.

112498 Pathnames can be one of:

- 112499 1. An absolute pathname.
- 112500 2. A pathname preceded by *~user* where *user* is a login name on the specified  
112501 system and is replaced by that user's login directory. Note that if an invalid  
112502 login is specified, the default is to the public directory (called *PUBDIR*; the  
112503 actual location of *PUBDIR* is implementation-defined).
- 112504 3. A pathname preceded by *~/destination* where *destination* is appended to  
112505 *PUBDIR*.

112506 **Note:** This destination is treated as a filename unless more than one file is being  
112507 transferred by this request or the destination is already a directory. To  
112508 ensure that it is a directory, follow the destination with a '/'. For  
112509 example, *~/dan/* as the destination makes the directory **PUBDIR/dan** if it  
112510 does not exist and puts the requested files in that directory.

- 112511 4. Anything else shall be prefixed by the current directory.

112512 If the result is an erroneous pathname for the remote system, the copy shall fail. If  
112513 the *destination-file* is a directory, the last part of the *source-file* name shall be used.

112514 The read, write, and execute permissions given by *uucp* are implementation-  
112515 defined.

## 112516 STDIN

112517 Not used.

## 112518 INPUT FILES

112519 The files to be copied are regular files.

## 112520 ENVIRONMENT VARIABLES

112521 The following environment variables shall affect the execution of *uucp*:

112522 *LANG* Provide a default value for the internationalization variables that are unset or null.  
112523 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
112524 variables used to determine the values of locale categories.)

112525 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
112526 internationalization variables.

112527 *LC\_COLLATE*  
112528 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
112529 character collating elements within bracketed filename patterns.

112530 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
112531 characters (for example, single-byte as opposed to multi-byte characters in  
112532 arguments and input files) and the behavior of character classes within bracketed  
112533 filename patterns (for example, "[[:lower:]]\*").

112534 *LC\_MESSAGES*  
112535 Determine the locale that should be used to affect the format and contents of  
112536 diagnostic messages written to standard error, and informative messages written  
112537 to standard output.

- 112538 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 112539 **ASYNCHRONOUS EVENTS**
- 112540 Default.
- 112541 **STDOUT**
- 112542 Not used.
- 112543 **STDERR**
- 112544 The standard error shall be used only for diagnostic messages.
- 112545 **OUTPUT FILES**
- 112546 The output files (which may be on other systems) are copies of the input files.
- 112547 If *-m* is used, mail files are modified.
- 112548 **EXTENDED DESCRIPTION**
- 112549 None.
- 112550 **EXIT STATUS**
- 112551 The following exit values shall be returned:
- 112552 0 Successful completion.
- 112553 >0 An error occurred.
- 112554 **CONSEQUENCES OF ERRORS**
- 112555 Default.
- 112556 **APPLICATION USAGE**
- 112557 This utility is part of the UUCP Utilities option and need not be supported by all implementations.
- 112558
- 112559 The domain of remotely accessible files can (and for obvious security reasons usually should) be severely restricted.
- 112560
- 112561 Note that the *'!'* character in addresses has to be escaped when using *cs**h* as a command interpreter because of its history substitution syntax. For *ksh* and *sh* the escape is not necessary, but may be used.
- 112562
- 112563
- 112564 As noted above, shell metacharacters appearing in pathnames are expanded on the appropriate system. On an internationalized system, this is done under the control of local settings of *LC\_COLLATE* and *LC\_CTYPE*. Thus, care should be taken when using bracketed filename patterns, as collation and typing rules may vary from one system to another. Also be aware that certain types of expression (that is, equivalence classes, character classes, and collating symbols) need not be supported on non-internationalized systems.
- 112565
- 112566
- 112567
- 112568
- 112569
- 112570 **EXAMPLES**
- 112571 None.
- 112572 **RATIONALE**
- 112573 None.
- 112574 **FUTURE DIRECTIONS**
- 112575 None.
- 112576 **SEE ALSO**
- 112577 *mailx*, *uuencode*, *uustat*, *uux*

112579 **CHANGE HISTORY**

112580 First released in Issue 2.

112581 **Issue 6**112582 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.112583 The UN margin codes and associated shading are removed from the *-C*, *-f*, *-j*, *-n*, and *-r*  
112584 options in response to The Open Group Base Resolution bwg2001-003.112585 **Issue 7**

112586 SD5-XCU-ERN-46 is applied, moving this utility to the UUCP Utilities Option Group.

112587 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

112588 **NAME**

112589       uudecode — decode a binary file

112590 **SYNOPSIS**112591       uudecode [-o *outfile*] [*file*]112592 **DESCRIPTION**

112593       The *uudecode* utility shall read a file, or standard input if no file is specified, that includes data  
 112594       created by the *uuencode* utility. The *uudecode* utility shall scan the input file, searching for data  
 112595       compatible with one of the formats specified in *uuencode*, and attempt to create or overwrite the  
 112596       file described by the data (or overridden by the **-o** option). The pathname shall be contained in  
 112597       the data or specified by the **-o** option. The file access permission bits and contents for the file to  
 112598       be produced shall be contained in that data. The mode bits of the created file (other than  
 112599       standard output) shall be set from the file access permission bits contained in the data; that is,  
 112600       other attributes of the mode, including the file mode creation mask (see *umask*), shall not affect  
 112601       the file being produced. If either of the *op* characters '+' and '-' (see *chmod*) are specified in  
 112602       symbolic mode, the initial mode on which those operations are based is unspecified.

112603       If the pathname of the file resolves to an existing file and the user does not have write  
 112604       permission on that file, *uudecode* shall terminate with an error. If the pathname of the file resolves  
 112605       to an existing file and the user has write permission on that file, the existing file shall be  
 112606       overwritten and, if possible, the mode bits of the file (other than standard output) shall be set as  
 112607       described above; if the mode bits cannot be set, *uudecode* shall not treat this as an error.

112608       If the input data was produced by *uuencode* on a system with a different number of bits per byte  
 112609       than on the target system, the results of *uudecode* are unspecified.

112610 **OPTIONS**112611       The *uudecode* utility shall conform to XBD [Section 12.2](#) (on page 216).

112612       The following option shall be supported by the implementation:

112613       **-o *outfile***   A pathname of a file that shall be used instead of any pathname contained in the  
 112614       input data. Specifying an *outfile* option-argument of **/dev/stdout** shall indicate  
 112615       standard output.

112616 **OPERANDS**

112617       The following operand shall be supported:

112618       *file*           The pathname of a file containing the output of *uuencode*.112619 **STDIN**

112620       See the INPUT FILES section.

112621 **INPUT FILES**112622       The input files shall be files containing the output of *uuencode*.112623 **ENVIRONMENT VARIABLES**112624       The following environment variables shall affect the execution of *uudecode*:

112625       **LANG**           Provide a default value for the internationalization variables that are unset or null.  
 112626       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 112627       variables used to determine the values of locale categories.)

112628       **LC\_ALL**          If set to a non-empty string value, override the values of all the other  
 112629       internationalization variables.

112630       **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
 112631       characters (for example, single-byte as opposed to multi-byte characters in  
 112632       arguments and input files).

112633 **LC\_MESSAGES**

112634 Determine the locale that should be used to affect the format and contents of  
 112635 diagnostic messages written to standard error.

112636 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

112637 **ASYNCHRONOUS EVENTS**

112638 Default.

112639 **STDOUT**

112640 If the file data header encoded by *uuencode* is `-` or `/dev/stdout`, or the `-o /dev/stdout` option  
 112641 overrides the file data, the standard output shall be in the same format as the file originally  
 112642 encoded by *uuencode*. Otherwise, the standard output shall not be used.

112643 **STDERR**

112644 The standard error shall be used only for diagnostic messages.

112645 **OUTPUT FILES**

112646 The output file shall be in the same format as the file originally encoded by *uuencode*.

112647 **EXTENDED DESCRIPTION**

112648 None.

112649 **EXIT STATUS**

112650 The following exit values shall be returned:

112651 0 Successful completion.

112652 >0 An error occurred.

112653 **CONSEQUENCES OF ERRORS**

112654 Default.

112655 **APPLICATION USAGE**

112656 The user who is invoking *uudecode* must have write permission on any file being created.

112657 The output of *uuencode* is essentially an encoded bit stream that is not cognizant of byte  
 112658 boundaries. It is possible that a 9-bit byte target machine can process input from an 8-bit source,  
 112659 if it is aware of the requirement, but the reverse is unlikely to be satisfying. Of course, the only  
 112660 data that is meaningful for such a transfer between architectures is generally character data.

112661 **EXAMPLES**

112662 None.

112663 **RATIONALE**

112664 Input files are not necessarily text files, as stated by an early proposal. Although the *uuencode*  
 112665 output is a text file, that output could have been wrapped within another file or mail message  
 112666 that is not a text file.

112667 The `-o` option is not historical practice, but was added at the request of WG15 so that the user  
 112668 could override the target pathname without having to edit the input data itself.

112669 In early drafts, the `[-o outfile]` option-argument allowed the use of `-` to mean standard output.  
 112670 The symbol `-` has only been used previously in POSIX.1-2008 as a standard input indicator. The  
 112671 standard developers did not wish to overload the meaning of `-` in this manner. The `/dev/stdout`  
 112672 concept exists on most modern systems. The `/dev/stdout` syntax does not refer to a new special  
 112673 file. It is just a magic cookie to specify standard output.

112674 **FUTURE DIRECTIONS**

112675 None.

112676 **SEE ALSO**112677 *chmod, umask, uuencode*112678 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)112679 **CHANGE HISTORY**

112680 First released in Issue 4.

112681 **Issue 6**

112682 This utility is marked as part of the User Portability Utilities option.

112683 The `-o outfile` option is added, as specified in the IEEE P1003.2b draft standard.

112684 The normative text is reworded to avoid use of the term “must” for application requirements.

112685 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/35 is applied, clarifying in the  
112686 DESCRIPTION that the initial mode used if either of the *op* characters is '+' or '-' is  
112687 unspecified.

112688 **Issue 7**

112689 The *uudecode* utility is moved from the User Portability Utilities option to the Base. User  
112690 Portability Utilities is now an option for interactive utilities.

112691 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

112692 **NAME**

112693 uuencode — encode a binary file

112694 **SYNOPSIS**112695 uuencode [-m] [*file*] *decode\_pathname*112696 **DESCRIPTION**

112697 The *uuencode* utility shall write an encoded version of the named input file, or standard input if  
 112698 no *file* is specified, to standard output. The output shall be encoded using one of the algorithms  
 112699 described in the STDOUT section and shall include the file access permission bits (in *chmod* octal  
 112700 or symbolic notation) of the input file and the *decode\_pathname*, for re-creation of the file on  
 112701 another system that conforms to this volume of POSIX.1-2008.

112702 **OPTIONS**112703 The *uuencode* utility shall conform to XBD [Section 12.2](#) (on page 216).

112704 The following option shall be supported by the implementation:

112705 **-m** Encode the output using the MIME Base64 algorithm described in STDOUT. If **-m**  
 112706 is not specified, the historical algorithm described in STDOUT shall be used.

112707 **OPERANDS**

112708 The following operands shall be supported:

112709 *decode\_pathname*

112710 The pathname of the file into which the *uudecode* utility shall place the decoded  
 112711 file. Specifying a *decode\_pathname* operand of **/dev/stdout** shall indicate that  
 112712 *uudecode* is to use standard output. If there are characters in *decode\_pathname* that  
 112713 are not in the portable filename character set the results are unspecified.

112714 *file* A pathname of the file to be encoded.

112715 **STDIN**

112716 See the INPUT FILES section.

112717 **INPUT FILES**

112718 Input files can be files of any type.

112719 **ENVIRONMENT VARIABLES**112720 The following environment variables shall affect the execution of *uuencode*:

112721 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 112722 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 112723 variables used to determine the values of locale categories.)

112724 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 112725 internationalization variables.

112726 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 112727 characters (for example, single-byte as opposed to multi-byte characters in  
 112728 arguments and input files).

112729 **LC\_MESSAGES**

112730 Determine the locale that should be used to affect the format and contents of  
 112731 diagnostic messages written to standard error.

112732 **XS** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

112733 **ASYNCHRONOUS EVENTS**

112734 Default.

112735 **STDOUT**112736 **uuencode Base64 Algorithm**112737 The standard output shall be a text file (encoded in the character set of the current locale) that  
112738 begins with the line:

112739 "begin-base64Δ%sΔs\n", &lt;mode&gt;, &lt;decode\_pathname&gt;

112740 and ends with the line:

112741 "====\n"

112742 In both cases, the lines shall have no preceding or trailing &lt;blank&gt; characters.

112743 The encoding process represents 24-bit groups of input bits as output strings of four encoded  
 112744 characters. Proceeding from left to right, a 24-bit input group shall be formed by concatenating  
 112745 three 8-bit input groups. Each 24-bit input group then shall be treated as four concatenated 6-bit  
 112746 groups, each of which shall be translated into a single digit in the Base64 alphabet. When  
 112747 encoding a bit stream via the Base64 encoding, the bit stream shall be presumed to be ordered  
 112748 with the most-significant bit first. That is, the first bit in the stream shall be the high-order bit in  
 112749 the first byte, and the eighth bit shall be the low-order bit in the first byte, and so on. Each 6-bit  
 112750 group is used as an index into an array of 64 printable characters, as shown in [Table 4-22](#).

112751 **Table 4-22** uuencode Base64 Values

Value	Encoding	Value	Encoding	Value	Encoding	Value	Encoding
0	A	17	R	34	i	51	z
1	B	18	S	35	j	52	0
2	C	19	T	36	k	53	1
3	D	20	U	37	l	54	2
4	E	21	V	38	m	55	3
5	F	22	W	39	n	56	4
6	G	23	X	40	o	57	5
7	H	24	Y	41	p	58	6
8	I	25	Z	42	q	59	7
9	J	26	a	43	r	60	8
10	K	27	b	44	s	61	9
11	L	28	c	45	t	62	+
12	M	29	d	46	u	63	/
13	N	30	e	47	v	(pad)	=
14	O	31	f	48	w		
15	P	32	g	49	x		
16	Q	33	h	50	y		

112770 The character referenced by the index shall be placed in the output string.

112771 The output stream (encoded bytes) shall be represented in lines of no more than 76 characters  
 112772 each. All line breaks or other characters not found in the table shall be ignored by decoding  
 112773 software (see [uudecode](#)).

112774 Special processing shall be performed if fewer than 24 bits are available at the end of a message  
 112775 or encapsulated part of a message. A full encoding quantum shall always be completed at the

end of a message. When fewer than 24 input bits are available in an input group, zero bits shall be added (on the right) to form an integral number of 6-bit groups. Output character positions that are not required to represent actual input data shall be set to the character '='. Since all Base64 input is an integral number of octets, only the following cases can arise:

1. The final quantum of encoding input is an integral multiple of 24 bits; here, the final unit of encoded output shall be an integral multiple of 4 characters with no '=' padding.
2. The final quantum of encoding input is exactly 16 bits; here, the final unit of encoded output shall be three characters followed by one '=' padding character.
3. The final quantum of encoding input is exactly 8 bits; here, the final unit of encoded output shall be two characters followed by two '=' padding characters.

A terminating "====" evaluates to nothing and denotes the end of the encoded data.

### uuencode Historical Algorithm

The standard output shall be a text file (encoded in the character set of the current locale) that begins with the line:

```
"beginΔ%sΔ%s\n" <mode>, <decode_pathname>
```

and ends with the line:

```
"end\n"
```

In both cases, the lines shall have no preceding or trailing <blank> characters.

The algorithm that shall be used for lines in between **begin** and **end** takes three octets as input and writes four characters of output by splitting the input at six-bit intervals into four octets, containing data in the lower six bits only. These octets shall be converted to characters by adding a value of 0x20 to each octet, so that each octet is in the range [0x20,0x5f], and then it shall be assumed to represent a printable character in the ISO/IEC 646:1991 standard encoded character set. It then shall be translated into the corresponding character codes for the codeset in use in the current locale. (For example, the octet 0x41, representing 'A', would be translated to 'A' in the current codeset, such as 0xc1 if it were EBCDIC.)

Where the bits of two octets are combined, the least significant bits of the first octet shall be shifted left and combined with the most significant bits of the second octet shifted right. Thus the three octets *A*, *B*, *C* shall be converted into the four octets:

```
0x20 + (( A >> 2 ) & 0x3F)
0x20 + ((( A << 4 ) | (( B >> 4 ) & 0xF ) ) & 0x3F)
0x20 + ((( B << 2 ) | (( C >> 6 ) & 0x3 ) ) & 0x3F)
0x20 + (( C ) & 0x3F)
```

These octets then shall be translated into the local character set.

Each encoded line contains a length character, equal to the number of characters to be decoded plus 0x20 translated to the local character set as described above, followed by the encoded characters. The maximum number of octets to be encoded on each line shall be 45.

### STDERR

The standard error shall be used only for diagnostic messages.

**112815 OUTPUT FILES**

112816 None.

**112817 EXTENDED DESCRIPTION**

112818 None.

**112819 EXIT STATUS**

112820 The following exit values shall be returned:

112821 0 Successful completion.

112822 >0 An error occurred.

**112823 CONSEQUENCES OF ERRORS**

112824 Default.

**112825 APPLICATION USAGE**

112826 The file is expanded by 35 percent (each three octets become four, plus control information)  
112827 causing it to take longer to transmit.

112828 Since this utility is intended to create files to be used for data interchange between systems with  
112829 possibly different codesets, and to represent binary data as a text file, the ISO/IEC 646:1991  
112830 standard was chosen for a midpoint in the algorithm as a known reference point. The output  
112831 from *uuencode* is a text file on the local system. If the output were in the ISO/IEC 646:1991  
112832 standard codeset, it might not be a text file (at least because the <newline> characters might not  
112833 match), and the goal of creating a text file would be defeated. If this text file was then carried to  
112834 another machine with the same codeset, it would be perfectly compatible with that system's  
112835 *uudecode*. If it was transmitted over a mail system or sent to a machine with a different codeset,  
112836 it is assumed that, as for every other text file, some translation mechanism would convert it (by  
112837 the time it reached a user on the other system) into an appropriate codeset. This translation only  
112838 makes sense from the local codeset, not if the file has been put into a ISO/IEC 646:1991 standard  
112839 representation first. Similarly, files processed by *uuencode* can be placed in *pax* archives,  
112840 intermixed with other text files in the same codeset.

**112841 EXAMPLES**

112842 None.

**112843 RATIONALE**

112844 A new algorithm was added at the request of the international community to parallel work in  
112845 RFC 2045 (MIME). As with the historical *uuencode* format, the Base64 Content-Transfer-Encoding  
112846 is designed to represent arbitrary sequences of octets in a form that is not humanly readable. A  
112847 65-character subset of the ISO/IEC 646:1991 standard is used, enabling 6 bits to be represented  
112848 per printable character. (The extra 65th character, '=', is used to signify a special processing  
112849 function.)

112850 This subset has the important property that it is represented identically in all versions of the  
112851 ISO/IEC 646:1991 standard, including US ASCII, and all characters in the subset are also  
112852 represented identically in all versions of EBCDIC. The historical *uuencode* algorithm does not  
112853 share this property, which is the reason that a second algorithm was added to the ISO POSIX-2  
112854 standard.

112855 The string "====" was used for the termination instead of the end used in the original format  
112856 because the latter is a string that could be valid encoded input.

112857 In an early draft, the *-m* option was named *-b* (for Base64), but it was renamed to reflect its  
112858 relationship to the RFC 2045. A *-u* was also present to invoke the default algorithm, but since  
112859 this was not historical practice, it was omitted as being unnecessary.

112860 See the RATIONALE section in *uuencode* for the derivation of the **/dev/stdout** symbol.

112861 **FUTURE DIRECTIONS**

112862 None.

112863 **SEE ALSO**

112864 *chmod*, *mailx*, *uuencode*

112865 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

112866 **CHANGE HISTORY**

112867 First released in Issue 4.

112868 **Issue 6**

112869 This utility is marked as part of the User Portability Utilities option.

112870 The Base64 algorithm and the ability to output to **/dev/stdout** are added as specified in the  
112871 IEEE P1003.2b draft standard.

112872 **Issue 7**

112873 The *uuencode* utility is moved from the User Portability Utilities option to the Base. User  
112874 Portability Utilities is now an option for interactive utilities.

112875 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

112876 **NAME**

112877 uustat — uucp status enquiry and job control

112878 **SYNOPSIS**112879 UU uustat [-q|-k *jobid*|-r *jobid*]112880 uustat [-s *system*] [-u *user*]112881 **DESCRIPTION**

112882 The *uustat* utility shall display the status of, or cancel, previously specified *uucp* requests, or  
 112883 provide general status on *uucp* connections to other systems.

112884 When no options are given, *uustat* shall write to standard output the status of all *uucp* requests  
 112885 issued by the current user.

112886 Typical implementations of this utility require a communications line configured to use XBD  
 112887 [Chapter 11](#) (on page 199), but other communications means may be used. On systems where  
 112888 there are no available communications means (either temporarily or permanently), this utility  
 112889 shall write an error message describing the problem and exit with a non-zero exit status.

112890 **OPTIONS**112891 The *uustat* utility shall conform to XBD [Section 12.2](#) (on page 216).

112892 The following options shall be supported:

112893 **-q** Write the jobs queued for each machine.

112894 **-k *jobid*** Kill the *uucp* request whose job identification is *jobid*. The application shall ensure  
 112895 that the killed *uucp* request belongs to the person invoking *uustat* unless that user  
 112896 has appropriate privileges.

112897 **-r *jobid*** Rejuvenate *jobid*. The files associated with *jobid* are touched so that their  
 112898 modification time is set to the current time. This prevents the cleanup program  
 112899 from deleting the job until the jobs modification time reaches the limit imposed by  
 112900 the program.

112901 **-s *system*** Write the status of all *uucp* requests for remote system *system*.112902 **-u *user*** Write the status of all *uucp* requests issued by *user*.112903 **OPERANDS**

112904 None.

112905 **STDIN**

112906 Not used.

112907 **INPUT FILES**

112908 None.

112909 **ENVIRONMENT VARIABLES**112910 The following environment variables shall affect the execution of *uustat*:

112911 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 112912 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 112913 variables used to determine the values of locale categories.)

112914 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 112915 internationalization variables.

- 112916 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
112917 characters (for example, single-byte as opposed to multi-byte characters in  
112918 arguments).
- 112919 **LC\_MESSAGES**  
112920 Determine the locale that should be used to affect the format and contents of  
112921 diagnostic messages written to standard error, and informative messages written  
112922 to standard output.
- 112923 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 112924 **ASYNCHRONOUS EVENTS**  
112925 Default.
- 112926 **STDOUT**  
112927 The standard output shall consist of information about each job selected, in an unspecified  
112928 format. The information shall include at least the job ID, the user ID or name, and the remote  
112929 system name.
- 112930 **STDERR**  
112931 The standard error shall be used only for diagnostic messages.
- 112932 **OUTPUT FILES**  
112933 None.
- 112934 **EXTENDED DESCRIPTION**  
112935 None.
- 112936 **EXIT STATUS**  
112937 The following exit values shall be returned:  
112938 0 Successful completion.  
112939 >0 An error occurred.
- 112940 **CONSEQUENCES OF ERRORS**  
112941 Default.
- 112942 **APPLICATION USAGE**  
112943 This utility is part of the UUCP Utilities option and need not be supported by all  
112944 implementations.
- 112945 **EXAMPLES**  
112946 None.
- 112947 **RATIONALE**  
112948 None.
- 112949 **FUTURE DIRECTIONS**  
112950 None.
- 112951 **SEE ALSO**  
112952 *uucp*  
112953 XBD [Chapter 8](#) (on page 173), [Chapter 11](#) (on page 199), [Section 12.2](#) (on page 216)
- 112954 **CHANGE HISTORY**  
112955 First released in Issue 2.

112956 **Issue 6**

112957 The normative text is reworded to avoid use of the term “must” for application requirements.

112958 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

112959 The UN margin code and associated shading are removed from the **-q** option in response to The  
112960 Open Group Base Resolution bwg2001-003.

112961 **Issue 7**

112962 SD5-XCU-ERN-46 is applied, moving this utility to the UUCP Utilities Option Group.

112963 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

112964 **NAME**

112965 uux — remote command execution

112966 **SYNOPSIS**112967 UU `uux [-jnp] command-string`112968 **DESCRIPTION**

112969 The *uux* utility shall gather zero or more files from various systems, execute a shell pipeline (see  
 112970 [Section 2.9](#), on page 2355) on a specified system, and then send the standard output of the  
 112971 command to a file on a specified system. Only the first command of a pipeline can have a *system-*  
 112972 *name!* prefix. All other commands in the pipeline shall be executed on the system of the first  
 112973 command.

112974 The following restrictions are applicable to the shell pipeline processed by *uux*:

- 112975 • In gathering files from different systems, pathname expansion shall not be performed by  
 112976 *uux*. Thus, a request such as:  
 112977 `uux "c99 remsys!~/*.c"`  
 112978 would attempt to copy the file named literally *\*.c* to the local system.
- 112979 • The redirection operators "*>>*", "*<<*", "*>|*", and "*>&*" shall not be accepted. Any use of  
 112980 these redirection operators shall cause this utility to write an error message describing the  
 112981 problem and exit with a non-zero exit status.
- 112982 • The reserved word *!* cannot be used at the head of the pipeline to modify the exit status.  
 112983 (See the *command-string* operand description below.)
- 112984 • Alias substitution shall not be performed.

112985 A filename can be specified as for *uucp*; it can be an absolute pathname, a pathname preceded by  
 112986 *~name* (which is replaced by the corresponding login directory), a pathname specified as *~/dest*  
 112987 (*dest* is prefixed by the public directory called *PUBDIR*; the actual location of *PUBDIR* is  
 112988 implementation-defined), or a simple filename (which is prefixed by *uux* with the current  
 112989 directory). See *uucp* for the details.

112990 The execution of commands on remote systems shall take place in an execution directory known  
 112991 to the *uucp* system. All files required for the execution shall be put into this directory unless they  
 112992 already reside on that machine. Therefore, the application shall ensure that non-local filenames  
 112993 (without path or machine reference) are unique within the *uux* request.

112994 The *uux* utility shall attempt to get all files to the execution system. For files that are output files,  
 112995 the application shall ensure that the filename is escaped using parentheses.

112996 The remote system shall notify the user by mail if the requested command on the remote system  
 112997 was disallowed or the files were not accessible. This notification can be turned off by the *-n*  
 112998 option.

112999 Typical implementations of this utility require a communications line configured to use XBD  
 113000 [Chapter 11](#) (on page 199), but other communications means may be used. On systems where  
 113001 there are no available communications means (either temporarily or permanently), this utility  
 113002 shall write an error message describing the problem and exit with a non-zero exit status.

113003 The *uux* utility cannot guarantee support for all character encodings in all circumstances. For  
 113004 example, transmission data may be restricted to 7 bits by the underlying network, 8-bit data and  
 113005 filenames need not be portable to non-internationalized systems, and so on. Under these  
 113006 circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991  
 113007 standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used

113008 and that only characters defined in the portable filename character set be used for naming files.

#### 113009 OPTIONS

113010 The *uux* utility shall conform to XBD [Section 12.2](#) (on page 216).

113011 The following options shall be supported:

113012 **-j** Write the job identification string to standard output. This job identification can be  
113013 used by *uustat* to obtain the status or terminate a job.

113014 **-n** Do not notify the user if the command fails.

113015 **-p** Make the standard input to *uux* the standard input to the *command-string*.

#### 113016 OPERANDS

113017 The following operand shall be supported:

113018 *command-string*

113019 A string made up of one or more arguments that are similar to normal command  
113020 arguments, except that the command and any filenames can be prefixed by *system-*  
113021 *name!*. A null *system-name* shall be interpreted as the local system.

#### 113022 STDIN

113023 The standard input shall not be used unless the **'-'** or **-p** option is specified; in those cases, the  
113024 standard input shall be made the standard input of the *command-string*.

#### 113025 INPUT FILES

113026 Input files shall be selected according to the contents of *command-string*.

#### 113027 ENVIRONMENT VARIABLES

113028 The following environment variables shall affect the execution of *uux*:

113029 **LANG** Provide a default value for the internationalization variables that are unset or null.  
113030 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
113031 variables used to determine the values of locale categories.)

113032 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
113033 internationalization variables.

113034 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
113035 characters (for example, single-byte as opposed to multi-byte characters in  
113036 arguments).

113037 **LC\_MESSAGES**

113038 Determine the locale that should be used to affect the format and contents of  
113039 diagnostic messages written to standard error.

113040 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 113041 ASYNCHRONOUS EVENTS

113042 Default.

#### 113043 STDOUT

113044 The standard output shall not be used unless the **-j** option is specified; in that case, the job  
113045 identification string shall be written to standard output in the following format:

113046 "%s\n", <*jobid*>

113047 **STDERR**

113048 The standard error shall be used only for diagnostic messages.

113049 **OUTPUT FILES**

113050 Output files shall be created or written, or both, according to the contents of *command-string*.

113051 If **-n** is not used, mail files shall be modified following any command or file-access failures on  
113052 the remote system.

113053 **EXTENDED DESCRIPTION**

113054 None.

113055 **EXIT STATUS**

113056 The following exit values shall be returned:

113057 0 Successful completion.

113058 >0 An error occurred.

113059 **CONSEQUENCES OF ERRORS**

113060 Default.

113061 **APPLICATION USAGE**

113062 This utility is part of the UUCP Utilities option and need not be supported by all  
113063 implementations.

113064 Note that, for security reasons, many installations limit the list of commands executable on  
113065 behalf of an incoming request from *uux*. Many sites permit little more than the receipt of mail  
113066 via *uux*.

113067 Any characters special to the command interpreter should be quoted either by quoting the entire  
113068 *command-string* or quoting the special characters as individual arguments.

113069 As noted in *uucp*, shell pattern matching notation characters appearing in pathnames are  
113070 expanded on the appropriate local system. This is done under the control of local settings of  
113071 *LC\_COLLATE* and *LC\_CTYPE*. Thus, care should be taken when using bracketed filename  
113072 patterns, as collation and typing rules may vary from one system to another. Also be aware that  
113073 certain types of expression (that is, equivalence classes, character classes, and collating symbols)  
113074 need not be supported on non-internationalized systems.

113075 **EXAMPLES**

113076 1. The following command gets **file1** from system **a** and **file2** from system **b**, executes *diff* on  
113077 the local system, and puts the results in **file.diff** in the local *PUBDIR* directory. (*PUBDIR*  
113078 is the *uucp* public directory on the local system.)

113079 `uux "!diff a!/usr/file1 b!/a4/file2 >!~/file.diff"`

113080 2. The following command fails because *uux* places all files copied to a system in the same  
113081 working directory. Although the files **xyz** are from two different systems, their filenames  
113082 are the same and conflict.

113083 `uux "!diff a!/usr1/xyz b!/usr2/xyz >!~/xyz.diff"`

113084 3. The following command succeeds (assuming *diff* is permitted on system **a**) because the  
113085 file local to system **a** is not copied to the working directory, and hence does not conflict  
113086 with the file from system **c**.

113087 `uux "a!diff a!/usr/xyz c!/usr/xyz >!~/xyz.diff"`

113088 **RATIONALE**

113089 None.

113090 **FUTURE DIRECTIONS**

113091 None.

113092 **SEE ALSO**113093 [Chapter 2](#) (on page 2335), [uucp](#), [uuencode](#), [uustat](#)113094 XBD [Chapter 8](#) (on page 173), [Chapter 11](#) (on page 199), [Section 12.2](#) (on page 216)113095 **CHANGE HISTORY**

113096 First released in Issue 2.

113097 **Issue 6**

113098 The obsolescent SYNOPSIS is removed.

113099 The normative text is reworded to avoid use of the term “must” for application requirements.

113100 The UN margin code and associated shading are removed from the `-j` option in response to The  
113101 Open Group Base Resolution bwg2001-003.113102 **Issue 7**

113103 SD5-XCU-ERN-46 is applied, moving this utility to the UUCP Utilities Option Group.

113104 **NAME**113105 val — validate SCCS files (**DEVELOPMENT**)113106 **SYNOPSIS**

```
113107 XSI    val -
113108        val [-s] [-m name] [-r SID] [-y type] file...
```

113109 **DESCRIPTION**

113110 The *val* utility shall determine whether the specified *file* is an SCCS file meeting the  
 113111 characteristics specified by the options.

113112 **OPTIONS**

113113 The *val* utility shall conform to XBD [Section 12.2](#) (on page 216), except that the usage of the ‘-’  
 113114 operand is not strictly as intended by the guidelines (that is, reading options and operands from  
 113115 standard input).

113116 The following options shall be supported:

- 113117 **-m name** Specify a *name*, which is compared with the SCCS %M% keyword in *file*; see [get](#).
- 113118 **-r SID** Specify a *SID* (SCCS Identification String), an SCCS delta number. A check shall be  
 113119 made to determine whether the *SID* is ambiguous (for example, **-r 1** is ambiguous  
 113120 because it physically does not exist but implies 1.1, 1.2, and so on, which may exist)  
 113121 or invalid (for example, **-r 1.0** or **-r 1.1.0** are invalid because neither case can exist  
 113122 as a valid delta number). If the *SID* is valid and not ambiguous, a check shall be  
 113123 made to determine whether it actually exists.
- 113124 **-s** Silence the diagnostic message normally written to standard output for any error  
 113125 that is detected while processing each named file on a given command line.
- 113126 **-y type** Specify a *type*, which shall be compared with the SCCS %Y% keyword in *file*; see  
 113127 [get](#).

113128 **OPERANDS**

113129 The following operands shall be supported:

- 113130 *file* A pathname of an existing SCCS file. If exactly one *file* operand appears, and it is  
 113131 ‘-’, the standard input shall be read: each line shall be independently processed  
 113132 as if it were a command line argument list. (However, the line is not subjected to  
 113133 any of the shell word expansions, such as parameter expansion or quote removal.)

113134 **STDIN**

113135 The standard input shall be a text file used only when the *file* operand is specified as ‘-’.

113136 **INPUT FILES**

113137 Any SCCS files processed shall be files of an unspecified format.

113138 **ENVIRONMENT VARIABLES**

113139 The following environment variables shall affect the execution of *val*:

- 113140 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 113141 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 113142 variables used to determine the values of locale categories.)
- 113143 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 113144 internationalization variables.

113145 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 113146 characters (for example, single-byte as opposed to multi-byte characters in  
 113147 arguments and input files).

113148 **LC\_MESSAGES**  
 113149 Determine the locale that should be used to affect the format and contents of  
 113150 diagnostic messages written to standard error, and informative messages written  
 113151 to standard output.

113152 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 113153 ASYNCHRONOUS EVENTS

113154 Default.

## 113155 STDOUT

113156 The standard output shall consist of informative messages about either:

- 113157 1. Each file processed
- 113158 2. Each command line read from standard input

113159 If the standard input is not used, for each *file* operand yielding a discrepancy, the output line  
 113160 shall have the following format:

113161 "%s: %s\n", <pathname>, <unspecified string>

113162 If the standard input is used, for each input line yielding a discrepancy, the output shall have the  
 113163 following format:

113164 "%s\n\n %s: %s\n", <input>, <pathname>, <unspecified string>

113165 where <input> is the input line minus its terminating <newline>.

## 113166 STDERR

113167 Not used.

## 113168 OUTPUT FILES

113169 None.

## 113170 EXTENDED DESCRIPTION

113171 None.

## 113172 EXIT STATUS

113173 The 8-bit code returned by *val* shall be a disjunction of the possible errors; that is, it can be  
 113174 interpreted as a bit string where set bits are interpreted as follows:

113175	0x80	=	Missing file argument.
113176	0x40	=	Unknown or duplicate option.
113177	0x20	=	Corrupted SCCS file.
113178	0x10	=	Cannot open file or file not SCCS.
113179	0x08	=	<i>SID</i> is invalid or ambiguous.
113180	0x04	=	<i>SID</i> does not exist.
113181	0x02	=	%Y%, -y mismatch.
113182	0x01	=	%M%, -m mismatch.

113183 Note that *val* can process two or more files on a given command line and can process multiple  
 113184 command lines (when reading the standard input). In these cases an aggregate code shall be  
 113185 returned: a logical OR of the codes generated for each command line and file processed.

**113186 CONSEQUENCES OF ERRORS**

113187 Default.

**113188 APPLICATION USAGE**

113189 Since the *val* exit status sets the 0x80 bit, shell applications checking "\$?" cannot tell if it  
113190 terminated due to a missing file argument or receipt of a signal.

**113191 EXAMPLES**

113192 In a directory with three SCCS files—*s.x* (of *t* type “text”), *s.y*, and *s.z* (a corrupted file)—the  
113193 following command could produce the output shown:

```
113194 val - <<EOF
113195 -y source s.x
113196 -m y s.y
113197 s.z
113198 EOF
113199 -y source s.x

113200 s.x: %Y%, -y mismatch
113201 s.z
113202 s.z: corrupted SCCS file
```

**113203 RATIONALE**

113204 None.

**113205 FUTURE DIRECTIONS**

113206 None.

**113207 SEE ALSO**

113208 *admin, delta, get, prs*

113209 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

**113210 CHANGE HISTORY**

113211 First released in Issue 2.

**113212 Issue 6**

113213 The Open Group Corrigendum U025/4 is applied, correcting a typographical error in the EXIT  
113214 STATUS.

**113215 Issue 7**

113216 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

113217 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0147 [416] and XCU/TC1-2008/0148  
113218 [416] are applied.

113219 **NAME**

113220 vi — screen-oriented (visual) display editor

113221 **SYNOPSIS**113222 UP `vi [-rR] [-c command] [-t tagstring] [-w size] [file...]`113223 **DESCRIPTION**113224 This utility shall be provided on systems that both support the User Portability Utilities option  
113225 and define the POSIX2\_CHAR\_TERM symbol. On other systems it is optional.113226 The *vi* (visual) utility is a screen-oriented text editor. Only the open and visual modes of the  
113227 editor are described in POSIX.1-2008; see the line editor *ex* for additional editing capabilities  
113228 used in *vi*. The user can switch back and forth between *vi* and *ex* and execute *ex* commands from  
113229 within *vi*.113230 This reference page uses the term *edit buffer* to describe the current working text. No specific  
113231 implementation is implied by this term. All editing changes are performed on the edit buffer,  
113232 and no changes to it shall affect any file until an editor command writes the file.113233 When using *vi*, the terminal screen acts as a window into the editing buffer. Changes made to  
113234 the editing buffer shall be reflected in the screen display; the position of the cursor on the screen  
113235 shall indicate the position within the editing buffer.113236 Certain terminals do not have all the capabilities necessary to support the complete *vi* definition.  
113237 When these commands cannot be supported on such terminals, this condition shall not produce  
113238 an error message such as “not an editor command” or report a syntax error. The implementation  
113239 may either accept the commands and produce results on the screen that are the result of an  
113240 unsuccessful attempt to meet the requirements of this volume of POSIX.1-2008 or report an error  
113241 describing the terminal-related deficiency.113242 **OPTIONS**113243 The *vi* utility shall conform to XBD [Section 12.2](#) (on page 216), except that ‘+’ may be  
113244 recognized as an option delimiter as well as ‘-’.

113245 The following options shall be supported:

113246 **-c *command*** See the *ex* command description of the **-c** option.113247 **-r** See the *ex* command description of the **-r** option.113248 **-R** See the *ex* command description of the **-R** option.113249 **-t *tagstring*** See the *ex* command description of the **-t** option.113250 **-w *size*** See the *ex* command description of the **-w** option.113251 **OPERANDS**113252 See the OPERANDS section of the *ex* command for a description of the operands supported by  
113253 the *vi* command.113254 **STDIN**113255 If standard input is not a terminal device, the results are undefined. The standard input consists  
113256 of a series of commands and input text, as described in the EXTENDED DESCRIPTION section.113257 If a read from the standard input returns an error, or if the editor detects an end-of-file condition  
113258 from the standard input, it shall be equivalent to a SIGHUP asynchronous event.

**113259 INPUT FILES**

113260 See the INPUT FILES section of the *ex* command for a description of the input files supported by  
 113261 the *vi* command.

**113262 ENVIRONMENT VARIABLES**

113263 See the ENVIRONMENT VARIABLES section of the *ex* command for the environment variables  
 113264 that affect the execution of the *vi* command.

**113265 ASYNCHRONOUS EVENTS**

113266 See the ASYNCHRONOUS EVENTS section of the *ex* for the asynchronous events that affect the  
 113267 execution of the *vi* command.

**113268 STDOUT**

113269 If standard output is not a terminal device, undefined results occur.

113270 Standard output may be used for writing prompts to the user, for informational messages, and  
 113271 for writing lines from the file.

**113272 STDERR**

113273 If standard output is not a terminal device, undefined results occur.

113274 The standard error shall be used only for diagnostic messages.

**113275 OUTPUT FILES**

113276 See the OUTPUT FILES section of the *ex* command for a description of the output files  
 113277 supported by the *vi* command.

**113278 EXTENDED DESCRIPTION**

113279 If the terminal does not have the capabilities necessary to support an unspecified portion of the  
 113280 *vi* definition, implementations shall start initially in *ex* mode or open mode. Otherwise, after  
 113281 initialization, *vi* shall be in command mode; text input mode can be entered by one of several  
 113282 commands used to insert or change text. In text input mode, <ESC> can be used to return to  
 113283 command mode; other uses of <ESC> are described later in this section; see [Terminate](#)  
 113284 [Command or Input Mode](#) (on page 3374).

**113285 Initialization in *ex* and *vi***

113286 See [Initialization in \*ex\* and \*vi\*](#) (on page 2690) for a description of *ex* and *vi* initialization for the *vi*  
 113287 utility.

**113288 Command Descriptions in *vi***

113289 The following symbols are used in this reference page to represent arguments to commands.

113290 *buffer* See the description of *buffer* in the EXTENDED DESCRIPTION section of the *ex* utility;  
 113291 see [Command Descriptions in \*ex\*](#) (on page 2699).

113292 In open and visual mode, when a command synopsis shows both [*buffer*] and [*count*]  
 113293 preceding the command name, they can be specified in either order.

113294 *count* A positive integer used as an optional argument to most commands, either to give a  
 113295 repeat count or as a size. This argument is optional and shall default to 1 unless  
 113296 otherwise specified.

113297 The Synopsis lines for the *vi* commands <control>-G, <control>-L, <control>-R,  
 113298 <control>-], %, &, ^, D, m, M, Q, u, U, and ZZ do not have *count* as an optional  
 113299 argument. Regardless, it shall not be an error to specify a *count* to these commands, and  
 113300 any specified *count* shall be ignored.

*motion* An optional trailing argument used by the **!**, **<**, **>**, **c**, **d**, and **y** commands, which is used to indicate the region of text that shall be affected by the command. The motion can be either one of the command characters repeated or one of several other *vi* commands (listed in the following table). Each of the applicable commands specifies the region of text matched by repeating the command; each command that can be used as a motion command specifies the region of text it affects.

Commands that take *motion* arguments operate on either lines or characters, depending on the circumstances. When operating on lines, all lines that fall partially or wholly within the text region specified for the command shall be affected. When operating on characters, only the exact characters in the specified text region shall be affected. Each motion command specifies this individually.

When commands that may be motion commands are not used as motion commands, they shall set the current position to the current line and column as specified.

The following commands shall be valid cursor motion commands:

<apostrophe>	(	-	j	H
<carriage-return>	)	\$	k	L
<comma>	[	%	l	M
<control>-H	]	_	n	N
<control>-N	{	;	t	T
<control>-P	}	?	w	W
<grave-accent>	^	b	B	
<newline>	+	e	E	
<space>		f	F	
<zero>	/	h	G	

Any *count* that is specified to a command that has an associated motion command shall be applied to the motion command. If a *count* is applied to both the command and its associated motion command, the effect shall be multiplicative.

The following symbols are used in this section to specify locations in the edit buffer:

*current character*

The character that is currently indicated by the cursor.

*end of a line*

The point located between the last non-<newline> (if any) and the terminating <newline> of a line. For an empty line, this location coincides with the beginning of the line.

*end of the edit buffer*

The location corresponding to the end of the last line in the edit buffer.

The following symbols are used in this section to specify command actions:

*bigword* In the POSIX locale, *vi* shall recognize four kinds of *bigwords*:

1. A maximal sequence of non-<blank> characters preceded and followed by <blank> characters or the beginning or end of a line or the edit buffer
2. One or more sequential blank lines
3. The first character in the edit buffer

- 113343 4. The last non-`<newline>` in the edit buffer
- 113344 *word* In the POSIX locale, *vi* shall recognize five kinds of words:
- 113345 1. A maximal sequence of letters, digits, and underscores, delimited at both ends
- 113346 by:
- 113347 — Characters other than letters, digits, or underscores
- 113348 — The beginning or end of a line
- 113349 — The beginning or end of the edit buffer
- 113350 2. A maximal sequence of characters other than letters, digits, underscores, or
- 113351 `<blank>` characters, delimited at both ends by:
- 113352 — A letter, digit, underscore
- 113353 — `<blank>` characters
- 113354 — The beginning or end of a line
- 113355 — The beginning or end of the edit buffer
- 113356 3. One or more sequential blank lines
- 113357 4. The first character in the edit buffer
- 113358 5. The last non-`<newline>` in the edit buffer
- 113359 *section boundary*
- 113360 A *section boundary* is one of the following:
- 113361 1. A line whose first character is a `<form-feed>`
- 113362 2. A line whose first character is an open curly brace ( `' { '` )
- 113363 3. A line whose first character is a `<period>` and whose second and third characters
- 113364 match a two-character pair in the **sections** edit option (see *ex*)
- 113365 4. A line whose first character is a `<period>` and whose only other character
- 113366 matches the first character of a two-character pair in the **sections** edit option,
- 113367 where the second character of the two-character pair is a `<space>`
- 113368 5. The first line of the edit buffer
- 113369 6. The last line of the edit buffer if the last line of the edit buffer is empty or if it is a
- 113370 `]]` or `}` command; otherwise, the last non-`<newline>` of the last line of the edit
- 113371 buffer
- 113372 *paragraph boundary*
- 113373 A *paragraph boundary* is one of the following:
- 113374 1. A section boundary
- 113375 2. A line whose first character is a `<period>` and whose second and third characters
- 113376 match a two-character pair in the **paragraphs** edit option (see *ex*)
- 113377 3. A line whose first character is a `<period>` and whose only other character
- 113378 matches the first character of a two-character pair in the *paragraphs* edit option,
- 113379 where the second character of the two-character pair is a `<space>`

#### 4. One or more sequential blank lines

*remembered search direction*

See the description of *remembered search direction* in *ex*.

*sentence boundary*

A *sentence boundary* is one of the following:

1. A paragraph boundary
2. The first non-`<blank>` that occurs after a paragraph boundary
3. The first non-`<blank>` that occurs after a `<period>` (`' . '`), `<exclamation-mark>` (`' ! '`), or `<question-mark>` (`' ? '`), followed by two `<space>` characters or the end of a line; any number of closing parenthesis (`' ) '`), closing brackets (`' ] '`), double-quote (`' " '`), or single-quote (`<apostrophe>`) characters can appear between the punctuation mark and the two `<space>` characters or end-of-line

In the remainder of the description of the *vi* utility, the term “buffer line” refers to a line in the edit buffer and the term “display line” refers to the line or lines on the display screen used to display one buffer line. The term “current line” refers to a specific “buffer line”.

If there are display lines on the screen for which there are no corresponding buffer lines because they correspond to lines that would be after the end of the file, they shall be displayed as a single `<tilde>` (`' ~ '`) character, plus the terminating `<newline>`.

The last line of the screen shall be used to report errors or display informational messages. It shall also be used to display the input for “line-oriented commands” (`/`, `?`, `:`, and `!`). When a line-oriented command is executed, the editor shall enter text input mode on the last line on the screen, using the respective command characters as prompt characters. (In the case of the `!` command, the associated motion shall be entered by the user before the editor enters text input mode.) The line entered by the user shall be terminated by a `<newline>`, a non-`<control>`-V-escaped `<carriage-return>`, or unescaped `<ESC>`. It is unspecified if more characters than require a display width minus one column number of screen columns can be entered.

If any command is executed that overwrites a portion of the screen other than the last line of the screen (for example, the *ex* **suspend** or `!` commands), other than the *ex* **shell** command, the user shall be prompted for a character before the screen is refreshed and the edit session continued.

`<tab>` characters shall take up the number of columns on the screen set by the **tabstop** edit option (see *ex*), unless there are less than that number of columns before the display margin that will cause the displayed line to be folded; in this case, they shall only take up the number of columns up to that boundary.

The cursor shall be placed on the current line and relative to the current column as specified by each command described in the following sections.

In open mode, if the current line is not already displayed, then it shall be displayed.

In visual mode, if the current line is not displayed, then the lines that are displayed shall be expanded, scrolled, or redrawn to cause an unspecified portion of the current line to be displayed. If the screen is redrawn, no more than the number of display lines specified by the value of the **window** edit option shall be displayed (unless the current line cannot be completely displayed in the number of display lines specified by the **window** edit option) and the current line shall be positioned as close to the center of the displayed lines as possible (within the constraints imposed by the distance of the line from the beginning or end of the edit buffer). If the current line is before the first line in the display and the screen is scrolled, an unspecified

portion of the current line shall be placed on the first line of the display. If the current line is after the last line in the display and the screen is scrolled, an unspecified portion of the current line shall be placed on the last line of the display.

In visual mode, if a line from the edit buffer (other than the current line) does not entirely fit into the lines at the bottom of the display that are available for its presentation, the editor may choose not to display any portion of the line. The lines of the display that do not contain text from the edit buffer for this reason shall each consist of a single '@' character.

In visual mode, the editor may choose for unspecified reasons to not update lines in the display to correspond to the underlying edit buffer text. The lines of the display that do not correctly correspond to text from the edit buffer for this reason shall consist of a single '@' character (plus the terminating <newline>), and the <control>-R command shall cause the editor to update the screen to correctly represent the edit buffer.

Open and visual mode commands that set the current column set it to a column position in the display, and not a character position in the line. In this case, however, the column position in the display shall be calculated for an infinite width display; for example, the column related to a character that is part of a line that has been folded onto additional screen lines will be offset from the display line column where the buffer line begins, not from the beginning of a particular display line.

The display cursor column in the display is based on the value of the current column, as follows, with each rule applied in turn:

1. If the current column is after the last display line column used by the displayed line, the display cursor column shall be set to the last display line column occupied by the last non-<newline> in the current line; otherwise, the display cursor column shall be set to the current column.
2. If the character of which some portion is displayed in the display line column specified by the display cursor column requires more than a single display line column:
  - a. If in text input mode, the display cursor column shall be adjusted to the first display line column in which any portion of that character is displayed.
  - b. Otherwise, the display cursor column shall be adjusted to the last display line column in which any portion of that character is displayed.

The current column shall not be changed by these adjustments to the display cursor column.

If an error occurs during the parsing or execution of a *vi* command:

- The terminal shall be alerted. Execution of the *vi* command shall stop, and the cursor (for example, the current line and column) shall not be further modified.
- Unless otherwise specified by the following command sections, it is unspecified whether an informational message shall be displayed.
- Any partially entered *vi* command shall be discarded.
- If the *vi* command resulted from a **map** expansion, all characters from that **map** expansion shall be discarded, except as otherwise specified by the **map** command (see *ex*).
- If the *vi* command resulted from the execution of a buffer, no further commands caused by the execution of the buffer shall be executed.

**Page Backwards**

*Synopsis:*     [*count*] <control>-B

If in open mode, the <control>-B command shall behave identically to the **z** command. Otherwise, if the current line is the first line of the edit buffer, it shall be an error.

If the **window** edit option is less than 3, display a screen where the last line of the display shall be some portion of:

(*current first line*) -1

otherwise, display a screen where the first line of the display shall be some portion of:

(*current first line*) - *count* x ((*window edit option*) -2)

If this calculation would result in a line that is before the first line of the edit buffer, the first line of the display shall display some portion of the first line of the edit buffer.

*Current line:* If no lines from the previous display remain on the screen, set to the last line of the display; otherwise, set to (*line* - the number of new lines displayed on this screen).

*Current column:* Set to non-<blank>.

**Scroll Forward**

*Synopsis:*     [*count*] <control>-D

If the current line is the last line of the edit buffer, it shall be an error.

If no *count* is specified, *count* shall default to the *count* associated with the previous <control>-D or <control>-U command. If there was no previous <control>-D or <control>-U command, *count* shall default to the value of the **scroll** edit option.

If in open mode, write lines starting with the line after the current line, until *count* lines or the last line of the file have been written.

*Current line:* If the current line + *count* is past the last line of the edit buffer, set to the last line of the edit buffer; otherwise, set to the current line + *count*.

*Current column:* Set to non-<blank>.

**Scroll Forward by Line**

*Synopsis:*     [*count*] <control>-E

Display the line *count* lines after the last line currently displayed.

If the last line of the edit buffer is displayed, it shall be an error. If there is no line *count* lines after the last line currently displayed, the last line of the display shall display some portion of the last line of the edit buffer.

*Current line:* Unchanged if the previous current character is displayed; otherwise, set to the first line displayed.

*Current column:* Unchanged.

**Page Forward**

*Synopsis:*     [*count*] <control>-F

If in open mode, the <control>-F command shall behave identically to the **z** command. Otherwise, if the current line is the last line of the edit buffer, it shall be an error.

If the **window** edit option is less than 3, display a screen where the first line of the display shall be some portion of:

(*current last line*) +1

otherwise, display a screen where the first line of the display shall be some portion of:

(*current first line*) + *count* x ((*window edit option*) -2)

If this calculation would result in a line that is after the last line of the edit buffer, the last line of the display shall display some portion of the last line of the edit buffer.

*Current line:* If no lines from the previous display remain on the screen, set to the first line of the display; otherwise, set to (*line* + the number of new lines displayed on this screen).

*Current column:* Set to non-<blank>.

**Display Information**

*Synopsis:*     <control>-G

This command shall be equivalent to the **ex file** command.

**Move Cursor Backwards**

*Synopsis:*     [*count*] <control>-H

                  [*count*] h

                  the current erase character (see **stty**)

If there are no characters before the current character on the current line, it shall be an error. If there are less than *count* previous characters on the current line, *count* shall be adjusted to the number of previous characters on the line.

If used as a motion command:

1. The text region shall be from the character before the starting cursor up to and including the *count*th character before the starting cursor.
2. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Unchanged.

*Current column:* Set to (*column* - the number of columns occupied by *count* characters ending with the previous current column).

**Move Down**

*Synopsis:*    [*count*] <newline>  
                   [*count*] <control>-J  
                   [*count*] <control>-M  
                   [*count*] <control>-N  
                   [*count*] j  
                   [*count*] <carriage-return>  
                   [*count*] +

If there are less than *count* lines after the current line in the edit buffer, it shall be an error.

If used as a motion command:

1. The text region shall include the starting line and the next *count* – 1 lines.
2. Any text copied to a buffer shall be in line mode.

If not used as a motion command:

*Current line:* Set to *current line* + *count*.

*Current column:* Set to non-<blank> for the <carriage-return>, <control>-M, and + commands; otherwise, unchanged.

**Clear and Redisplay**

*Synopsis:*    <control>-L

If in open mode, clear the screen and redisplay the current line. Otherwise, clear and redisplay the screen.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Move Up**

*Synopsis:*    [*count*] <control>-P  
                   [*count*] k  
                   [*count*] –

If there are less than *count* lines before the current line in the edit buffer, it shall be an error.

If used as a motion command:

1. The text region shall include the starting line and the previous *count* lines.
2. Any text copied to a buffer shall be in line mode.

If not used as a motion command:

*Current line:* Set to *current line* – *count*.

*Current column:* Set to non-<blank> for the – command; otherwise, unchanged.

**113565 Redraw Screen**

113566 *Synopsis:*      <control>-R

113567 If any lines have been deleted from the display screen and flagged as deleted on the terminal  
113568 using the @ convention (see the beginning of the EXTENDED DESCRIPTION section), they shall  
113569 be redisplayed to match the contents of the edit buffer.

113570 It is unspecified whether lines flagged with @ because they do not fit on the terminal display  
113571 shall be affected.

113572 *Current line:* Unchanged.

113573 *Current column:* Unchanged.

**113574 Scroll Backward**

113575 *Synopsis:*      [count] <control>-U

113576 If the current line is the first line of the edit buffer, it shall be an error.

113577 If no *count* is specified, *count* shall default to the *count* associated with the previous <control>-D  
113578 or <control>-U command. If there was no previous <control>-D or <control>-U command, *count*  
113579 shall default to the value of the **scroll** edit option.

113580 *Current line:* If *count* is greater than the current line, set to 1; otherwise, set to the current line –  
113581 *count*.

113582 *Current column:* Set to non-<blank>.

**113583 Scroll Backward by Line**

113584 *Synopsis:*      [count] <control>-Y

113585 Display the line *count* lines before the first line currently displayed.

113586 If the current line is the first line of the edit buffer, it shall be an error. If this calculation would  
113587 result in a line that is before the first line of the edit buffer, the first line of the display shall  
113588 display some portion of the first line of the edit buffer.

113589 *Current line:* Unchanged if the previous current character is displayed; otherwise, set to the first  
113590 line displayed.

113591 *Current column:* Unchanged.

**113592 Edit the Alternate File**

113593 *Synopsis:*      <control>-^

113594 This command shall be equivalent to the *ex* **edit** command, with the alternate pathname as its  
113595 argument.

**Terminate Command or Input Mode**

*Synopsis:*      <ESC>

If a partial *vi* command (as defined by at least one, non-*count* character) has been entered, discard the *count* and the command character(s).

Otherwise, if no command characters have been entered, and the <ESC> was the result of a map expansion, the terminal shall be alerted and the <ESC> character shall be discarded, but it shall not be an error.

Otherwise, it shall be an error.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Search for tagstring**

*Synopsis:*      <control>-]

If the current character is not a word or <blank>, it shall be an error.

This command shall be equivalent to the *ex tag* command, with the argument to that command defined as follows.

If the current character is a <blank>:

1. Skip all <blank> characters after the cursor up to the end of the line.
2. If the end of the line is reached, it shall be an error.

Then, the argument to the *ex tag* command shall be the current character and all subsequent characters, up to the first non-word character or the end of the line.

**Move Cursor Forward**

*Synopsis:*      [*count*] <space>  
                 [*count*] 1 (ell)

If there are less than *count* non-<newline> characters after the cursor on the current line, *count* shall be adjusted to the number of non-<newline> characters after the cursor on the line.

If used as a motion command:

1. If the current or *count*th character after the cursor is the last non-<newline> in the line, the text region shall be comprised of the current character up to and including the last non-<newline> in the line. Otherwise, the text region shall be from the current character up to, but not including, the *count*th character after the cursor.
2. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

If there are no non-<newline> characters after the current character on the current line, it shall be an error.

*Current line:* Unchanged.

*Current column:* Set to the last column that displays any portion of the *count*th character after the current character.

**Replace Text with Results from Shell Command**

*Synopsis:*     [*count*] ! *motion shell-commands* <newline>

If the motion command is the ! command repeated:

1. If the edit buffer is empty and no *count* was supplied, the command shall be the equivalent of the *ex :read !* command, with the text input, and no text shall be copied to any buffer.
2. Otherwise:
  - a. If there are less than *count* –1 lines after the current line in the edit buffer, it shall be an error.
  - b. The text region shall be from the current line up to and including the next *count* –1 lines.

Otherwise, the text region shall be the lines in which any character of the text region specified by the motion command appear.

Any text copied to a buffer shall be in line mode.

This command shall be equivalent to the *ex !* command for the specified lines.

**Move Cursor to End-of-Line**

*Synopsis:*     [*count*] \$

It shall be an error if there are less than (*count* –1) lines after the current line in the edit buffer.

If used as a motion command:

1. If *count* is 1:
  - a. It shall be an error if the line is empty.
  - b. Otherwise, the text region shall consist of all characters from the starting cursor to the last non-<newline> in the line, inclusive, and any text copied to a buffer shall be in character mode.
2. Otherwise, if the starting cursor position is at or before the first non-<blank> in the line, the text region shall consist of the current and the next *count* –1 lines, and any text saved to a buffer shall be in line mode.
3. Otherwise, the text region shall consist of all characters from the starting cursor to the last non-<newline> in the line that is *count* –1 lines forward from the current line, and any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Set to the *current line* + *count* –1.

*Current column:* The current column is set to the last display line column of the last non-<newline> in the line, or column position 1 if the line is empty.

The current column shall be adjusted to be on the last display line column of the last non-<newline> of the current line as subsequent commands change the current line, until a command changes the current column.

**Move to Matching Character***Synopsis:*     %

If the character at the current position is not a parenthesis, bracket, or curly brace, search forward in the line to the first one of those characters. If no such character is found, it shall be an error.

The matching character shall be the parenthesis, bracket, or curly brace matching the parenthesis, bracket, or curly brace, respectively, that was at the current position or that was found on the current line.

Matching shall be determined as follows, for an open parenthesis:

1. Set a counter to 1.
2. Search forwards until a parenthesis is found or the end of the edit buffer is reached.
3. If the end of the edit buffer is reached, it shall be an error.
4. If an open parenthesis is found, increment the counter by 1.
5. If a close parenthesis is found, decrement the counter by 1.
6. If the counter is zero, the current character is the matching character.

Matching for a close parenthesis shall be equivalent, except that the search shall be backwards, from the starting character to the beginning of the buffer, a close parenthesis shall increment the counter by 1, and an open parenthesis shall decrement the counter by 1.

Matching for brackets and curly braces shall be equivalent, except that searching shall be done for open and close brackets or open and close curly braces. It is implementation-defined whether other characters are searched for and matched as well.

If used as a motion command:

1. If the matching cursor was after the starting cursor in the edit buffer, and the starting cursor position was at or before the first non-`<blank>` non-`<newline>` in the starting line, and the matching cursor position was at or after the last non-`<blank>` non-`<newline>` in the matching line, the text region shall consist of the current line to the matching line, inclusive, and any text copied to a buffer shall be in line mode.
2. If the matching cursor was before the starting cursor in the edit buffer, and the starting cursor position was at or after the last non-`<blank>` non-`<newline>` in the starting line, and the matching cursor position was at or before the first non-`<blank>` non-`<newline>` in the matching line, the text region shall consist of the current line to the matching line, inclusive, and any text copied to a buffer shall be in line mode.
3. Otherwise, the text region shall consist of the starting character to the matching character, inclusive, and any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Set to the line where the matching character is located.

*Current column:* Set to the last column where any portion of the matching character is displayed.

**Repeat Substitution***Synopsis:*     &

Repeat the previous substitution command. This command shall be equivalent to the *ex &* command with the current line as its addresses, and without *options*, *count*, or *flags*.

**Return to Previous Context at Beginning of Line***Synopsis:*     ' *character*

It shall be an error if there is no line in the edit buffer marked by *character*.

If used as a motion command:

1. If the starting cursor is after the marked cursor, then the locations of the starting cursor and the marked cursor in the edit buffer shall be logically swapped.
2. The text region shall consist of the starting line up to and including the marked line, and any text copied to a buffer shall be in line mode.

If not used as a motion command:

*Current line:* Set to the line referenced by the mark.

*Current column:* Set to non-<blank>.

**Return to Previous Context***Synopsis:*     ' *character*

It shall be an error if the marked line is no longer in the edit buffer. If the marked line no longer contains a character in the saved numbered character position, it shall be as if the marked position is the first non-<blank>.

If used as a motion command:

1. It shall be an error if the marked cursor references the same character in the edit buffer as the starting cursor.
2. If the starting cursor is after the marked cursor, then the locations of the starting cursor and the marked cursor in the edit buffer shall be logically swapped.
3. If the starting line is empty or the starting cursor is at or before the first non-<blank> non-<newline> of the starting line, and the marked cursor line is empty or the marked cursor references the first character of the marked cursor line, the text region shall consist of all lines containing characters from the starting cursor to the line before the marked cursor line, inclusive, and any text copied to a buffer shall be in line mode.
4. Otherwise, if the marked cursor line is empty or the marked cursor references a character at or before the first non-<blank> non-<newline> of the marked cursor line, the region of text shall be from the starting cursor to the last non-<newline> of the line before the marked cursor line, inclusive, and any text copied to a buffer shall be in character mode.
5. Otherwise, the region of text shall be from the starting cursor (inclusive), to the marked cursor (exclusive), and any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Set to the line referenced by the mark.

*Current column:* Set to the last column in which any portion of the character referenced by the

mark is displayed.

## Return to Previous Section

*Synopsis:*     [*count*] [[

Move the cursor backward through the edit buffer to the first character of the previous section boundary, *count* times.

If used as a motion command:

1. If the starting cursor was at the first character of the starting line or the starting line was empty, and the first character of the boundary was the first character of the boundary line, the text region shall consist of the current line up to and including the line where the *count*th next boundary starts, and any text copied to a buffer shall be in line mode.
2. If the boundary was the last line of the edit buffer or the last non-<newline> of the last line of the edit buffer, the text region shall consist of the last character in the edit buffer up to and including the starting character, and any text saved to a buffer shall be in character mode.
3. Otherwise, the text region shall consist of the starting character up to but not including the first character in the *count*th next boundary, and any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Set to the line where the *count*th next boundary in the edit buffer starts.

*Current column:* Set to the last column in which any portion of the first character of the *count*th next boundary is displayed, or column position 1 if the line is empty.

## Move to Next Section

*Synopsis:*     [*count*] ]]

Move the cursor forward through the edit buffer to the first character of the next section boundary, *count* times.

If used as a motion command:

1. If the starting cursor was at the first character of the starting line or the starting line was empty, and the first character of the boundary was the first character of the boundary line, the text region shall consist of the current line up to and including the line where the *count*th previous boundary starts, and any text copied to a buffer shall be in line mode.
2. If the boundary was the first line of the edit buffer, the text region shall consist of the first character in the edit buffer up to but not including the starting character, and any text copied to a buffer shall be in character mode.
3. Otherwise, the text region shall consist of the first character in the *count*th previous section boundary up to but not including the starting character, and any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Set to the line where the *count*th previous boundary in the edit buffer starts.

*Current column:* Set to the last column in which any portion of the first character of the *count*th previous boundary is displayed, or column position 1 if the line is empty.

**Move to First Non-<blank> Position on Current Line***Synopsis:*     `^`

If used as a motion command:

1. If the line has no non-<blank> non-<newline> characters, or if the cursor is at the first non-<blank> non-<newline> of the line, it shall be an error.
2. If the cursor is before the first non-<blank> non-<newline> of the line, the text region shall be comprised of the current character, up to, but not including, the first non-<blank> non-<newline> of the line.
3. If the cursor is after the first non-<blank> non-<newline> of the line, the text region shall be from the character before the starting cursor up to and including the first non-<blank> non-<newline> of the line.
4. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Unchanged.*Current column:* Set to non-<blank>.**Current and Line Above***Synopsis:*     `[count] _`If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an error.

If used as a motion command:

1. If *count* is less than 2, the text region shall be the current line.
2. Otherwise, the text region shall include the starting line and the next *count* -1 lines.
3. Any text copied to a buffer shall be in line mode.

If not used as a motion command:

*Current line:* Set to current line + *count* -1.*Current column:* Set to non-<blank>.**Move Back to Beginning of Sentence***Synopsis:*     `[count] (`

Move backward to the beginning of a sentence. This command shall be equivalent to the `[]` command, with the exception that sentence boundaries shall be used instead of section boundaries.

**Move Forward to Beginning of Sentence***Synopsis:*     `[count] )`

Move forward to the beginning of a sentence. This command shall be equivalent to the `][]` command, with the exception that sentence boundaries shall be used instead of section boundaries.

**Move Back to Preceding Paragraph**

*Synopsis:*     [*count*] {

Move back to the beginning of the preceding paragraph. This command shall be equivalent to the `[[` command, with the exception that paragraph boundaries shall be used instead of section boundaries.

**Move Forward to Next Paragraph**

*Synopsis:*     [*count*] }

Move forward to the beginning of the next paragraph. This command shall be equivalent to the `]]` command, with the exception that paragraph boundaries shall be used instead of section boundaries.

**Move to Specific Column Position**

*Synopsis:*     [*count*] |

For the purposes of this command, lines that are too long for the current display and that have been folded shall be treated as having a single, 1-based, number of columns.

If there are less than *count* columns in which characters from the current line are displayed on the screen, *count* shall be adjusted to be the last column in which any portion of the line is displayed on the screen.

If used as a motion command:

1. If the line is empty, or the cursor character is the same as the character on the *count*th column of the line, it shall be an error.
2. If the cursor is before the *count*th column of the line, the text region shall be comprised of the current character, up to but not including the character on the *count*th column of the line.
3. If the cursor is after the *count*th column of the line, the text region shall be from the character before the starting cursor up to and including the character on the *count*th column of the line.
4. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Unchanged.

*Current column:* Set to the last column in which any portion of the character that is displayed in the *count* column of the line is displayed.

**Reverse Find Character**

*Synopsis:*     [*count*] ,

If the last **F**, **f**, **T**, or **t** command was **F**, **f**, **T**, or **t**, this command shall be equivalent to an **f**, **F**, **t**, or **T** command, respectively, with the specified *count* and the same search character.

If there was no previous **F**, **f**, **T**, or **t** command, it shall be an error.

**Repeat**

*Synopsis:*      [*count*] .

Repeat the last **!**, **<**, **>**, **A**, **C**, **D**, **I**, **J**, **O**, **P**, **R**, **S**, **X**, **Y**, **a**, **c**, **d**, **i**, **o**, **p**, **r**, **s**, **x**, **y**, or **~** command. It shall be an error if none of these commands have been executed. Commands (other than commands that enter text input mode) executed as a result of map expansions, shall not change the value of the last repeatable command.

Repeated commands with associated motion commands shall repeat the motion command as well; however, any specified *count* shall replace the *count*(s) that were originally specified to the repeated command or its associated motion command.

If the motion component of the repeated command is **f**, **F**, **t**, or **T**, the repeated command shall not set the remembered search character for the **;** and **,** commands.

If the repeated command is **p** or **P**, and the buffer associated with that command was a numeric buffer named with a number less than 9, the buffer associated with the repeated command shall be set to be the buffer named by the name of the previous buffer logically incremented by 1.

If the repeated character is a text input command, the input text associated with that command is repeated literally:

- Input characters are neither macro or abbreviation-expanded.
- Input characters are not interpreted in any special way with the exception that <newline>, <carriage-return>, and <control>-T behave as described in [Input Mode Commands in vi](#) (on page 3399).

*Current line:* Set as described for the repeated command.

*Current column:* Set as described for the repeated command.

**Find Regular Expression**

*Synopsis:*      /

If the input line contains no non-<newline> characters, it shall be equivalent to a line containing only the last regular expression encountered. The enhanced regular expressions supported by *vi* are described in [Regular Expressions in ex](#) (on page 2723).

Otherwise, the line shall be interpreted as one or more regular expressions, optionally followed by an address offset or a *vi* **z** command.

If the regular expression is not the last regular expression on the line, or if a line offset or **z** command is specified, the regular expression shall be terminated by an unescaped **'/'** character, which shall not be used as part of the regular expression. If the regular expression is not the first regular expression on the line, it shall be preceded by zero or more <blank> characters, a <semicolon>, zero or more <blank> characters, and a leading **'/'** character, which shall not be interpreted as part of the regular expression. It shall be an error to precede any regular expression with any characters other than these.

Each search shall begin from the character after the first character of the last match (or, if it is the first search, after the cursor). If the **wraps**can edit option is set, the search shall continue to the character before the starting cursor character; otherwise, to the end of the edit buffer. It shall be an error if any search fails to find a match, and an informational message to this effect shall be displayed.

An optional address offset (see [Addressing in ex](#), on page 2692) can be specified after the last regular expression by including a trailing **'/'** character after the regular expression and

specifying the address offset. This offset will be from the line containing the match for the last regular expression specified. It shall be an error if the line offset would indicate a line address less than 1 or greater than the last line in the edit buffer. An address offset of zero shall be supported. It shall be an error to follow the address offset with any other characters than <blank> characters.

If not used as a motion command, an optional **z** command (see [Redraw Window](#), on page 3398) can be specified after the last regular expression by including a trailing ' / ' character after the regular expression, zero or more <blank> characters, a ' z ', zero or more <blank> characters, an optional new **window** edit option value, zero or more <blank> characters, and a location character. The effect shall be as if the **z** command was executed after the / command. It shall be an error to follow the **z** command with any other characters than <blank> characters.

The remembered search direction shall be set to forward.

If used as a motion command:

1. It shall be an error if the last match references the same character in the edit buffer as the starting cursor.
2. If any address offset is specified, the last match shall be adjusted by the specified offset as described previously.
3. If the starting cursor is after the last match, then the locations of the starting cursor and the last match in the edit buffer shall be logically swapped.
4. If any address offset is specified, the text region shall consist of all lines containing characters from the starting cursor to the last match line, inclusive, and any text copied to a buffer shall be in line mode.
5. Otherwise, if the starting line is empty or the starting cursor is at or before the first non-<blank> non-<newline> of the starting line, and the last match line is empty or the last match starts at the first character of the last match line, the text region shall consist of all lines containing characters from the starting cursor to the line before the last match line, inclusive, and any text copied to a buffer shall be in line mode.
6. Otherwise, if the last match line is empty or the last match begins at a character at or before the first non-<blank> non-<newline> of the last match line, the region of text shall be from the current cursor to the last non-<newline> of the line before the last match line, inclusive, and any text copied to a buffer shall be in character mode.
7. Otherwise, the region of text shall be from the current cursor (inclusive), to the first character of the last match (exclusive), and any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* If a match is found, set to the last matched line plus the address offset, if any; otherwise, unchanged.

*Current column:* Set to the last column on which any portion of the first character in the last matched string is displayed, if a match is found; otherwise, unchanged.

**Move to First Character in Line**

*Synopsis:*     0   (zero)

Move to the first character on the current line. The character '0' shall not be interpreted as a command if it is immediately preceded by a digit.

If used as a motion command:

1. If the cursor character is the first character in the line, it shall be an error.
2. The text region shall be from the character before the cursor character up to and including the first character in the line.
3. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Unchanged.

*Current column:* The last column in which any portion of the first character in the line is displayed, or if the line is empty, unchanged.

**Execute an ex Command**

*Synopsis:*     :

Execute one or more *ex* commands.

If any portion of the screen other than the last line of the screen was overwritten by any *ex* command (except **shell**), *vi* shall display a message indicating that it is waiting for an input from the user, and shall then read a character. This action may also be taken for other, unspecified reasons.

If the next character entered is a ':', another *ex* command shall be accepted and executed. Any other character shall cause the screen to be refreshed and *vi* shall return to command mode.

*Current line:* As specified for the *ex* command.

*Current column:* As specified for the *ex* command.

**Repeat Find**

*Synopsis:*     [count] ;

This command shall be equivalent to the last **F**, **f**, **T**, or **t** command, with the specified *count*, and with the same search character used for the last **F**, **f**, **T**, or **t** command. If there was no previous **F**, **f**, **T**, or **t** command, it shall be an error.

**Shift Left**

*Synopsis:*     [count] < *motion*

If the motion command is the < command repeated:

1. If there are less than *count* - 1 lines after the current line in the edit buffer, it shall be an error.
2. The text region shall be from the current line, up to and including the next *count* - 1 lines.

Shift any line in the text region specified by the *count* and motion command one shiftwidth (see the *ex* **shiftwidth** option) toward the start of the line, as described by the *ex* < command. The unshifted lines shall be copied to the unnamed buffer in line mode.

113977 *Current line*: If the motion was from the current cursor position toward the end of the edit buffer,  
 113978 unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region  
 113979 specified by the motion command.

113980 *Current column*: Set to non-<blank>.

## 113981 **Shift Right**

113982 *Synopsis:*     `[count] > motion`

113983 If the motion command is the `>` command repeated:

- 113984     1. If there are less than *count* - 1 lines after the current line in the edit buffer, it shall be an  
 113985       error.
- 113986     2. The text region shall be from the current line, up to and including the next *count* - 1 lines.

113987 Shift any line with characters in the text region specified by the *count* and motion command one  
 113988 shiftwidth (see the *ex* **shiftwidth** option) away from the start of the line, as described by the *ex* `>`  
 113989 command. The unshifted lines shall be copied into the unnamed buffer in line mode.

113990 *Current line*: If the motion was from the current cursor position toward the end of the edit buffer,  
 113991 unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region  
 113992 specified by the motion command.

113993 *Current column*: Set to non-<blank>.

## 113994 **Scan Backwards for Regular Expression**

113995 *Synopsis:*     `?`

113996 Scan backwards; the `?` command shall be equivalent to the `/` command (see [Find Regular](#)  
 113997 [Expression](#), on page 3381) with the following exceptions:

- 113998     1. The input prompt shall be a `' ? '`.
- 113999     2. Each search shall begin from the character before the first character of the last match (or, if  
 114000       it is the first search, the character before the cursor character).
- 114001     3. The search direction shall be from the cursor toward the beginning of the edit buffer, and  
 114002       the **wrapscan** edit option shall affect whether the search wraps to the end of the edit  
 114003       buffer and continues.
- 114004     4. The remembered search direction shall be set to backward.

## 114005 **Execute**

114006 *Synopsis:*     `@buffer`

114007 If the *buffer* is specified as `@`, the last buffer executed shall be used. If no previous buffer has been  
 114008 executed, it shall be an error.

114009 Behave as if the contents of the named buffer were entered as standard input. After each line of a  
 114010 line-mode buffer, and all but the last line of a character mode buffer, behave as if a `<newline>`  
 114011 were entered as standard input.

114012 If an error occurs during this process, an error message shall be written, and no more characters  
 114013 resulting from the execution of this command shall be processed.

114014 If a *count* is specified, behave as if that count were entered as user input before the characters  
 114015 from the `@` buffer were entered.

114016 *Current line*: As specified for the individual commands.

114017 *Current column*: As specified for the individual commands.

## 114018 **Reverse Case**

114019 *Synopsis*:     [*count*] ~

114020 Reverse the case of the current character and the next *count* -1 characters, such that lowercase  
114021 characters that have uppercase counterparts shall be changed to uppercase characters, and  
114022 uppercase characters that have lowercase counterparts shall be changed to lowercase characters,  
114023 as prescribed by the current locale. No other characters shall be affected by this command.

114024 If there are less than *count* -1 characters after the cursor in the edit buffer, *count* shall be adjusted  
114025 to the number of characters after the cursor in the edit buffer minus 1.

114026 For the purposes of this command, the next character after the last non-<newline> on the line  
114027 shall be the next character in the edit buffer.

114028 *Current line*: Set to the line including the (*count*-1)th character after the cursor.

114029 *Current column*: Set to the last column in which any portion of the (*count*-1)th character after the  
114030 cursor is displayed.

## 114031 **Append**

114032 *Synopsis*:     [*count*] a

114033 Enter text input mode after the current cursor position. No characters already in the edit buffer  
114034 shall be affected by this command. A *count* shall cause the input text to be appended *count* -1  
114035 more times to the end of the input.

114036 *Current line/column*: As specified for the text input commands (see [Input Mode Commands in vi](#),  
114037 on page 3399).

## 114038 **Append at End-of-Line**

114039 *Synopsis*:     [*count*] A

114040 This command shall be equivalent to the *vi* command:

114041 \$ [ *count* ] a

114042 (see [Append](#)).

## 114043 **Move Backward to Preceding Word**

114044 *Synopsis*:     [*count*] b

114045 With the exception that words are used as the delimiter instead of bigwords, this command shall  
114046 be equivalent to the **B** command.

**Move Backward to Preceding Bigword**

*Synopsis:*     [*count*] B

If the edit buffer is empty or the cursor is on the first character of the edit buffer, it shall be an error. If less than *count* bigwords begin between the cursor and the start of the edit buffer, *count* shall be adjusted to the number of bigword beginnings between the cursor and the start of the edit buffer.

If used as a motion command:

1. The text region shall be from the first character of the *count*th previous bigword beginning up to but not including the cursor character.
2. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Set to the line containing the *current column*.

*Current column:* Set to the last column upon which any part of the first character of the *count*th previous bigword is displayed.

**Change**

*Synopsis:*     [*buffer*][*count*] c *motion*

If the motion command is the **c** command repeated:

1. The buffer text shall be in line mode.
2. If there are less than *count* - 1 lines after the current line in the edit buffer, it shall be an error.
3. The text region shall be from the current line up to and including the next *count* - 1 lines.

Otherwise, the buffer text mode and text region shall be as specified by the motion command.

The replaced text shall be copied into *buffer*, if specified, and into the unnamed buffer. If the text to be replaced contains characters from more than a single line, or the buffer text is in line mode, the replaced text shall be copied into the numeric buffers as well.

If the buffer text is in line mode:

1. Any lines that contain characters in the region shall be deleted, and the editor shall enter text input mode at the beginning of a new line which shall replace the first line deleted.
2. If the **autoindent** edit option is set, **autoindent** characters equal to the **autoindent** characters on the first line deleted shall be inserted as if entered by the user.

Otherwise, if characters from more than one line are in the region of text:

1. The text shall be deleted.
2. Any text remaining in the last line in the text region shall be appended to the first line in the region, and the last line in the region shall be deleted.
3. The editor shall enter text input mode after the last character not deleted from the first line in the text region, if any; otherwise, on the first column of the first line in the region.

Otherwise:

1. If the glyph for ' \$ ' is smaller than the region, the end of the region shall be marked with a ' \$ '.
2. The editor shall enter text input mode, overwriting the region of text.

*Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#), on page 3399).

### Change to End-of-Line

*Synopsis:*     [buffer][count] C

This command shall be equivalent to the *vi* command:

[buffer][count] c\$

See the **c** command.

### Delete

*Synopsis:*     [buffer][count] d motion

If the motion command is the **d** command repeated:

1. The buffer text shall be in line mode.
2. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an error.
3. The text region shall be from the current line up to and including the next *count* -1 lines.

Otherwise, the buffer text mode and text region shall be as specified by the motion command.

If in open mode, and the current line is deleted, and the line remains on the display, an '@' character shall be displayed as the first glyph of that line.

Delete the region of text into *buffer*, if specified, and into the unnamed buffer. If the text to be deleted contains characters from more than a single line, or the buffer text is in line mode, the deleted text shall be copied into the numeric buffers, as well.

*Current line:* Set to the first text region line that appears in the edit buffer, unless that line has been deleted, in which case it shall be set to the last line in the edit buffer, or line 1 if the edit buffer is empty.

*Current column:*

1. If the line is empty, set to column position 1.
2. Otherwise, if the buffer text is in line mode or the motion was from the cursor toward the end of the edit buffer:
  - a. If a character from the current line is displayed in the current column, set to the last column that displays any portion of that character.
  - b. Otherwise, set to the last column in which any portion of any character in the line is displayed.
3. Otherwise, if a character is displayed in the column that began the text region, set to the last column that displays any portion of that character.

4. Otherwise, set to the last column in which any portion of any character in the line is displayed.

### Delete to End-of-Line

*Synopsis:*     [*buffer*] D

Delete the text from the current position to the end of the current line; equivalent to the *vi* command:

[*buffer*] d\$

### Move to End-of-Word

*Synopsis:*     [*count*] e

With the exception that words are used instead of bigwords as the delimiter, this command shall be equivalent to the **E** command.

### Move to End-of-Bigword

*Synopsis:*     [*count*] E

If the edit buffer is empty it shall be an error. If less than *count* bigwords end between the cursor and the end of the edit buffer, *count* shall be adjusted to the number of bigword endings between the cursor and the end of the edit buffer.

If used as a motion command:

1. The text region shall be from the last character of the *count*th next bigword up to and including the cursor character.
2. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Set to the line containing the current column.

*Current column:* Set to the last column upon which any part of the last character of the *count*th next bigword is displayed.

### Find Character in Current Line (Forward)

*Synopsis:*     [*count*] f *character*

It shall be an error if *count* occurrences of the character do not occur after the cursor in the line.

If used as a motion command:

1. The text range shall be from the cursor character up to and including the *count*th occurrence of the specified character after the cursor.
2. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Unchanged.

*Current column:* Set to the last column in which any portion of the *count*th occurrence of the specified character after the cursor appears in the line.

**Find Character in Current Line (Reverse)**

*Synopsis:*     [*count*] F *character*

It shall be an error if *count* occurrences of the character do not occur before the cursor in the line.

If used as a motion command:

1. The text region shall be from the *count*th occurrence of the specified character before the cursor, up to, but not including the cursor character.
2. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Unchanged.

*Current column:* Set to the last column in which any portion of the *count*th occurrence of the specified character before the cursor appears in the line.

**Move to Line**

*Synopsis:*     [*count*] G

If *count* is not specified, it shall default to the last line of the edit buffer. If *count* is greater than the last line of the edit buffer, it shall be an error.

If used as a motion command:

1. The text region shall be from the cursor line up to and including the specified line.
2. Any text copied to a buffer shall be in line mode.

If not used as a motion command:

*Current line:* Set to *count* if *count* is specified; otherwise, the last line.

*Current column:* Set to non-<blank>.

**Move to Top of Screen**

*Synopsis:*     [*count*] H

If the beginning of the line *count* greater than the first line of which any portion appears on the display does not exist, it shall be an error.

If used as a motion command:

1. If in open mode, the text region shall be the current line.
2. Otherwise, the text region shall be from the starting line up to and including (the first line of the display + *count* - 1).
3. Any text copied to a buffer shall be in line mode.

If not used as a motion command:

If in open mode, this command shall set the current column to non-<blank> and do nothing else.

Otherwise, it shall set the current line and current column as follows.

*Current line:* Set to (the first line of the display + *count* - 1).

*Current column:* Set to non-<blank>.

**Insert Before Cursor**

*Synopsis:*     [*count*] i

Enter text input mode before the current cursor position. No characters already in the edit buffer shall be affected by this command. A *count* shall cause the input text to be appended *count* -1 more times to the end of the input.

*Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#), on page 3399).

**Insert at Beginning of Line**

*Synopsis:*     [*count*] I

This command shall be equivalent to the *vi* command `^[count]i`.

**Join**

*Synopsis:*     [*count*] J

If the current line is the last line in the edit buffer, it shall be an error.

This command shall be equivalent to the *ex* **join** command with no addresses, and an *ex* command *count* value of 1 if *count* was not specified or if a *count* of 1 was specified, and an *ex* command *count* value of *count* -1 for any other value of *count*, except that the current line and column shall be set as follows.

*Current line:* Unchanged.

*Current column:* The last column in which any portion of the character following the last character in the initial line is displayed, or the last non-<newline> in the line if no characters were appended.

**Move to Bottom of Screen**

*Synopsis:*     [*count*] L

If the beginning of the line *count* less than the last line of which any portion appears on the display does not exist, it shall be an error.

If used as a motion command:

1. If in open mode, the text region shall be the current line.
2. Otherwise, the text region shall include all lines from the starting cursor line to (the last line of the display -(*count* -1)).
3. Any text copied to a buffer shall be in line mode.

If not used as a motion command:

1. If in open mode, this command shall set the current column to non-<blank> and do nothing else.
2. Otherwise, it shall set the current line and current column as follows.

*Current line:* Set to (the last line of the display -(*count* -1)).

*Current column:* Set to non-<blank>.

114226 **Mark Position**114227 *Synopsis:*    m letter

114228 This command shall be equivalent to the *ex mark* command with the specified character as an  
 114229 argument.

114230 **Move to Middle of Screen**114231 *Synopsis:*    M

114232 The middle line of the display shall be calculated as follows:

114233 (the top line of the display) + (((number of lines displayed) + 1) / 2) - 1

114234 If used as a motion command:

- 114235       1. If in open mode, the text region shall be the current line.
- 114236       2. Otherwise, the text region shall include all lines from the starting cursor line up to and  
 114237       including the middle line of the display.
- 114238       3. Any text copied to a buffer shall be in line mode.

114239 If not used as a motion command:

114240 If in open mode, this command shall set the current column to non-&lt;blank&gt; and do nothing else.

114241 Otherwise, it shall set the current line and current column as follows.

114242 *Current line:* Set to the middle line of the display.114243 *Current column:* Set to non-<blank>.114244 **Repeat Regular Expression Find (Forward)**114245 *Synopsis:*    n

114246 If the remembered search direction was forward, the *n* command shall be equivalent to the *vi /*  
 114247 command with no characters entered by the user. Otherwise, it shall be equivalent to the *vi ?*  
 114248 command with no characters entered by the user.

114249 If the *n* command is used as a motion command for the *!* command, the editor shall not enter  
 114250 text input mode on the last line on the screen, and shall behave as if the user entered a single  
 114251 ' ! ' character as the text input.

114252 **Repeat Regular Expression Find (Reverse)**114253 *Synopsis:*    N

114254 Scan for the next match of the last pattern given to */* or *?*, but in the reverse direction; this is the  
 114255 reverse of *n*.

114256 If the remembered search direction was forward, the *N* command shall be equivalent to the *vi ?*  
 114257 command with no characters entered by the user. Otherwise, it shall be equivalent to the *vi /*  
 114258 command with no characters entered by the user. If the *N* command is used as a motion  
 114259 command for the *!* command, the editor shall not enter text input mode on the last line on the  
 114260 screen, and shall behave as if the user entered a single *!* character as the text input.

**Insert Empty Line Below**

*Synopsis:*      ○

Enter text input mode in a new line appended after the current line. A *count* shall cause the input text to be appended *count* –1 more times to the end of the already added text, each time starting on a new, appended line.

*Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#), on page 3399).

**Insert Empty Line Above**

*Synopsis:*      ○

Enter text input mode in a new line inserted before the current line. A *count* shall cause the input text to be appended *count* –1 more times to the end of the already added text, each time starting on a new, appended line.

*Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#), on page 3399).

**Put from Buffer Following**

*Synopsis:*      [*buffer*] p

If no *buffer* is specified, the unnamed buffer shall be used.

If the buffer text is in line mode, the text shall be appended below the current line, and each line of the buffer shall become a new line in the edit buffer. A *count* shall cause the buffer text to be appended *count* –1 more times to the end of the already added text, each time starting on a new, appended line.

If the buffer text is in character mode, the text shall be appended into the current line after the cursor, and each line of the buffer other than the first and last shall become a new line in the edit buffer. A *count* shall cause the buffer text to be appended *count* –1 more times to the end of the already added text, each time starting after the last added character.

*Current line:* If the buffer text is in line mode, set the line to line +1; otherwise, unchanged.

*Current column:* If the buffer text is in line mode:

1. If there is a non-<blank> in the first line of the buffer, set to the last column on which any portion of the first non-<blank> in the line is displayed.
2. If there is no non-<blank> in the first line of the buffer, set to the last column on which any portion of the last non-<newline> in the first line of the buffer is displayed.

If the buffer text is in character mode:

1. If the text in the buffer is from more than a single line, then set to the last column on which any portion of the first character from the buffer is displayed.
2. Otherwise, if the buffer is the unnamed buffer, set to the last column on which any portion of the last character from the buffer is displayed.
3. Otherwise, set to the first column on which any portion of the first character from the buffer is displayed.

**Put from Buffer Before**

*Synopsis:*     [*buffer*] P

If no *buffer* is specified, the unnamed buffer shall be used.

If the buffer text is in line mode, the text shall be inserted above the current line, and each line of the buffer shall become a new line in the edit buffer. A *count* shall cause the buffer text to be appended *count* -1 more times to the end of the already added text, each time starting on a new, appended line.

If the buffer text is in character mode, the text shall be inserted into the current line before the cursor, and each line of the buffer other than the first and last shall become a new line in the edit buffer. A *count* shall cause the buffer text to be appended *count* -1 more times to the end of the already added text, each time starting after the last added character.

*Current line:* Unchanged.

*Current column:* If the buffer text is in line mode:

1. If there is a non-<blank> in the first line of the buffer, set to the last column on which any portion of that character is displayed.
2. If there is no non-<blank> in the first line of the buffer, set to the last column on which any portion of the last non-<newline> in the first line of the buffer is displayed.

If the buffer text is in character mode:

1. If the text in the buffer is from more than a single line, then set to the last column on which any portion of the first character from the buffer is displayed.
2. Otherwise, if the buffer is the unnamed buffer, set to the last column on which any portion of the last character from the buffer is displayed.
3. Otherwise, set to the first column on which any portion of the first character from the buffer is displayed.

**Enter ex Mode**

*Synopsis:*     Q

Leave visual or open mode and enter *ex* command mode.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Replace Character**

*Synopsis:*     [*count*] r *character*

Replace the *count* characters at and after the cursor with the specified character. If there are less than *count* non-<newline> characters at and after the cursor on the line, it shall be an error.

If character is <control>-V, any next character other than the <newline> shall be stripped of any special meaning and used as a literal character.

If character is <ESC>, no replacement shall be made and the current line and current column shall be unchanged.

If character is <carriage-return> or <newline>, *count* new lines shall be appended to the current line. All but the last of these lines shall be empty. *count* characters at and after the cursor shall be

discarded, and any remaining characters after the cursor in the current line shall be moved to the last of the new lines. If the **autoindent** edit option is set, they shall be preceded by the same number of **autoindent** characters found on the line from which the command was executed.

*Current line*: Unchanged unless the replacement character is a <carriage-return> or <newline>, in which case it shall be set to line + *count*.

*Current column*: Set to the last column position on which a portion of the last replaced character is displayed, or if the replacement character caused new lines to be created, set to non-<blank>.

### Replace Characters

*Synopsis*:        R

Enter text input mode at the current cursor position possibly replacing text on the current line. A *count* shall cause the input text to be appended *count* - 1 more times to the end of the input.

*Current line/column*: As specified for the text input commands (see [Input Mode Commands in vi](#), on page 3399).

### Substitute Character

*Synopsis*:        [*buffer*][*count*] s

This command shall be equivalent to the *vi* command:

[*buffer*][*count*] c<space>

### Substitute Lines

*Synopsis*:        [*buffer*][*count*] S

This command shall be equivalent to the *vi* command:

[*buffer*][*count*] c\_

### Move Cursor to Before Character (Forward)

*Synopsis*:        [*count*] t *character*

It shall be an error if *count* occurrences of the character do not occur after the cursor in the line.

If used as a motion command:

1. The text region shall be from the cursor up to but not including the *count*th occurrence of the specified character after the cursor.
2. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line*: Unchanged.

*Current column*: Set to the last column in which any portion of the character before the *count*th occurrence of the specified character after the cursor appears in the line.

**Move Cursor to After Character (Reverse)**

*Synopsis:*     [*count*] T *character*

It shall be an error if *count* occurrences of the character do not occur before the cursor in the line.

If used as a motion command:

1. If the character before the cursor is the specified character, it shall be an error.
2. The text region shall be from the character before the cursor up to but not including the *count*th occurrence of the specified character before the cursor.
3. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Unchanged.

*Current column:* Set to the last column in which any portion of the character after the *count*th occurrence of the specified character before the cursor appears in the line.

**Undo**

*Synopsis:*     u

This command shall be equivalent to the *ex* **undo** command except that the current line and current column shall be set as follows:

*Current line:* Set to the first line added or changed if any; otherwise, move to the line preceding any deleted text if one exists; otherwise, move to line 1.

*Current column:* If undoing an *ex* command, set to the first non-<blank>.

Otherwise, if undoing a text input command:

1. If the command was a **C**, **c**, **O**, **o**, **R**, **S**, or **s** command, the current column shall be set to the value it held when the text input command was entered.
2. Otherwise, set to the last column in which any portion of the first character after the deleted text is displayed, or, if no non-<newline> characters follow the text deleted from this line, set to the last column in which any portion of the last non-<newline> in the line is displayed, or 1 if the line is empty.

Otherwise, if a single line was modified (that is, not added or deleted) by the **u** command:

1. If text was added or changed, set to the last column in which any portion of the first character added or changed is displayed.
2. If text was deleted, set to the last column in which any portion of the first character after the deleted text is displayed, or, if no non-<newline> characters follow the deleted text, set to the last column in which any portion of the last non-<newline> in the line is displayed, or 1 if the line is empty.

Otherwise, set to non-<blank>.

**Undo Current Line**

*Synopsis:*     U

Restore the current line to its state immediately before the most recent time that it became the current line.

*Current line:* Unchanged.

*Current column:* Set to the first column in the line in which any portion of the first character in the line is displayed.

**Move to Beginning of Word**

*Synopsis:*     [count] w

With the exception that words are used as the delimiter instead of bigwords, this command shall be equivalent to the **W** command.

**Move to Beginning of Bigword**

*Synopsis:*     [count] W

If the edit buffer is empty, it shall be an error. If there are less than *count* bigwords between the cursor and the end of the edit buffer, *count* shall be adjusted to move the cursor to the last bigword in the edit buffer.

If used as a motion command:

1. If the associated command is **c**, *count* is 1, and the cursor is on a <blank>, the region of text shall be the current character and no further action shall be taken.
2. If there are less than *count* bigwords between the cursor and the end of the edit buffer, then the command shall succeed, and the region of text shall include the last character of the edit buffer.
3. If there are <blank> characters or an end-of-line that precede the *count*th bigword, and the associated command is **c**, the region of text shall be up to and including the last character before the preceding <blank> characters or end-of-line.
4. If there are <blank> characters or an end-of-line that precede the bigword, and the associated command is **d** or **y**, the region of text shall be up to and including the last <blank> before the start of the bigword or end-of-line.
5. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

1. If the cursor is on the last character of the edit buffer, it shall be an error.

*Current line:* Set to the line containing the current column.

*Current column:* Set to the last column in which any part of the first character of the *count*th next bigword is displayed.

**Delete Character at Cursor**

*Synopsis:*     [*buffer*][*count*] x

Delete the *count* characters at and after the current character into *buffer*, if specified, and into the unnamed buffer.

If the line is empty, it shall be an error. If there are less than *count* non-<newline> characters at and after the cursor on the current line, *count* shall be adjusted to the number of non-<newline> characters at and after the cursor.

*Current line:* Unchanged.

*Current column:* If the line is empty, set to column position 1. Otherwise, if there were *count* or less non-<newline> characters at and after the cursor on the current line, set to the last column that displays any part of the last non-<newline> of the line. Otherwise, unchanged.

**Delete Character Before Cursor**

*Synopsis:*     [*buffer*][*count*] X

Delete the *count* characters before the current character into *buffer*, if specified, and into the unnamed buffer.

If there are no characters before the current character on the current line, it shall be an error. If there are less than *count* previous characters on the current line, *count* shall be adjusted to the number of previous characters on the line.

*Current line:* Unchanged.

*Current column:* Set to (current column – the width of the deleted characters).

**Yank**

*Synopsis:*     [*buffer*][*count*] y *motion*

Copy (yank) the region of text into *buffer*, if specified, and into the unnamed buffer.

If the motion command is the y command repeated:

1. The buffer shall be in line mode.
2. If there are less than *count* – 1 lines after the current line in the edit buffer, it shall be an error.
3. The text region shall be from the current line up to and including the next *count* – 1 lines.

Otherwise, the buffer text mode and text region shall be as specified by the motion command.

*Current line:* If the motion was from the current cursor position toward the end of the edit buffer, unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region specified by the motion command.

*Current column:*

1. If the motion was from the current cursor position toward the end of the edit buffer, unchanged.
2. Otherwise, if the current line is empty, set to column position 1.
3. Otherwise, set to the last column that displays any part of the first character in the file that is part of the text region specified by the motion command.

**Yank Current Line**

*Synopsis:*     `[buffer][count] Y`

This command shall be equivalent to the *vi* command:

`[buffer][count] y_`

**Redraw Window**

If in open mode, the **z** command shall have the Synopsis:

*Synopsis:*     `[count] z`

If *count* is not specified, it shall default to the **window** edit option `-1`. The **z** command shall be equivalent to the *ex z* command, with a type character of `=` and a *count* of *count* `-2`, except that the current line and current column shall be set as follows, and the **window** edit option shall not be affected. If the calculation for the *count* argument would result in a negative number, the *count* argument to the *ex z* command shall be zero. A blank line shall be written after the last line is written.

*Current line:* Unchanged.

*Current column:* Unchanged.

If not in open mode, the **z** command shall have the following Synopsis:

*Synopsis:*     `[line] z [count] character`

If *line* is not specified, it shall default to the current line. If *line* is specified, but is greater than the number of lines in the edit buffer, it shall default to the number of lines in the edit buffer.

If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in the *ex window* command), and the screen shall be redrawn.

*line* shall be placed as specified by the following characters:

<newline>, <carriage-return>

Place the beginning of the line on the first line of the display.

. Place the beginning of the line in the center of the display. The middle line of the display shall be calculated as described for the **M** command.

– Place an unspecified portion of the line on the last line of the display.

+ If *line* was specified, equivalent to the <newline> case. If *line* was not specified, display a screen where the first line of the display shall be (current last line) `+1`. If there are no lines after the last line in the display, it shall be an error.

^ If *line* was specified, display a screen where the last line of the display shall contain an unspecified portion of the first line of a display that had an unspecified portion of the specified line on the last line of the display. If this calculation results in a line before the beginning of the edit buffer, display the first screen of the edit buffer.

Otherwise, display a screen where the last line of the display shall contain an unspecified portion of (current first line `-1`). If this calculation results in a line before the beginning of the edit buffer, it shall be an error.

114513 *Current line*: If *line* and the ' ^ ' character were specified:

114514 1. If the first screen was displayed as a result of the command attempting to display lines  
114515 before the beginning of the edit buffer: if the first screen was already displayed,  
114516 unchanged; otherwise, set to (current first line -1).

114517 2. Otherwise, set to the last line of the display.

114518 If *line* and the ' + ' character were specified, set to the first line of the display.

114519 Otherwise, if *line* was specified, set to *line*.

114520 Otherwise, unchanged.

114521 *Current column*: Set to non-<blank>.

## 114522 **Exit**

114523 *Synopsis*:      ZZ

114524 This command shall be equivalent to the *ex xit* command with no addresses, trailing !, or  
114525 filename (see the *ex xit* command).

## 114526 **Input Mode Commands in vi**

114527 In text input mode, the current line shall consist of zero or more of the following categories, plus  
114528 the terminating <newline>:

114529 1. Characters preceding the text input entry point

114530 Characters in this category shall not be modified during text input mode.

114531 2. **autoindent** characters

114532 **autoindent** characters shall be automatically inserted into each line that is created in text  
114533 input mode, either as a result of entering a <newline> or <carriage-return> while in text  
114534 input mode, or as an effect of the command itself; for example, **O** or **o** (see the *ex*  
114535 **autoindent** command), as if entered by the user.

114536 It shall be possible to erase **autoindent** characters with the <control>-D command; it is  
114537 unspecified whether they can be erased by <control>-H, <control>-U, and <control>-W  
114538 characters. Erasing any **autoindent** character turns the glyph into erase-columns and  
114539 deletes the character from the edit buffer, but does not change its representation on the  
114540 screen.

114541 3. Text input characters

114542 Text input characters are the characters entered by the user. Erasing any text input  
114543 character turns the glyph into erase-columns and deletes the character from the edit  
114544 buffer, but does not change its representation on the screen.

114545 Each text input character entered by the user (that does not have a special meaning) shall  
114546 be treated as follows:

114547 a. The text input character shall be appended to the last character in the edit buffer  
114548 from the first, second, or third categories.

114549 b. If there are no erase-columns on the screen, the text input command was the **R**  
114550 command, and characters in the fifth category from the original line follow the  
114551 cursor, the next such character shall be deleted from the edit buffer. If the  
114552 **slowopen** edit option is not set, the corresponding glyph on the screen shall

- 114553 become erase-columns.
- 114554 c. If there are erase-columns on the screen, as many columns as they occupy, or as are  
114555 necessary, shall be overwritten to display the text input character. (If only part of a  
114556 multi-column glyph is overwritten, the remainder shall be left on the screen, and  
114557 continue to be treated as erase-columns; it is unspecified whether the remainder of  
114558 the glyph is modified in any way.)
- 114559 d. If additional display line columns are needed to display the text input character:
- 114560 i. If the **slowopen** edit option is set, the text input characters shall be  
114561 displayed on subsequent display line columns, overwriting any characters  
114562 displayed in those columns.
- 114563 ii. Otherwise, any characters currently displayed on or after the column on the  
114564 display line where the text input character is to be displayed shall be  
114565 pushed ahead the number of display line columns necessary to display the  
114566 rest of the text input character.
- 114567 4. Erase-columns
- 114568 Erase-columns are not logically part of the edit buffer, appearing only on the screen, and  
114569 may be overwritten on the screen by subsequent text input characters. When text input  
114570 mode ends, all erase-columns shall no longer appear on the screen.
- 114571 Erase-columns are initially the region of text specified by the **c** command (see [Change](#), on  
114572 page 3386); however, erasing **autoindent** or text input characters causes the glyphs of the  
114573 erased characters to be treated as erase-columns.
- 114574 5. Characters following the text region for the **c** command, or the text input entry point for  
114575 all other commands
- 114576 Characters in this category shall not be modified during text input mode, except as  
114577 specified in category 3.b. for the **R** text input command, or as <blank> characters deleted  
114578 when a <newline> or <carriage-return> is entered.
- 114579 It is unspecified whether it is an error to attempt to erase past the beginning of a line that was  
114580 created by the entry of a <newline> or <carriage-return> during text input mode. If it is not an  
114581 error, the editor shall behave as if the erasing character was entered immediately after the last  
114582 text input character entered on the previous line, and all of the non-<newline> characters on the  
114583 current line shall be treated as erase-columns.
- 114584 When text input mode is entered, or after a text input mode character is entered (except as  
114585 specified for the special characters below), the cursor shall be positioned as follows:
- 114586 1. On the first column that displays any part of the first erase-column, if one exists
- 114587 2. Otherwise, if the **slowopen** edit option is set, on the first display line column after the last  
114588 character in the first, second, or third categories, if one exists
- 114589 3. Otherwise, the first column that displays any part of the first character in the fifth  
114590 category, if one exists
- 114591 4. Otherwise, the display line column after the last character in the first, second, or third  
114592 categories, if one exists
- 114593 5. Otherwise, on column position 1
- 114594 The characters that are updated on the screen during text input mode are unspecified, other than  
114595 that the last text input character shall always be updated, and, if the **slowopen** edit option is not

114596 set, the current cursor character shall always be updated.

114597 The following specifications are for command characters entered during text input mode.

114598 **NUL**

114599 *Synopsis:* NUL

114600 If the first character of the text input is a NUL, the most recently input text shall be input as if  
 114601 entered by the user, and then text input mode shall be exited. The text shall be input literally;  
 114602 that is, characters are neither macro or abbreviation expanded, nor are any characters interpreted  
 114603 in any special manner. It is unspecified whether implementations shall support more than 256  
 114604 bytes of remembered input text.

114605 **<control>-D**

114606 *Synopsis:* <control>-D

114607 The <control>-D character shall have no special meaning when in text input mode for a line-  
 114608 oriented command (see [Command Descriptions in vi](#), on page 3365).

114609 This command need not be supported on block-mode terminals.

114610 If the cursor does not follow an **autoindent** character, or an **autoindent** character and a '0' or  
 114611 '^' character:

- 114612 1. If the cursor is in column position 1, the <control>-D character shall be discarded and no  
 114613 further action taken.
- 114614 2. Otherwise, the <control>-D character shall have no special meaning.

114615 If the last input character was a '0', the cursor shall be moved to column position 1.

114616 Otherwise, if the last input character was a '^', the cursor shall be moved to column position 1.  
 114617 In addition, the **autoindent** level for the next input line shall be derived from the same line from  
 114618 which the **autoindent** level for the current input line was derived.

114619 Otherwise, the cursor shall be moved back to the column after the previous shiftwidth (see the  
 114620 *ex* **shiftwidth** command) boundary.

114621 All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
 114622 cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on  
 114623 page 3399).

114624 *Current line:* Unchanged.

114625 *Current column:* Set to 1 if the <control>-D was preceded by a '^' or '0'; otherwise, set to  
 114626 (column -1) - ((column -2) % **shiftwidth**).

114627 **<control>-H**

114628 *Synopsis:* <control>-H

114629 If in text input mode for a line-oriented command, and there are no characters to erase, text  
 114630 input mode shall be terminated, no further action shall be done for this command, and the  
 114631 current line and column shall be unchanged.

114632 If there are characters other than **autoindent** characters that have been input on the current line  
 114633 before the cursor, the cursor shall move back one character.

114634 Otherwise, if there are **autoindent** characters on the current line before the cursor, it is

implementation-defined whether the <control>-H command is an error or if the cursor moves back one **autoindent** character.

Otherwise, if the cursor is in column position 1 and there are previous lines that have been input, it is implementation-defined whether the <control>-H command is an error or if it is equivalent to entering <control>-H after the last input character on the previous input line.

Otherwise, it shall be an error.

All of the glyphs on columns between the starting cursor position and (inclusively) the ending cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on page 3399).

The current erase character (see *stty*) shall cause an equivalent action to the <control>-H command, unless the previously inserted character was a <backslash>, in which case it shall be as if the literal current erase character had been inserted instead of the <backslash>.

*Current line*: Unchanged, unless previously input lines are erased, in which case it shall be set to line -1.

*Current column*: Set to the first column that displays any portion of the character backed up over.

#### <newline>

*Synopsis*:     <newline>  
                  <carriage-return>  
                  <control>-J  
                  <control>-M

If input was part of a line-oriented command, text input mode shall be terminated and the command shall continue execution with the input provided.

Otherwise, terminate the current line. If there are no characters other than **autoindent** characters on the line, all characters on the line shall be discarded. Otherwise, it is unspecified whether the **autoindent** characters in the line are modified by entering these characters.

Continue text input mode on a new line appended after the current line. If the **slowopen** edit option is set, the lines on the screen below the current line shall not be pushed down, but the first of them shall be cleared and shall appear to be overwritten. Otherwise, the lines of the screen below the current line shall be pushed down.

If the **autoindent** edit option is set, an appropriate number of **autoindent** characters shall be added as a prefix to the line as described by the *ex* **autoindent** edit option.

All columns after the cursor that are erase-columns (as described in [Input Mode Commands in vi](#), on page 3399) shall be discarded.

If the **autoindent** edit option is set, all <blank> characters immediately following the cursor shall be discarded.

All remaining characters after the cursor shall be transferred to the new line, positioned after any **autoindent** characters.

*Current line*: Set to current line +1.

*Current column*: Set to the first column that displays any portion of the first character after the **autoindent** characters on the new line, if any, or the first column position after the last **autoindent** character, if any, or column position 1.

114676 **<control>-T**114677 *Synopsis:*      <control>-T114678 The <control>-T character shall have no special meaning when in text input mode for a line-  
114679 oriented command (see [Command Descriptions in vi](#), on page 3365).

114680 This command need not be supported on block-mode terminals.

114681 Behave as if the user entered the minimum number of <blank> characters necessary to move the  
114682 cursor forward to the column position after the next **shiftwidth** (see the *ex* **shiftwidth**  
114683 command) boundary.114684 *Current line:* Unchanged.114685 *Current column:* Set to  $column + \text{shiftwidth} - ((column - 1) \% \text{shiftwidth})$ .114686 **<control>-U**114687 *Synopsis:*      <control>-U114688 If there are characters other than **autoindent** characters that have been input on the current line  
114689 before the cursor, the cursor shall move to the first character input after the **autoindent**  
114690 characters.114691 Otherwise, if there are **autoindent** characters on the current line before the cursor, it is  
114692 implementation-defined whether the <control>-U command is an error or if the cursor moves to  
114693 the first column position on the line.114694 Otherwise, if the cursor is in column position 1 and there are previous lines that have been  
114695 input, it is implementation-defined whether the <control>-U command is an error or if it is  
114696 equivalent to entering <control>-U after the last input character on the previous input line.

114697 Otherwise, it shall be an error.

114698 All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
114699 cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on  
114700 page 3399).114701 The current *kill* character (see *stty*) shall cause an equivalent action to the <control>-U command,  
114702 unless the previously inserted character was a <backslash>, in which case it shall be as if the  
114703 literal current *kill* character had been inserted instead of the <backslash>.114704 *Current line:* Unchanged, unless previously input lines are erased, in which case it shall be set to  
114705 line -1.114706 *Current column:* Set to the first column that displays any portion of the last character backed up  
114707 over.114708 **<control>-V**114709 *Synopsis:*      <control>-V  
114710                      <control>-Q114711 Allow the entry of any subsequent character, other than <control>-J or the <newline>, as a literal  
114712 character, removing any special meaning that it may have to the editor in text input mode. If a  
114713 <control>-V or <control>-Q is entered before a <control>-J or <newline>, the <control>-V or  
114714 <control>-Q character shall be discarded, and the <control>-J or <newline> shall behave as  
114715 described in the <newline> command character during input mode.

114716 For purposes of the display only, the editor shall behave as if a ' ^ ' character was entered, and

the cursor shall be positioned as if overwriting the ' ^ ' character. When a subsequent character is entered, the editor shall behave as if that character was entered instead of the original <control>-V or <control>-Q character.

*Current line:* Unchanged.

*Current column:* Unchanged.

#### <control>-W

*Synopsis:*      <control>-W

If there are characters other than **autoindent** characters that have been input on the current line before the cursor, the cursor shall move back over the last word preceding the cursor (including any <blank> characters between the end of the last word and the current cursor); the cursor shall not move to before the first character after the end of any **autoindent** characters.

Otherwise, if there are **autoindent** characters on the current line before the cursor, it is implementation-defined whether the <control>-W command is an error or if the cursor moves to the first column position on the line.

Otherwise, if the cursor is in column position 1 and there are previous lines that have been input, it is implementation-defined whether the <control>-W command is an error or if it is equivalent to entering <control>-W after the last input character on the previous input line.

Otherwise, it shall be an error.

All of the glyphs on columns between the starting cursor position and (inclusively) the ending cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on page 3399).

*Current line:* Unchanged, unless previously input lines are erased, in which case it shall be set to line -1.

*Current column:* Set to the first column that displays any portion of the last character backed up over.

#### <ESC>

*Synopsis:*      <ESC>

If input was part of a line-oriented command:

1. If *interrupt* was entered, text input mode shall be terminated and the editor shall return to command mode. The terminal shall be alerted.
2. If <ESC> was entered, text input mode shall be terminated and the command shall continue execution with the input provided.

Otherwise, terminate text input mode and return to command mode.

Any **autoindent** characters entered on newly created lines that have no other non-<newline> characters shall be deleted.

Any leading **autoindent** and <blank> characters on newly created lines shall be rewritten to be the minimum number of <blank> characters possible.

The screen shall be redisplayed as necessary to match the contents of the edit buffer.

*Current line:* Unchanged.

114756 *Current column:*

- 114757 1. If there are text input characters on the current line, the column shall be set to the last
- 114758 column where any portion of the last text input character is displayed.
- 114759 2. Otherwise, if a character is displayed in the current column, unchanged.
- 114760 3. Otherwise, set to column position 1.

#### 114761 **EXIT STATUS**

114762 The following exit values shall be returned:

- 114763 0 Successful completion.
- 114764 >0 An error occurred.

#### 114765 **CONSEQUENCES OF ERRORS**

114766 When any error is encountered and the standard input is not a terminal device file, *vi* shall not

114767 write the file or return to command or text input mode, and shall terminate with a non-zero exit

114768 status.

114769 Otherwise, when an unrecoverable error is encountered it shall be equivalent to a SIGHUP

114770 asynchronous event.

114771 Otherwise, when an error is encountered, the editor shall behave as specified in [Command](#)

114772 [Descriptions in vi](#) (on page 3365).

#### 114773 **APPLICATION USAGE**

114774 None.

#### 114775 **EXAMPLES**

114776 None.

#### 114777 **RATIONALE**

114778 See the RATIONALE for [ex](#) for more information on *vi*. Major portions of the *vi* utility

114779 specification point to *ex* to avoid inadvertent divergence. While *ex* and *vi* have historically been

114780 implemented as a single utility, this is not required by POSIX.1-2008.

114781 It is recognized that portions of *vi* would be difficult, if not impossible, to implement

114782 satisfactorily on a block-mode terminal, or a terminal without any form of cursor addressing,

114783 thus it is not a mandatory requirement that such features should work on all terminals. It is the

114784 intention, however, that a *vi* implementation should provide the full set of capabilities on all

114785 terminals capable of supporting them.

114786 Historically, *vi* exited immediately if the standard input was not a terminal. POSIX.1-2008

114787 permits, but does not require, this behavior. An end-of-file condition is not equivalent to an end-

114788 of-file character. A common end-of-file character, <control>-D, is historically a *vi* command.

114789 The text in the STDOUT section reflects the usage of the verb *display* in this section; some

114790 implementations of *vi* use standard output to write to the terminal, but POSIX.1-2008 does not

114791 require that to be the case.

114792 Historically, implementations reverted to open mode if the terminal was incapable of supporting

114793 full visual mode. POSIX.1-2008 requires this behavior. Historically, the open mode of *vi* behaved

114794 roughly equivalently to the visual mode, with the exception that only a single line from the edit

114795 buffer (one “buffer line”) was kept current at any time. This line was normally displayed on the

114796 next-to-last line of a terminal with cursor addressing (and the last line performed its normal

114797 visual functions for line-oriented commands and messages). In addition, some few commands

114798 behaved differently in open mode than in visual mode. POSIX.1-2008 requires conformance to

114799 historical practice.

Historically, *ex* and *vi* implementations have expected text to proceed in the usual European/Latin order of left to right, top to bottom. There is no requirement in POSIX.1-2008 that this be the case. The specification was deliberately written using words like “before”, “after”, “first”, and “last” in order to permit implementations to support the natural text order of the language.

Historically, lines past the end of the edit buffer were marked with single <tilde> ('~') characters; that is, if the one-based display was 20 lines in length, and the last line of the file was on line one, then lines 2-20 would contain only a single '~' character.

Historically, the *vi* editor attempted to display only complete lines at the bottom of the screen (it did display partial lines at the top of the screen). If a line was too long to fit in its entirety at the bottom of the screen, the screen lines where the line would have been displayed were displayed as single '@' characters, instead of displaying part of the line. POSIX.1-2008 permits, but does not require, this behavior. Implementations are encouraged to attempt always to display a complete line at the bottom of the screen when doing scrolling or screen positioning by buffer lines.

Historically, lines marked with '@' were also used to minimize output to dumb terminals over slow lines; that is, changes local to the cursor were updated, but changes to lines on the screen that were not close to the cursor were simply marked with an '@' sign instead of being updated to match the current text. POSIX.1-2008 permits, but does not require this feature because it is used ever less frequently as terminals become smarter and connections are faster.

### Initialization in *ex* and *vi*

Historically, *vi* always had a line in the edit buffer, even if the edit buffer was “empty”. For example:

1. The *ex* command = executed from visual mode wrote “1” when the buffer was empty.
2. Writes from visual mode of an empty edit buffer wrote files of a single character (a <newline>), while writes from *ex* mode of an empty edit buffer wrote empty files.
3. Put and read commands into an empty edit buffer left an empty line at the top of the edit buffer.

For consistency, POSIX.1-2008 does not permit any of these behaviors.

Historically, *vi* did not always return the terminal to its original modes; for example, ICRNL was modified if it was not originally set. POSIX.1-2008 does not permit this behavior.

### Command Descriptions in *vi*

Motion commands are among the most complicated aspects of *vi* to describe. With some exceptions, the text region and buffer type effect of a motion command on a *vi* command are described on a case-by-case basis. The descriptions of text regions in POSIX.1-2008 are not intended to imply direction; that is, an inclusive region from line *n* to line *n*+5 is identical to a region from line *n*+5 to line *n*. This is of more than academic interest—movements to marks can be in either direction, and, if the **wraps** option is set, so can movements to search points. Historically, lines are always stored into buffers in text order; that is, from the start of the edit buffer to the end. POSIX.1-2008 requires conformance to historical practice.

Historically, command counts were applied to any associated motion, and were multiplicative to any supplied motion count. For example, **2cw** is the same as **c2w**, and **2c3w** is the same as **c6w**. POSIX.1-2008 requires this behavior. Historically, *vi* commands that used bigwords, words, paragraphs, and sentences as objects treated groups of empty lines, or lines that contained only

<blank> characters, inconsistently. Some commands treated them as a single entity, while others treated each line separately. For example, the **w**, **W**, and **B** commands treated groups of empty lines as individual words; that is, the command would move the cursor to each new empty line. The **e** and **E** commands treated groups of empty lines as a single word; that is, the first use would move past the group of lines. The **b** command would just beep at the user, or if done from the start of the line as a motion command, fail in unexpected ways. If the lines contained only (or ended with) <blank> characters, the **w** and **W** commands would just beep at the user, the **E** and **e** commands would treat the group as a single word, and the **B** and **b** commands would treat the lines as individual words. For consistency and simplicity of specification, POSIX.1-2008 requires that all *vi* commands treat groups of empty or blank lines as a single entity, and that movement through lines ending with <blank> characters be consistent with other movements.

Historically, *vi* documentation indicated that any number of double-quotes were skipped after punctuation marks at sentence boundaries; however, implementations only skipped single-quotes. POSIX.1-2008 requires both to be skipped.

Historically, the first and last characters in the edit buffer were word boundaries. This historical practice is required by POSIX.1-2008.

Historically, *vi* attempted to update the minimum number of columns on the screen possible, which could lead to misleading information being displayed. POSIX.1-2008 makes no requirements other than that the current character being entered is displayed correctly, leaving all other decisions in this area up to the implementation.

Historically, lines were arbitrarily folded between columns of any characters that required multiple column positions on the screen, with the exception of tabs, which terminated at the right-hand margin. POSIX.1-2008 permits the former and requires the latter. Implementations that do not arbitrarily break lines between columns of characters that occupy multiple column positions should not permit the cursor to rest on a column that does not contain any part of a character.

The historical *vi* had a problem in that all movements were by buffer lines, not by display or screen lines. This is often the right thing to do; for example, single line movements, such as **j** or **k**, should work on buffer lines. Commands like **dj**, or **j.**, where **.** is a change command, only make sense for buffer lines. It is not, however, the right thing to do for screen motion or scrolling commands like <control>-D, <control>-F, and **H**. If the window is fairly small, using buffer lines in these cases can result in completely random motion; for example, **1<control>-D** can result in a completely changed screen, without any overlap. This is clearly not what the user wanted. The problem is even worse in the case of the **H**, **L**, and **M** commands—as they position the cursor at the first non-<blank> of the line, they may all refer to the same location in large lines, and will result in no movement at all.

In addition, if the line is larger than the screen, using buffer lines can make it impossible to display parts of the line—there are not any commands that do not display the beginning of the line in historical *vi*, and if both the beginning and end of the line cannot be on the screen at the same time, the user suffers. Finally, the page and half-page scrolling commands historically moved to the first non-<blank> in the new line. If the line is approximately the same size as the screen, this is inadequate because the cursor before and after a <control>-D command will refer to the same location on the screen.

Implementations of *ex* and *vi* exist that do not have these problems because the relevant commands (<control>-B, <control>-D, <control>-F, <control>-U, <control>-Y, <control>-E, **H**, **L**, and **M**) operate on display (screen) lines, not (edit) buffer lines.

POSIX.1-2008 does not permit this behavior by default because the standard developers believed that users would find it too confusing. However, historical practice has been relaxed. For

example, *ex* and *vi* historically attempted, albeit sometimes unsuccessfully, to never put part of a line on the last lines of a screen; for example, if a line would not fit in its entirety, no part of the line was displayed, and the screen lines corresponding to the line contained single '@' characters. This behavior is permitted, but not required by POSIX.1-2008, so that it is possible for implementations to support long lines in small screens more reasonably without changing the commands to be oriented to the display (instead of oriented to the buffer). POSIX.1-2008 also permits implementations to refuse to edit any edit buffer containing a line that will not fit on the screen in its entirety.

The display area (for example, the value of the **window** edit option) has historically been “grown”, or expanded, to display new text when local movements are done in displays where the number of lines displayed is less than the maximum possible. Expansion has historically been the first choice, when the target line is less than the maximum possible expansion value away. Scrolling has historically been the next choice, done when the target line is less than half a display away, and otherwise, the screen was redrawn. There were exceptions, however, in that *ex* commands generally always caused the screen to be redrawn. POSIX.1-2008 does not specify a standard behavior because there may be external issues, such as connection speed, the number of characters necessary to redraw as opposed to scroll, or terminal capabilities that implementations will have to accommodate.

The current line in POSIX.1-2008 maps one-to-one to a buffer line in the file. The current column does not. There are two different column values that are described by POSIX.1-2008. The first is the current column value as set by many of the *vi* commands. This value is remembered for the lifetime of the editor. The second column value is the actual position on the screen where the cursor rests. The two are not always the same. For example, when the cursor is backed by a multi-column character, the actual cursor position on the screen has historically been the last column of the character in command mode, and the first column of the character in input mode.

Commands that set the current line, but that do not set the current cursor value (for example, **j** and **k**) attempt to get as close as possible to the remembered column position, so that the cursor tends to restrict itself to a vertical column as the user moves around in the edit buffer. POSIX.1-2008 requires conformance to historical practice, requiring that the display location of the cursor on the display line be adjusted from the current column value as necessary to support this historical behavior.

Historically, only a single line (and for some terminals, a single line minus 1 column) of characters could be entered by the user for the line-oriented commands; that is, **:**, **!**, **/**, or **?**. POSIX.1-2008 permits, but does not require, this limitation.

Historically, “soft” errors in *vi* caused the terminal to be alerted, but no error message was displayed. As a general rule, no error message was displayed for errors in command execution in *vi*, when the error resulted from the user attempting an invalid or impossible action, or when a searched-for object was not found. Examples of soft errors included **h** at the left margin, **<control>-B** or **[** at the beginning of the file, **2G** at the end of the file, and so on. In addition, errors such as **%**, **]**, **)**, **N**, **n**, **f**, **F**, **t**, and **T** failing to find the searched-for object were soft as well. Less consistently, **/** and **?** displayed an error message if the pattern was not found, **/**, **?**, **N**, and **n** displayed an error message if no previous regular expression had been specified, and **;** did not display an error message if no previous **f**, **F**, **t**, or **T** command had occurred. Also, behavior in this area might reasonably be based on a runtime evaluation of the speed of a network connection. Finally, some implementations have provided error messages for soft errors in order to assist naive users, based on the value of a verbose edit option. POSIX.1-2008 does not list specific errors for which an error message shall be displayed. Implementations should conform to historical practice in the absence of any strong reason to diverge.

## Page Backwards

The <control>-B and <control>-F commands historically considered it an error to attempt to page past the beginning or end of the file, whereas the <control>-D and <control>-U commands simply moved to the beginning or end of the file. For consistency, POSIX.1-2008 requires the latter behavior for all four commands. All four commands still consider it an error if the current line is at the beginning (<control>-B, <control>-U) or end (<control>-F, <control>-D) of the file. Historically, the <control>-B and <control>-F commands skip two lines in order to include overlapping lines when a single command is entered. This makes less sense in the presence of a *count*, as there will be, by definition, no overlapping lines. The actual calculation used by historical implementations of the *vi* editor for <control>-B was:

$$((\text{current first line}) - \text{count} \times (\text{window edit option})) + 2$$

and for <control>-F was:

$$((\text{current first line}) + \text{count} \times (\text{window edit option})) - 2$$

This calculation does not work well when intermixing commands with and without counts; for example, **3<control>-F is not equivalent to entering the <control>-F command three times, and is not reversible by entering the <control>-B command three times. For consistency with other *vi* commands that take counts, POSIX.1-2008 requires a different calculation.**

## Scroll Forward

The 4BSD and System V implementations of *vi* differed on the initial value used by the **scroll** command. 4BSD used:

$$((\text{window edit option}) + 1) / 2$$

while System V used the value of the **scroll** edit option. The System V version is specified by POSIX.1-2008 because the standard developers believed that it was more intuitive and permitted the user a method of setting the scroll value initially without also setting the number of lines that are displayed.

## Scroll Forward by Line

Historically, the <control>-E and <control>-Y commands considered it an error if the last and first lines, respectively, were already on the screen. POSIX.1-2008 requires conformance to historical practice. Historically, the <control>-E and <control>-Y commands had no effect in open mode. For simplicity and consistency of specification, POSIX.1-2008 requires that they behave as usual, albeit with a single line screen.

## Clear and Redisplay

The historical <control>-L command refreshed the screen exactly as it was supposed to be currently displayed, replacing any '@' characters for lines that had been deleted but not updated on the screen with refreshed '@' characters. The intent of the <control>-L command is to refresh when the screen has been accidentally overwritten; for example, by a **write** command from another user, or modem noise.

## Redraw Screen

The historical <control>-R command redisplayed only when necessary to update lines that had been deleted but not updated on the screen and that were flagged with '@' characters. There is no requirement that the screen be in any way refreshed if no lines of this form are currently displayed. POSIX.1-2008 permits implementations to extend this command to refresh lines on the screen flagged with '@' characters because they are too long to be displayed in the current framework; however, the current line and column need not be modified.

## Search for tagstring

Historically, the first non-<blank> at or after the cursor was the first character, and all subsequent characters that were word characters, up to the end of the line, were included. For example, with the cursor on the leading <space> or on the '#' character in the text "#bar@", the tag was "#bar". On the character 'b' it was "bar", and on the 'a' it was "ar". POSIX.1-2008 requires this behavior.

## Replace Text with Results from Shell Command

Historically, the <, >, and ! commands considered most cursor motions other than line-oriented motions an error; for example, the command >/foo<CR> succeeded, while the command >I failed, even though the text region described by the two commands might be identical. For consistency, all three commands only consider entire lines and not partial lines, and the region is defined as any line that contains a character that was specified by the motion.

## Move to Matching Character

Other matching characters have been left implementation-defined in order to allow extensions such as matching '<' and '>' for searching HTML, or #ifdef, #else, and #endif for searching C source.

## Repeat Substitution

POSIX.1-2008 requires that any c and g flags specified to the previous substitute command be ignored; however, the r flag may still apply, if supported by the implementation.

## Return to Previous (Context or Section)

The [I, ]I, (, ), {, and } commands are all affected by "section boundaries", but in some historical implementations not all of the commands recognize the same section boundaries. This is a bug, not a feature, and a unique section-boundary algorithm was not described for each command. One special case that is preserved is that the sentence command moves to the end of the last line of the edit buffer while the other commands go to the beginning, in order to preserve the traditional character cut semantics of the sentence command. Historically, vi section boundaries at the beginning and end of the edit buffer were the first non-<blank> on the first and last lines of the edit buffer if one exists; otherwise, the last character of the first and last lines of the edit buffer if one exists. To increase consistency with other section locations, this has been simplified by POSIX.1-2008 to the first character of the first and last lines of the edit buffer, or the first and the last lines of the edit buffer if they are empty.

Sentence boundaries were problematic in the historical vi. They were not only the boundaries as defined for the section and paragraph commands, but they were the first non-<blank> that occurred after those boundaries, as well. Historically, the vi section commands were documented as taking an optional window size as a count preceding the command. This was not implemented in historical versions, so POSIX.1-2008 requires that the count repeat the command,

115020 for consistency with other *vi* commands.

### 115021 Repeat

115022 Historically, mapped commands other than text input commands could not be repeated using  
115023 the **period** command. POSIX.1-2008 requires conformance to historical practice.

115024 The restrictions on the interpretation of special characters (for example, <control>-H) in the  
115025 repetition of text input mode commands is intended to match historical practice. For example,  
115026 given the input sequence:

```
115027 iab<control>-H<control>-H<control>-Hdef<escape>
```

115028 the user should be informed of an error when the sequence is first entered, but not during a  
115029 command repetition. The character <control>-T is specifically exempted from this restriction.  
115030 Historical implementations of *vi* ignored <control>-T characters that were input in the original  
115031 command during command repetition. POSIX.1-2008 prohibits this behavior.

### 115032 Find Regular Expression

115033 Historically, commands did not affect the line searched to or from if the motion command was a  
115034 search (*/*, *?*, *N*, *n*) and the final position was the start/end of the line. There were some special  
115035 cases and *vi* was not consistent. POSIX.1-2008 does not permit this behavior, for consistency.  
115036 Historical implementations permitted but were unable to handle searches as motion commands  
115037 that wrapped (that is, due to the edit option **wrapscreen**) to the original location. POSIX.1-2008  
115038 requires that this behavior be treated as an error.

115039 Historically, the syntax */RE/0* was used to force the command to cut text in line mode.  
115040 POSIX.1-2008 requires conformance to historical practice.

115041 Historically, in open mode, a **z** specified to a search command redisplayed the current line  
115042 instead of displaying the current screen with the current line highlighted. For consistency and  
115043 simplicity of specification, POSIX.1-2008 does not permit this behavior.

115044 Historically, trailing **z** commands were permitted and ignored if entered as part of a search used  
115045 as a motion command. For consistency and simplicity of specification, POSIX.1-2008 does not  
115046 permit this behavior.

### 115047 Execute an *ex* Command

115048 Historically, *vi* implementations restricted the commands that could be entered on the colon  
115049 command line (for example, **append** and **change**), and some other commands were known to  
115050 cause them to fail catastrophically. For consistency, POSIX.1-2008 does not permit these  
115051 restrictions. When executing an *ex* command by entering *:*, it is not possible to enter a <newline>  
115052 as part of the command because it is considered the end of the command. A different approach  
115053 is to enter *ex* command mode by using the *vi* **Q** command (and later resuming visual mode with  
115054 the *ex* **vi** command). In *ex* command mode, the single-line limitation does not exist. So, for  
115055 example, the following is valid:

```
115056 Q
115057 s/break here/break\
115058 here/
115059 vi
```

115060 POSIX.1-2008 requires that, if the *ex* command overwrites any part of the screen that would be  
115061 erased by a refresh, *vi* pauses for a character from the user. Historically, this character could be  
115062 any character; for example, a character input by the user before the message appeared, or even a

mapped character. This is probably a bug, but implementations that have tried to be more rigorous by requiring that the user enter a specific character, or that the user enter a character after the message was displayed, have been forced by user indignation back into historical behavior. POSIX.1-2008 requires conformance to historical practice.

### Shift Left (Right)

Refer to the Rationale for the **!** and **/** commands. Historically, the **<** and **>** commands sometimes moved the cursor to the first non-**<blank>** (for example if the command was repeated or with **\_** as the motion command), and sometimes left it unchanged. POSIX.1-2008 does not permit this inconsistency, requiring instead that the cursor always move to the first non-**<blank>**. Historically, the **<** and **>** commands did not support buffer arguments, although some implementations allow the specification of an optional buffer. This behavior is neither required nor disallowed by POSIX.1-2008.

### Execute

Historically, buffers could execute other buffers, and loops, infinite and otherwise, were possible. POSIX.1-2008 requires conformance to historical practice. The *\*buffer* syntax of *ex* is not required in *vi*, because it is not historical practice and has been used in some *vi* implementations to support additional scripting languages.

### Reverse Case

Historically, the **~** command ignored any associated *count*, and acted only on the characters in the current line. For consistency with other *vi* commands, POSIX.1-2008 requires that an associated *count* act on the next *count* characters, and that the command move to subsequent lines if warranted by *count*, to make it possible to modify large pieces of text in a reasonably efficient manner. There exist *vi* implementations that optionally require an associated motion command for the **~** command. Implementations supporting this functionality are encouraged to base it on the **tildedop** edit option and handle the text regions and cursor positioning identically to the **yank** command.

### Append

Historically, *counts* specified to the **A**, **a**, **I**, and **i** commands repeated the input of the first line *count* times, and did not repeat the subsequent lines of the input text. POSIX.1-2008 requires that the entire text input be repeated *count* times.

### Move Backward to Preceding Word

Historically, *vi* became confused if word commands were used as motion commands in empty files. POSIX.1-2008 requires that this be an error. Historical implementations of *vi* had a large number of bugs in the word movement commands, and they varied greatly in behavior in the presence of empty lines, “words” made up of a single character, and lines containing only **<blank>** characters. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

### Change to End-of-Line

Some historical implementations of the **C** command did not behave as described by POSIX.1-2008 when the **\$** key was remapped because they were implemented by pushing the **\$** key onto the input queue and reprocessing it. POSIX.1-2008 does not permit this behavior. Historically, the **C**, **S**, and **s** commands did not copy replaced text into the numeric buffers. For consistency and simplicity of specification, POSIX.1-2008 requires that they behave like their respective **c** commands in all respects.

### Delete

Historically, lines in open mode that were deleted were scrolled up, and an **@** glyph written over the beginning of the line. In the case of terminals that are incapable of the necessary cursor motions, the editor erased the deleted line from the screen. POSIX.1-2008 requires conformance to historical practice; that is, if the terminal cannot display the **'@'** character, the line cannot remain on the screen.

### Delete to End-of-Line

Some historical implementations of the **D** command did not behave as described by POSIX.1-2008 when the **\$** key was remapped because they were implemented by pushing the **\$** key onto the input queue and reprocessing it. POSIX.1-2008 does not permit this behavior.

### Join

An historical oddity of *vi* is that the commands **J**, **1J**, and **2J** are all equivalent. POSIX.1-2008 requires conformance to historical practice. The *vi* **J** command is specified in terms of the *ex* **join** command with an *ex* command *count* value. The address correction for a *count* that is past the end of the edit buffer is necessary for historical compatibility for both *ex* and *vi*.

### Mark Position

Historical practice is that only lowercase letters, plus backquote and single-quote, could be used to mark a cursor position. POSIX.1-2008 requires conformance to historical practice, but encourages implementations to support other characters as marks as well.

### Repeat Regular Expression Find (Forward and Reverse)

Historically, the **N** and **n** commands could not be used as motion components for the **c** command. With the exception of the **cN** command, which worked if the search crossed a line boundary, the text region would be discarded, and the user would not be in text input mode. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

### Insert Empty Line (Below and Above)

Historically, counts to the **O** and **o** commands were used as the number of physical lines to open, if the terminal was dumb and the **slowopen** option was not set. This was intended to minimize traffic over slow connections and repainting for dumb terminals. POSIX.1-2008 does not permit this behavior, requiring that a *count* to the open command behave as for other text input commands. This change to historical practice was made for consistency, and because a superset of the functionality is provided by the **slowopen** edit option.

### Put from Buffer (Following and Before)

Historically, *counts* to the **p** and **P** commands were ignored if the buffer was a line mode buffer, but were (mostly) implemented as described in POSIX.1-2008 if the buffer was a character mode buffer. Because implementations exist that do not have this limitation, and because pasting lines multiple times is generally useful, POSIX.1-2008 requires that *count* be supported for all **p** and **P** commands.

Historical implementations of *vi* were widely known to have major problems in the **p** and **P** commands, particularly when unusual regions of text were copied into the edit buffer. The standard developers viewed these as bugs, and they are not permitted for consistency and simplicity of specification.

Historically, a **P** or **p** command (or an *ex* **put** command executed from open or visual mode) executed in an empty file, left an empty line as the first line of the file. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

### Replace Character

Historically, the **r** command did not correctly handle the *erase* and *word erase* characters as arguments, nor did it handle an associated *count* greater than 1 with a <carriage-return> argument, for which it replaced *count* characters with a single <newline>. POSIX.1-2008 does not permit these inconsistencies.

Historically, the **r** command permitted the <control>-V escaping of entered characters, such as <ESC> and the <carriage-return>; however, it required two leading <control>-V characters instead of one. POSIX.1-2008 requires that this be changed for consistency with the other text input commands of *vi*.

Historically, it is an error to enter the **r** command if there are less than *count* characters at or after the cursor in the line. While a reasonable and unambiguous extension would be to permit the **r** command on empty lines, it would require that too large a *count* be adjusted to match the number of characters at or after the cursor for consistency, which is sufficiently different from historical practice to be avoided. POSIX.1-2008 requires conformance to historical practice.

### Replace Characters

Historically, if there were **autoindent** characters in the line on which the **R** command was run, and **autoindent** was set, the first <newline> would be properly indented and no characters would be replaced by the <newline>. Each additional <newline> would replace *n* characters, where *n* was the number of characters that were needed to indent the rest of the line to the proper indentation level. This behavior is a bug and is not permitted by POSIX.1-2008.

### Undo

Historical practice for cursor positioning after undoing commands was mixed. In most cases, when undoing commands that affected a single line, the cursor was moved to the start of added or changed text, or immediately after deleted text. However, if the user had moved from the line being changed, the column was either set to the first non-<blank>, returned to the origin of the command, or remained unchanged. When undoing commands that affected multiple lines or entire lines, the cursor was moved to the first character in the first line restored. As an example of how inconsistent this was, a search, followed by an **o** text input command, followed by an **undo** would return the cursor to the location where the **o** command was entered, but a **cw** command followed by an **o** command followed by an **undo** would return the cursor to the first non-<blank> of the line. POSIX.1-2008 requires the most useful of these behaviors, and discards the least useful, in the interest of consistency and simplicity of specification.

## Yank

Historically, the **yank** command did not move to the end of the motion if the motion was in the forward direction. It moved to the end of the motion if the motion was in the backward direction, except for the **\_** command, or for the **G** and **'** commands when the end of the motion was on the current line. This was further complicated by the fact that for a number of motion commands, the **yank** command moved the cursor but did not update the screen; for example, a subsequent command would move the cursor from the end of the motion, even though the cursor on the screen had not reflected the cursor movement for the **yank** command. POSIX.1-2008 requires that all **yank** commands associated with backward motions move the cursor to the end of the motion for consistency, and specifically, to make **'** commands as motions consistent with search patterns as motions.

## Yank Current Line

Some historical implementations of the **Y** command did not behave as described by POSIX.1-2008 when the **'\_'** key was remapped because they were implemented by pushing the **'\_'** key onto the input queue and reprocessing it. POSIX.1-2008 does not permit this behavior.

## Redraw Window

Historically, the **z** command always redrew the screen. This is permitted but not required by POSIX.1-2008, because of the frequent use of the **z** command in macros such as **map n nz.** for screen positioning, instead of its use to change the screen size. The standard developers believed that expanding or scrolling the screen offered a better interface for users. The ability to redraw the screen is preserved if the optional new window size is specified, and in the **<control>-L** and **<control>-R** commands.

The semantics of **z^** are confusing at best. Historical practice is that the screen before the screen that ended with the specified line is displayed. POSIX.1-2008 requires conformance to historical practice.

Historically, the **z** command would not display a partial line at the top or bottom of the screen. If the partial line would normally have been displayed at the bottom of the screen, the command worked, but the partial line was replaced with **'@'** characters. If the partial line would normally have been displayed at the top of the screen, the command would fail. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

Historically, the **z** command with a line specification of 1 ignored the command. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

Historically, the **z** command did not set the cursor column to the first non-**<blank>** for the character if the first screen was to be displayed, and was already displayed. For consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

## Input Mode Commands in vi

Historical implementations of **vi** did not permit the user to erase more than a single line of input, or to use normal erase characters such as *line erase*, *worderase*, and *erase* to erase **autoindent** characters. As there exist implementations of **vi** that do not have these limitations, both behaviors are permitted, but only historical practice is required. In the case of these extensions, **vi** is required to pause at the **autoindent** and previous line boundaries.

Historical implementations of **vi** updated only the portion of the screen where the current cursor character was displayed. For example, consider the **vi** input keystrokes:

```
iabcd<escape>0C<tab>
```

Historically, the <tab> would overwrite the characters "abcd" when it was displayed. Other implementations replace only the 'a' character with the <tab>, and then push the rest of the characters ahead of the cursor. Both implementations have problems. The historical implementation is probably visually nicer for the above example; however, for the keystrokes:

```
iabcd<ESC>OR<tab><ESC>
```

the historical implementation results in the string "bcd" disappearing and then magically reappearing when the <ESC> character is entered. POSIX.1-2008 requires the former behavior when overwriting erase-columns—that is, overwriting characters that are no longer logically part of the edit buffer—and the latter behavior otherwise.

Historical implementations of *vi* discarded the <control>-D and <control>-T characters when they were entered at places where their command functionality was not appropriate. POSIX.1-2008 requires that the <control>-T functionality always be available, and that <control>-D be treated as any other key when not operating on **autoindent** characters.

## NUL

Some historical implementations of *vi* limited the number of characters entered using the NUL input character to 256 bytes. POSIX.1-2008 permits this limitation; however, implementations are encouraged to remove this limit.

## <control>-D

See also Rationale for the input mode command <newline>. The hidden assumptions in the <control>-D command (and in the *vi* **autoindent** specification in general) is that <space> characters take up a single column on the screen and that <tab> characters are comprised of an integral number of <space> characters.

## <newline>

Implementations are permitted to rewrite **autoindent** characters in the line when <newline>, <carriage-return>, <control>-D, and <control>-T are entered, or when the **shift** commands are used, because historical implementations have both done so and found it necessary to do so. For example, a <control>-D when the cursor is preceded by a single <tab>, with **tabstop** set to 8, and **shiftwidth** set to 3, will result in the <tab> being replaced by several <space> characters.

## <control>-T

See also the Rationale for the input mode command <newline>. Historically, <control>-T only worked if no non-<blank> characters had yet been input in the current input line. In addition, the characters inserted by <control>-T were treated as **autoindent** characters, and could not be erased using normal user erase characters. Because implementations exist that do not have these limitations, and as moving to a column boundary is generally useful, POSIX.1-2008 requires that both limitations be removed.

**<control>-V**

Historically, *vi* used **^V**, regardless of the value of the literal-next character of the terminal. POSIX.1-2008 requires conformance to historical practice.

The uses described for <control>-V can also be accomplished with <control>-Q, which is useful on terminals that use <control>-V for the down-arrow function. However, most historical implementations use <control>-Q for the *termios* START character, so the editor will generally not receive the <control>-Q unless **stty ixon** mode is set to off. (In addition, some historical implementations of *vi* explicitly set **ixon** mode to on, so it was difficult for the user to set it to off.) Any of the command characters described in POSIX.1-2008 can be made ineffective by their selection as *termios* control characters, using the *stty* utility or other methods described in the System Interfaces volume of POSIX.1-2008.

**<ESC>**

Historically, SIGINT alerted the terminal when used to end input mode. This behavior is permitted, but not required, by POSIX.1-2008.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*ed*, *ex*, *stty*

XBD [Section 12.2](#) (on page 216)

**CHANGE HISTORY**

First released in Issue 2.

**Issue 5**

The FUTURE DIRECTIONS section is added.

**Issue 6**

This utility is marked as part of the User Portability Utilities option.

The APPLICATION USAGE section is added.

The obsolescent SYNOPSIS is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **reindent** command description is added.

The *vi* utility has been extensively rewritten for alignment with the IEEE P1003.2b draft standard.

IEEE PASC Interpretations 1003.2 #57, #62, #63, #64, #78, and #188 are applied.

IEEE PASC Interpretation 1003.2 #207 is applied, clarifying the description of the **R** command in a manner similar to the descriptions of other text input mode commands such as **i**, **o**, and **O**.

The **-l** option is removed.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/41 is applied, adding *[count]* to the Synopsis for **[[**.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/42 is applied, adding *[count]* to the Synopsis for **]]**.

115302 **Issue 7**

115303 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that '+' may be recognized  
115304 as an option delimiter in the OPTIONS section.

115305 Austin Group Interpretation 1003.1-2001 #087 is applied, updating the Put from Buffer Before (P)  
115306 command description to address multi-line requirements.

115307 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

115308 **NAME**

115309       wait — await process completion

115310 **SYNOPSIS**115311       wait [*pid*...]115312 **DESCRIPTION**

115313       When an asynchronous list (see [Section 2.9.3.1](#), on page 2360) is started by the shell, the process  
 115314       ID of the last command in each element of the asynchronous list shall become known in the  
 115315       current shell execution environment; see [Section 2.12](#) (on page 2371).

115316       If the *wait* utility is invoked with no operands, it shall wait until all process IDs known to the  
 115317       invoking shell have terminated and exit with a zero exit status.

115318       If one or more *pid* operands are specified that represent known process IDs, the *wait* utility shall  
 115319       wait until all of them have terminated. If one or more *pid* operands are specified that represent  
 115320       unknown process IDs, *wait* shall treat them as if they were known process IDs that exited with  
 115321       exit status 127. The exit status returned by the *wait* utility shall be the exit status of the process  
 115322       requested by the last *pid* operand.

115323       The known process IDs are applicable only for invocations of *wait* in the current shell execution  
 115324       environment.

115325 **OPTIONS**

115326       None.

115327 **OPERANDS**

115328       The following operand shall be supported:

115329       *pid*           One of the following:

- 115330           1. The unsigned decimal integer process ID of a command, for which the  
 115331           utility is to wait for the termination.
- 115332           2. A job control job ID (see XBD [Section 3.204](#), on page 66) that identifies a  
 115333           background process group to be waited for. The job control job ID notation  
 115334           is applicable only for invocations of *wait* in the current shell execution  
 115335           environment; see [Section 2.12](#) (on page 2371). The exit status of *wait* shall be  
 115336           determined by the last command in the pipeline.

115337       **Note:**       The job control job ID type of *pid* is only available on systems supporting  
 115338       the User Portability Utilities option.

115339 **STDIN**

115340       Not used.

115341 **INPUT FILES**

115342       None.

115343 **ENVIRONMENT VARIABLES**115344       The following environment variables shall affect the execution of *wait*:

115345       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 115346       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 115347       variables used to determine the values of locale categories.)

115348       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 115349       internationalization variables.

115350	<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).
115351		
115352		
115353	<i>LC_MESSAGES</i>	
115354		Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
115355		
115356	XSI <i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
115357	<b>ASYNCHRONOUS EVENTS</b>	
115358		Default.
115359	<b>STDOUT</b>	
115360		Not used.
115361	<b>STDERR</b>	
115362		The standard error shall be used only for diagnostic messages.
115363	<b>OUTPUT FILES</b>	
115364		None.
115365	<b>EXTENDED DESCRIPTION</b>	
115366		None.
115367	<b>EXIT STATUS</b>	
115368		If one or more operands were specified, all of them have terminated or were not known by the invoking shell, and the status of the last operand specified is known, then the exit status of <i>wait</i> shall be the exit status information of the command indicated by the last operand specified. If the process terminated abnormally due to the receipt of a signal, the exit status shall be greater than 128 and shall be distinct from the exit status generated by other signals, but the exact value is unspecified. (See the <i>kill</i> <i>-l</i> option.) Otherwise, the <i>wait</i> utility shall exit with one of the following values:
115369		
115370		
115371		
115372		
115373		
115374		
115375	0	The <i>wait</i> utility was invoked with no operands and all process IDs known by the invoking shell have terminated.
115376		
115377	1-126	The <i>wait</i> utility detected an error.
115378	127	The command identified by the last <i>pid</i> operand specified is unknown.
115379	<b>CONSEQUENCES OF ERRORS</b>	
115380		Default.
115381	<b>APPLICATION USAGE</b>	
115382		On most implementations, <i>wait</i> is a shell built-in. If it is called in a subshell or separate utility execution environment, such as one of the following:
115383		
115384		
115385		( <i>wait</i> )
115386		<i>nohup wait</i> ...
115387		<i>find . -exec wait</i> ... \;
115388		it returns immediately because there are no known process IDs to wait for in those environments.
115389		Historical implementations of interactive shells have discarded the exit status of terminated background processes before each shell prompt. Therefore, the status of background processes was usually lost unless it terminated while <i>wait</i> was waiting for it. This could be a serious problem when a job that was expected to run for a long time actually terminated quickly with a syntax or initialization error because the exit status returned was usually zero if the requested
115390		
115391		
115392		
115393		

process ID was not found. This volume of POSIX.1-2008 requires the implementation to keep the status of terminated jobs available until the status is requested, so that scripts like:

```
j1&
p1=$!
j2&
wait $p1
echo Job 1 exited with status $?
wait $!
echo Job 2 exited with status $?
```

work without losing status on any of the jobs. The shell is allowed to discard the status of any process if it determines that the application cannot get the process ID for that process from the shell. It is also required to remember only {CHILD\_MAX} number of processes in this way. Since the only way to get the process ID from the shell is by using the '!' shell parameter, the shell is allowed to discard the status of an asynchronous list if "\$!" was not referenced before another asynchronous list was started. (This means that the shell only has to keep the status of the last asynchronous list started if the application did not reference "\$!". If the implementation of the shell is smart enough to determine that a reference to "\$!" was not saved anywhere that the application can retrieve it later, it can use this information to trim the list of saved information. Note also that a successful call to *wait* with no operands discards the exit status of all asynchronous lists.)

If the exit status of *wait* is greater than 128, there is no way for the application to know if the waited-for process exited with that value or was killed by a signal. Since most utilities exit with small values, there is seldom any ambiguity. Even in the ambiguous cases, most applications just need to know that the asynchronous job failed; it does not matter whether it detected an error and failed or was killed and did not complete its job normally.

#### EXAMPLES

Although the exact value used when a process is terminated by a signal is unspecified, if it is known that a signal terminated a process, a script can still reliably determine which signal by using *kill* as shown by the following script:

```
sleep 1000&
pid=$!
kill -kill $pid
wait $pid
echo $pid was terminated by a SIG$(kill -l $?) signal.
```

If the following sequence of commands is run in less than 31 seconds:

```
sleep 257 | sleep 31 &
jobs -l %%
```

either of the following commands returns the exit status of the second *sleep* in the pipeline:

```
wait <pid of sleep 31>
wait %%
```

#### RATIONALE

The description of *wait* does not refer to the *waitpid()* function from the System Interfaces volume of POSIX.1-2008 because that would needlessly overspecify this interface. However, the wording means that *wait* is required to wait for an explicit process when it is given an argument so that the status information of other processes is not consumed. Historical implementations use the *wait()* function defined in the System Interfaces volume of POSIX.1-2008 until *wait()* returns the requested process ID or finds that the requested process does not exist. Because this

115441 means that a shell script could not reliably get the status of all background children if a second  
115442 background job was ever started before the first job finished, it is recommended that the *wait*  
115443 utility use a method such as the functionality provided by the *waitpid()* function.

115444 The ability to wait for multiple *pid* operands was adopted from the KornShell.

115445 This new functionality was added because it is needed to determine the exit status of any  
115446 asynchronous list accurately. The only compatibility problem that this change creates is for a  
115447 script like

```
115448 while sleep 60 do  
115449     job& echo Job started $(date) as $! done
```

115450 which causes the shell to monitor all of the jobs started until the script terminates or runs out of  
115451 memory. This would not be a problem if the loop did not reference "\$!" or if the script would  
115452 occasionally *wait* for jobs it started.

#### 115453 FUTURE DIRECTIONS

115454 None.

#### 115459 CHANGE HISTORY

115460 First released in Issue 2.

115461 **NAME**115462 `wc` — word, line, and byte or character count115463 **SYNOPSIS**115464 `wc [-c|-m] [-lw] [file...]`115465 **DESCRIPTION**115466 The *wc* utility shall read one or more input files and, by default, write the number of <newline>  
115467 characters, words, and bytes contained in each input file to the standard output.115468 The utility also shall write a total count for all named files, if more than one input file is  
115469 specified.115470 The *wc* utility shall consider a *word* to be a non-zero-length string of characters delimited by  
115471 white space.115472 **OPTIONS**115473 The *wc* utility shall conform to XBD [Section 12.2](#) (on page 216).

115474 The following options shall be supported:

115475 **-c** Write to the standard output the number of bytes in each input file.115476 **-l** Write to the standard output the number of <newline> characters in each input  
115477 file.115478 **-m** Write to the standard output the number of characters in each input file.115479 **-w** Write to the standard output the number of words in each input file.115480 When any option is specified, *wc* shall report only the information requested by the specified  
115481 options.115482 **OPERANDS**

115483 The following operand shall be supported:

115484 *file* A pathname of an input file. If no *file* operands are specified, the standard input  
115485 shall be used.115486 **STDIN**115487 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
115488 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
115489 the standard input shall not be used. See the INPUT FILES section.115490 **INPUT FILES**

115491 The input files may be of any type.

115492 **ENVIRONMENT VARIABLES**115493 The following environment variables shall affect the execution of *wc*:115494 **LANG** Provide a default value for the internationalization variables that are unset or null.  
115495 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
115496 variables used to determine the values of locale categories.)115497 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
115498 internationalization variables.115499 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
115500 characters (for example, single-byte as opposed to multi-byte characters in  
115501 arguments and input files) and which characters are defined as white-space  
115502 characters.

- 115503 *LC\_MESSAGES*
- 115504 Determine the locale that should be used to affect the format and contents of
- 115505 diagnostic messages written to standard error and informative messages written to
- 115506 standard output.
- 115507 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 115508 **ASYNCHRONOUS EVENTS**
- 115509 Default.
- 115510 **STDOUT**
- 115511 By default, the standard output shall contain an entry for each input file of the form:
- 115512 "%d %d %d %s\n", <newlines>, <words>, <bytes>, <file>
- 115513 If the **-m** option is specified, the number of characters shall replace the <bytes> field in this
- 115514 format.
- 115515 If any options are specified and the **-l** option is not specified, the number of <newline>
- 115516 characters shall not be written.
- 115517 If any options are specified and the **-w** option is not specified, the number of words shall not be
- 115518 written.
- 115519 If any options are specified and neither **-c** nor **-m** is specified, the number of bytes or characters
- 115520 shall not be written.
- 115521 If no input *file* operands are specified, no name shall be written and no <blank> characters
- 115522 preceding the pathname shall be written.
- 115523 If more than one input *file* operand is specified, an additional line shall be written, of the same
- 115524 format as the other lines, except that the word **total** (in the POSIX locale) shall be written instead
- 115525 of a pathname and the total of each column shall be written as appropriate. Such an additional
- 115526 line, if any, is written at the end of the output.
- 115527 **STDERR**
- 115528 The standard error shall be used only for diagnostic messages.
- 115529 **OUTPUT FILES**
- 115530 None.
- 115531 **EXTENDED DESCRIPTION**
- 115532 None.
- 115533 **EXIT STATUS**
- 115534 The following exit values shall be returned:
- 115535 0 Successful completion.
- 115536 >0 An error occurred.
- 115537 **CONSEQUENCES OF ERRORS**
- 115538 Default.

**115539 APPLICATION USAGE**

115540 The **-m** option is not a switch, but an option at the same level as **-c**. Thus, to produce the full  
115541 default output with character counts instead of bytes, the command required is:

115542 `wc -mlw`

**115543 EXAMPLES**

115544 None.

**115545 RATIONALE**

115546 The output file format *pseudo-printf()* string differs from the System V version of *wc*:

115547 `"%7d%7d%7d %s\n"`

115548 which produces possibly ambiguous and unparseable results for very large files, as it assumes no  
115549 number shall exceed six digits.

115550 Some historical implementations use only <space>, <tab>, and <newline> as word separators.  
115551 The equivalent of the ISO C standard *isspace()* function is more appropriate.

115552 The **-c** option stands for “character” count, even though it counts bytes. This stems from the  
115553 sometimes erroneous historical view that bytes and characters are the same size. Due to  
115554 international requirements, the **-m** option (reminiscent of “multi-byte”) was added to obtain  
115555 actual character counts.

115556 Early proposals only specified the results when input files were text files. The current  
115557 specification more closely matches historical practice. (Bytes, words, and <newline> characters  
115558 are counted separately and the results are written when an end-of-file is detected.)

115559 Historical implementations of the *wc* utility only accepted one argument to specify the options  
115560 **-c**, **-l**, and **-w**. Some of them also had multiple occurrences of an option cause the  
115561 corresponding count to be written multiple times and had the order of specification of the  
115562 options affect the order of the fields on output, but did not document either of these. Because  
115563 common usage either specifies no options or only one option, and because none of this was  
115564 documented, the changes required by this volume of POSIX.1-2008 should not break many  
115565 historical applications (and do not break any historical conforming applications).

**115566 FUTURE DIRECTIONS**

115567 None.

**115568 SEE ALSO**

115569 *cksum*

115570 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

**115571 CHANGE HISTORY**

115572 First released in Issue 2.

**115573 Issue 7**

115574 Austin Group Interpretation 1003.1-2001 #092 is applied.

115575 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

115576 **NAME**115577        what — identify SCCS files (**DEVELOPMENT**)115578 **SYNOPSIS**115579 XSI        `what [-s] file...`115580 **DESCRIPTION**

115581        The *what* utility shall search the given files for all occurrences of the pattern that *get* (see *get*)  
 115582        substitutes for the %Z% keyword ("@( # )") and shall write to standard output what follows  
 115583        until the first occurrence of one of the following:

115584        "    &gt;    newline    \    NUL

115585 **OPTIONS**115586        The *what* utility shall conform to XBD [Section 12.2](#) (on page 216).

115587        The following option shall be supported:

115588        -s            Quit after finding the first occurrence of the pattern in each file.

115589 **OPERANDS**

115590        The following operands shall be supported:

115591        *file*            A pathname of a file to search.115592 **STDIN**

115593        Not used.

115594 **INPUT FILES**

115595        The input files shall be of any file type.

115596 **ENVIRONMENT VARIABLES**115597        The following environment variables shall affect the execution of *what*:

115598        *LANG*            Provide a default value for the internationalization variables that are unset or null.  
 115599                          (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 115600                          variables used to determine the values of locale categories.)

115601        *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
 115602                          internationalization variables.

115603        *LC\_CTYPE*        Determine the locale for the interpretation of sequences of bytes of text data as  
 115604                          characters (for example, single-byte as opposed to multi-byte characters in  
 115605                          arguments and input files).

115606        *LC\_MESSAGES*

115607                          Determine the locale that should be used to affect the format and contents of  
 115608                          diagnostic messages written to standard error.

115609        *NLSPATH*        Determine the location of message catalogs for the processing of *LC\_MESSAGES*.115610 **ASYNCHRONOUS EVENTS**

115611        Default.

115612 **STDOUT**115613        The standard output shall consist of the following for each *file* operand:

115614        "%s:\n\t%s\n", &lt;pathname&gt;, &lt;identification string&gt;

**115615 STDERR**

115616 The standard error shall be used only for diagnostic messages.

**115617 OUTPUT FILES**

115618 None.

**115619 EXTENDED DESCRIPTION**

115620 None.

**115621 EXIT STATUS**

115622 The following exit values shall be returned:

115623 0 Any matches were found.

115624 1 Otherwise.

**115625 CONSEQUENCES OF ERRORS**

115626 Default.

**115627 APPLICATION USAGE**

115628 The *what* utility is intended to be used in conjunction with the SCCS command *get*, which  
115629 automatically inserts identifying information, but it can also be used where the information is  
115630 inserted by any other means.

115631 When the string "@(#)" is included in a library routine in a shared library, it might not be found  
115632 in an **a.out** file using that library routine.

**115633 EXAMPLES**

115634 If the C-language program in file **f.c** contains:

115635 `char ident[] = "@(#)identification information";`

115636 and **f.c** is compiled to yield **f.o** and **a.out**, then the command:

115637 `what f.c f.o a.out`

115638 writes:

115639 **f.c:**  
115640     identification information  
115641     ...  
115642 **f.o:**  
115643     identification information  
115644     ...  
115645 **a.out:**  
115646     identification information  
115647     ...

**115648 RATIONALE**

115649 None.

**115650 FUTURE DIRECTIONS**

115651 None.

**115652 SEE ALSO**

115653 *get*

115654 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

115655 **CHANGE HISTORY**  
115656 First released in Issue 2.

115657 **NAME**

115658       who — display who is on the system

115659 **SYNOPSIS**

115660 XSI       who [-mTu] [-abdHlprt] [file]

115661 XSI       who [-mu] -s [-bHlprt] [file]

115662       who -q [file]

115663       who am i

115664       who am I

115665 **DESCRIPTION**115666       The *who* utility shall list various pieces of information about accessible users. The domain of  
115667       accessibility is implementation-defined.115668 XSI       Based on the options given, *who* can also list the user's name, terminal line, login time, elapsed  
115669       time since activity occurred on the line, and the process ID of the command interpreter for each  
115670       current system user.115671 **OPTIONS**115672       The *who* utility shall conform to XBD [Section 12.2](#) (on page 216).115673       The following options shall be supported. The metavariables, such as *<line>*, refer to fields  
115674       described in the STDOUT section.115675 XSI       **-a**       Process the implementation-defined database or named file with the **-b**, **-d**, **-l**, **-p**,  
115676       **-r**, **-t**, **-T** and **-u** options turned on.115677 XSI       **-b**       Write the time and date of the last system reboot. The system reboot time is the  
115678       time at which the implementation is able to commence running processes.115679 XSI       **-d**       Write a list of all processes that have expired and not been respawned by the *init*  
115680       system process. The *<exit>* field shall appear for dead processes and contain the  
115681       termination and exit values of the dead process. This can be useful in determining  
115682       why a process terminated.115683 XSI       **-H**       Write column headings above the regular output.115684 XSI       **-l**       (The letter ell.) List only those lines on which the system is waiting for someone to  
115685       login. The *<name>* field shall be **LOGIN** in such cases. Other fields shall be the  
115686       same as for user entries except that the *<state>* field does not exist.115687       **-m**       Output only information about the current terminal.115688 XSI       **-p**       List any other process that is currently active and has been previously spawned by  
115689       *init*.115690 XSI       **-q**       (Quick.) List only the names and the number of users currently logged on. When  
115691       this option is used, all other options shall be ignored.115692 XSI       **-r**       Write the current *run-level* of the *init* process.115693 XSI       **-s**       List only the *<name>*, *<line>*, and *<time>* fields. This is the default case.115694 XSI       **-t**       Indicate the last change to the system clock.115695       **-T**       Show the state of each terminal, as described in the STDOUT section.

115696        **-u**        Write “idle time” for each displayed user in addition to any other information. The  
 115697 idle time is the time since any activity occurred on the user’s terminal. The method  
 115698 XSI of determining this is unspecified. This option shall list only those users who are  
 115699 currently logged in. The *<name>* is the user’s login name. The *<line>* is the name  
 115700 of the line as found in the directory */dev*. The *<time>* is the time that the user  
 115701 logged in. The *<activity>* is the number of hours and minutes since activity last  
 115702 occurred on that particular line. A dot indicates that the terminal has seen activity  
 115703 in the last minute and is therefore “current”. If more than twenty-four hours have  
 115704 elapsed or the line has not been used since boot time, the entry shall be marked  
 115705 *<old>*. This field is useful when trying to determine whether a person is working at  
 115706 the terminal or not. The *<pid>* is the process ID of the user’s login process.

#### 115707 OPERANDS

115708 XSI        The following operands shall be supported:

115709        **am i, am I**        In the POSIX locale, limit the output to describing the invoking user, equivalent to  
 115710 the **-m** option. The **am** and **i** or **I** must be separate arguments.

115711        *file*                Specify a pathname of a file to substitute for the implementation-defined database  
 115712 of logged-on users that *who* uses by default.

#### 115713 STDIN

115714        Not used.

#### 115715 INPUT FILES

115716        None.

#### 115717 ENVIRONMENT VARIABLES

115718        The following environment variables shall affect the execution of *who*:

115719        *LANG*                Provide a default value for the internationalization variables that are unset or null.  
 115720 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 115721 variables used to determine the values of locale categories.)

115722        *LC\_ALL*                If set to a non-empty string value, override the values of all the other  
 115723 internationalization variables.

115724        *LC\_CTYPE*             Determine the locale for the interpretation of sequences of bytes of text data as  
 115725 characters (for example, single-byte as opposed to multi-byte characters in  
 115726 arguments).

115727        *LC\_MESSAGES*           Determine the locale that should be used to affect the format and contents of  
 115728 diagnostic messages written to standard error.

115729        *LC\_TIME*                Determine the locale used for the format and contents of the date and time strings.

115730        *NLSPATH*             Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

115731 XSI        *TZ*                        Determine the timezone used when writing date and time information. If *TZ* is  
 115732 unset or null, an unspecified default timezone shall be used.

#### 115734 ASYNCHRONOUS EVENTS

115735        Default.

#### 115736 STDOUT

115737        The *who* utility shall write its default format to the standard output in an implementation-  
 115738 defined format, subject only to the requirement of containing the information described above.

115739 XSI OF XSI-conformant systems shall write the default information to the standard output in the  
 115740 following general format:

115741 `<name>[<state>]<line><time>[<activity>][<pid>][<comment>][<exit>]`

115742 For the `-b` option, `<line>` shall be "system boot". The `<name>` is unspecified.

115743 The following format shall be used for the `-T` option:

115744 `"%s %c %s %s\n" <name>, <terminal state>, <terminal name>,  
 115745 <time of login>`

115746 where `<terminal state>` is one of the following characters:

115747 + The terminal allows write access to other users.

115748 – The terminal denies write access to other users.

115749 ? The terminal write-access state cannot be determined.

115750 `<space>` This entry is not associated with a terminal.

115751 In the POSIX locale, the `<time of login>` shall be equivalent in format to the output of:

115752 `date +"%b %e %H:%M"`

115753 If the `-u` option is used with `-T`, the idle time shall be added to the end of the previous format in  
 115754 an unspecified format.

#### 115755 **STDERR**

115756 The standard error shall be used only for diagnostic messages.

#### 115757 **OUTPUT FILES**

115758 None.

#### 115759 **EXTENDED DESCRIPTION**

115760 None.

#### 115761 **EXIT STATUS**

115762 The following exit values shall be returned:

115763 0 Successful completion.

115764 >0 An error occurred.

#### 115765 **CONSEQUENCES OF ERRORS**

115766 Default.

#### 115767 **APPLICATION USAGE**

115768 The name *init* used for the system process is the most commonly used on historical systems, but  
 115769 it may vary.

115770 The “domain of accessibility” referred to is a broad concept that permits interpretation either on  
 115771 a very secure basis or even to allow a network-wide implementation like the historical *rwwho*.

#### 115772 **EXAMPLES**

115773 None.

#### 115774 **RATIONALE**

115775 Due to differences between historical implementations, the base options provided were a  
 115776 compromise to allow users to work with those functions. The standard developers also  
 115777 considered removing all the options, but felt that these options offered users valuable  
 115778 functionality. Additional options to match historical systems are available on XSI-conformant

- 115779 systems.
- 115780 It is recognized that the *who* command may be of limited usefulness, especially in a multi-level  
115781 secure environment. The standard developers considered, however, that having some standard  
115782 method of determining the “accessibility” of other users would aid user portability.
- 115783 No format was specified for the default *who* output for systems not supporting the XSI option. In  
115784 such a user-oriented command, designed only for human use, this was not considered to be a  
115785 deficiency.
- 115786 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, and *write* require  
115787 that they use the same format.
- 115788 It is acceptable for an implementation to produce no output for an invocation of *who* **mil**.
- 115789 **FUTURE DIRECTIONS**
- 115790 None.
- 115791 **SEE ALSO**
- 115792 *mesg*
- 115793 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)
- 115794 **CHANGE HISTORY**
- 115795 First released in Issue 2.
- 115796 **Issue 6**
- 115797 This utility is marked as part of the User Portability Utilities option.
- 115798 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.
- 115799 **Issue 7**
- 115800 SD5-XCU-ERN-58 is applied, clarifying the **-b** option.
- 115801 The *who* utility is moved from the User Portability Utilities option to the Base. User Portability  
115802 Utilities is now an option for interactive utilities.
- 115803 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

115804 **NAME**

115805 write — write to another user

115806 **SYNOPSIS**115807 write *user\_name* [*terminal*]115808 **DESCRIPTION**

115809 The *write* utility shall read lines from the standard input and write them to the terminal of the  
 115810 specified user. When first invoked, it shall write the message:

115811 **Message from sender-login-id** (*sending-terminal*) [*date*]...

115812 to *user\_name*. When it has successfully completed the connection, the sender's terminal shall be  
 115813 alerted twice to indicate that what the sender is typing is being written to the recipient's  
 115814 terminal.

115815 If the recipient wants to reply, this can be accomplished by typing:

115816 write *sender-login-id* [*sending-terminal*]

115817 upon receipt of the initial message. Whenever a line of input as delimited by an NL, EOF, or  
 115818 EOL special character (see XBD [Chapter 11](#), on page 199) is accumulated while in canonical  
 115819 input mode, the accumulated data shall be written on the other user's terminal. Characters shall  
 115820 be processed as follows:

- 115821 • Typing <alert> shall write the <alert> character to the recipient's terminal.
- 115822 • Typing the erase and kill characters shall affect the sender's terminal in the manner  
 115823 described by the **termios** interface in XBD [Chapter 11](#) (on page 199).
- 115824 • Typing the interrupt or end-of-file characters shall cause *write* to write an appropriate  
 115825 message ("EOT\n" in the POSIX locale) to the recipient's terminal and exit.
- 115826 • Typing characters from *LC\_CTYPE* classifications **print** or **space** shall cause those  
 115827 characters to be sent to the recipient's terminal.
- 115828 • When and only when the *stty* **ixten** local mode is enabled, the existence and processing of  
 115829 additional special control characters and multi-byte or single-byte functions is  
 115830 implementation-defined.
- 115831 • Typing other non-printable characters shall cause implementation-defined sequences of  
 115832 printable characters to be written to the recipient's terminal.

115833 To write to a user who is logged in more than once, the *terminal* argument can be used to  
 115834 indicate which terminal to write to; otherwise, the recipient's terminal is selected in an  
 115835 implementation-defined manner and an informational message is written to the sender's  
 115836 standard output, indicating which terminal was chosen.

115837 Permission to be a recipient of a *write* message can be denied or granted by use of the *mesg*  
 115838 utility. However, a user's privilege may further constrain the domain of accessibility of other  
 115839 users' terminals. The *write* utility shall fail when the user lacks appropriate privileges to perform  
 115840 the requested action.

115841 **OPTIONS**

115842 None.

115843 **OPERANDS**

- 115844 The following operands shall be supported:
- 115845 *user\_name* Login name of the person to whom the message shall be written. The application  
115846 shall ensure that this operand is of the form returned by the *who* utility.
- 115847 *terminal* Terminal identification in the same format provided by the *who* utility.
- 115848 **STDIN**
- 115849 Lines to be copied to the recipient's terminal are read from standard input.
- 115850 **INPUT FILES**
- 115851 None.
- 115852 **ENVIRONMENT VARIABLES**
- 115853 The following environment variables shall affect the execution of *write*:
- 115854 *LANG* Provide a default value for the internationalization variables that are unset or null.  
115855 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
115856 variables used to determine the values of locale categories.)
- 115857 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
115858 internationalization variables.
- 115859 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
115860 characters (for example, single-byte as opposed to multi-byte characters in  
115861 arguments and input files). If the recipient's locale does not use an *LC\_CTYPE*  
115862 equivalent to the sender's, the results are undefined.
- 115863 *LC\_MESSAGES*
- 115864 Determine the locale that should be used to affect the format and contents of  
115865 diagnostic messages written to standard error and informative messages written to  
115866 standard output.
- 115867 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 115868 **ASYNCHRONOUS EVENTS**
- 115869 If an interrupt signal is received, *write* shall write an appropriate message on the recipient's  
115870 terminal and exit with a status of zero. It shall take the standard action for all other signals.
- 115871 **STDOUT**
- 115872 An informational message shall be written to standard output if a recipient is logged in more  
115873 than once.
- 115874 **STDERR**
- 115875 The standard error shall be used only for diagnostic messages.
- 115876 **OUTPUT FILES**
- 115877 The recipient's terminal is used for output.
- 115878 **EXTENDED DESCRIPTION**
- 115879 None.
- 115880 **EXIT STATUS**
- 115881 The following exit values shall be returned:
- 115882 0 Successful completion.
- 115883 >0 The addressed user is not logged on or the addressed user denies permission.

**115884 CONSEQUENCES OF ERRORS**

115885 Default.

**115886 APPLICATION USAGE**

115887 The *talk* utility is considered by some users to be a more usable utility on full-screen terminals.

**115888 EXAMPLES**

115889 None.

**115890 RATIONALE**

115891 The *write* utility was included in this volume of POSIX.1-2008 since it can be implemented on all  
115892 terminal types. The standard developers considered the *talk* utility, which cannot be  
115893 implemented on certain terminals, to be a “better” communications interface. Both of these  
115894 programs are in widespread use on historical implementations. Therefore, the standard  
115895 developers decided that both utilities should be specified.

115896 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
115897 require that they all use or accept the same format.

**115898 FUTURE DIRECTIONS**

115899 None.

**115900 SEE ALSO**

115901 *mesg*, *talk*, *who*

115902 XBD [Chapter 8](#) (on page 173), [Chapter 11](#) (on page 199)

**115903 CHANGE HISTORY**

115904 First released in Issue 2.

**115905 Issue 5**

115906 The FUTURE DIRECTIONS section is added.

**115907 Issue 6**

115908 This utility is marked as part of the User Portability Utilities option.

115909 The normative text is reworded to avoid use of the term “must” for application requirements.

**115910 Issue 7**

115911 The *write* utility is moved from the User Portability Utilities option to the Base. User Portability  
115912 Utilities is now an option for interactive utilities.

115913 **NAME**115914 **xargs** — construct argument lists and invoke utility115915 **SYNOPSIS**

```
115916 XSI      xargs [-ptx] [-E eofstr] [-I replstr|-L number] [-n number]
115917          [-s size] [utility [argument...]]
```

115918 **DESCRIPTION**

115919 The *xargs* utility shall construct a command line consisting of the *utility* and *argument* operands  
 115920 specified followed by as many arguments read in sequence from standard input as fit in length  
 115921 and number constraints specified by the options. The *xargs* utility shall then invoke the  
 115922 constructed command line and wait for its completion. This sequence shall be repeated until one  
 115923 of the following occurs:

- 115924 • An end-of-file condition is detected on standard input.
- 115925 • An argument consisting of just the logical end-of-file string (see the `-E eofstr` option) is  
 115926 found on standard input after double-quote processing, <apostrophe> processing, and  
 115927 <backslash>-escape processing (see next paragraph). All arguments up to but not  
 115928 including the argument consisting of just the logical end-of-file string shall be used as  
 115929 arguments in constructed command lines.
- 115930 • An invocation of a constructed command line returns an exit status of 255.

115931 The application shall ensure that arguments in the standard input are separated by unquoted  
 115932 <blank> characters, unescaped <blank> characters, or <newline> characters. A string of zero or  
 115933 more non-double-quote ( ' " ' ) characters and non-<newline> characters can be quoted by  
 115934 enclosing them in double-quotes. A string of zero or more non-<apostrophe> ( ' \ ' ' ) characters  
 115935 and non-<newline> characters can be quoted by enclosing them in <apostrophe> characters.  
 115936 Any unquoted character can be escaped by preceding it with a <backslash>. The utility named  
 115937 by *utility* shall be executed one or more times until the end-of-file is reached or the logical end-of  
 115938 file string is found. The results are unspecified if the utility named by *utility* attempts to read  
 115939 from its standard input.

115940 The generated command line length shall be the sum of the size in bytes of the utility name and  
 115941 each argument treated as strings, including a null byte terminator for each of these strings. The  
 115942 *xargs* utility shall limit the command line length such that when the command line is invoked,  
 115943 the combined argument and environment lists (see the *exec* family of functions in the System  
 115944 Interfaces volume of POSIX.1-2008) shall not exceed {ARG\_MAX}-2048 bytes. Within this  
 115945 constraint, if neither the `-n` nor the `-s` option is specified, the default command line length shall  
 115946 be at least {LINE\_MAX}.

115947 **OPTIONS**115948 The *xargs* utility shall conform to XBD [Section 12.2](#) (on page 216).

115949 The following options shall be supported:

115950 `-E eofstr` Use *eofstr* as the logical end-of-file string. If `-E` is not specified, it is unspecified  
 115951 whether the logical end-of-file string is the <underscore> character ( ' \_ ' ) or the  
 115952 end-of-file string capability is disabled. When *eofstr* is the null string, the logical  
 115953 end-of-file string capability shall be disabled and <underscore> characters shall be  
 115954 taken literally.

115955 XSI `-I replstr` Insert mode: *utility* is executed for each logical line from standard input.  
 115956 Arguments in the standard input shall be separated only by unescaped <newline>  
 115957 characters, not by <blank> characters. Any unquoted unescaped <blank>  
 115958 characters at the beginning of each line shall be ignored. The resulting argument  
 115959 shall be inserted in *arguments* in place of each occurrence of *replstr*. At least five

115960		arguments in <i>arguments</i> can each contain one or more instances of <i>replstr</i> . Each of
115961		these constructed arguments cannot grow larger than an implementation-defined
115962		limit greater than or equal to 255 bytes. Option <b>-x</b> shall be forced on.
115963	XSI	<b>-L number</b> The <i>utility</i> shall be executed for each non-empty <i>number</i> lines of arguments from
115964		standard input. The last invocation of <i>utility</i> shall be with fewer lines of arguments
115965		if fewer than <i>number</i> remain. A line is considered to end with the first <newline>
115966		unless the last character of the line is an unescaped <blank>; a trailing unescaped
115967		<blank> signals continuation to the next non-empty line, inclusive.
115968		<b>-n number</b> Invoke <i>utility</i> using as many standard input arguments as possible, up to <i>number</i> (a
115969		positive decimal integer) arguments maximum. Fewer arguments shall be used if:
115970		• The command line length accumulated exceeds the size specified by the <b>-s</b>
115971		option (or {LINE_MAX} if there is no <b>-s</b> option).
115972		• The last iteration has fewer than <i>number</i> , but not zero, operands remaining.
115973		<b>-p</b> Prompt mode: the user is asked whether to execute <i>utility</i> at each invocation. Trace
115974		mode ( <b>-t</b> ) is turned on to write the command instance to be executed, followed by
115975		a prompt to standard error. An affirmative response read from <b>/dev/tty</b> shall
115976		execute the command; otherwise, that particular invocation of <i>utility</i> shall be
115977		skipped.
115978		<b>-s size</b> Invoke <i>utility</i> using as many standard input arguments as possible yielding a
115979		command line length less than <i>size</i> (a positive decimal integer) bytes. Fewer
115980		arguments shall be used if:
115981		• The total number of arguments exceeds that specified by the <b>-n</b> option.
115982	XSI	• The total number of lines exceeds that specified by the <b>-L</b> option.
115983		• End-of-file is encountered on standard input before <i>size</i> bytes are
115984		accumulated.
115985		Values of <i>size</i> up to at least {LINE_MAX} bytes shall be supported, provided that
115986		the constraints specified in the DESCRIPTION are met. It shall not be considered
115987		an error if a value larger than that supported by the implementation or exceeding
115988		the constraints specified in the DESCRIPTION is given; <i>xargs</i> shall use the largest
115989		value it supports within the constraints.
115990		<b>-t</b> Enable trace mode. Each generated command line shall be written to standard
115991		error just prior to invocation.
115992		<b>-x</b> Terminate if a constructed command line will not fit in the implied or specified size
115993		(see the <b>-s</b> option above).

## 115994 OPERANDS

115995 The following operands shall be supported:

115996	<i>utility</i>	The name of the utility to be invoked, found by search path using the <i>PATH</i>
115997		environment variable, described in XBD Chapter 8 (on page 173). If <i>utility</i> is
115998		omitted, the default shall be the <i>echo</i> utility. If the <i>utility</i> operand names any of the
115999		special built-in utilities in Section 2.14 (on page 2374), the results are undefined.
116000	<i>argument</i>	An initial option or operand for the invocation of <i>utility</i> .

116001 **STDIN**

116002 The standard input shall be a text file. The results are unspecified if an end-of-file condition is  
 116003 detected immediately following an escaped <newline>.

116004 **INPUT FILES**

116005 The file `/dev/tty` shall be used to read responses required by the `-p` option.

116006 **ENVIRONMENT VARIABLES**

116007 The following environment variables shall affect the execution of *xargs*:

116008 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 116009 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 116010 variables used to determine the values of locale categories.)

116011 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 116012 internationalization variables.

116013 **LC\_COLLATE**

116014 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 116015 character collating elements used in the extended regular expression defined for  
 116016 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

116017 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 116018 characters (for example, single-byte as opposed to multi-byte characters in  
 116019 arguments and input files) and the behavior of character classes used in the  
 116020 extended regular expression defined for the **yesexpr** locale keyword in the  
 116021 *LC\_MESSAGES* category.

116022 **LC\_MESSAGES**

116023 Determine the locale used to process affirmative responses, and the locale used to  
 116024 affect the format and contents of diagnostic messages and prompts written to  
 116025 standard error.

116026 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

116027 **PATH** Determine the location of *utility*, as described in XBD [Chapter 8](#) (on page 173).

116028 **ASYNCHRONOUS EVENTS**

116029 Default.

116030 **STDOUT**

116031 Not used.

116032 **STDERR**

116033 The standard error shall be used for diagnostic messages and the `-t` and `-p` options. If the `-t`  
 116034 option is specified, the *utility* and its constructed argument list shall be written to standard error,  
 116035 as it will be invoked, prior to invocation. If `-p` is specified, a prompt of the following format  
 116036 shall be written (in the POSIX locale):

116037 " ? . . . "

116038 at the end of the line of the output from `-t`.

116039 **OUTPUT FILES**

116040 None.

116041 **EXTENDED DESCRIPTION**

116042 None.

116043 **EXIT STATUS**

116044 The following exit values shall be returned:

116045 0 All invocations of *utility* returned exit status zero.

116046 1-125 A command line meeting the specified requirements could not be assembled, one or  
116047 more of the invocations of *utility* returned a non-zero exit status, or some other error  
116048 occurred.

116049 126 The utility specified by *utility* was found but could not be invoked.116050 127 The utility specified by *utility* could not be found.116051 **CONSEQUENCES OF ERRORS**

116052 If a command line meeting the specified requirements cannot be assembled, the utility cannot be  
116053 invoked, an invocation of the utility is terminated by a signal, or an invocation of the utility exits  
116054 with exit status 255, the *xargs* utility shall write a diagnostic message and exit without  
116055 processing any remaining input.

116056 **APPLICATION USAGE**

116057 The 255 exit status allows a utility being used by *xargs* to tell *xargs* to terminate if it knows no  
116058 further invocations using the current data stream will succeed. Thus, *utility* should explicitly *exit*  
116059 with an appropriate value to avoid accidentally returning with 255.

116060 Note that since input is parsed as lines, <blank> characters separate arguments, and  
116061 <backslash>, <apostrophe>, and double-quote characters are used for quoting, if *xargs* is used to  
116062 bundle the output of commands like *find dir -print* or *ls* into commands to be executed,  
116063 unexpected results are likely if any filenames contain <blank>, <newline>, or quoting characters.  
116064 This can be solved by using *find* to call a script that converts each file found into a quoted string  
116065 that is then piped to *xargs*, but in most cases it is preferable just to have *find* do the argument  
116066 aggregation itself by using *-exec* with a '+' terminator instead of ';' . Note that the quoting  
116067 rules used by *xargs* are not the same as in the shell. They were not made consistent here because  
116068 existing applications depend on the current rules. An easy (but inefficient) method that can be  
116069 used to transform input consisting of one argument per line into a quoted form that *xargs*  
116070 interprets correctly is to precede each non-<newline> character with a <backslash>. More  
116071 efficient alternatives are shown in Example 2 and Example 5 below.

116072 On implementations with a large value for {ARG\_MAX}, *xargs* may produce command lines  
116073 longer than {LINE\_MAX}. For invocation of utilities, this is not a problem. If *xargs* is being used  
116074 to create a text file, users should explicitly set the maximum command line length with the *-s*  
116075 option.

116076 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
116077 an error occurs so that applications can distinguish "failure to find a utility" from "invoked  
116078 utility exited with an error indication". The value 127 was chosen because it is not commonly  
116079 used for other meanings; most utilities use small values for "normal error conditions" and the  
116080 values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
116081 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
116082 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
116083 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
116084 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
116085 any other reason.

## 116086 EXAMPLES

- 116087 1. The following command combines the output of the parenthesized commands (minus the  
 116088 <apostrophe> characters) onto one line, which is then appended to the file log. It assumes  
 116089 that the expansion of "\$0 \$" does not include any <apostrophe> or <newline>  
 116090 characters.

116091 (logname; date; printf "'%s'\n" "\$0 \$") | xargs -E "" >>log

- 116092 2. The following command invokes *diff* with successive pairs of arguments originally typed  
 116093 as command line arguments. It assumes there are no embedded <newline> characters in  
 116094 the elements of the original argument list.

116095 printf "%s\n" "\$@" | sed 's/^[^:alnum:]]/\&/g' |  
 116096 xargs -E "" -n 2 -x diff

- 116097 3. In the following commands, the user is asked which files in the current directory  
 116098 (excluding dotfiles) are to be archived. The files are archived into **arch**; *a*, one at a time or  
 116099 *b*, many at a time. The commands assume that no filenames contain <blank>, <newline>,  
 116100 <backslash>, <apostrophe>, or double-quote characters.

116101 a. ls | xargs -E "" -p -L 1 ar -r arch

116102 b. ls | xargs -E "" -p -L 1 | xargs -E "" ar -r arch

- 116103 4. The following command invokes *command1* one or more times with multiple arguments,  
 116104 stopping if an invocation of *command1* has a non-zero exit status.

116105 xargs -E "" sh -c 'command1 "\$@" || exit 255' sh < xargs\_input

- 116106 5. On XSI-conformant systems, the following command moves all files from directory **\$1** to  
 116107 directory **\$2**, and echoes each move command just before doing it. It assumes no  
 116108 filenames contain <newline> characters and that neither **\$1** nor **\$2** contains the sequence  
 116109 "{ }".

116110 ls -A "\$1" | sed -e 's/"/"\&"/g' -e 's/.\*/"&"/' |  
 116111 xargs -E "" -I {} -t mv "\$1"/{} "\$2"/{ }

## 116112 RATIONALE

116113 The *xargs* utility was usually found only in System V-based systems; BSD systems included an  
 116114 *apply* utility that provided functionality similar to *xargs -n number*. The SVID lists *xargs* as a  
 116115 software development extension. This volume of POSIX.1-2008 does not share the view that it is  
 116116 used only for development, and therefore it is not optional.

116117 The classic application of the *xargs* utility is in conjunction with the *find* utility to reduce the  
 116118 number of processes launched by a simplistic use of the *find -exec* combination. The *xargs* utility  
 116119 is also used to enforce an upper limit on memory required to launch a process. With this basis in  
 116120 mind, this volume of POSIX.1-2008 selected only the minimal features required.

116121 Although the 255 exit status is mostly an accident of historical implementations, it allows a  
 116122 utility being used by *xargs* to tell *xargs* to terminate if it knows no further invocations using the  
 116123 current data stream shall succeed. Any non-zero exit status from a utility falls into the 1-125  
 116124 range when *xargs* exits. There is no statement of how the various non-zero utility exit status  
 116125 codes are accumulated by *xargs*. The value could be the addition of all codes, their highest  
 116126 value, the last one received, or a single value such as 1. Since no algorithm is arguably better  
 116127 than the others, and since many of the standard utilities say little more (portably) than  
 116128 "pass/fail", no new algorithm was invented.

116129 Several other *xargs* options were removed because simple alternatives already exist within this

volume of POSIX.1-2008. For example, the `-i replstr` option can be just as efficiently performed using a shell **for** loop. Since *xargs* calls an *exec* function with each input line, the `-i` option does not usually exploit the grouping capabilities of *xargs*.

The requirement that *xargs* never produces command lines such that invocation of *utility* is within 2048 bytes of hitting the POSIX *exec* {ARG\_MAX} limitations is intended to guarantee that the invoked utility has room to modify its environment variables and command line arguments and still be able to invoke another utility. Note that the minimum {ARG\_MAX} allowed by the System Interfaces volume of POSIX.1-2008 is 4096 bytes and the minimum value allowed by this volume of POSIX.1-2008 is 2048 bytes; therefore, the 2048 bytes difference seems reasonable. Note, however, that *xargs* may never be able to invoke a utility if the environment passed in to *xargs* comes close to using {ARG\_MAX} bytes.

The version of *xargs* required by this volume of POSIX.1-2008 is required to wait for the completion of the invoked command before invoking another command. This was done because historical scripts using *xargs* assumed sequential execution. Implementations wanting to provide parallel operation of the invoked utilities are encouraged to add an option enabling parallel invocation, but should still wait for termination of all of the children before *xargs* terminates normally.

The `-e` option was omitted from the ISO POSIX-2:1993 standard in the belief that the *eofstr* option-argument was recognized only when it was on a line by itself and before quote and escape processing were performed, and that the logical end-of-file processing was only enabled if a `-e` option was specified. In that case, a simple *sed* script could be used to duplicate the `-e` functionality. Further investigation revealed that:

- The logical end-of-file string was checked for after quote and escape processing, making a *sed* script that provided equivalent functionality much more difficult to write.
- The default was to perform logical end-of-file processing with an `<underscore>` as the logical end-of-file string.

To correct this misunderstanding, the `-E eofstr` option was adopted from the X/Open Portability Guide. Users should note that the description of the `-E` option matches historical documentation of the `-e` option (which was not adopted because it did not support the Utility Syntax Guidelines), by saying that if *eofstr* is the null string, logical end-of-file processing is disabled. Historical implementations of *xargs* actually did not disable logical end-of-file processing; they treated a null argument found in the input as a logical end-of-file string. (A null *string* argument could be generated using single or double-quotes (' ' or " "). Since this behavior was not documented historically, it is considered to be a bug.

The `-I`, `-L`, and `-n` options are mutually-exclusive. Some implementations use the last one specified if more than one is given on a command line; other implementations treat combinations of the options in different ways.

## FUTURE DIRECTIONS

None.

## SEE ALSO

[Chapter 2](#) (on page 2335), [diff](#), [echo](#), [find](#)

[XBD Chapter 8](#) (on page 173), [Section 12.2](#) (on page 216)

[XSH exec](#)

**CHANGE HISTORY**

116173 First released in Issue 2.

**Issue 5**

116176 A second FUTURE DIRECTION is added.

**Issue 6**

116178 The obsolescent `-e`, `-i`, and `-l` options are removed.

116179 The following new requirements on POSIX implementations derive from alignment with the  
116180 Single UNIX Specification:

- 116181 • The `-p` option is added.
- 116182 • In the INPUT FILES section, the file `/dev/tty` is used to read responses required by the `-p`  
116183 option.
- 116184 • The STDERR section is updated to describe the `-p` option.

116185 The description of the `-E` option is aligned with the ISO POSIX-2: 1993 standard.

116186 The normative text is reworded to avoid use of the term “must” for application requirements.

**Issue 7**

116188 Austin Group Interpretation 1003.1-2001 #123 is applied, changing the description of the `xargs -I`  
116189 option.

116190 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
116191 `LC_MESSAGES` environment variable.

116192 SD5-XCU-ERN-68 is applied.

116193 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

116194 SD5-XCU-ERN-128 is applied, clarifying the DESCRIPTION of the logical end-of-file string.

116195 SD5-XCU-ERN-132 is applied, updating the EXAMPLES section.

116196 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0149 [342] is applied.

116197 **NAME**116198 yacc — yet another compiler compiler (**DEVELOPMENT**)116199 **SYNOPSIS**116200 CD `yacc [-dltv] [-b file_prefix] [-p sym_prefix] grammar`116201 **DESCRIPTION**

116202 The *yacc* utility shall read a description of a context-free grammar in *grammar* and write C source  
 116203 code, conforming to the ISO C standard, to a code file, and optionally header information into a  
 116204 header file, in the current directory. The generated source code shall not depend on any  
 116205 undefined, unspecified, or implementation-defined behavior, except in cases where it is copied  
 116206 directly from the supplied grammar, or in cases that are documented by the implementation.  
 116207 The C code shall define a function and related routines and macros for an automaton that  
 116208 executes a parsing algorithm meeting the requirements in [Algorithms](#) (on page 3454).

116209 The form and meaning of the grammar are described in the EXTENDED DESCRIPTION section.

116210 The C source code and header file shall be produced in a form suitable as input for the C  
 116211 compiler (see [c99](#)).

116212 **OPTIONS**

116213 The *yacc* utility shall conform to XBD [Section 12.2](#) (on page 216), except for Guideline 9.

116214 The following options shall be supported:

116215 **-b *file\_prefix*** Use *file\_prefix* instead of **y** as the prefix for all output filenames. The code file  
 116216 **y.tab.c**, the header file **y.tab.h** (created when **-d** is specified), and the description  
 116217 file **y.output** (created when **-v** is specified), shall be changed to *file\_prefix.tab.c*,  
 116218 *file\_prefix.tab.h*, and *file\_prefix.output*, respectively.

116219 **-d** Write the header file; by default only the code file is written. See the OUTPUT  
 116220 FILES section.

116221 **-l** Produce a code file that does not contain any **#line** constructs. If this option is not  
 116222 present, it is unspecified whether the code file or header file contains **#line**  
 116223 directives. This should only be used after the grammar and the associated actions  
 116224 are fully debugged.

116225 **-p *sym\_prefix***  
 116226 Use *sym\_prefix* instead of **yy** as the prefix for all external names produced by *yacc*.  
 116227 The names affected shall include the functions *yyparse()*, *yylex()*, and *yyerror()*,  
 116228 and the variables *yyval*, *yychar*, and *yydebug*. (In the remainder of this section, the  
 116229 six symbols cited are referenced using their default names only as a notational  
 116230 convenience.) Local names may also be affected by the **-p** option; however, the **-p**  
 116231 option shall not affect **#define** symbols generated by *yacc*.

116232 **-t** Modify conditional compilation directives to permit compilation of debugging  
 116233 code in the code file. Runtime debugging statements shall always be contained in  
 116234 the code file, but by default conditional compilation directives prevent their  
 116235 compilation.

116236 **-v** Write a file containing a description of the parser and a report of conflicts  
 116237 generated by ambiguities in the grammar.

**116238 OPERANDS**

116239 The following operand is required:

116240 *grammar* A pathname of a file containing instructions, hereafter called *grammar*, for which a  
 116241 parser is to be created. The format for the grammar is described in the EXTENDED  
 116242 DESCRIPTION section.

**116243 STDIN**

116244 Not used.

**116245 INPUT FILES**

116246 The file *grammar* shall be a text file formatted as specified in the EXTENDED DESCRIPTION  
 116247 section.

**116248 ENVIRONMENT VARIABLES**

116249 The following environment variables shall affect the execution of *yacc*:

116250 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 116251 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 116252 variables used to determine the values of locale categories.)

116253 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 116254 internationalization variables.

116255 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 116256 characters (for example, single-byte as opposed to multi-byte characters in  
 116257 arguments and input files).

116258 *LC\_MESSAGES*

116259 Determine the locale that should be used to affect the format and contents of  
 116260 diagnostic messages written to standard error.

116261 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

116262 The *LANG* and *LC\_\** variables affect the execution of the *yacc* utility as stated. The *main()*  
 116263 function defined in Yacc Library (on page 3454) shall call:

116264 `setlocale(LC_ALL, " ")`

116265 and thus the program generated by *yacc* shall also be affected by the contents of these variables  
 116266 at runtime.

**116267 ASYNCHRONOUS EVENTS**

116268 Default.

**116269 STDOUT**

116270 Not used.

**116271 STDERR**

116272 If shift/reduce or reduce/reduce conflicts are detected in *grammar*, *yacc* shall write a report of  
 116273 those conflicts to the standard error in an unspecified format.

116274 Standard error shall also be used for diagnostic messages.

**116275 OUTPUT FILES**

116276 The code file, the header file, and the description file shall be text files. All are described in the  
 116277 following sections.

## Code File

This file shall contain the C source code for the *yyparse()* function. It shall contain code for the various semantic actions with macro substitution performed on them as described in the EXTENDED DESCRIPTION section. It also shall contain a copy of the **#define** statements in the header file. If a **%union** declaration is used, the declaration for YYSTYPE shall also be included in this file.

## Header File

The header file shall contain **#define** statements that associate the token numbers with the token names. This allows source files other than the code file to access the token codes. If a **%union** declaration is used, the declaration for YYSTYPE and an *extern YYSTYPE yylval* declaration shall also be included in this file.

## Description File

The description file shall be a text file containing a description of the state machine corresponding to the parser, using an unspecified format. Limits for internal tables (see [Limits](#), on page 3455) shall also be reported, in an implementation-defined manner. (Some implementations may use dynamic allocation techniques and have no specific limit values to report.)

## EXTENDED DESCRIPTION

The *yacc* command accepts a language that is used to define a grammar for a target language to be parsed by the tables and code generated by *yacc*. The language accepted by *yacc* as a grammar for the target language is described below using the *yacc* input language itself.

The input *grammar* includes rules describing the input structure of the target language and code to be invoked when these rules are recognized to provide the associated semantic action. The code to be executed shall appear as bodies of text that are intended to be C-language code. These bodies of text shall not contain C-language trigraphs. The C-language inclusions are presumed to form a correct function when processed by *yacc* into its output files. The code included in this way shall be executed during the recognition of the target language.

Given a grammar, the *yacc* utility generates the files described in the OUTPUT FILES section. The code file can be compiled and linked using *c99*. If the declaration and programs sections of the grammar file did not include definitions of *main()*, *yylex()*, and *yyerror()*, the compiled output requires linking with externally supplied versions of those functions. Default versions of *main()* and *yyerror()* are supplied in the *yacc* library and can be linked in by using the *-ly* operand to *c99*. The *yacc* library interfaces need not support interfaces with other than the default **yy** symbol prefix. The application provides the lexical analyzer function, *yylex()*; the *lex* utility is specifically designed to generate such a routine.

## Input Language

The application shall ensure that every specification file consists of three sections in order: *declarations*, *grammar rules*, and *programs*, separated by double <percent-sign> characters ("%"). The declarations and programs sections can be empty. If the latter is empty, the preceding "%" mark separating it from the rules section can be omitted.

The input is free form text following the structure of the grammar defined below.

## Lexical Structure of the Grammar

The <blank>, <newline>, and <form-feed> character shall be ignored, except that the application shall ensure that they do not appear in names or multi-character reserved symbols. Comments shall be enclosed in `" / * . . . * / "`, and can appear wherever a name is valid.

Names are of arbitrary length, made up of letters, periods ( `' . '` ), underscores ( `' _ '` ), and non-initial digits. Uppercase and lowercase letters are distinct. Conforming applications shall not use names beginning in `yy` or `YY` since the *yacc* parser uses such names. Many of the names appear in the final output of *yacc*, and thus they should be chosen to conform with any additional rules created by the C compiler to be used. In particular they appear in `#define` statements.

A literal shall consist of a single character enclosed in single-quote characters. All of the escape sequences supported for character constants by the ISO C standard shall be supported by *yacc*.

The relationship with the lexical analyzer is discussed in detail below.

The application shall ensure that the NUL character is not used in grammar rules or literals.

## Declarations Section

The declarations section is used to define the symbols used to define the target language and their relationship with each other. In particular, much of the additional information required to resolve ambiguities in the context-free grammar for the target language is provided here.

Usually *yacc* assigns the relationship between the symbolic names it generates and their underlying numeric value. The declarations section makes it possible to control the assignment of these values.

It is also possible to keep semantic information associated with the tokens currently on the parse stack in a user-defined C-language **union**, if the members of the union are associated with the various names in the grammar. The declarations section provides for this as well.

The first group of declarators below all take a list of names as arguments. That list can optionally be preceded by the name of a C union member (called a *tag* below) appearing within `' < '` and `' > '`. (As an exception to the typographical conventions of the rest of this volume of POSIX.1-2008, in this case `<tag>` does not represent a metavariable, but the literal angle bracket characters surrounding a symbol.) The use of *tag* specifies that the tokens named on this line shall be of the same C type as the union member referenced by *tag*. This is discussed in more detail below.

For lists used to define tokens, the first appearance of a given token can be followed by a positive integer (as a string of decimal digits). If this is done, the underlying value assigned to it for lexical purposes shall be taken to be that number.

The following declares *name* to be a token:

```
%token [<tag>] name [number] [name [number]]...
```

If *tag* is present, the C type for all tokens on this line shall be declared to be the type referenced by *tag*. If a positive integer, *number*, follows a *name*, that value shall be assigned to the token.

The following declares *name* to be a token, and assigns precedence to it:

```
%left [<tag>] name [number] [name [number]]...
```

```
%right [<tag>] name [number] [name [number]]...
```

One or more lines, each beginning with one of these symbols, can appear in this section. All tokens on the same line have the same precedence level and associativity; the lines are in order

116362 of increasing precedence or binding strength. **%left** denotes that the operators on that line are  
 116363 left associative, and **%right** similarly denotes right associative operators. If *tag* is present, it shall  
 116364 declare a C type for *names* as described for **%token**.

116365 The following declares *name* to be a token, and indicates that this cannot be used associatively:

```
116366 %nonassoc [<tag>] name [number] [name [number]]...
```

116367 If the parser encounters associative use of this token it reports an error. If *tag* is present, it shall  
 116368 declare a C type for *names* as described for **%token**.

116369 The following declares that union member *names* are non-terminals, and thus it is required to  
 116370 have a *tag* field at its beginning:

```
116371 %type <tag> name...
```

116372 Because it deals with non-terminals only, assigning a token number or using a literal is also  
 116373 prohibited. If this construct is present, *yacc* shall perform type checking; if this construct is not  
 116374 present, the parse stack shall hold only the **int** type.

116375 Every name used in *grammar* not defined by a **%token**, **%left**, **%right**, or **%nonassoc** declaration  
 116376 is assumed to represent a non-terminal symbol. The *yacc* utility shall report an error for any non-  
 116377 terminal symbol that does not appear on the left side of at least one grammar rule.

116378 Once the type, precedence, or token number of a name is specified, it shall not be changed. If the  
 116379 first declaration of a token does not assign a token number, *yacc* shall assign a token number.  
 116380 Once this assignment is made, the token number shall not be changed by explicit assignment.

116381 The following declarators do not follow the previous pattern.

116382 The following declares the non-terminal *name* to be the *start symbol*, which represents the largest,  
 116383 most general structure described by the grammar rules:

```
116384 %start name
```

116385 By default, it is the left-hand side of the first grammar rule; this default can be overridden with  
 116386 this declaration.

116387 The following declares the *yacc* value stack to be a union of the various types of values desired.

```
116388 %union { body of union (in C) }
```

116389 The body of the union shall not contain unbalanced curly brace preprocessing tokens.

116390 By default, the values returned by actions (see below) and the lexical analyzer shall be of type  
 116391 **int**. The *yacc* utility keeps track of types, and it shall insert corresponding union member names  
 116392 in order to perform strict type checking of the resulting parser.

116393 Alternatively, given that at least one *<tag>* construct is used, the union can be declared in a  
 116394 header file (which shall be included in the declarations section by using a **#include** construct  
 116395 within **%{** and **%}**), and a **typedef** used to define the symbol **YYSTYPE** to represent this union.  
 116396 The effect of **%union** is to provide the declaration of **YYSTYPE** directly from the *yacc* input.

116397 C-language declarations and definitions can appear in the declarations section, enclosed by the  
 116398 following marks:

```
116399 %{ ... %}
```

116400 These statements shall be copied into the code file, and have global scope within it so that they  
 116401 can be used in the rules and program sections. The statements shall not contain **"%}"** outside a  
 116402 comment, string literal, or multi-character constant.

116403 The application shall ensure that the declarations section is terminated by the token `%%`.

#### 116404 Grammar Rules in yacc

116405 The rules section defines the context-free grammar to be accepted by the function *yacc* generates,  
116406 and associates with those rules C-language actions and additional precedence information. The  
116407 grammar is described below, and a formal definition follows.

116408 The rules section is comprised of one or more grammar rules. A grammar rule has the form:

116409 `A : BODY ;`

116410 The symbol **A** represents a non-terminal name, and **BODY** represents a sequence of zero or  
116411 more *names*, *literals*, and *semantic actions* that can then be followed by optional *precedence rules*.  
116412 Only the names and literals participate in the formation of the grammar; the semantic actions  
116413 and precedence rules are used in other ways. The `<colon>` and the `<semicolon>` are *yacc*  
116414 punctuation. If there are several successive grammar rules with the same left-hand side, the  
116415 `<vertical-line>` (`'|'`) can be used to avoid rewriting the left-hand side; in this case the  
116416 `<semicolon>` appears only after the last rule. The BODY part can be empty (or empty of names  
116417 and literals) to indicate that the non-terminal symbol matches the empty string.

116418 The *yacc* utility assigns a unique number to each rule. Rules using the vertical bar notation are  
116419 distinct rules. The number assigned to the rule appears in the description file.

116420 The elements comprising a BODY are:

116421 *name, literal* These form the rules of the grammar: *name* is either a *token* or a *non-terminal*; *literal*  
116422 stands for itself (less the lexically required quotation marks).

116423 *semantic action*

116424 With each grammar rule, the user can associate actions to be performed each time  
116425 the rule is recognized in the input process. (Note that the word “action” can also  
116426 refer to the actions of the parser—shift, reduce, and so on.)

116427 These actions can return values and can obtain the values returned by previous  
116428 actions. These values are kept in objects of type YYSTYPE (see `%union`). The  
116429 result value of the action shall be kept on the parse stack with the left-hand side of  
116430 the rule, to be accessed by other reductions as part of their right-hand side. By  
116431 using the `<tag>` information provided in the declarations section, the code  
116432 generated by *yacc* can be strictly type checked and contain arbitrary information. In  
116433 addition, the lexical analyzer can provide the same kinds of values for tokens, if  
116434 desired.

116435 An action is an arbitrary C statement and as such can do input or output, call  
116436 subprograms, and alter external variables. An action is one or more C statements  
116437 enclosed in curly braces `'{'` and `'}'`. The statements shall not contain  
116438 unbalanced curly brace preprocessing tokens.

116439 Certain pseudo-variables can be used in the action. These are macros for access to  
116440 data structures known internally to *yacc*.

116441 `$$` The value of the action can be set by assigning it to `$$`. If type  
116442 checking is enabled and the type of the value to be assigned cannot  
116443 be determined, a diagnostic message may be generated.

116444 `$number` This refers to the value returned by the component specified by the  
116445 token *number* in the right side of a rule, reading from left to right;  
116446 *number* can be zero or negative. If *number* is zero or negative, it refers

116447 to the data associated with the name on the parser's stack preceding  
 116448 the leftmost symbol of the current rule. (That is, "\$0" refers to the  
 116449 name immediately preceding the leftmost name in the current rule to  
 116450 be found on the parser's stack and "\$-1" refers to the symbol to *its*  
 116451 left.) If *number* refers to an element past the current point in the rule,  
 116452 or beyond the bottom of the stack, the result is undefined. If type  
 116453 checking is enabled and the type of the value to be assigned cannot  
 116454 be determined, a diagnostic message may be generated.

116455 \$<tag>number

116456 These correspond exactly to the corresponding symbols without the  
 116457 tag inclusion, but allow for strict type checking (and preclude  
 116458 unwanted type conversions). The effect is that the macro is expanded  
 116459 to use *tag* to select an element from the YYSTYPE union (using  
 116460 *dataname.tag*). This is particularly useful if *number* is not positive.

116461 \$<tag>\$

116462 This imposes on the reference the type of the union member  
 116463 referenced by *tag*. This construction is applicable when a reference to  
 116464 a left context value occurs in the grammar, and provides *yacc* with a  
 means for selecting a type.

116465 Actions can occur anywhere in a rule (not just at the end); an action can access  
 116466 values returned by actions to its left, and in turn the value it returns can be  
 116467 accessed by actions to its right. An action appearing in the middle of a rule shall be  
 116468 equivalent to replacing the action with a new non-terminal symbol and adding an  
 116469 empty rule with that non-terminal symbol on the left-hand side. The semantic  
 116470 action associated with the new rule shall be equivalent to the original action. The  
 116471 use of actions within rules might introduce conflicts that would not otherwise  
 116472 exist.

116473 By default, the value of a rule shall be the value of the first element in it. If the first  
 116474 element does not have a type (particularly in the case of a literal) and type  
 116475 checking is turned on by **%type**, an error message shall result.

116476 *precedence* The keyword **%prec** can be used to change the precedence level associated with a  
 116477 particular grammar rule. Examples of this are in cases where a unary and binary  
 116478 operator have the same symbolic representation, but need to be given different  
 116479 precedences, or where the handling of an ambiguous if-else construction is  
 116480 necessary. The reserved symbol **%prec** can appear immediately after the body of  
 116481 the grammar rule and can be followed by a token name or a literal. It shall cause  
 116482 the precedence of the grammar rule to become that of the following token name or  
 116483 literal. The action for the rule as a whole can follow **%prec**.

116484 If a program section follows, the application shall ensure that the grammar rules are terminated  
 116485 by **%%**.

## 116486 Programs Section

116487 The *programs* section can include the definition of the lexical analyzer *yylex()*, and any other  
 116488 functions; for example, those used in the actions specified in the grammar rules. It is unspecified  
 116489 whether the programs section precedes or follows the semantic actions in the output file;  
 116490 therefore, if the application contains any macro definitions and declarations intended to apply to  
 116491 the code in the semantic actions, it shall place them within "%{ . . . %}" in the declarations  
 116492 section.

116493 **Input Grammar**

116494 The following input to *yacc* yields a parser for the input to *yacc*. This formal syntax takes  
 116495 precedence over the preceding text syntax description.

116496 The lexical structure is defined less precisely; [Lexical Structure of the Grammar](#) (on page 3446)  
 116497 defines most terms. The correspondence between the previous terms and the tokens below is as  
 116498 follows.

116499 **IDENTIFIER** This corresponds to the concept of *name*, given previously. It also includes  
 116500 literals as defined previously.

116501 **C\_IDENTIFIER** This is a name, and additionally it is known to be followed by a <colon>. A  
 116502 literal cannot yield this token.

116503 **NUMBER** A string of digits (a non-negative decimal integer).

116504 **TYPE, LEFT, MARK, LCURL, RCURL**

116505 These correspond directly to **%type**, **%left**, **%%**, **%{**, and **%}**.

116506 **{...}** This indicates C-language source code, with the possible inclusion of '\$'  
 116507 macros as discussed previously.

```

## Conflicts

The parser produced for an input grammar may contain states in which conflicts occur. The conflicts occur because the grammar is not LALR(1). An ambiguous grammar always contains at least one LALR(1) conflict. The *yacc* utility shall resolve all conflicts, using either default rules or user-specified precedence rules.

Conflicts are either shift/reduce conflicts or reduce/reduce conflicts. A shift/reduce conflict is where, for a given state and lookahead symbol, both a shift action and a reduce action are possible. A reduce/reduce conflict is where, for a given state and lookahead symbol, reductions by two different rules are possible.

The rules below describe how to specify what actions to take when a conflict occurs. Not all shift/reduce conflicts can be successfully resolved this way because the conflict may be due to something other than ambiguity, so incautious use of these facilities can cause the language accepted by the parser to be much different from that which was intended. The description file shall contain sufficient information to understand the cause of the conflict. Where ambiguity is the reason either the default or explicit rules should be adequate to produce a working parser.

The declared precedences and associativities (see [Declarations Section](#), on page 3446) are used to resolve parsing conflicts as follows:

1. A precedence and associativity is associated with each grammar rule; it is the precedence and associativity of the last token or literal in the body of the rule. If the **%prec** keyword is used, it overrides this default. Some grammar rules might not have both precedence and associativity.
2. If there is a shift/reduce conflict, and both the grammar rule and the input symbol have precedence and associativity associated with them, then the conflict is resolved in favor of the action (shift or reduce) associated with the higher precedence. If the precedences are the same, then the associativity is used; left associative implies reduce, right associative implies shift, and non-associative implies an error in the string being parsed.
3. When there is a shift/reduce conflict that cannot be resolved by rule 2, the shift is done. Conflicts resolved this way are counted in the diagnostic output described in [Error Handling](#).
4. When there is a reduce/reduce conflict, a reduction is done by the grammar rule that occurs earlier in the input sequence. Conflicts resolved this way are counted in the diagnostic output described in [Error Handling](#).

Conflicts resolved by precedence or associativity shall not be counted in the shift/reduce and reduce/reduce conflicts reported by *yacc* on either standard error or in the description file.

## Error Handling

The token **error** shall be reserved for error handling. The name **error** can be used in grammar rules. It indicates places where the parser can recover from a syntax error. The default value of **error** shall be 256. Its value can be changed using a **%token** declaration. The lexical analyzer should not return the value of **error**.

The parser shall detect a syntax error when it is in a state where the action associated with the lookahead symbol is **error**. A semantic action can cause the parser to initiate error handling by executing the macro YYERROR. When YYERROR is executed, the semantic action passes control back to the parser. YYERROR cannot be used outside of semantic actions.

When the parser detects a syntax error, it normally calls *yyerror()* with the character string "syntax error" as its argument. The call shall not be made if the parser is still recovering

from a previous error when the error is detected. The parser is considered to be recovering from a previous error until the parser has shifted over at least three normal input symbols since the last error was detected or a semantic action has executed the macro *yterror*. The parser shall not call *yterror*() when YYERROR is executed.

The macro function YYRECOVERING shall return 1 if a syntax error has been detected and the parser has not yet fully recovered from it. Otherwise, zero shall be returned.

When a syntax error is detected by the parser, the parser shall check if a previous syntax error has been detected. If a previous error was detected, and if no normal input symbols have been shifted since the preceding error was detected, the parser checks if the lookahead symbol is an endmarker (see [Interface to the Lexical Analyzer](#)). If it is, the parser shall return with a non-zero value. Otherwise, the lookahead symbol shall be discarded and normal parsing shall resume.

When YYERROR is executed or when the parser detects a syntax error and no previous error has been detected, or at least one normal input symbol has been shifted since the previous error was detected, the parser shall pop back one state at a time until the parse stack is empty or the current state allows a shift over **error**. If the parser empties the parse stack, it shall return with a non-zero value. Otherwise, it shall shift over **error** and then resume normal parsing. If the parser reads a lookahead symbol before the error was detected, that symbol shall still be the lookahead symbol when parsing is resumed.

The macro *yterror* in a semantic action shall cause the parser to act as if it has fully recovered from any previous errors. The macro *yyclearin* shall cause the parser to discard the current lookahead token. If the current lookahead token has not yet been read, *yyclearin* shall have no effect.

The macro YYACCEPT shall cause the parser to return with the value zero. The macro YYABORT shall cause the parser to return with a non-zero value.

### Interface to the Lexical Analyzer

The *yylex*() function is an integer-valued function that returns a *token number* representing the kind of token read. If there is a value associated with the token returned by *yylex*() (see the discussion of *tag* above), it shall be assigned to the external variable *yylval*.

If the parser and *yylex*() do not agree on these token numbers, reliable communication between them cannot occur. For (single-byte character) literals, the token is simply the numeric value of the character in the current character set. The numbers for other tokens can either be chosen by *yacc*, or chosen by the user. In either case, the **#define** construct of C is used to allow *yylex*() to return these numbers symbolically. The **#define** statements are put into the code file, and the header file if that file is requested. The set of characters permitted by *yacc* in an identifier is larger than that permitted by C. Token names found to contain such characters shall not be included in the **#define** declarations.

If the token numbers are chosen by *yacc*, the tokens other than literals shall be assigned numbers greater than 256, although no order is implied. A token can be explicitly assigned a number by following its first appearance in the declarations section with a number. Names and literals not defined this way retain their default definition. All token numbers assigned by *yacc* shall be unique and distinct from the token numbers used for literals and user-assigned tokens. If duplicate token numbers cause conflicts in parser generation, *yacc* shall report an error; otherwise, it is unspecified whether the token assignment is accepted or an error is reported.

The end of the input is marked by a special token called the *endmarker*, which has a token number that is zero or negative. (These values are invalid for any other token.) All lexical analyzers shall return zero or negative as a token number upon reaching the end of their input.

116675 If the tokens up to, but excluding, the endmarker form a structure that matches the start symbol,  
116676 the parser shall accept the input. If the endmarker is seen in any other context, it shall be  
116677 considered an error.

## 116678 **Completing the Program**

116679 In addition to *yyparse()* and *yylex()*, the functions *yyerror()* and *main()* are required to make a  
116680 complete program. The application can supply *main()* and *yyerror()*, or those routines can be  
116681 obtained from the *yacc* library.

## 116682 **Yacc Library**

116683 The following functions shall appear only in the *yacc* library accessible through the **-l y** operand  
116684 to *c99*; they can therefore be redefined by a conforming application:

### 116685 **int main(void)**

116686 This function shall call *yyparse()* and exit with an unspecified value. Other actions within  
116687 this function are unspecified.

### 116688 **int yyerror(const char \*s)**

116689 This function shall write the NUL-terminated argument to standard error, followed by a  
116690 <newline>.

116691 The order of the **-l y** and **-l l** operands given to *c99* is significant; the application shall either  
116692 provide its own *main()* function or ensure that **-l y** precedes **-l l**.

## 116693 **Debugging the Parser**

116694 The parser generated by *yacc* shall have diagnostic facilities in it that can be optionally enabled  
116695 at either compile time or at runtime (if enabled at compile time). The compilation of the runtime  
116696 debugging code is under the control of *YYDEBUG*, a preprocessor symbol. If *YYDEBUG* has a  
116697 non-zero value, the debugging code shall be included. If its value is zero, the code shall not be  
116698 included.

116699 In parsers where the debugging code has been included, the external **int yydebug** can be used to  
116700 turn debugging on (with a non-zero value) and off (zero value) at runtime. The initial value of  
116701 *yydebug* shall be zero.

116702 When **-t** is specified, the code file shall be built such that, if *YYDEBUG* is not already defined at  
116703 compilation time (using the *c99* **-D YYDEBUG** option, for example), *YYDEBUG* shall be set  
116704 explicitly to 1. When **-t** is not specified, the code file shall be built such that, if *YYDEBUG* is not  
116705 already defined, it shall be set explicitly to zero.

116706 The format of the debugging output is unspecified but includes at least enough information to  
116707 determine the shift and reduce actions, and the input symbols. It also provides information  
116708 about error recovery.

## 116709 **Algorithms**

116710 The parser constructed by *yacc* implements an LALR(1) parsing algorithm as documented in the  
116711 literature. It is unspecified whether the parser is table-driven or direct-coded.

116712 A parser generated by *yacc* shall never request an input symbol from *yylex()* while in a state  
116713 where the only actions other than the error action are reductions by a single rule.

116714 The literature of parsing theory defines these concepts.

## Limits

The *yacc* utility may have several internal tables. The minimum maximums for these tables are shown in the following table. The exact meaning of these values is implementation-defined. The implementation shall define the relationship between these values and between them and any error messages that the implementation may generate should it run out of space for any internal structure. An implementation may combine groups of these resources into a single pool as long as the total available to the user does not fall below the sum of the sizes specified by this section.

**Table 4-23** Internal Limits in *yacc*

Limit	Minimum Maximum	Description
{NTERMS}	126	Number of tokens.
{NNONTERM}	200	Number of non-terminals.
{NPROD}	300	Number of rules.
{NSTATES}	600	Number of states.
{MEMSIZE}	5 200	Length of rules. The total length, in names (tokens and non-terminals), of all the rules of the grammar. The left-hand side is counted for each rule, even if it is not explicitly repeated, as specified in <a href="#">Grammar Rules in yacc</a> (on page 3448).
{ACTSIZE}	4 000	Number of actions. “Actions” here (and in the description file) refer to parser actions (shift, reduce, and so on) not to semantic actions defined in <a href="#">Grammar Rules in yacc</a> (on page 3448).

## EXIT STATUS

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

## CONSEQUENCES OF ERRORS

If any errors are encountered, the run is aborted and *yacc* exits with a non-zero status. Partial code files and header files may be produced. The summary information in the description file shall always be produced if the *-v* flag is present.

## APPLICATION USAGE

Historical implementations experience name conflicts on the names **yacc.tmp**, **yacc.acts**, **yacc.debug**, **y.tab.c**, **y.tab.h**, and **y.output** if more than one copy of *yacc* is running in a single directory at one time. The *-b* option was added to overcome this problem. The related problem of allowing multiple *yacc* parsers to be placed in the same file was addressed by adding a *-p* option to override the previously hard-coded **yy** variable prefix.

The description of the *-p* option specifies the minimal set of function and variable names that cause conflict when multiple parsers are linked together. **YYSTYPE** does not need to be changed. Instead, the programmer can use *-b* to give the header files for different parsers different names, and then the file with the *yylex()* for a given parser can include the header for that parser. Names such as *yyclearerr* do not need to be changed because they are used only in the actions; they do not have linkage. It is possible that an implementation has other names, either internal ones for implementing things such as *yyclearerr*, or providing non-standard features that it wants

to change with `-p`.

Unary operators that are the same token as a binary operator in general need their precedence adjusted. This is handled by the `%prec` advisory symbol associated with the particular grammar rule defining that unary operator. (See [Grammar Rules in yacc](#) (on page 3448).) Applications are not required to use this operator for unary operators, but the grammars that do not require it are rare.

## EXAMPLES

Access to the *yacc* library is obtained with library search operands to *c99*. To use the *yacc* library *main()*:

```
c99 y.tab.c -l y
```

Both the *lex* library and the *yacc* library contain *main()*. To access the *yacc main()*:

```
c99 y.tab.c lex.yy.c -l y -l l
```

This ensures that the *yacc* library is searched first, so that its *main()* is used.

The historical *yacc* libraries have contained two simple functions that are normally coded by the application programmer. These functions are similar to the following code:

```
#include <locale.h>
int main(void)
{
    extern int yyparse();

    setlocale(LC_ALL, "");

    /* If the following parser is one created by lex, the
       application must be careful to ensure that LC_CTYPE
       and LC_COLLATE are set to the POSIX locale. */
    (void) yyparse();
    return (0);
}

#include <stdio.h>

int yyerror(const char *msg)
{
    (void) fprintf(stderr, "%s\n", msg);
    return (0);
}
```

## RATIONALE

The references in **Referenced Documents** may be helpful in constructing the parser generator. The referenced DeRemer and Pennello article (along with the works it references) describes a technique to generate parsers that conform to this volume of POSIX.1-2008. Work in this area continues to be done, so implementors should consult current literature before doing any new implementations. The original Knuth article is the theoretical basis for this kind of parser, but the tables it generates are impractically large for reasonable grammars and should not be used. The “equivalent to” wording is intentional to assure that the best tables that are LALR(1) can be generated.

There has been confusion between the class of grammars, the algorithms needed to generate parsers, and the algorithms needed to parse the languages. They are all reasonably orthogonal. In particular, a parser generator that accepts the full range of LR(1) grammars need not generate a table any more complex than one that accepts SLR(1) (a relatively weak class of LR grammars)

for a grammar that happens to be SLR(1). Such an implementation need not recognize the case, either; table compression can yield the SLR(1) table (or one even smaller than that) without recognizing that the grammar is SLR(1). The speed of an LR(1) parser for any class is dependent more upon the table representation and compression (or the code generation if a direct parser is generated) than upon the class of grammar that the table generator handles.

The speed of the parser generator is somewhat dependent upon the class of grammar it handles. However, the original Knuth article algorithms for constructing LR parsers were judged by its author to be impractically slow at that time. Although full LR is more complex than LALR(1), as computer speeds and algorithms improve, the difference (in terms of acceptable wall-clock execution time) is becoming less significant.

Potential authors are cautioned that the referenced DeRemer and Pennello article previously cited identifies a bug (an over-simplification of the computation of LALR(1) lookahead sets) in some of the LALR(1) algorithm statements that preceded it to publication. They should take the time to seek out that paper, as well as current relevant work, particularly Aho's.

The **-b** option was added to provide a portable method for permitting *yacc* to work on multiple separate parsers in the same directory. If a directory contains more than one *yacc* grammar, and both grammars are constructed at the same time (by, for example, a parallel *make* program), conflict results. While the solution is not historical practice, it corrects a known deficiency in historical implementations. Corresponding changes were made to all sections that referenced the filenames **y.tab.c** (now "the code file"), **y.tab.h** (now "the header file"), and **y.output** (now "the description file").

The grammar for *yacc* input is based on System V documentation. The textual description shows there that the **' ; '** is required at the end of the rule. The grammar and the implementation do not require this. (The use of **C\_IDENTIFIER** causes a reduce to occur in the right place.)

Also, in that implementation, the constructs such as **%token** can be terminated by a **<semicolon>**, but this is not permitted by the grammar. The keywords such as **%token** can also appear in uppercase, which is again not discussed. In most places where **' % '** is used, **<backslash>** can be substituted, and there are alternate spellings for some of the symbols (for example, **%LEFT** can be **"%<"** or even **"\<"**).

Historically, **<tag>** can contain any characters except **' > '**, including white space, in the implementation. However, since the *tag* must reference an ISO C standard union member, in practice conforming implementations need to support only the set of characters for ISO C standard identifiers in this context.

Some historical implementations are known to accept actions that are terminated by a period. Historical implementations often allow **' \$ '** in names. A conforming implementation does not need to support either of these behaviors.

Deciding when to use **%prec** illustrates the difficulty in specifying the behavior of *yacc*. There may be situations in which the *grammar* is not, strictly speaking, in error, and yet *yacc* cannot interpret it unambiguously. The resolution of ambiguities in the grammar can in many instances be resolved by providing additional information, such as using **%type** or **%union** declarations. It is often easier and it usually yields a smaller parser to take this alternative when it is appropriate.

The size and execution time of a program produced without the runtime debugging code is usually smaller and slightly faster in historical implementations.

Statistics messages from several historical implementations include the following types of information:

116852 *n*/512 terminals, *n*/300 non-terminals  
116853 *n*/600 grammar rules, *n*/1500 states  
116854 *n* shift/reduce, *n* reduce/reduce conflicts reported  
116855 *n*/350 working sets used  
116856 Memory: states, etc. *n*/15 000, parser *n*/15 000  
116857 *n*/600 distinct lookahead sets  
116858 *n* extra closures  
116859 *n* shift entries, *n* exceptions  
116860 *n* goto entries  
116861 *n* entries saved by goto default  
116862 Optimizer space used: input *n*/15 000, output *n*/15 000  
116863 *n* table entries, *n* zero  
116864 Maximum spread: *n*, Maximum offset: *n*

116865 The report of internal tables in the description file is left implementation-defined because all  
116866 aspects of these limits are also implementation-defined. Some implementations may use  
116867 dynamic allocation techniques and have no specific limit values to report.

116868 The format of the **y.output** file is not given because specification of the format was not seen to  
116869 enhance applications portability. The listing is primarily intended to help human users  
116870 understand and debug the parser; use of **y.output** by a conforming application script would be  
116871 unusual. Furthermore, implementations have not produced consistent output and no popular  
116872 format was apparent. The format selected by the implementation should be human-readable, in  
116873 addition to the requirement that it be a text file.

116874 Standard error reports are not specifically described because they are seldom of use to  
116875 conforming applications and there was no reason to restrict implementations.

116876 Some implementations recognize "`={"`" as equivalent to '`{`' because it appears in historical  
116877 documentation. This construction was recognized and documented as obsolete as long ago as  
116878 1978, in the referenced *Yacc: Yet Another Compiler-Compiler*. This volume of POSIX.1-2008 chose to  
116879 leave it as obsolete and omit it.

116880 Multi-byte characters should be recognized by the lexical analyzer and returned as tokens. They  
116881 should not be returned as multi-byte character literals. The token **error** that is used for error  
116882 recovery is normally assigned the value 256 in the historical implementation. Thus, the token  
116883 value 256, which is used in many multi-byte character sets, is not available for use as the value  
116884 of a user-defined token.

#### 116885 FUTURE DIRECTIONS

116886 None.

#### 116890 CHANGE HISTORY

116891 First released in Issue 2.

#### 116892 Issue 5

116893 The FUTURE DIRECTIONS section is added.

#### 116894 Issue 6

116895 This utility is marked as part of the C-Language Development Utilities option.

116896 Minor changes have been added to align with the IEEE P1003.2b draft standard.

- 116897 The normative text is reworded to avoid use of the term “must” for application requirements.
- 116898 IEEE PASC Interpretation 1003.2 #177 is applied, changing the comment on **RCURL** from the }%  
116899 token to the %}.
- 116900 **Issue 7**
- 116901 Austin Group Interpretation 1003.1-2001 #190 is applied, clarifying the requirements for  
116902 generated code to conform to the ISO C standard.
- 116903 Austin Group Interpretation 1003.1-2001 #191 is applied, clarifying the handling of C-language  
116904 trigraphs and curly brace preprocessing tokens.
- 116905 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
116906 apply.
- 116907 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

116908 **NAME**

116909           zcat — expand and concatenate data

116910 **SYNOPSIS**116911 XSI        zcat [*file...*]116912 **DESCRIPTION**

116913       The *zcat* utility shall write to standard output the uncompressed form of files that have been  
 116914       compressed using the *compress* utility. It is the equivalent of *uncompress -c*. Input files are not  
 116915       affected.

116916 **OPTIONS**

116917       None.

116918 **OPERANDS**

116919       The following operand shall be supported:

116920       *file*       The pathname of a file previously processed by the *compress* utility. If *file* already  
 116921       has the *.Z* suffix specified, it is used as submitted. Otherwise, the *.Z* suffix is  
 116922       appended to the filename prior to processing.

116923 **STDIN**116924       The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*.116925 **INPUT FILES**116926       Input files shall be compressed files that are in the format produced by the *compress* utility.116927 **ENVIRONMENT VARIABLES**116928       The following environment variables shall affect the execution of *zcat*:

116929       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 116930       (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 116931       variables used to determine the values of locale categories.)

116932       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 116933       internationalization variables.

116934       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 116935       characters (for example, single-byte as opposed to multi-byte characters in  
 116936       arguments).

116937       *LC\_MESSAGES*

116938       Determine the locale that should be used to affect the format and contents of  
 116939       diagnostic messages written to standard error.

116940       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

116941 **ASYNCHRONOUS EVENTS**

116942       Default.

116943 **STDOUT**

116944       The compressed files given as input shall be written on standard output in their uncompressed  
 116945       form.

116946 **STDERR**

116947       The standard error shall be used only for diagnostic messages.

116948 **OUTPUT FILES**

116949       None.

116950 **EXTENDED DESCRIPTION**

116951       None.

116952 **EXIT STATUS**

116953       The following exit values shall be returned:

116954       0   Successful completion.

116955       &gt;0   An error occurred.

116956 **CONSEQUENCES OF ERRORS**

116957       Default.

116958 **APPLICATION USAGE**

116959       None.

116960 **EXAMPLES**

116961       None.

116962 **RATIONALE**

116963       None.

116964 **FUTURE DIRECTIONS**

116965       None.

# Rationale for Base Definitions

## A.1 Introduction

### A.1.1 Scope

POSIX.1-2008 is one of a family of standards known as POSIX. The family of standards extends to many topics; POSIX.1 consists of both operating system interfaces and shell and utilities. POSIX.1-2008 is technically identical to The Open Group Base Specifications, Issue 7.

#### Scope of POSIX.1-2008

The (paraphrased) goals of this development were to revise the single document that is ISO/IEC 9945:2003 Parts 1 through 4, IEEE Std 1003.1, 2004 Edition, and the appropriate parts of The Open Group Single UNIX Specification, Version 3. This work has been undertaken by the Austin Group, a joint working group of IEEE, The Open Group, and ISO/IEC JTC 1/SC 22.

The following are the base documents in this version:

- IEEE Std 1003.1, 2004 Edition
- ISO/IEC 9899:1999, Programming Languages — C, including ISO/IEC 9899:1999/Cor.1:2001(E), ISO/IEC 9899:1999/Cor.2:2004(E), and ISO/IEC 9899:1999/Cor.3
- The Open Group Extended API Sets, Parts 1 through 4

This version has addressed the following areas:

- Issues raised by Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1, and ISO/IEC defect reports against ISO/IEC 9945

The repository of interpretations can be accessed at [www.opengroup.org/austin/interps](http://www.opengroup.org/austin/interps).

- Issues raised in corrigenda for The Open Group Technical Standards and working group resolutions from The Open Group
- Issues arising from ISO TR 24715:2006, Conflicts between POSIX and the LSB

This is a Type 3 informative technical report highlighting differences between the LSB 3.1 and the 2004 Edition of this standard.

- Changes to make the text self-consistent with the additional material merged

The new material merged has come from the The Open Group Extended API Sets, Parts 1 through 4. A list of the new interfaces is included in [Section B.1.1](#) (on page 3551).

- Features, marked legacy or obsolescent in the base documents, have been considered for removal in this version

See [Section B.1.1](#) (on page 3551) and [Section C.1.1](#) (on page 3695).

- 117014 • A review and reorganization of the options within the standard
- 117015 This has included marking the following options obsolescent:
- 117016 — Batch Environment Services and Utilities
- 117017 — Tracing
- 117018 — XSI STREAMS
- 117019 The UUCP Utilities option is a new option for this version.
- 117020 Functionality from the following former options is now mandatory in this version:
- 117021 AIO    \_POSIX\_ASYNCHRONOUS\_IO (Asynchronous Input and Output)
- 117022 BAR    \_POSIX\_BARRIERS (Barriers)
- 117023 CS     \_POSIX\_CLOCK\_SELECTION (Clock Selection)
- 117024 MF     \_POSIX\_MAPPED\_FILES (Memory Mapped Files)
- 117025 MPR    \_POSIX\_MEMORY\_PROTECTION (Memory Protection)
- 117026 RTS    \_POSIX\_REALTIME\_SIGNALS (Realtime Signals Extension)
- 117027 RWL    \_POSIX\_READER\_WRITER\_LOCKS (Read-Write Locks)
- 117028 SEM    \_POSIX\_SEMAPHORES (Semaphores)
- 117029 SPI    \_POSIX\_SPIN\_LOCKS (Spin Locks)
- 117030 THR    \_POSIX\_THREADS (Threads)
- 117031 TMO    \_POSIX\_TIMEOUTS (Timeouts)
- 117032 TMR    \_POSIX\_TIMERS (Timers)
- 117033 TSF    \_POSIX\_THREAD\_SAFE\_FUNCTIONS (Thread-Safe Functions)
- 117034 • Alignment with the ISO/IEC 9899:1999 standard, including ISO/IEC
- 117035 9899:1999/Cor.2:2004(E)
- 117036 • A review of the use of fixed path filenames within the standard
- 117037 For example, the *at*, *batch*, and *crontab* utilities previously had a requirement for use of the
- 117038 directory **/usr/lib/cron**.
- 117039 The following were requirements on POSIX.1-2008:
- 117040 • Backward-compatibility
- 117041 For interfaces carried forward, it was agreed that there should be no breakage of
- 117042 functionality in the existing base documents. All strictly conforming applications will be
- 117043 conforming but not necessarily strictly conforming to the revised standard. The goal is for
- 117044 system implementations to be able to support the existing and revised standards
- 117045 simultaneously.
- 117046 • Architecture and *n*-bit-neutral
- 117047 The common standard should not make any implicit assumptions about the system
- 117048 architecture or size of data types; for example, previously some 32-bit implicit assumptions
- 117049 had crept into the standards.
- 117050 • Extensibility
- 117051 It should be possible to extend the common standard without breaking backwards-
- 117052 compatibility; for example, the name space should be reserved and structured to avoid
- 117053 duplication of names between the standard and extensions to it.

**POSIX.1 and the ISO C Standard**

The standard developers believed it essential for a programmer to have a single complete reference place, but recognized that deference to the formal standard has to be addressed for the duplicate interface definitions between the ISO C standard and POSIX.1-2008.

Where an interface has a version in the ISO C standard, the DESCRIPTION section describes the relationship to the ISO C standard and markings are included as appropriate to show where the ISO C standard has been extended in the text.

A block of text is included at the start of each affected reference page stating whether the page is aligned with the ISO C standard or extended. Each page has been parsed for additions beyond the ISO C standard (that is, including both POSIX and UNIX extensions), and these extensions are marked as CX extensions (for C extensions).

**FIPS Requirements**

The Federal Information Processing Standards (FIPS) are a series of US government procurement standards managed and maintained on behalf of the US Department of Commerce by the National Institute of Standards and Technology (NIST).

The following restrictions were integrated into IEEE Std 1003.1-2001. They originally came from FIPS 151-2 which was withdrawn by NIST on February 25 2000.

- The implementation supports `_POSIX_CHOWN_RESTRICTED`.
- The limit `{NGROUPS_MAX}` is greater than or equal to 8.
- The implementation supports the setting of the group ID of a file (when it is created) to that of the parent directory.
- The implementation supports `_POSIX_SAVED_IDS`.
- The implementation supports `_POSIX_VDISABLE`.
- The implementation supports `_POSIX_JOB_CONTROL`.
- The implementation supports `_POSIX_NO_TRUNC`.
- The `read()` function returns the number of bytes read when interrupted by a signal and does not return `-1`.
- The `write()` function returns the number of bytes written when interrupted by a signal and does not return `-1`.
- In the environment for the login shell, the environment variables `LOGNAME` and `HOME` are defined and have the properties described in POSIX.1-2008.
- The value of `{CHILD_MAX}` is greater than or equal to 25.
- The value of `{OPEN_MAX}` is greater than or equal to 20.
- The implementation supports the functionality associated with the symbols `CS7`, `CS8`, `CSTOPB`, `PARODD`, and `PARENB` defined in **<termios.h>**.

**117089 A.1.2 Conformance**

117090 See [Section A.2](#) (on page 3473).

**117091 A.1.3 Normative References**

117092 There is no additional rationale provided for this section.

**117093 A.1.4 Change History**

117094 For Issue 7 onwards, in references to Technical Corrigenda, the original Austin Group defect  
117095 report numbers that gave rise to the change are included in square brackets after the change  
117096 number from the Technical Corrigendum. For more information on Austin Group defect reports  
117097 see [www.opengroup.org/austin/defectform.html](http://www.opengroup.org/austin/defectform.html).

**117098 A.1.5 Terminology**

117099 The meanings specified in POSIX.1-2008 for the words *shall*, *should*, and *may* are mandated by  
117100 ISO/IEC directives.

117101 In the Rationale (Informative) volume of POSIX.1-2008, the words *shall*, *should*, and *may* are  
117102 sometimes used to illustrate similar usages in POSIX.1-2008. However, the rationale itself does  
117103 not specify anything regarding implementations or applications.

**117104 conformance document**

117105 As a practical matter, the conformance document is effectively part of the system  
117106 documentation. Conformance documents are distinguished by POSIX.1-2008 so that they  
117107 can be referred to distinctly.

**117108 implementation-defined**

117109 This definition is analogous to that of the ISO C standard and, together with “undefined”  
117110 and “unspecified”, provides a range of specification of freedom allowed to the interface  
117111 implementor.

**117112 may**

117113 The use of *may* has been limited as much as possible, due both to confusion stemming from  
117114 its ordinary English meaning and to objections regarding the desirability of having as few  
117115 options as possible and those as clearly specified as possible.

117116 The usage of *can* and *may* were selected to contrast optional application behavior (can)  
117117 against optional implementation behavior (may).

**117118 shall**

117119 Declarative sentences are sometimes used in POSIX.1-2008 as if they included the word  
117120 *shall*, and facilities thus specified are no less required. For example, the two statements:

- 117121 1. The *foo()* function shall return zero.
- 117122 2. The *foo()* function returns zero.

117123 are meant to be exactly equivalent.

**117124 should**

117125 In POSIX.1-2008, the word *should* does not usually apply to the implementation, but rather  
117126 to the application. Thus, the important words regarding implementations are *shall*, which  
117127 indicates requirements, and *may*, which indicates options.

**obsolescent**

The term “obsolescent” means “do not use this feature in new applications”. A feature noted as obsolescent is supported by all implementations, but may be removed in a future version; new applications should not use these features. The obsolescence concept is not an ideal solution, but was used as a method of increasing consensus: many more objections would be heard from the user community if some of these historical features were suddenly removed without the grace period obsolescence implies. The phrase “may be removed in a future version” implies that the result of that consideration might in fact keep those features indefinitely if the predominance of applications do not migrate away from them quickly.

**legacy**

The term “legacy” was included in earlier versions of this standard but is no longer used in the current version.

**system documentation**

The system documentation should normally describe the whole of the implementation, including any extensions provided by the implementation. Such documents normally contain information at least as detailed as the specifications in POSIX.1-2008. Few requirements are made on the system documentation, but the term is needed to avoid a dangling pointer where the conformance document is permitted to point to the system documentation.

**undefined**

See *implementation-defined*.

**unspecified**

See *implementation-defined*.

The definitions for “unspecified” and “undefined” appear nearly identical at first examination, but are not. The term “unspecified” means that a conforming application may deal with the unspecified behavior, and it should not care what the outcome is. The term “undefined” says that a conforming application should not do it because no definition is provided for what it does (and implicitly it would care what the outcome was if it tried it). It is important to remember, however, that if the syntax permits the statement at all, it must have some outcome in a real implementation.

Thus, the terms “undefined” and “unspecified” apply to the way the application should think about the feature. In terms of the implementation, it is always “defined”—there is always some result, even if it is an error. The implementation is free to choose the behavior it prefers.

This also implies that an implementation, or another standard, could specify or define the result in a useful fashion. The terms apply to POSIX.1-2008 specifically.

The term “implementation-defined” implies requirements for documentation that are not required for “undefined” (or “unspecified”). Where there is no need for a conforming program to know the definition, the term “undefined” is used, even though “implementation-defined” could also have been used in this context. There could be a fourth term, specifying “this standard does not say what this does; it is acceptable to define it in an implementation, but it does not need to be documented”, and undefined would then be used very rarely for the few things for which any definition is not useful. In particular, implementation-defined is used where it is believed that certain classes of application will need to know such details to determine whether the application can be successfully ported to the implementation. Such applications are not always strictly portable, but nevertheless are common and useful; often the requirements met by the application cannot be met without dealing with the issues implied by “implementation-defined”. In some places the text refers to facilities supplied by the implementation that are

117177 outside the standard as implementation-supplied or implementation-provided. This is not  
 117178 intended to imply a requirement for documentation. If it were, the term “implementation-  
 117179 defined” would have been used.

117180 In many places POSIX.1-2008 is silent about the behavior of some possible construct. For  
 117181 example, a variable may be defined for a specified range of values and behaviors are  
 117182 described for those values; nothing is said about what happens if the variable has any other  
 117183 value. That kind of silence can imply an error in the standard, but it may also imply that the  
 117184 standard was intentionally silent and that any behavior is permitted. There is a natural  
 117185 tendency to infer that if the standard is silent, a behavior is prohibited. That is not the intent.  
 117186 Silence is intended to be equivalent to the term “unspecified”. -

117187 Three terms used within POSIX.1-2008 overlap in meaning: “macro”, “symbolic name”, and  
 117188 “symbolic constant”.

#### 117189 **macro**

117190 This usually describes a C preprocessor symbol, the result of the **#define** operator, with or  
 117191 without an argument. It may also be used to describe similar mechanisms in editors and  
 117192 text processors.

#### 117193 **symbolic name**

117194 In earlier versions of this standard this was also sometimes used to refer to a C preprocessor  
 117195 symbol (without arguments), but the intention is for all such uses to have been removed. It  
 117196 is now mainly used to refer to the names for characters in character sets, but is sometimes  
 117197 used to refer to host names and even filenames.

#### 117198 **symbolic constant**

117199 This also refers to a C preprocessor symbol, with specific associated requirements. See the  
 117200 definition in [Section 3.380](#) (on page 95).

### 117201 **A.1.6 Definitions and Concepts**

117202 There is no additional rationale provided for this section.

### 117203 **A.1.7 Portability**

117204 To aid the identification of options within POSIX.1-2008, a notation consisting of margin codes  
 117205 and shading is used. This is based on the notation used in earlier versions of The Open Group  
 117206 Base specifications.

117207 The benefit of this approach is a reduction in the number of *if* statements within the running  
 117208 text, that makes the text easier to read, and also an identification to the programmer that they  
 117209 need to ensure that their target platforms support the underlying options. For example, if  
 117210 functionality is marked with RPP in the margin, it will be available on all systems supporting  
 117211 the Robust Mutex Priority Protection option, but may not be available on some others.

#### 117212 *A.1.7.1 Codes*

117213 This section includes codes for options defined in XBD [Section 2.1.6](#) (on page 26), and the  
 117214 following additional codes for other purposes:

117215 CX This margin code is used to denote extensions beyond the ISO C standard. For  
 117216 interfaces that are duplicated between POSIX.1-2008 and the ISO C standard, a CX  
 117217 introduction block describes the nature of the duplication, with any extensions

- 117218 appropriately CX marked and shaded.
- 117219 Where an interface is added to an ISO C standard header, within the header the  
 117220 interface has an appropriate margin marker and shading (for example, CX, XSI, TSF,  
 117221 and so on) and the same marking appears on the reference page in the SYNOPSIS  
 117222 section. This enables a programmer to easily identify that the interface is extending an  
 117223 ISO C standard header.
- 117224 **MX and MXX**  
 117225 These two margin codes both relate to the IEC 60559 Floating-Point option. The MX  
 117226 code denotes functionality that is mandated by the ISO C standard for IEC 60559  
 117227 implementations; the MXX code denotes IEC 60559 functionality that is an extension to  
 117228 the ISO C standard.
- 117229 **OB** This margin code is used to denote obsolescent behavior and thus flag a possible future  
 117230 applications portability warning.
- 117231 **OH** The Single UNIX Specification has historically tried to reduce the number of headers an  
 117232 application has had to include when using a particular interface. Sometimes this was  
 117233 fewer than the base standard, and hence a notation is used to flag which headers are  
 117234 optional if you are using a system supporting the XSI option.

#### 117235 A.1.7.2 Margin Code Notation

- 117236 Since some features may depend on one or more options, or require more than one option, a  
 117237 notation is used. Where a feature requires support of a single option, a single margin code will  
 117238 occur in the margin. If it depends on two options and both are required, then the codes will  
 117239 appear with a <space> separator. If either of two options are required, then a logical OR is  
 117240 denoted using the ' | ' symbol. If more than two codes are used, a special notation is used.

## 117241 A.2 Conformance

- 117242 The terms “profile” and “profiling” are used throughout this section.
- 117243 A profile of a standard or standards is a codified set of option selections, such that by being  
 117244 conformant to a profile, particular classes of users are specifically supported.

### 117245 A.2.1 Implementation Conformance

- 117246 These definitions allow application developers to know what to depend on in an  
 117247 implementation.
- 117248 There is no definition of a “strictly conforming implementation”; that would be an  
 117249 implementation that provides *only* those facilities specified by POSIX.1 with no extensions  
 117250 whatsoever. This is because no actual operating system implementation can exist without  
 117251 system administration and initialization facilities that are beyond the scope of POSIX.1.

## 117252 A.2.1.1 Requirements

117253 The word “support” is used in certain instances, rather than “provide”, in order to allow an  
117254 implementation that has no resident software development facilities, but that supports the  
117255 execution of a *Strictly Conforming POSIX.1 Application*, to be a *conforming implementation*.

## 117256 A.2.1.2 Documentation

117257 The conformance documentation is required to use the same numbering scheme as POSIX.1 for  
117258 purposes of cross-referencing. All options that an implementation chooses are reflected in  
117259 **<limits.h>** and **<unistd.h>**.

117260 Note that the use of “may” in terms of where conformance documents record where  
117261 implementations may vary, implies that it is not required to describe those features identified as  
117262 undefined or unspecified.

117263 Other aspects of systems must be evaluated by purchasers for suitability. Many systems  
117264 incorporate buffering facilities, maintaining updated data in volatile storage and transferring  
117265 such updates to non-volatile storage asynchronously. Various exception conditions, such as a  
117266 power failure or a system crash, can cause this data to be lost. The data may be associated with a  
117267 file that is still open, with one that has been closed, with a directory, or with any other internal  
117268 system data structures associated with permanent storage. This data can be lost, in whole or  
117269 part, so that only careful inspection of file contents could determine that an update did not  
117270 occur.

117271 Also, interrelated file activities, where multiple files and/or directories are updated, or where  
117272 space is allocated or released in the file system structures, can leave inconsistencies in the  
117273 relationship between data in the various files and directories, or in the file system itself. Such  
117274 inconsistencies can break applications that expect updates to occur in a specific sequence, so that  
117275 updates in one place correspond with related updates in another place.

117276 For example, if a user creates a file, places information in the file, and then records this action in  
117277 another file, a system or power failure at this point followed by restart may result in a state in  
117278 which the record of the action is permanently recorded, but the file created (or some of its  
117279 information) has been lost. The consequences of this to the user may be undesirable. For a user  
117280 on such a system, the only safe action may be to require the system administrator to have a  
117281 policy that requires, after any system or power failure, that the entire file system must be  
117282 restored from the most recent backup copy (causing all intervening work to be lost).

117283 The characteristics of each implementation will vary in this respect and may or may not meet  
117284 the requirements of a given application or user. Enforcement of such requirements is beyond the  
117285 scope of POSIX.1. It is up to the purchaser to determine what facilities are provided in an  
117286 implementation that affect the exposure to possible data or sequence loss, and also what  
117287 underlying implementation techniques and/or facilities are provided that reduce or limit such  
117288 loss or its consequences.

## 117289 A.2.1.3 POSIX Conformance

117290 This really means conformance to the base standard; however, since this document includes the  
117291 core material of the Single UNIX Specification, the standard developers decided that it was  
117292 appropriate to segment the conformance requirements into two, the former for the base  
117293 standard, and the latter for the Single UNIX Specification (denoted XSI Conformance).

117294 Within POSIX.1 there are some symbolic constants that, if defined to a certain value or range of  
117295 values, indicate that a certain option is enabled. Other symbolic constants exist in POSIX.1 for  
117296 other reasons.

117297 In this version, some features that were previously optional have been made mandatory. For  
 117298 backwards compatibility, the symbolic constants associated with the option are still required  
 117299 now with fixed allowable ranges or values. The following options from the previous version of  
 117300 this standard are now mandatory:

117301        \_POSIX\_ASYNCHRONOUS\_IO  
 117302        \_POSIX\_BARRIERS  
 117303        \_POSIX\_CLOCK\_SELECTION  
 117304        \_POSIX\_MAPPED\_FILES  
 117305        \_POSIX\_MEMORY\_PROTECTION  
 117306        \_POSIX\_READER\_WRITER\_LOCKS  
 117307        \_POSIX\_REALTIME\_SIGNALS  
 117308        \_POSIX\_SEMAPHORES  
 117309        \_POSIX\_SPIN\_LOCKS  
 117310        \_POSIX\_THREAD\_SAFE\_FUNCTIONS  
 117311        \_POSIX\_THREADS  
 117312        \_POSIX\_TIMEOUTS  
 117313        \_POSIX\_TIMERS

117314 A POSIX-conformant system may support the XSI option required by the Single UNIX  
 117315 Specification. This was intentional since the standard developers intend them to be upwards-  
 117316 compatible, so that a system conforming to the Single UNIX Specification can also conform to  
 117317 the base standard at the same time.

#### 117318 A.2.1.4 XSI Conformance

117319 This section is included to describe the conformance requirements for the base volumes of the  
 117320 Single UNIX Specification.

117321 XSI conformance can be thought of as a profile, selecting certain options from POSIX.1-2008.

#### 117322 A.2.1.5 Option Groups

117323 The concept of “Option Groups” is included to allow collections of related functions or options  
 117324 to be grouped together. This has been used as follows: the “XSI Option Groups” have been  
 117325 created to allow super-options, collections of underlying options and related functions, to be  
 117326 collectively supported by XSI-conforming systems.

117327 The standard developers considered the matter of subprofiling and decided it was better to  
 117328 include an enabling mechanism rather than detailed normative requirements. A set of  
 117329 subprofiling options was developed and included later in this volume of POSIX.1-2008 as an  
 117330 informative illustration.

#### 117331 Subprofiling Considerations

117332 The goal of not simultaneously fixing maximums and minimums was to allow implementations  
 117333 of the base standard or standards to support multiple profiles without conflict.

The following summarizes the rules for the limit types:

Limit Type	Fixed Value	Minimum Acceptable Value	Maximum Acceptable Value
Standard Profile	Xs Xp == Xs (No change)	Ys Yp >= Ys (May increase the limit)	Zs Zp <= Zs (May decrease the limit)

The intent is that ranges specified by limits in profiles be entirely contained within the corresponding ranges of the base standard or standards being profiled, and that the unlimited end of a range in a base standard must remain unlimited in any profile of that standard.

Thus, the fixed `_POSIX_*` limits are constants and must not be changed by a profile. The variable counterparts (typically without the leading `_POSIX_`) can be changed but still remain semantically the same; that is, they still allow implementation values to vary as long as they meet the requirements for that value (be it a minimum or maximum).

Where a profile does not provide a feature upon which a limit is based, the limit is not relevant. Applications written to that profile should be written to operate independently of the value of the limit.

An example which has previously allowed implementations to support both the base standard and two other profiles in a compatible manner follows:

```
Base standard (POSIX.1-1996): _POSIX_CHILD_MAX 6
Base standard: CHILD_MAX    minimum maximum _POSIX_CHILD_MAX
FIPS profile/SUSv2  CHILD_MAX    25 (minimum maximum)
```

Another example:

```
Base standard (POSIX.1-1996): _POSIX_NGROUPS_MAX 0
Base standard: NGROUPS_MAX    minimum maximum _POSIX_NGROUP_MAX
FIPS profile/SUSv2  NGROUPS_MAX    8
```

A profile may lower a minimum maximum below the equivalent `_POSIX` value:

```
Base standard: _POSIX_foo_MAX    Z
Base standard: foo_MAX    _POSIX_foo_MAX
profile standard : foo_MAX    X (X can be less than, equal to,
                                or greater than _POSIX_foo_MAX)
```

In this case an implementation conforming to the profile may not conform to the base standard, but an implementation to the base standard will conform to the profile.

#### A.2.1.6 Options

The final subsections within *Implementation Conformance* list the core options within POSIX.1-2008. This includes both options for the System Interfaces volume of POSIX.1-2008 and the Shell and Utilities volume of POSIX.1-2008.

## 117370 A.2.2 Application Conformance

117371 These definitions guide users or adapters of applications in determining on which  
117372 implementations an application will run and how much adaptation would be required to make  
117373 it run on others. These definitions are modeled after related ones in the ISO C standard.

117374 POSIX.1 occasionally uses the expressions “portable application” or “conforming application”.  
117375 As they are used, these are synonyms for any of these terms. The differences between the classes  
117376 of application conformance relate to the requirements for other standards, the options supported  
117377 (such as the XSI option) or, in the case of the Conforming POSIX.1 Application Using Extensions,  
117378 to implementation extensions. When one of the less explicit expressions is used, it should be  
117379 apparent from the context of the discussion which of the more explicit names is appropriate

### 117380 A.2.2.1 Strictly Conforming POSIX Application

117381 This definition is analogous to that of an ISO C standard “conforming program”.

117382 The major difference between a Strictly Conforming POSIX Application and an ISO C standard  
117383 strictly conforming program is that the latter is not allowed to use features of POSIX that are not  
117384 in the ISO C standard.

### 117385 A.2.2.2 Conforming POSIX Application

117386 Examples of <National Bodies> include ANSI, BSI, and AFNOR.

### 117387 A.2.2.3 Conforming POSIX Application Using Extensions

117388 Due to possible requirements for configuration or implementation characteristics in excess of the  
117389 specifications in <limits.h> or related to the hardware (such as array size or file space), not  
117390 every Conforming POSIX Application Using Extensions will run on every conforming  
117391 implementation.

### 117392 A.2.2.4 Strictly Conforming XSI Application

117393 This is intended to be upwards-compatible with the definition of a Strictly Conforming POSIX  
117394 Application, with the addition of the facilities and functionality included in the XSI option.

### 117395 A.2.2.5 Conforming XSI Application Using Extensions

117396 Such applications may use extensions beyond the facilities defined by POSIX.1-2008 including  
117397 the XSI option, but need to document the additional requirements.

## 117398 A.2.3 Language-Dependent Services for the C Programming Language

117399 POSIX.1 is, for historical reasons, both a specification of an operating system interface, shell and  
117400 utilities, and a C binding for that specification. Efforts had been previously undertaken to  
117401 generate a language-independent specification; however, that had failed, and the fact that the  
117402 ISO C standard is the *de facto* primary language on POSIX and the UNIX system makes this a  
117403 necessary and workable situation.

#### 117404 A.2.4 Other Language-Related Specifications

117405 There is no additional rationale provided for this section.

### 117406 A.3 Definitions

117407 The definitions in this section are stated so that they can be used as exact substitutes for the  
117408 terms in text. They should not contain requirements or cross-references to sections within  
117409 POSIX.1-2008; that is accomplished by using an informative note. In addition, the term should  
117410 not be included in its own definition. Where requirements or descriptions need to be addressed  
117411 but cannot be included in the definitions, due to not meeting the above criteria, these occur in  
117412 the General Concepts chapter.

117413 In this version, the definitions have been reworked extensively to meet style requirements and to  
117414 include terms from the base documents (see the Scope).

117415 Many of these definitions are necessarily circular, and some of the terms (such as “process”) are  
117416 variants of basic computing science terms that are inherently hard to define. Where some  
117417 definitions are more conceptual and contain requirements, these appear in the General Concepts  
117418 chapter. Those listed in this section appear in an alphabetical glossary format of terms.

117419 Some definitions must allow extension to cover terms or facilities that are not explicitly  
117420 mentioned in POSIX.1-2008. For example, the definition of “Extended Security Controls”  
117421 permits implementations beyond those defined in POSIX.1-2008.

117422 Some terms in the following list of notes do not appear in POSIX.1-2008; these are marked  
117423 suffixed with an asterisk (\*). Many of them have been specifically excluded from POSIX.1-2008  
117424 because they concern system administration, implementation, or other issues that are not  
117425 specific to the programming interface. Those are marked with a reason, such as  
117426 “implementation-defined”.

#### 117427 Appropriate Privileges

117428 One of the fundamental security problems with many historical UNIX systems has been that the  
117429 privilege mechanism is monolithic—a user has either no privileges or *all* privileges. Thus, a  
117430 successful “trojan horse” attack on a privileged process defeats all security provisions.  
117431 Therefore, POSIX.1 allows more granular privilege mechanisms to be defined. For many  
117432 historical implementations of the UNIX system, the presence of the term “appropriate  
117433 privileges” in POSIX.1 may be understood as a synonym for “superuser” (UID 0). However,  
117434 other systems have emerged where this is not the case and each discrete controllable action has  
117435 *appropriate privileges* associated with it. Because this mechanism is implementation-defined, it  
117436 must be described in the conformance document. Although that description affects several parts  
117437 of POSIX.1 where the term “appropriate privilege” is used, because the term “implementation-  
117438 defined” only appears here, the description of the entire mechanism and its effects on these  
117439 other sections belongs in this equivalent section of the conformance document. This is especially  
117440 convenient for implementations with a single mechanism that applies in all areas, since it only  
117441 needs to be described once.

**Base Character\***

The term “Base Character” has been removed, as it was felt that the use of this term within POSIX.1-2008 was common usage English.

**Byte**

The restriction that a byte is now exactly eight bits was a conscious decision by the standard developers. It came about due to a combination of factors, primarily the use of the type `int8_t` within the networking functions and the alignment with the ISO/IEC 9899:1999 standard, where the `intN_t` types are now defined.

According to the ISO/IEC 9899:1999 standard:

- The `[u]intN_t` types must be two’s complement with no padding bits and no illegal values.
- All types (apart from bit fields, which are not relevant here) must occupy an integral number of bytes.
- If a type with width  $W$  occupies  $B$  bytes with  $C$  bits per byte ( $C$  is the value of `{CHAR_BIT}`), then it has  $P$  padding bits where  $P+W=B*C$ .
- Therefore, for `int8_t`  $P=0$ ,  $W=8$ . Since  $B \geq 1$ ,  $C \geq 8$ , the only solution is  $B=1$ ,  $C=8$ .

The standard developers also felt that this was not an undue restriction for the current state-of-the-art for this version of the standard, but recognize that if industry trends continue, a wider character type may be required in the future.

**Character**

The term “character” is used to mean a sequence of one or more bytes representing a single graphic symbol. The deviation in the exact text of the ISO C standard definition for “byte” meets the intent of the rationale of the ISO C standard also clears up the ambiguity raised by the term “basic execution character set”. The octet-minimum requirement is a reflection of the `{CHAR_BIT}` value.

**Child Process**

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/3 is applied, adding the `vfork()` function to those listed.

**Clock Tick**

The ISO C standard defines a similar interval for use by the `clock()` function. There is no requirement that these intervals be the same. In historical implementations these intervals are different.

**Command**

The terms “command” and “utility” are related but have distinct meanings. Command is defined as “a directive to a shell to perform a specific task”. The directive can be in the form of a single utility name (for example, `ls`), or the directive can take the form of a compound command (for example, `"ls | grep name | pr"`). A utility is a program that can be called by name from a shell. Issuing only the name of the utility to a shell is the equivalent of a one-word command. A utility may be invoked as a separate program that executes in a different process than the command language interpreter, or it may be implemented as a part of the command language interpreter. For example, the `echo` command (the directive to perform a specific task) may be implemented such that the `echo` utility (the logic that performs the task of echoing) is in a separate program; therefore, it is executed in a process that is different from the command

language interpreter. Conversely, the logic that performs the *echo* utility could be built into the command language interpreter; therefore, it could execute in the same process as the command language interpreter.

The terms “tool” and “application” can be thought of as being synonymous with “utility” from the perspective of the operating system kernel. Tools, applications, and utilities historically have run, typically, in processes above the kernel level. Tools and utilities historically have been a part of the operating system non-kernel code and have performed system-related functions, such as listing directory contents, checking file systems, repairing file systems, or extracting system status information. Applications have not generally been a part of the operating system, and they perform non-system-related functions, such as word processing, architectural design, mechanical design, workstation publishing, or financial analysis. Utilities have most frequently been provided by the operating system distributor, applications by third-party software distributors, or by the users themselves. Nevertheless, POSIX.1-2008 does not differentiate between tools, utilities, and applications when it comes to receiving services from the system, a shell, or the standard utilities. (For example, the *xargs* utility invokes another utility; it would be of fairly limited usefulness if the users could not run their own applications in place of the standard utilities.) Utilities are not applications in the sense that they are not themselves subject to the restrictions of POSIX.1-2008 or any other standard—there is no requirement for *grep*, *stty*, or any of the utilities defined here to be any of the classes of conforming applications.

### Column Positions

In most 1-byte character sets, such as ASCII, the concept of column positions is identical to character positions and to bytes. Therefore, it has been historically acceptable for some implementations to describe line folding or tab stops or table column alignment in terms of bytes or character positions. Other character sets pose complications, as they can have internal representations longer than one octet and they can have display characters that have different widths on the terminal screen or printer.

In POSIX.1-2008 the term “column positions” has been defined to mean character—not byte—positions in input files (such as “column position 7 of the FORTRAN input”). Output files describe the column position in terms of the display width of the narrowest printable character in the character set, adjusted to fit the characteristics of the output device. It is very possible that *n* column positions will not be able to hold *n* characters in some character sets, unless all of those characters are of the narrowest width. It is assumed that the implementation is aware of the width of the various characters, deriving this information from the value of *LC\_CTYPE*, and thus can determine how many column positions to allot for each character in those utilities where it is important.

The term “column position” was used instead of the more natural “column” because the latter is frequently used in the different contexts of columns of figures, columns of table values, and so on. Wherever confusion might result, these latter types of columns are referred to as “text columns”.

### Controlling Terminal

The question of which of possibly several special files referring to the terminal is meant is not addressed in POSIX.1. The pathname */dev/tty* is a synonym for the controlling terminal associated with a process.

117527	<b>Device Number*</b>
117528	The concept is handled in <i>stat()</i> as <i>ID of device</i> .
117529	<b>Direct I/O</b>
117530	Historically, direct I/O refers to the system bypassing intermediate buffering, but may be
117531	extended to cover implementation-defined optimizations.
117532	<b>Directory</b>
117533	The format of the directory file is implementation-defined and differs radically between
117534	System V and 4.3 BSD. However, routines (derived from 4.3 BSD) for accessing directories and
117535	certain constraints on the format of the information returned by those routines are described in
117536	the <b>&lt;dirent.h&gt;</b> header.
117537	<b>Directory Entry</b>
117538	Throughout POSIX.1-2008, the term “link” is used (about the <i>link()</i> function, for example) in
117539	describing the objects that point to files from directories.
117540	<b>Display</b>
117541	The Shell and Utilities volume of POSIX.1-2008 assigns precise requirements for the terms
117542	“display” and “write”. Some historical systems have chosen to implement certain utilities
117543	without using the traditional file descriptor model. For example, the <i>vi</i> editor might employ
117544	direct screen memory updates on a personal computer, rather than a <i>write()</i> system call. An
117545	instance of user prompting might appear in a dialog box, rather than with standard error. When
117546	the Shell and Utilities volume of POSIX.1-2008 uses the term “display”, the method of
117547	outputting to the terminal is unspecified; many historical implementations use <i>termcap</i> or
117548	<i>terminfo</i> , but this is not a requirement. The term “write” is used when the Shell and Utilities
117549	volume of POSIX.1-2008 mandates that a file descriptor be used and that the output can be
117550	redirected. However, it is assumed that when the writing is directly to the terminal (it has not
117551	been redirected elsewhere), there is no practical way for a user or test suite to determine whether
117552	a file descriptor is being used. Therefore, the use of a file descriptor is mandated only for the
117553	redirection case and the implementation is free to use any method when the output is not
117554	redirected. The verb <i>write</i> is used almost exclusively, with the very few exceptions of those
117555	utilities where output redirection need not be supported: <i>tabs</i> , <i>talk</i> , <i>tput</i> , and <i>vi</i> .
117556	<b>Dot</b>
117557	The symbolic name <i>dot</i> is carefully used in POSIX.1 to distinguish the working directory
117558	filename from a period or a decimal point.
117559	<b>Dot-Dot</b>
117560	Historical implementations permit the use of these filenames without their special meanings.
117561	Such use precludes any meaningful use of these filenames by a Conforming POSIX.1
117562	Application. Therefore, such use is considered an extension, the use of which makes an
117563	implementation non-conforming; see also <a href="#">Section A.4.12</a> (on page 3506).

**Epoch**

Historically, the origin of UNIX system time was referred to as “00:00:00 GMT, January 1, 1970”. Greenwich Mean Time is actually not a term acknowledged by the international standards community; therefore, this term, “Epoch”, is used to abbreviate the reference to the actual standard, Coordinated Universal Time.

**FIFO Special File**

See [Pipe](#) (on page 3490).

**File**

It is permissible for an implementation-defined file type to be non-readable or non-writable.

**File Classes**

These classes correspond to the historical sets of permission bits. The classes are general to allow implementations flexibility in expanding the access mechanism for more stringent security environments. Note that a process is in one and only one class, so there is no ambiguity.

**Filename**

Filenames are sequences of bytes, not sequences of characters. The only bytes that this standard says cannot appear in any filename are the slash byte and the null byte. This is a side-effect of the fact that no conforming implementations of the standard currently provide a way to pass information specifying the locale associated with strings passed between user-level applications and the kernel. This decision could be revisited if implementations develop a way to associate a locale with the strings passed between kernel space and user space.

Implementations may add other restrictions to the byte sequences allowed in filenames except that any filename consisting of no more than {NAME\_MAX} bytes from the set of characters in the portable filename character set must be allowed.

See [Pathname](#) (on page 3489).

**File System**

Historically, the meaning of this term has been overloaded with two meanings: that of the complete file hierarchy, and that of a mountable subset of that hierarchy; that is, a mounted file system. POSIX.1 uses the term “file system” in the second sense, except that it is limited to the scope of a process (and root directory of a process). This usage also clarifies the domain in which a file serial number is unique.

**Graphic Character**

This definition is made available for those definitions (in particular, *TZ*) which must exclude control characters.

117597 **Group Database**

117598 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/4 is applied, removing the words “of  
117599 implementation-defined format”. See [User Database](#) (on page 3499).

117600 **Group File\***

117601 Implementation-defined; see [User Database](#) (on page 3499).

117602 **Historical Implementations\***

117603 This refers to previously existing implementations of programming interfaces and operating  
117604 systems that are related to the interface specified by POSIX.1.

117605 **Hosted Implementation\***

117606 This refers to a POSIX.1 implementation that is accomplished through interfaces from the  
117607 POSIX.1 services to some alternate form of operating system kernel services. Note that the line  
117608 between a hosted implementation and a native implementation is blurred, since most  
117609 implementations will provide some services directly from the kernel and others through some  
117610 indirect path. (For example, *fopen()* might use *open()*; or *mkfifo()* might use *mknod()*.) There is  
117611 no necessary relationship between the type of implementation and its correctness, performance,  
117612 and/or reliability.

117613 **Implementation\***

117614 This term is generally used instead of its synonym, “system”, to emphasize the consequences of  
117615 decisions to be made by system implementors. Perhaps if no options or extensions to POSIX.1  
117616 were allowed, this usage would not have occurred.

117617 The term “specific implementation” is sometimes used as a synonym for “implementation”.  
117618 This should not be interpreted too narrowly; both terms can represent a relatively broad group  
117619 of systems. For example, a hardware vendor could market a very wide selection of systems that  
117620 all used the same instruction set, with some systems desktop models and others large multi-user  
117621 minicomputers. This wide range would probably share a common POSIX.1 operating system,  
117622 allowing an application compiled for one to be used on any of the others; this is a [*specific*]  
117623 *implementation*. However, such a wide range of machines probably has some differences  
117624 between the models. Some may have different clock rates, different file systems, different  
117625 resource limits, different network connections, and so on, depending on their sizes or intended  
117626 usages. Even on two identical machines, the system administrators may configure them  
117627 differently. Each of these different systems is known by the term “a specific instance of a specific  
117628 implementation”. This term is only used in the portions of POSIX.1 dealing with runtime  
117629 queries: *sysconf()* and *pathconf()*.

117630 **Incomplete Pathname\***

117631 Absolute pathname has been adequately defined.

## Job Control

In order to understand the job control facilities in POSIX.1 it is useful to understand how they are used by a job control-cognizant shell to create the user interface effect of job control.

While the job control facilities supplied by POSIX.1 can, in theory, support different types of interactive job control interfaces supplied by different types of shells, there was historically one particular interface that was most common when the standard was originally developed (provided by BSD C Shell).

This discussion describes that interface as a means of illustrating how the POSIX.1 job control facilities can be used.

Job control allows users to selectively stop (suspend) the execution of processes and continue (resume) their execution at a later point. The user typically employs this facility via the interactive interface jointly supplied by the terminal I/O driver and a command interpreter (shell).

The user can launch jobs (command pipelines) in either the foreground or background. When launched in the foreground, the shell waits for the job to complete before prompting for additional commands. When launched in the background, the shell does not wait, but immediately prompts for new commands.

If the user launches a job in the foreground and subsequently regrets this, the user can type the suspend character (typically set to <control>-Z), which causes the foreground job to stop and the shell to begin prompting for new commands. The stopped job can be continued by the user (via special shell commands) either as a foreground job or as a background job. Background jobs can also be moved into the foreground via shell commands.

If a background job attempts to access the login terminal (controlling terminal), it is stopped by the terminal driver and the shell is notified, which, in turn, notifies the user. (Terminal access includes *read()* and certain terminal control functions, and conditionally includes *write()*.) The user can continue the stopped job in the foreground, thus allowing the terminal access to succeed in an orderly fashion. After the terminal access succeeds, the user can optionally move the job into the background via the suspend character and shell commands.

### Implementing Job Control Shells

The interactive interface described previously can be accomplished using the POSIX.1 job control facilities in the following way.

The key feature necessary to provide job control is a way to group processes into jobs. This grouping is necessary in order to direct signals to a single job and also to identify which job is in the foreground. (There is at most one job that is in the foreground on any controlling terminal at a time.)

The concept of process groups is used to provide this grouping. The shell places each job in a separate process group via the *setpgid()* function. To do this, the *setpgid()* function is invoked by the shell for each process in the job. It is actually useful to invoke *setpgid()* twice for each process: once in the child process, after calling *fork()* to create the process, but before calling one of the *exec* family of functions to begin execution of the program, and once in the parent shell process, after calling *fork()* to create the child. The redundant invocation avoids a race condition by ensuring that the child process is placed into the new process group before either the parent or the child relies on this being the case. The process group ID for the job is selected by the shell to be equal to the process ID of one of the processes in the job. Some shells choose to make one process in the job be the parent of the other processes in the job (if any). Other shells (for example, the C Shell) choose to make themselves the parent of all processes in the pipeline (job). In order to support this latter case, the *setpgid()* function accepts a process group ID parameter

since the correct process group ID cannot be inherited from the shell. The shell itself is considered to be a job and is the sole process in its own process group.

The shell also controls which job is currently in the foreground. A foreground and background job differ in two ways: the shell waits for a foreground command to complete (or stop) before continuing to read new commands, and the terminal I/O driver inhibits terminal access by background jobs (causing the processes to stop). Thus, the shell must work cooperatively with the terminal I/O driver and have a common understanding of which job is currently in the foreground. It is the user who decides which command should be currently in the foreground, and the user informs the shell via shell commands. The shell, in turn, informs the terminal I/O driver via the *tcsetpgrp()* function. This indicates to the terminal I/O driver the process group ID of the foreground process group (job). When the current foreground job either stops or terminates, the shell places itself in the foreground via *tcsetpgrp()* before prompting for additional commands. Note that when a job is created the new process group begins as a background process group. It requires an explicit act of the shell via *tcsetpgrp()* to move a process group (job) into the foreground.

When a process in a job stops or terminates, its parent (for example, the shell) receives synchronous notification by calling the *waitpid()* function with the WUNTRACED flag set. Asynchronous notification is also provided when the parent establishes a signal handler for SIGCHLD and does not specify the SA\_NOCLDSTOP flag. Usually all processes in a job stop as a unit since the terminal I/O driver always sends job control stop signals to all processes in the process group.

To continue a stopped job, the shell sends the SIGCONT signal to the process group of the job. In addition, if the job is being continued in the foreground, the shell invokes *tcsetpgrp()* to place the job in the foreground before sending SIGCONT. Otherwise, the shell leaves itself in the foreground and reads additional commands.

There is additional flexibility in the POSIX.1 job control facilities that allows deviations from the typical interface. Clearing the TOSTOP terminal flag allows background jobs to perform *write()* functions without stopping. The same effect can be achieved on a per-process basis by having a process set the signal action for SIGTTOU to SIG\_IGN.

Note that the terms “job” and “process group” can be used interchangeably. A login session that is not using the job control facilities can be thought of as a large collection of processes that are all in the same job (process group). Such a login session may have a partial distinction between foreground and background processes; that is, the shell may choose to wait for some processes before continuing to read new commands and may not wait for other processes. However, the terminal I/O driver will consider all these processes to be in the foreground since they are all members of the same process group.

In addition to the basic job control operations already mentioned, a job control-cognizant shell needs to perform the following actions.

When a foreground (not background) job stops, the shell must sample and remember the current terminal settings so that it can restore them later when it continues the stopped job in the foreground (via the *tcgetattr()* and *tcsetattr()* functions).

Because a shell itself can be spawned from a shell, it must take special action to ensure that subshells interact well with their parent shells.

A subshell can be spawned to perform an interactive function (prompting the terminal for commands) or a non-interactive function (reading commands from a file). When operating non-interactively, the job control shell will refrain from performing the job control-specific actions described above. It will behave as a shell that does not support job control. For example, all jobs will be left in the same process group as the shell, which itself remains in the process group

established for it by its parent. This allows the shell and its children to be treated as a single job by a parent shell, and they can be affected as a unit by terminal keyboard signals.

An interactive subshell can be spawned from another job control-cognizant shell in either the foreground or background. (For example, from the C Shell, the user can execute the command, `csch &`.) Before the subshell activates job control by calling `setpgid()` to place itself in its own process group and `tcsetpgrp()` to place its new process group in the foreground, it needs to ensure that it has already been placed in the foreground by its parent. (Otherwise, there could be multiple job control shells that simultaneously attempt to control mediation of the terminal.) To determine this, the shell retrieves its own process group via `getpgrp()` and the process group of the current foreground job via `tcgetpgrp()`. If these are not equal, the shell sends SIGTTIN to its own process group, causing itself to stop. When continued later by its parent, the shell repeats the process group check. When the process groups finally match, the shell is in the foreground and it can proceed to take control. After this point, the shell ignores all the job control stop signals so that it does not inadvertently stop itself.

#### *Implementing Job Control Applications*

Most applications do not need to be aware of job control signals and operations; the intuitively correct behavior happens by default. However, sometimes an application can inadvertently interfere with normal job control processing, or an application may choose to overtly effect job control in cooperation with normal shell procedures.

An application can inadvertently subvert job control processing by “blindly” altering the handling of signals. A common application error is to learn how many signals the system supports and to ignore or catch them all. Such an application makes the assumption that it does not know what this signal is, but knows the right handling action for it. The system may initialize the handling of job control stop signals so that they are being ignored. This allows shells that do not support job control to inherit and propagate these settings and hence to be immune to stop signals. A job control shell will set the handling to the default action and propagate this, allowing processes to stop. In doing so, the job control shell is taking responsibility for restarting the stopped applications. If an application wishes to catch the stop signals itself, it should first determine their inherited handling states. If a stop signal is being ignored, the application should continue to ignore it. This is directly analogous to the recommended handling of SIGINT described in the referenced UNIX Programmer’s Manual.

If an application is reading the terminal and has disabled the interpretation of special characters (by clearing the ISIG flag), the terminal I/O driver will not send SIGTSTP when the suspend character is typed. Such an application can simulate the effect of the suspend character by recognizing it and sending SIGTSTP to its process group as the terminal driver would have done. Note that the signal is sent to the process group, not just to the application itself; this ensures that other processes in the job also stop. (Note also that other processes in the job could be children, siblings, or even ancestors.) Applications should not assume that the suspend character is <control>-Z (or any particular value); they should retrieve the current setting at startup.

#### *Implementing Job Control Systems*

The intent in adding 4.2 BSD-style job control functionality was to adopt the necessary 4.2 BSD programmatic interface with only minimal changes to resolve syntactic or semantic conflicts with System V or to close recognized security holes. The goal was to maximize the ease of providing both conforming implementations and Conforming POSIX.1 Applications.

It is only useful for a process to be affected by job control signals if it is the descendant of a job control shell. Otherwise, there will be nothing that continues the stopped process.

POSIX.1 does not specify how controlling terminal access is affected by a user logging out (that

117775 is, by a controlling process terminating). 4.2 BSD uses the *vhangup()* function to prevent any  
 117776 access to the controlling terminal through file descriptors opened prior to logout. System V does  
 117777 not prevent controlling terminal access through file descriptors opened prior to logout (except  
 117778 for the case of the special file, */dev/tty*). Some implementations choose to make processes  
 117779 immune from job control after logout (that is, such processes are always treated as if in the  
 117780 foreground); other implementations continue to enforce foreground/background checks after  
 117781 logout. Therefore, a Conforming POSIX.1 Application should not attempt to access the  
 117782 controlling terminal after logout since such access is unreliable. If an implementation chooses to  
 117783 deny access to a controlling terminal after its controlling process exits, POSIX.1 requires a certain  
 117784 type of behavior (see [Controlling Terminal](#), on page 3480).

#### 117785 **Kernel\***

117786 See [System Call\\*](#) (on page 3497).

#### 117787 **Library Routine\***

117788 See [System Call\\*](#) (on page 3497).

#### 117789 **Logical Device\***

117790 Implementation-defined.

#### 117791 **Map**

117792 The definition of map is included to clarify the usage of mapped pages in the description of the  
 117793 behavior of process memory locking.

#### 117794 **Memory-Resident**

117795 The term “memory-resident” is historically understood to mean that the so-called resident pages  
 117796 are actually present in the physical memory of the computer system and are immune from  
 117797 swapping, paging, copy-on-write faults, and so on. This is the actual intent of POSIX.1-2008 in  
 117798 the process memory locking section for implementations where this is logical. But for some  
 117799 implementations—primarily mainframes—actually locking pages into primary storage is not  
 117800 advantageous to other system objectives, such as maximizing throughput. For such  
 117801 implementations, memory locking is a “hint” to the implementation that the application wishes  
 117802 to avoid situations that would cause long latencies in accessing memory. Furthermore, there are  
 117803 other implementation-defined issues with minimizing memory access latencies that “memory  
 117804 residency” does not address—such as MMU reload faults. The definition attempts to  
 117805 accommodate various implementations while allowing conforming applications to specify to the  
 117806 implementation that they want or need the best memory access times that the implementation  
 117807 can provide.

#### 117808 **Memory Object\***

117809 The term “memory object” usually implies shared memory. If the object is the same as a  
 117810 filename in the file system name space of the implementation, it is expected that the data written  
 117811 into the memory object be preserved on disk. A memory object may also apply to a physical  
 117812 device on an implementation. In this case, writes to the memory object are sent to the controller  
 117813 for the device and reads result in control registers being returned.

**Mount Point\***

The directory on which a “mounted file system” is mounted. This term, like *mount()* and *umount()*, was not included because it was implementation-defined.

**Mounted File System\***

See [File System](#) (on page 3482).

**Name**

There are no explicit limits in POSIX.1-2008 on the sizes of names, words (see the definition of word in the Base Definitions volume of POSIX.1-2008), lines, or other objects. However, other implicit limits do apply: shell script lines produced by many of the standard utilities cannot exceed {LINE\_MAX} and the sum of exported variables comes under the {ARG\_MAX} limit. Historical shells dynamically allocate memory for names and words and parse incoming lines a character at a time. Lines cannot have an arbitrary {LINE\_MAX} limit because of historical practice, such as *makefiles*, where *make* removes the <newline> characters associated with the commands for a target and presents the shell with one very long line. The text on INPUT FILES in XCU [Section 1.4](#) (on page 2326) does allow a shell to run out of memory, but it cannot have arbitrary programming limits.

**Native Implementation\***

This refers to an implementation of POSIX.1 that interfaces directly to an operating system kernel; see also *hosted implementation*. A similar concept is a native UNIX system, which would be a kernel derived from one of the original UNIX system products.

**Nice Value**

This definition is not intended to suggest that all processes in a system have priorities that are comparable. Scheduling policy extensions, such as adding realtime priorities, make the notion of a single underlying priority for all scheduling policies problematic. Some implementations may implement the features related to *nice* to affect all processes on the system, others to affect just the general time-sharing activities implied by POSIX.1-2008, and others may have no effect at all. Because of the use of “implementation-defined” in *nice* and *renice*, a wide range of implementation strategies is possible.

**Open File Description**

An “open file description”, as it is currently named, describes how a file is being accessed. What is currently called a “file descriptor” is actually just an identifier or “handle”; it does not actually describe anything.

The following alternate names were discussed:

- For “open file description”:  
“open instance”, “file access description”, “open file information”, and “file access information”.
- For “file descriptor”:  
“file handle”, “file number” (cf., *fileno()*). Some historical implementations use the term “file table entry”.

**Orphaned Process Group**

Historical implementations have a concept of an orphaned process, which is a process whose parent process has exited. When job control is in use, it is necessary to prevent processes from being stopped in response to interactions with the terminal after they no longer are controlled by a job control-cognizant program. Because signals generated by the terminal are sent to a process group and not to individual processes, and because a signal may be provoked by a process that is not orphaned, but sent to another process that is orphaned, it is necessary to define an orphaned process group. The definition assumes that a process group will be manipulated as a group and that the job control-cognizant process controlling the group is outside of the group and is the parent of at least one process in the group (so that state changes may be reported via *waitpid()*). Therefore, a group is considered to be controlled as long as at least one process in the group has a parent that is outside of the process group, but within the session.

This definition of orphaned process groups ensures that a session leader's process group is always considered to be orphaned, and thus it is prevented from stopping in response to terminal signals.

**Page**

The term "page" is defined to support the description of the behavior of memory mapping for shared memory and memory mapped files, and the description of the behavior of process memory locking. It is not intended to imply that shared memory/file mapping and memory locking are applicable only to "paged" architectures. For the purposes of POSIX.1-2008, whatever the granularity on which an architecture supports mapping or locking, this is considered to be a "page". If an architecture cannot support the memory mapping or locking functions specified by POSIX.1-2008 on any granularity, then these options will not be implemented on the architecture.

**Pathname**

Pathnames historically allowed all bytes except for the <slash> and <NUL> characters. For compatibility with existing file systems, this usage is maintained throughout the standard by noting that a pathname need not be a valid character string in all locales. However, the properties of the portable filename character set are such that a pathname using only those characters and the <slash> is portable in all locales as a character string.

**Passwd File\***

Implementation-defined; see [User Database](#) (on page 3499).

**Parent Directory**

There may be more than one directory entry pointing to a given directory in some implementations. The wording here identifies that exactly one of those is the parent directory. In pathname resolution, dot-dot is identified as the way that the unique directory is identified. (That is, the parent directory is the one to which dot-dot points.) In the case of a remote file system, if the same file system is mounted several times, it would appear as if they were distinct file systems (with interesting synchronization properties).

**117892 Pipe**

117893 It proved convenient to define a pipe as a special case of a FIFO, even though historically the  
117894 latter was not introduced until System III and does not exist at all in 4.3 BSD.

**117895 Portable Filename Character Set**

117896 The encoding of this character set is not specified—specifically, ASCII is not required. But the  
117897 implementation must provide a unique character code for each of the printable graphics  
117898 specified by POSIX.1; see also [Section A.4.6](#) (on page 3502).

117899 Situations where characters beyond the portable filename character set (or historically ASCII or  
117900 the ISO/IEC 646:1991 standard) would be used (in a context where the portable filename  
117901 character set or the ISO/IEC 646:1991 standard is required by POSIX.1) are expected to be  
117902 common. Although such a situation renders the use technically non-compliant, mutual  
117903 agreement among the users of an extended character set will make such use portable between  
117904 those users. Such a mutual agreement could be formalized as an optional extension to POSIX.1.  
117905 (Making it required would eliminate too many possible systems, as even those systems using the  
117906 ISO/IEC 646:1991 standard as a base character set extend their character sets for Western  
117907 Europe and the rest of the world in different ways.)

117908 Nothing in POSIX.1 is intended to preclude the use of extended characters where interchange is  
117909 not required or where mutual agreement is obtained. It has been suggested that in several places  
117910 “should” be used instead of “shall”. Because (in the worst case) use of any character beyond the  
117911 portable filename character set would render the program or data not portable to all possible  
117912 systems, no extensions are permitted in this context.

**117913 Process Lifetime**

117914 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/5 is applied, adding *fork()*, *posix\_spawn()*,  
117915 *posix\_spawnp()*, and *vfork()* to the list of functions.

**117916 Process Termination**

117917 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/6 is applied, rewording the definition to  
117918 address the “passive exit” on termination of the last thread or the *\_Exit()* function.

**117919 Regular File**

117920 POSIX.1 does not intend to preclude the addition of structuring data (for example, record  
117921 lengths) in the file, as long as such data is not visible to an application that uses the features  
117922 described in POSIX.1.

**117923 Root Directory**

117924 This definition permits the operation of *chroot()*, even though that function is not in POSIX.1; see  
117925 also [Section A.4.5](#) (on page 3501).

**117926 Root File System\***

117927 Implementation-defined.

**Root of a File System\***

Implementation-defined; see [Mount Point\\*](#) (on page 3488).

**Signal**

The definition implies a double meaning for the term. Although a signal is an event, common usage implies that a signal is an identifier of the class of event.

**Superuser\***

This concept, with great historical significance to UNIX system users, has been replaced with the notion of appropriate privileges.

**Supplementary Group ID**

The POSIX.1-1990 standard is inconsistent in its treatment of supplementary groups. The definition of supplementary group ID explicitly permits the effective group ID to be included in the set, but wording in the description of the *setuid()* and *setgid()* functions states: “Any supplementary group IDs of the calling process remain unchanged by these function calls”. In the case of *setgid()* this contradicts that definition. In addition, some felt that the unspecified behavior in the definition of supplementary group IDs adds unnecessary portability problems. The standard developers considered several solutions to this problem:

1. Reword the description of *setgid()* to permit it to change the supplementary group IDs to reflect the new effective group ID. A problem with this is that it adds more “may”s to the wording and does not address the portability problems of this optional behavior.
2. Mandate the inclusion of the effective group ID in the supplementary set (giving {NGROUPS\_MAX} a minimum value of 1). This is the behavior of 4.4 BSD. In that system, the effective group ID is the first element of the array of supplementary group IDs (there is no separate copy stored, and changes to the effective group ID are made only in the supplementary group set). By convention, the initial value of the effective group ID is duplicated elsewhere in the array so that the initial value is not lost when executing a set-group-ID program.
3. Change the definition of supplementary group ID to exclude the effective group ID and specify that the effective group ID does not change the set of supplementary group IDs. This is the behavior of 4.2 BSD, 4.3 BSD, and System V Release 4.
4. Change the definition of supplementary group ID to exclude the effective group ID, and require that *getgroups()* return the union of the effective group ID and the supplementary group IDs.
5. Change the definition of {NGROUPS\_MAX} to be one more than the number of supplementary group IDs, so it continues to be the number of values returned by *getgroups()* and existing applications continue to work. This alternative is effectively the same as the second (and might actually have the same implementation).

The standard developers decided to permit either 2 or 3. The effective group ID is orthogonal to the set of supplementary group IDs, and it is implementation-defined whether *getgroups()* returns this. If the effective group ID is returned with the set of supplementary group IDs, then all changes to the effective group ID affect the supplementary group set returned by *getgroups()*. It is permissible to eliminate duplicates from the list returned by *getgroups()*. However, if a group ID is contained in the set of supplementary group IDs, setting the group ID to that value and then to a different value should not remove that value from the supplementary group IDs.

The definition of supplementary group IDs has been changed to not include the effective group

117972 ID. This simplifies permanent rationale and makes the relevant functions easier to understand.  
 117973 The *getgroups()* function has been modified so that it can, on an implementation-defined basis,  
 117974 return the effective group ID. By making this change, functions that modify the effective group  
 117975 ID do not need to discuss adding to the supplementary group list; the only view into the  
 117976 supplementary group list that the application developer has is through the *getgroups()* function.

## 117977 Symbolic Constant

117978 Earlier versions of this standard used a variety of terms other than “macro” for many of the  
 117979 constants defined in headers, and it was not clear in which of these cases they were required to  
 117980 be macros or not, or to be pre-processor constants (i.e., usable in *#if*) or not. In cases where the  
 117981 symbols had a reserved prefix or suffix, there was often inconsistency between whether the  
 117982 prefix/suffix was reserved only for macros or for any use, and whether the term “macro” or a  
 117983 different term was used in the descriptions of the symbols. There were also some unintentional  
 117984 differences from the ISO C standard.

117985 One of the most commonly used terms was “symbolic constant”. This has now been designated  
 117986 as the default term to be used wherever appropriate, and a formal definition of the term has  
 117987 been added giving the exact requirements for symbols that are described as symbolic constants.

117988 The standard developers have performed a major rationalization of the header descriptions of  
 117989 symbols with constant values according to the following policy:

- 117990 • Where symbols are from the ISO C standard, the wording from the ISO C standard (or  
 117991 equivalent, in cases where the exact wording is not appropriate) is used to describe them.
- 117992 • For all other constants, the first choice is to use “symbolic constant” when the  
 117993 requirements for the symbol are a reasonably close fit with those of the term.

117994 The description of the symbol can override individual requirements for symbolic  
 117995 constants; e.g., to specify a non-integer type, or to add a requirement that the symbol is  
 117996 usable in *#if* preprocessor directives.

- 117997 • When neither of the above apply, the exact requirements are stated in the description.  
 117998 (Note that macros are not required to be usable in *#if*, or even to expand to constant  
 117999 expressions, unless explicitly stated.)

- 118000 • In cases where there is a reserved prefix or suffix, if the symbol(s) with that prefix/suffix  
 118001 are from the ISO C standard and are required to be macros, or if the symbol is required to  
 118002 be usable in *#if*, then the prefix/suffix is reserved for use only as macros. If the symbol(s)  
 118003 are “symbolic constants” and not required to be usable in *#if*, the prefix/suffix is reserved  
 118004 for any use except in a few special cases.

118005 Where a constant is required to be a macro but is also allowed to be another type of constant  
 118006 such as an enumeration constant, on implementations which do define it as another type of  
 118007 constant the macro is typically defined as follows:

```
118008 #define macro_name macro_name
```

118009 This allows applications to use *#ifdef*, etc. to determine whether the macro is defined, but the  
 118010 macro is not usable in *#if* preprocessor directives because the preprocessor will treat the  
 118011 unexpanded word *macro\_name* as having the value zero.

## Symbolic Link

Earlier versions of this standard did not require symbolic links to have attributes such as ownership and a file serial number. This was because the 4.4 BSD implementation did not have them, and it was expected that other implementations may wish to do the same. However, experience with 4.4 BSD has shown that symbolic links implemented in this way cause problems for users and application developers, and later BSD systems have reverted to using *inodes* to implement symbolic links. Allowing *no-inode* symbolic links also caused problems in the standard. For example, leaving the *st\_ino* value for symbolic links unspecified meant that the common technique of comparing the *st\_dev* and *st\_ino* values for two pathnames to see if they refer to the same file could only be used with *stat()* in conforming applications and not with *lstat()*. The standard now requires symbolic links to have meaningful values for the same **struct stat** fields as regular files, except for the file mode bits in *st\_mode*. Historically, the file mode bits were unused (the contents of a symbolic link could always be read), but implementations differed as to whether the file mode bits (as returned in *st\_mode* or reported by *ls -l*) were set according to the *umask* or just to a fixed value such as 0777. Accordingly, the standard requires the file mode bits to be ignored by *readlink()* and when a symbolic link is followed during pathname resolution, but leaves the corresponding part of the value returned in *st\_mode* unspecified.

Historical implementations were followed when determining which interfaces should apply to symbolic links. Interfaces that historically followed symbolic links include *chmod()*, *stat()*, and *utime()*. Interfaces that historically did not follow symbolic links include *lstat()*, *rename()*, *remove()*, *rmdir()*, and *unlink()*. For *chown()* and *link()*, historical implementations differed. POSIX.1-2008 inherited the *lchown()* function from the Single UNIX Specification, Version 2, and therefore requires *chown()* to follow symbolic links. Earlier versions of this standard required *link()* to follow symbolic links, but with the addition of the *linkat()* function (which has a flag to indicate whether to follow symbolic links), both behaviors are now allowed for *link()*.

When the final component of a pathname is a symbolic link, the standard requires that a trailing *<slash>* causes the link to be followed. This is the behavior of historical implementations. For example, for */a/b* and */a/b/*, if */a/b* is a symbolic link to a directory, then */a/b* refers to the symbolic link, and */a/b/* refers to the directory to which the symbolic link points.

Because a symbolic link and its referenced object coexist in the file system name space, confusion can arise in distinguishing between the link itself and the referenced object. Historically, utilities and system calls have adopted their own link following conventions in a somewhat *ad hoc* fashion. Rules for a uniform approach are outlined here, although historical practice has been adhered to as much as was possible. To promote consistent system use, user-written utilities are encouraged to follow these same rules.

Symbolic links are handled either by operating on the link itself, or by operating on the object referenced by the link. In the latter case, an application or system call is said to “follow” the link. Symbolic links may reference other symbolic links, in which case links are dereferenced until an object that is not a symbolic link is found, a symbolic link that references a file that does not exist is found, or a loop is detected. (Current implementations do not detect loops, but have a limit on the number of symbolic links that they will dereference before declaring it an error.)

There are four domains for which default symbolic link policy is established in a system. In almost all cases, there are utility options that override this default behavior. The four domains are as follows:

1. Symbolic links specified to system calls that take pathname arguments
2. Symbolic links specified as command line pathname arguments to utilities that are not performing a traversal of a file hierarchy

3. Symbolic links referencing files not of type directory, specified to utilities that are performing a traversal of a file hierarchy

4. Symbolic links referencing files of type directory, specified to utilities that are performing a traversal of a file hierarchy

#### First Domain

The first domain is considered in earlier rationale.

#### Second Domain

The reason this category is restricted to utilities that are not traversing the file hierarchy is that some standard utilities take an option that specifies a hierarchical traversal, but by default operate on the arguments themselves. Generally, users specifying the option for a file hierarchy traversal wish to operate on a single, physical hierarchy, and therefore symbolic links, which may reference files outside of the hierarchy, are ignored. For example, *chown owner file* is a different operation from the same command with the **-R** option specified. In this example, the behavior of the command *chown owner file* is described here, while the behavior of the command *chown -R owner file* is described in the third and fourth domains.

The general rule is that the utilities in this category follow symbolic links named as arguments.

Exceptions in the second domain are:

- The *mv* and *rm* utilities do not follow symbolic links named as arguments, but respectively attempt to rename or delete them.
- The *ls* utility is also an exception to this rule. For compatibility with historical systems, when the **-R** option is not specified, the *ls* utility follows symbolic links named as arguments if the **-L** option is specified or if the **-F**, **-d**, or **-l** options are not specified. (If the **-L** option is specified, *ls* always follows symbolic links; it is the only utility where the **-L** option affects its behavior even though a tree walk is not being performed.)

All other standard utilities, when not traversing a file hierarchy, always follow symbolic links named as arguments.

Historical practice is that the **-h** option is specified if standard utilities are to act upon symbolic links instead of upon their targets. Examples of commands that have historically had a **-h** option for this purpose are the *chgrp*, *chown*, *file*, and *test* utilities.

#### Third Domain

The third domain is symbolic links, referencing files not of type directory, specified to utilities that are performing a traversal of a file hierarchy. (This includes symbolic links specified as command line pathname arguments or encountered during the traversal.)

The intention of the Shell and Utilities volume of POSIX.1-2008 is that the operation that the utility is performing is applied to the symbolic link itself, if that operation is applicable to symbolic links. If the operation is not applicable to symbolic links, the symbolic link should be ignored. Specifically, by default, no change should be made to the file referenced by the symbolic link.

#### Fourth Domain

The fourth domain is symbolic links referencing files of type directory, specified to utilities that are performing a traversal of a file hierarchy. (This includes symbolic links specified as command line pathname arguments or encountered during the traversal.)

Most standard utilities do not, by default, indirect into the file hierarchy referenced by the symbolic link. (The Shell and Utilities volume of POSIX.1-2008 uses the informal term “physical

walk” to describe this case. The case where the utility does indirect through the symbolic link is termed a “logical walk”.)

There are three reasons for the default to be a physical walk:

1. With very few exceptions, a physical walk has been the historical default on UNIX systems supporting symbolic links. Because some utilities (that is, *rm*) must default to a physical walk, regardless, changing historical practice in this regard would be confusing to users and needlessly incompatible.
2. For systems where symbolic links have the historical file attributes (that is, *owner*, *group*, *mode*), defaulting to a logical traversal would require the addition of a new option to the commands to modify the attributes of the link itself. This is painful and more complex than the alternatives.
3. There is a security issue with defaulting to a logical walk. Historically, the command *chown -R user file* has been safe for the superuser because *setuid* and *setgid* bits were lost when the ownership of the file was changed. If the walk were logical, changing ownership would no longer be safe because a user might have inserted a symbolic link pointing to any file in the tree. Again, this would necessitate the addition of an option to the commands doing hierarchy traversal to not indirect through the symbolic links, and historical scripts doing recursive walks would instantly become security problems. While this is mostly an issue for system administrators, it is preferable to not have different defaults for different classes of users.

However, the standard developers agreed to leave it unspecified to achieve consensus.

As consistently as possible, users may cause standard utilities performing a file hierarchy traversal to follow any symbolic links named on the command line, regardless of the type of file they reference, by specifying the **-H** (for half logical) option. This option is intended to make the command line name space look like the logical name space.

As consistently as possible, users may cause standard utilities performing a file hierarchy traversal to follow any symbolic links named on the command line as well as any symbolic links encountered during the traversal, regardless of the type of file they reference, by specifying the **-L** (for logical) option. This option is intended to make the entire name space look like the logical name space.

For consistency, implementors are encouraged to use the **-P** (for “physical”) flag to specify the physical walk in utilities that do logical walks by default for whatever reason.

When one or more of the **-H**, **-L**, and **-P** flags can be specified, the last one specified determines the behavior of the utility. This permits users to alias commands so that the default behavior is a logical walk and then override that behavior on the command line.

#### *Exceptions in the Third and Fourth Domains*

The *ls* and *rm* utilities are exceptions to these rules. The *rm* utility never follows symbolic links and does not support the **-H**, **-L**, or **-P** options. Some historical versions of *ls* always followed symbolic links given on the command line whether the **-L** option was specified or not. Historical versions of *ls* did not support the **-H** option. In POSIX.1-2008, unless one of the **-H** or **-L** options is specified, the *ls* utility only follows symbolic links to directories that are given as operands. The *ls* utility does not support the **-P** option.

The Shell and Utilities volume of POSIX.1-2008 requires that the standard utilities *ls*, *find*, and *pax* detect infinite loops when doing logical walks; that is, a directory, or more commonly a symbolic link, that refers to an ancestor in the current file hierarchy. If the file system itself is corrupted, causing the infinite loop, it may be impossible to recover. Because *find* and *ls* are often used in system administration and security applications, they should attempt to recover and

118151 continue as best as they can. The *pax* utility should terminate because the archive it was creating  
118152 is by definition corrupted. Other, less vital, utilities should probably simply terminate as well.  
118153 Implementations are strongly encouraged to detect infinite loops in all utilities.

118154 Historical practice is shown in [Table A-1](#) (on page 3497). The heading **SVID3** stands for the  
118155 Third Edition of the System V Interface Definition.

118156 Historically, several shells have had built-in versions of the *pwd* utility. In some of these shells,  
118157 *pwd* reported the physical path, and in others, the logical path. Implementations of the shell  
118158 corresponding to POSIX.1-2008 must report the logical path by default.

118159 The *cd* command is required, by default, to treat the filename dot-dot logically. Implementors are  
118160 required to support the **-P** flag in *cd* so that users can have their current environment handled  
118161 physically. In 4.3 BSD, *chgrp* during tree traversal changed the group of the symbolic link, not  
118162 the target. Symbolic links in 4.4 BSD did not have *owner*, *group*, *mode*, or other standard UNIX  
118163 system file attributes.

118164

**Table A-1** Historical Practice for Symbolic Links

Utility	SVID3	4.3 BSD	4.4 BSD	POSIX	Comments
118165 <i>cd</i>				–L	Treat " . . " logically.
118166 <i>cd</i>				–P	Treat " . . " physically.
118167 <i>chgrp</i>			–H	–H	Follow command line symlinks.
118168 <i>chgrp</i>			–h	–L	Follow symlinks.
118169 <i>chgrp</i>	–h			–h	Affect the symlink.
118170 <i>chmod</i>					Affect the symlink.
118171 <i>chmod</i>			–H		Follow command line symlinks.
118172 <i>chmod</i>			–h		Follow symlinks.
118173 <i>chown</i>			–H	–H	Follow command line symlinks.
118174 <i>chown</i>			–h	–L	Follow symlinks.
118175 <i>chown</i>	–h			–h	Affect the symlink.
118176 <i>cp</i>			–H	–H	Follow command line symlinks.
118177 <i>cp</i>			–h	–L	Follow symlinks.
118178 <i>cpio</i>	–L		–L		Follow symlinks.
118179 <i>du</i>			–H	–H	Follow command line symlinks.
118180 <i>du</i>			–h	–L	Follow symlinks.
118181 <i>file</i>	–h			–h	Affect the symlink.
118182 <i>find</i>			–H	–H	Follow command line symlinks.
118183 <i>find</i>			–h	–L	Follow symlinks.
118184 <i>find</i>	–follow		–follow		Follow symlinks.
118185 <i>ln</i>	–s	–s	–s	–s	Create a symbolic link.
118186 <i>ls</i>	–L	–L	–L	–L	Follow symlinks.
118187 <i>ls</i>				–H	Follow command line symlinks.
118188 <i>mv</i>					Operates on the symlink.
118189 <i>pax</i>			–H	–H	Follow command line symlinks.
118190 <i>pax</i>			–h	–L	Follow symlinks.
118191 <i>pwd</i>				–L	Printed path may contain symlinks.
118192 <i>pwd</i>				–P	Printed path will not contain symlinks.
118193 <i>rm</i>					Operates on the symlink.
118194 <i>tar</i>			–H		Follow command line symlinks.
118195 <i>tar</i>		–h	–h		Follow symlinks.
118196 <i>test</i>	–h		–h	–h	Affect the symlink.

118198

**Synchronously-Generated Signal**

118199

Those signals that may be generated synchronously include SIGABRT, SIGBUS, SIGILL, SIGFPE, SIGPIPE, and SIGSEGV.

118200

118201

Any signal sent via the *raise()* function or a *kill()* function targeting the current process is also considered synchronous.

118202

118203

**System Call\***

118204

The distinction between a “system call” and a “library routine” is an implementation detail that may differ between implementations and has thus been excluded from POSIX.1.

118205

118206

See “Interface, Not Implementation” in the Preface.

**118207 System Console**

118208 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/7 is applied, changing from “An  
118209 implementation-defined device” to “A device”.

**118210 System Databases**

118211 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/9 is applied, rewording the definition to  
118212 reference the existing definitions for “group database” and “user database”.

**118213 System Process**

118214 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/8 is applied, rewording the definition to  
118215 remove the requirement for an implementation to define the object.

**118216 System Reboot**

118217 A “system reboot” is an event initiated by an unspecified circumstance that causes all processes  
118218 (other than special system processes) to be terminated in an implementation-defined manner,  
118219 after which any changes to the state and contents of files created or written to by a Conforming  
118220 POSIX.1 Application prior to the event are implementation-defined.

118221 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/10 is applied, changing “An  
118222 implementation-defined sequence of events” to “An unspecified sequence of events”.

**118223 Synchronized I/O Data (and File) Integrity Completion**

118224 These terms specify that for synchronized read operations, pending writes must be successfully  
118225 completed before the read operation can complete. This is motivated by two circumstances.  
118226 Firstly, when synchronizing processes can access the same file, but not share common buffers  
118227 (such as for a remote file system), this requirement permits the reading process to guarantee that  
118228 it can read data written remotely. Secondly, having data written synchronously is insufficient to  
118229 guarantee the order with respect to a subsequent write by a reading process, and thus this extra  
118230 read semantic is necessary.

**118231 Text File**

118232 The term “text file” does not prevent the inclusion of control or other non-printable characters  
118233 (other than NUL). Therefore, standard utilities that list text files as inputs or outputs are either  
118234 able to process the special characters or they explicitly describe their limitations within their  
118235 individual descriptions. The definition of “text file” has caused controversy. The only difference  
118236 between text and binary files is that text files have lines of less than {LINE\_MAX} bytes, with no  
118237 NUL characters, each terminated by a <newline>. The definition allows a file with a single  
118238 <newline>, or a totally empty file, to be called a text file. If a file ends with an incomplete line it  
118239 is not strictly a text file by this definition. The <newline> referred to in POSIX.1-2008 is not some  
118240 generic line separator, but a single character; files created on systems where they use multiple  
118241 characters for ends of lines are not portable to all conforming systems without some translation  
118242 process unspecified by POSIX.1-2008.

**Thread**

POSIX.1-2008 defines a thread to be a flow of control within a process. Each thread has a minimal amount of private state; most of the state associated with a process is shared among all of the threads in the process. While most multi-thread extensions to POSIX have taken this approach, others have made different decisions.

**Note:** The choice to put threads within a process does not constrain implementations to implement threads in that manner. However, all functions have to behave as though threads share the indicated state information with the process from which they were created.

Threads need to share resources in order to cooperate. Memory has to be widely shared between threads in order for the threads to cooperate at a fine level of granularity. Threads keep data structures and the locks protecting those data structures in shared memory. For a data structure to be usefully shared between threads, such structures should not refer to any data that can only be interpreted meaningfully by a single thread. Thus, any system resources that might be referred to in data structures need to be shared between all threads. File descriptors, pathnames, and pointers to stack variables are all things that programmers want to share between their threads. Thus, the file descriptor table, the root directory, the current working directory, and the address space have to be shared.

Library implementations are possible as long as the effective behavior is as if system services invoked by one thread do not suspend other threads. This may be difficult for some library implementations on systems that do not provide asynchronous facilities.

See [Section B.2.9](#) (on page 3622) for additional rationale.

**Thread ID**

See [Section B.2.9.2](#) (on page 3639) for additional rationale.

**Thread-Safe Function**

All functions required by POSIX.1-2008 need to be thread-safe; see [Section A.4.17](#) (on page 3509) and [Section B.2.9.1](#) (on page 3636) for additional rationale.

**User Database**

There are no references in POSIX.1-2008 to a “passwd file” or a “group file”, and there is no requirement that the *group* or *passwd* databases be kept in files containing editable text. Many large timesharing systems use *passwd* databases that are hashed for speed. Certain security classifications prohibit certain information in the *passwd* database from being publicly readable.

The term “encoded” is used instead of “encrypted” in order to avoid the implementation connotations (such as reversibility or use of a particular algorithm) of the latter term.

The *getgrent()*, *setgrent()*, *endgrent()*, *getpwent()*, *setpwent()*, and *endpwent()* functions are not included as part of the base standard because they provide a linear database search capability that is not generally useful (the *getpwuid()*, *getpwnam()*, *getgrgid()*, and *getgrnam()* functions are provided for keyed lookup) and because in certain distributed systems, especially those with different authentication domains, it may not be possible or desirable to provide an application with the ability to browse the system databases indiscriminately. They are provided on XSI-conformant systems due to their historical usage by many existing applications.

A change from historical implementations is that the structures used by these functions have fields of the types **gid\_t** and **uid\_t**, which are required to be defined in the **<sys/types.h>** header. POSIX.1-2008 requires implementations to ensure that these types are defined by inclusion of **<grp.h>** and **<pwd.h>**, respectively, without imposing any name space pollution or errors from redefinition of types.

118288 POSIX.1-2008 is silent about the content of the strings containing user or group names. These  
 118289 could be digit strings. POSIX.1-2008 is also silent as to whether such digit strings bear any  
 118290 relationship to the corresponding (numeric) user or group ID.

118291 *Database Access*

118292 The thread-safe versions of the user and group database access functions return values in user-  
 118293 supplied buffers instead of possibly using static data areas that may be overwritten by each call.

118294 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/11 is applied, removing the words “of  
 118295 implementation-defined format”.

118296 **Virtual Processor\***

118297 The term “virtual processor” was chosen as a neutral term describing all kernel-level  
 118298 schedulable entities, such as processes, Mach tasks, or lightweight processes. Implementing  
 118299 threads using multiple processes as virtual processors, or implementing multiplexed threads  
 118300 above a virtual processor layer, should be possible, provided some mechanism has also been  
 118301 implemented for sharing state between processes or virtual processors. Many systems may also  
 118302 wish to provide implementations of threads on systems providing “shared processes” or  
 118303 “variable-weight processes”. It was felt that exposing such implementation details would  
 118304 severely limit the type of systems upon which the threads interface could be supported and  
 118305 prevent certain types of valid implementations. It was also determined that a virtual processor  
 118306 interface was out of the scope of the Rationale (Informative) volume of POSIX.1-2008.

118307 **XSI**

118308 This is included to allow POSIX.1-2008 to be adopted as an IEEE standard and an Open Group  
 118309 Standard, serving both the POSIX and the Single UNIX Specification in a core set of volumes.

118310 The term “XSI” has been used for 10 years in connection with the XPG series and the first and  
 118311 second versions of the base volumes of the Single UNIX Specification. The XSI margin code was  
 118312 introduced to denote the extended or more restrictive semantics beyond POSIX that are  
 118313 applicable to UNIX systems.

## 118314 **A.4 General Concepts**

118315 The general concepts are similar in nature to the definitions section, with the exception that a  
 118316 term defined in general concepts can contain normative requirements.

### 118317 **A.4.1 Concurrent Execution**

118318 There is no additional rationale provided for this section.

**118319 A.4.2 Directory Protection**

118320 There is no additional rationale provided for this section.

**118321 A.4.3 Extended Security Controls**

118322 Allowing an implementation to define extended security controls enables the use of  
 118323 POSIX.1-2008 in environments that require different or more rigorous security than that  
 118324 provided in POSIX.1. Extensions are allowed in two areas: privilege and file access permissions.  
 118325 The semantics of these areas have been defined to permit extensions with reasonable, but not  
 118326 exact, compatibility with all existing practices. For example, the elimination of the superuser  
 118327 definition precludes identifying a process as privileged or not by virtue of its effective user ID.

**118328 A.4.4 File Access Permissions**

118329 A process should not try to anticipate the result of an attempt to access data by *a priori* use of  
 118330 these rules. Rather, it should make the attempt to access data and examine the return value (and  
 118331 possibly *errno* as well), or use *access()*. An implementation may include other security  
 118332 mechanisms in addition to those specified in POSIX.1, and an access attempt may fail because of  
 118333 those additional mechanisms, even though it would succeed according to the rules given in this  
 118334 section. (For example, the user's security level might be lower than that of the object of the  
 118335 access attempt.) The supplementary group IDs provide another reason for a process to not  
 118336 attempt to anticipate the result of an access attempt.

118337 Since the current standard does not specify a method for opening a directory for searching, it is  
 118338 unspecified whether search permission on the *fd* argument to *openat()* and related functions is  
 118339 based on whether the directory was opened with search mode or on the current permissions  
 118340 allowed by the directory at the time a search is performed. When there is existing practice that  
 118341 supports opening directories for searching, it is expected that these functions will be modified to  
 118342 specify that the search permissions will be granted based on the file access modes of the  
 118343 directory's file descriptor identified by *fd*, and not on the mode of the directory at the time the  
 118344 directory is searched.

**118345 A.4.5 File Hierarchy**

118346 Though the file hierarchy is commonly regarded to be a tree, POSIX.1 does not define it as such  
 118347 for three reasons:

- 118348 1. Links may join branches.
- 118349 2. In some network implementations, there may be no single absolute root directory; see  
 118350 *pathname resolution*.
- 118351 3. With symbolic links, the file system need not be a tree or even a directed acyclic graph.

118352 **A.4.6 Filenames**

118353 Historically, certain filenames and pathnames have been reserved. This list includes **core**,  
118354 **/etc/passwd**, and so on. Conforming applications should avoid these.

118355 Most historical implementations prohibit case folding in filenames; that is, treating uppercase  
118356 and lowercase alphabetic characters as identical. However, some consider case folding desirable:

- 118357 • For user convenience
- 118358 • For ease-of-implementation of the POSIX.1 interface as a hosted system on some popular  
118359 operating systems

118360 Variants, such as maintaining case distinctions in filenames, but ignoring them in comparisons,  
118361 have been suggested. Methods of allowing escaped characters of the case opposite the default  
118362 have been proposed.

118363 Many reasons have been expressed for not allowing case folding, including:

- 118364 • No solid evidence has been produced as to whether case-sensitivity or case-insensitivity is  
118365 more convenient for users.
- 118366 • Making case-insensitivity a POSIX.1 implementation option would be worse than either  
118367 having it or not having it, because:
  - 118368 — More confusion would be caused among users.
  - 118369 — Application developers would have to account for both cases in their code.
  - 118370 — POSIX.1 implementors would still have other problems with native file systems, such  
118371 as short or otherwise constrained filenames or pathnames, and the lack of  
118372 hierarchical directory structure.
- 118373 • Case folding is not easily defined in many European languages, both because many of  
118374 them use characters outside the US ASCII alphabetic set, and because:
  - 118375 — In Spanish, the digraph "ll" is considered to be a single letter, the capitalized form  
118376 of which may be either "Ll" or "LL", depending on context.
  - 118377 — In French, the capitalized form of a letter with an accent may or may not retain the  
118378 accent, depending on the country in which it is written.
  - 118379 — In German, the sharp ess may be represented as a single character resembling a  
118380 Greek beta ( $\beta$ ) in lowercase, but as the digraph "SS" in uppercase.
  - 118381 — In Greek, there are several lowercase forms of some letters; the one to use depends on  
118382 its position in the word. Arabic has similar rules.
- 118383 • Many East Asian languages, including Japanese, Chinese, and Korean, do not distinguish  
118384 case and are sometimes encoded in character sets that use more than one byte per  
118385 character.
- 118386 • Multiple character codes may be used on the same machine simultaneously. There are  
118387 several ISO character sets for European alphabets. In Japan, several Japanese character  
118388 codes are commonly used together, sometimes even in filenames; this is evidently also the  
118389 case in China. To handle case insensitivity, the kernel would have to at least be able to  
118390 distinguish for which character sets the concept made sense.
- 118391 • The file system implementation historically deals only with bytes, not with characters.  
118392 Limitations on valid encodings ensure that the byte sequences for the <slash> character,  
118393 <period> character, and <NUL> character will not be confused with any other character in  
118394 any locale. However, there exist common single-shift encodings where other single-byte

118395 characters from the portable filename character set can also occur as a subset of a multi-  
 118396 byte character, making case folding of portable filename bytes dependent on the context of  
 118397 whether a shift-state is active.

118398 • The purpose of POSIX.1 is to standardize the common, existing definition, not to change it.  
 118399 Mandating case-insensitivity would make all historical implementations non-standard.

118400 • Not only the interface, but also application programs would need to change, counter to the  
 118401 purpose of having minimal changes to existing application code.

118402 • At least one of the original developers of the UNIX system has expressed objection in the  
 118403 strongest terms to either requiring case-insensitivity or making it an option, mostly on the  
 118404 basis that POSIX.1 should not hinder portability of application programs across related  
 118405 implementations in order to allow compatibility with unrelated operating systems.

118406 Two proposals were entertained regarding case folding in filenames:

118407 1. Remove all wording that previously permitted case folding.

118408 Rationale Case folding is inconsistent with the portable filename character set and  
 118409 filename definitions (all bytes except <slash> and null). No known  
 118410 implementations allowing all bytes except <slash> and null also do case  
 118411 folding.

118412 2. Change “though this practice is not recommended:” to “although this practice is strongly  
 118413 discouraged.”

118414 Rationale If case folding must be included in POSIX.1, the wording should be stronger  
 118415 to discourage the practice.

118416 The consensus selected the first proposal. Otherwise, a conforming application would have to  
 118417 assume that case folding would occur when it was not wanted, but that it would not occur when  
 118418 it was wanted.

#### 118419 **A.4.7 Filename Portability**

118420 Filenames should be constructed from the portable filename character set because the use of  
 118421 other characters can be confusing or ambiguous in certain contexts. (For example, the use of a  
 118422 <colon> (‘ : ’) in a pathname could cause ambiguity if that pathname were included in a *PATH*  
 118423 definition.)

118424 The constraint on use of the <hyphen-minus> character as the first character of a portable  
 118425 filename is a constraint on application behavior and not on implementations, since applications  
 118426 might not work as expected when such a filename is passed as a command line argument.

#### 118427 **A.4.8 File Times Update**

118428 This section reflects the actions of historical implementations. The times are not updated  
 118429 immediately, but are only marked for update by the functions. An implementation may update  
 118430 these times immediately.

118431 The accuracy of the time update values is intentionally left unspecified so that systems can  
 118432 control the bandwidth of a possible covert channel.

118433 The wording was carefully chosen to make it clear that there is no requirement that the  
 118434 conformance document contain information that might incidentally affect file timestamps. Any  
 118435 function that performs pathname resolution might update several last data access timestamps.

118436 Functions such as `getpwnam()` and `getgrnam()` might update the last data access timestamp of  
118437 some specific file or files. It is intended that these are not required to be documented in the  
118438 conformance document, but they should appear in the system documentation.

#### 118439 **A.4.9 Host and Network Byte Order**

118440 There is no additional rationale provided for this section.

#### 118441 **A.4.10 Measurement of Execution Time**

118442 The methods used to measure the execution time of processes and threads, and the precision of  
118443 these measurements, may vary considerably depending on the software architecture of the  
118444 implementation, and on the underlying hardware. Implementations can also make tradeoffs  
118445 between the scheduling overhead and the precision of the execution time measurements.  
118446 POSIX.1-2008 does not impose any requirement on the accuracy of the execution time; it instead  
118447 specifies that the measurement mechanism and its precision are implementation-defined.

#### 118448 **A.4.11 Memory Synchronization**

118449 In older multi-processors, access to memory by the processors was strictly multiplexed. This  
118450 meant that a processor executing program code interrogates or modifies memory in the order  
118451 specified by the code and that all the memory operation of all the processors in the system  
118452 appear to happen in some global order, though the operation histories of different processors are  
118453 interleaved arbitrarily. The memory operations of such machines are said to be sequentially  
118454 consistent. In this environment, threads can synchronize using ordinary memory operations. For  
118455 example, a producer thread and a consumer thread can synchronize access to a circular data  
118456 buffer as follows:

```
118457 int rdptr = 0;  
118458 int wrptr = 0;  
118459 data_t buf[BUFSIZE];  
  
118460 Thread 1:  
118461     while (work_to_do) {  
118462         int next;  
  
118463         buf[wrptr] = produce();  
118464         next = (wrptr + 1) % BUFSIZE;  
118465         while (rdptr == next)  
118466             ;  
118467         wrptr = next;  
118468     }  
  
118469 Thread 2:  
118470     while (work_to_do) {  
118471         while (rdptr == wrptr)  
118472             ;  
118473         consume(buf[rdptr]);  
118474         rdptr = (rdptr + 1) % BUFSIZE;  
118475     }
```

118476 In modern multi-processors, these conditions are relaxed to achieve greater performance. If one  
118477 processor stores values in location A and then location B, then other processors loading data

from location B and then location A may see the new value of B but the old value of A. The memory operations of such machines are said to be weakly ordered. On these machines, the circular buffer technique shown in the example will fail because the consumer may see the new value of *wrptr* but the old value of the data in the buffer. In such machines, synchronization can only be achieved through the use of special instructions that enforce an order on memory operations. Most high-level language compilers only generate ordinary memory operations to take advantage of the increased performance. They usually cannot determine when memory operation order is important and generate the special ordering instructions. Instead, they rely on the programmer to use synchronization primitives correctly to ensure that modifications to a location in memory are ordered with respect to modifications and/or access to the same location in other threads. Access to read-only data need not be synchronized. The resulting program is said to be data race-free.

Synchronization is still important even when accessing a single primitive variable (for example, an integer). On machines where the integer may not be aligned to the bus data width or be larger than the data width, a single memory load may require multiple memory cycles. This means that it may be possible for some parts of the integer to have an old value while other parts have a newer value. On some processor architectures this cannot happen, but portable programs cannot rely on this.

In summary, a portable multi-threaded program, or a multi-process program that shares writable memory between processes, has to use the synchronization primitives to synchronize data access. It cannot rely on modifications to memory being observed by other threads in the order written in the application or even on modification of a single variable being seen atomically.

Conforming applications may only use the functions listed to synchronize threads of control with respect to memory access. There are many other candidates for functions that might also be used. Examples are: signal sending and reception, or pipe writing and reading. In general, any function that allows one thread of control to wait for an action caused by another thread of control is a candidate. POSIX.1-2008 does not require these additional functions to synchronize memory access since this would imply the following:

- All these functions would have to be recognized by advanced compilation systems so that memory operations and calls to these functions are not reordered by optimization.
- All these functions would potentially have to have memory synchronization instructions added, depending on the particular machine.
- The additional functions complicate the model of how memory is synchronized and make automatic data race detection techniques impractical.

Formal definitions of the memory model were rejected as unreadable by the vast majority of programmers. In addition, most of the formal work in the literature has concentrated on the memory as provided by the hardware as opposed to the application programmer through the compiler and runtime system. It was believed that a simple statement intuitive to most programmers would be most effective. POSIX.1-2008 defines functions that can be used to synchronize access to memory, but it leaves open exactly how one relates those functions to the semantics of each function as specified elsewhere in POSIX.1-2008. POSIX.1-2008 also does not make a formal specification of the partial ordering in time that the functions can impose, as that is implied in the description of the semantics of each function. It simply states that the programmer has to ensure that modifications do not occur “simultaneously” with other access to a memory location.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/4 is applied, adding a new paragraph beneath the table of functions: “The *pthread\_once()* function shall synchronize memory for the first call in each thread for a given *pthread\_once\_t* object.”.

118527 **A.4.12 Pathname Resolution**

118528 It is necessary to differentiate between the definition of pathname and the concept of pathname  
118529 resolution with respect to the handling of trailing <slash> characters. By specifying the behavior  
118530 here, it is not possible to provide an implementation that is conforming but extends all interfaces  
118531 that handle pathnames to also handle strings that are not legal pathnames (because they have  
118532 trailing <slash> characters).

118533 Pathnames that end with one or more trailing <slash> characters must refer to directory paths.  
118534 Earlier versions of this standard were not specific about the distinction between trailing <slash>  
118535 characters on files and directories, and both were permitted.

118536 Two types of implementation have been prevalent; those that ignored trailing <slash> characters  
118537 on all pathnames regardless, and those that permitted them only on existing directories.

118538 An earlier version of this standard required that a pathname with a trailing <slash> character be  
118539 treated as if it had a trailing " / . " everywhere. This specification was ambiguous. In situations  
118540 where the intent was that the application wanted to require the implementation to accept the  
118541 pathname only if it named a directory (existing or to be created as a result of the call performing  
118542 pathname resolution), literally adding a ' . ' after the trailing <slash> could be interpreted to  
118543 require use of that pathname to fail. Some of the uses that created ambiguous requirements  
118544 included `mkdir("newdir/")` and `rmdir("existing-dir/")`. POSIX.1-2008 requires that a pathname  
118545 with a trailing <slash> be rejected unless it refers to a file that is a directory or to a file that is to  
118546 be created as a directory. The `rename()` function and the `mv` utility further specify that a trailing  
118547 <slash> cannot be used on a pathname naming a file that does not exist when used as the last  
118548 argument to `rename()` or `renameat()`, or as the last operand to `mv`.

118549 Note that this change does not break any conforming applications; since there were two different  
118550 types of implementation, no application could have portably depended on either behavior. This  
118551 change does however require some implementations to be altered to remain compliant.  
118552 Substantial discussion over a three-year period has shown that the benefits to application  
118553 developers outweighs the disadvantages for some vendors.

118554 On a historical note, some early applications automatically appended a '/' to every path.  
118555 Rather than fix the applications, the system implementation was modified to accept this  
118556 behavior by ignoring any trailing <slash>.

118557 Each directory has exactly one parent directory which is represented by the name **dot-dot** in the  
118558 first directory. No other directory, regardless of linkages established by symbolic links, is  
118559 considered the parent directory by POSIX.1-2008.

118560 There are two general categories of interfaces involving pathname resolution: those that follow  
118561 the symbolic link, and those that do not. There are several exceptions to this rule; for example,  
118562 `open(path, O_CREAT | O_EXCL)` will fail when `path` names a symbolic link. However, in all other  
118563 situations, the `open()` function will follow the link.

118564 What the filename **dot-dot** refers to relative to the root directory is implementation-defined. In  
118565 Version 7 it refers to the root directory itself; this is the behavior mentioned in POSIX.1-2008. In  
118566 some networked systems the construction `././hostname/` is used to refer to the root directory of  
118567 another host, and POSIX.1 permits this behavior.

118568 Other networked systems use the construct `//hostname` for the same purpose; that is, a double  
118569 initial <slash> is used. There is a potential problem with existing applications that create full  
118570 pathnames by taking a trunk and a relative pathname and making them into a single string  
118571 separated by ' / ', because they can accidentally create networked pathnames when the trunk is  
118572 ' / '. This practice is not prohibited because such applications can be made to conform by  
118573 simply changing to use " / / " as a separator instead of ' / ':

- If the trunk is `'/'`, the full pathname will begin with `"/"` (the initial `'/'` and the separator `"/"`). This is the same as `'/'`, which is what is desired. (This is the general case of making a relative pathname into an absolute one by prefixing with `"/"` instead of `'/'`.)
- If the trunk is `"/A"`, the result is `"/A/..."`; since non-leading sequences of two or more `<slash>` characters are treated as a single `<slash>`, this is equivalent to the desired `"/A/..."`.
- If the trunk is `"/A"`, the implementation-defined semantics will apply. (The multiple `<slash>` rule would apply.)

Application developers should avoid generating pathnames that start with `"/"`. Implementations are strongly encouraged to avoid using this special interpretation since a number of applications currently do not follow this practice and may inadvertently generate `"/..."`.

The term “root directory” is only defined in POSIX.1 relative to the process. In some implementations, there may be no absolute root directory. The initialization of the root directory of a process is implementation-defined.

When the standard says: “Pathname resolution for a given pathname shall yield the same results when used by any interface in POSIX.1-2008 as long as there are no changes to any files evaluated during pathname resolution for the given pathname between resolutions”, this applies to absolute pathnames or to relative pathnames from the same current working directory. Using the same relative pathname from two different working directories may yield different results.

Earlier versions of this standard were unclear as to whether a pathname was required to be a character string or just a string. This standard is now clear that filenames are just strings, and that pathname processing is locale-independent.

#### A.4.13 Process ID Reuse

There is no additional rationale provided for this section.

#### A.4.14 Scheduling Policy

There is no additional rationale provided for this section.

#### A.4.15 Seconds Since the Epoch

Coordinated Universal Time (UTC) includes leap seconds. However, in POSIX time (seconds since the Epoch), leap seconds are ignored (not applied) to provide an easy and compatible method of computing time differences. Broken-down POSIX time is therefore not necessarily UTC, despite its appearance.

As of December 2007, 23 leap seconds had been added to UTC since the Epoch, 1 January, 1970. Historically, one leap second is added every 15 months on average, so this offset can be expected to grow with time.

Most systems’ notion of “time” is that of a continuously increasing value, so this value should increase even during leap seconds. However, not only do most systems not keep track of leap seconds, but most systems are probably not synchronized to any standard time reference. Therefore, it is inappropriate to require that a time represented as seconds since the Epoch

precisely represent the number of seconds between the referenced time and the Epoch.

It is sufficient to require that applications be allowed to treat this time as if it represented the number of seconds between the referenced time and the Epoch. It is the responsibility of the vendor of the system, and the administrator of the system, to ensure that this value represents the number of seconds between the referenced time and the Epoch as closely as necessary for the application being run on that system.

It is important that the interpretation of time names and seconds since the Epoch values be consistent across conforming systems; that is, it is important that all conforming systems interpret “536 457 599 seconds since the Epoch” as 59 seconds, 59 minutes, 23 hours 31 December 1986, regardless of the accuracy of the system’s idea of the current time. The expression is given to ensure a consistent interpretation, not to attempt to specify the calendar. The relationship between *tm\_yday* and the day of week, day of month, and month is in accordance with the Gregorian calendar, and so is not specified in POSIX.1.

Consistent interpretation of seconds since the Epoch can be critical to certain types of distributed applications that rely on such timestamps to synchronize events. The accrual of leap seconds in a time standard is not predictable. The number of leap seconds since the Epoch will likely increase. POSIX.1 is more concerned about the synchronization of time between applications of astronomically short duration.

Note that *tm\_yday* is zero-based, not one-based, so the day number in the example above is 364. Note also that the division is an integer division (discarding remainder) as in the C language.

Note also that the meaning of *gmtime()*, *localtime()*, and *mktime()* is specified in terms of this expression. However, the ISO C standard computes *tm\_yday* from *tm\_mday*, *tm\_mon*, and *tm\_year* in *mktime()*. Because it is stated as a (bidirectional) relationship, not a function, and because the conversion between month-day-year and day-of-year dates is presumed well known and is also a relationship, this is not a problem.

Implementations that implement **time\_t** as a signed 32-bit integer will overflow in 2038. This standard requires that **time\_t** be an integer type with implementation-defined size, but does not mandate a particular size. The requirement that **time\_t** be integral is an additional constraint beyond the ISO C standard, which allows a real-floating **time\_t**. Implementation practice has shown that much existing code is unprepared to deal with a floating-point **time\_t**, and that use of **struct timespec** is a more uniform way to provide sub-second time manipulation within applications.

See also [Epoch](#) (on page 3482).

The topic of whether seconds since the Epoch should account for leap seconds has been debated on a number of occasions, and each time consensus was reached (with acknowledged dissent each time) that the majority of users are best served by treating all days identically. (That is, the majority of applications were judged to assume a single length—as measured in seconds since the Epoch—for all days. Thus, leap seconds are not applied to seconds since the Epoch.) Those applications which do care about leap seconds can determine how to handle them in whatever way those applications feel is best. This was particularly emphasized because there was disagreement about what the best way of handling leap seconds might be. It is a practical impossibility to mandate that a conforming implementation must have a fixed relationship to any particular official clock (consider isolated systems, or systems performing “reruns” by setting the clock to some arbitrary time).

Note that as a practical consequence of this, the length of a second as measured by some external standard is not specified. This unspecified second is nominally equal to an International System (SI) second in duration. Applications must be matched to a system that provides the particular handling of external time in the way required by the application.

118663 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/12 is applied, making an editorial  
118664 correction to the paragraph commencing “How any changes to the value of seconds ...”.

#### 118665 **A.4.16 Semaphore**

118666 There is no additional rationale provided for this section.

#### 118667 **A.4.17 Thread-Safety**

118668 Where the interface of a function required by POSIX.1-2008 precludes thread-safety, an alternate  
118669 thread-safe form is provided. The names of these thread-safe forms are the same as the non-  
118670 thread-safe forms with the addition of the suffix “\_r”. The suffix “\_r” is historical, where the  
118671 ‘r’ stood for “reentrant”.

118672 In some cases, thread-safety is provided by restricting the arguments to an existing function.

118673 See also [Section B.2.9.1](#) (on page 3636).

#### 118674 **A.4.18 Tracing**

118675 Refer to [Section B.2.11](#) (on page 3652).

#### 118676 **A.4.19 Treatment of Error Conditions for Mathematical Functions**

118677 It is intended that undeserved underflow and inexact floating-point exceptions are raised only if  
118678 avoiding them would be too costly.

#### 118683 **A.4.22 Variable Assignment**

118684 There is no additional rationale provided for this section.

## A.5 File Format Notation

The notation for spaces allows some flexibility for application output. Note that an empty character position in *format* represents one or more <blank> characters on the output (not *white space*, which can include <newline> characters). Therefore, another utility that reads that output as its input must be prepared to parse the data using *scanf()*, *awk*, and so on. The 'Δ' character is used when exactly one <space> is output.

The treatment of integers and spaces is different from the *printf()* function in that they can be surrounded with <blank> characters. This was done so that, given a format such as:

```
"%d\n" , <foo>
```

the implementation could use a *printf()* call such as:

```
printf("%6d\n" , foo);
```

and still conform. This notation is thus somewhat like *scanf()* in addition to *printf()*.

The *printf()* function was chosen as a model because most of the standard developers were familiar with it. One difference from the C function *printf()* is that the l and h conversion specifier characters are not used. As expressed by the Shell and Utilities volume of POSIX.1-2008, there is no differentiation between decimal values for type **int**, type **long**, or type **short**. The conversion specifications %d or %i should be interpreted as an arbitrary length sequence of digits. Also, no distinction is made between single precision and double precision numbers (**float** or **double** in C). These are simply referred to as floating-point numbers.

Many of the output descriptions in the Shell and Utilities volume of POSIX.1-2008 use the term "line", such as:

```
"%s" , <input line>
```

Since the definition of *line* includes the trailing <newline> already, there is no need to include a '\n' in the format; a double <newline> would otherwise result.

## A.6 Character Set

### A.6.1 Portable Character Set

The portable character set is listed in full so there is no dependency on the ISO/IEC 646: 1991 standard (or historically ASCII) encoded character set, although the set is identical to the characters defined in the International Reference version of the ISO/IEC 646: 1991 standard.

POSIX.1-2008 poses no requirement that multiple character sets or codesets be supported, leaving this as a marketing differentiation for implementors. Although multiple charmap files are supported, it is the responsibility of the implementation to provide the file(s); if only one is provided, only that one will be accessible using the *localedef -f* option.

The statement about invariance in codesets for the portable character set is worded to avoid precluding implementations where multiple incompatible codesets are available (for instance, ASCII and EBCDIC). The standard utilities cannot be expected to produce predictable results if they access portable characters that vary on the same implementation.

Not all character sets need include the portable character set, but each locale must include it. For

118723 example, a Japanese-based locale might be supported by a mixture of character sets: JIS X 0201  
 118724 Roman (a Japanese version of the ISO/IEC 646:1991 standard), JIS X 0208, and JIS X 0201  
 118725 Katakana. Not all of these character sets include the portable characters, but at least one does  
 118726 (JIS X 0201 Roman).

## 118727 **A.6.2 Character Encoding**

118728 Encoding mechanisms based on single shifts, such as the EUC encoding used in some Asian and  
 118729 other countries, can be supported via the current charmap mechanism. With single-shift  
 118730 encoding, each character is preceded by a shift code (SS2 or SS3). A complete EUC code,  
 118731 consisting of the portable character set (G0) and up to three additional character sets (G1, G2,  
 118732 G3), can be described using the current charmap mechanism; the encoding for each character in  
 118733 additional character sets G2 and G3 must then include their single-shift code. Other mechanisms  
 118734 to support locales based on encoding mechanisms such as locking shift are not addressed by this  
 118735 volume of POSIX.1-2008.

118736 The encodings for <slash> and <period> are required to be the same across all locales, in part  
 118737 because pathname resolution requires recognition of these bytes. It is a fortunate accident that all  
 118738 common shift-based encodings did not use either <slash> or <period> as a valid second byte in  
 118739 a multi-byte character.

118740 The encodings for <newline> and <carriage-return> are required to be the same across all +  
 118741 locales since they are special to the general terminal interface and cannot be changed (see XBD +  
 118742 [Section 11.1.9](#), on page 204). +

118743 Earlier versions of this standard did not state the requirement that the POSIX locale contains 256 +  
 118744 single-byte characters. This was an oversight; the intention was always that the POSIX locale +  
 118745 should have an 8-bit-clean single-byte encoding.

## 118746 **A.6.3 C Language Wide-Character Codes**

118747 The standard does not specify how wide characters are encoded or provide a method for  
 118748 defining wide characters in a charmap. It specifies ways of translating between wide characters  
 118749 and multi-byte characters. The standard does not prevent an extension from providing a method  
 118750 to define wide characters.

118751 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/13 is applied, adding a statement that the  
 118752 standard has no means of defining a wide-character codeset.

## 118753 **A.6.4 Character Set Description File**

118754 IEEE PASC Interpretation 1003.2 #196 is applied, removing three lines of text dealing with  
 118755 ranges of symbolic names using position constant values which had been erroneously included  
 118756 in the final IEEE P1003.2b draft standard.

118757 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/14 is applied, correcting the example and  
 118758 adding a statement that the standard provides no means of defining a wide-character codeset.

118759 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/15 is applied, allowing the value zero for  
 118760 the width value of **WIDTH** and **WIDTH\_DEFAULT**. This is required to cover some existing  
 118761 locales.

## 118762 A.6.4.1 State-Dependent Character Encodings

118763 A requirement was considered that would force utilities to eliminate any redundant locking  
 118764 shifts, but this was left as a quality of implementation issue.

118765 This change satisfies the following requirement from the ISO POSIX-2:1993 standard, Annex  
 118766 H.1:

118767 *The support of state-dependent (shift encoding) character sets should be addressed fully. See*  
 118768 *descriptions of these in XBD Section 6.2 (on page 128). If such character encodings are supported,*  
 118769 *it is expected that this will impact XBD Section 6.2 (on page 128), Chapter 7 (on page 135),*  
 118770 *Chapter 9 (on page 181), and the comm, cut, diff, grep, head, join, paste, and tail utilities.*

118771 The character set description file provides:

- 118772 • The capability to describe character set attributes (such as collation order or character  
 118773 classes) independent of character set encoding, and using only the characters in the  
 118774 portable character set. This makes it possible to create generic *localedef* source files for all  
 118775 codesets that share the portable character set (such as the ISO 8859 family or IBM Extended  
 118776 ASCII).
- 118777 • Standardized symbolic names for all characters in the portable character set, making it  
 118778 possible to refer to any such character regardless of encoding.

118779 Implementations are free to choose their own symbolic names, as long as the names identified  
 118780 by the Base Definitions volume of POSIX.1-2008 are also defined; this provides support for  
 118781 already existing “character names”.

118782 The names selected for the members of the portable character set follow the  
 118783 ISO/IEC 8859-1:1998 standard and the ISO/IEC 10646-1:2000 standard. However, several  
 118784 commonly used UNIX system names occur as synonyms in the list:

- 118785 • The historical UNIX system names are used for control characters.
- 118786 • The word “slash” is given in addition to “solidus”.
- 118787 • The word “backslash” is given in addition to “reverse-solidus”.
- 118788 • The word “hyphen” is given in addition to “hyphen-minus”.
- 118789 • The word “period” is given in addition to “full-stop”.
- 118790 • For digits, the word “digit” is eliminated.
- 118791 • For letters, the words “Latin Capital Letter” and “Latin Small Letter” are eliminated.
- 118792 • The words “left brace” and “right brace” are given in addition to “left-curly-bracket” and  
 118793 “right-curly-bracket”.
- 118794 • The names of the digits are preferred over the numbers to avoid possible confusion  
 118795 between ‘0’ and ‘O’, and between ‘1’ and ‘l’ (one and the letter ell).

118796 The names for the control characters in XBD Chapter 6 (on page 125) were taken from the  
 118797 ISO/IEC 4873:1991 standard.

118798 The charmap file was introduced to resolve problems with the portability of, especially, *localedef*  
 118799 sources. POSIX.1-2008 assumes that the portable character set is constant across all locales, but  
 118800 does not prohibit implementations from supporting two incompatible codings, such as both  
 118801 ASCII and EBCDIC. Such dual-support implementations should have all charmaps and *localedef*  
 118802 sources encoded using one portable character set, in effect cross-compiling for the other  
 118803 environment. Naturally, charmaps (and *localedef* sources) are only portable without  
 118804 transformation between systems using the same encodings for the portable character set. They

can, however, be transformed between two sets using only a subset of the actual characters (the portable character set). However, the particular coded character set used for an application or an implementation does not necessarily imply different characteristics or collation; on the contrary, these attributes should in many cases be identical, regardless of codeset. The charmap provides the capability to define a common locale definition for multiple codesets (the same *localedef* source can be used for codesets with different extended characters; the ability in the charmap to define empty names allows for characters missing in certain codesets).

The **<escape\_char>** declaration was added at the request of the international community to ease the creation of portable charmap files on terminals not implementing the default **<backslash>-escape**. The **<comment\_char>** declaration was added at the request of the international community to eliminate the potential confusion between the **<number-sign>** and the hash sign.

The octal number notation with no leading zero required was selected to match those of *awk* and *tr* and is consistent with that used by *localedef*. To avoid confusion between an octal constant and the back-references used in *localedef* source, the octal, hexadecimal, and decimal constants must contain at least two digits. As single-digit constants are relatively rare, this should not impose any significant hardship. Provision is made for more digits to account for systems in which the byte size is larger than 8 bits. For example, a Unicode (ISO/IEC 10646-1:2000 standard) system that has defined 16-bit bytes may require six octal, four hexadecimal, and five decimal digits.

The decimal notation is supported because some newer international standards define character values in decimal, rather than in the old column/row notation.

The charmap identifies the coded character sets supported by an implementation. At least one charmap must be provided, but no implementation is required to provide more than one. Likewise, implementations can allow users to generate new charmaps (for instance, for a new version of the ISO 8859 family of coded character sets), but does not have to do so. If users are allowed to create new charmaps, the system documentation describes the rules that apply (for instance, “only coded character sets that are supersets of the ISO/IEC 646:1991 standard IRV, no multi-byte characters”).

This addition of the **WIDTH** specification satisfies the following requirement from the ISO POSIX-2:1993 standard, Annex H.1:

- (9) *The definition of column position relies on the implementation's knowledge of the integral width of the characters. The charmap or LC\_CTYPE locale definitions should be enhanced to allow application specification of these widths.*

The character “width” information was first considered for inclusion under *LC\_CTYPE* but was moved because it is more closely associated with the information in the charmap than information in the locale source (cultural conventions information). Concerns were raised that formalizing this type of information is moving the locale source definition from the codeset-independent entity that it was designed to be to a repository of codeset-specific information. A similar issue occurred with the **<code\_set\_name>**, **<mb\_cur\_max>**, and **<mb\_cur\_min>** information, which was resolved to reside in the charmap definition.

The width definition was added to the IEEE P1003.2b draft standard with the intent that the *wcswidth()* and/or *wcwidth()* functions (currently specified in the System Interfaces volume of POSIX.1-2008) be the mechanism to retrieve the character width information.

118848 **A.7 Locale**118849 **A.7.1 General**

118850 The description of locales is based on work performed in the UniForum Technical Committee,  
 118851 Subcommittee on Internationalization. Wherever appropriate, keywords are taken from the  
 118852 ISO C standard or the X/Open Portability Guide.

118853 The value used to specify a locale with environment variables is the name specified as the *name*  
 118854 operand to the *localedef* utility when the locale was created. This provides a verifiable method to  
 118855 create and invoke a locale.

118856 The “object” definitions need not be portable, as long as “source” definitions are. Strictly  
 118857 speaking, source definitions are portable only between implementations using the same  
 118858 character set(s). Such source definitions, if they use symbolic names only, easily can be ported  
 118859 between systems using different codesets, as long as the characters in the portable character set  
 118860 (see XBD Section 6.1, on page 125) have common values between the codesets; this is frequently  
 118861 the case in historical implementations. Of source, this requires that the symbolic names used for  
 118862 characters outside the portable character set be identical between character sets. The definition  
 118863 of symbolic names for characters is outside the scope of POSIX.1-2008, but is certainly within the  
 118864 scope of other standards organizations.

118865 Applications can select the desired locale by invoking the *setlocale()* function (or equivalent)  
 118866 with the appropriate value. If the function is invoked with an empty string, the value of the  
 118867 corresponding environment variable is used. If the environment variable is not set or is set to the  
 118868 empty string, the implementation sets the appropriate environment as defined in XBD Chapter 8  
 118869 (on page 173).

118870 **A.7.2 POSIX Locale**

118871 On POSIX.1 implementations the POSIX locale is equal to the C locale, even though the |  
 118872 requirements for the POSIX locale are more extensive than the ISO C standard requirements for |  
 118873 the C locale. To avoid being classified as a C-language function, the name has been changed to |  
 118874 the POSIX locale; the environment variable value can be either "POSIX" or, for historical |  
 118875 reasons, "C".

118876 The POSIX definitions mirror the historical UNIX system behavior.

118877 The use of symbolic names for characters in the tables does not imply that the POSIX locale must  
 118878 be described using symbolic character names, but merely that it may be advantageous to do so.

118879 **A.7.3 Locale Definition**

118880 The decision to separate the file format from the *localedef* utility description was only partially  
 118881 editorial. Implementations may provide other interfaces than *localedef*. Requirements on “the  
 118882 utility”, mostly concerning error messages, are described in this way because they are meant to  
 118883 affect the other interfaces implementations may provide as well as *localedef*.

118884 The text about POSIX2\_LOCALEDEF does not mean that internationalization is optional; only  
 118885 that the functionality of the *localedef* utility is. REs, for instance, must still be able to recognize,  
 118886 for example, character class expressions such as "[[:alpha:]]". A possible analogy is with  
 118887 an applications development environment; while all conforming implementations must be

capable of executing applications, not all need to have the development environment installed. The assumption is that the capability to modify the behavior of utilities (and applications) via locale settings must be supported. If the *localedef* utility is not present, then the only choice is to select an existing (presumably implementation-documented) locale. An implementation could, for example, choose to support only the POSIX locale, which would in effect limit the amount of changes from historical implementations quite drastically. The *localedef* utility is still required, but would always terminate with an exit code indicating that no locale could be created. Supported locales must be documented using the syntax defined in this chapter. (This ensures that users can accurately determine what capabilities are provided. If the implementation decides to provide additional capabilities to the ones in this chapter, that is already provided for.)

If the option is present (that is, locales can be created), then the *localedef* utility must be capable of creating locales based on the syntax and rules defined in this chapter. This does not mean that the implementation cannot also provide alternate means for creating locales.

The octal, decimal, and hexadecimal notations are the same employed by the charmap facility (see XBD Section 6.4, on page 129). To avoid confusion between an octal constant and a back-reference, the octal, hexadecimal, and decimal constants must contain at least two digits. As single-digit constants are relatively rare, this should not impose any significant hardship. Provision is made for more digits to account for systems in which the byte size is larger than 8 bits. For example, a Unicode (see the ISO/IEC 10646-1:2000 standard) system that has defined 16-bit bytes may require six octal, four hexadecimal, and five decimal digits. As with the charmap file, multi-byte characters are described in the locale definition file using “big-endian” notation for reasons of portability. There is no requirement that the internal representation in the computer memory be in this same order.

One of the guidelines used for the development of this volume of POSIX.1-2008 is that characters outside the invariant part of the ISO/IEC 646:1991 standard should not be used in portable specifications. The <backslash> character is not in the invariant part; the <number-sign> is, but with multiple representations: as a <number-sign>, and as a hash sign. As far as general usage of these symbols, they are covered by the “grandfather clause”, but for newly defined interfaces, the WG15 POSIX working group has requested that POSIX provide alternate representations. Consequently, while the default escape character remains the <backslash> and the default comment character is the <number-sign>, implementations are required to recognize alternative representations, identified in the applicable source file via the <escape\_char> and <comment\_char> keywords.

#### A.7.3.1 LC\_CTYPE

The *LC\_CTYPE* category is primarily used to define the encoding-independent aspects of a character set, such as character classification. In addition, certain encoding-dependent characteristics are also defined for an application via the *LC\_CTYPE* category. POSIX.1-2008 does not mandate that the encoding used in the locale is the same as the one used by the application because an implementation may decide that it is advantageous to define locales in a system-wide encoding rather than having multiple, logically identical locales in different encodings, and to convert from the application encoding to the system-wide encoding on usage. Other implementations could require encoding-dependent locales.

In either case, the *LC\_CTYPE* attributes that are directly dependent on the encoding, such as <mb\_cur\_max> and the display width of characters, are not user-specifiable in a locale source and are consequently not defined as keywords.

Implementations may define additional keywords or extend the *LC\_CTYPE* mechanism to allow application-defined keywords.

The text “The ellipsis specification shall only be valid within a single encoded character set” is present because it is possible to have a locale supported by multiple character encodings, as explained in the rationale for XBD [Section 6.1](#) (on page 125). An example given there is of a possible Japanese-based locale supported by a mixture of the character sets JIS X 0201 Roman, JIS X 0208, and JIS X 0201 Katakana. Attempting to express a range of characters across these sets is not logical and the implementation is free to reject such attempts.

As the `LC_CTYPE` character classes are based on the ISO C standard character class definition, the category does not support multi-character elements. For instance, the German character <sharp-s> is traditionally classified as a lowercase letter. There is no corresponding uppercase letter; in proper capitalization of German text, the <sharp-s> will be replaced by "SS"; that is, by two characters. This kind of conversion is outside the scope of the **toupper** and **tolower** keywords.

Where POSIX.1-2008 specifies that only certain characters can be specified, as for the keywords **digit** and **xdigit**, the specified characters must be from the portable character set, as shown. As an example, only the Arabic digits 0 through 9 are acceptable as digits.

The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included characters. These only need to be specified if the character values (that is, encoding) differs from the implementation default values. It is not possible to define a locale without these automatically included characters unless some implementation extension is used to prevent their inclusion. Such a definition would not be a proper superset of the C locale, and thus, it might not be possible for the standard utilities to be implemented as programs conforming to the ISO C standard.

The definition of character class **digit** requires that only ten characters—the ones defining digits—can be specified; alternate digits (for example, Hindi or Kanji) cannot be specified here. However, the encoding may vary if an implementation supports more than one encoding.

The definition of character class **xdigit** requires that the characters included in character class **digit** are included here also and allows for different symbols for the hexadecimal digits 10 through 15.

The inclusion of the **charclass** keyword satisfies the following requirement from the ISO POSIX-2: 1993 standard, Annex H.1:

(3) *The LC\_CTYPE (2.5.2.1) locale definition should be enhanced to allow user-specified additional character classes, similar in concept to the ISO C standard Multibyte Support Extension (MSE) `iswctype()` function.*

This keyword was previously included in The Open Group specifications and is now mandated in the Shell and Utilities volume of POSIX.1-2008.

The symbolic constant `{CHARCLASS_NAME_MAX}` was also adopted from The Open Group specifications. Applications portability is enhanced by the use of symbolic constants.

#### A.7.3.2 LC\_COLLATE

The rules governing collation depend to some extent on the use. At least five different levels of increasingly complex collation rules can be distinguished:

1. *Byte/machine code order*: This is the historical collation order in the UNIX system and many proprietary operating systems. Collation is here performed character by character, without any regard to context. The primary virtue is that it usually is quite fast and also completely deterministic; it works well when the native machine collation sequence matches the user expectations.

2. *Character order*: On this level, collation is also performed character by character, without regard to context. The order between characters is, however, not determined by the code values, but on the expectations by the user of the “correct” order between characters. In addition, such a (simple) collation order can specify that certain characters collate equally (for example, uppercase and lowercase letters).
3. *String ordering*: On this level, entire strings are compared based on relatively straightforward rules. Several “passes” may be required to determine the order between two strings. Characters may be ignored in some passes, but not in others; the strings may be compared in different directions; and simple string substitutions may be performed before strings are compared. This level is best described as “dictionary” ordering; it is based on the spelling, not the pronunciation, or meaning, of the words.
4. *Text search ordering*: This is a further refinement of the previous level, best described as “telephone book ordering”; some common homonyms (words spelled differently but with the same pronunciation) are collated together; numbers are collated as if they were spelled out, and so on.
5. *Semantic-level ordering*: Words and strings are collated based on their meaning; entire words (such as “the”) are eliminated; the ordering is not deterministic. This usually requires special software and is highly dependent on the intended use.

While the historical collation order formally is at level 1, for the English language it corresponds roughly to elements at level 2. The user expects to see the output from the *ls* utility sorted very much as it would be in a dictionary. While telephone book ordering would be an optimal goal for standard collation, this was ruled out as the order would be language-dependent. Furthermore, a requirement was that the order must be determined solely from the text string and the collation rules; no external information (for example, “pronunciation dictionaries”) could be required.

As a result, the goal for the collation support is at level 3. This also matches the requirements for the Canadian collation order, as well as other, known collation requirements for alphabetic scripts. It specifically rules out collation based on pronunciation rules or based on semantic analysis of the text.

The syntax for the *LC\_COLLATE* category source meets the requirements for level 3 and has been verified to produce the correct result with examples based on French, Canadian, and Danish collation order. Because it supports multi-character collating elements, it is also capable of supporting collation in codesets where a character is expressed using non-spacing characters followed by the base character (such as the ISO/IEC 6937: 2001 standard).

The directives that can be specified in an operand to the **order\_start** keyword are based on the requirements specified in several proposed standards and in customary use. The following is a rephrasing of rules defined for “lexical ordering in English and French” by the Canadian Standards Association (the text in square brackets is rephrased):

- Once special characters [punctuation] have been removed from original strings, the ordering is determined by scanning forwards (left to right) [disregarding case and diacriticals].
- In case of equivalence, special characters are once again removed from original strings and the ordering is determined by scanning backwards (starting from the rightmost character of the string and back), character by character [disregarding case but considering diacriticals].
- In case of repeated equivalence, special characters are removed again from original strings and the ordering is determined by scanning forwards, character by character [considering both case and diacriticals].

- If there is still an ordering equivalence after the first three rules have been applied, then only special characters and the position they occupy in the string are considered to determine ordering. The string that has a special character in the lowest position comes first. If two strings have a special character in the same position, the character [with the lowest collation value] comes first. In case of equality, the other special characters are considered until there is a difference or until all special characters have been exhausted.

It is estimated that this part of POSIX.1-2008 covers the requirements for all European languages, and no particular problems are anticipated with Slavic or Middle East character sets.

The Far East (particularly Japanese/Chinese) collations are often based on contextual information and pronunciation rules (the same ideogram can have different meanings and different pronunciations). Such collation, in general, falls outside the desired goal of POSIX.1-2008. There are, however, several other collation rules (stroke/radical or “most common pronunciation”) that can be supported with the mechanism described here.

The character order is defined by the order in which characters and elements are specified between the **order\_start** and **order\_end** keywords. Weights assigned to the characters and elements define the collation sequence; in the absence of weights, the character order is also the collation sequence.

The **position** keyword provides the capability to consider, in a compare, the relative position of characters not subject to **IGNORE**. As an example, consider the two strings “o-ring” and “or-ing”. Assuming the <hyphen-minus> is subject to **IGNORE** on the first pass, the two strings compare equal, and the position of the <hyphen-minus> is immaterial. On second pass, all characters except the <hyphen-minus> are subject to **IGNORE**, and in the normal case the two strings would again compare equal. By taking position into account, the first collates before the second.

This standard recommends (by the use of “should” in the normative text) that all implementation-provided locales define a collation sequence that has a total ordering of all characters unless the locale name has an ‘@’ modifier indicating that it has a special collation sequence. Defining locales in this way eliminates unexpected behavior when non-identical strings can collate equally (for example, `sort -u` and `sort | uniq` are not equivalent). The exception for locales with a suitable ‘@’ modifier in the name allows implementations to supply locales which do not have a total ordering of all characters provided that they draw attention to it in the modifier name. For example, `@icase` could indicate that each upper and lowercase character pair collates equally. Even with an ‘@’ modifier, total ordering is preferred when possible; for example, characters that are “ignored” in dictionary order need not be completely ignored (by using **IGNORE** for all collation weights), but can instead be given a unique weight after one or more **IGNORE** weights.

#### A.7.3.3 LC\_MONETARY

The currency symbol does not appear in `LC_MONETARY` because it is not defined in the C locale of the ISO C standard.

The ISO C standard limits the size of decimal points and thousands delimiters to single-byte values. In locales based on multi-byte coded character sets, this cannot be enforced; POSIX.1-2008 does not prohibit such characters, but makes the behavior unspecified (in the text “In contexts where other standards ...”).

The grouping specification is based on, but not identical to, the ISO C standard. The `-1` indicates that no further grouping is performed; the equivalent of `{CHAR_MAX}` in the ISO C standard.

The text “the value is not available in the locale” is taken from the ISO C standard and is used instead of the “unspecified” text in early proposals. There is no implication that omitting these

keywords or assigning them values of " " or -1 produces unspecified results; such omissions or assignments eliminate the effects described for the keyword or produce zero-length strings, as appropriate.

The locale definition is an extension of the ISO C standard *localeconv()* specification. In particular, rules on how **currency\_symbol** is treated are extended to also cover **int\_curr\_symbol**, and **p\_sep\_by\_space** and **n\_sep\_by\_space** have been augmented with the value 2, which places a <space> between the sign and the symbol. This has been updated to match the ISO/IEC 9899:1999 standard requirements and is an incompatible change from UNIX 98 and the ISO POSIX-2 standard and the ISO POSIX-1:1996 standard requirements. The following table shows the result of various combinations:

		<b>p_sep_by_space</b>		
		<b>2</b>	<b>1</b>	<b>0</b>
<b>p_cs_precedes = 1</b>	<b>p_sign_posn = 0</b>	(\$1.25)	(\$ 1.25)	(\$1.25)
	<b>p_sign_posn = 1</b>	+ \$1.25	+\$ 1.25	+\$1.25
	<b>p_sign_posn = 2</b>	\$1.25 +	\$ 1.25+	\$1.25+
	<b>p_sign_posn = 3</b>	+ \$1.25	+\$ 1.25	+\$1.25
	<b>p_sign_posn = 4</b>	\$ +1.25	\$+ 1.25	+\$1.25
<b>p_cs_precedes = 0</b>	<b>p_sign_posn = 0</b>	(1.25 \$)	(1.25 \$)	(1.25\$)
	<b>p_sign_posn = 1</b>	+1.25 \$	+1.25 \$	+1.25\$
	<b>p_sign_posn = 2</b>	1.25\$ +	1.25 \$+	1.25\$+
	<b>p_sign_posn = 3</b>	1.25+ \$	1.25 +\$	1.25+\$
	<b>p_sign_posn = 4</b>	1.25\$ +	1.25 \$+	1.25\$+

The following is an example of the interpretation of the **mon\_grouping** keyword. Assuming that the value to be formatted is 123 456 789 and the **mon\_thousands\_sep** is <apostrophe>, then the following table shows the result. The third column shows the equivalent string in the ISO C standard that would be used by the *localeconv()* function to accommodate this grouping.

<b>mon_grouping</b>	<b>Formatted Value</b>	<b>ISO C String</b>
3;-1	123456'789	"\3\177"
3	123'456'789	"\3"
3;2;-1	1234'56'789	"\3\2\177"
3;2	12'34'56'789	"\3\2"
-1	123456789	"\177"

In these examples, the octal value of {CHAR\_MAX} is 177.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/6 adds a correction that permits the Euro currency symbol and addresses extensibility. The correction is stated using the term "should" intentionally, in order to make this a recommendation rather than a restriction on implementations. This allows for flexibility in implementations on how they handle future currency symbol additions.

IEEE Std 1003.1-2001/Cor 1-2002, tem XBD/TC1/D6/5 is applied, adding the **int\_[np]\_\*** values to the POSIX locale definition of *LC\_MONETARY*.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/16 is applied, updating the descriptions of **p\_sep\_by\_space**, **n\_sep\_by\_space**, **int\_p\_sep\_by\_space**, and **int\_n\_sep\_by\_space** to match the description of these keywords in the ISO C standard and the System Interfaces volume of POSIX.1-2008, *localeconv()*.

## 119120 A.7.3.4 LC\_NUMERIC

119121 See the rationale for LC\_MONETARY for a description of the behavior of grouping.

## 119122 A.7.3.5 LC\_TIME

119123 Although certain of the conversion specifications in the POSIX locale (such as the name of the  
119124 month) are shown with initial capital letters, this need not be the case in other locales. Programs  
119125 using these conversion specifications may need to adjust the capitalization if the output is going  
119126 to be used at the beginning of a sentence.

119127 The LC\_TIME descriptions of **abday**, **day**, **mon**, and **abmon** imply a Gregorian style calendar  
119128 (7-day weeks, 12-month years, leap years, and so on). Formatting time strings for other types of  
119129 calendars is outside the scope of POSIX.1-2008.

119130 While the ISO 8601:2004 standard numbers the weekdays starting with Monday, historical  
119131 practice is to use the Sunday as the first day. Rather than change the order and introduce  
119132 potential confusion, the days must be specified beginning with Sunday; previous references to  
119133 "first day" have been removed. Note also that the Shell and Utilities volume of POSIX.1-2008  
119134 *date* utility supports numbering compliant with the ISO 8601:2004 standard.

119135 As specified under *date* in the Shell and Utilities volume of POSIX.1-2008 and *strftime()* in the  
119136 System Interfaces volume of POSIX.1-2008, the conversion specifications corresponding to the  
119137 optional keywords consist of a modifier followed by a traditional conversion specification (for  
119138 instance, %Ex). If the optional keywords are not supported by the implementation or are  
119139 unspecified for the current locale, these modified conversion specifications are treated as the  
119140 traditional conversion specifications. For example, assume the following keywords:

```
119141 alt_digits    "0th"; "1st"; "2nd"; "3rd"; "4th"; "5th"; \
119142              "6th"; "7th"; "8th"; "9th"; "10th"
```

```
119143 d_fmt        "The %Od day of %B in %Y"
```

119144 On July 4th 1776, the %x conversion specifications would result in "The 4th day of July  
119145 in 1776", while on July 14th 1789 it would result in "The 14 day of July in 1789". It  
119146 can be noted that the above example is for illustrative purposes only; the %O modifier is  
119147 primarily intended to provide for Kanji or Hindi digits in *date* formats.

119148 The following is an example for Japan that supports the current plus last three Emperors and  
119149 reverts to Western style numbering for years prior to the Meiji era. The example also allows for  
119150 the custom of using a special name for the first year of an era instead of using 1. (The examples  
119151 substitute romaji where kanji should be used.)

```
119152 era_d_fmt    "%EY%mgatsu%dnichi (%a)"
```

```
119153 era          "+:2:1990/01/01:+*:Heisei:%EC%Eynen"; \
119154             "+:1:1989/01/08:1989/12/31:Heisei:%ECgannen"; \
119155             "+:2:1927/01/01:1989/01/07:Shouwa:%EC%Eynen"; \
119156             "+:1:1926/12/25:1926/12/31:Shouwa:%ECgannen"; \
119157             "+:2:1913/01/01:1926/12/24:Taishou:%EC%Eynen"; \
119158             "+:1:1912/07/30:1912/12/31:Taishou:%ECgannen"; \
119159             "+:2:1869/01/01:1912/07/29:Meiji:%EC%Eynen"; \
119160             "+:1:1868/09/08:1868/12/31:Meiji:%ECgannen"; \
119161             "-:1868:1868/09/07:-*::%Ey"
```

119162 Assuming that the current date is September 21, 1991, a request to *date* or *strftime()* would yield  
119163 the following results:

```
119164 %Ec - Heisei3nen9gatsu2lnichi (Sat) 14:39:26
```

```

119165 %EC - Heisei
119166 %Ex - Heisei3nen9gatsu2lnichi (Sat)
119167 %Ey - 3
119168 %EY - Heisei3nen

119169 Example era definitions for the Republic of China:

119170 era      "+:2:1913/01/01:+*:ChungHwaMingGuo:%EC%EyNen";\
119171          "+:1:1912/1/1:1912/12/31:ChungHwaMingGuo:%ECYuenNen";\
119172          "+:1:1911/12/31:-*:MingChien:%EC%EyNen"

119173 Example definitions for the Christian Era:

119174 era      "+:1:0001/01/01:+*:AD:%EC %Ey";\
119175          "+:1:-0001/12/31:-*:BC:%Ey %EC"

```

#### 119176 A.7.3.6 LC\_MESSAGES

119177 The **yesstr** and **nostr** locale keywords and the YESSTR and NOSTR *langinfo* items were formerly  
 119178 used to match user affirmative and negative responses. In POSIX.1-2008, the **yesexpr**, **noexpr**,  
 119179 YESEXPR, and NOEXPR extended regular expressions have replaced them. Applications  
 119180 should use the general locale-based messaging facilities to issue prompting messages which  
 119181 include sample desired responses.

119182 Affirmative responses like:

```

119183 y
119184 Yes
119185 Yes!

```

119186 and negative responses like:

```

119187 N
119188 No
119189 Never
119190 No way!

```

119191 should all be recognized as affirmative and negative responses, respectively, by the EREs  
 119192 identified by the **yesexpr** and **noexpr** keywords for English language-based locales. There is no  
 119193 requirement that multi-line responses nor ambiguous responses like:

```

119194 no or yes
119195 yes or no
119196 maybe

```

119197 be correctly classified by either of these EREs. Application writers are encouraged to include  
 119198 locale-specific suggestions for affirmative and negative responses in prompts.

#### 119199 A.7.4 Locale Definition Grammar

119200 There is no additional rationale provided for this section.

119201 A.7.4.1 *Locale Lexical Conventions*

119202 There is no additional rationale provided for this section.

119203 A.7.4.2 *Locale Grammar*

119204 There is no additional rationale provided for this section.

## 119205 A.7.5 Locale Definition Example

119206 The following is an example of a locale definition file that could be used as input to the *localedf*  
119207 utility. It assumes that the utility is executed with the *-f* option, naming a charmap file with (at  
119208 least) the following content:

```
119209 CHARMAP
119210 <space>      \x20
119211 <dollar>     \x24
119212 <A>          \101
119213 <a>          \141
119214 <A-acute>    \346
119215 <a-acute>    \365
119216 <A-grave>    \300
119217 <a-grave>    \366
119218 <b>          \142
119219 <C>          \103
119220 <c>          \143
119221 <c-cedilla>  \347
119222 <d>          \x64
119223 <H>          \110
119224 <h>          \150
119225 <eszet>     \xb7
119226 <s>          \x73
119227 <z>          \x7a
119228 END CHARMAP
```

119229 It should not be taken as complete or to represent any actual locale, but only to illustrate the  
119230 syntax.

```
119231 #
119232 LC_CTYPE
119233 lower  <a>;<b>;<c>;<c-cedilla>;<d>;...;<z>
119234 upper  A;B;C;Ç;...;Z
119235 space  \x20;\x09;\x0a;\x0b;\x0c;\x0d
119236 blank  \040;\011
119237 toupper (<a>,<A>);(<b>,B);(<c>,C);(<ç>,Ç);(<d>,D);(<z>,Z)
119238 END LC_CTYPE
119239 #
119240 LC_COLLATE
119241 #
119242 # The following example of collation is based on
119243 # Canadian standard Z243.4.1-1998, "Canadian Alphanumeric
119244 # Ordering Standard for Character Sets of CSA Z234.4 Standard".
119245 # (Other parts of this example locale definition file do not
119246 # purport to relate to Canada, or to any other real culture.)
```

```

119247 # The proposed standard defines a 4-weight collation, such that
119248 # in the first pass, characters are compared without regard to
119249 # case or accents; in the second pass, backwards-compare without
119250 # regard to case; in the third pass, forwards-compare without
119251 # regard to diacriticals. In the 3 first passes, non-alphabetic
119252 # characters are ignored; in the fourth pass, only special
119253 # characters are considered, such that "The string that has a
119254 # special character in the lowest position comes first. If two
119255 # strings have a special character in the same position, the
119256 # collation value of the special character determines ordering.
119257 #
119258 # Only a subset of the character set is used here; mostly to
119259 # illustrate the set-up.
119260 #
119261 collating-symbol <NULL>
119262 collating-symbol <LOW_VALUE>
119263 collating-symbol <LOWER-CASE>
119264 collating-symbol <SUBSCRIPT-LOWER>
119265 collating-symbol <SUPERScript-LOWER>
119266 collating-symbol <UPPER-CASE>
119267 collating-symbol <NO-ACCENT>
119268 collating-symbol <PECULIAR>
119269 collating-symbol <LIGATURE>
119270 collating-symbol <ACUTE>
119271 collating-symbol <GRAVE>
119272 # Further collating-symbols follow.
119273 #
119274 # Properly, the standard does not include any multi-character
119275 # collating elements; the one below is added for completeness.
119276 #
119277 collating_element <ch> from "<c><h>"
119278 collating_element <CH> from "<C><H>"
119279 collating_element <Ch> from "<C><h>"
119280 #
119281 order_start forward;backward;forward;forward,position
119282 #
119283 # Collating symbols are specified first in the sequence to allocate
119284 # basic collation values to them, lower than that of any character.
119285 <NULL>
119286 <LOW_VALUE>
119287 <LOWER-CASE>
119288 <SUBSCRIPT-LOWER>
119289 <SUPERScript-LOWER>
119290 <UPPER-CASE>
119291 <NO-ACCENT>
119292 <PECULIAR>
119293 <LIGATURE>
119294 <ACUTE>
119295 <GRAVE>
119296 <RING-ABOVE>
119297 <DIAERESIS>
119298 <TILDE>
119299 # Further collating symbols are given a basic collating value here.

```

```

119300      #
119301      # Here follow special characters.
119302      <space>          IGNORE;IGNORE;IGNORE;<space>
119303      # Other special characters follow here.
119304      #
119305      # Here follow the regular characters.
119306      <a>               <a>;<NO-ACCENT>;<LOWER-CASE>;IGNORE
119307      <A>               <a>;<NO-ACCENT>;<UPPER-CASE>;IGNORE
119308      <a-acute>         <a>;<ACUTE>;<LOWER-CASE>;IGNORE

## 119379 A.8 Environment Variables

### 119380 A.8.1 Environment Variable Definition

119381 The variable *environ* is not intended to be declared in any header, but rather to be declared by  
 119382 the user for accessing the array of strings that is the environment. This is the traditional usage of  
 119383 the symbol. Putting it into a header could break some programs that use the symbol for their  
 119384 own purposes.

119385 The decision to restrict conforming systems to the use of digits, uppercase letters, and  
 119386 underscores for environment variable names allows applications to use lowercase letters in their  
 119387 environment variable names without conflicting with any conforming system.

119388 In addition to the obvious conflict with the shell syntax for positional parameter substitution,  
 119389 some historical applications (including some shells) exclude names with leading digits from the  
 119390 environment.

## 119391 **A.8.2 Internationalization Variables**

119392 Utilities conforming to the Shell and Utilities volume of POSIX.1-2008 and written in standard C  
119393 can access the locale variables by issuing the following call:

```
119394 setlocale(LC_ALL, " ")
```

119395 If this were omitted, the ISO C standard specifies that the C (or POSIX) locale would be used.

119396 The DESCRIPTION of *setlocale()* requires that when setting all categories of a locale, if the value  
119397 of any of the environment variable searches yields a locale that is not supported (and non-null),  
119398 the *setlocale()* function returns a null pointer and the global locale is unchanged.

119399 For the standard utilities, if any of the environment variables are invalid, it makes sense to  
119400 default to an implementation-defined, consistent locale environment. It is more confusing for a  
119401 user to have partial settings occur in case of a mistake. All utilities would then behave in one  
119402 language/cultural environment. Furthermore, it provides a way of forcing the whole  
119403 environment to be the implementation-defined default. Disastrous results could occur if a  
119404 pipeline of utilities partially uses the environment variables in different ways. In this case, it  
119405 would be appropriate for utilities that use *LANG* and related variables to exit with an error if  
119406 any of the variables are invalid. For example, users typing individual commands at a terminal  
119407 might want *date* to work if *LC\_MONETARY* is invalid as long as *LC\_TIME* is valid. Since these  
119408 are conflicting reasonable alternatives, POSIX.1-2008 leaves the results unspecified if the locale  
119409 environment variables would not produce a complete locale matching the specification of the  
119410 user.

119411 The locale settings of individual categories cannot be truly independent and still guarantee  
119412 correct results. For example, when collating two strings, characters must first be extracted from  
119413 each string (governed by *LC\_CTYPE*) before being mapped to collating elements (governed by  
119414 *LC\_COLLATE*) for comparison. That is, if *LC\_CTYPE* is causing parsing according to the rules of  
119415 a large, multi-byte code set (potentially returning 20 000 or more distinct character codeset  
119416 values), but *LC\_COLLATE* is set to handle only an 8-bit codeset with 256 distinct characters,  
119417 meaningful results are obviously impossible.

119418 The *LC\_MESSAGES* variable affects the language of messages generated by the standard  
119419 utilities.

119420 The description of the environment variable names starting with the characters “LC\_”  
119421 acknowledges the fact that the interfaces presented may be extended as new international  
119422 functionality is required. In the ISO C standard, names preceded by “LC\_” are reserved in the  
119423 name space for future categories.

119424 To avoid name clashes, new categories and environment variables are divided into two  
119425 classifications: “implementation-independent” and “implementation-defined”.

119426 Implementation-independent names will have the following format:

```
119427 LC_NAME
```

119428 where *NAME* is the name of the new category and environment variable. Capital letters must be  
119429 used for implementation-independent names.

119430 Implementation-defined names must be in lowercase letters, as below:

```
119431 LC_name
```

### A.8.3 Other Environment Variables

#### COLUMNS, LINES

The default values for the number of column positions, *COLUMNS*, and screen height, *LINES*, are unspecified because historical implementations use different methods to determine values corresponding to the size of the screen in which the utility is run. This size is typically known to the implementation through the value of *TERM*, or by more elaborate methods such as extensions to the *stty* utility or knowledge of how the user is dynamically resizing windows on a bit-mapped display terminal. Users should not need to set these variables in the environment unless there is a specific reason to override the default behavior of the implementation, such as to display data in an area arbitrarily smaller than the terminal or window. Values for these variables that are not decimal integers greater than zero are implicitly undefined values; it is unnecessary to enumerate all of the possible values outside of the acceptable set.

#### LOGNAME

In most implementations, the value of such a variable is easily forged, so security-critical applications should rely on other means of determining user identity. *LOGNAME* is required to be constructed from the portable filename character set for reasons of interchange. No diagnostic condition is specified for violating this rule, and no requirement for enforcement exists. The intent of the requirement is that if extended characters are used, the “guarantee” of portability implied by a standard is void.

#### PATH

Many historical implementations of the Bourne shell do not interpret a trailing <colon> to represent the current working directory and are thus non-conforming. The C Shell and the KornShell conform to POSIX.1-2008 on this point. The usual name of dot may also be used to refer to the current working directory.

Many implementations historically have used a default value of */bin* and */usr/bin* for the *PATH* variable. POSIX.1-2008 does not mandate this default path be identical to that retrieved from *getconf PATH* because it is likely that the standardized utilities may be provided in another directory separate from the directories used by some historical applications.

#### SHELL

The *SHELL* variable names the preferred shell of the user; it is a guide to applications. There is no direct requirement that that shell conform to POSIX.1-2008; that decision should rest with the user. It is the intention of the standard developers that alternative shells be permitted, if the user chooses to develop or acquire one. An operating system that builds its shell into the “kernel” in such a manner that alternative shells would be impossible does not conform to the spirit of POSIX.1-2008.

#### TZ

The quoted form of the timezone variable allows timezone names of the form UTC+1 (or any name that contains the <plus-sign> (‘+’), the <hyphen-minus> (‘-’), or digits), which may be appropriate for countries that do not have an official timezone name. It would be coded as <UTC+1>+1<UTC+2>, which would cause *std* to have a value of UTC+1 and *dst* a value of UTC+2, each with a length of 5 characters. This does not appear to conflict with any existing usage. The characters ‘<’ and ‘>’ were chosen for quoting because they are easier to parse visually than a quoting character that does not provide some sense of bracketing (and in a string like this, such bracketing is helpful). They were also chosen because they do not need special treatment when assigning to the *TZ* variable. Users are often confused by embedding quotes in a

string. Because '`<`' and '`>`' are meaningful to the shell, the whole string would have to be quoted, but that is easily explained. (Parentheses would have presented the same problems.) Although the '`>`' symbol could have been permitted in the string by either escaping it or doubling it, it seemed of little value to require that. This could be provided as an extension if there was a need. Timezone names of this new form lead to a requirement that the value of `{_POSIX_TZNAME_MAX}` change from 3 to 6.

Since the *TZ* environment variable is usually inherited by all applications started by a user after the value of the *TZ* environment variable is changed and since many applications run using the C or POSIX locale, using characters that are not in the portable character set in the *std* and *dst* fields could cause unexpected results.

The format of the *TZ* environment variable is changed in Issue 6 to allow for the quoted form, as defined in earlier versions of the ISO POSIX-1 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/7 is applied, adding the *ctime\_r()* and *localtime\_r()* functions to the list of functions that use the *TZ* environment variable.

## A.9 Regular Expressions

Rather than repeating the description of REs for each utility supporting REs, the standard developers preferred a common, comprehensive description of regular expressions in one place. The most common behavior is described here, and exceptions or extensions to this are documented for the respective utilities, as appropriate.

The BRE corresponds to the *ed* or historical *grep* type, and the ERE corresponds to the historical *egrep* type (now *grep -E*).

The text is based on the *ed* description and substantially modified, primarily to aid developers and others in the understanding of the capabilities and limitations of REs. Much of this was influenced by internationalization requirements.

It should be noted that the definitions in this section do not cover the *tr* utility; the *tr* syntax does not employ REs.

The specification of REs is particularly important to internationalization because pattern matching operations are very basic operations in business and other operations. The syntax and rules of REs are intended to be as intuitive as possible to make them easy to understand and use. The historical rules and behavior do not provide that capability to non-English language users, and do not provide the necessary support for commonly used characters and language constructs. It was necessary to provide extensions to the historical RE syntax and rules to accommodate other languages.

As they are limited to bracket expressions, the rationale for these modifications is in XBD [Section 9.3.5](#) (on page 184).

## 119512 **A.9.1 Regular Expression Definitions**

119513 It is possible to determine what strings correspond to subexpressions by recursively applying  
 119514 the leftmost longest rule to each subexpression, but only with the proviso that the overall match  
 119515 is leftmost longest. For example, matching "\(ac\*\\)c\*d[ac]\*\1" against *acdacaaa* matches  
 119516 *acdacaaa* (with \1=*a*); simply matching the longest match for "\(ac\*\\)" would yield \1=*ac*, but  
 119517 the overall match would be smaller (*acdac*). Conceptually, the implementation must examine  
 119518 every possible match and among those that yield the leftmost longest total matches, pick the one  
 119519 that does the longest match for the leftmost subexpression, and so on. Note that this means that  
 119520 matching by subexpressions is context-dependent: a subexpression within a larger RE may  
 119521 match a different string from the one it would match as an independent RE, and two instances of  
 119522 the same subexpression within the same larger RE may match different lengths even in similar  
 119523 sequences of characters. For example, in the ERE "(a.\*b)(a.\*b)", the two identical  
 119524 subexpressions would match four and six characters, respectively, of *accbaccccb*.

119525 The definition of single character has been expanded to include also collating elements  
 119526 consisting of two or more characters; this expansion is applicable only when a bracket  
 119527 expression is included in the BRE or ERE. An example of such a collating element may be the  
 119528 Dutch *ij*, which collates as a 'y'. In some encodings, a ligature "i with j" exists as a character  
 119529 and would represent a single-character collating element. In another encoding, no such ligature  
 119530 exists, and the two-character sequence *ij* is defined as a multi-character collating element.  
 119531 Outside brackets, the *ij* is treated as a two-character RE and matches the same characters in a  
 119532 string. Historically, a bracket expression only matched a single character. The ISO POSIX-2: 1993  
 119533 standard required bracket expressions like "[^[:lower:]]" to match multi-character collating  
 119534 elements such as "*ij*". However, this requirement led to behavior that many users did not  
 119535 expect and that could not feasibly be mimicked in user code, and it was rarely if ever  
 119536 implemented correctly. The current standard leaves it unspecified whether a bracket expression  
 119537 matches a multi-character collating element, allowing both historical and ISO POSIX-2: 1993  
 119538 standard implementations to conform.

119539 Also, in the current standard, it is unspecified whether character class expressions like  
 119540 "[[:lower:]]" can include multi-character collating elements like "*ij*"; hence  
 119541 "[[:lower:]]" can match "*ij*", and "[^[:lower:]]" can fail to match "*ij*". Common  
 119542 practice is for a character class expression to match a collating element if it matches the collating  
 119543 element's first character.

## 119544 **A.9.2 Regular Expression General Requirements**

119545 The definition of which sequence is matched when several are possible is based on the leftmost-  
 119546 longest rule historically used by deterministic recognizers. This rule is easier to define and  
 119547 describe, and arguably more useful, than the first-match rule historically used by non-  
 119548 deterministic recognizers. It is thought that dependencies on the choice of rule are rare; carefully  
 119549 contrived examples are needed to demonstrate the difference.

119550 A formal expression of the leftmost-longest rule is:

119551       The search is performed as if all possible suffixes of the string were tested for a prefix  
 119552       matching the pattern; the longest suffix containing a matching prefix is chosen, and the  
 119553       longest possible matching prefix of the chosen suffix is identified as the matching  
 119554       sequence.

119555 Historically, most RE implementations only match lines, not strings. However, that is more an  
 119556 effect of the usage than of an inherent feature of REs themselves. Consequently, POSIX.1-2008  
 119557 does not regard <newline> characters as special; they are ordinary characters, and both a

119558 <period> and a non-matching list can match them. Those utilities (like *grep*) that do not allow  
 119559 <newline> characters to match are responsible for eliminating any <newline> from strings  
 119560 before matching against the RE. The *regcomp()* function, however, can provide support for such  
 119561 processing without violating the rules of this section.

119562 Some implementations of *egrep* have had very limited flexibility in handling complex EREs.  
 119563 POSIX.1-2008 does not attempt to define the complexity of a BRE or ERE, but does place a lower  
 119564 limit on it—any RE must be handled, as long as it can be expressed in 256 bytes or less. (Of  
 119565 course, this does not place an upper limit on the implementation.) There are historical programs  
 119566 using a non-deterministic-recognizer implementation that should have no difficulty with this  
 119567 limit. It is possible that a good approach would be to attempt to use the faster, but more limited,  
 119568 deterministic recognizer for simple expressions and to fall back on the non-deterministic  
 119569 recognizer for those expressions requiring it. Non-deterministic implementations must be  
 119570 careful to observe the rules on which match is chosen; the longest match, not the first match,  
 119571 starting at a given character is used.

119572 The term “invalid” highlights a difference between this section and some others: POSIX.1-2008  
 119573 frequently avoids mandating of errors for syntax violations because they can be used by  
 119574 implementors to trigger extensions. However, the authors of the internationalization features of  
 119575 REs wanted to mandate errors for certain conditions to identify usage problems or non-portable  
 119576 constructs. These are identified within this rationale as appropriate. The remaining syntax  
 119577 violations have been left implicitly or explicitly undefined. For example, the BRE construct  
 119578 “\{1, 2, 3\}” does not comply with the grammar. A conforming application cannot rely on it  
 119579 producing an error nor matching the literal characters “\{1, 2, 3\}”.

119580 The term “undefined” was used in favor of “unspecified” because many of the situations are  
 119581 considered errors on some implementations, and the standard developers considered that  
 119582 consistency throughout the section was preferable to mixing undefined and unspecified.

### 119583 **A.9.3 Basic Regular Expressions**

119584 There is no additional rationale provided for this section.

#### 119585 *A.9.3.1 BREs Matching a Single Character or Collating Element*

119592 There is no additional rationale provided for this section.

## 119593 A.9.3.5 RE Bracket Expression

119594 Range expressions are, historically, an integral part of REs. However, the requirements of  
 119595 “natural language behavior” and portability do conflict. In the POSIX locale, ranges must be  
 119596 treated according to the collating sequence and include such characters that fall within the range  
 119597 based on that collating sequence, regardless of character values. In other locales, ranges have  
 119598 unspecified behavior.

119599 Some historical implementations allow range expressions where the ending range point of one  
 119600 range is also the starting point of the next (for instance, "[a-m-o]"). This behavior should not  
 119601 be permitted, but to avoid breaking historical implementations, it is now *undefined* whether it is  
 119602 a valid expression and how it should be interpreted.

119603 Current practice in *awk* and *lex* is to accept escape sequences in bracket expressions as per XBD  
 119604 Table 5-1 (on page 121), while the normal ERE behavior is to regard such a sequence as  
 119605 consisting of two characters. Allowing the *awk/lex* behavior in EREs would change the normal  
 119606 behavior in an unacceptable way; it is expected that *awk* and *lex* will decode escape sequences in  
 119607 EREs before passing them to *regcomp()* or comparable routines. Each utility describes the escape  
 119608 sequences it accepts as an exception to the rules in this section; the list is not the same, for  
 119609 historical reasons.

119610 As noted previously, the new syntax and rules have been added to accommodate other  
 119611 languages than English. The remainder of this section describes the rationale for these  
 119612 modifications.

119613 In the POSIX locale, a regular expression that starts with a range expression matches a set of  
 119614 strings that are contiguously sorted, but this is not necessarily true in other locales. For example,  
 119615 a French locale might have the following behavior:

```
119616 $ ls
119617 alpha  Alpha  estimé  ESTIMÉ  été  eurêka
119618 $ ls [a-e]*
119619 alpha  Alpha  estimé  eurêka
```

119620 Such disagreements between matching and contiguous sorting are unavoidable because POSIX  
 119621 sorting cannot be implemented in terms of a deterministic finite-state automaton (DFA), but  
 119622 range expressions by design are implementable in terms of DFAs.

119623 Historical implementations used native character order to interpret range expressions. The  
 119624 ISO POSIX-2:1993 standard instead required collating element order (CEO): the order that  
 119625 collating elements were specified between the **order\_start** and **order\_end** keywords in the  
 119626 *LC\_COLLATE* category of the current locale. CEO had some advantages in portability over the  
 119627 native character order, but it also had some disadvantages:

- 119628 • CEO could not feasibly be mimicked in user code, leading to inconsistencies between  
 119629 POSIX matchers and matchers in popular user programs like Emacs, *ksh*, and Perl.
- 119630 • CEO caused range expressions to match accented and capitalized letters contrary to many  
 119631 users' expectations. For example, "[a-e]" typically matched both 'E' and 'á' but  
 119632 neither 'A' nor 'é'.
- 119633 • CEO was not consistent across implementations. In practice, CEO was often less portable  
 119634 than native character order. For example, it was common for the CEOs of two  
 119635 implementation-supplied locales to disagree, even if both locales were named "da\_DK".

119636 Because of these problems, some implementations of regular expressions continued to use native  
 119637 character order. Others used the collation sequence, which is more consistent with sorting than  
 119638 either CEO or native order, but which departs further from the traditional POSIX semantics  
 119639 because it generally requires "[a-e]" to match either 'A' or 'E' but not both. As a result of

119640 this kind of implementation variation, programmers who wanted to write portable regular  
 119641 expressions could not rely on the ISO POSIX-2: 1993 standard guarantees in practice.

119642 While revising the standard, lengthy consideration was given to proposals to attack this problem  
 119643 by adding an API for querying the CEO to allow user-mode matchers, but none of these  
 119644 proposals had implementation experience and none achieved consensus. Leaving the standard  
 119645 alone was also considered, but rejected due to the problems described above.

119646 The current standard leaves unspecified the behavior of a range expression outside the POSIX  
 119647 locale. This makes it clearer that conforming applications should avoid range expressions  
 119648 outside the POSIX locale, and it allows implementations and compatible user-mode matchers to  
 119649 interpret range expressions using native order, CEO, collation sequence, or other, more  
 119650 advanced techniques. The concerns which led to this change were raised in IEEE PASC  
 119651 interpretation 1003.2 #43 and others, and related to ambiguities in the specification of how  
 119652 multi-character collating elements should be handled in range expressions. These ambiguities  
 119653 had led to multiple interpretations of the specification, in conflicting ways, which led to varying  
 119654 implementations. As noted above, efforts were made to resolve the differences, but no solution  
 119655 has been found that would be specific enough to allow for portable software while not  
 119656 invalidating existing implementations.

119657 The standard developers recognize that collating elements are important, such elements being  
 119658 common in several European languages; for example, 'ch' or 'll' in traditional Spanish;  
 119659 'aa' in several Scandinavian languages. Existing internationalized implementations have  
 119660 processed, and continue to process, these elements in range expressions. Efforts are expected to  
 119661 continue in the future to find a way to define the behavior of these elements precisely and  
 119662 portably.

119663 The ISO POSIX-2: 1993 standard required "[b-a]" to be an invalid expression in the POSIX  
 119664 locale, but this requirement has been relaxed in this version of the standard so that "[b-a]" can  
 119665 instead be treated as a valid expression that does not match any string.

119666 The standard specifies three possible behaviors for regular expressions such as "[ :alpha: ]".  
 119667 One behavior is the traditional implementation, which behaves like "[ :a-hlp]". Another, for  
 119668 alignment with the *tr* utility, is to treat it like "[ [ :alpha: ] ]". And finally, the standard allows  
 119669 rejecting the regular expression as invalid, as a means of alerting a user to the non-portable  
 119670 aspect of that regular expression. The set of regular expressions with this undefined behavior is  
 119671 limited solely to the expressions where the outer '[' and ']' of the bracket expression can be  
 119672 confused with the missing bracket pair '[' and ']' necessary to form a collating symbol,  
 119673 equivalence class, or character class; thus "[\_ :alpha:]" or "[::]" do not trigger the  
 119674 unspecified behavior.

#### 119675 A.9.3.6 BREs Matching Multiple Characters

119676 The limit of nine back-references to subexpressions in the RE is based on the use of a single-digit  
 119677 identifier; increasing this to multiple digits would break historical applications. This does not  
 119678 imply that only nine subexpressions are allowed in REs. The following is a valid BRE with ten  
 119679 subexpressions:

119680 `\(\(\(ab\) *c\) *d\)\(ef\) *\(\(gh\)\{2\}\(ij\) *\(\(kl\) *\(\(mn\) *\(\(op\) *\(\(qr\) *`

119681 The standard developers regarded the common historical behavior, which supported "\n\*", but  
 119682 not "\n{min,max}", "\(\...\)\*", or "\(\...\)\{min,max\}", as a non-intentional  
 119683 result of a specific implementation, and they supported both duplication and interval  
 119684 expressions following subexpressions and back-references.

119685 The changes to the processing of the back-reference expression remove an unspecified or  
 119686 ambiguous behavior in the Shell and Utilities volume of POSIX.1-2008, aligning it with the

119687 requirements specified for the *regcomp()* expression, and is the result of PASC Interpretation  
119688 1003.2-92 #43 submitted for the ISO POSIX-2: 1993 standard.

#### 119689 A.9.3.7 BRE Precedence

119690 There is no additional rationale provided for this section.

#### 119691 A.9.3.8 BRE Expression Anchoring

119692 Often, the <dollar-sign> is viewed as matching the ending <newline> in text files. This is not  
119693 strictly true; the <newline> is typically eliminated from the strings to be matched, and the  
119694 <dollar-sign> matches the terminating null character.

119695 The ability of ' ^ ', ' \$ ', and ' \* ' to be non-special in certain circumstances may be confusing to  
119696 some programmers, but this situation was changed only in a minor way from historical practice  
119697 to avoid breaking many historical scripts. Some consideration was given to making the use of  
119698 the anchoring characters undefined if not escaped and not at the beginning or end of strings.  
119699 This would cause a number of historical BREs, such as " 2 ^ 10 ", " \$HOME ", and " \$1 . 35 ", that  
119700 relied on the characters being treated literally, to become invalid.

119701 However, one relatively uncommon case was changed to allow an extension used on some  
119702 implementations. Historically, the BREs " ^foo " and " \ ( ^foo \ ) " did not match the same  
119703 string, despite the general rule that subexpressions and entire BREs match the same strings. To  
119704 increase consensus, POSIX.1-2008 has allowed an extension on some implementations to treat  
119705 these two cases in the same way by declaring that anchoring *may* occur at the beginning or end  
119706 of a subexpression. Therefore, portable BREs that require a literal <circumflex> at the beginning  
119707 or a <dollar-sign> at the end of a subexpression must escape them. Note that a BRE such as  
119708 " a \ ( ^bc \ ) " will either match " a ^bc " or nothing on different systems under the rules.

119709 ERE anchoring has been different from BRE anchoring in all historical systems. An unescaped  
119710 anchor character has never matched its literal counterpart outside a bracket expression. Some  
119711 implementations treated " foo\$bar " as a valid expression that never matched anything; others  
119712 treated it as invalid. POSIX.1-2008 mandates the former, valid unmatched behavior.

119713 Some implementations have extended the BRE syntax to add alternation. For example, the  
119714 subexpression " \ ( foo\$ | bar \ ) " would match either " foo " at the end of the string or " bar "  
119715 anywhere. The extension is triggered by the use of the undefined " \ | " sequence. Because the  
119716 BRE is undefined for portable scripts, the extending system is free to make other assumptions,  
119717 such that the ' \$ ' represents the end-of-line anchor in the middle of a subexpression. If it were  
119718 not for the extension, the ' \$ ' would match a literal <dollar-sign> under the rules.

### 119719 A.9.4 Extended Regular Expressions

119720 As with BREs, the standard developers decided to make the interpretation of escaped ordinary  
119721 characters undefined.

119722 The <right-parenthesis> is not listed as an ERE special character because it is only special in the  
119723 context of a preceding <left-parenthesis>. If found without a preceding <left-parenthesis>, the  
119724 <right-parenthesis> has no special meaning.

119725 The interval expression, " { m , n } ", has been added to EREs. Historically, the interval expression  
119726 has only been supported in some ERE implementations. The standard developers estimated that  
119727 the addition of interval expressions to EREs would not decrease consensus and would also make  
119728 BREs more of a subset of EREs than in many historical implementations.

- 119729 It was suggested that, in addition to interval expressions, back-references ( '\n' ) should also be  
 119730 added to EREs. This was rejected by the standard developers as likely to decrease consensus.
- 119731 In historical implementations, multiple duplication symbols are usually interpreted from left to  
 119732 right and treated as additive. As an example, "a+\*b" matches zero or more instances of 'a'  
 119733 followed by a 'b'. In POSIX.1-2008, multiple duplication symbols are undefined; that is, they  
 119734 cannot be relied upon for conforming applications. One reason for this is to provide some scope  
 119735 for future enhancements.
- 119736 The precedence of operations differs between EREs and those in *lex*; in *lex*, for historical reasons,  
 119737 interval expressions have a lower precedence than concatenation.
- 119738 A.9.4.1 *EREs Matching a Single Character or Collating Element*  
 119739 There is no additional rationale provided for this section.
- 119740 A.9.4.2 *ERE Ordinary Characters*  
 119741 There is no additional rationale provided for this section.
- 119742 A.9.4.3 *ERE Special Characters*  
 119743 There is no additional rationale provided for this section.
- 119744 A.9.4.4 *Periods in EREs*  
 119745 There is no additional rationale provided for this section.
- 119746 A.9.4.5 *ERE Bracket Expression*  
 119747 There is no additional rationale provided for this section.
- 119748 A.9.4.6 *EREs Matching Multiple Characters*  
 119749 There is no additional rationale provided for this section.
- 119750 A.9.4.7 *ERE Alternation*  
 119751 There is no additional rationale provided for this section.
- 119752 A.9.4.8 *ERE Precedence*  
 119753 There is no additional rationale provided for this section.
- 119754 A.9.4.9 *ERE Expression Anchoring*  
 119755 There is no additional rationale provided for this section.

119756 **A.9.5 Regular Expression Grammar**

119757 The grammars are intended to represent the range of acceptable syntaxes available to  
 119758 conforming applications. There are instances in the text where undefined constructs are  
 119759 described; as explained previously, these allow implementation extensions. There is no intended  
 119760 requirement that an implementation extension must somehow fit into the grammars shown  
 119761 here.

119762 The BRE grammar does not permit `L_ANCHOR` or `R_ANCHOR` inside `"\("` and `"\)"` (which  
 119763 implies that `'^'` and `'$'` are ordinary characters). This reflects the semantic limits on the  
 119764 application, as noted in XBD [Section 9.3.8](#) (on page 188). Implementations are permitted to  
 119765 extend the language to interpret `'^'` and `'$'` as anchors in these locations, and as such,  
 119766 conforming applications cannot use unescaped `'^'` and `'$'` in positions inside `"\("` and `"\)"`  
 119767 that might be interpreted as anchors.

119768 The ERE grammar does not permit several constructs that XBD [Section 9.4.2](#) (on page 188) and  
 119769 [Section 9.4.3](#) (on page 189) specify as having undefined results:

- 119770 • `ORD_CHAR` preceded by `<backslash>`
- 119771 • `ERE_dupl_symbol(s)` appearing first in an ERE, or immediately following `'|'`, `'^'`, or `'('`
- 119772 • `'{'` not part of a valid `ERE_dupl_symbol`
- 119773 • `'|'` appearing first or last in an ERE, or immediately following `'|'` or `'('`, or  
 119774 immediately preceding `')`

119775 Implementations are permitted to extend the language to allow these. Conforming applications  
 119776 cannot use such constructs.

119777 *A.9.5.1 BRE/ERE Grammar Lexical Conventions*

119778 There is no additional rationale provided for this section.

119779 *A.9.5.2 RE and Bracket Expression Grammar*

119780 The removal of the `Back_open_paren Back_close_paren` option from the `nondupl_RE` specification is  
 119781 the result of PASC Interpretation 1003.2-92 #43 submitted for the ISO POSIX-2:1993 standard.  
 119782 Although the grammar required support for null subexpressions, this section does not describe  
 119783 the meaning of, and historical practice did not support, this construct.

119784 *A.9.5.3 ERE Grammar*

119785 There is no additional rationale provided for this section.

## 119786 A.10 Directory Structure and Devices

### 119787 A.10.1 Directory Structure and Files

119788 A description of the historical `/usr/tmp` was omitted, removing any concept of differences in  
119789 emphasis between the `/` and `/usr` directories. The descriptions of `/bin`, `/usr/bin`, `/lib`, and `/usr/lib`  
119790 were omitted because they are not useful for applications. In an early draft, a distinction was  
119791 made between system and application directory usage, but this was not found to be useful.

119792 The directories `/` and `/dev` are included because the notion of a hierarchical directory structure is  
119793 key to other information presented elsewhere in POSIX.1-2008. In early drafts, it was argued that  
119794 special devices and temporary files could conceivably be handled without a directory structure  
119795 on some implementations. For example, the system could treat the characters `" /tmp "` as a  
119796 special token that would store files using some non-POSIX file system structure. This notion was  
119797 rejected by the standard developers, who required that all the files in this section be  
119798 implemented via POSIX file systems.

119799 The `/tmp` directory is retained in POSIX.1-2008 to accommodate historical applications that  
119800 assume its availability. Implementations are encouraged to provide suitable directory names in  
119801 the environment variable `TMPDIR` and applications are encouraged to use the contents of  
119802 `TMPDIR` for creating temporary files.

119803 The standard files `/dev/null` and `/dev/tty` are required to be both readable and writable to allow  
119804 applications to have the intended historical access to these files.

119805 The standard file `/dev/console` has been added for alignment with the Single UNIX  
119806 Specification.

### 119807 A.10.2 Output Devices and Terminal Types

119808 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/17 is applied, making it clear that the  
119809 requirements for documenting terminal support are in the system documentation.

## 119810 A.11 General Terminal Interface

119811 If the implementation does not support this interface on any device types, it should behave as if  
119812 it were being used on a device that is not a terminal device (in most cases `errno` will be set to  
119813 `[ENOTTY]` on return from functions defined by this interface). This is based on the fact that  
119814 many applications are written to run both interactively and in some non-interactive mode, and  
119815 they adapt themselves at runtime. Requiring that they all be modified to test an environment  
119816 variable to determine whether they should try to adapt is unnecessary. On a system that  
119817 provides no general terminal interface, providing all the entry points as stubs that return  
119818 `[ENOTTY]` (or an equivalent, as appropriate) has the same effect and requires no changes to the  
119819 application.

119820 Although the needs of both interface implementors and application developers were addressed  
119821 throughout POSIX.1-2008, this section pays more attention to the needs of the latter. This is  
119822 because, while many aspects of the programming interface can be hidden from the user by the  
119823 application developer, the terminal interface is usually a large part of the user interface.  
119824 Although to some extent the application developer can build missing features or work around

inappropriate ones, the difficulties of doing that are greater in the terminal interface than elsewhere. For example, efficiency prohibits the average program from interpreting every character passing through it in order to simulate character erase, line kill, and so on. These functions should usually be done by the operating system, possibly at the interrupt level.

The *tc\**() functions were introduced as a way of avoiding the problems inherent in the traditional *ioctl*() function and in variants of it that were proposed. For example, *tcsetattr*() is specified in place of the use of the TCSETA *ioctl*() command function. This allows specification of all the arguments in a manner consistent with the ISO C standard unlike the varying third argument of *ioctl*(), which is sometimes a pointer (to any of many different types) and sometimes an **int**.

The advantages of this new method include:

- It allows strict type checking.
- The direction of transfer of control data is explicit.
- Portable capabilities are clearly identified.
- The need for a general interface routine is avoided.
- Size of the argument is well-defined (there is only one type).

The disadvantages include:

- No historical implementation used the new method.
- There are many small routines instead of one general-purpose one.
- The historical parallel with *fcntl*() is broken.

The issue of modem control was excluded from POSIX.1-2008 on the grounds that:

- It was concerned with setting and control of hardware timers.
- The appropriate timers and settings vary widely internationally.
- Feedback from European computer manufacturers indicated that this facility was not consistent with European needs and that specification of such a facility was not a requirement for portability.

## A.11.1 Interface Characteristics

### A.11.1.1 Opening a Terminal Device File

The **O\_TTY\_INIT** flag for *open*() has been added to POSIX.1-2008 to solve a problem encountered by applications written for earlier versions of this standard which need to open a modem or similar device and initialize all of the parameter settings. Using the *tcgetattr*()-*modify-tcsetattr*() method mandated by the standard could result in non-conforming behavior if the device had previously been used with non-conforming parameter settings, on implementations which do not reset the parameter settings in between the last close of the device by one application and the first open by another application. To avoid this problem, some application developers were resorting to using *memset*() to zero the **termios** structure before setting all of the standard parameters, but this risks non-conforming behavior on systems where some non-standard parameter needs a non-zero value in order for the terminal to behave in a conforming manner.

119864 On systems which do reset the parameter settings to defaults between uses of a terminal device,  
119865 it is expected that either `O_TTY_INIT` will have the value zero or `open(ttypath,`  
119866 `O_RDWR|O_TTY_INIT)` will do nothing additional.

119867 The standard developers considered an alternative solution of a special *fildev* argument for the  
119868 `tcgetattr()` call to obtain default parameters. However, this would not be adequate if a system  
119869 supports several different types of terminal device and the default settings need to differ  
119870 between the different types. With the `O_TTY_INIT` open flag, the implementor can determine  
119871 which device type is being opened.

119872 The standard developers also considered a special `POSIX_TTY_INIT` value for the **termios**  
119873 structure used in `tcsetattr()`, which would reset the values if used immediately after an `open()`  
119874 call. However, it was felt that this would lead to confusion amongst application developers who  
119875 wanted to reset the parameters at other points, and implementations might diverge.

#### 119876 A.11.1.2 Process Groups

119877 There is a potential race when the members of the foreground process group on a terminal leave  
119878 that process group, either by exit or by changing process groups. After the last process exits the  
119879 process group, but before the foreground process group ID of the terminal is changed (usually  
119880 by a job control shell), it would be possible for a new process to be created with its process ID  
119881 equal to the terminal's foreground process group ID. That process might then become the  
119882 process group leader and accidentally be placed into the foreground on a terminal that was not  
119883 necessarily its controlling terminal. As a result of this problem, the controlling terminal is  
119884 defined to not have a foreground process group during this time.

119885 The cases where a controlling terminal has no foreground process group occur when all  
119886 processes in the foreground process group either terminate and are waited for or join other  
119887 process groups via `setpgid()` or `setsid()`. If the process group leader terminates, this is the first  
119888 case described; if it leaves the process group via `setpgid()`, this is the second case described (a  
119889 process group leader cannot successfully call `setsid()`). When one of those cases causes a  
119890 controlling terminal to have no foreground process group, it has two visible effects on  
119891 applications. The first is the value returned by `tcgetpgrp()`. The second (which occurs only in the  
119892 case where the process group leader terminates) is the sending of signals in response to special  
119893 input characters. The intent of POSIX.1-2008 is that no process group be wrongly identified as  
119894 the foreground process group by `tcgetpgrp()` or unintentionally receive signals because of  
119895 placement into the foreground.

119896 In 4.3 BSD, the old process group ID continues to be used to identify the foreground process  
119897 group and is returned by the function equivalent to `tcgetpgrp()`. In that implementation it is  
119898 possible for a newly created process to be assigned the same value as a process ID and then form  
119899 a new process group with the same value as a process group ID. The result is that the new  
119900 process group would receive signals from this terminal for no apparent reason, and  
119901 POSIX.1-2008 precludes this by forbidding a process group from entering the foreground in this  
119902 way. It would be more direct to place part of the requirement made by the last sentence under  
119903 `fork()`, but there is no convenient way for that section to refer to the value that `tcgetpgrp()`  
119904 returns, since in this case there is no process group and thus no process group ID.

119905 One possibility for a conforming implementation is to behave similarly to 4.3 BSD, but to  
119906 prevent this reuse of the ID, probably in the implementation of `fork()`, as long as it is in use by  
119907 the terminal.

119908 Another possibility is to recognize when the last process stops using the terminal's foreground  
119909 process group ID, which is when the process group lifetime ends, and to change the terminal's  
119910 foreground process group ID to a reserved value that is never used as a process ID or process  
119911 group ID. (See the definition of *process group lifetime* in the definitions section.) The process ID

119912 can then be reserved until the terminal has another foreground process group.

119913 The 4.3 BSD implementation permits the leader (and only member) of the foreground process  
119914 group to leave the process group by calling the equivalent of *setpgid()* and to later return,  
119915 expecting to return to the foreground. There are no known application needs for this behavior,  
119916 and POSIX.1-2008 neither requires nor forbids it (except that it is forbidden for session leaders)  
119917 by leaving it unspecified.

119918 *A.11.1.3 The Controlling Terminal*

119919 POSIX.1-2008 does not specify a mechanism by which to allocate a controlling terminal. This is  
119920 normally done by a system utility (such as *getty*) and is considered an administrative feature  
119921 outside the scope of POSIX.1-2008.

119922 Historical implementations allocate controlling terminals on certain *open()* calls. Since *open()* is  
119923 part of POSIX.1, its behavior had to be dealt with. The traditional behavior is not required  
119924 because it is not very straightforward or flexible for either implementations or applications.  
119925 However, because of its prevalence, it was not practical to disallow this behavior either. Thus, a  
119926 mechanism was standardized to ensure portable, predictable behavior in *open()*.

119927 Some historical implementations deallocate a controlling terminal on the last system-wide close.  
119928 This behavior is neither required nor prohibited. Even on implementations that do provide this  
119929 behavior, applications generally cannot depend on it due to its system-wide nature.

119930 *A.11.1.4 Terminal Access Control*

119931 The access controls described in this section apply only to a process that is accessing its  
119932 controlling terminal. A process accessing a terminal that is not its controlling terminal is  
119933 effectively treated the same as a member of the foreground process group. While this may seem  
119934 unintuitive, note that these controls are for the purpose of job control, not security, and job  
119935 control relates only to the controlling terminal of a process. Normal file access permissions  
119936 handle security.

119937 If the process calling *read()* or *write()* is in a background process group that is orphaned, it is not  
119938 desirable to stop the process group, as it is no longer under the control of a job control shell that  
119939 could put it into the foreground again. Accordingly, calls to *read()* or *write()* functions by such  
119940 processes receive an immediate error return. This is different from 4.2 BSD, which kills orphaned  
119941 processes that receive terminal stop signals.

119942 The foreground/background/orphaned process group check performed by the terminal driver  
119943 must be repeatedly performed until the calling process moves into the foreground or until the  
119944 process group of the calling process becomes orphaned. That is, when the terminal driver  
119945 determines that the calling process is in the background and should receive a job control signal,  
119946 it sends the appropriate signal (SIGTTIN or SIGTTOU) to every process in the process group of  
119947 the calling process and then it allows the calling process to immediately receive the signal. The  
119948 latter is typically performed by blocking the process so that the signal is immediately noticed.  
119949 Note, however, that after the process finishes receiving the signal and control is returned to the  
119950 driver, the terminal driver must re-execute the foreground/background/orphaned process  
119951 group check. The process may still be in the background, either because it was continued in the  
119952 background by a job control shell, or because it caught the signal and did nothing.

119953 The terminal driver repeatedly performs the foreground/background/orphaned process group  
119954 checks whenever a process is about to access the terminal. In the case of *write()* or the control  
119955 *tc\*()* functions, the check is performed at the entry of the function. In the case of *read()*, the  
119956 check is performed not only at the entry of the function, but also after blocking the process to

119957 wait for input characters (if necessary). That is, once the driver has determined that the process  
119958 calling the *read()* function is in the foreground, it attempts to retrieve characters from the input  
119959 queue. If the queue is empty, it blocks the process waiting for characters. When characters are  
119960 available and control is returned to the driver, the terminal driver must return to the repeated  
119961 foreground/background/orphaned process group check again. The process may have moved  
119962 from the foreground to the background while it was blocked waiting for input characters.

119963 A.11.1.5 *Input Processing and Reading Data*

119964 There is no additional rationale provided for this section.

119965 A.11.1.6 *Canonical Mode Input Processing*

119966 The term “character” is intended here. ERASE should erase the last character, not the last byte.  
119967 In the case of multi-byte characters, these two may be different.

119968 4.3 BSD has a WERASE character that erases the last “word” typed (but not any preceding  
119969 <blank> or <tab> characters). A word is defined as a sequence of non-<blank> characters, with  
119970 <tab> characters counted as <blank> characters. Like ERASE, WERASE does not erase beyond  
119971 the beginning of the line. This WERASE feature has not been specified in POSIX.1 because it is  
119972 difficult to define in the international environment. It is only useful for languages where words  
119973 are delimited by <blank> characters. In some ideographic languages, such as Japanese and  
119974 Chinese, words are not delimited at all. The WERASE character should presumably go back to  
119975 the beginning of a sentence in those cases; practically, this means it would not be used much for  
119976 those languages.

119977 It should be noted that there is a possible inherent deadlock if the application and  
119978 implementation conflict on the value of {MAX\_CANON}. With ICANON set (if IXOFF is  
119979 enabled) and more than {MAX\_CANON} characters transmitted without a <linefeed>,  
119980 transmission will be stopped, the <linefeed> (or <carriage-return> when ICRLF is set) will never  
119981 arrive, and the *read()* will never be satisfied.

119982 An application should not set IXOFF if it is using canonical mode unless it knows that (even in  
119983 the face of a transmission error) the conditions described previously cannot be met or unless it  
119984 is prepared to deal with the possible deadlock in some other way, such as timeouts.

119985 It should also be noted that this can be made to happen in non-canonical mode if the trigger  
119986 value for sending IXOFF is less than VMIN and VTIME is zero.

119987 A.11.1.7 *Non-Canonical Mode Input Processing*

119988 Some points to note about MIN and TIME:

- 119989 1. The interactions of MIN and TIME are not symmetric. For example, when MIN>0 and  
119990 TIME=0, TIME has no effect. However, in the opposite case where MIN=0 and TIME>0,  
119991 both MIN and TIME play a role in that MIN is satisfied with the receipt of a single  
119992 character.
- 119993 2. Also note that in case A (MIN>0, TIME>0), TIME represents an inter-character timer,  
119994 while in case C (MIN=0, TIME>0), TIME represents a read timer.

119995 These two points highlight the dual purpose of the MIN/TIME feature. Cases A and B, where  
119996 MIN>0, exist to handle burst-mode activity (for example, file transfer programs) where a  
119997 program would like to process at least MIN characters at a time. In case A, the inter-character  
119998 timer is activated by a user as a safety measure; in case B, it is turned off.

119999 Cases C and D exist to handle single-character timed transfers. These cases are readily adaptable  
 120000 to screen-based applications that need to know if a character is present in the input queue before  
 120001 refreshing the screen. In case C, the read is timed; in case D, it is not.

120002 Another important note is that MIN is always just a minimum. It does not denote a record  
 120003 length. That is, if a program does a read of 20 bytes, MIN is 10, and 25 characters are present, 20  
 120004 characters are returned to the user. In the special case of MIN=0, this still applies: if more than  
 120005 one character is available, they all will be returned immediately.

#### 120006 A.11.1.8 Writing Data and Output Processing

120007 There is no additional rationale provided for this section.

#### 120008 A.11.1.9 Special Characters

120009 There is no additional rationale provided for this section.

#### 120010 A.11.1.10 Modem Disconnect

120011 There is no additional rationale provided for this section.

#### 120012 A.11.1.11 Closing a Terminal Device File

120013 POSIX.1-2008 does not specify that a *close()* on a terminal device file include the equivalent of a  
 120014 call to *tcflow(fd,TCOON)*.

120015 An implementation that discards output at the time *close()* is called after reporting the return  
 120016 value to the *write()* call that data was written does not conform with POSIX.1-2008. An  
 120017 application has functions such as *tcdrain()*, *tcflush()*, and *tcflow()* available to obtain the detailed  
 120018 behavior it requires with respect to flushing of output.

120019 At the time of the last close on a terminal device, an application relinquishes any ability to exert  
 120020 flow control via *tcflow()*.

### 120021 A.11.2 Parameters that Can be Set

#### 120022 A.11.2.1 The termios Structure

120023 This structure is part of an interface that, in general, retains the historic grouping of flags.  
 120024 Although a more optimal structure for implementations may be possible, the degree of change  
 120025 to applications would be significantly larger.

#### 120026 A.11.2.2 Input Modes

120027 Some historical implementations treated a long break as multiple events, as many as one per  
 120028 character time. The wording in POSIX.1 explicitly prohibits this.

120029 Although the ISTRIP flag is normally superfluous with today's terminal hardware and software,  
 120030 it is historically supported. Therefore, applications may be using ISTRIP, and there is no  
 120031 technical problem with supporting this flag. Also, applications may wish to receive only 7-bit  
 120032 input bytes and may not be connected directly to the hardware terminal device (for example,

120033 when a connection traverses a network).

120034 Also, there is no requirement in general that the terminal device ensures that high-order bits  
120035 beyond the specified character size are cleared. ISTRIP provides this function for 7-bit  
120036 characters, which are common.

120037 In dealing with multi-byte characters, the consequences of a parity error in such a character, or  
120038 in an escape sequence affecting the current character set, are beyond the scope of POSIX.1 and  
120039 are best dealt with by the application processing the multi-byte characters.

#### 120040 *A.11.2.3 Output Modes*

120041 POSIX.1 does not describe post-processing of output to a terminal or detailed control of that  
120042 from a conforming application. (That is, translation of <newline> to <carriage-return> followed  
120043 by <linefeed> or <tab> processing.) There is nothing that a conforming application should do to  
120044 its output for a terminal because that would require knowledge of the operation of the terminal.  
120045 It is the responsibility of the operating system to provide post-processing appropriate to the  
120046 output device, whether it is a terminal or some other type of device.

120047 Extensions to POSIX.1 to control the type of post-processing already exist and are expected to  
120048 continue into the future. The control of these features is primarily to adjust the interface between  
120049 the system and the terminal device so the output appears on the display correctly. This should  
120050 be set up before use by any application.

120051 In general, both the input and output modes should not be set absolutely, but rather modified  
120052 from the inherited state.

#### 120053 *A.11.2.4 Control Modes*

120054 This section could be misread that the symbol "CSIZE" is a title in the **termios** *c\_flag* field.  
120055 Although it does serve that function, it is also a required symbol, as a literal reading of POSIX.1  
120056 (and the caveats about typography) would indicate.

#### 120057 *A.11.2.5 Local Modes*

120058 Non-canonical mode is provided to allow fast bursts of input to be read efficiently while still  
120059 allowing single-character input.

120060 The ECHONL function historically has been in many implementations. Since there seems to be  
120061 no technical problem with supporting ECHONL, it is included in POSIX.1 to increase consensus.

120062 The alternate behavior possible when ECHOK or ECHOE are specified with ICANON is  
120063 permitted as a compromise depending on what the actual terminal hardware can do. Erasing  
120064 characters and lines is preferred, but is not always possible.

#### 120065 *A.11.2.6 Special Control Characters*

120066 Permitting VMIN and VTIME to overlap with VEOF and VEOL was a compromise for historical  
120067 implementations. Only when backwards-compatibility of object code is a serious concern to an  
120068 implementor should an implementation continue this practice. Correct applications that work  
120069 with the overlap (at the source level) should also work if it is not present, but not the reverse.

## A.12 Utility Conventions

### A.12.1 Utility Argument Syntax

The standard developers considered that recent trends toward diluting the SYNOPSIS sections of historical reference pages to the equivalent of:

```
command [options][operands]
```

were a disservice to the reader. Therefore, considerable effort was placed into rigorous definitions of all the command line arguments and their interrelationships. The relationships depicted in the synopses are normative parts of POSIX.1-2008; this information is sometimes repeated in textual form, but that is only for clarity within context.

The use of “undefined” for conflicting argument usage and for repeated usage of the same option is meant to prevent conforming applications from using conflicting arguments or repeated options unless specifically allowed (as is the case with *ls*, which allows simultaneous, repeated use of the *-C*, *-l*, and *-1* options). Many historical implementations will tolerate this usage, choosing either the first or the last applicable argument. This tolerance can continue, but conforming applications cannot rely upon it. (Other implementations may choose to print usage messages instead.)

The use of “undefined” for conflicting argument usage also allows an implementation to make reasonable extensions to utilities where the implementor considers mutually-exclusive options according to POSIX.1-2008 to have a sensible meaning and result.

POSIX.1-2008 does not define the result of a command when an option-argument or operand is not followed by ellipses and the application specifies more than one of that option-argument or operand. This allows an implementation to define valid (although non-standard) behavior for the utility when more than one such option or operand is specified.

The requirements for option-arguments are summarized as follows:

	SYNOPSIS Shows:	
	<i>-a arg</i>	<i>-c[ arg]</i>
Conforming application uses:	<i>-a arg</i>	<i>-carg</i> or <i>-c</i>
System supports:	<i>-a arg</i> and <i>-aarg</i>	<i>-carg</i> and <i>-c</i>
Non-conforming applications may use:	<i>-aarg</i>	N/A

Earlier versions of this standard included obsolescent syntax which showed some options with (mandatory) adjacent option-arguments in the SYNOPSIS for some utilities. These have since been removed. For all options with mandatory option-arguments, the SYNOPSIS now shows <blank> characters between the option and the option-argument; however, historical usage has not been consistent in this area; therefore, <blank> characters are required to be used by conforming applications and to be handled by all implementations, but implementations are also required to handle an adjacent option-argument in order to preserve backwards-compatibility for old scripts. One of the justifications for selecting the multiple-argument method was that the single-argument case is inherently ambiguous when the option-argument can legitimately be a null string.

POSIX.1-2008 explicitly states that digits are permitted as operands and option-arguments. The lower and upper bounds for the values of the numbers used for operands and option-arguments were derived from the ISO C standard values for {LONG\_MIN} and {LONG\_MAX}. The

requirement on the standard utilities is that numbers in the specified range do not cause a syntax error, although the specification of a number need not be semantically correct for a particular operand or option-argument of a utility. For example, the specification of:

```
dd obs=3000000000
```

would yield undefined behavior for the application and could be a syntax error because the number 3 000 000 000 is outside of the range -2 147 483 647 to +2 147 483 647. On the other hand:

```
dd obs=2000000000
```

may cause some error, such as “blocksize too large”, rather than a syntax error.

## A.12.2 Utility Syntax Guidelines

This section is based on the rules listed in the SVID. It was included for two reasons:

1. The individual utility descriptions in XCU [Chapter 4](#) (on page 2443) needed a set of common (although not universal) actions on which they could anchor their descriptions of option and operand syntax. Most of the standard utilities actually do use these guidelines, and many of their historical implementations use the *getopt()* function for their parsing. Therefore, it was simpler to cite the rules and merely identify exceptions.
2. Developers of conforming applications need suggested guidelines if the POSIX community is to avoid the chaos of historical UNIX system command syntax.

It is recommended that all *future* utilities and applications use these guidelines to enhance “user portability”. The fact that some historical utilities could not be changed (to avoid breaking historical applications) should not deter this future goal.

The voluntary nature of the guidelines is highlighted by repeated uses of the word *should* throughout. This usage should not be misinterpreted to imply that utilities that claim conformance in their OPTIONS sections do not always conform.

Guidelines 1 and 2 encourage utility writers to use only characters from the portable character set because use of locale-specific characters may make the utility inaccessible from other locales. Use of uppercase letters is discouraged due to problems associated with porting utilities to systems that do not distinguish between uppercase and lowercase characters in filenames. Use of non-alphanumeric characters is discouraged due to the number of utilities that treat non-alphanumeric characters in “special” ways depending on context (such as the shell using white-space characters to delimit arguments, various quote characters for quoting, the <dollar-sign> to introduce variable expansion, etc.).

In XCU [Section 2.9.1](#) (on page 2355), it is further stated that a command used in the Shell Command Language cannot be named with a trailing <colon>.

Guideline 3 was changed to allow alphanumeric characters (letters and digits) from the character set to allow compatibility with historical usage. Historical practice allows the use of digits wherever practical, and there are no portability issues that would prohibit the use of digits. In fact, from an internationalization viewpoint, digits (being non-language-dependent) are preferable over letters (a -2 is intuitively self-explanatory to any user, while in the -f *filename* the letter ‘f’ is a mnemonic aid only to speakers of Latin-based languages where “filename” happens to translate to a word that begins with ‘f’). Since Guideline 3 still retains the word “single”, multi-digit options are not allowed. Instances of historical utilities that used them have been marked obsolescent, with the numbers being changed from option names to option-arguments.

It was difficult to achieve a satisfactory solution to the problem of name space in option

characters. When the standard developers desired to extend the historical *cc* utility to accept ISO C standard programs, they found that all of the portable alphabet was already in use by various vendors. Thus, they had to devise a new name, *c89* (now superseded by *c99*), rather than something like *cc -X*. There were suggestions that implementors be restricted to providing extensions through various means (such as using a <plus-sign> as the option delimiter or using option characters outside the alphanumeric set) that would reserve all of the remaining alphanumeric characters for future POSIX standards. These approaches were resisted because they lacked the historical style of UNIX systems. Furthermore, if a vendor-provided option should become commonly used in the industry, it would be a candidate for standardization. It would be desirable to standardize such a feature using historical practice for the syntax (the semantics can be standardized with any syntax). This would not be possible if the syntax was one reserved for the vendor. However, since the standardization process may lead to minor changes in the semantics, it may prove to be better for a vendor to use a syntax that will not be affected by standardization.

Guideline 8 includes the concept of <comma>-separated lists in a single argument. It is up to the utility to parse such a list itself because *getopt()* just returns the single string. This situation was retained so that certain historical utilities would not violate the guidelines. Applications preparing for international use should be aware of an occasional problem with <comma>-separated lists: in some locales, the <comma> is used as the radix character. Thus, if an application is preparing operands for a utility that expects a <comma>-separated list, it should avoid generating non-integer values through one of the means that is influenced by setting the *LC\_NUMERIC* variable (such as *awk*, *bc*, *printf*, or *printf()*).

Unless explicitly stated otherwise in the utility description, Guideline 9 requires applications to put options before operands, and requires utilities to accept any such usage without misinterpreting operands as options. For example, if an implementation of the *printf* utility supports a *-e* option as an extension, the command:

```
printf %s -e
```

must output the string "-e" without interpreting the *-e* as an option. Similarly, the command:

```
ls myfile -l
```

must interpret the *-l* argument as a second file operand, not as a *-l* option.

Applications calling any utility with a first operand starting with '-' should usually specify *--*, as indicated by Guideline 10, to mark the end of the options. This is true even if the SYNOPSIS in the Shell and Utilities volume of POSIX.1-2008 does not specify any options; implementations may provide options as extensions to the Shell and Utilities volume of POSIX.1-2008. The standard utilities that do not support Guideline 10 indicate that fact in the OPTIONS section of the utility description.

Guideline 7 allows any string to be an option-argument; an option-argument can begin with any character, can be - or --, and can be an empty string. For example, the commands *pr -h -*, *pr -h --*, *pr -h -d*, *pr -h +2*, and *pr -h ''* contain the option-arguments -, --, -d, +2, and an empty string, respectively. Conversely, the command *pr -h -- -d* treats -d as an option, not as an argument, because the -- is an option-argument here, not a delimiter.

Guideline 11 was modified to clarify that the order of different options should not matter relative to one another. However, the order of repeated options that also have option-arguments may be significant; therefore, such options are required to be interpreted in the order that they are specified. The *make* utility is an instance of a historical utility that uses repeated options in which the order is significant. Multiple files are specified by giving multiple instances of the *-f* option; for example:

```
make -f common_header -f specific_rules target
```

Guideline 13 does not imply that all of the standard utilities automatically accept the operand `'-'` to mean standard input or output, nor does it specify the actions of the utility upon encountering multiple `'-'` operands. It simply says that, by default, `'-'` operands are not used for other purposes in the file reading or writing (but not when using `stat()`, `unlink()`, `touch`, and so on) utilities. In earlier versions of this standard, all information concerning actual treatment of the `'-'` operand is found in the individual utility sections. Many implementations, however, treated `'-'` as standard input or output and many applications depended on this behavior even though it was not standard. This behavior is now implementation-defined. Portable applications should not use `'-'` to mean standard input or output unless it is explicitly stated to do so in the utility description and they should always use `'./-'` if they intend to refer to a file named `-` in the current working directory.

Guideline 14 is intended to prohibit implementations that would treat the command `ls -l -d` as if it were `ls -- -l -d` or `ls -l -- -d`.

The standard permits implementations to have extensions that violate the Utility Syntax Guidelines so long as when the utility is used in line with the forms defined by the standard it follows the Utility Syntax Guidelines. Thus, `head-42file` and `ls--help` are permitted extensions. The intent is to allow extensions so long as the standard form is accepted and follows the guidelines.

An area of concern was that as implementations mature, implementation-defined utilities and implementation-defined utility options will result. The idea was expressed that there needed to be a standard way, say an environment variable or some such mechanism, to identify implementation-defined utilities separately from standard utilities that may have the same name. It was decided that there already exist several ways of dealing with this situation and that it is outside of the scope to attempt to standardize in the area of non-standard items. A method that exists on some historical implementations is the use of the so-called `/local/bin` or `/usr/local/bin` directory to separate local or additional copies or versions of utilities. Another method that is also used is to isolate utilities into completely separate domains. Still another method to ensure that the desired utility is being used is to request the utility by its full pathname. There are many approaches to this situation; the examples given above serve to illustrate that there is more than one.

## A.13 Headers

### A.13.1 Format of Entries

Each header reference page has a common layout of sections describing the interface. This layout is similar to the manual page or “man” page format shipped with most UNIX systems, and each header has sections describing the SYNOPSIS and DESCRIPTION. These are the two sections that relate to conformance.

Additional sections are informative, and add considerable information for the application developer. APPLICATION USAGE sections provide additional caveats, issues, and recommendations to the developer. RATIONALE sections give additional information on the decisions made in defining the interface.

FUTURE DIRECTIONS sections act as pointers to related work that may impact the interface in the future, and often cautions the developer to architect the code to account for a change in this area. Note that a future directions statement should not be taken as a commitment to adopt a

- 120247 feature or interface in the future.
- 120248 The CHANGE HISTORY section describes when the interface was introduced, and how it has  
120249 changed.
- 120250 Option labels and margin markings in the page can be useful in guiding the application  
120251 developer.

120252 **A.13.2 Removed Headers in Issue 7**

- 120253 The headers removed in Issue 7 (from the Issue 6 base document) are as follows:

# *Rationale for System Interfaces*

## **B.1 Introduction**

### **B.1.1 Change History**

The change history is provided as an informative section, to track changes from earlier versions of this standard.

The following sections describe changes made to the System Interfaces volume of POSIX.1-2008 since Issue 6 of the base document. The CHANGE HISTORY section for each entry details the technical changes that have been made to that entry from Issue 5. Changes between earlier versions of the base document and Issue 5 are not included.

#### **Changes from Issue 6 to Issue 7 (POSIX.1-2008)**

The following list summarizes the major changes that were made in the System Interfaces volume of POSIX.1-2008 from Issue 6 to Issue 7:

- The Open Group Technical Standard, 2006, Extended API Set Part 1 is incorporated.
- The Open Group Technical Standard, 2006, Extended API Set Part 2 is incorporated.
- The Open Group Technical Standard, 2006, Extended API Set Part 3 is incorporated.
- The Open Group Technical Standard, 2006, Extended API Set Part 4 is incorporated.
- Existing functionality is aligned with ISO/IEC 9899:1999, Programming Languages — C, ISO/IEC 9899:1999/Cor.2:2004(E)
- Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1, and responses to ISO/IEC defect reports against ISO/IEC 9945 are applied.
- The Open Group corrigenda and resolutions are applied.
- Features, marked legacy or obsolescent in the base document, have been considered for removal in this version.
- The options within the standard have been revised.

**New Features in Issue 7**

The functions first introduced in Issue 7 (over the Issue 6 base document) are as follows:

**New Functions in Issue 7**

<i>alphasort()</i>	<i>iswdigit_l()</i>	<i>strfmon_l()</i>
<i>dirfd()</i>	<i>iswgraph_l()</i>	<i>strncascmp_l()</i>
<i>dprintf()</i>	<i>iswlower_l()</i>	<i>strndup()</i>
<i>duplocale()</i>	<i>iswprint_l()</i>	<i>strnlen()</i>
<i>faccessat()</i>	<i>iswpunct_l()</i>	<i>strsignal()</i>
<i>fchmodat()</i>	<i>iswspace_l()</i>	<i>strxfrm_l()</i>
<i>fchownat()</i>	<i>iswupper_l()</i>	<i>symlinkat()</i>
<i>fdopendir()</i>	<i>iswxdigit_l()</i>	<i>tolower_l()</i>
<i>execve()</i>	<i>isxdigit_l()</i>	<i>toupper_l()</i>
<i>fnmopen()</i>	<i>linkat()</i>	<i>towctrans_l()</i>
<i>freelocale()</i>	<i>mbsnrtowcs()</i>	<i>tolower_l()</i>
<i>fstatat()</i>	<i>mkdirat()</i>	<i>towupper_l()</i>
<i>futimens()</i>	<i>mkdtemp()</i>	<i>unlinkat()</i>
<i>getdelim()</i>	<i>mkffloat()</i>	<i>uselocale()</i>
<i>getline()</i>	<i>mknodat()</i>	<i>utimensat()</i>
<i>isalnum_l()</i>	<i>newlocale()</i>	<i>vdprintf()</i>
<i>isalpha_l()</i>	<i>openat()</i>	<i>wcpcpy()</i>
<i>isblank_l()</i>	<i>open_memstream()</i>	<i>wcpncpy()</i>
<i>iscntrl_l()</i>	<i>open_wmemstream()</i>	<i>wscascmp_l()</i>
<i>isdigit_l()</i>	<i>psiginfo()</i>	<i>wscascmp_l()</i>
<i>isgraph_l()</i>	<i>psignal()</i>	<i>wscoll_l()</i>
<i>islower_l()</i>	<i>pthread_mutexattr_getrobust()</i>	<i>wcsdup()</i>
<i>isprint_l()</i>	<i>pthread_mutexattr_setrobust()</i>	<i>wcsncascmp_l()</i>
<i>ispunct_l()</i>	<i>pthread_mutex_consistent()</i>	<i>wcsncascmp_l()</i>
<i>isspace_l()</i>	<i>readlinkat()</i>	<i>wcsnlen()</i>
<i>isupper_l()</i>	<i>renameat()</i>	<i>wcsnrtombs()</i>
<i>iswalnum_l()</i>	<i>scandir()</i>	<i>wcsxfrm_l()</i>
<i>iswalphal_l()</i>	<i>stpcpy()</i>	<i>wctrans_l()</i>
<i>iswblank_l()</i>	<i>stpncpy()</i>	<i>wctype_l()</i>
<i>iswcntrl_l()</i>	<i>strcascmp_l()</i>	
<i>iswctype_l()</i>	<i>strcoll_l()</i>	

**Newly Mandated Functions in Issue 7**

The functions that were previously part of an option group but are now mandatory in Issue 7 are as follows:

Newly Mandated Functions in Issue 7		
120323		
120324	<i>aiocancel()</i>	<i>pthread_atfork()</i>
120325	<i>aioerror()</i>	<i>pthread_attr_destroy()</i>
120326	<i>aiofsync()</i>	<i>pthread_attr_getdetachstate()</i>
120327	<i>aio_read()</i>	<i>pthread_attr_getguardsize()</i>
120328	<i>aio_return()</i>	<i>pthread_attr_getschedparam()</i>
120329	<i>aio_suspend()</i>	<i>pthread_attr_init()</i>
120330	<i>aio_write()</i>	<i>pthread_attr_setdetachstate()</i>
120331	<i>asctime_r()</i>	<i>pthread_attr_setguardsize()</i>
120332	<i>catclose()</i>	<i>pthread_attr_setschedparam()</i>
120333	<i>catgets()</i>	<i>pthread_barrier_destroy()</i>
120334	<i>catopen()</i>	<i>pthread_barrier_init()</i>
120335	<i>clock_getres()</i>	<i>pthread_barrier_wait()</i>
120336	<i>clock_gettime()</i>	<i>pthread_barrierattr_destroy()</i>
120337	<i>clock_nanosleep()</i>	<i>pthread_barrierattr_init()</i>
120338	<i>clock_settime()</i>	<i>pthread_cancel()</i>
120339	<i>ctime_r()</i>	<i>pthread_cleanup_pop()</i>
120340	<i>dlclose()</i>	<i>pthread_cleanup_push()</i>
120341	<i>dlderror()</i>	<i>pthread_cond_broadcast()</i>
120342	<i>dlopen()</i>	<i>pthread_cond_destroy()</i>
120343	<i>dlsym()</i>	<i>pthread_cond_init()</i>
120344	<i>fchdir()</i>	<i>pthread_cond_signal()</i>
120345	<i>flockfile()</i>	<i>pthread_cond_timedwait()</i>
120346	<i>fstatvfs()</i>	<i>pthread_cond_wait()</i>
120347	<i>ftrylockfile()</i>	<i>pthread_condattr_destroy()</i>
120348	<i>funlockfile()</i>	<i>pthread_condattr_getclock()</i>
120349	<i>getc_unlocked()</i>	<i>pthread_condattr_init()</i>
120350	<i>getchar_unlocked()</i>	<i>pthread_condattr_setclock()</i>
120351	<i>getgrgid_r()</i>	<i>pthread_create()</i>
120352	<i>getgrnam_r()</i>	<i>pthread_detach()</i>
120353	<i>getlogin_r()</i>	<i>pthread_equal()</i>
120354	<i>getpgid()</i>	<i>pthread_exit()</i>
120355	<i>getpwnam_r()</i>	<i>pthread_getspecific()</i>
120356	<i>getpwuid_r()</i>	<i>pthread_join()</i>
120357	<i>getsid()</i>	<i>pthread_key_create()</i>
120358	<i>getsubopt()</i>	<i>pthread_key_delete()</i>
120359	<i>gmtime_r()</i>	<i>pthread_mutex_destroy()</i>
120360	<i>iconv()</i>	<i>pthread_mutex_init()</i>
120361	<i>iconv_close()</i>	<i>pthread_mutex_lock()</i>
120362	<i>iconv_open()</i>	<i>pthread_mutex_timedlock()</i>
120363	<i>lchown()</i>	<i>pthread_mutex_trylock()</i>
120364	<i>lio_listio()</i>	<i>pthread_mutex_unlock()</i>
120365	<i>localtime_r()</i>	<i>pthread_mutexattr_destroy()</i>
120366	<i>mkstemp()</i>	<i>pthread_mutexattr_gettype()</i>
120367	<i>mmap()</i>	<i>pthread_mutexattr_init()</i>
120368	<i>mprotect()</i>	<i>pthread_mutexattr_settype()</i>
120369	<i>munmap()</i>	<i>pthread_once()</i>
120370	<i>nanosleep()</i>	<i>pthread_rwlock_destroy()</i>
120371	<i>nl_langinfo()</i>	<i>pthread_rwlock_init()</i>
120372	<i>poll()</i>	<i>pthread_rwlock_rdlock()</i>
120373	<i>posix_trace_timedgetnext_event()</i>	<i>pthread_rwlock_timedrdlock()</i>
120374	<i>pread()</i>	<i>pthread_rwlock_timedwrlock()</i>
		<i>pthread_rwlock_tryrdlock()</i>
		<i>pthread_rwlock_trywrlock()</i>
		<i>pthread_rwlock_unlock()</i>
		<i>pthread_rwlock_wrlock()</i>
		<i>pthread_rwlockattr_destroy()</i>
		<i>pthread_rwlockattr_init()</i>
		<i>pthread_self()</i>
		<i>pthread_setcancelstate()</i>
		<i>pthread_setcanceltype()</i>
		<i>pthread_setspecific()</i>
		<i>pthread_spin_destroy()</i>
		<i>pthread_spin_init()</i>
		<i>pthread_spin_lock()</i>
		<i>pthread_spin_trylock()</i>
		<i>pthread_spin_unlock()</i>
		<i>pthread_testcancel()</i>
		<i>putc_unlocked()</i>
		<i>putchar_unlocked()</i>
		<i>pwrite()</i>
		<i>rand_r()</i>

		<i>sem_close()</i>
		<i>sem_destroy()</i>
		<i>sem_getvalue()</i>
		<i>sem_init()</i>
		<i>sem_open()</i>
		<i>sem_post()</i>
		<i>sem_timedwait()</i>
		<i>sem_trywait()</i>
		<i>sem_unlink()</i>
		<i>sem_wait()</i>
		<i>sigqueue()</i>
		<i>sigqueue()</i>
		<i>sigtimedwait()</i>
		<i>sigwaitinfo()</i>
		<i>statvfs()</i>
		<i>strcasecmp()</i>
		<i>strdup()</i>
		<i>strerror_r()</i>
		<i>strfmon()</i>
		<i>strncasecmp()</i>
		<i>strtok_r()</i>
		<i>tcgetsid()</i>
		<i>timer_create()</i>
		<i>timer_delete()</i>
		<i>timer_getoverrun()</i>
		<i>timer_gettime()</i>
		<i>timer_settime()</i>
		<i>truncate()</i>
		<i>ttynam_r()</i>
		<i>waitid()</i>

**Obsolescent Functions in Issue 7**

The base functions moved to obsolescent status in Issue 7 (from the Issue 6 base document) are as follows:

**Obsolescent Base Functions in Issue 7**

<i>asctime()</i>	<i>gets()</i>
<i>asctime_r()</i>	<i>rand_r()</i>
<i>ctime()</i>	<i>tmpnam()</i>
<i>ctime_r()</i>	<i>utime()</i>

The XSI functions moved to obsolescent status in Issue 7 (from the Issue 6 base document) are as follows:

**Obsolescent XSI Functions in Issue 7**

<i>_longjmp()</i>	<i>pthread_getconcurrency()</i>	<i>sigset()</i>
<i>_setjmp()</i>	<i>pthread_setconcurrency()</i>	<i>siginterrupt()</i>
<i>_tolower()</i>	<i>setitimer()</i>	<i>tempnam()</i>
<i>_toupper()</i>	<i>setpggrp()</i>	<i>toascii()</i>
<i>ftw()</i>	<i>sighold()</i>	<i>ulimit()</i>
<i>getitimer()</i>	<i>sigignore()</i>	
<i>gettimeofday()</i>	<i>sigpause()</i>	
<i>isascii()</i>	<i>sigrelse()</i>	

**Removed Functions and Symbols in Issue 7**

The functions and symbols removed in Issue 7 (from the Issue 6 base document) are as follows:

**Removed Functions and Symbols in Issue 7**

<i>bcmp()</i>	<i>gethostbyaddr()</i>	<i>rindex()</i>
<i>bcopy()</i>	<i>gethostbyname()</i>	<i>scalb()</i>
<i>bsd_signal()</i>	<i>getwd()</i>	<i>setcontext()</i>
<i>bzero()</i>	<i>h_errno</i>	<i>swapcontext()</i>
<i>ecvt()</i>	<i>index()</i>	<i>ualarm()</i>
<i>fcvt()</i>	<i>makecontext()</i>	<i>usleep()</i>
<i>ftime()</i>	<i>mktemp()</i>	<i>vfork()</i>
<i>gcvt()</i>	<i>pthread_attr_getstackaddr()</i>	<i>wcswcs()</i>
<i>getcontext()</i>	<i>pthread_attr_setstackaddr()</i>	

**B.1.2 Relationship to Other Formal Standards**

There is no additional rationale provided for this section.

**B.1.3 Format of Entries**

Each system interface reference page has a common layout of sections describing the interface. This layout is similar to the manual page or “man” page format shipped with most UNIX systems, and each header has sections describing the SYNOPSIS, DESCRIPTION, RETURN VALUE, and ERRORS. These are the four sections that relate to conformance.

Additional sections are informative, and add considerable information for the application developer. EXAMPLES sections provide example usage. APPLICATION USAGE sections

120415 provide additional caveats, issues, and recommendations to the developer. RATIONALE  
 120416 sections give additional information on the decisions made in defining the interface.

120417 FUTURE DIRECTIONS sections act as pointers to related work that may impact the interface in  
 120418 the future, and often cautions the developer to architect the code to account for a change in this  
 120419 area. Note that a future directions statement should not be taken as a commitment to adopt a  
 120420 feature or interface in the future.

120421 The CHANGE HISTORY section describes when the interface was introduced, and how it has  
 120422 changed.

120423 Option labels and margin markings in the page can be useful in guiding the application  
 120424 developer.

## 120425 B.2 General Information

### 120426 B.2.1 Use and Implementation of Interfaces

120427 The information concerning the use of functions was adapted from a description in the ISO C  
 120428 standard. Here is an example of how an application program can protect itself from functions  
 120429 that may or may not be macros, rather than true functions:

120430 The `atoi()` function may be used in any of several ways:

- 120431 • By use of its associated header (possibly generating a macro expansion):

```
120432 #include <stdlib.h>
120433 /* ... */
120434 i = atoi(str);
```

- 120435 • By use of its associated header (assuredly generating a true function call):

```
120436 #include <stdlib.h>
120437 #undef atoi
120438 /* ... */
120439 i = atoi(str);
```

120440 or:

```
120441 #include <stdlib.h>
120442 /* ... */
120443 i = (atoi) (str);
```

- 120444 • By explicit declaration:

```
120445 extern int atoi (const char *);
120446 /* ... */
120447 i = atoi(str);
```

- 120448 • By implicit declaration:

```
120449 /* ... */
120450 i = atoi(str);
```

120451 (Assuming no function prototype is in scope. This is not allowed by the ISO C standard for  
 120452 functions with variable arguments; furthermore, parameter type conversion “widening” is

120453 subject to different rules in this case.)

120454 Note that the ISO C standard reserves names starting with ‘\_’ for the compiler. Therefore, the  
 120455 compiler could, for example, implement an intrinsic, built-in function `_asm_builtin_atoi()`, which  
 120456 it recognized and expanded into inline assembly code. Then, in `<stdlib.h>`, there could be the  
 120457 following:

120458 `#define atoi(X) _asm_builtin_atoi(X)`

120459 The user’s “normal” call to `atoi()` would then be expanded inline, but the implementor would  
 120460 also be required to provide a callable function named `atoi()` for use when the application  
 120461 requires it; for example, if its address is to be stored in a function pointer variable.

120462 Implementors should note that since applications can **#undef** a macro in order to ensure that the  
 120463 function is used, this means that it is not safe for implementations to use the names of any  
 120464 standard functions in macro values, since the application could use **#undef** to ensure that no  
 120465 macro exists and then use the same name for an identifier with local scope. For example,  
 120466 historically it was common for a `getchar()` macro to be defined in `<stdio.h>` as:

120467 `#define getchar() getc(stdin)`

120468 This definition does not conform, because an application is allowed to use the identifier `getc`  
 120469 with local scope, and the expansion of the `getchar()` macro would then pick up the local `getc`.  
 120470 The following is conforming code, but would not compile with the above definition of `getchar()`:

120471 `#include <stdio.h>`

120472 `#undef getc`

120473 `int main(void)`

120474 `{`

120475  `int getc;`

120476  `getc = getchar();`

120477  `return getc;`

120478 `}`

120479 This does not only affect function-like macros. For example, the following definition does not  
 120480 conform because there could be a local `sysconf` variable in scope when `SIGRTMIN` is expanded:

120481 `#define SIGRTMIN ((int)sysconf(_SC_SIGRT_MIN))`

120482 Implementors can avoid the problem by using aliases for standard functions instead of the  
 120483 actual function, with names that conforming applications cannot use for local variables. For  
 120484 example:

120485 `#define SIGRTMIN ((int)__sysconf(_SC_SIGRT_MIN))`

## 120486 **B.2.2 The Compilation Environment**

### 120487 *B.2.2.1 POSIX.1 Symbols*

120488 This and the following section address the issue of “name space pollution”. The ISO C standard  
 120489 requires that the name space beyond what it reserves not be altered except by explicit action of  
 120490 the application developer. This section defines the actions to add the POSIX.1 symbols for those  
 120491 headers where both the ISO C standard and POSIX.1 need to define symbols, and also where the

120492 XSI option extends the base standard.

120493 When headers are used to provide symbols, there is a potential for introducing symbols that the  
120494 application developer cannot predict. Ideally, each header should only contain one set of  
120495 symbols, but this is not practical for historical reasons. Thus, the concept of feature test macros is  
120496 included. Two feature test macros are explicitly defined by POSIX.1-2008; it is expected that  
120497 future versions may add to this.

120498 **Note:** Feature test macros allow an application to announce to the implementation its desire to have  
120499 certain symbols and prototypes exposed. They should not be confused with the version test  
120500 macros and constants for options in `<unistd.h>` which are the implementation's way of  
120501 announcing functionality to the application.

120502 It is further intended that these feature test macros apply only to the headers specified by  
120503 POSIX.1-2008. Implementations are expressly permitted to make visible symbols not specified  
120504 by POSIX.1-2008, within both POSIX.1 and other headers, under the control of feature test  
120505 macros that are not defined by POSIX.1-2008.

#### 120506 **The `_POSIX_C_SOURCE` Feature Test Macro**

120507 The POSIX.1-1990 standard specified a macro called `_POSIX_SOURCE`. This has been  
120508 superseded by `_POSIX_C_SOURCE`. This symbol will allow implementations to support various  
120509 versions of this standard simultaneously. For instance, when `_POSIX_C_SOURCE` is defined as  
120510 200809L, the system should make visible the same name space as permitted and required by the  
120511 POSIX.1-2008 standard. A special case is the one where the implementation wishes to make  
120512 available support for the 1990 version of the POSIX standard, in which instance when either  
120513 `_POSIX_SOURCE` is defined or `_POSIX_C_SOURCE` is defined as 1, the system should make  
120514 visible the same name space as permitted and required by the POSIX.1-1990 standard.

120515 It is expected that C bindings to future POSIX standards will define new values for  
120516 `_POSIX_C_SOURCE`, with each new value reserving the name space for that new standard.

#### 120517 **The `_XOPEN_SOURCE` Feature Test Macro**

120518 The feature test macro `_XOPEN_SOURCE` is provided as the announcement mechanism for the  
120519 application that it requires functionality from the Single UNIX Specification. `_XOPEN_SOURCE`  
120520 must be defined to the value 700 before the inclusion of any header to enable the functionality in  
120521 the Single UNIX Specification Version 4. Its definition subsumes the use of `_POSIX_C_SOURCE`.

120522 An extract of code from a conforming application, that appears before any **#include** statements,  
120523 is given below:

```
120524 #define _XOPEN_SOURCE 700 /* Single UNIX Specification, Version 4 */  
120525 #include ...
```

120526 Note that the definition of `_XOPEN_SOURCE` with the value 700 makes the definition of  
120527 `_POSIX_C_SOURCE` redundant and it can safely be omitted.

#### 120528 *B.2.2.2 The Name Space*

120529 The reservation of identifiers is paraphrased from the ISO C standard. The text is included  
120530 because it needs to be part of POSIX.1-2008, regardless of possible changes in future versions of  
120531 the ISO C standard.

120532 These identifiers may be used by implementations, particularly for feature test macros.  
120533 Implementations should not use feature test macro names that might be reasonably used by a  
120534 standard.

Including headers more than once is a reasonably common practice, and it should be carried forward from the ISO C standard. More significantly, having definitions in more than one header is explicitly permitted. Where the potential declaration is “benign” (the same definition twice) the declaration can be repeated, if that is permitted by the compiler. (This is usually true of macros, for example.) In those situations where a repetition is not benign (for example, **typedefs**), conditional compilation must be used. The situation actually occurs both within the ISO C standard and within POSIX.1: **time\_t** should be in `<sys/types.h>`, and the ISO C standard mandates that it be in `<time.h>`.

The area of name space pollution *versus* additions to structures is difficult because of the macro structure of C. The following discussion summarizes all the various problems with and objections to the issue.

Note the phrase “user-defined macro”. Users are not permitted to define macro names (or any other name) beginning with “\_**[A-Z\_]**”. Thus, the conflict cannot occur for symbols reserved to the vendor’s name space, and the permission to add fields automatically applies, without qualification, to those symbols.

1. Data structures (and unions) need to be defined in headers by implementations to meet certain requirements of POSIX.1 and the ISO C standard.

2. The structures defined by POSIX.1 are typically minimal, and any practical implementation would wish to add fields to these structures either to hold additional related information or for backwards-compatibility (or both). Future standards (and *de facto* standards) would also wish to add to these structures. Issues of field alignment make it impractical (at least in the general case) to simply omit fields when they are not defined by the particular standard involved.

The **dirent** structure is an example of such a minimal structure (although one could argue about whether the other fields need visible names). The *st\_rdev* field of most implementations’ **stat** structure is a common example where extension is needed and where a conflict could occur.

3. Fields in structures are in an independent name space, so the addition of such fields presents no problem to the C language itself in that such names cannot interact with identically named user symbols because access is qualified by the specific structure name.

4. There is an exception to this: macro processing is done at a lexical level. Thus, symbols added to a structure might be recognized as user-provided macro names at the location where the structure is declared. This only can occur if the user-provided name is declared as a macro before the header declaring the structure is included. The user’s use of the name after the declaration cannot interfere with the structure because the symbol is hidden and only accessible through access to the structure. Presumably, the user would not declare such a macro if there was an intention to use that field name.

5. Macros from the same or a related header might use the additional fields in the structure, and those field names might also collide with user macros. Although this is a less frequent occurrence, since macros are expanded at the point of use, no constraint on the order of use of names can apply.

6. An “obvious” solution of using names in the reserved name space and then redefining them as macros when they should be visible does not work because this has the effect of exporting the symbol into the general name space. For example, given a (hypothetical) system-provided header `<h.h>`, and two parts of a C program in **a.c** and **b.c**, in header `<h.h>`:

```
struct foo {
    int __i;
```

```

120583     }
120584     #ifdef _FEATURE_TEST
120585     #define i __i;
120586     #endif

```

120587 In file **a.c**:

```

120588     #include h.h
120589     extern int i;
120590     ...

```

120591 In file **b.c**:

```

120592     extern int i;
120593     ...

```

120594 The symbol that the user thinks of as *i* in both files has an external name of `__i` in **a.c**; the  
 120595 same symbol *i* in **b.c** has an external name *i* (ignoring any hidden manipulations the  
 120596 compiler might perform on the names). This would cause a mysterious name resolution  
 120597 problem when **a.o** and **b.o** are linked.

120598 Simply avoiding definition then causes alignment problems in the structure.

120599 A structure of the form:

```

120600     struct foo {
120601         union {
120602             int __i;
120603             #ifdef _FEATURE_TEST
120604                 int i;
120605             #endif
120606         } __ii;
120607     }

```

120608 does not work because the name of the logical field *i* is `__ii.i`, and introduction of a macro  
 120609 to restore the logical name immediately reintroduces the problem discussed previously  
 120610 (although its manifestation might be more immediate because a syntax error would result  
 120611 if a recursive macro did not cause it to fail first).

120612 7. A more workable solution would be to declare the structure:

```

120613     struct foo {
120614         #ifdef _FEATURE_TEST
120615             int i;
120616         #else
120617             int __i;
120618         #endif
120619     }

```

120620 However, if a macro (particularly one required by a standard) is to be defined that uses  
 120621 this field, two must be defined: one that uses *i*, the other that uses `__i`. If more than one  
 120622 additional field is used in a macro and they are conditional on distinct combinations of  
 120623 features, the complexity goes up as  $2^n$ .

120624 All this leaves a difficult situation: vendors must provide very complex headers to deal with  
 120625 what is conceptually simple and safe—adding a field to a structure. It is the possibility of user-  
 120626 provided macros with the same name that makes this difficult.

120627 Several alternatives were proposed that involved constraining the user's access to part of the

name space available to the user (as specified by the ISO C standard). In some cases, this was only until all the headers had been included. There were two proposals discussed that failed to achieve consensus:

1. Limiting it for the whole program.
2. Restricting the use of identifiers containing only uppercase letters until after all system headers had been included. It was also pointed out that because macros might wish to access fields of a structure (and macro expansion occurs totally at point of use) restricting names in this way would not protect the macro expansion, and thus the solution was inadequate.

It was finally decided that reservation of symbols would occur, but as constrained.

The current wording also allows the addition of fields to a structure, but requires that user macros of the same name not interfere. This allows vendors to do one of the following:

- Not create the situation (do not extend the structures with user-accessible names or use the solution in (7) above)
- Extend their compilers to allow some way of adding names to structures and macros safely

There are at least two ways that the compiler might be extended: add new preprocessor directives that turn off and on macro expansion for certain symbols (without changing the value of the macro) and a function or lexical operation that suppresses expansion of a word. The latter seems more flexible, particularly because it addresses the problem in macros as well as in declarations.

The following seems to be a possible implementation extension to the C language that will do this: any token that during macro expansion is found to be preceded by three '#' symbols shall not be further expanded in exactly the same way as described for macros that expand to their own name as in Section 3.8.3.4 of the ISO C standard. A vendor may also wish to implement this as an operation that is lexically a function, which might be implemented as:

```
#define __safe_name(x) ###x
```

Using a function notation would insulate vendors from changes in standards until such a functionality is standardized (if ever). Standardization of such a function would be valuable because it would then permit third parties to take advantage of it portably in software they may supply.

The symbols that are “explicitly permitted, but not required by POSIX.1-2008” include those classified below. (That is, the symbols classified below might, but are not required to, be present when `_POSIX_C_SOURCE` is defined to have the value 200809L.)

- Symbols in `<limits.h>` and `<unistd.h>` that are defined to indicate support for options or limits that are constant at compile-time
- Symbols in the name space reserved for the implementation by the ISO C standard
- Symbols in a name space reserved for a particular type of extension (for example, type names ending with `_t` in `<sys/types.h>`)
- Additional members of structures or unions whose names do not reduce the name space reserved for applications

Since both implementations and future versions of this standard and other POSIX standards may use symbols in the reserved spaces described in these tables, there is a potential for name space clashes. To avoid future name space clashes when adding symbols, implementations should not use the `posix_`, `POSIX_`, or `_POSIX_` prefixes.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/2 is applied, deleting the entries `POSIX_`, `_POSIX_`, and `posix_` from the column of allowed name space prefixes for use by an implementation in the first table. The presence of these prefixes was contradicting later text which states that: “The prefixes `posix_`, `POSIX_`, and `_POSIX_` are reserved for use by XCU Chapter 2 (on page 2335) and other POSIX standards. Implementations may add symbols to the headers shown in the following table, provided the identifiers ... do not use the reserved prefixes `posix_`, `POSIX_`, or `_POSIX_`.”.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/3 is applied, correcting the reserved macro prefix from: “`PRI[a-z]`, `SCN[a-z]`” to: “`PRI[Xa-z]`, `SCN[Xa-z]`” in the second table. The change was needed since the ISO C standard allows implementations to define macros of the form `PRI` or `SCN` followed by any lowercase letter or ‘`x`’ in `<inttypes.h>`. (The ISO/IEC 9899:1999 standard, Subclause 7.26.4.)

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/4 is applied, adding a new section listing reserved names for the `<stdint.h>` header. This change is for alignment with the ISO C standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/2 is applied, making it clear that implementations are permitted to have symbols with the prefix `_POSIX_` visible in any header.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/3 is applied, updating the table of allowed macro prefixes to include the prefix `FP_[A-Z]` for `<math.h>`. This text is added for consistency with the `<math.h>` reference page in the Base Definitions volume of POSIX.1-2008 which permits additional implementation-defined floating-point classifications.

Austin Group Interpretation 1003.1-2001 #048 is applied, reserving `SEEK_` in the name space.

### 120693 B.2.3 Error Numbers

It was the consensus of the standard developers that to allow the conformance document to state that an error occurs and under what conditions, but to disallow a statement that it never occurs, does not make sense. It could be implied by the current wording that this is allowed, but to reduce the possibility of future interpretation requests, it is better to make an explicit statement.

The ISO C standard requires that `errno` be an assignable lvalue. Originally, the definition in POSIX.1 was stricter than that in the ISO C standard, `extern int errno`, in order to support historical usage. In a multi-threaded environment, implementing `errno` as a global variable results in non-deterministic results when accessed. It is required, however, that `errno` work as a per-thread error reporting mechanism. In order to do this, a separate `errno` value has to be maintained for each thread. The following section discusses the various alternative solutions that were considered.

In order to avoid this problem altogether for new functions, these functions avoid using `errno` and, instead, return the error number directly as the function return value; a return value of zero indicates that no error was detected.

For any function that can return errors, the function return value is not used for any purpose other than for reporting errors. Even when the output of the function is scalar, it is passed through a function argument. While it might have been possible to allow some scalar outputs to be coded as negative function return values and mixed in with positive error status returns, this was rejected—using the return value for a mixed purpose was judged to be of limited use and error prone.

Checking the value of `errno` alone is not sufficient to determine the existence or type of an error, since it is not required that a successful function call clear `errno`. The variable `errno` should only be examined when the return value of a function indicates that the value of `errno` is meaningful. In that case, the function is required to set the variable to something other than zero.

120718 The variable *errno* is never set to zero by any function call; to do so would contradict the ISO C  
120719 standard.

120720 POSIX.1 requires (in the ERRORS sections of function descriptions) certain error values to be set  
120721 in certain conditions because many existing applications depend on them. Some error numbers,  
120722 such as [EFAULT], are entirely implementation-defined and are noted as such in their  
120723 description in the ERRORS section. This section otherwise allows wide latitude to the  
120724 implementation in handling error reporting.

120725 Some of the ERRORS sections in POSIX.1-2008 have two subsections. The first:

120726 “The function shall fail if:”

120727 could be called the “mandatory” section.

120728 The second:

120729 “The function may fail if:”

120730 could be informally known as the “optional” section.

120731 Attempting to infer the quality of an implementation based on whether it detects optional error  
120732 conditions is not useful.

120733 Following each one-word symbolic name for an error, there is a description of the error. The  
120734 rationale for some of the symbolic names follows:

120735 [ECANCELED] This spelling was chosen as being more common.

120736 [EFAULT] Most historical implementations do not catch an error and set *errno* when an  
120737 invalid address is given to the functions *wait()*, *time()*, or *times()*. Some  
120738 implementations cannot reliably detect an invalid address. And most systems  
120739 that detect invalid addresses will do so only for a system call, not for a library  
120740 routine.

120741 [EFTYPE] This error code was proposed in earlier proposals as “Inappropriate operation  
120742 for file type”, meaning that the operation requested is not appropriate for the  
120743 file specified in the function call. This code was proposed, although the same  
120744 idea was covered by [ENOTTY], because the connotations of the name would  
120745 be misleading. It was pointed out that the *fcntl()* function uses the error code  
120746 [EINVAL] for this notion, and hence all instances of [EFTYPE] were changed  
120747 to this code.

120748 [EINTR] POSIX.1 prohibits conforming implementations from restarting interrupted  
120749 system calls of conforming applications unless the SA\_RESTART flag is in  
120750 effect for the signal. However, it does not require that [EINTR] be returned  
120751 when another legitimate value may be substituted; for example, a partial  
120752 transfer count when *read()* or *write()* are interrupted. This is only given when  
120753 the signal-catching function returns normally as opposed to returns by  
120754 mechanisms like *longjmp()* or *siglongjmp()*.

120755 [ELOOP] In specifying conditions under which implementations would generate this  
120756 error, the following goals were considered:

120757 • To ensure that actual loops are detected, including loops that result from  
120758 symbolic links across distributed file systems.

120759 • To ensure that during pathname resolution an application can rely on  
120760 the ability to follow at least {SYMLOOP\_MAX} symbolic links in the  
120761 absence of a loop.

120762		• To allow implementations to provide the capability of traversing more
120763		than {SYMLOOP_MAX} symbolic links in the absence of a loop.
120764		• To allow implementations to detect loops and generate the error prior to
120765		encountering {SYMLOOP_MAX} symbolic links.
120766	[ENAMETOOLONG]	
120767		When a symbolic link is encountered during pathname resolution, the
120768		contents of that symbolic link are used to create a new pathname. The
120769		standard developers intended to allow, but not require, that implementations
120770		enforce the restriction of {PATH_MAX} on the result of this pathname
120771		substitution.
120772		Implementations are allowed, but not required, to treat a pathname longer
120773		than {PATH_MAX} passed into the system as an error. Implementations are
120774		required to return a pathname (even if it is longer than {PATH_MAX}) when
120775		the user supplies a buffer with an interface that specifies the buffer size, as
120776		long as the user-supplied buffer is large enough to hold the entire pathname
120777		(see XSH <i>getcwd()</i> for an example of this type of interface). Implementations
120778		are required to treat a request to pass a pathname longer than {PATH_MAX}
120779		from the system to a user-supplied buffer of an unspecified size (usually
120780		assumed to be of size {PATH_MAX}) as an error (see XSH <i>realpath()</i> for an
120781		example of this type of interface).
120782	[ENOMEM]	The term “main memory” is not used in POSIX.1 because it is
120783		implementation-defined.
120784	[ENOTSUP]	This error code is to be used when an implementation chooses to implement
120785		the required functionality of POSIX.1-2008 but does not support optional
120786		facilities defined by POSIX.1-2008. In some earlier versions of this standard,
120787		the difference between [ENOTSUP] and [ENOSYS] was that [ENOSYS]
120788		indicated that the function was not supported at all. This is no longer the case
120789		as [ENOSYS] can also be used to indicate non-support of optional
120790		functionality for a function that has some required functionality. (See XSH
120791		<i>encrypt()</i> .)
120792	[ENOTTY]	The symbolic name for this error is derived from a time when device control
120793		was done by <i>ioctl()</i> and that operation was only permitted on a terminal
120794		interface. The term “TTY” is derived from “teletypewriter”, the devices to
120795		which this error originally applied.
120796	[EOVERFLOW]	Most of the uses of this error code are related to large file support. Typically,
120797		these cases occur on systems which support multiple programming
120798		environments with different sizes for <b>off_t</b> , but they may also occur in
120799		connection with remote file systems.
120800		In addition, when different programming environments have different widths
120801		for types such as <b>int</b> and <b>uid_t</b> , several functions may encounter a condition
120802		where a value in a particular environment is too wide to be represented. In
120803		that case, this error should be raised. For example, suppose the currently
120804		running process has 64-bit <b>int</b> , and file descriptor 9 223 372 036 854 775 807 is
120805		open and does not have the close-on-exec flag set. If the process then uses
120806		<i>execl()</i> to <i>exec</i> a file compiled in a programming environment with 32-bit <b>int</b> ,
120807		the call to <i>execl()</i> can fail with <i>errno</i> set to [EOVERFLOW]. A similar failure
120808		can occur with <i>execl()</i> if any of the user IDs or any of the group IDs to be
120809		assigned to the new process image are out of range for the executed file’s
120810		programming environment.

120811 Note, however, that this condition cannot occur for functions that are  
120812 explicitly described as always being successful, such as *getpid()*.

120813 [EPIPE] This condition normally generates the signal SIGPIPE; the error is returned if  
120814 the generation of the signal is suppressed or the signal does not terminate the  
120815 process.

120816 [EROFS] In historical implementations, attempting to *unlink()* or *rmdir()* a mount point  
120817 would generate an [EBUSY] error. An implementation could be envisioned  
120818 where such an operation could be performed without error. In this case, if  
120819 *either* the directory entry or the actual data structures reside on a read-only file  
120820 system, [EROFS] is the appropriate error to generate. (For example, changing  
120821 the link count of a file on a read-only file system could not be done, as is  
120822 required by *unlink()*, and thus an error should be reported.)

120823 Three error numbers, [EDOM], [EILSEQ], and [ERANGE], were added to this section primarily  
120824 for consistency with the ISO C standard.

#### 120825 **Alternative Solutions for Per-Thread *errno***

120826 The usual implementation of *errno* as a single global variable does not work in a multi-threaded  
120827 environment. In such an environment, a thread may make a POSIX.1 call and get a -1 error  
120828 return, but before that thread can check the value of *errno*, another thread might have made a  
120829 second POSIX.1 call that also set *errno*. This behavior is unacceptable in robust programs. There  
120830 were a number of alternatives that were considered for handling the *errno* problem:

- 120831 • Implement *errno* as a per-thread integer variable.
- 120832 • Implement *errno* as a service that can access the per-thread error number.
- 120833 • Change all POSIX.1 calls to accept an extra status argument and avoid setting *errno*.
- 120834 • Change all POSIX.1 calls to raise a language exception.

120835 The first option offers the highest level of compatibility with existing practice but requires  
120836 special support in the linker, compiler, and/or virtual memory system to support the new  
120837 concept of thread private variables. When compared with current practice, the third and fourth  
120838 options are much cleaner, more efficient, and encourage a more robust programming style, but  
120839 they require new versions of all of the POSIX.1 functions that might detect an error. The second  
120840 option offers compatibility with existing code that uses the **<errno.h>** header to define the  
120841 symbol *errno*. In this option, *errno* may be a macro defined:

```
120842 #define errno  (*__errno())
120843 extern int      *__errno();
```

120844 This option may be implemented as a per-thread variable whereby an *errno* field is allocated in  
120845 the user space object representing a thread, and whereby the function *\_\_errno()* makes a system  
120846 call to determine the location of its user space object and returns the address of the *errno* field of  
120847 that object. Another implementation, one that avoids calling the kernel, involves allocating  
120848 stacks in chunks. The stack allocator keeps a side table indexed by chunk number containing a  
120849 pointer to the thread object that uses that chunk. The *\_\_errno()* function then looks at the stack  
120850 pointer, determines the chunk number, and uses that as an index into the chunk table to find its  
120851 thread object and thus its private value of *errno*. On most architectures, this can be done in four  
120852 to five instructions. Some compilers may wish to implement *\_\_errno()* inline to improve  
120853 performance.

## Disallowing Return of the [EINTR] Error Code

Many blocking interfaces defined by POSIX.1-2008 may return [EINTR] if interrupted during their execution by a signal handler. Blocking interfaces introduced under the threads functionality do not have this property. Instead, they require that the interface appear to be atomic with respect to interruption. In particular, clients of blocking interfaces need not handle any possible [EINTR] return as a special case since it will never occur. If it is necessary to restart operations or complete incomplete operations following the execution of a signal handler, this is handled by the implementation, rather than by the application.

Requiring applications to handle [EINTR] errors on blocking interfaces has been shown to be a frequent source of often unreproducible bugs, and it adds no compelling value to the available functionality. Thus, blocking interfaces introduced for use by multi-threaded programs do not use this paradigm. In particular, in none of the functions *flockfile()*, *pthread\_cond\_timedwait()*, *pthread\_cond\_wait()*, *pthread\_join()*, *pthread\_mutex\_lock()*, and *sigwait()* did providing [EINTR] returns add value, or even particularly make sense. Thus, these functions do not provide for an [EINTR] return, even when interrupted by a signal handler. The same arguments can be applied to *sem\_wait()*, *sem\_trywait()*, *sigwaitinfo()*, and *sigtimedwait()*, but implementations are permitted to return [EINTR] error codes for these functions for compatibility with earlier versions of this standard. Applications cannot rely on calls to these functions returning [EINTR] error codes when signals are delivered to the calling thread, but they should allow for the possibility.

Austin Group Interpretation 1003.1-2001 #050 is applied, allowing [ENOTSUP] and [EOPNOTSUPP] to be the same values.

### B.2.3.1 Additional Error Numbers

The ISO C standard defines the name space for implementations to add additional error numbers.

## B.2.4 Signal Concepts

Historical implementations of signals, using the *signal()* function, have shortcomings that make them unreliable for many application uses. Because of this, a new signal mechanism, based very closely on the one of 4.2 BSD and 4.3 BSD, was added to POSIX.1.

### Signal Names

The restriction on the actual type used for **sigset\_t** is intended to guarantee that these objects can always be assigned, have their address taken, and be passed as parameters by value. It is not intended that this type be a structure including pointers to other data structures, as that could impact the portability of applications performing such operations. A reasonable implementation could be a structure containing an array of some integer type.

The signals described in POSIX.1-2008 must have unique values so that they may be named as parameters of **case** statements in the body of a C-language **switch** clause. However, implementation-defined signals may have values that overlap with each other or with signals specified in POSIX.1-2008. An example of this is SIGABRT, which traditionally overlaps some other signal, such as SIGIOT.

SIGKILL, SIGTERM, SIGUSR1, and SIGUSR2 are ordinarily generated only through the explicit use of the *kill()* function, although some implementations generate SIGKILL under extraordinary circumstances. SIGTERM is traditionally the default signal sent by the *kill* command.

The signals SIGBUS, SIGEMT, SIGIOT, SIGTRAP, and SIGSYS were omitted from POSIX.1 because their behavior is implementation-defined and could not be adequately categorized. Conforming implementations may deliver these signals, but must document the circumstances under which they are delivered and note any restrictions concerning their delivery. The signals SIGFPE, SIGILL, and SIGSEGV are similar in that they also generally result only from programming errors. They were included in POSIX.1 because they do indicate three relatively well-categorized conditions. They are all defined by the ISO C standard and thus would have to be defined by any system with an ISO C standard binding, even if not explicitly included in POSIX.1.

There is very little that a Conforming POSIX.1 Application can do by catching, ignoring, or masking any of the signals SIGILL, SIGTRAP, SIGIOT, SIGEMT, SIGBUS, SIGSEGV, SIGSYS, or SIGFPE. They will generally be generated by the system only in cases of programming errors. While it may be desirable for some robust code (for example, a library routine) to be able to detect and recover from programming errors in other code, these signals are not nearly sufficient for that purpose. One portable use that does exist for these signals is that a command interpreter can recognize them as the cause of termination of a process (with *wait()*) and print an appropriate message. The mnemonic tags for these signals are derived from their PDP-11 origin.

The signals SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU, and SIGCONT are provided for job control and are unchanged from 4.2 BSD. The signal SIGCHLD is also typically used by job control shells to detect children that have terminated or, as in 4.2 BSD, stopped.

Some implementations, including System V, have a signal named SIGCLD, which is similar to SIGCHLD in 4.2 BSD. POSIX.1 permits implementations to have a single signal with both names. POSIX.1 carefully specifies ways in which conforming applications can avoid the semantic differences between the two different implementations. The name SIGCHLD was chosen for POSIX.1 because most current application usages of it can remain unchanged in conforming applications. SIGCLD in System V has more cases of semantics that POSIX.1 does not specify, and thus applications using it are more likely to require changes in addition to the name change.

The signals SIGUSR1 and SIGUSR2 are commonly used by applications for notification of exceptional behavior and are described as “reserved as application-defined” so that such use is not prohibited. Implementations should not generate SIGUSR1 or SIGUSR2, except when explicitly requested by *kill()*. It is recommended that libraries not use these two signals, as such use in libraries could interfere with their use by applications calling the libraries. If such use is unavoidable, it should be documented. It is prudent for non-portable libraries to use non-standard signals to avoid conflicts with use of standard signals by portable libraries.

There is no portable way for an application to catch or ignore non-standard signals. Some implementations define the range of signal numbers, so applications can install signal-catching functions for all of them. Unfortunately, implementation-defined signals often cause problems when caught or ignored by applications that do not understand the reason for the signal. While the desire exists for an application to be more robust by handling all possible signals (even those only generated by *kill()*), no existing mechanism was found to be sufficiently portable to include in POSIX.1. The value of such a mechanism, if included, would be diminished given that SIGKILL would still not be catchable.

A number of new signal numbers are reserved for applications because the two user signals defined by POSIX.1 are insufficient for many realtime applications. A range of signal numbers is specified, rather than an enumeration of additional reserved signal names, because different applications and application profiles will require a different number of application signals. It is not desirable to burden all application domains and therefore all implementations with the maximum number of signals required by all possible applications. Note that in this context, signal numbers are essentially different signal priorities.

120948 The relatively small number of required additional signals, `{_POSIX_RTSIG_MAX}`, was chosen  
 120949 so as not to require an unreasonably large signal mask/set. While this number of signals  
 120950 defined in POSIX.1 will fit in a single 32-bit word signal mask, it is recognized that most existing  
 120951 implementations define many more signals than are specified in POSIX.1 and, in fact, many  
 120952 implementations have already exceeded 32 signals (including the “null signal”). Support of  
 120953 `{_POSIX_RTSIG_MAX}` additional signals may push some implementation over the single 32-bit  
 120954 word line, but is unlikely to push any implementations that are already over that line beyond  
 120955 the 64-signal line.

#### 120956 B.2.4.1 Signal Generation and Delivery

120957 The terms defined in this section are not used consistently in documentation of historical  
 120958 systems. Each signal can be considered to have a lifetime beginning with generation and ending  
 120959 with delivery or acceptance. The POSIX.1 definition of “delivery” does not exclude ignored  
 120960 signals; this is considered a more consistent definition. This revised text in several parts of  
 120961 POSIX.1-2008 clarifies the distinct semantics of asynchronous signal delivery and synchronous  
 120962 signal acceptance. The previous wording attempted to categorize both under the term  
 120963 “delivery”, which led to conflicts over whether the effects of asynchronous signal delivery  
 120964 applied to synchronous signal acceptance.

120965 Signals generated for a process are delivered to only one thread. Thus, if more than one thread  
 120966 is eligible to receive a signal, one has to be chosen. The choice of threads is left entirely up to the  
 120967 implementation both to allow the widest possible range of conforming implementations and to  
 120968 give implementations the freedom to deliver the signal to the “easiest possible” thread should  
 120969 there be differences in ease of delivery between different threads.

120970 Note that should multiple delivery among cooperating threads be required by an application,  
 120971 this can be trivially constructed out of the provided single-delivery semantics. The construction  
 120972 of a *sigwait\_multiple()* function that accomplishes this goal is presented with the rationale for  
 120973 *sigwaitinfo()*.

120974 Implementations should deliver unblocked signals as soon after they are generated as possible.  
 120975 However, it is difficult for POSIX.1 to make specific requirements about this, beyond those in  
 120976 *kill()* and *sigprocmask()*. Even on systems with prompt delivery, scheduling of higher priority  
 120977 processes is always likely to cause delays.

120978 In general, the interval between the generation and delivery of unblocked signals cannot be  
 120979 detected by an application. Thus, references to pending signals generally apply to blocked,  
 120980 pending signals. An implementation registers a signal as pending on the process when no  
 120981 thread has the signal unblocked and there are no threads blocked in a *sigwait()* function for that  
 120982 signal. Thereafter, the implementation delivers the signal to the first thread that unblocks the  
 120983 signal or calls a *sigwait()* function on a signal set containing this signal rather than choosing the  
 120984 recipient thread at the time the signal is sent.

120985 In the 4.3 BSD system, signals that are blocked and set to `SIG_IGN` are discarded immediately  
 120986 upon generation. For a signal that is ignored as its default action, if the action is `SIG_DFL` and  
 120987 the signal is blocked, a generated signal remains pending. In the 4.1 BSD system and in  
 120988 System V Release 3 (two other implementations that support a somewhat similar signal  
 120989 mechanism), all ignored blocked signals remain pending if generated. Because it is not normally  
 120990 useful for an application to simultaneously ignore and block the same signal, it was unnecessary  
 120991 for POSIX.1 to specify behavior that would invalidate any of the historical implementations.

120992 There is one case in some historical implementations where an unblocked, pending signal does  
 120993 not remain pending until it is delivered. In the System V implementation of *signal()*, pending  
 120994 signals are discarded when the action is set to `SIG_DFL` or a signal-catching routine (as well as  
 120995 to `SIG_IGN`). Except in the case of setting `SIGCHLD` to `SIG_DFL`, implementations that do this

120996 do not conform completely to POSIX.1. Some earlier proposals for POSIX.1 explicitly stated this,  
 120997 but these statements were redundant due to the requirement that functions defined by POSIX.1  
 120998 not change attributes of processes defined by POSIX.1 except as explicitly stated.

120999 POSIX.1 specifically states that the order in which multiple, simultaneously pending signals are  
 121000 delivered is unspecified. This order has not been explicitly specified in historical  
 121001 implementations, but has remained quite consistent and been known to those familiar with the  
 121002 implementations. Thus, there have been cases where applications (usually system utilities) have  
 121003 been written with explicit or implicit dependencies on this order. Implementors and others  
 121004 porting existing applications may need to be aware of such dependencies.

121005 When there are multiple pending signals that are not blocked, implementations should arrange  
 121006 for the delivery of all signals at once, if possible. Some implementations stack calls to all pending  
 121007 signal-catching routines, making it appear that each signal-catcher was interrupted by the next  
 121008 signal. In this case, the implementation should ensure that this stacking of signals does not  
 121009 violate the semantics of the signal masks established by *sigaction()*. Other implementations  
 121010 process at most one signal when the operating system is entered, with remaining signals saved  
 121011 for later delivery. Although this practice is widespread, this behavior is neither standardized  
 121012 nor endorsed. In either case, implementations should attempt to deliver signals associated with  
 121013 the current state of the process (for example, SIGFPE) before other signals, if possible.

121014 In 4.2 BSD and 4.3 BSD, it is not permissible to ignore or explicitly block SIGCONT, because if  
 121015 blocking or ignoring this signal prevented it from continuing a stopped process, such a process  
 121016 could never be continued (only killed by SIGKILL). However, 4.2 BSD and 4.3 BSD do block  
 121017 SIGCONT during execution of its signal-catching function when it is caught, creating exactly  
 121018 this problem. A proposal was considered to disallow catching SIGCONT in addition to ignoring  
 121019 and blocking it, but this limitation led to objections. The consensus was to require that  
 121020 SIGCONT always continue a stopped process when generated. This removed the need to  
 121021 disallow ignoring or explicit blocking of the signal; note that SIG\_IGN and SIG\_DFL are  
 121022 equivalent for SIGCONT.

#### 121023 B.2.4.2 Realtime Signal Generation and Delivery

121024 The realtime signals functionality is required in this version of the standard for the following  
 121025 reasons:

- 121026 • The **sigevent** structure is used by other POSIX.1 functions that result in asynchronous  
 121027 event notifications to specify the notification mechanism to use and other information  
 121028 needed by the notification mechanism. POSIX.1-2008 defines only three symbolic values  
 121029 for the notification mechanism:

- 121030 — SIGEV\_NONE is used to indicate that no notification is required when the event  
 121031 occurs. This is useful for applications that use asynchronous I/O with polling for  
 121032 completion.

- 121033 — SIGEV\_SIGNAL indicates that a signal is generated when the event occurs.

- 121034 — SIGEV\_THREAD provides for “callback functions” for asynchronous notifications  
 121035 done by a function call within the context of a new thread. This provides a multi-  
 121036 threaded process with a more natural means of notification than signals.

121037 The primary difficulty with previous notification approaches has been to specify the  
 121038 environment of the notification routine.

- 121039 — One approach is to limit the notification routine to call only functions permitted in a  
 121040 signal handler. While the list of permissible functions is clearly stated, this is overly  
 121041 restrictive.

121042 — A second approach is to define a new list of functions or classes of functions that are  
121043 explicitly permitted or not permitted. This would give a programmer more lists to  
121044 deal with, which would be awkward.

121045 — The third approach is to define completely the environment for execution of the  
121046 notification function. A clear definition of an execution environment for notification  
121047 is provided by executing the notification function in the environment of a newly  
121048 created thread.

121049 Implementations may support additional notification mechanisms by defining new values  
121050 for *sigev\_notify*.

121051 For a notification type of SIGEV\_SIGNAL, the other members of the **sigevent** structure  
121052 defined by POSIX.1-2008 specify the realtime signal—that is, the signal number and  
121053 application-defined value that differentiates between occurrences of signals with the same  
121054 number—that will be generated when the event occurs. The structure is defined in  
121055 **<signal.h>**, even though the structure is not directly used by any of the signal functions,  
121056 because it is part of the signals interface used by the POSIX.1b “client functions”. When the  
121057 client functions include **<signal.h>** to define the signal names, the **sigevent** structure will  
121058 also be defined.

121059 An application-defined value passed to the signal handler is used to differentiate between  
121060 different “events” instead of requiring that the application use different signal numbers for  
121061 several reasons:

121062 — Realtime applications potentially handle a very large number of different events.  
121063 Requiring that implementations support a correspondingly large number of distinct  
121064 signal numbers will adversely impact the performance of signal delivery because the  
121065 signal masks to be manipulated on entry and exit to the handlers will become large.

121066 — Event notifications are prioritized by signal number (the rationale for this is  
121067 explained in the following paragraphs) and the use of different signal numbers to  
121068 differentiate between the different event notifications overloads the signal number  
121069 more than has already been done. It also requires that the application developer  
121070 make arbitrary assignments of priority to events that are logically of equal priority.

121071 A union is defined for the application-defined value so that either an integer constant or a  
121072 pointer can be portably passed to the signal-catching function. On some architectures a  
121073 pointer cannot be cast to an **int** and *vice versa*.

121074 Use of a structure here with an explicit notification type discriminant rather than explicit  
121075 parameters to realtime functions, or embedded in other realtime structures, provides for  
121076 future extensions to POSIX.1-2008. Additional, perhaps more efficient, notification  
121077 mechanisms can be supported for existing realtime function interfaces, such as timers and  
121078 asynchronous I/O, by extending the **sigevent** structure appropriately. The existing  
121079 realtime function interfaces will not have to be modified to use any such new notification  
121080 mechanism. The revised text concerning the SIGEV\_SIGNAL value makes consistent the  
121081 semantics of the members of the **sigevent** structure, particularly in the definitions of  
121082 *lio\_listio()* and *aio\_fsync()*. For uniformity, other revisions cause this specification to be  
121083 referred to rather than inaccurately duplicated in the descriptions of functions and  
121084 structures using the **sigevent** structure. The revised wording does not relax the  
121085 requirement that the signal number be in the range SIGRTMIN to SIGRTMAX to guarantee  
121086 queuing and passing of the application value, since that requirement is still implied by the  
121087 signal names.

- POSIX.1-2008 is intentionally vague on whether “non-realtime” signal-generating mechanisms can result in a **siginfo\_t** being supplied to the handler on delivery. In one existing implementation, a **siginfo\_t** is posted on signal generation, even though the implementation does not support queuing of multiple occurrences of a signal. It is not the intent of POSIX.1-2008 to preclude this, independent of the mandate to define signals that do support queuing. Any interpretation that appears to preclude this is a mistake in the reading or writing of the standard.

- Signals handled by realtime signal handlers might be generated by functions or conditions that do not allow the specification of an application-defined value and do not queue. POSIX.1-2008 specifies the *si\_code* member of the **siginfo\_t** structure used in existing practice and defines additional codes so that applications can detect whether an application-defined value is present or not. The code `SI_USER` for *kill()*-generated signals is adopted from existing practice.

- The *sigaction()* *sa\_flags* value `SA_SIGINFO` tells the implementation that the signal-catching function expects two additional arguments. When the flag is not set, a single argument, the signal number, is passed as specified by POSIX.1-2008. Although POSIX.1-2008 does not explicitly allow the *info* argument to the handler function to be `NULL`, this is existing practice. This provides for compatibility with programs whose signal-catching functions are not prepared to accept the additional arguments. POSIX.1-2008 is explicitly unspecified as to whether signals actually queue when `SA_SIGINFO` is not set for a signal, as there appear to be no benefits to applications in specifying one behavior or another. One existing implementation queues a **siginfo\_t** on each signal generation, unless the signal is already pending, in which case the implementation discards the new **siginfo\_t**; that is, the queue length is never greater than one. This implementation only examines `SA_SIGINFO` on signal delivery, discarding the queued **siginfo\_t** if its delivery was not requested.

The third argument to the signal-catching function, *context*, is left undefined by POSIX.1-2008, but is specified in the interface because it matches existing practice for the `SA_SIGINFO` flag. It was considered undesirable to require a separate implementation for `SA_SIGINFO` for POSIX conformance on implementations that already support the two additional parameters.

- The requirement to deliver lower numbered signals in the range `SIGRTMIN` to `SIGRTMAX` first, when multiple unblocked signals are pending, results from several considerations:

- A method is required to prioritize event notifications. The signal number was chosen instead of, for instance, associating a separate priority with each request, because an implementation has to check pending signals at various points and select one for delivery when more than one is pending. Specifying a selection order is the minimal additional semantic that will achieve prioritized delivery. If a separate priority were to be associated with queued signals, it would be necessary for an implementation to search all non-empty, non-blocked signal queues and select from among them the pending signal with the highest priority. This would significantly increase the cost of and decrease the determinism of signal delivery.

- Given the specified selection of the lowest numeric unblocked pending signal, preemptive priority signal delivery can be achieved using signal numbers and signal masks by ensuring that the *sa\_mask* for each signal number blocks all signals with a higher numeric value.

For realtime applications that want to use only the newly defined realtime signal numbers without interference from the standard signals, this can be achieved by blocking all of the standard signals in the thread signal mask and in the *sa\_mask*

121137 installed by the signal action for the realtime signal handlers.

121138 POSIX.1-2008 explicitly leaves unspecified the ordering of signals outside of the range of  
121139 realtime signals and the ordering of signals within this range with respect to those outside  
121140 the range. It was believed that this would unduly constrain implementations or standards  
121141 in the future definition of new signals.

121142 *B.2.4.3 Signal Actions*

121143 Early proposals mentioned SIGCONT as a second exception to the rule that signals are not  
121144 delivered to stopped processes until continued. Because POSIX.1-2008 now specifies that  
121145 SIGCONT causes the stopped process to continue when it is generated, delivery of SIGCONT is  
121146 not prevented because a process is stopped, even without an explicit exception to this rule.

121147 Ignoring a signal by setting the action to SIG\_IGN (or SIG\_DFL for signals whose default action  
121148 is to ignore) is not the same as installing a signal-catching function that simply returns. Invoking  
121149 such a function will interrupt certain system functions that block processes (for example, *wait()*,  
121150 *sigsuspend()*, *pause()*, *read()*, *write()*) while ignoring a signal has no such effect on the process.

121151 Historical implementations discard pending signals when the action is set to SIG\_IGN.  
121152 However, they do not always do the same when the action is set to SIG\_DFL and the default  
121153 action is to ignore the signal. POSIX.1-2008 requires this for the sake of consistency and also for  
121154 completeness, since the only signal this applies to is SIGCHLD, and POSIX.1-2008 disallows  
121155 setting its action to SIG\_IGN.

121156 Some implementations (System V, for example) assign different semantics for SIGCHLD  
121157 depending on whether the action is set to SIG\_IGN or SIG\_DFL. Since POSIX.1 requires that the  
121158 default action for SIGCHLD be to ignore the signal, applications should always set the action to  
121159 SIG\_DFL in order to avoid SIGCHLD.

121160 Whether or not an implementation allows SIG\_IGN as a SIGCHLD disposition to be inherited  
121161 across a call to one of the *exec* family of functions or *posix\_spawn()* is explicitly left as  
121162 unspecified. This change was made as a result of IEEE PASC Interpretation 1003.1 #132, and  
121163 permits the implementation to decide between the following alternatives:

- 121164 • Unconditionally leave SIGCHLD set to SIG\_IGN, in which case the implementation would  
121165 not allow applications that assume inheritance of SIG\_DFL to conform to POSIX.1-2008  
121166 without change. The implementation would, however, retain an ability to control  
121167 applications that create child processes but never call on the *wait* family of functions,  
121168 potentially filling up the process table.
- 121169 • Unconditionally reset SIGCHLD to SIG\_DFL, in which case the implementation would  
121170 allow applications that assume inheritance of SIG\_DFL to conform. The implementation  
121171 would, however, lose an ability to control applications that spawn child processes but  
121172 never reap them.
- 121173 • Provide some mechanism, not specified in POSIX.1-2008, to control inherited SIGCHLD  
121174 dispositions.

121175 Some implementations (System V, for example) will deliver a SIGCHLD signal immediately when  
121176 a process establishes a signal-catching function for SIGCHLD when that process has a child that  
121177 has already terminated. Other implementations, such as 4.3 BSD, do not generate a new  
121178 SIGCHLD signal in this way. In general, a process should not attempt to alter the signal action  
121179 for the SIGCHLD signal while it has any outstanding children. However, it is not always  
121180 possible for a process to avoid this; for example, shells sometimes start up processes in pipelines  
121181 with other processes from the pipeline as children. Processes that cannot ensure that they have  
121182 no children when altering the signal action for SIGCHLD thus need to be prepared for, but not

121183 depend on, generation of an immediate SIGCHLD signal.

121184 The default action of the stop signals (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is to stop a  
121185 process that is executing. If a stop signal is delivered to a process that is already stopped, it has  
121186 no effect. In fact, if a stop signal is generated for a stopped process whose signal mask blocks the  
121187 signal, the signal will never be delivered to the process since the process must receive a  
121188 SIGCONT, which discards all pending stop signals, in order to continue executing.

121189 The SIGCONT signal continues a stopped process even if SIGCONT is blocked (or ignored).  
121190 However, if a signal-catching routine has been established for SIGCONT, it will not be entered  
121191 until SIGCONT is unblocked.

121192 If a process in an orphaned process group stops, it is no longer under the control of a job control  
121193 shell and hence would not normally ever be continued. Because of this, orphaned processes that  
121194 receive terminal-related stop signals (SIGTSTP, SIGTTIN, SIGTTOU, but not SIGSTOP) must not  
121195 be allowed to stop. The goal is to prevent stopped processes from languishing forever. (As  
121196 SIGSTOP is sent only via *kill()*, it is assumed that the process or user sending a SIGSTOP can  
121197 send a SIGCONT when desired.) Instead, the system must discard the stop signal. As an  
121198 extension, it may also deliver another signal in its place. 4.3 BSD sends a SIGKILL, which is  
121199 overly effective because SIGKILL is not catchable. Another possible choice is SIGHUP. 4.3 BSD  
121200 also does this for orphaned processes (processes whose parent has terminated) rather than for  
121201 members of orphaned process groups; this is less desirable because job control shells manage  
121202 process groups. POSIX.1 also prevents SIGTTIN and SIGTTOU signals from being generated for  
121203 processes in orphaned process groups as a direct result of activity on a terminal, preventing  
121204 infinite loops when *read()* and *write()* calls generate signals that are discarded; see [Section](#)  
121205 [A.11.1.4](#) (on page 3539). A similar restriction on the generation of SIGTSTP was considered, but  
121206 that would be unnecessary and more difficult to implement due to its asynchronous nature.

121207 Although POSIX.1 requires that signal-catching functions be called with only one argument,  
121208 there is nothing to prevent conforming implementations from extending POSIX.1 to pass  
121209 additional arguments, as long as Strictly Conforming POSIX.1 Applications continue to compile  
121210 and execute correctly. Most historical implementations do, in fact, pass additional, signal-  
121211 specific arguments to certain signal-catching routines.

121212 There was a proposal to change the declared type of the signal handler to:

121213 `void func (int sig, ...);`

121214 The usage of ellipses ("...") is ISO C standard syntax to indicate a variable number of  
121215 arguments. Its use was intended to allow the implementation to pass additional information to  
121216 the signal handler in a standard manner.

121217 Unfortunately, this construct would require all signal handlers to be defined with this syntax  
121218 because the ISO C standard allows implementations to use a different parameter passing  
121219 mechanism for variable parameter lists than for non-variable parameter lists. Thus, all existing  
121220 signal handlers in all existing applications would have to be changed to use the variable syntax  
121221 in order to be standard and portable. This is in conflict with the goal of Minimal Changes to  
121222 Existing Application Code.

121223 When terminating a process from a signal-catching function, processes should be aware of any  
121224 interpretation that their parent may make of the status returned by *wait()*, *waitid()*, or *waitpid()*.  
121225 In particular, a signal-catching function should not call *exit(0)* or *\_exit(0)* unless it wants to  
121226 indicate successful termination. A non-zero argument to *exit()* or *\_exit()* can be used to indicate  
121227 unsuccessful termination. Alternatively, the process can use *kill()* to send itself a fatal signal  
121228 (first ensuring that the signal is set to the default action and not blocked). See also the  
121229 RATIONALE section of the *\_exit()* function.

121230 The behavior of *unsafe* functions, as defined by this section, is undefined when they are called |

from (or after a *longjmp()* or *siglongjmp()* out of) signal-catching functions in certain circumstances. The behavior of async-signal-safe functions, as defined by this section, is as specified by POSIX.1, regardless of invocation from a signal-catching function. This is the only intended meaning of the statement that async-signal-safe functions may be used in signal-catching functions without restriction. Applications must still consider all effects of such functions on such things as data structures, files, and process state. In particular, application developers need to consider the restrictions on interactions when interrupting *sleep()* (see *sleep()*) and interactions among multiple handles for a file description. The fact that any specific function is listed as async-signal-safe does not necessarily mean that invocation of that function from a signal-catching function is recommended.

In order to prevent errors arising from interrupting non-async-signal-safe function calls, applications should protect calls to these functions either by blocking the appropriate signals or through the use of some programmatic semaphore. POSIX.1 does not address the more general problem of synchronizing access to shared data structures. Note in particular that even the “safe” functions may modify the global variable *errno*; the signal-catching function may want to save and restore its value. The same principles apply to the async-signal-safety of application routines and asynchronous data access.

Note that although *longjmp()* and *siglongjmp()* are in the list of async-signal-safe functions, there are restrictions on subsequent behavior after the function is called from a signal-catching function. This is because the code executing after *longjmp()* or *siglongjmp()* can call any unsafe functions with the same danger as calling those unsafe functions directly from the signal handler. Applications that use *longjmp()* or *siglongjmp()* out of signal handlers require rigorous protection in order to be portable. Many of the other functions that are excluded from the list are traditionally implemented using either the C language *malloc()* or *free()* functions or the ISO C standard I/O library, both of which traditionally use data structures in a non-async-signal-safe manner. Because any combination of different functions using a common data structure can cause async-signal-safety problems, POSIX.1 does not define the behavior when any unsafe function is called in (or after a *longjmp()* or *siglongjmp()* out of) a signal handler that interrupts any unsafe function or the non-async-signal-safe processing equivalent to *exit()* that is performed after return from the initial call to *main()*.

The only realtime extension to signal actions is the addition of the additional parameters to the signal-catching function. This extension has been explained and motivated in the previous section. In making this extension, though, developers of POSIX.1b ran into issues relating to function prototypes. In response to input from the POSIX.1 standard developers, members were added to the **sigaction** structure to specify function prototypes for the newer signal-catching function specified by POSIX.1b. These members follow changes that are being made to POSIX.1. Note that POSIX.1-2008 explicitly states that these fields may overlap so that a union can be defined. This enabled existing implementations of POSIX.1 to maintain binary-compatibility when these extensions were added.

The **siginfo\_t** structure was adopted for passing the application-defined value to match existing practice, but the existing practice has no provision for an application-defined value, so this was added. Note that POSIX normally reserves the “\_t” type designation for opaque types. The **siginfo\_t** structure breaks with this convention to follow existing practice and thus promote portability.

POSIX.1-2008 specifies several values for the *si\_code* member of the **siginfo\_t** structure. Some were introduced in POSIX.1b; others were XSI functionality in the Single UNIX Specification, Version 2 and Version 3, that has now become Base functionality. Historically, an *si\_code* value of less than or equal to zero indicated that the signal was generated by a process via the *kill()* function, and values of *si\_code* that provided additional information for implementation-generated signals, such as SIGFPE or SIGSEGV, were all positive. This functionality is partially

specified for XSI systems in that if *si\_code* is less than or equal to zero, the signal was generated by a process. However, since POSIX.1b did not specify that SI\_USER (or SI\_QUEUE) had a value less than or equal to zero, it is not true that when the signal is generated by a process, the value of *si\_code* will always be less than or equal to zero. XSI applications should check whether *si\_code* is SI\_USER or SI\_QUEUE in addition to checking whether it is less than or equal to zero. Applications on systems that do not support the XSI option should just check for SI\_USER and SI\_QUEUE.

If an implementation chooses to define additional values for *si\_code*, these values have to be different from the values of the non-signal-specific symbols specified by POSIX.1-2008. This will allow conforming applications to differentiate between signals generated by standard events and those generated by other implementation events in a manner compatible with existing practice.

The unique values of *si\_code* for the POSIX.1b asynchronous events have implications for implementations of, for example, asynchronous I/O or message passing in user space library code. Such an implementation will be required to provide a hidden interface to the signal generation mechanism that allows the library to specify the standard values of *si\_code*.

POSIX.1-2008 also specifies additional members of **siginfo\_t**, beyond those that were in POSIX.1b. Like the *si\_code* values mentioned above, these were XSI functionality in the Single UNIX Specification, Version 2 and Version 3, that has now become Base functionality. They provide additional information when *si\_code* has one of the values that moved from XSI to Base.

Although it is not explicitly visible to applications, there are additional semantics for signal actions implied by queued signals and their interaction with other POSIX.1b realtime functions. Specifically:

- It is not necessary to queue signals whose action is SIG\_IGN.
- For implementations that support POSIX.1b timers, some interaction with the timer functions at signal delivery is implied to manage the timer overrun count.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/5 is applied, reordering the RTS shaded text under the third and fourth paragraphs of the SIG\_DFL description. This corrects an earlier editorial error in this section.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/6 is applied, adding the *abort()* function to the list of async-signal-safe functions.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/4 is applied, adding the *socketmark()* function to the list of functions that shall be either reentrant or non-interruptible by signals and shall be async-signal-safe.

#### 121315 B.2.4.4 Signal Effects on Other Functions

The most common behavior of an interrupted function after a signal-catching function returns is for the interrupted function to give an [EINTR] error unless the SA\_RESTART flag is in effect for the signal. However, there are a number of specific exceptions, including *sleep()* and certain situations with *read()* and *write()*.

The historical implementations of many functions defined by POSIX.1-2008 are not interruptible, but delay delivery of signals generated during their execution until after they complete. This is never a problem for functions that are guaranteed to complete in a short (imperceptible to a human) period of time. It is normally those functions that can suspend a process indefinitely or for long periods of time (for example, *wait()*, *pause()*, *sigsuspend()*, *sleep()*, or *read()/write()* on a slow device like a terminal) that are interruptible. This permits applications to respond to interactive signals or to set timeouts on calls to most such functions with *alarm()*. Therefore,

121327 implementations should generally make such functions (including ones defined as extensions)  
121328 interruptible.

121329 Functions not mentioned explicitly as interruptible may be so on some implementations,  
121330 possibly as an extension where the function gives an [EINTR] error. There are several functions  
121331 (for example, *getpid()*, *getuid()*) that are specified as never returning an error, which can thus  
121332 never be extended in this way.

121333 If a signal-catching function returns while the SA\_RESTART flag is in effect, an interrupted  
121334 function is restarted at the point it was interrupted. Conforming applications cannot make  
121335 assumptions about the internal behavior of interrupted functions, even if the functions are  
121336 async-signal-safe. For example, suppose the *read()* function is interrupted with SA\_RESTART in  
121337 effect, the signal-catching function closes the file descriptor being read from and returns, and the  
121338 *read()* function is then restarted; in this case the application cannot assume that the *read()*  
121339 function will give an [EBADF] error, since *read()* might have checked the file descriptor for  
121340 validity before being interrupted.

## 121341 B.2.5 Standard I/O Streams

121342 Although the ISO C standard guarantees that, at program start-up, *stdin* is open for reading and  
121343 *stdout* and *stderr* are open for writing, this guarantee is contingent (as are all guarantees made by  
121344 the ISO C and POSIX standards) on the program being executed in a conforming environment.  
121345 Programs executed with file descriptor 0 not open for reading or with file descriptor 1 or 2 not  
121346 open for writing are executed in a non-conforming environment. Application writers are warned  
121347 (in *exec*, *posix\_spawn()*, and Section C.2.7, on page 3723) not to execute a standard utility or a  
121348 conforming application with file descriptor 0 not open for reading or with file descriptor 1 or 2  
121349 not open for writing.

### 121350 B.2.5.1 Interaction of File Descriptors and Standard I/O Streams

121351 There is no additional rationale provided for this section.

### 121352 B.2.5.2 Stream Orientation and Encoding Rules

121353 There is no additional rationale provided for this section.

## 121354 B.2.6 STREAMS

121355 STREAMS are included into POSIX.1-2008 as part of the alignment with the Single UNIX  
121356 Specification, but marked as an option in recognition that not all systems may wish to  
121357 implement the facility. The option within POSIX.1-2008 is denoted by the XSR margin marker.  
121358 The standard developers made this option independent of the XSI option. In this version of the  
121359 standard this option is marked obsolescent.

121360 STREAMS are a method of implementing network services and other character-based  
121361 input/output mechanisms, with the STREAM being a full-duplex connection between a process  
121362 and a device. STREAMS provides direct access to protocol modules, and optional protocol  
121363 modules can be interposed between the process-end of the STREAM and the device-driver at the  
121364 device-end of the STREAM. Pipes can be implemented using the STREAMS mechanism, so they  
121365 can provide process-to-process as well as process-to-device communications.

121366 This section introduces STREAMS I/O, the message types used to control them, an overview of  
121367 the priority mechanism, and the interfaces used to access them.

121368 B.2.6.1 Accessing STREAMS

121369 There is no additional rationale provided for this section.

121370 **B.2.7 XSI Interprocess Communication**

121371 There are two forms of IPC supported as options in POSIX.1-2008. The traditional System V IPC  
121372 routines derived from the SVID—that is, the *msg\**(), *sem\**(), and *shm\**() interfaces—are  
121373 mandatory on XSI-conformant systems. Thus, all XSI-conformant systems provide the same  
121374 mechanisms for manipulating messages, shared memory, and semaphores.

121375 In addition, the POSIX Realtime Extension provides an alternate set of routines for those systems  
121376 supporting the appropriate options.

121377 The application developer is presented with a choice: the System V interfaces or the POSIX  
121378 interfaces (loosely derived from the Berkeley interfaces). The XSI profile prefers the System V  
121379 interfaces, but the POSIX interfaces may be more suitable for realtime or other performance-  
121380 sensitive applications.

121381 B.2.7.1 IPC General Information

121382 General information that is shared by all three mechanisms is described in this section. The  
121383 common permissions mechanism is briefly introduced, describing the mode bits, and how they  
121384 are used to determine whether or not a process has access to read or write/alter the appropriate  
121385 instance of one of the IPC mechanisms. All other relevant information is contained in the  
121386 reference pages themselves.

121387 The semaphore type of IPC allows processes to communicate through the exchange of  
121388 semaphore values. A semaphore is a positive integer. Since many applications require the use of  
121389 more than one semaphore, XSI-conformant systems have the ability to create sets or arrays of  
121390 semaphores.

121391 Calls to support semaphores include:

121392 *semctl*(), *semget*(), *semop*()

121393 Semaphore sets are created by using the *semget*() function.

121394 The message type of IPC allows processes to communicate through the exchange of data stored  
121395 in buffers. This data is transmitted between processes in discrete portions known as messages.

121396 Calls to support message queues include:

121397 *msgctl*(), *msgget*(), *msgrcv*(), *msgsnd*()

121398 The shared memory type of IPC allows two or more processes to share memory and  
121399 consequently the data contained therein. This is done by allowing processes to set up access to a  
121400 common memory address space. This sharing of memory provides a fast means of exchange of  
121401 data between processes.

121402 Calls to support shared memory include:

121403 *shmctl*(), *shmdt*(), *shmget*()

121404 The *ftok*() interface is also provided.

**B.2.8 Realtime****Advisory Information**

POSIX.1b contains an Informative Annex with proposed interfaces for “realtime files”. These interfaces could determine groups of the exact parameters required to do “direct I/O” or “extents”. These interfaces were objected to by a significant portion of the balloting group as too complex. A conforming application had little chance of correctly navigating the large parameter space to match its desires to the system. In addition, they only applied to a new type of file (realtime files) and they told the implementation exactly what to do as opposed to advising the implementation on application behavior and letting it optimize for the system the (portable) application was running on. For example, it was not clear how a system that had a disk array should set its parameters.

There seemed to be several overall goals:

- Optimizing sequential access
- Optimizing caching behavior
- Optimizing I/O data transfer
- Preallocation

The advisory interfaces, *posix\_fadvise()* and *posix\_madvise()*, satisfy the first two goals. The `POSIX_FADV_SEQUENTIAL` and `POSIX_MADV_SEQUENTIAL` advice tells the implementation to expect serial access. Typically the system will prefetch the next several serial accesses in order to overlap I/O. It may also free previously accessed serial data if memory is tight. If the application is not doing serial access it can use `POSIX_FADV_WILLNEED` and `POSIX_MADV_WILLNEED` to accomplish I/O overlap, as required. When the application advises `POSIX_FADV_RANDOM` or `POSIX_MADV_RANDOM` behavior, the implementation usually tries to fetch a minimum amount of data with each request and it does not expect much locality. `POSIX_FADV_DONTNEED` and `POSIX_MADV_DONTNEED` allow the system to free up caching resources as the data will not be required in the near future.

`POSIX_FADV_NOREUSE` tells the system that caching the specified data is not optimal. For file I/O, the transfer should go directly to the user buffer instead of being cached internally by the implementation. To portably perform direct disk I/O on all systems, the application must perform its I/O transfers according to the following rules:

1. The user buffer should be aligned according to the `{POSIX_REC_XFER_ALIGN} pathconf()` variable.
2. The number of bytes transferred in an I/O operation should be a multiple of the `{POSIX_ALLOC_SIZE_MIN} pathconf()` variable.
3. The offset into the file at the start of an I/O operation should be a multiple of the `{POSIX_ALLOC_SIZE_MIN} pathconf()` variable.
4. The application should ensure that all threads which open a given file specify `POSIX_FADV_NOREUSE` to be sure that there is no unexpected interaction between threads using buffered I/O and threads using direct I/O to the same file.

In some cases, a user buffer must be properly aligned in order to be transferred directly to/from the device. The `{POSIX_REC_XFER_ALIGN} pathconf()` variable tells the application the proper alignment.

The preallocation goal is met by the space control function, *posix\_fallocate()*. The application can use *posix\_fallocate()* to guarantee no `[ENOSPC]` errors and to improve performance by prepaying any overhead required for block allocation.

Implementations may use information conveyed by a previous *posix\_fadvise()* call to influence the manner in which allocation is performed. For example, if an application did the following calls:

```
fd = open("file");
posix_fadvise(fd, offset, len, POSIX_FADV_SEQUENTIAL);
posix_fallocate(fd, len, size);
```

an implementation might allocate the file contiguously on disk.

Finally, the *pathconf()* variables {POSIX\_REC\_MIN\_XFER\_SIZE}, {POSIX\_REC\_MAX\_XFER\_SIZE}, and {POSIX\_REC\_INCR\_XFER\_SIZE} tell the application a range of transfer sizes that are recommended for best I/O performance.

Where bounded response time is required, the vendor can supply the appropriate settings of the advisories to achieve a guaranteed performance level.

The interfaces meet the goals while allowing applications using regular files to take advantage of performance optimizations. The interfaces tell the implementation expected application behavior which the implementation can use to optimize performance on a particular system with a particular dynamic load.

The *posix\_memalign()* function was added to allow for the allocation of specifically aligned buffers; for example, for {POSIX\_REC\_XFER\_ALIGN}.

The working group also considered the alternative of adding a function which would return an aligned pointer to memory within a user-supplied buffer. This was not considered to be the best method, because it potentially wastes large amounts of memory when buffers need to be aligned on large alignment boundaries.

## Message Passing

This section provides the rationale for the definition of the message passing interface in POSIX.1-2008. This is presented in terms of the objectives, models, and requirements imposed upon this interface.

- Objectives

Many applications, including both realtime and database applications, require a means of passing arbitrary amounts of data between cooperating processes comprising the overall application on one or more processors. Many conventional interfaces for interprocess communication are insufficient for realtime applications in that efficient and deterministic data passing methods cannot be implemented. This has prompted the definition of message passing interfaces providing these facilities:

- Open a message queue.
- Send a message to a message queue.
- Receive a message from a queue, either synchronously or asynchronously.
- Alter message queue attributes for flow and resource control.

It is assumed that an application may consist of multiple cooperating processes and that these processes may wish to communicate and coordinate their activities. The message passing facility described in POSIX.1-2008 allows processes to communicate through system-wide queues. These message queues are accessed through names that may be pathnames. A message queue can be opened for use by multiple sending and/or multiple receiving processes.

- 121493 • Background on Embedded Applications
- 121494 Interprocess communication utilizing message passing is a key facility for the construction  
121495 of deterministic, high-performance realtime applications. The facility is present in all  
121496 realtime systems and is the framework upon which the application is constructed. The  
121497 performance of the facility is usually a direct indication of the performance of the resulting  
121498 application.
- 121499 Realtime applications, especially for embedded systems, are typically designed around the  
121500 performance constraints imposed by the message passing mechanisms. Applications for  
121501 embedded systems are typically very tightly constrained. Application developers expect to  
121502 design and control the entire system. In order to minimize system costs, the writer will  
121503 attempt to use all resources to their utmost and minimize the requirement to add  
121504 additional memory or processors.
- 121505 The embedded applications usually share address spaces and only a simple message  
121506 passing mechanism is required. The application can readily access common data incurring  
121507 only mutual-exclusion overheads. The models desired are the simplest possible with the  
121508 application building higher-level facilities only when needed.
- 121509 • Requirements
- 121510 The following requirements determined the features of the message passing facilities  
121511 defined in POSIX.1-2008:
- 121512 — Naming of Message Queues
- 121513 The mechanism for gaining access to a message queue is a pathname evaluated in a  
121514 context that is allowed to be a file system name space, or it can be independent of  
121515 any file system. This is a specific attempt to allow implementations based on either  
121516 method in order to address both embedded systems and to also allow  
121517 implementation in larger systems.
- 121518 The interface of *mq\_open()* is defined to allow but not require the access control and  
121519 name conflicts resulting from utilizing a file system for name resolution. All required  
121520 behavior is specified for the access control case. Yet a conforming implementation,  
121521 such as an embedded system kernel, may define that there are no distinctions  
121522 between users and may define that all processes have all access privileges.
- 121523 — Embedded System Naming
- 121524 Embedded systems need to be able to utilize independent name spaces for accessing  
121525 the various system objects. They typically do not have a file system, precluding its  
121526 utilization as a common name resolution mechanism. The modularity of an  
121527 embedded system limits the connections between separate mechanisms that can be  
121528 allowed.
- 121529 Embedded systems typically do not have any access protection. Since the system  
121530 does not support the mixing of applications from different areas, and usually does  
121531 not even have the concept of an authorization entity, access control is not useful.
- 121532 — Large System Naming
- 121533 On systems with more functionality, the name resolution must support the ability to  
121534 use the file system as the name resolution mechanism/object storage medium and to  
121535 have control over access to the objects. Utilizing the pathname space can result in  
121536 further errors when the names conflict with other objects.

121537 — Fixed Size of Messages

121538 The interfaces impose a fixed upper bound on the size of messages that can be sent to  
121539 a specific message queue. The size is set on an individual queue basis and cannot be  
121540 changed dynamically.

121541 The purpose of the fixed size is to increase the ability of the system to optimize the  
121542 implementation of *mq\_send()* and *mq\_receive()*. With fixed sizes of messages and  
121543 fixed numbers of messages, specific message blocks can be pre-allocated. This  
121544 eliminates a significant amount of checking for errors and boundary conditions.  
121545 Additionally, an implementation can optimize data copying to maximize  
121546 performance. Finally, with a restricted range of message sizes, an implementation is  
121547 better able to provide deterministic operations.

121548 — Prioritization of Messages

121549 Message prioritization allows the application to determine the order in which  
121550 messages are received. Prioritization of messages is a key facility that is provided by  
121551 most realtime kernels and is heavily utilized by the applications. The major purpose  
121552 of having priorities in message queues is to avoid priority inversions in the message  
121553 system, where a high-priority message is delayed behind one or more lower-priority  
121554 messages. This allows the applications to be designed so that they do not need to be  
121555 interrupted in order to change the flow of control when exceptional conditions occur.  
121556 The prioritization does add additional overhead to the message operations in those  
121557 cases it is actually used but a clever implementation can optimize for the FIFO case to  
121558 make that more efficient.

121559 — Asynchronous Notification

121560 The interface supports the ability to have a task asynchronously notified of the  
121561 availability of a message on the queue. The purpose of this facility is to allow the task  
121562 to perform other functions and yet still be notified that a message has become  
121563 available on the queue.

121564 To understand the requirement for this function, it is useful to understand two  
121565 models of application design: a single task performing multiple functions and  
121566 multiple tasks performing a single function. Each of these models has advantages.

121567 Asynchronous notification is required to build the model of a single task performing  
121568 multiple operations. This model typically results from either the expectation that  
121569 interruption is less expensive than utilizing a separate task or from the growth of the  
121570 application to include additional functions.

121571 **Semaphores**

121572 Semaphores are a high-performance process synchronization mechanism. Semaphores are  
121573 named by null-terminated strings of characters.

121574 A semaphore is created using the *sem\_init()* function or the *sem\_open()* function with the  
121575 *O\_CREAT* flag set in *oflag*.

121576 To use a semaphore, a process has to first initialize the semaphore or inherit an open descriptor  
121577 for the semaphore via *fork()*.

121578 A semaphore preserves its state when the last reference is closed. For example, if a semaphore  
121579 has a value of 13 when the last reference is closed, it will have a value of 13 when it is next  
121580 opened.

121581 When a semaphore is created, an initial state for the semaphore has to be provided. This value is

a non-negative integer. Negative values are not possible since they indicate the presence of blocked processes. The persistence of any of these objects across a system crash or a system reboot is undefined. Conforming applications must not depend on any sort of persistence across a system reboot or a system crash.

- Models and Requirements

A realtime system requires synchronization and communication between the processes comprising the overall application. An efficient and reliable synchronization mechanism has to be provided in a realtime system that will allow more than one schedulable process mutually-exclusive access to the same resource. This synchronization mechanism has to allow for the optimal implementation of synchronization or systems implementors will define other, more cost-effective methods.

At issue are the methods whereby multiple processes (tasks) can be designed and implemented to work together in order to perform a single function. This requires interprocess communication and synchronization. A semaphore mechanism is the lowest level of synchronization that can be provided by an operating system.

A semaphore is defined as an object that has an integral value and a set of blocked processes associated with it. If the value is positive or zero, then the set of blocked processes is empty; otherwise, the size of the set is equal to the absolute value of the semaphore value. The value of the semaphore can be incremented or decremented by any process with access to the semaphore and must be done as an indivisible operation. When a semaphore value is less than or equal to zero, any process that attempts to lock it again will block or be informed that it is not possible to perform the operation.

A semaphore may be used to guard access to any resource accessible by more than one schedulable task in the system. It is a global entity and not associated with any particular process. As such, a method of obtaining access to the semaphore has to be provided by the operating system. A process that wants access to a critical resource (section) has to wait on the semaphore that guards that resource. When the semaphore is locked on behalf of a process, it knows that it can utilize the resource without interference by any other cooperating process in the system. When the process finishes its operation on the resource, leaving it in a well-defined state, it posts the semaphore, indicating that some other process may now obtain the resource associated with that semaphore.

In this section, mutexes and condition variables are specified as the synchronization mechanisms between threads.

These primitives are typically used for synchronizing threads that share memory in a single process. However, this section provides an option allowing the use of these synchronization interfaces and objects between processes that share memory, regardless of the method for sharing memory.

Much experience with semaphores shows that there are two distinct uses of synchronization: locking, which is typically of short duration; and waiting, which is typically of long or unbounded duration. These distinct usages map directly onto mutexes and condition variables, respectively.

Semaphores are provided in POSIX.1-2008 primarily to provide a means of synchronization for processes; these processes may or may not share memory. Mutexes and condition variables are specified as synchronization mechanisms between threads; these threads always share (some) memory. Both are synchronization paradigms that have been in widespread use for a number of years. Each set of primitives is particularly well matched to certain problems.

With respect to binary semaphores, experience has shown that condition variables and

mutexes are easier to use for many synchronization problems than binary semaphores. The primary reason for this is the explicit appearance of a Boolean predicate that specifies when the condition wait is satisfied. This Boolean predicate terminates a loop, including the call to `pthread_cond_wait()`. As a result, extra wakeups are benign since the predicate governs whether the thread will actually proceed past the condition wait. With stateful primitives, such as binary semaphores, the wakeup in itself typically means that the wait is satisfied. The burden of ensuring correctness for such waits is thus placed on *all* signalers of the semaphore rather than on an *explicitly coded* Boolean predicate located at the condition wait. Experience has shown that the latter creates a major improvement in safety and ease-of-use.

Counting semaphores are well matched to dealing with producer/consumer problems, including those that might exist between threads of different processes, or between a signal handler and a thread. In the former case, there may be little or no memory shared by the processes; in the latter case, one is not communicating between co-equal threads, but between a thread and an interrupt-like entity. It is for these reasons that POSIX.1-2008 allows semaphores to be used by threads.

Mutexes and condition variables have been effectively used with and without priority inheritance, priority ceiling, and other attributes to synchronize threads that share memory. The efficiency of their implementation is comparable to or better than that of other synchronization primitives that are sometimes harder to use (for example, binary semaphores). Furthermore, there is at least one known implementation of Ada tasking that uses these primitives. Mutexes and condition variables together constitute an appropriate, sufficient, and complete set of inter-thread synchronization primitives.

Efficient multi-threaded applications require high-performance synchronization primitives. Considerations of efficiency and generality require a small set of primitives upon which more sophisticated synchronization functions can be built.

• Standardization Issues

It is possible to implement very high-performance semaphores using test-and-set instructions on shared memory locations. The library routines that implement such a high-performance interface have to properly ensure that a `sem_wait()` or `sem_trywait()` operation that cannot be performed will issue a blocking semaphore system call or properly report the condition to the application. The same interface to the application program would be provided by a high-performance implementation.

B.2.8.1 Realtime Signals

**Realtime Signals Extension**

This portion of the rationale presents models, requirements, and standardization issues relevant to the Realtime Signals Extension. This extension provides the capability required to support reliable, deterministic, asynchronous notification of events. While a new mechanism, unencumbered by the historical usage and semantics of POSIX.1 signals, might allow for a more efficient implementation, the application requirements for event notification can be met with a small number of extensions to signals. Therefore, a minimal set of extensions to signals to support the application requirements is specified.

The realtime signal extensions specified in this section are used by other realtime functions requiring asynchronous notification:

• Models

The model supported is one of multiple cooperating processes, each of which handles

multiple asynchronous external events. Events represent occurrences that are generated as the result of some activity in the system. Examples of occurrences that can constitute an event include:

- Completion of an asynchronous I/O request
- Expiration of a POSIX.1b timer
- Arrival of an interprocess message
- Generation of a user-defined event

Processing of these events may occur synchronously via polling for event notifications or asynchronously via a software interrupt mechanism. Existing practice for this model is well established for traditional proprietary realtime operating systems, realtime executives, and realtime extended POSIX-like systems.

A contrasting model is that of “cooperating sequential processes” where each process handles a single priority of events via polling. Each process blocks while waiting for events, and each process depends on the preemptive, priority-based process scheduling mechanism to arbitrate between events of different priority that need to be processed concurrently. Existing practice for this model is also well established for small realtime executives that typically execute in an unprotected physical address space, but it is just emerging in the context of a fuller function operating system with multiple virtual address spaces.

It could be argued that the cooperating sequential process model, and the facilities supported by the POSIX Threads Extension obviate a software interrupt model. But, even with the cooperating sequential process model, the need has been recognized for a software interrupt model to handle exceptional conditions and process aborting, so the mechanism must be supported in any case. Furthermore, it is not the purview of POSIX.1-2008 to attempt to convince realtime practitioners that their current application models based on software interrupts are “broken” and should be replaced by the cooperating sequential process model. Rather, it is the charter of POSIX.1-2008 to provide standard extensions to mechanisms that support existing realtime practice.

#### • Requirements

This section discusses the following realtime application requirements for asynchronous event notification:

- Reliable delivery of asynchronous event notification

The events notification mechanism guarantees delivery of an event notification. Asynchronous operations (such as asynchronous I/O and timers) that complete significantly after they are invoked have to guarantee that delivery of the event notification can occur at the time of completion.

- Prioritized handling of asynchronous event notifications

The events notification mechanism supports the assigning of a user function as an event notification handler. Furthermore, the mechanism supports the preemption of an event handler function by a higher priority event notification and supports the selection of the highest priority pending event notification when multiple notifications (of different priority) are pending simultaneously.

The model here is based on hardware interrupts. Asynchronous event handling allows the application to ensure that time-critical events are immediately processed when delivered, without the indeterminism of being at a random location within a polling loop. Use of handler priority allows the specification of how handlers are

- 121722 interrupted by other higher priority handlers.
- 121723 — Differentiation between multiple occurrences of event notifications of the same type
- 121724 The events notification mechanism passes an application-defined value to the event  
121725 handler function. This value can be used for a variety of purposes, such as enabling  
121726 the application to identify which of several possible events of the same type (for  
121727 example, timer expirations) has occurred.
- 121728 — Polled reception of asynchronous event notifications
- 121729 The events notification mechanism supports blocking and non-blocking polls for  
121730 asynchronous event notification.
- 121731 The polled mode of operation is often preferred over the interrupt mode by those  
121732 practitioners accustomed to this model. Providing support for this model facilitates  
121733 the porting of applications based on this model to POSIX.1b conforming systems.
- 121734 — Deterministic response to asynchronous event notifications
- 121735 The events notification mechanism does not preclude implementations that provide  
121736 deterministic event dispatch latency and minimizes the number of system calls  
121737 needed to use the event facilities during realtime processing.
- 121738 • Rationale for Extension
- 121739 POSIX.1 signals have many of the characteristics necessary to support the asynchronous  
121740 handling of event notifications, and the Realtime Signals Extension addresses the  
121741 following deficiencies in the POSIX.1 signal mechanism:
- 121742 — Signals do not support reliable delivery of event notification. Subsequent  
121743 occurrences of a pending signal are not guaranteed to be delivered.
- 121744 — Signals do not support prioritized delivery of event notifications. The order of signal  
121745 delivery when multiple unblocked signals are pending is undefined.
- 121746 — Signals do not support the differentiation between multiple signals of the same type.

121747 *B.2.8.2 Asynchronous I/O*

121748 Many applications need to interact with the I/O subsystem in an asynchronous manner. The  
121749 asynchronous I/O mechanism provides the ability to overlap application processing and I/O  
121750 operations initiated by the application. The asynchronous I/O mechanism allows a single  
121751 process to perform I/O simultaneously to a single file multiple times or to multiple files  
121752 multiple times.

121753 **Overview**

121754 Asynchronous I/O operations proceed in logical parallel with the processing done by the  
121755 application after the asynchronous I/O has been initiated. Other than this difference,  
121756 asynchronous I/O behaves similarly to normal I/O using *read()*, *write()*, *lseek()*, and *fsync()*.  
121757 The effect of issuing an asynchronous I/O request is as if a separate thread of execution were to  
121758 perform atomically the implied *lseek()* operation, if any, and then the requested I/O operation  
121759 (either *read()*, *write()*, or *fsync()*). There is no seek implied with a call to *aio\_fsync()*. Concurrent  
121760 asynchronous operations and synchronous operations applied to the same file update the file as  
121761 if the I/O operations had proceeded serially.

121762 When asynchronous I/O completes, a signal can be delivered to the application to indicate the  
121763 completion of the I/O. This signal can be used to indicate that buffers and control blocks used  
121764 for asynchronous I/O can be reused. Signal delivery is not required for an asynchronous

operation and may be turned off on a per-operation basis by the application. Signals may also be synchronously polled using *aio\_suspend()*, *sigtimedwait()*, or *sigwaitinfo()*.

Normal I/O has a return value and an error status associated with it. Asynchronous I/O returns a value and an error status when the operation is first submitted, but that only relates to whether the operation was successfully queued up for servicing. The I/O operation itself also has a return status and an error value. To allow the application to retrieve the return status and the error value, functions are provided that, given the address of an asynchronous I/O control block, yield the return and error status associated with the operation. Until an asynchronous I/O operation is done, its error status is [EINPROGRESS]. Thus, an application can poll for completion of an asynchronous I/O operation by waiting for the error status to become equal to a value other than [EINPROGRESS]. The return status of an asynchronous I/O operation is undefined so long as the error status is equal to [EINPROGRESS].

Storage for asynchronous operation return and error status may be limited. Submission of asynchronous I/O operations may fail if this storage is exceeded. When an application retrieves the return status of a given asynchronous operation, therefore, any system-maintained storage used for this status and the error status may be reclaimed for use by other asynchronous operations.

Asynchronous I/O can be performed on file descriptors that have been enabled for POSIX.1b synchronized I/O. In this case, the I/O operation still occurs asynchronously, as defined herein; however, the asynchronous operation I/O in this case is not completed until the I/O has reached either the state of synchronized I/O data integrity completion or synchronized I/O file integrity completion, depending on the sort of synchronized I/O that is enabled on the file descriptor.

## Models

Three models illustrate the use of asynchronous I/O: a journalization model, a data acquisition model, and a model of the use of asynchronous I/O in supercomputing applications.

- Journalization Model

Many realtime applications perform low-priority journalizing functions. Journalizing requires that logging records be queued for output without blocking the initiating process.

- Data Acquisition Model

A data acquisition process may also serve as a model. The process has two or more channels delivering intermittent data that must be read within a certain time. The process issues one asynchronous read on each channel. When one of the channels needs data collection, the process reads the data and posts it through an asynchronous write to secondary memory for future processing.

- Supercomputing Model

The supercomputing community has used asynchronous I/O much like that specified in POSIX.1 for many years. This community requires the ability to perform multiple I/O operations to multiple devices with a minimal number of entries to “the system”; each entry to “the system” provokes a major delay in operations when compared to the normal progress made by the application. This existing practice motivated the use of combined *lseek()* and *read()* or *write()* calls, as well as the *lio\_listio()* call. Another common practice is to disable signal notification for I/O completion, and simply poll for I/O completion at some interval by which the I/O should be completed. Likewise, interfaces like *aio\_cancel()* have been in successful commercial use for many years. Note also that an underlying implementation of asynchronous I/O will require the ability, at least internally, to cancel outstanding asynchronous I/O, at least when the process exits. (Consider an asynchronous read from a terminal, when the process intends to exit immediately.)

## Requirements

Asynchronous input and output for realtime implementations have these requirements:

- The ability to queue multiple asynchronous read and write operations to a single open instance. Both sequential and random access should be supported.
- The ability to queue asynchronous read and write operations to multiple open instances.
- The ability to obtain completion status information by polling and/or asynchronous event notification.
- Asynchronous event notification on asynchronous I/O completion is optional.
- It has to be possible for the application to associate the event with the *aioctx* for the operation that generated the event.
- The ability to cancel queued requests.
- The ability to wait upon asynchronous I/O completion in conjunction with other types of events.
- The ability to accept an *aio\_read()* and an *aio\_cancel()* for a device that accepts a *read()*, and the ability to accept an *aio\_write()* and an *aio\_cancel()* for a device that accepts a *write()*. This does not imply that the operation is asynchronous.

## Standardization Issues

The following issues are addressed by the standardization of asynchronous I/O:

- Rationale for New Interface

Non-blocking I/O does not satisfy the needs of either realtime or high-performance computing models; these models require that a process overlap program execution and I/O processing. Realtime applications will often make use of direct I/O to or from the address space of the process, or require synchronized (unbuffered) I/O; they also require the ability to overlap this I/O with other computation. In addition, asynchronous I/O allows an application to keep a device busy at all times, possibly achieving greater throughput. Supercomputing and database architectures will often have specialized hardware that can provide true asynchrony underlying the logical asynchrony provided by this interface. In addition, asynchronous I/O should be supported by all types of files and devices in the same manner.

- Effect of Buffering

If asynchronous I/O is performed on a file that is buffered prior to being actually written to the device, it is possible that asynchronous I/O will offer no performance advantage over normal I/O; the cycles *stolen* to perform the asynchronous I/O will be taken away from the running process and the I/O will occur at interrupt time. This potential lack of gain in performance in no way obviates the need for asynchronous I/O by realtime applications, which very often will use specialized hardware support, multiple processors, and/or unbuffered, synchronized I/O.

### B.2.8.3 Memory Management

All memory management and shared memory definitions are located in the `<sys/mman.h>` header. This is for alignment with historical practice.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/7 is applied, correcting the shading and margin markers in the introduction to Section 2.8.3.1.

## Memory Locking Functions

This portion of the rationale presents models, requirements, and standardization issues relevant to process memory locking.

- Models

Realtime systems that conform to POSIX.1-2008 are expected (and desired) to be supported on systems with demand-paged virtual memory management, non-paged swapping memory management, and physical memory systems with no memory management hardware. The general case, however, is the demand-paged, virtual memory system with each POSIX process running in a virtual address space. Note that this includes architectures where each process resides in its own virtual address space and architectures where the address space of each process is only a portion of a larger global virtual address space.

The concept of memory locking is introduced to eliminate the indeterminacy introduced by paging and swapping, and to support an upper bound on the time required to access the memory mapped into the address space of a process. Ideally, this upper bound will be the same as the time required for the processor to access “main memory”, including any address translation and cache miss overheads. But some implementations—primarily on mainframes—will not actually force locked pages to be loaded and held resident in main memory. Rather, they will handle locked pages so that accesses to these pages will meet the performance metrics for locked process memory in the implementation. Also, although it is not, for example, the intention that this interface, as specified, be used to lock process memory into “cache”, it is conceivable that an implementation could support a large static RAM memory and define this as “main memory” and use a large[r] dynamic RAM as “backing store”. These interfaces could then be interpreted as supporting the locking of process memory into the static RAM. Support for multiple levels of backing store would require extensions to these interfaces.

Implementations may also use memory locking to guarantee a fixed translation between virtual and physical addresses where such is beneficial to improving determinacy for direct-to/from-process input/output. POSIX.1-2008 does not guarantee to the application that the virtual-to-physical address translations, if such exist, are fixed, because such behavior would not be implementable on all architectures on which implementations of POSIX.1-2008 are expected. But POSIX.1-2008 does mandate that an implementation define, for the benefit of potential users, whether or not locking guarantees fixed translations.

Memory locking is defined with respect to the address space of a process. Only the pages mapped into the address space of a process may be locked by the process, and when the pages are no longer mapped into the address space—for whatever reason—the locks established with respect to that address space are removed. Shared memory areas warrant special mention, as they may be mapped into more than one address space or mapped more than once into the address space of a process; locks may be established on pages within these areas with respect to several of these mappings. In such a case, the lock state of the underlying physical pages is the logical OR of the lock state with respect to each of the mappings. Only when all such locks have been removed are the shared pages considered unlocked.

In recognition of the page granularity of Memory Management Units (MMU), and in order to support locking of ranges of address space, memory locking is defined in terms of “page” granularity. That is, for the interfaces that support an address and size specification for the region to be locked, the address must be on a page boundary, and all pages mapped by the specified range are locked, if valid. This means that the length is implicitly rounded

up to a multiple of the page size. The page size is implementation-defined and is available to applications as a compile-time symbolic constant or at runtime via *sysconf()*.

A “real memory” POSIX.1b implementation that has no MMU could elect not to support these interfaces, returning [ENOSYS]. But an application could easily interpret this as meaning that the implementation would unconditionally page or swap the application when such is not the case. It is the intention of POSIX.1-2008 that such a system could define these interfaces as “NO-OPs”, returning success without actually performing any function except for mandated argument checking.

#### • Requirements

For realtime applications, memory locking is generally considered to be required as part of application initialization. This locking is performed after an application has been loaded (that is, *exec'd*) and the program remains locked for its entire lifetime. But to support applications that undergo major mode changes where, in one mode, locking is required, but in another it is not, the specified interfaces allow repeated locking and unlocking of memory within the lifetime of a process.

When a realtime application locks its address space, it should not be necessary for the application to then “touch” all of the pages in the address space to guarantee that they are resident or else suffer potential paging delays the first time the page is referenced. Thus, POSIX.1-2008 requires that the pages locked by the specified interfaces be resident when the locking functions return successfully.

Many architectures support system-managed stacks that grow automatically when the current extent of the stack is exceeded. A realtime application has a requirement to be able to “preallocate” sufficient stack space and lock it down so that it will not suffer page faults to grow the stack during critical realtime operation. There was no consensus on a portable way to specify how much stack space is needed, so POSIX.1-2008 supports no specific interface for preallocating stack space. But an application can portably lock down a specific amount of stack space by specifying MCL\_FUTURE in a call to *mlockall()* and then calling a dummy function that declares an automatic array of the desired size.

Memory locking for realtime applications is also generally considered to be an “all or nothing” proposition. That is, the entire process, or none, is locked down. But, for applications that have well-defined sections that need to be locked and others that do not, POSIX.1-2008 supports an optional set of interfaces to lock or unlock a range of process addresses. Reasons for locking down a specific range include:

- An asynchronous event handler function that must respond to external events in a deterministic manner such that page faults cannot be tolerated
- An input/output “buffer” area that is the target for direct-to-process I/O, and the overhead of implicit locking and unlocking for each I/O call cannot be tolerated

Finally, locking is generally viewed as an “application-wide” function. That is, the application is globally aware of which regions are locked and which are not over time. This is in contrast to a function that is used temporarily within a “third party” library routine whose function is unknown to the application, and therefore must have no “side-effects”. The specified interfaces, therefore, do not support “lock stacking” or “lock nesting” within a process. But, for pages that are shared between processes or mapped more than once into a process address space, “lock stacking” is essentially mandated by the requirement that unlocking of pages that are mapped by more than one process or more than once by the same process does not affect locks established on the other mappings.

There was some support for “lock stacking” so that locking could be transparently used in functions or opaque modules. But the consensus was not to burden all implementations

121951 with lock stacking (and reference counting), and an implementation option was proposed.  
 121952 There were strong objections to the option because applications would have to support  
 121953 both options in order to remain portable. The consensus was to eliminate lock stacking  
 121954 altogether, primarily through overwhelming support for the System V “m[un]lock[all]”  
 121955 interface on which POSIX.1-2008 is now based.

121956 Locks are not inherited across *fork()*s because some implementations implement *fork()* by  
 121957 creating new address spaces for the child. In such an implementation, requiring locks to be  
 121958 inherited would lead to new situations in which a fork would fail due to the inability of  
 121959 the system to lock sufficient memory to lock both the parent and the child. The consensus  
 121960 was that there was no benefit to such inheritance. Note that this does not mean that locks  
 121961 are removed when, for instance, a thread is created in the same address space.

121962 Similarly, locks are not inherited across *exec* because some implementations implement *exec*  
 121963 by unmapping all of the pages in the address space (which, by definition, removes the  
 121964 locks on these pages), and maps in pages of the *exec*'d image. In such an implementation,  
 121965 requiring locks to be inherited would lead to new situations in which *exec* would fail.  
 121966 Reporting this failure would be very cumbersome to detect in time to report to the calling  
 121967 process, and no appropriate mechanism exists for informing the *exec*'d process of its status.

121968 It was determined that, if the newly loaded application required locking, it was the  
 121969 responsibility of that application to establish the locks. This is also in keeping with the  
 121970 general view that it is the responsibility of the application to be aware of all locks that are  
 121971 established.

121972 There was one request to allow (not mandate) locks to be inherited across *fork()*, and a  
 121973 request for a flag, *MCL\_INHERIT*, that would specify inheritance of memory locks across  
 121974 *execs*. Given the difficulties raised by this and the general lack of support for the feature in  
 121975 POSIX.1-2008, it was not added. POSIX.1-2008 does not preclude an implementation from  
 121976 providing this feature for administrative purposes, such as a “run” command that will  
 121977 lock down and execute a specified application. Additionally, the rationale for the objection  
 121978 equated *fork()* with creating a thread in the address space. POSIX.1-2008 does not mandate  
 121979 releasing locks when creating additional threads in an existing process.

#### 121980 • Standardization Issues

121981 One goal of POSIX.1-2008 is to define a set of primitives that provide the necessary  
 121982 functionality for realtime applications, with consideration for the needs of other  
 121983 application domains where such were identified, which is based to the extent possible on  
 121984 existing industry practice.

121985 The Memory Locking option is required by many realtime applications to tune  
 121986 performance. Such a facility is accomplished by placing constraints on the virtual memory  
 121987 system to limit paging of time of the process or of critical sections of the process. This  
 121988 facility should not be used by most non-realtime applications.

121989 Optional features provided in POSIX.1-2008 allow applications to lock selected address  
 121990 ranges with the caveat that the process is responsible for being aware of the page  
 121991 granularity of locking and the unnested nature of the locks.

## Mapped Files Functions

The memory mapped files functionality provides a mechanism that allows a process to access files by directly incorporating file data into its address space. Once a file is “mapped” into a process address space, the data can be manipulated by instructions as memory. The use of mapped files can significantly reduce I/O data movement since file data does not have to be copied into process data buffers as in *read()* and *write()*. If more than one process maps a file, its contents are shared among them. This provides a low overhead mechanism by which processes can synchronize and communicate.

- Historical Perspective

Realtime applications have historically been implemented using a collection of cooperating processes or tasks. In early systems, these processes ran on bare hardware (that is, without an operating system) with no memory relocation or protection. The application paradigms that arose from this environment involve the sharing of data between the processes.

When realtime systems were implemented on top of vendor-supplied operating systems, the paradigm or performance benefits of direct access to data by multiple processes was still deemed necessary. As a result, operating systems that claim to support realtime applications must support the shared memory paradigm.

Additionally, a number of realtime systems provide the ability to map specific sections of the physical address space into the address space of a process. This ability is required if an application is to obtain direct access to memory locations that have specific properties (for example, refresh buffers or display devices, dual ported memory locations, DMA target locations). The use of this ability is common enough to warrant some degree of standardization of its interface. This ability overlaps the general paradigm of shared memory in that, in both instances, common global objects are made addressable by individual processes or tasks.

Finally, a number of systems also provide the ability to map process addresses to files. This provides both a general means of sharing persistent objects, and using files in a manner that optimizes memory and swapping space usage.

Simple shared memory is clearly a special case of the more general file mapping capability. In addition, there is relatively widespread agreement and implementation of the file mapping interface. In these systems, many different types of objects can be mapped (for example, files, memory, devices, and so on) using the same mapping interfaces. This approach both minimizes interface proliferation and maximizes the generality of programs using the mapping interfaces.

- Memory Mapped Files Usage

A memory object can be concurrently mapped into the address space of one or more processes. The *mmap()* and *munmap()* functions allow a process to manipulate their address space by mapping portions of memory objects into it and removing them from it. When multiple processes map the same memory object, they can share access to the underlying data. Implementations may restrict the size and alignment of mappings to be on *page*-size boundaries. The page size, in bytes, is the value of the system-configurable variable {PAGESIZE}, typically accessed by calling *sysconf()* with a *name* argument of *\_SC\_PAGESIZE*. If an implementation has no restrictions on size or alignment, it may specify a 1-byte page size.

To map memory, a process first opens a memory object. The *ftruncate()* function can be used to contract or extend the size of the memory object even when the object is currently mapped. If the memory object is extended, the contents of the extended areas are zeros.

122039 After opening a memory object, the application maps the object into its address space  
122040 using the *mmap()* function call. Once a mapping has been established, it remains mapped  
122041 until unmapped with *munmap()*, even if the memory object is closed. The *mprotect()*  
122042 function can be used to change the memory protections initially established by *mmap()*.

122043 A *close()* of the file descriptor, while invalidating the file descriptor itself, does not unmap  
122044 any mappings established for the memory object. The address space, including all mapped  
122045 regions, is inherited on *fork()*. The entire address space is unmapped on process  
122046 termination or by successful calls to any of the *exec* family of functions.

122047 The *msync()* function is used to force mapped file data to permanent storage.

122048 • Effects on Other Functions

122049 With memory mapped files, the operation of the *open()*, *creat()*, and *unlink()* functions are  
122050 a natural result of using the file system name space to map the global names for memory  
122051 objects.

122052 The *ftruncate()* function can be used to set the length of a sharable memory object.

122053 The meaning of *stat()* fields other than the size and protection information is undefined on  
122054 implementations where memory objects are not implemented using regular files. When  
122055 regular files are used, the times reflect when the implementation updated the file image of  
122056 the data, not when a process updated the data in memory.

122057 The operations of *fdopen()*, *write()*, *read()*, and *lseek()* were made unspecified for objects  
122058 opened with *shm\_open()*, so that implementations that did not implement memory objects  
122059 as regular files would not have to support the operation of these functions on shared  
122060 memory objects.

122061 The behavior of memory objects with respect to *close()*, *dup()*, *dup2()*, *open()*, *close()*,  
122062 *fork()*, *\_exit()*, and the *exec* family of functions is the same as the behavior of the existing  
122063 practice of the *mmap()* function.

122064 A memory object can still be referenced after a close. That is, any mappings made to the  
122065 file are still in effect, and reads and writes that are made to those mappings are still valid  
122066 and are shared with other processes that have the same mapping. Likewise, the memory  
122067 object can still be used if any references remain after its name(s) have been deleted. Any  
122068 references that remain after a close must not appear to the application as file descriptors.

122069 This is existing practice for *mmap()* and *close()*. In addition, there are already mappings  
122070 present (text, data, stack) that do not have open file descriptors. The text mapping in  
122071 particular is considered a reference to the file containing the text. The desire was to treat all  
122072 mappings by the process uniformly. Also, many modern implementations use *mmap()* to  
122073 implement shared libraries, and it would not be desirable to keep file descriptors for each  
122074 of the many libraries an application can use. It was felt there were many other existing  
122075 programs that used this behavior to free a file descriptor, and thus POSIX.1-2008 could not  
122076 forbid it and still claim to be using existing practice.

122077 For implementations that implement memory objects using memory only, memory objects  
122078 will retain the memory allocated to the file after the last close and will use that same  
122079 memory on the next open. Note that closing the memory object is not the same as deleting  
122080 the name, since the memory object is still defined in the memory object name space.

122081 The locks of *fcntl()* do not block any read or write operation, including read or write access  
122082 to shared memory or mapped files. In addition, implementations that only support shared  
122083 memory objects should not be required to implement record locks. The reference to *fcntl()*  
122084 is added to make this point explicitly. The other *fcntl()* commands are useful with shared  
122085 memory objects.

122086 The size of pages that mapping hardware may be able to support may be a configurable  
122087 value, or it may change based on hardware implementations. The addition of the  
122088 `_SC_PAGESIZE` parameter to the `sysconf()` function is provided for determining the  
122089 mapping page size at runtime.

## 122090 Shared Memory Functions

122091 Implementations may support the Shared Memory Objects option independently of memory  
122092 mapped files. Shared memory objects are named regions of storage that may be independent of  
122093 the file system and can be mapped into the address space of one or more processes to allow  
122094 them to share the associated memory.

### 122095 • Requirements

122096 Shared memory is used to share data among several processes, each potentially running at  
122097 different priority levels, responding to different inputs, or performing separate tasks.  
122098 Shared memory is not just simply providing common access to data, it is providing the  
122099 fastest possible communication between the processes. With one memory write operation,  
122100 a process can pass information to as many processes as have the memory region mapped.

122101 As a result, shared memory provides a mechanism that can be used for all other  
122102 interprocess communication facilities. It may also be used by an application for  
122103 implementing more sophisticated mechanisms than semaphores and message queues.

122104 The need for a shared memory interface is obvious for virtual memory systems, where the  
122105 operating system is directly preventing processes from accessing each other's data.  
122106 However, in unprotected systems, such as those found in some embedded controllers, a  
122107 shared memory interface is needed to provide a portable mechanism to allocate a region of  
122108 memory to be shared and then to communicate the address of that region to other  
122109 processes.

122110 This, then, provides the minimum functionality that a shared memory interface must have  
122111 in order to support realtime applications: to allocate and name an object to be mapped into  
122112 memory for potential sharing (`open()` or `shm_open()`), and to make the memory object  
122113 available within the address space of a process (`mmap()`). To complete the interface, a  
122114 mechanism to release the claim of a process on a shared memory object (`munmap()`) is also  
122115 needed, as well as a mechanism for deleting the name of a sharable object that was  
122116 previously created (`unlink()` or `shm_unlink()`).

122117 After a mapping has been established, an implementation should not have to provide  
122118 services to maintain that mapping. All memory writes into that area will appear  
122119 immediately in the memory mapping of that region by any other processes.

122120 Thus, requirements include:

- 122121 — Support creation of sharable memory objects and the mapping of these objects into  
122122 the address space of a process.
- 122123 — Sharable memory objects should be accessed by global names accessible from all  
122124 processes.
- 122125 — Support the mapping of specific sections of physical address space (such as a  
122126 memory mapped device) into the address space of a process. This should not be  
122127 done by the process specifying the actual address, but again by an implementation-  
122128 defined global name (such as a special device name) dedicated to this purpose.
- 122129 — Support the mapping of discrete portions of these memory objects.

- 122130 — Support for minimum hardware configurations that contain no physical media on
- 122131 which to store shared memory contents permanently.
- 122132 — The ability to preallocate the entire shared memory region so that minimum
- 122133 hardware configurations without virtual memory support can guarantee contiguous
- 122134 space.
- 122135 — The maximizing of performance by not requiring functionality that would require
- 122136 implementation interaction above creating the shared memory area and returning
- 122137 the mapping.

122138 Note that the above requirements do not preclude:

- 122139 — The sharable memory object from being implemented using actual files on an actual
- 122140 file system.
- 122141 — The global name that is accessible from all processes being restricted to a file system
- 122142 area that is dedicated to handling shared memory.
- 122143 — An implementation not providing implementation-defined global names for the
- 122144 purpose of physical address mapping.

122145 • Shared Memory Objects Usage

122146 If the Shared Memory Objects option is supported, a shared memory object may be

122147 created, or opened if it already exists, with the *shm\_open()* function. If the shared memory

122148 object is created, it has a length of zero. The *ftruncate()* function can be used to set the size

122149 of the shared memory object after creation. The *shm\_unlink()* function removes the name

122150 for a shared memory object created by *shm\_open()*.

122151 • Shared Memory Overview

122152 The shared memory facility defined by POSIX.1-2008 usually results in memory locations

122153 being added to the address space of the process. The implementation returns the address

122154 of the new space to the application by means of a pointer. This works well in languages

122155 like C. However, in languages without pointer types it will not work. In the bindings for

122156 such a language, either a special COMMON section will need to be defined (which is

122157 unlikely), or the binding will have to allow existing structures to be mapped. The

122158 implementation will likely have to place restrictions on the size and alignment of such

122159 structures or will have to map a suitable region of the address space of the process into the

122160 memory object, and thus into other processes. These are issues for that particular language

122161 binding. For POSIX.1-2008, however, the practice will not be forbidden, merely undefined.

122162 Two potentially different name spaces are used for naming objects that may be mapped

122163 into process address spaces. When using memory mapped files, files may be accessed via

122164 *open()*. When the Shared Memory Objects option is supported, sharable memory objects

122165 that might not be files may be accessed via the *shm\_open()* function. These operations are

122166 not mutually-exclusive.

122167 Some implementations supporting the Shared Memory Objects option may choose to

122168 implement the shared memory object name space as part of the file system name space.

122169 There are several reasons for this:

- 122170 — It allows applications to prevent name conflicts by use of the directory structure.
- 122171 — It uses an existing mechanism for accessing global objects and prevents the creation
- 122172 of a new mechanism for naming global objects.

122173 In such implementations, memory objects can be implemented using regular files, if that is

122174 what the implementation chooses. The *shm\_open()* function can be implemented as an

122175 *open()* call in a fixed directory with the `O_CLOEXEC` flag set. The *shm\_unlink()* function  
122176 can be implemented as an *unlink()* call.

122177 On the other hand, it is also expected that small embedded systems that support the  
122178 Shared Memory Objects option may wish to implement shared memory without having  
122179 any file systems present. In this case, the implementations may choose to use a simple  
122180 string valued name space for shared memory regions. The *shm\_open()* function permits  
122181 either type of implementation.

122182 Some implementations have hardware that supports protection of mapped data from  
122183 certain classes of access and some do not. Systems that supply this functionality support  
122184 the memory protection functionality.

122185 Some implementations restrict size, alignment, and protections to be on *page*-size  
122186 boundaries. If an implementation has no restrictions on size or alignment, it may specify a  
122187 1-byte page size. Applications on implementations that do support larger pages must be  
122188 cognizant of the page size since this is the alignment and protection boundary.

122189 Simple embedded implementations may have a 1-byte page size and only support the  
122190 Shared Memory Objects option. This provides simple shared memory between processes  
122191 without requiring mapping hardware.

122192 POSIX.1-2008 specifically allows a memory object to remain referenced after a close  
122193 because that is existing practice for the *mmap()* function.

## 122194 **Typed Memory Functions**

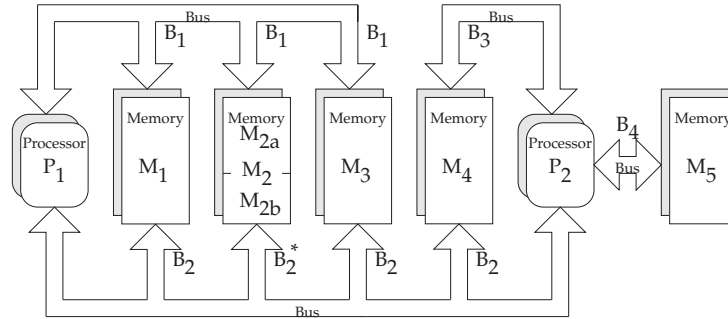

122195 Implementations may support the Typed Memory Objects option without supporting either the  
122196 Shared Memory option or memory mapped files. Types memory objects are pools of specialized  
122197 storage, different from the main memory resource normally used by a processor to hold code  
122198 and data, that can be mapped into the address space of one or more processes.

### 122199 • Model

122200 Realtime systems conforming to one of the POSIX.13 realtime profiles are expected (and  
122201 desired) to be supported on systems with more than one type or pool of memory (for  
122202 example, SRAM, DRAM, ROM, EPROM, EEPROM), where each type or pool of memory  
122203 may be accessible by one or more processors via one or more buses (ports). Memory  
122204 mapped files, shared memory objects, and the language-specific storage allocation  
122205 operators (*malloc()* for the ISO C standard, *new* for ISO Ada) fail to provide application  
122206 program interfaces versatile enough to allow applications to control their utilization of  
122207 such diverse memory resources. The typed memory interfaces *posix\_typed\_mem\_open()*,  
122208 *posix\_mem\_offset()*, *posix\_typed\_mem\_get\_info()*, *mmap()*, and *munmap()* defined herein  
122209 support the model of typed memory described below.

122210 For purposes of this model, a system comprises several processors (for example,  $P_1$  and  
122211  $P_2$ ), several physical memory pools (for example,  $M_1$ ,  $M_2$ ,  $M_{2a}$ ,  $M_{2b}$ ,  $M_3$ ,  $M_4$ , and  $M_5$ ), and  
122212 several buses or “ports” (for example,  $B_1$ ,  $B_2$ ,  $B_3$ , and  $B_4$ ) interconnecting the various  
122213 processors and memory pools in some system-specific way. Notice that some memory  
122214 pools may be contained in others (for example,  $M_{2a}$  and  $M_{2b}$  are contained in  $M_2$ ).

122215 **Figure B-1** (on page 3595) shows an example of such a model. In a system like this, an  
122216 application should be able to perform the following operations:

\* All addresses in pool M<sub>2</sub> (comprising pools M<sub>2a</sub> and M<sub>2b</sub>) accessible via port B<sub>1</sub>.  
 Addresses in pool M<sub>2b</sub> are also accessible via port B<sub>2</sub>.  
 Addresses in pool M<sub>2a</sub> are *not* accessible via port B<sub>2</sub>.

**Figure B-1** Example of a System with Typed Memory

#### — Typed Memory Allocation

An application should be able to allocate memory dynamically from the desired pool using the desired bus, and map it into the address space of a process. For example, processor P<sub>1</sub> can allocate some portion of memory pool M<sub>1</sub> through port B<sub>1</sub>, treating all unmapped subareas of M<sub>1</sub> as a heap-storage resource from which memory may be allocated. This portion of memory is mapped into address space of the process, and subsequently deallocated when unmapped from all processes.

#### — Using the Same Storage Region from Different Buses

An application process with a mapped region of storage that is accessed from one bus should be able to map that same storage area at another address (subject to page size restrictions detailed in *mmap()*), to allow it to be accessed from another bus. For example, processor P<sub>1</sub> may wish to access the same region of memory pool M<sub>2b</sub> both through ports B<sub>1</sub> and B<sub>2</sub>.

#### — Sharing Typed Memory Regions

Several application processes running on the same or different processors may wish to share a particular region of a typed memory pool. Each process or processor may wish to access this region through different buses. For example, processor P<sub>1</sub> may want to share a region of memory pool M<sub>4</sub> with processor P<sub>2</sub>, and they may be required to use buses B<sub>2</sub> and B<sub>3</sub>, respectively, to minimize bus contention. A problem arises here when a process allocates and maps a portion of fragmented memory and then wants to share this region of memory with another process, either in the same processor or different processors. The solution adopted is to allow the first process to find out the memory map (offsets and lengths) of all the different fragments of memory that were mapped into its address space, by repeatedly calling *posix\_mem\_offset()*. Then, this process can pass the offsets and lengths obtained to the second process, which can then map the same memory fragments into its address space.

#### — Contiguous Allocation

The problem of finding the memory map of the different fragments of the memory pool that were mapped into logically contiguous addresses of a given process can be

solved by requesting contiguous allocation. For example, a process in  $P_1$  can allocate 10 Kbytes of physically contiguous memory from  $M_3-B_1$ , and obtain the offset (within pool  $M_3$ ) of this block of memory. Then, it can pass this offset (and the length) to a process in  $P_2$  using some interprocess communication mechanism. The second process can map the same block of memory by using the offset transferred and specifying  $M_3-B_2$ .

#### 122254 — Unallocated Mapping

Any subarea of a memory pool that is mapped to a process, either as the result of an allocation request or an explicit mapping, is normally unavailable for allocation. Special processes such as debuggers, however, may need to map large areas of a typed memory pool, yet leave those areas available for allocation.

Typed memory allocation and mapping has to coexist with storage allocation operators like *malloc()*, but systems are free to choose how to implement this coexistence. For example, it may be system configuration-dependent if all available system memory is made part of one of the typed memory pools or if some part will be restricted to conventional allocation operators. Equally system configuration-dependent may be the availability of operators like *malloc()* to allocate storage from certain typed memory pools. It is not excluded to configure a system such that a given named pool,  $P_1$ , is in turn split into non-overlapping named subpools. For example,  $M_1-B_1$ ,  $M_2-B_1$ , and  $M_3-B_1$  could also be accessed as one common pool  $M_{123}-B_1$ . A call to *malloc()* on  $P_1$  could work on such a larger pool while full optimization of memory usage by  $P_1$  would require typed memory allocation at the subpool level.

#### 122270 • Existing Practice

OS-9 provides for the naming (numbering) and prioritization of memory types by a system administrator. It then provides APIs to request memory allocation of typed (colored) memory by number, and to generate a bus address from a mapped memory address (translate). When requesting colored memory, the user can specify type 0 to signify allocation from the first available type in priority order.

HP-RT presents interfaces to map different kinds of storage regions that are visible through a VME bus, although it does not provide allocation operations. It also provides functions to perform address translation between VME addresses and virtual addresses. It represents a VME-bus unique solution to the general problem.

The PSOS approach is similar (that is, based on a pre-established mapping of bus address ranges to specific memories) with a concept of segments and regions (regions dynamically allocated from a heap which is a special segment). Therefore, PSOS does not fully address the general allocation problem either. PSOS does not have a “process”-based model, but more of a “thread”-only-based model of multi-tasking. So mapping to a process address space is not an issue.

QNX uses the System V approach of opening specially named devices (shared memory segments) and using *mmap()* to then gain access from the process. They do not address allocation directly, but once typed shared memory can be mapped, an “allocation manager” process could be written to handle requests for allocation.

The System V approach also included allocation, implemented by opening yet other special “devices” which allocate, rather than appearing as a whole memory object.

The Orkid realtime kernel interface definition has operations to manage memory “regions” and “pools”, which are areas of memory that may reflect the differing physical nature of the memory. Operations to allocate memory from these regions and pools are also provided.

- Requirements

Existing practice in SVID-derived UNIX systems relies on functionality similar to *mmap()* and its related interfaces to achieve mapping and allocation of typed memory. However, the issue of sharing typed memory (allocated or mapped) and the complication of multiple ports are not addressed in any consistent way by existing UNIX system practice. Part of this functionality is existing practice in specialized realtime operating systems. In order to solidify the capabilities implied by the model above, the following requirements are imposed on the interface:

- Identification of Typed Memory Pools and Ports

All processes (running in all processors) in the system are able to identify a particular (system configured) typed memory pool accessed through a particular (system configured) port by a name. That name is a member of a name space common to all these processes, but need not be the same name space as that containing ordinary pathnames. The association between memory pools/ports and corresponding names is typically established when the system is configured. The “open” operation for typed memory objects should be distinct from the *open()* function, for consistency with other similar services, but implementable on top of *open()*. This implies that the handle for a typed memory object will be a file descriptor.

- Allocation and Mapping of Typed Memory

Once a typed memory object has been identified by a process, it is possible to both map user-selected subareas of that object into process address space and to map system-selected (that is, dynamically allocated) subareas of that object, with user-specified length, into process address space. It is also possible to determine the maximum length of memory allocation that may be requested from a given typed memory object.

- Sharing Typed Memory

Two or more processes are able to share portions of typed memory, either user-selected or dynamically allocated. This requirement applies also to dynamically allocated regions of memory that are composed of several non-contiguous pieces.

- Contiguous Allocation

For dynamic allocation, it is the user’s option whether the system is required to allocate a contiguous subarea within the typed memory object, or whether it is permitted to allocate discontinuous fragments which appear contiguous in the process mapping. Contiguous allocation simplifies the process of sharing allocated typed memory, while discontinuous allocation allows for potentially better recovery of deallocated typed memory.

- Accessing Typed Memory Through Different Ports

Once a subarea of a typed memory object has been mapped, it is possible to determine the location and length corresponding to a user-selected portion of that object within the memory pool. This location and length can then be used to remap that portion of memory for access from another port. If the referenced portion of typed memory was allocated discontinuously, the length thus determined may be shorter than anticipated, and the user code must adapt to the value returned.

- Deallocation

When a previously mapped subarea of typed memory is no longer mapped by any process in the system—as a result of a call or calls to *munmap()*—that subarea

becomes potentially reusable for dynamic allocation; actual reuse of the subarea is a function of the dynamic typed memory allocation policy.

— Unallocated Mapping

It must be possible to map user-selected subareas of a typed memory object without marking that subarea as unavailable for allocation. This option is not the default behavior, and requires appropriate privileges.

• Scenario

The following scenario will serve to clarify the use of the typed memory interfaces.

Process A running on  $P_1$  (see Figure B-1, on page 3595) wants to allocate some memory from memory pool  $M_2$ , and it wants to share this portion of memory with process B running on  $P_2$ . Since  $P_2$  only has access to the lower part of  $M_2$ , both processes will use the memory pool named  $M_{2b}$  which is the part of  $M_2$  that is accessible both from  $P_1$  and  $P_2$ . The operations that both processes need to perform are shown below:

— Allocating Typed Memory

Process A calls *posix\_typed\_mem\_open()* with the name **/typed.m2b-b1** and a *tflag* of **POSIX\_TYPED\_MEM\_ALLOCATE** to get a file descriptor usable for allocating from pool  $M_{2b}$  accessed through port  $B_1$ . It then calls *mmap()* with this file descriptor requesting a length of 4096 bytes. The system allocates two discontinuous blocks of sizes 1024 and 3072 bytes within  $M_{2b}$ . The *mmap()* function returns a pointer to a 4096-byte array in process A's logical address space, mapping the allocated blocks contiguously. Process A can then utilize the array, and store data in it.

— Determining the Location of the Allocated Blocks

Process A can determine the lengths and offsets (relative to  $M_{2b}$ ) of the two blocks allocated, by using the following procedure: First, process A calls *posix\_mem\_offset()* with the address of the first element of the array and length 4096. Upon return, the offset and length (1024 bytes) of the first block are returned. A second call to *posix\_mem\_offset()* is then made using the address of the first element of the array plus 1024 (the length of the first block), and a new length of 4096–1024. If there were more fragments allocated, this procedure could have been continued within a loop until the offsets and lengths of all the blocks were obtained. Notice that this relatively complex procedure can be avoided if contiguous allocation is requested (by opening the typed memory object with the *tflag* **POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG**).

— Sharing Data Across Processes

Process A passes the two offset values and lengths obtained from the *posix\_mem\_offset()* calls to process B running on  $P_2$ , via some form of interprocess communication. Process B can gain access to process A's data by calling *posix\_typed\_mem\_open()* with the name **/typed.m2b-b2** and a *tflag* of zero, then using two *mmap()* calls on the resulting file descriptor to map the two subareas of that typed memory object to its own address space.

• Rationale for no *mem\_alloc()* and *mem\_free()*

The standard developers had originally proposed a pair of new flags to *mmap()* which, when applied to a typed memory object descriptor, would cause *mmap()* to allocate dynamically from an unallocated and unmapped area of the typed memory object. Deallocation was similarly accomplished through the use of *munmap()*. This was rejected by the ballot group because it excessively complicated the (already rather complex)

*mmap()* interface and introduced semantics useful only for typed memory, to a function which must also map shared memory and files. They felt that a memory allocator should be built on top of *mmap()* instead of being incorporated within the same interface, much as the ISO C standard libraries build *malloc()* on top of the virtual memory mapping functions *brk()* and *sbrk()*. This would eliminate the complicated semantics involved with unmapping only part of an allocated block of typed memory.

To attempt to achieve ballot group consensus, typed memory allocation and deallocation was first migrated from *mmap()* and *munmap()* to a pair of complementary functions modeled on the ISO C standard *malloc()* and *free()*. The *mem\_alloc()* function specified explicitly the typed memory object (typed memory pool/access port) from which allocation takes place, unlike *malloc()* where the memory pool and port are unspecified. The *mem\_free()* function handled deallocation. These new semantics still met all of the requirements detailed above without modifying the behavior of *mmap()* except to allow it to map specified areas of typed memory objects. An implementation would have been free to implement *mem\_alloc()* and *mem\_free()* over *mmap()*, through *mmap()*, or independently but cooperating with *mmap()*.

The ballot group was queried to see if this was an acceptable alternative, and while there was some agreement that it achieved the goal of removing the complicated semantics of allocation from the *mmap()* interface, several balloters realized that it just created two additional functions that behaved, in great part, like *mmap()*. These balloters proposed an alternative which has been implemented here in place of a separate *mem\_alloc()* and *mem\_free()*. This alternative is based on four specific suggestions:

1. The *posix\_typed\_mem\_open()* function should provide a flag which specifies “allocate on *mmap()*” (otherwise, *mmap()* just maps the underlying object). This allows things roughly similar to */dev/zero* versus */dev/swap*. Two such flags have been implemented, one of which forces contiguous allocation.
2. The *posix\_mem\_offset()* function is acceptable because it can be applied usefully to mapped objects in general. It should return the file descriptor of the underlying object.
3. The *mem\_get\_info()* function in an earlier draft should be renamed *posix\_typed\_mem\_get\_info()* because it is not generally applicable to memory objects. It should probably return the file descriptor’s allocation attribute. The renaming of the function has been implemented, but having it return a piece of information which is readily known by an application without this function has been rejected. Its whole purpose is to query the typed memory object for attributes that are not user-specified, but determined by the implementation.
4. There should be no separate *mem\_alloc()* or *mem\_free()* functions. Instead, using *mmap()* on a typed memory object opened with an “allocate on *mmap()*” flag should be used to force allocation. These are precisely the semantics defined in the current draft.

- Rationale for no Typed Memory Access Management

The working group had originally defined an additional interface (and an additional kind of object: typed memory master) to establish and dissolve mappings to typed memory on behalf of devices or processors which were independent of the operating system and had no inherent capability to directly establish mappings on their own. This was to have provided functionality similar to device driver interfaces such as *physio()* and their underlying bus-specific interfaces (for example, *mballoc()*) which serve to set up and break down DMA pathways, and derive mapped addresses for use by hardware devices and processor cards.

122437 The ballot group felt that this was beyond the scope of POSIX.1 and its amendments.  
122438 Furthermore, the removal of interrupt handling interfaces from a preceding amendment  
122439 (the IEEE Std 1003.1d-1999) during its balloting process renders these typed memory  
122440 access management interfaces an incomplete solution to portable device management from  
122441 a user process; it would be possible to initiate a device transfer to/from typed memory, but  
122442 impossible to handle the transfer-complete interrupt in a portable way.

122443 To achieve ballot group consensus, all references to typed memory access management  
122444 capabilities were removed. The concept of portable interfaces from a device driver to both  
122445 operating system and hardware is being addressed by the Uniform Driver Interface (UDI)  
122446 industry forum, with formal standardization deferred until proof of concept and industry-  
122447 wide acceptance and implementation.

#### 122448 B.2.8.4 Process Scheduling

122449 IEEE PASC Interpretation 1003.1 #96 has been applied, adding the *pthread\_setschedprio()*  
122450 function. This was added since previously there was no way for a thread to lower its own  
122451 priority without going to the tail of the threads list for its new priority. This capability is  
122452 necessary to bound the duration of priority inversion encountered by a thread.

122453 The following portion of the rationale presents models, requirements, and standardization  
122454 issues relevant to process scheduling; see also [Section B.2.9.4](#) (on page 3640).

122455 In an operating system supporting multiple concurrent processes, the system determines the  
122456 order in which processes execute to meet implementation-defined goals. For time-sharing  
122457 systems, the goal is to enhance system throughput and promote fairness; the application is  
122458 provided with little or no control over this sequencing function. While this is acceptable and  
122459 desirable behavior in a time-sharing system, it is inappropriate in a realtime system; realtime  
122460 applications must specifically control the execution sequence of their concurrent processes in  
122461 order to meet externally defined response requirements.

122462 In POSIX.1-2008, the control over process sequencing is provided using a concept of scheduling  
122463 policies. These policies, described in detail in this section, define the behavior of the system  
122464 whenever processor resources are to be allocated to competing processes. Only the behavior of  
122465 the policy is defined; conforming implementations are free to use any mechanism desired to  
122466 achieve the described behavior.

##### 122467 • Models

122468 In an operating system supporting multiple concurrent processes, the system determines  
122469 the order in which processes execute and might force long-running processes to yield to  
122470 other processes at certain intervals. Typically, the scheduling code is executed whenever an  
122471 event occurs that might alter the process to be executed next.

122472 The simplest scheduling strategy is a “first-in, first-out” (FIFO) dispatcher. Whenever a  
122473 process becomes runnable, it is placed on the end of a ready list. The process at the front of  
122474 the ready list is executed until it exits or becomes blocked, at which point it is removed  
122475 from the list. This scheduling technique is also known as “run-to-completion” or “run-to-  
122476 block”.

122477 A natural extension to this scheduling technique is the assignment of a “non-migrating  
122478 priority” to each process. This policy differs from strict FIFO scheduling in only one  
122479 respect: whenever a process becomes runnable, it is placed at the end of the list of  
122480 processes runnable at that priority level. When selecting a process to run, the system  
122481 always selects the first process from the highest priority queue with a runnable process.  
122482 Thus, when a process becomes unblocked, it will preempt a running process of lower  
122483 priority without otherwise altering the ready list. Further, if a process elects to alter its

122484 priority, it is removed from the ready list and reinserted, using its new priority, according  
122485 to the policy above.

122486 While the above policy might be considered unfriendly in a time-sharing environment in  
122487 which multiple users require more balanced resource allocation, it could be ideal in a  
122488 realtime environment for several reasons. The most important of these is that it is  
122489 deterministic: the highest-priority process is always run and, among processes of equal  
122490 priority, the process that has been runnable for the longest time is executed first. Because of  
122491 this determinism, cooperating processes can implement more complex scheduling simply  
122492 by altering their priority. For instance, if processes at a single priority were to reschedule  
122493 themselves at fixed time intervals, a time-slice policy would result.

122494 In a dedicated operating system in which all processes are well-behaved realtime  
122495 applications, non-migrating priority scheduling is sufficient. However, many existing  
122496 implementations provide for more complex scheduling policies.

122497 POSIX.1-2008 specifies a linear scheduling model. In this model, every process in the  
122498 system has a priority. The system scheduler always dispatches a process that has the  
122499 highest (generally the most time-critical) priority among all runnable processes in the  
122500 system. As long as there is only one such process, the dispatching policy is trivial. When  
122501 multiple processes of equal priority are eligible to run, they are ordered according to a  
122502 strict run-to-completion (FIFO) policy.

122503 The priority is represented as a positive integer and is inherited from the parent process.  
122504 For processes running under a fixed priority scheduling policy, the priority is never altered  
122505 except by an explicit function call.

122506 It was determined arbitrarily that larger integers correspond to “higher priorities”.

122507 Certain implementations might impose restrictions on the priority ranges to which  
122508 processes can be assigned. There also can be restrictions on the set of policies to which  
122509 processes can be set.

122510 • Requirements

122511 Realtime processes require that scheduling be fast and deterministic, and that it guarantees  
122512 to preempt lower priority processes.

122513 Thus, given the linear scheduling model, realtime processes require that they be run at a  
122514 priority that is higher than other processes. Within this framework, realtime processes are  
122515 free to yield execution resources to each other in a completely portable and  
122516 implementation-defined manner.

122517 As there is a generally perceived requirement for processes at the same priority level to  
122518 share processor resources more equitably, provisions are made by providing a scheduling  
122519 policy (that is, SCHED\_RR) intended to provide a timeslice-like facility.

122520 **Note:** The following topics assume that low numeric priority implies low scheduling criticality  
122521 and *vice versa*.

122522 • Rationale for New Interface

122523 Realtime applications need to be able to determine when processes will run in relation to  
122524 each other. It must be possible to guarantee that a critical process will run whenever it is  
122525 runnable; that is, whenever it wants to for as long as it needs. SCHED\_FIFO satisfies this  
122526 requirement. Additionally, SCHED\_RR was defined to meet a realtime requirement for a  
122527 well-defined time-sharing policy for processes at the same priority.

122528 It would be possible to use the BSD *setpriority()* and *getpriority()* functions by redefining  
122529 the meaning of the “nice” parameter according to the scheduling policy currently in use by

122530 the process. The System V *nice()* interface was felt to be undesirable for realtime because it  
122531 specifies an adjustment to the “nice” value, rather than setting it to an explicit value.  
122532 Realtime applications will usually want to set priority to an explicit value. Also, System V  
122533 *nice()* does not allow for changing the priority of another process.

122534 With the POSIX.1b interfaces, the traditional “nice” value does not affect the SCHED\_FIFO  
122535 or SCHED\_RR scheduling policies. If a “nice” value is supported, it is implementation-  
122536 defined whether it affects the SCHED\_OTHER policy.

122537 An important aspect of POSIX.1-2008 is the explicit description of the queuing and  
122538 preemption rules. It is critical, to achieve deterministic scheduling, that such rules be  
122539 stated clearly in POSIX.1-2008.

122540 POSIX.1-2008 does not address the interaction between priority and swapping. The issues  
122541 involved with swapping and virtual memory paging are extremely implementation-  
122542 defined and would be nearly impossible to standardize at this point. The proposed  
122543 scheduling paradigm, however, fully describes the scheduling behavior of runnable  
122544 processes, of which one criterion is that the working set be resident in memory. Assuming  
122545 the existence of a portable interface for locking portions of a process in memory, paging  
122546 behavior need not affect the scheduling of realtime processes.

122547 POSIX.1-2008 also does not address the priorities of “system” processes. In general, these  
122548 processes should always execute in low-priority ranges to avoid conflict with other  
122549 realtime processes. Implementations should document the priority ranges in which system  
122550 processes run.

122551 The default scheduling policy is not defined. The effect of I/O interrupts and other system  
122552 processing activities is not defined. The temporary lending of priority from one process to  
122553 another (such as for the purposes of affecting freeing resources) by the system is not  
122554 addressed. Preemption of resources is not addressed. Restrictions on the ability of a  
122555 process to affect other processes beyond a certain level (influence levels) is not addressed.

122556 The rationale used to justify the simple time-quantum scheduler is that it is common  
122557 practice to depend upon this type of scheduling to ensure “fair” distribution of processor  
122558 resources among portions of the application that must interoperate in a serial fashion. Note  
122559 that POSIX.1-2008 is silent with respect to the setting of this time quantum, or whether it is  
122560 a system-wide value or a per-process value, although it appears that the prevailing  
122561 realtime practice is for it to be a system-wide value.

122562 In a system with  $N$  processes at a given priority, all processor-bound, in which the time  
122563 quantum is equal for all processes at a specific priority level, the following assumptions  
122564 are made of such a scheduling policy:

- 122565 1. A time quantum  $Q$  exists and the current process will own control of the processor  
122566 for at least a duration of  $Q$  and will have the processor for a duration of  $Q$ .
- 122567 2. The  $N$ th process at that priority will control a processor within a duration of  $(N-1)$   
122568  $\times Q$ .

122569 These assumptions are necessary to provide equal access to the processor and bounded  
122570 response from the application.

122571 The assumptions hold for the described scheduling policy only if no system overhead,  
122572 such as interrupt servicing, is present. If the interrupt servicing load is non-zero, then one  
122573 of the two assumptions becomes fallacious, based upon how  $Q$  is measured by the system.

122574 If  $Q$  is measured by clock time, then the assumption that the process obtains a duration  $Q$   
122575 processor time is false if interrupt overhead exists. Indeed, a scenario can be constructed  
122576 with  $N$  processes in which a single process undergoes complete processor starvation if a

122577 peripheral device, such as an analog-to-digital converter, generates significant interrupt  
122578 activity periodically with a period of  $N \times Q$ .

122579 If  $Q$  is measured as actual processor time, then the assumption that the  $N$ th process runs in  
122580 within the duration  $(N-1) \times Q$  is false.

122581 It should be noted that SCHED\_FIFO suffers from interrupt-based delay as well. However,  
122582 for SCHED\_FIFO, the implied response of the system is “as soon as possible”, so that the  
122583 interrupt load for this case is a vendor selection and not a compliance issue.

122584 With this in mind, it is necessary either to complete the definition by including bounds on  
122585 the interrupt load, or to modify the assumptions that can be made about the scheduling  
122586 policy.

122587 Since the motivation of inclusion of the policy is common usage, and since current  
122588 applications do not enjoy the luxury of bounded interrupt load, item (2) above is sufficient  
122589 to express existing application needs and is less restrictive in the standard definition. No  
122590 difference in interface is necessary.

122591 In an implementation in which the time quantum is equal for all processes at a specific  
122592 priority, our assumptions can then be restated as:

- 122593 — A time quantum  $Q$  exists, and a processor-bound process will be rescheduled after a  
122594 duration of, at most,  $Q$ . Time quantum  $Q$  may be defined in either wall clock time or  
122595 execution time.
- 122596 — In general, the  $N$ th process of a priority level should wait no longer than  $(N-1) \times Q$   
122597 time to execute, assuming no processes exist at higher priority levels.
- 122598 — No process should wait indefinitely.

122599 For implementations supporting per-process time quanta, these assumptions can be  
122600 readily extended.

## 122601 **Sporadic Server Scheduling Policy**

122602 The sporadic server is a mechanism defined for scheduling aperiodic activities in time-critical  
122603 realtime systems. This mechanism reserves a certain bounded amount of execution capacity for  
122604 processing aperiodic events at a high priority level. Any aperiodic events that cannot be  
122605 processed within the bounded amount of execution capacity are executed in the background at a  
122606 low priority level. Thus, a certain amount of execution capacity can be guaranteed to be  
122607 available for processing periodic tasks, even under burst conditions in the arrival of aperiodic  
122608 processing requests (that is, a large number of requests in a short time interval). The sporadic  
122609 server also simplifies the schedulability analysis of the realtime system, because it allows  
122610 aperiodic processes or threads to be treated as if they were periodic. The sporadic server was  
122611 first described by Sprunt, et al.

122612 The key concept of the sporadic server is to provide and limit a certain amount of computation  
122613 capacity for processing aperiodic events at their assigned normal priority, during a time interval  
122614 called the “replenishment period”. Once the entity controlled by the sporadic server mechanism  
122615 is initialized with its period and execution-time budget attributes, it preserves its execution  
122616 capacity until an aperiodic request arrives. The request will be serviced (if there are no higher  
122617 priority activities pending) as long as there is execution capacity left. If the request is completed,  
122618 the actual execution time used to service it is subtracted from the capacity, and a replenishment  
122619 of this amount of execution time is scheduled to happen one replenishment period after the  
122620 arrival of the aperiodic request. If the request is not completed, because there is no execution  
122621 capacity left, then the aperiodic process or thread is assigned a lower background priority. For  
122622 each portion of consumed execution capacity the execution time used is replenished after one

replenishment period. At the time of replenishment, if the sporadic server was executing at a background priority level, its priority is elevated to the normal level. Other similar replenishment policies have been defined, but the one presented here represents a compromise between efficiency and implementation complexity.

The interface that appears in this section defines a new scheduling policy for threads and processes that behaves according to the rules of the sporadic server mechanism. Scheduling attributes are defined and functions are provided to allow the user to set and get the parameters that control the scheduling behavior of this mechanism, namely the normal and low priority, the replenishment period, the maximum number of pending replenishment operations, and the initial execution-time budget.

- Scheduling Aperiodic Activities

Virtually all realtime applications are required to process aperiodic activities. In many cases, there are tight timing constraints that the response to the aperiodic events must meet. Usual timing requirements imposed on the response to these events are:

- The effects of an aperiodic activity on the response time of lower priority activities must be controllable and predictable.
- The system must provide the fastest possible response time to aperiodic events.
- It must be possible to take advantage of all the available processing bandwidth not needed by time-critical activities to enhance average-case response times to aperiodic events.

Traditional methods for scheduling aperiodic activities are background processing, polling tasks, and direct event execution:

- Background processing consists of assigning a very low priority to the processing of aperiodic events. It utilizes all the available bandwidth in the system that has not been consumed by higher priority threads. However, it is very difficult, or impossible, to meet requirements on average-case response time, because the aperiodic entity has to wait for the execution of all other entities which have higher priority.
- Polling consists of creating a periodic process or thread for servicing aperiodic requests. At regular intervals, the polling entity is started and its services accumulated pending aperiodic requests. If no aperiodic requests are pending, the polling entity suspends itself until its next period. Polling allows the aperiodic requests to be processed at a higher priority level. However, worst and average-case response times of polling entities are a direct function of the polling period, and there is execution overhead for each polling period, even if no event has arrived. If the deadline of the aperiodic activity is short compared to the inter-arrival time, the polling frequency must be increased to guarantee meeting the deadline. For this case, the increase in frequency can dramatically reduce the efficiency of the system and, therefore, its capacity to meet all deadlines. Yet, polling represents a good way to handle a large class of practical problems because it preserves system predictability, and because the amortized overhead drops as load increases.
- Direct event execution consists of executing the aperiodic events at a high fixed-priority level. Typically, the aperiodic event is processed by an interrupt service routine as soon as it arrives. This technique provides predictable response times for aperiodic events, but makes the response times of all lower priority activities completely unpredictable under burst arrival conditions. Therefore, if the density of aperiodic event arrivals is unbounded, it may be a dangerous technique for time-critical systems. Yet, for those cases in which the physics of the system imposes a

bound on the event arrival rate, it is probably the most efficient technique.

- The sporadic server scheduling algorithm combines the predictability of the polling approach with the short response times of the direct event execution. Thus, it allows systems to meet an important class of application requirements that cannot be met by using the traditional approaches. Multiple sporadic servers with different attributes can be applied to the scheduling of multiple classes of aperiodic events, each with different kinds of timing requirements, such as individual deadlines, average response times, and so on. It also has many other interesting applications for realtime, such as scheduling producer/consumer tasks in time-critical systems, limiting the effects of faults on the estimation of task execution-time requirements, and so on.

- Existing Practice

The sporadic server has been used in different kinds of applications, including military avionics, robot control systems, industrial automation systems, and so on. There are examples of many systems that cannot be successfully scheduled using the classic approaches, such as direct event execution, or polling, and are schedulable using a sporadic server scheduler. The sporadic server algorithm itself can successfully schedule all systems scheduled with direct event execution or polling.

The sporadic server scheduling policy has been implemented as a commercial product in the run-time system of the Verdex Ada compiler. There are also many applications that have used a much less efficient application-level sporadic server. These realtime applications would benefit from a sporadic server scheduler implemented at the scheduler level.

- Library-Level *versus* Kernel-Level Implementation

The sporadic server interface described in this section requires the sporadic server policy to be implemented at the same level as the scheduler. This means that the process sporadic server must be implemented at the kernel level and the thread sporadic server policy implemented at the same level as the thread scheduler; that is, kernel or library level.

In an earlier interface for the sporadic server, this mechanism was implementable at a different level than the scheduler. This feature allowed the implementor to choose between an efficient scheduler-level implementation, or a simpler user or library-level implementation. However, the working group considered that this interface made the use of sporadic servers more complex, and that library-level implementations would lack some of the important functionality of the sporadic server, namely the limitation of the actual execution time of aperiodic activities. The working group also felt that the interface described in this chapter does not preclude library-level implementations of threads intended to provide efficient low-overhead scheduling for those threads that are not scheduled under the sporadic server policy.

- Range of Scheduling Priorities

Each of the scheduling policies supported in POSIX.1-2008 has an associated range of priorities. The priority ranges for each policy might or might not overlap with the priority ranges of other policies. For time-critical realtime applications it is usual for periodic and aperiodic activities to be scheduled together in the same processor. Periodic activities will usually be scheduled using the SCHED\_FIFO scheduling policy, while aperiodic activities may be scheduled using SCHED\_SPORADIC. Since the application developer will require complete control over the relative priorities of these activities in order to meet his timing requirements, it would be desirable for the priority ranges of SCHED\_FIFO and SCHED\_SPORADIC to overlap completely. Therefore, although POSIX.1-2008 does not

122719 require any particular relationship between the different priority ranges, it is  
122720 recommended that these two ranges should coincide.

122721 • Dynamically Setting the Sporadic Server Policy

122722 Several members of the working group requested that implementations should not be  
122723 required to support dynamically setting the sporadic server scheduling policy for a thread.  
122724 The reason is that this policy may have a high overhead for library-level implementations  
122725 of threads, and if threads are allowed to dynamically set this policy, this overhead can be  
122726 experienced even if the thread does not use that policy. By disallowing the dynamic setting  
122727 of the sporadic server scheduling policy, these implementations can accomplish efficient  
122728 scheduling for threads using other policies. If a strictly conforming application needs to  
122729 use the sporadic server policy, and is therefore willing to pay the overhead, it must set this  
122730 policy at the time of thread creation.

122731 • Limitation of the Number of Pending Replenishments

122732 The number of simultaneously pending replenishment operations must be limited for each  
122733 sporadic server for two reasons: an unlimited number of replenishment operations would  
122734 need an unlimited number of system resources to store all the pending replenishment  
122735 operations; on the other hand, in some implementations each replenishment operation will  
122736 represent a source of priority inversion (just for the duration of the replenishment  
122737 operation) and thus, the maximum amount of replenishments must be bounded to  
122738 guarantee bounded response times. The way in which the number of replenishments is  
122739 bounded is by lowering the priority of the sporadic server to *sched\_ss\_low\_priority* when  
122740 the number of pending replenishments has reached its limit. In this way, no new  
122741 replenishments are scheduled until the number of pending replenishments decreases.

122742 In the sporadic server scheduling policy defined in POSIX.1-2008, the application can  
122743 specify the maximum number of pending replenishment operations for a single sporadic  
122744 server, by setting the value of the *sched\_ss\_max\_repl* scheduling parameter. This value must  
122745 be between one and {SS\_REPL\_MAX}, which is a maximum limit imposed by the  
122746 implementation. The limit {SS\_REPL\_MAX} must be greater than or equal to  
122747 {\_POSIX\_SS\_REPL\_MAX}, which is defined to be four in POSIX.1-2008. The minimum  
122748 limit of four was chosen so that an application can at least guarantee that four different  
122749 aperiodic events can be processed during each interval of length equal to the  
122750 replenishment period.

122751 B.2.8.5 Clocks and Timers

122752 • Clocks

122753 POSIX.1-2008 and the ISO C standard both define functions for obtaining system time.  
122754 Implicit behind these functions is a mechanism for measuring passage of time. This  
122755 specification makes this mechanism explicit and calls it a clock. The CLOCK\_REALTIME  
122756 clock required by POSIX.1-2008 is a higher resolution version of the clock that maintains  
122757 POSIX.1 system time. This is a “system-wide” clock, in that it is visible to all processes  
122758 and, were it possible for multiple processes to all read the clock at the same time, they  
122759 would see the same value.

122760 An extensible interface was defined, with the ability for implementations to define  
122761 additional clocks. This was done because of the observation that many realtime platforms  
122762 support multiple clocks, and it was desired to fit this model within the standard interface.  
122763 But implementation-defined clocks need not represent actual hardware devices, nor are  
122764 they necessarily system-wide.

- Timers

Two timer types are required for a system to support realtime applications:

1. One-shot

A one-shot timer is a timer that is armed with an initial expiration time, either relative to the current time or at an absolute time (based on some timing base, such as time in seconds and nanoseconds since the Epoch). The timer expires once and then is disarmed. With the specified facilities, this is accomplished by setting the *it\_value* member of the *value* argument to the desired expiration time and the *it\_interval* member to zero.

2. Periodic

A periodic timer is a timer that is armed with an initial expiration time, again either relative or absolute, and a repetition interval. When the initial expiration occurs, the timer is reloaded with the repetition interval and continues counting. With the specified facilities, this is accomplished by setting the *it\_value* member of the *value* argument to the desired initial expiration time and the *it\_interval* member to the desired repetition interval.

For both of these types of timers, the time of the initial timer expiration can be specified in two ways:

1. Relative (to the current time)
2. Absolute

- Examples of Using Realtime Timers

In the diagrams below, *S* indicates a program schedule, *R* shows a schedule method request, and *E* suggests an internal operating system event.

— Periodic Timer: Data Logging

During an experiment, it might be necessary to log realtime data periodically to an internal buffer or to a mass storage device. With a periodic scheduling method, a logging module can be started automatically at fixed time intervals to log the data.

Program schedule is requested every 10 seconds.

[Time (in Seconds)]

To achieve this type of scheduling using the specified facilities, one would allocate a per-process timer based on clock ID `CLOCK_REALTIME`. Then the timer would be armed via a call to `timer_settime()` with the `TIMER_ABSTIME` flag reset, and with an initial expiration value and a repetition interval of 10 seconds.

— One-shot Timer (Relative Time): Device Initialization

In an emission test environment, large sample bags are used to capture the exhaust from a vehicle. The exhaust is purged from these bags before each and every test. With a one-shot timer, a module could initiate the purge function and then suspend itself for a predetermined period of time while the sample bags are prepared.

Program schedule requested 20 seconds after call is issued.

122810 [Time (in Seconds)]

122811 To achieve this type of scheduling using the specified facilities, one would allocate a  
122812 per-process timer based on clock ID `CLOCK_REALTIME`. Then the timer would be  
122813 armed via a call to `timer_settime()` with the `TIMER_ABSTIME` flag reset, and with an  
122814 initial expiration value of 20 seconds and a repetition interval of zero.

122815 Note that if the program wishes merely to suspend itself for the specified interval, it  
122816 could more easily use `nanosleep()`.

122817 — One-shot Timer (Absolute Time): Data Transmission

122818 The results from an experiment are often moved to a different system within a  
122819 network for post-processing or archiving. With an absolute one-shot timer, a module  
122820 that moves data from a test-cell computer to a host computer can be automatically  
122821 scheduled on a daily basis.

122822 Program schedule requested for 2:30 a.m.

122826 [Time of Day]

122827 To achieve this type of scheduling using the specified facilities, a per-process timer  
122828 would be allocated based on clock ID `CLOCK_REALTIME`. Then the timer would be  
122829 armed via a call to `timer_settime()` with the `TIMER_ABSTIME` flag set, and an initial  
122830 expiration value equal to 2:30 a.m. of the next day.

122831 — Periodic Timer (Relative Time): Signal Stabilization

122832 Some measurement devices, such as emission analyzers, do not respond  
122833 instantaneously to an introduced sample. With a periodic timer with a relative initial  
122834 expiration time, a module that introduces a sample and records the average response  
122835 could suspend itself for a predetermined period of time while the signal is stabilized  
122836 and then sample at a fixed rate.

122837 Program schedule requested 15 seconds after call is issued and every 2 seconds  
122838 thereafter.

122842 [Time (in Seconds)]

122843 To achieve this type of scheduling using the specified facilities, one would allocate a  
122844 per-process timer based on clock ID `CLOCK_REALTIME`. Then the timer would be  
122845 armed via a call to `timer_settime()` with `TIMER_ABSTIME` flag reset, and with an  
122846 initial expiration value of 15 seconds and a repetition interval of 2 seconds.

122847 — Periodic Timer (Absolute Time): Work Shift-related Processing

122848 Resource utilization data is useful when time to perform experiments is being  
122849 scheduled at a facility. With a periodic timer with an absolute initial expiration time,  
122850 a module can be scheduled at the beginning of a work shift to gather resource  
122851 utilization data throughout the shift. This data can be used to allocate resources

122852 effectively to minimize bottlenecks and delays and maximize facility throughput.

122853 Program schedule requested for 2:00 a.m. and every 15 minutes thereafter.

122854 R S S S S S S

122855 -----+-----+-----+-----+-----+-----+-----+-----+----->

122856 23:00 23:30 24:00 00:30 01:00 01:30 02:00 02:30 03:00

122857 [Time of Day]

122858 To achieve this type of scheduling using the specified facilities, one would allocate a

122859 per-process timer based on clock ID `CLOCK_REALTIME`. Then the timer would be

122860 armed via a call to `timer_settime()` with `TIMER_ABSTIME` flag set, and with an initial

122861 expiration value equal to 2:00 a.m. and a repetition interval equal to 15 minutes.

122862 • Relationship of Timers to Clocks

122863 The relationship between clocks and timers armed with an absolute time is

122864 straightforward: a timer expiration signal is requested when the associated clock reaches

122865 or exceeds the specified time. The relationship between clocks and timers armed with a

122866 relative time (an interval) is less obvious, but not unintuitive. In this case, a timer

122867 expiration signal is requested when the specified interval, *as measured by the associated clock*,

122868 has passed. For the required `CLOCK_REALTIME` clock, this allows timer expiration

122869 signals to be requested at specified “wall clock” times (absolute), or when a specified

122870 interval of “realtime” has passed (relative). For an implementation-defined clock—say, a

122871 process virtual time clock—timer expirations could be requested when the process has

122872 used a specified total amount of virtual time (absolute), or when it has used a specified

122873 *additional* amount of virtual time (relative).

122874 The interfaces also allow flexibility in the implementation of the functions. For example, an

122875 implementation could convert all absolute times to intervals by subtracting the clock value

122876 at the time of the call from the requested expiration time and “counting down” at the

122877 supported resolution. Or it could convert all relative times to absolute expiration time by

122878 adding in the clock value at the time of the call and comparing the clock value to the

122879 expiration time at the supported resolution. Or it might even choose to maintain absolute

122880 times as absolute and compare them to the clock value at the supported resolution for

122881 absolute timers, and maintain relative times as intervals and count them down at the

122882 resolution supported for relative timers. The choice will be driven by efficiency

122883 considerations and the underlying hardware or software clock implementation.

122884 • Data Definitions for Clocks and Timers

122885 POSIX.1-2008 uses a time representation capable of supporting nanosecond resolution

122886 timers for the following reasons:

- 122887 — To enable POSIX.1-2008 to represent those computer systems already using
- 122888 nanosecond or submicrosecond resolution clocks.
- 122889 — To accommodate those per-process timers that might need nanoseconds to specify an
- 122890 absolute value of system-wide clocks, even though the resolution of the per-process
- 122891 timer may only be milliseconds, or *vice versa*.
- 122892 — Because the number of nanoseconds in a second can be represented in 32 bits.

122893 Time values are represented in the **timespec** structure. The `tv_sec` member is of type **time\_t**

122894 so that this member is compatible with time values used by POSIX.1 functions and the

122895 ISO C standard. The `tv_nsec` member is a **signed long** in order to simplify and clarify code

122896 that decrements or finds differences of time values. Note that because 1 billion (number of

122897 nanoseconds per second) is less than half of the value representable by a signed 32-bit

122898 value, it is always possible to add two valid fractional seconds represented as integral  
122899 nanoseconds without overflowing the signed 32-bit value.

122900 A maximum allowable resolution for the CLOCK\_REALTIME clock of 20 ms (1/50  
122901 seconds) was chosen to allow line frequency clocks in European countries to be  
122902 conforming. 60 Hz clocks in the US will also be conforming, as will finer granularity  
122903 clocks, although a Strictly Conforming Application cannot assume a granularity of less  
122904 than 20 ms (1/50 seconds).

122905 The minimum allowable maximum time allowed for the CLOCK\_REALTIME clock and  
122906 the function *nanosleep()*, and timers created with *clock\_id=CLOCK\_REALTIME*, is  
122907 determined by the fact that the *tv\_sec* member is of type **time\_t**.

122908 POSIX.1-2008 specifies that timer expirations must not be delivered early, and *nanosleep()*  
122909 must not return early due to quantization error. POSIX.1-2008 discusses the various  
122910 implementations of *alarm()* in the rationale and states that implementations that do not  
122911 allow alarm signals to occur early are the most appropriate, but refrained from mandating  
122912 this behavior. Because of the importance of predictability to realtime applications,  
122913 POSIX.1-2008 takes a stronger stance.

122914 The standard developers considered using a time representation that differs from  
122915 POSIX.1b in the second 32 bit of the 64-bit value. Whereas POSIX.1b defines this field as a  
122916 fractional second in nanoseconds, the other methodology defines this as a binary fraction  
122917 of one second, with the radix point assumed before the most significant bit.

122918 POSIX.1b is a software, source-level standard and most of the benefits of the alternate  
122919 representation are enjoyed by hardware implementations of clocks and algorithms. It was  
122920 felt that mandating this format for POSIX.1b clocks and timers would unnecessarily  
122921 burden the application developer with writing, possibly non-portable, multiple precision  
122922 arithmetic packages to perform conversion between binary fractions and integral units  
122923 such as nanoseconds, milliseconds, and so on.

#### 122924 **Rationale for the Monotonic Clock**

122925 For those applications that use time services to achieve realtime behavior, changing the value of  
122926 the clock on which these services rely may cause erroneous timing behavior. For these  
122927 applications, it is necessary to have a monotonic clock which cannot run backwards, and which  
122928 has a maximum clock jump that is required to be documented by the implementation.  
122929 Additionally, it is desirable (but not required by POSIX.1-2008) that the monotonic clock  
122930 increases its value uniformly. This clock should not be affected by changes to the system time;  
122931 for example, to synchronize the clock with an external source or to account for leap seconds.  
122932 Such changes would cause errors in the measurement of time intervals for those time services  
122933 that use the absolute value of the clock.

122934 One could argue that by defining the behavior of time services when the value of a clock is  
122935 changed, deterministic realtime behavior can be achieved. For example, one could specify that  
122936 relative time services should be unaffected by changes in the value of a clock. However, there are  
122937 time services that are based upon an absolute time, but that are essentially intended as relative  
122938 time services. For example, *pthread\_cond\_timedwait()* uses an absolute time to allow it to wake  
122939 up after the required interval despite spurious wakeups. Although sometimes the  
122940 *pthread\_cond\_timedwait()* timeouts are absolute in nature, there are many occasions in which they  
122941 are relative, and their absolute value is determined from the current time plus a relative time  
122942 interval. In this latter case, if the clock changes while the thread is waiting, the wait interval will  
122943 not be the expected length. If a *pthread\_cond\_timedwait()* function were created that would take a  
122944 relative time, it would not solve the problem because to retain the intended “deadline” a thread  
122945 would need to compensate for latency due to the spurious wakeup, and preemption between

wakeup and the next wait.

The solution is to create a new monotonic clock, whose value does not change except for the regular ticking of the clock, and use this clock for implementing the various relative timeouts that appear in the different POSIX interfaces, as well as allow `pthread_cond_timedwait()` to choose this new clock for its timeout. A new `clock_nanosleep()` function is created to allow an application to take advantage of this newly defined clock. Notice that the monotonic clock may be implemented using the same hardware clock as the system clock.

Relative timeouts for `sigtimedwait()` and `aio_suspend()` have been redefined to use the monotonic clock, if present. The `alarm()` function has not been redefined, because the same effect but with better resolution can be achieved by creating a timer (for which the appropriate clock may be chosen).

The `pthread_cond_timedwait()` function has been treated in a different way, compared to other functions with absolute timeouts, because it is used to wait for an event, and thus it may have a deadline, while the other timeouts are generally used as an error recovery mechanism, and for them the use of the monotonic clock is not so important. Since the desired timeout for the `pthread_cond_timedwait()` function may either be a relative interval or an absolute time of day deadline, a new initialization attribute has been created for condition variables to specify the clock that is used for measuring the timeout in a call to `pthread_cond_timedwait()`. In this way, if a relative timeout is desired, the monotonic clock will be used; if an absolute deadline is required instead, the `CLOCK_REALTIME` or another appropriate clock may be used. This capability has not been added to other functions with absolute timeouts because for those functions the expected use of the timeout is mostly to prevent errors, and not so often to meet precise deadlines. As a consequence, the complexity of adding this capability is not justified by its perceived application usage.

The `nanosleep()` function has not been modified with the introduction of the monotonic clock. Instead, a new `clock_nanosleep()` function has been created, in which the desired clock may be specified in the function call.

- History of Resolution Issues

Due to the shift from relative to absolute timeouts in IEEE Std 1003.1d-1999, the amendments to the `sem_timedwait()`, `pthread_mutex_timedlock()`, `mq_timedreceive()`, and `mq_timedsend()` functions of that standard have been removed. Those amendments specified that `CLOCK_MONOTONIC` would be used for the (relative) timeouts if the Monotonic Clock option was supported.

Having these functions continue to be tied solely to `CLOCK_MONOTONIC` would not work. Since the absolute value of a time value obtained from `CLOCK_MONOTONIC` is unspecified, under the absolute timeouts interface, applications would behave differently depending on whether the Monotonic Clock option was supported or not (because the absolute value of the clock would have different meanings in either case).

Two options were considered:

1. Leave the current behavior unchanged, which specifies the `CLOCK_REALTIME` clock for these (absolute) timeouts, to allow portability of applications between implementations supporting or not the Monotonic Clock option.
2. Modify these functions in the way that `pthread_cond_timedwait()` was modified to allow a choice of clock, so that an application could use `CLOCK_REALTIME` when it is trying to achieve an absolute timeout and `CLOCK_MONOTONIC` when it is trying to achieve a relative timeout.

It was decided that the features of `CLOCK_MONOTONIC` are not as critical to these

122993 functions as they are to `pthread_cond_timedwait()`. The `pthread_cond_timedwait()` function is  
122994 given a relative timeout; the timeout may represent a deadline for an event. When these  
122995 functions are given relative timeouts, the timeouts are typically for error recovery  
122996 purposes and need not be so precise.

122997 Therefore, it was decided that these functions should be tied to `CLOCK_REALTIME` and  
122998 not complicated by being given a choice of clock.

## 122999 **Execution Time Monitoring**

### 123000 • Introduction

123001 The main goals of the execution time monitoring facilities defined in this chapter are to  
123002 measure the execution time of processes and threads and to allow an application to  
123003 establish CPU time limits for these entities.

123004 The analysis phase of time-critical realtime systems often relies on the measurement of  
123005 execution times of individual threads or processes to determine whether the timing  
123006 requirements will be met. Also, performance analysis techniques for soft deadline realtime  
123007 systems rely heavily on the determination of these execution times. The execution time  
123008 monitoring functions provide application developers with the ability to measure these  
123009 execution times online and open the possibility of dynamic execution-time analysis and  
123010 system reconfiguration, if required.

123011 The second goal of allowing an application to establish execution time limits for individual  
123012 processes or threads and detecting when they overrun allows program robustness to be  
123013 increased by enabling online checking of the execution times.

123014 If errors are detected—possibly because of erroneous program constructs, the existence of  
123015 errors in the analysis phase, or a burst of event arrivals—online detection and recovery is  
123016 possible in a portable way. This feature can be extremely important for many time-critical  
123017 applications. Other applications require trapping CPU-time errors as a normal way to exit  
123018 an algorithm; for instance, some realtime artificial intelligence applications trigger a  
123019 number of independent inference processes of varying accuracy and speed, limit how long  
123020 they can run, and pick the best answer available when time runs out. In many periodic  
123021 systems, overrun processes are simply restarted in the next resource period, after necessary  
123022 end-of-period actions have been taken. This allows algorithms that are inherently data-  
123023 dependent to be made predictable.

123024 The interface that appears in this chapter defines a new type of clock, the CPU-time clock,  
123025 which measures execution time. Each process or thread can invoke the clock and timer  
123026 functions defined in POSIX.1 to use them. Functions are also provided to access the CPU-  
123027 time clock of other processes or threads to enable remote monitoring of these clocks.  
123028 Monitoring of threads of other processes is not supported, since these threads are not  
123029 visible from outside of their own process with the interfaces defined in POSIX.1.

### 123030 • Execution Time Monitoring Interface

123031 The clock and timer interface defined in POSIX.1 historically only defined one clock, which  
123032 measures wall-clock time. The requirements for measuring execution time of processes and  
123033 threads, and setting limits to their execution time by detecting when they overrun, can be  
123034 accomplished with that interface if a new kind of clock is defined. These new clocks  
123035 measure execution time, and one is associated with each process and with each thread. The  
123036 clock functions currently defined in POSIX.1 can be used to read and set these CPU-time  
123037 clocks, and timers can be created using these clocks as their timing base. These timers can  
123038 then be used to send a signal when some specified execution time has been exceeded. The  
123039 CPU-time clocks of each process or thread can be accessed by using the symbols

123040 CLOCK\_PROCESS\_CPUTIME\_ID or CLOCK\_THREAD\_CPUTIME\_ID.

123041 The clock and timer interface defined in POSIX.1 and extended with the new kind of CPU-  
123042 time clock would only allow processes or threads to access their own CPU-time clocks.  
123043 However, many realtime systems require the possibility of monitoring the execution time  
123044 of processes or threads from independent monitoring entities. In order to allow  
123045 applications to construct independent monitoring entities that do not require cooperation  
123046 from or modification of the monitored entities, two functions have been added:  
123047 *clock\_getcpuclockid()*, for accessing CPU-time clocks of other processes, and  
123048 *pthread\_getcpuclockid()*, for accessing CPU-time clocks of other threads. These functions  
123049 return the clock identifier associated with the process or thread specified in the call. These  
123050 clock IDs can then be used in the rest of the clock function calls.

123051 The clocks accessed through these functions could also be used as a timing base for the  
123052 creation of timers, thereby allowing independent monitoring entities to limit the CPU time  
123053 consumed by other entities. However, this possibility would imply additional complexity  
123054 and overhead because of the need to maintain a timer queue for each process or thread, to  
123055 store the different expiration times associated with timers created by different processes or  
123056 threads. The working group decided this additional overhead was not justified by  
123057 application requirements. Therefore, creation of timers attached to the CPU-time clocks of  
123058 other processes or threads has been specified as implementation-defined.

123059 • Overhead Considerations

123060 The measurement of execution time may introduce additional overhead in the thread  
123061 scheduling, because of the need to keep track of the time consumed by each of these  
123062 entities. In library-level implementations of threads, the efficiency of scheduling could be  
123063 somehow compromised because of the need to make a kernel call, at each context switch,  
123064 to read the process CPU-time clock. Consequently, a thread creation attribute called *cpu-*  
123065 *clock-requirement* was defined, to allow threads to disconnect their respective CPU-time  
123066 clocks. However, the Ballot Group considered that this attribute itself introduced some  
123067 overhead, and that in current implementations it was not worth the effort. Therefore, the  
123068 attribute was deleted, and thus thread CPU-time clocks are required for all threads if the  
123069 Thread CPU-Time Clocks option is supported.

123070 • Accuracy of CPU-Time Clocks

123071 The mechanism used to measure the execution time of processes and threads is specified in  
123072 POSIX.1-2008 as implementation-defined. The reason for this is that both the underlying  
123073 hardware and the implementation architecture have a very strong influence on the  
123074 accuracy achievable for measuring CPU time. For some implementations, the specification  
123075 of strict accuracy requirements would represent very large overheads, or even the  
123076 impossibility of being implemented.

123077 Since the mechanism for measuring execution time is implementation-defined, realtime  
123078 applications will be able to take advantage of accurate implementations using a portable  
123079 interface. Of course, strictly conforming applications cannot rely on any particular degree  
123080 of accuracy, in the same way as they cannot rely on a very accurate measurement of wall  
123081 clock time. There will always exist applications whose accuracy or efficiency requirements  
123082 on the implementation are more rigid than the values defined in POSIX.1-2008 or any  
123083 other standard.

123084 In any case, there is a minimum set of characteristics that realtime applications would  
123085 expect from most implementations. One such characteristic is that the sum of all the  
123086 execution times of all the threads in a process equals the process execution time, when no  
123087 CPU-time clocks are disabled. This need not always be the case because implementations  
123088 may differ in how they account for time during context switches. Another characteristic is

that the sum of the execution times of all processes in a system equals the number of processors, multiplied by the elapsed time, assuming that no processor is idle during that elapsed time. However, in some implementations it might not be possible to relate CPU time to elapsed time. For example, in a heterogeneous multi-processor system in which each processor runs at a different speed, an implementation may choose to define each “second” of CPU time to be a certain number of “cycles” that a CPU has executed.

- Existing Practice

Measuring and limiting the execution time of each concurrent activity are common features of most industrial implementations of realtime systems. Almost all critical realtime systems are currently built upon a cyclic executive. With this approach, a regular timer interrupt kicks off the next sequence of computations. It also checks that the current sequence has completed. If it has not, then some error recovery action can be undertaken (or at least an overrun is avoided). Current software engineering principles and the increasing complexity of software are driving application developers to implement these systems on multi-threaded or multi-process operating systems. Therefore, if a POSIX operating system is to be used for this type of application, then it must offer the same level of protection.

Execution time clocks are also common in most UNIX implementations, although these clocks usually have requirements different from those of realtime applications. The POSIX.1 *times()* function supports the measurement of the execution time of the calling process, and its terminated child processes. This execution time is measured in clock ticks and is supplied as two different values with the user and system execution times, respectively. BSD supports the function *getrusage()*, which allows the calling process to get information about the resources used by itself and/or all of its terminated child processes. The resource usage includes user and system CPU time. Some UNIX systems have options to specify high resolution (up to one microsecond) CPU-time clocks using the *times()* or the *getrusage()* functions.

The *times()* and *getrusage()* interfaces do not meet important realtime requirements, such as the possibility of monitoring execution time from a different process or thread, or the possibility of detecting an execution time overrun. The latter requirement is supported in some UNIX implementations that are able to send a signal when the execution time of a process has exceeded some specified value. For example, BSD defines the functions *getitimer()* and *setitimer()*, which can operate either on a realtime clock (wall-clock), or on virtual-time or profile-time clocks which measure CPU time in two different ways. These functions do not support access to the execution time of other processes.

The IBM MVS operating system supports per-process and per-thread execution time clocks. It also supports limiting the execution time of a given process.

Given all this existing practice, the working group considered that the POSIX.1 clocks and timers interface was appropriate to meet most of the requirements that realtime applications have for execution time clocks. Functions were added to get the CPU time clock IDs, and to allow/disallow the thread CPU-time clocks (in order to preserve the efficiency of some implementations of threads).

- Clock Constants

The definition of the manifest constants `CLOCK_PROCESS_CPUTIME_ID` and `CLOCK_THREAD_CPUTIME_ID` allows processes or threads, respectively, to access their own execution-time clocks. However, given a process or thread, access to its own execution-time clock is also possible if the clock ID of this clock is obtained through a call to *clock\_getcpuclockid()* or *pthread\_getcpuclockid()*. Therefore, these constants are not necessary and could be deleted to make the interface simpler. Their existence saves one

system call in the first access to the CPU-time clock of each process or thread. The working group considered this issue and decided to leave the constants in POSIX.1-2008 because they are closer to the POSIX.1b use of clock identifiers.

- Library Implementations of Threads

In library implementations of threads, kernel entities and library threads can coexist. In this case, if the CPU-time clocks are supported, most of the clock and timer functions will need to have two implementations: one in the thread library, and one in the system calls library. The main difference between these two implementations is that the thread library implementation will have to deal with clocks and timers that reside in the thread space, while the kernel implementation will operate on timers and clocks that reside in kernel space. In the library implementation, if the clock ID refers to a clock that resides in the kernel, a kernel call will have to be made. The correct version of the function can be chosen by specifying the appropriate order for the libraries during the link process.

- History of Resolution Issues: Deletion of the *enable* Attribute

In early proposals, consideration was given to inclusion of an attribute called *enable* for CPU-time clocks. This would allow implementations to avoid the overhead of measuring execution time for those processes or threads for which this measurement was not required. However, this is unnecessary since processes are already required to measure execution time by the POSIX.1 *times()* function. Consequently, the *enable* attribute is not present.

## Rationale Relating to Timeouts

- Requirements for Timeouts

Realtime systems which must operate reliably over extended periods without human intervention are characteristic in embedded applications such as avionics, machine control, and space exploration, as well as more mundane applications such as cable TV, security systems, and plant automation. A multi-tasking paradigm, in which many independent and/or cooperating software functions relinquish the processor(s) while waiting for a specific stimulus, resource, condition, or operation completion, is very useful in producing well engineered programs for such systems. For such systems to be robust and fault-tolerant, expected occurrences that are unduly delayed or that never occur must be detected so that appropriate recovery actions may be taken. This is difficult if there is no way for a task to regain control of a processor once it has relinquished control (blocked) awaiting an occurrence which, perhaps because of corrupted code, hardware malfunction, or latent software bugs, will not happen when expected. Therefore, the common practice in realtime operating systems is to provide a capability to time out such blocking services. Although there are several methods to achieve this already defined by POSIX, none are as reliable or efficient as initiating a timeout simultaneously with initiating a blocking service. This is especially critical in hard-realtime embedded systems because the processors typically have little time reserve, and allowed fault recovery times are measured in milliseconds rather than seconds.

The working group largely agreed that such timeouts were necessary and ought to become part of POSIX.1-2008, particularly vendors of realtime operating systems whose customers had already expressed a strong need for timeouts. There was some resistance to inclusion of timeouts in POSIX.1-2008 because the desired effect, fault tolerance, could, in theory, be achieved using existing facilities and alternative software designs, but there was no compelling evidence that realtime system designers would embrace such designs at the sacrifice of performance and/or simplicity.

- Which Services should be Timed Out?

Originally, the working group considered the prospect of providing timeouts on all blocking services, including those currently existing in POSIX.1, POSIX.1b, and POSIX.1c, and future interfaces to be defined by other working groups, as sort of a general policy. This was rather quickly rejected because of the scope of such a change, and the fact that many of those services would not normally be used in a realtime context. More traditional timesharing solutions to timeout would suffice for most of the POSIX.1 interfaces, while others had asynchronous alternatives which, while more complex to utilize, would be adequate for some realtime and all non-realtime applications.

The list of potential candidates for timeouts was narrowed to the following for further consideration:

- POSIX.1b
  - `sem_wait()`
  - `mq_receive()`
  - `mq_send()`
  - `lio_listio()`
  - `aio_suspend()`
  - `sigwait()` (timeout already implemented by `sigtimedwait()`)
- POSIX.1c
  - `pthread_mutex_lock()`
  - `pthread_join()`
  - `pthread_cond_wait()`  
(timeout already implemented by `pthread_cond_timedwait()`)
- POSIX.1
  - `read()`
  - `write()`

After further review by the working group, the `lio_listio()`, `read()`, and `write()` functions (all forms of blocking synchronous I/O) were eliminated from the list because of the following:

- Asynchronous alternatives exist
- Timeouts can be implemented, albeit non-portably, in device drivers
- A strong desire not to introduce modifications to POSIX.1 interfaces

The working group ultimately rejected `pthread_join()` since both that interface and a timed variant of that interface are non-minimal and may be implemented as a function. See below for a library implementation of `pthread_join()`.

Thus, there was a consensus among the working group members to add timeouts to 4 of the remaining 5 functions (the timeout for `aio_suspend()` was ultimately added directly to POSIX.1b, while the others were added by POSIX.1d). However, `pthread_mutex_lock()` remained contentious.

Many feel that `pthread_mutex_lock()` falls into the same class as the other functions; that is, it is desirable to time out a mutex lock because a mutex may fail to be unlocked due to

errant or corrupted code in a critical section (looping or branching outside of the unlock code), and therefore is equally in need of a reliable, simple, and efficient timeout. In fact, since mutexes are intended to guard small critical sections, most `pthread_mutex_lock()` calls would be expected to obtain the lock without blocking nor utilizing any kernel service, even in implementations of threads with global contention scope; the timeout alternative need only be considered after it is determined that the thread must block.

Those opposed to timing out mutexes feel that the very simplicity of the mutex is compromised by adding a timeout semantic, and that to do so is senseless. They claim that if a timed mutex is really deemed useful by a particular application, then it can be constructed from the facilities already in POSIX.1b and POSIX.1c. The following two C-language library implementations of mutex locking with timeout represent the solutions offered (in both implementations, the timeout parameter is specified as absolute time, not relative time as in the proposed POSIX.1c interfaces).

- Spinlock Implementation

```
#include <pthread.h>
#include <time.h>
#include <errno.h>

int pthread_mutex_timedlock(pthread_mutex_t *mutex,
                           const struct timespec *timeout)
{
    struct timespec timenow;

    while (pthread_mutex_trylock(mutex) == EBUSY)
    {
        clock_gettime(CLOCK_REALTIME, &timenow);
        if (timespec_cmp(&timenow, timeout) >= 0)
        {
            return ETIMEDOUT;
        }
        pthread_yield();
    }
    return 0;
}
```

The Spinlock implementation is generally unsuitable for any application using priority-based thread scheduling policies such as SCHED\_FIFO or SCHED\_RR, since the mutex could currently be held by a thread of lower priority within the same allocation domain, but since the waiting thread never blocks, only threads of equal or higher priority will ever run, and the mutex cannot be unlocked. Setting priority inheritance or priority ceiling protocol on the mutex does not solve this problem, since the priority of a mutex owning thread is only boosted if higher priority threads are blocked waiting for the mutex; clearly not the case for this spinlock.

- Condition Wait Implementation

```
#include <pthread.h>
#include <time.h>
#include <errno.h>

struct timed_mutex
{
    int locked;
    pthread_mutex_t mutex;
}
```

```

123274         pthread_cond_t cond;
123275     };
123276     typedef struct timed_mutex timed_mutex_t;
123277     int timed_mutex_lock(timed_mutex_t *tm,
123278         const struct timespec *timeout)
123279     {
123280         int timedout=FALSE;
123281         int error_status;
123282
123283         pthread_mutex_lock(&tm->mutex);
123284
123285         while (tm->locked && !timedout)
123286         {
123287             if ((error_status=pthread_cond_timedwait(&tm->cond,
123288                 &tm->mutex,
123289                 timeout))!=0)
123290             {
123291                 if (error_status==ETIMEDOUT) timedout = TRUE;
123292             }
123293         }
123294
123295         if(timedout)
123296         {
123297             pthread_mutex_unlock(&tm->mutex);
123298             return ETIMEDOUT;
123299         }
123300         else
123301         {
123302             tm->locked = TRUE;
123303             pthread_mutex_unlock(&tm->mutex);
123304             return 0;
123305         }
123306     }
123307
123308     void timed_mutex_unlock(timed_mutex_t *tm)
123309     {
123310         pthread_mutex_lock(&tm->mutex); / for case assignment not atomic /
123311         tm->locked = FALSE;
123312         pthread_mutex_unlock(&tm->mutex);
123313         pthread_cond_signal(&tm->cond);
123314     }

```

The Condition Wait implementation effectively substitutes the *pthread\_cond\_timedwait()* function (which is currently timed out) for the desired *pthread\_mutex\_timedlock()*. Since waits on condition variables currently do not include protocols which avoid priority inversion, this method is generally unsuitable for realtime applications because it does not provide the same priority inversion protection as the untimed *pthread\_mutex\_lock()*. Also, for any given implementations of the current mutex and condition variable primitives, this library implementation has a performance cost at least 2.5 times that of the untimed *pthread\_mutex\_lock()* even in the case where the timed mutex is readily locked without blocking (the interfaces required for this case are shown in bold). Even in uniprocessors or where assignment is atomic, at least an additional *pthread\_cond\_signal()* is required. *pthread\_mutex\_timedlock()* could be implemented at effectively no performance penalty in this case because the timeout parameters need only be considered after it is determined that the mutex cannot be locked immediately.

123324 Thus it has not yet been shown that the full semantics of mutex locking with timeout can  
 123325 be efficiently and reliably achieved using existing interfaces. Even if the existence of an  
 123326 acceptable library implementation were proven, it is difficult to justify why the interface  
 123327 itself should not be made portable, especially considering approval for the other four  
 123328 timeouts.

- 123329 • Rationale for Library Implementation of *pthread\_timedjoin()*

123330 Library implementation of *pthread\_timedjoin()*:

```

123331 /*
123332  * Construct a thread variety entirely from existing functions
123333  * with which a join can be done, allowing the join to time out.
123334  */
123335 #include <pthread.h>
123336 #include <time.h>

123337 struct timed_thread {
123338     pthread_t t;
123339     pthread_mutex_t m;
123340     int exiting;
123341     pthread_cond_t exit_c;
123342     void *(*start_routine)(void *arg);
123343     void *arg;
123344     void *status;
123345 };

123346 typedef struct timed_thread *timed_thread_t;
123347 static pthread_key_t timed_thread_key;
123348 static pthread_once_t timed_thread_once = PTHREAD_ONCE_INIT;

123349 static void timed_thread_init()
123350 {
123351     pthread_key_create(&timed_thread_key, NULL);
123352 }

123353 static void *timed_thread_start_routine(void *args)
123354 /*
123355  * Routine to establish thread-specific data value and run the actual
123356  * thread start routine which was supplied to timed_thread_create().
123357  */
123358 {
123359     timed_thread_t tt = (timed_thread_t) args;
123360     pthread_once(&timed_thread_once, timed_thread_init);
123361     pthread_setspecific(timed_thread_key, (void *)tt);
123362     timed_thread_exit((tt->start_routine)(tt->arg));
123363 }

123364 int timed_thread_create(timed_thread_t ttp, const pthread_attr_t *attr,
123365     void *(*start_routine)(void *), void *arg)
123366 /*
123367  * Allocate a thread which can be used with timed_thread_join().
123368  */
123369 {
123370     timed_thread_t tt;
  
```

```

123371         int result;
123372         tt = (timed_thread_t) malloc(sizeof(struct timed_thread));
123373         pthread_mutex_init(&tt->m, NULL);
123374         tt->exiting = FALSE;
123375         pthread_cond_init(&tt->exit_c, NULL);
123376         tt->start_routine = start_routine;
123377         tt->arg = arg;
123378         tt->status = NULL;
123379
123380         if ((result = pthread_create(&tt->t, attr,
123381             timed_thread_start_routine, (void *)tt)) != 0) {
123382             free(tt);
123383             return result;
123384         }
123385         pthread_detach(tt->t);
123386         ttp = tt;
123387         return 0;
123388     }
123389
123390     int timed_thread_join(timed_thread_t tt,
123391         struct timespec *timeout,
123392         void **status)
123393     {
123394         int result;
123395
123396         pthread_mutex_lock(&tt->m);
123397         result = 0;
123398         /*
123399          * Wait until the thread announces that it is exiting,
123400          * or until timeout.
123401          */
123402         while (result == 0 && ! tt->exiting) {
123403             result = pthread_cond_timedwait(&tt->exit_c, &tt->m, timeout);
123404         }
123405         pthread_mutex_unlock(&tt->m);
123406         if (result == 0 && tt->exiting) {
123407             *status = tt->status;
123408             free((void *)tt);
123409             return result;
123410         }
123411         return result;
123412     }
123413
123414     void timed_thread_exit(void *status)
123415     {
123416         timed_thread_t tt;
123417         void *specific;
123418
123419         if ((specific=pthread_getspecific(timed_thread_key)) == NULL){
123420             /*
123421              * Handle cases which won't happen with correct usage.
123422              */
123423             pthread_exit( NULL);
123424         }
123425     }

```

```

123420         tt = (timed_thread_t) specific;
123421         pthread_mutex_lock(&tt->m);
123422         /*
123423          * Tell a joiner that we're exiting.
123424          */
123425         tt->status = status;
123426         tt->exiting = TRUE;
123427         pthread_cond_signal(&tt->exit_c);
123428         pthread_mutex_unlock(&tt->m);
123429         /*
123430          * Call pthread exit() to call destructors and really
123431          * exit the thread.
123432          */
123433         pthread_exit(NULL);
123434     }

```

The *pthread\_join()* C-language example shown above demonstrates that it is possible, using existing pthread facilities, to construct a variety of thread which allows for joining such a thread, but which allows the join operation to time out. It does this by using a *pthread\_cond\_timedwait()* to wait for the thread to exit. A **timed\_thread\_t** descriptor structure is used to pass parameters from the creating thread to the created thread, and from the exiting thread to the joining thread. This implementation is roughly equivalent to what a normal *pthread\_join()* implementation would do, with the single change being that *pthread\_cond\_timedwait()* is used in place of a simple *pthread\_cond\_wait()*.

Since it is possible to implement such a facility entirely from existing pthread interfaces, and with roughly equal efficiency and complexity to an implementation which would be provided directly by a pthreads implementation, it was the consensus of the working group members that any *pthread\_timedjoin()* facility would be unnecessary, and should not be provided.

- Form of the Timeout Interfaces

The working group considered a number of alternative ways to add timeouts to blocking services. At first, a system interface which would specify a one-shot or persistent timeout to be applied to subsequent blocking services invoked by the calling process or thread was considered because it allowed all blocking services to be timed out in a uniform manner with a single additional interface; this was rather quickly rejected because it could easily result in the wrong services being timed out.

It was suggested that a timeout value might be specified as an attribute of the object (semaphore, mutex, message queue, and so on), but there was no consensus on this, either on a case-by-case basis or for all timeouts.

Looking at the two existing timeouts for blocking services indicates that the working group members favor a separate interface for the timed version of a function. However, *pthread\_cond\_timedwait()* utilizes an absolute timeout value while *sigtimedwait()* uses a relative timeout value. The working group members agreed that relative timeout values are appropriate where the timeout mechanism's primary use was to deal with an unexpected or error situation, but they are inappropriate when the timeout must expire at a particular time, or before a specific deadline. For the timeouts being introduced in POSIX.1-2008, the working group considered allowing both relative and absolute timeouts as is done with POSIX.1b timers, but ultimately favored the simpler absolute timeout form.

An absolute time measure can be easily implemented on top of an interface that specifies relative time, by reading the clock, calculating the difference between the current time and

123469 the desired wakeup time, and issuing a relative timeout call. But there is a race condition  
123470 with this approach because the thread could be preempted after reading the clock, but  
123471 before making the timed-out call; in this case, the thread would be awakened later than it  
123472 should and, thus, if the wakeup time represented a deadline, it would miss it.

123473 There is also a race condition when trying to build a relative timeout on top of an interface  
123474 that specifies absolute timeouts. In this case, the clock would have to be read to calculate  
123475 the absolute wakeup time as the sum of the current time plus the relative timeout interval.  
123476 In this case, if the thread is preempted after reading the clock but before making the timed-  
123477 out call, the thread would be awakened earlier than desired.

123478 But the race condition with the absolute timeouts interface is not as bad as the one that  
123479 happens with the relative timeout interface, because there are simple workarounds. For the  
123480 absolute timeouts interface, if the timing requirement is a deadline, the deadline can still  
123481 be met because the thread woke up earlier than the deadline. If the timeout is just used as  
123482 an error recovery mechanism, the precision of timing is not really important. If the timing  
123483 requirement is that between actions A and B a minimum interval of time must elapse, the  
123484 absolute timeout interface can be safely used by reading the clock after action A has been  
123485 started. It could be argued that, since the call with the absolute timeout is atomic from the  
123486 application point of view, it is not possible to read the clock after action A, if this action is  
123487 part of the timed-out call. But looking at the nature of the calls for which timeouts are  
123488 specified (locking a mutex, waiting for a semaphore, waiting for a message, or waiting  
123489 until there is space in a message queue), the timeouts that an application would build on  
123490 these actions would not be triggered by these actions themselves, but by some other  
123491 external action. For example, if waiting for a message to arrive to a message queue, and  
123492 waiting for at least 20 milliseconds, this time interval would start to be counted from some  
123493 event that would trigger both the action that produces the message, as well as the action  
123494 that waits for the message to arrive, and not by the wait-for-message operation itself. In  
123495 this case, the workaround proposed above could be used.

123496 For these reasons, the absolute timeout is preferred over the relative timeout interface.

## 123497 **B.2.9 Threads**

123498 Threads will normally be more expensive than subroutines (or functions, routines, and so on) if  
123499 specialized hardware support is not provided. Nevertheless, threads should be sufficiently  
123500 efficient to encourage their use as a medium to fine-grained structuring mechanism for  
123501 parallelism in an application. Structuring an application using threads then allows it to take  
123502 immediate advantage of any underlying parallelism available in the host environment. This  
123503 means implementors are encouraged to optimize for fast execution at the possible expense of  
123504 efficient utilization of storage. For example, a common thread creation technique is to cache  
123505 appropriate thread data structures. That is, rather than releasing system resources, the  
123506 implementation retains these resources and reuses them when the program next asks to create a  
123507 new thread. If this reuse of thread resources is to be possible, there has to be very little unique  
123508 state associated with each thread, because any such state has to be reset when the thread is  
123509 reused.

## Thread Creation Attributes

Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to support probable future standardization in these areas without requiring that the interface itself be changed.

Attributes objects provide clean isolation of the configurable aspects of threads. For example, “stack size” is an important attribute of a thread, but it cannot be expressed portably. When porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects can help by allowing the changes to be isolated in a single place, rather than being spread across every instance of thread creation.

Attributes objects can be used to set up *classes* of threads with similar attributes; for example, “threads with large stacks and high priority” or “threads with minimal stacks”. These classes can be defined in a single place and then referenced wherever threads need to be created. Changes to “class” decisions become straightforward, and detailed analysis of each `pthread_create()` call is not required.

The attributes objects are defined as opaque types as an aid to extensibility. If these objects had been specified as structures, adding new attributes would force recompilation of all multi-threaded programs when the attributes objects are extended; this might not be possible if different program components were supplied by different vendors.

Additionally, opaque attributes objects present opportunities for improving performance. Argument validity can be checked once when attributes are set, rather than each time a thread is created. Implementations will often need to cache kernel objects that are expensive to create. Opaque attributes objects provide an efficient mechanism to detect when cached objects become invalid due to attribute changes.

Because assignment is not necessarily defined on a given opaque type, implementation-defined default values cannot be defined in a portable way. The solution to this problem is to allow attribute objects to be initialized dynamically by attributes object initialization functions, so that default values can be supplied automatically by the implementation.

The following proposal was provided as a suggested alternative to the supplied attributes:

1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to the initialization routines (`pthread_create()`, `pthread_mutex_init()`, `pthread_cond_init()`). The parameter containing the flags should be an opaque type for extensibility. If no flags are set in the parameter, then the objects are created with default characteristics. An implementation may specify implementation-defined flag values and associated behavior.
2. If further specialization of mutexes and condition variables is necessary, implementations may specify additional procedures that operate on the `pthread_mutex_t` and `pthread_cond_t` objects (instead of on attributes objects).

The difficulties with this solution are:

1. A bitmask is not opaque if bits have to be set into bit-vector attributes objects using explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an `int`, application programmers need to know the location of each bit. If bits are set or read by encapsulation (that is, `get*()` or `set*()` functions), then the bitmask is merely an implementation of attributes objects as currently defined and should not be exposed to the programmer.
2. Many attributes are not Boolean or very small integral values. For example, scheduling policy may be placed in 3 bits or 4 bits, but priority requires 5 bits or more, thereby taking up at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this,

123557 the bitmask can only reasonably control whether particular attributes are set or not, and it  
123558 cannot serve as the repository of the value itself. The value needs to be specified as a  
123559 function parameter (which is non-extensible), or by setting a structure field (which is non-  
123560 opaque), or by *get\*()* and *set\*()* functions (making the bitmask a redundant addition to  
123561 the attributes objects).

123562 Stack size is defined as an optional attribute because the very notion of a stack is inherently  
123563 machine-dependent. Some implementations may not be able to change the size of the stack, for  
123564 example, and others may not need to because stack pages may be discontinuous and can be  
123565 allocated and released on demand.

123566 The attribute mechanism has been designed in large measure for extensibility. Future extensions  
123567 to the attribute mechanism or to any attributes object defined in POSIX.1-2008 have to be done  
123568 with care so as not to affect binary-compatibility.

123569 Attribute objects, even if allocated by means of dynamic allocation functions such as *malloc()*,  
123570 may have their size fixed at compile time. This means, for example, a *pthread\_create()* in an  
123571 implementation with extensions to the **pthread\_attr\_t** cannot look beyond the area that the  
123572 binary application assumes is valid. This suggests that implementations should maintain a size  
123573 field in the attributes object, as well as possibly version information, if extensions in different  
123574 directions (possibly by different vendors) are to be accommodated.

## 123575 Thread Implementation Models

123576 There are various thread implementation models. At one end of the spectrum is the “library-  
123577 thread model”. In such a model, the threads of a process are not visible to the operating system  
123578 kernel, and the threads are not kernel-scheduled entities. The process is the only kernel-  
123579 scheduled entity. The process is scheduled onto the processor by the kernel according to the  
123580 scheduling attributes of the process. The threads are scheduled onto the single kernel-scheduled  
123581 entity (the process) by the runtime library according to the scheduling attributes of the threads.  
123582 A problem with this model is that it constrains concurrency. Since there is only one kernel-  
123583 scheduled entity (namely, the process), only one thread per process can execute at a time. If the  
123584 thread that is executing blocks on I/O, then the whole process blocks.

123585 At the other end of the spectrum is the “kernel-thread model”. In this model, all threads are  
123586 visible to the operating system kernel. Thus, all threads are kernel-scheduled entities, and all  
123587 threads can concurrently execute. The threads are scheduled onto processors by the kernel  
123588 according to the scheduling attributes of the threads. The drawback to this model is that the  
123589 creation and management of the threads entails operating system calls, as opposed to subroutine  
123590 calls, which makes kernel threads heavier weight than library threads.

123591 Hybrids of these two models are common. A hybrid model offers the speed of library threads  
123592 and the concurrency of kernel threads. In hybrid models, a process has some (relatively small)  
123593 number of kernel scheduled entities associated with it. It also has a potentially much larger  
123594 number of library threads associated with it. Some library threads may be bound to kernel-  
123595 scheduled entities, while the other library threads are multiplexed onto the remaining kernel-  
123596 scheduled entities. There are two levels of thread scheduling:

- 123597 1. The runtime library manages the scheduling of (unbound) library threads onto kernel-  
123598 scheduled entities.
- 123599 2. The kernel manages the scheduling of kernel-scheduled entities onto processors.

123600 For this reason, a hybrid model is referred to as a two-level threads scheduling model. In this  
123601 model, the process can have multiple concurrently executing threads; specifically, it can have as  
123602 many concurrently executing threads as it has kernel-scheduled entities.

## Thread-Specific Data

Many applications require that a certain amount of context be maintained on a per-thread basis across procedure calls. A common example is a multi-threaded library routine that allocates resources from a common pool and maintains an active resource list for each thread. The thread-specific data interface provided to meet these needs may be viewed as a two-dimensional array of values with keys serving as the row index and thread IDs as the column index (although the implementation need not work this way).

- Models

Three possible thread-specific data models were considered:

1. No Explicit Support

A standard thread-specific data interface is not strictly necessary to support applications that require per-thread context. One could, for example, provide a hash function that converted a **pthread\_t** into an integer value that could then be used to index into a global array of per-thread data pointers. This hash function, in conjunction with *pthread\_self()*, would be all the interface required to support a mechanism of this sort. Unfortunately, this technique is cumbersome. It can lead to duplicated code as each set of cooperating modules implements their own per-thread data management schemes. This technique would also require that **pthread\_t** not be an opaque type.

2. Single (**void \***) Pointer

Another technique would be to provide a single word of per-thread storage and a pair of functions to fetch and store the value of this word. The word could then hold a pointer to a block of per-thread memory. The allocation, partitioning, and general use of this memory would be entirely up to the application. Although this method is not as problematic as technique 1, it suffers from interoperability problems. For example, all modules using the per-thread pointer would have to agree on a common usage protocol.

3. Key/Value Mechanism

This method associates an opaque key (for example, stored in a variable of type **pthread\_key\_t**) with each per-thread datum. These keys play the role of identifiers for per-thread data. This technique is the most generic and avoids the problems noted above, albeit at the cost of some complexity.

The primary advantage of the third model is its information hiding properties. Modules using this model are free to create and use their own key(s) independent of all other such usage, whereas the other models require that all modules that use thread-specific context explicitly cooperate with all other such modules. The data-independence provided by the third model is worth the additional interface. Therefore, the third model was chosen.

- Requirements

It is important that it be possible to implement the thread-specific data interface without the use of thread private memory. To do otherwise would increase the weight of each thread, thereby limiting the range of applications for which the threads interfaces provided by POSIX.1-2008 is appropriate.

The values that one binds to the key via *pthread\_setspecific()* may, in fact, be pointers to shared storage locations available to all threads. It is only the key/value bindings that are maintained on a per-thread basis, and these can be kept in any portion of the address space that is reserved for use by the calling thread (for example, on the stack). Thus, no per-

thread MMU state is required to implement the interface. On the other hand, there is nothing in the interface specification to preclude the use of a per-thread MMU state if it is available (for example, the key values returned by `pthread_key_create()` could be thread private memory addresses).

- Standardization Issues

Thread-specific data is a requirement for a usable thread interface. The binding described in this section provides a portable thread-specific data mechanism for languages that do not directly support a thread-specific storage class. A binding to POSIX.1-2008 for a language that does include such a storage class need not provide this specific interface.

If a language were to include the notion of thread-specific storage, it would be desirable (but *not* required) to provide an implementation of the pthreads thread-specific data interface based on the language feature. For example, assume that a compiler for a C-like language supports a *private* storage class that provides thread-specific storage. Something similar to the following macros might be used to effect a compatible implementation:

```
#define pthread_key_t          private void *
#define pthread_key_create(key) /* no-op */
#define pthread_setspecific(key,value) (key)=(value)
#define pthread_getspecific(key)      (key)
```

**Note:** For the sake of clarity, this example ignores destructor functions. A correct implementation would have to support them.

## Barriers

- Background

Barriers are typically used in parallel DO/FOR loops to ensure that all threads have reached a particular stage in a parallel computation before allowing any to proceed to the next stage. Highly efficient implementation is possible on machines which support a “Fetch and Add” operation as described in the referenced Almasi and Gottlieb (1989).

The use of return value `PTHREAD_BARRIER_SERIAL_THREAD` is shown in the following example:

```
if ( (status=pthread_barrier_wait(&barrier)) ==
    PTHREAD_BARRIER_SERIAL_THREAD) {
    ...serial section
}
else if (status != 0) {
    ...error processing
}
status=pthread_barrier_wait(&barrier);
...
```

This behavior allows a serial section of code to be executed by one thread as soon as all threads reach the first barrier. The second barrier prevents the other threads from proceeding until the serial section being executed by the one thread has completed.

Although barriers can be implemented with mutexes and condition variables, the referenced Almasi and Gottlieb (1989) provides ample illustration that such implementations are significantly less efficient than is possible. While the relative efficiency of barriers may well vary by implementation, it is important that they be recognized in the POSIX.1-2008 to facilitate applications portability while providing the necessary freedom to implementors.

- Lack of Timeout Feature

Alternate versions of most blocking routines have been provided to support watchdog timeouts. No alternate interface of this sort has been provided for barrier waits for the following reasons:

- Multiple threads may use different timeout values, some of which may be indefinite. It is not clear which threads should break through the barrier with a timeout error if and when these timeouts expire.
- The barrier may become unusable once a thread breaks out of a `pthread_barrier_wait()` with a timeout error. There is, in general, no way to guarantee the consistency of a barrier's internal data structures once a thread has timed out of a `pthread_barrier_wait()`. Even the inclusion of a special barrier reinitialization function would not help much since it is not clear how this function would affect the behavior of threads that reach the barrier between the original timeout and the call to the reinitialization function.

## Spin Locks

- Background

Spin locks represent an extremely low-level synchronization mechanism suitable primarily for use on shared memory multi-processors. It is typically an atomically modified Boolean value that is set to one when the lock is held and to zero when the lock is freed.

When a caller requests a spin lock that is already held, it typically spins in a loop testing whether the lock has become available. Such spinning wastes processor cycles so the lock should only be held for short durations and not across sleep/block operations. Callers should unlock spin locks before calling sleep operations.

Spin locks are available on a variety of systems. The functions included in POSIX.1-2008 are an attempt to standardize that existing practice.

- Lack of Timeout Feature

Alternate versions of most blocking routines have been provided to support watchdog timeouts. No alternate interface of this sort has been provided for spin locks for the following reasons:

- It is impossible to determine appropriate timeout intervals for spin locks in a portable manner. The amount of time one can expect to spend spin-waiting is inversely proportional to the degree of parallelism provided by the system.  
It can vary from a few cycles when each competing thread is running on its own processor, to an indefinite amount of time when all threads are multiplexed on a single processor (which is why spin locking is not advisable on uniprocessors).
- When used properly, the amount of time the calling thread spends waiting on a spin lock should be considerably less than the time required to set up a corresponding watchdog timer. Since the primary purpose of spin locks is to provide a low-overhead synchronization mechanism for multi-processors, the overhead of a timeout mechanism was deemed unacceptable.

It was also suggested that an additional `count` argument be provided (on the `pthread_spin_lock()` call) in lieu of a true timeout so that a spin lock call could fail gracefully if it was unable to apply the lock after `count` attempts. This idea was rejected because it is not existing practice. Furthermore, the same effect can be obtained with `pthread_spin_trylock()`, as illustrated below:

```

123740     int n = MAX_SPIN;
123741     while ( --n >= 0 )
123742     {
123743         if ( !pthread_spin_try_lock(...) )
123744             break;
123745     }
123746     if ( n >= 0 )
123747     {
123748         /* Successfully acquired the lock */
123749     }
123750     else
123751     {
123752         /* Unable to acquire the lock */
123753     }

```

- *process-shared* Attribute

The initialization functions associated with most POSIX synchronization objects (for example, mutexes, barriers, and read-write locks) take an attributes object with a *process-shared* attribute that specifies whether or not the object is to be shared across processes. In the draft corresponding to the first balloting round, two separate initialization functions are provided for spin locks, however: one for spin locks that were to be shared across processes (*spin\_init()*), and one for locks that were only used by multiple threads within a single process (*pthread\_spin\_init()*). This was done so as to keep the overhead associated with spin waiting to an absolute minimum. However, the balloting group requested that, since the overhead associated to a bit check was small, spin locks should be consistent with the rest of the synchronization primitives, and thus the *process-shared* attribute was introduced for spin locks.

- Spin Locks *versus* Mutexes

It has been suggested that mutexes are an adequate synchronization mechanism and spin locks are not necessary. Locking mechanisms typically must trade off the processor resources consumed while setting up to block the thread and the processor resources consumed by the thread while it is blocked. Spin locks require very little resources to set up the blocking of a thread. Existing practice is to simply loop, repeating the atomic locking operation until the lock is available. While the resources consumed to set up blocking of the thread are low, the thread continues to consume processor resources while it is waiting.

On the other hand, mutexes may be implemented such that the processor resources consumed to block the thread are large relative to a spin lock. After detecting that the mutex lock is not available, the thread must alter its scheduling state, add itself to a set of waiting threads, and, when the lock becomes available again, undo all of this before taking over ownership of the mutex. However, while a thread is blocked by a mutex, no processor resources are consumed.

Therefore, spin locks and mutexes may be implemented to have different characteristics. Spin locks may have lower overall overhead for very short-term blocking, and mutexes may have lower overall overhead when a thread will be blocked for longer periods of time. The presence of both interfaces allows implementations with these two different characteristics, both of which may be useful to a particular application.

It has also been suggested that applications can build their own spin locks from the *pthread\_mutex\_trylock()* function:

123788           while (pthread\_mutex\_trylock(&mutex));

123789           The apparent simplicity of this construct is somewhat deceiving, however. While the actual  
123790           wait is quite efficient, various guarantees on the integrity of mutex objects (for example,  
123791           priority inheritance rules) may add overhead to the successful path of the trylock  
123792           operation that is not required of spin locks. One could, of course, add an attribute to the  
123793           mutex to bypass such overhead, but the very act of finding and testing this attribute  
123794           represents more overhead than is found in the typical spin lock.

123795           The need to hold spin lock overhead to an absolute minimum also makes it impossible to  
123796           provide guarantees against starvation similar to those provided for mutexes or read-write  
123797           locks. The overhead required to implement such guarantees (for example, disabling  
123798           preemption before spinning) may well exceed the overhead of the spin wait itself by many  
123799           orders of magnitude. If a “safe” spin wait seems desirable, it can always be provided  
123800           (albeit at some performance cost) via appropriate mutex attributes.

## 123801           **Robust Mutexes**

123802           Robust mutexes are intended to protect applications that use mutexes to protect data shared  
123803           between different processes. If a process is terminated by a signal while a thread is holding a  
123804           mutex, there is no chance for the process to clean up after it. Waiters for the locked mutex might  
123805           wait indefinitely.

123806           With robust mutexes the problem can be solved: whenever a fatal signal terminates a process,  
123807           current or future waiters of the mutex are notified about this fact. The locking function provides  
123808           notification of this condition through the error condition [EOWNERDEAD]. A thread then has  
123809           the chance to clean up the state protected by the mutex and mark the state as consistent again by  
123810           a call to *pthread\_mutex\_consistent()*.

123811           Pre-existing implementations have used the semantics of robust mutexes for a variety of  
123812           situations, some of them not defined in the standard. Where a normally terminated process (i.e.,  
123813           when one thread calls *exit()*) causes notification of other waiters of robust mutexes if the mutex  
123814           is locked by any thread in the process. This behavior is defined in the standard and makes sense  
123815           because no thread other than the thread calling *exit()* has the chance to clean up its data.

123816           If a thread is terminated by cancellation or if it calls *pthread\_exit()*, the situation is different. In  
123817           both these situations the thread has the chance to clean up after itself by registering appropriate  
123818           cleanup handlers. There is no real reason to demand that other waiters for a robust mutex the  
123819           terminating thread owns are notified. The committee felt that this is actively encouraging bad  
123820           practice because programmers are tempted to rely on the robust mutex semantics instead of  
123821           correctly cleaning up after themselves.

123822           Therefore, the standard does not require notification of other waiters at the time a thread is  
123823           terminated while the process continues to run. The mutex is still recognized as being locked by  
123824           the process (with the thread gone it makes no sense to refer to the thread owning the mutex).  
123825           Therefore, a terminating process will cause notifications about the dead owner to be sent to all  
123826           waiters. This delay in the notification is not required, but programmers cannot rely on prompt  
123827           notification after a thread is terminated.

123828           For the same reason is it not required that an implementation supports robust mutexes that are  
123829           not shared between processes. If a robust mutex is used only within one process, all the cleanup  
123830           can be performed by the threads themselves by registering appropriate cleanup handlers. Fatal  
123831           signals are of no importance in this case because after the signal is delivered there is no thread  
123832           remaining to use the mutex.

123833           Some implementations might choose to support intra-process robust mutexes and they might  
123834           also send notification of a dead owner right after the previous owner died. But applications

123835 must not rely on this. Applications should only use robust mutexes for the purpose of handling  
123836 fatal signals in situations where inter-process mutexes are in use.

### 123837 **Supported Threads Functions**

123838 On POSIX-conforming systems, the following symbolic constants are always conforming:

123839 `_POSIX_READER_WRITER_LOCKS`  
123840 `_POSIX_THREADS`

123841 Therefore, the following threads functions are always supported:

123842 <code>pthread_atfork()</code>	<code>pthread_mutex_destroy()</code>
123843 <code>pthread_attr_destroy()</code>	<code>pthread_mutex_init()</code>
123844 <code>pthread_attr_getdetachstate()</code>	<code>pthread_mutex_lock()</code>
123845 <code>pthread_attr_getguardsize()</code>	<code>pthread_mutex_trylock()</code>
123846 <code>pthread_attr_getschedparam()</code>	<code>pthread_mutex_unlock()</code>
123847 <code>pthread_attr_init()</code>	<code>pthread_mutexattr_destroy()</code>
123848 <code>pthread_attr_setdetachstate()</code>	<code>pthread_mutexattr_getpshared()</code>
123849 <code>pthread_attr_setguardsize()</code>	<code>pthread_mutexattr_gettype()</code>
123850 <code>pthread_attr_setschedparam()</code>	<code>pthread_mutexattr_init()</code>
123851 <code>pthread_cancel()</code>	<code>pthread_mutexattr_setpshared()</code>
123852 <code>pthread_cleanup_pop()</code>	<code>pthread_mutexattr_settype()</code>
123853 <code>pthread_cleanup_push()</code>	<code>pthread_once()</code>
123854 <code>pthread_cond_broadcast()</code>	<code>pthread_rwlock_destroy()</code>
123855 <code>pthread_cond_destroy()</code>	<code>pthread_rwlock_init()</code>
123856 <code>pthread_cond_init()</code>	<code>pthread_rwlock_rdlock()</code>
123857 <code>pthread_cond_signal()</code>	<code>pthread_rwlock_tryrdlock()</code>
123858 <code>pthread_cond_timedwait()</code>	<code>pthread_rwlock_trywrlock()</code>
123859 <code>pthread_cond_wait()</code>	<code>pthread_rwlock_unlock()</code>
123860 <code>pthread_condattr_destroy()</code>	<code>pthread_rwlock_wrlock()</code>
123861 <code>pthread_condattr_getpshared()</code>	<code>pthread_rwlockattr_destroy()</code>
123862 <code>pthread_condattr_init()</code>	<code>pthread_rwlockattr_getpshared()</code>
123863 <code>pthread_condattr_setpshared()</code>	<code>pthread_rwlockattr_init()</code>
123864 <code>pthread_create()</code>	<code>pthread_rwlockattr_setpshared()</code>
123865 <code>pthread_detach()</code>	<code>pthread_self()</code>
123866 <code>pthread_equal()</code>	<code>pthread_setcancelstate()</code>
123867 <code>pthread_exit()</code>	<code>pthread_setcanceltype()</code>
123868 <code>pthread_getconcurrency()</code>	<code>pthread_setconcurrency()</code>
123869 <code>pthread_getspecific()</code>	<code>pthread_setspecific()</code>
123870 <code>pthread_join()</code>	<code>pthread_sigmask()</code>
123871 <code>pthread_key_create()</code>	<code>pthread_testcancel()</code>
123872 <code>pthread_key_delete()</code>	<code>sigwait()</code>
123873 <code>pthread_kill()</code>	

123874 On POSIX-conforming systems, the symbolic constant `_POSIX_THREAD_SAFE_FUNCTIONS` is  
 123875 always defined. Therefore, the following functions are always supported:

123876	<code>asctime_r()</code>	<code>getpwuid_r()</code>
123877	<code>ctime_r()</code>	<code>gmtime_r()</code>
123878	<code>flockfile()</code>	<code>localtime_r()</code>
123879	<code>ftrylockfile()</code>	<code>putc_unlocked()</code>
123880	<code>funlockfile()</code>	<code>putchar_unlocked()</code>
123881	<code>getc_unlocked()</code>	<code>rand_r()</code>
123882	<code>getchar_unlocked()</code>	<code>readdir_r()</code>
123883	<code>getgrgid_r()</code>	<code>strerror_r()</code>
123884	<code>getgrnam_r()</code>	<code>strtok_r()</code>
123885	<code>getpwnam_r()</code>	

## 123886 Threads Extensions

123887 The following extensions to the IEEE P1003.1c draft standard are now supported in  
 123888 POSIX.1-2008 as part of the alignment with the Single UNIX Specification:

- 123889 • Extended mutex attribute types
- 123890 • Read-write locks and attributes (also introduced by the IEEE Std 1003.1j-2000 amendment)
- 123891 • Thread concurrency level
- 123892 • Thread stack guard size
- 123893 • Parallel I/O
- 123894 • Robust mutexes

123895 These extensions carefully follow the threads programming model specified in POSIX.1c. As  
 123896 with POSIX.1c, all the new functions return zero if successful; otherwise, an error number is  
 123897 returned to indicate the error.

123898 The concept of attribute objects was introduced in POSIX.1c to allow implementations to extend  
 123899 POSIX.1-2008 without changing the existing interfaces. Attribute objects were defined for  
 123900 threads, mutexes, and condition variables. Attributes objects are defined as implementation-  
 123901 defined opaque types to aid extensibility, and functions are defined to allow attributes to be set  
 123902 or retrieved. This model has been followed when adding the new type attribute of  
 123903 **`pthread_mutexattr_t`** or the new read-write lock attributes object **`pthread_rwlockattr_t`**.

- 123904 • Extended Mutex Attributes

123905 POSIX.1c defines a mutex attributes object as an implementation-defined opaque object of  
 123906 type **`pthread_mutexattr_t`**, and specifies a number of attributes which this object must  
 123907 have and a number of functions which manipulate these attributes. These attributes  
 123908 include *detachstate*, *inheritsched*, *schedparm*, *schedpolicy*, *contentionscope*, *stackaddr*, and  
 123909 *stacksize*.

123910 The System Interfaces volume of POSIX.1-2008 specifies another mutex attribute called  
 123911 *type*. The *type* attribute allows applications to specify the behavior of mutex locking  
 123912 operations in situations where POSIX.1c behavior is undefined. The OSF DCE threads  
 123913 implementation, based on Draft 4 of POSIX.1c, specified a similar attribute. Note that the  
 123914 names of the attributes have changed somewhat from the OSF DCE threads  
 123915 implementation.

123916 The System Interfaces volume of POSIX.1-2008 also extends the specification of the  
 123917 following POSIX.1c functions which manipulate mutexes:

123918 `pthread_mutex_lock()`  
123919 `pthread_mutex_trylock()`  
123920 `pthread_mutex_unlock()`

123921 to take account of the new mutex attribute type and to specify behavior which was  
123922 declared as undefined in POSIX.1c. How a calling thread acquires or releases a mutex now  
123923 depends upon the mutex *type* attribute.

123924 The *type* attribute can have the following values:

123925 PTHREAD\_MUTEX\_NORMAL

123926 Basic mutex with no specific error checking built in. Does not report a deadlock error.

123927 PTHREAD\_MUTEX\_RECURSIVE

123928 Allows any thread to recursively lock a mutex. The mutex must be unlocked an equal  
123929 number of times to release the mutex.

123930 PTHREAD\_MUTEX\_ERRORCHECK

123931 Detects and reports simple usage errors; that is, an attempt to unlock a mutex that is  
123932 not locked by the calling thread or that is not locked at all, or an attempt to relock a  
123933 mutex the thread already owns.

123934 PTHREAD\_MUTEX\_DEFAULT

123935 The default mutex type. May be mapped to any of the above mutex types or may be  
123936 an implementation-defined type.

123937 *Normal* mutexes do not detect deadlock conditions; for example, a thread will hang if it  
123938 tries to relock a normal mutex that it already owns. Attempting to unlock a mutex locked  
123939 by another thread, or unlocking an unlocked mutex, results in undefined behavior. Normal  
123940 mutexes will usually be the fastest type of mutex available on a platform but provide the  
123941 least error checking.

123942 *Recursive* mutexes are useful for converting old code where it is difficult to establish clear  
123943 boundaries of synchronization. A thread can relock a recursive mutex without first  
123944 unlocking it. The relocking deadlock which can occur with normal mutexes cannot occur  
123945 with this type of mutex. However, multiple locks of a recursive mutex require the same  
123946 number of unlocks to release the mutex before another thread can acquire the mutex.  
123947 Furthermore, this type of mutex maintains the concept of an owner. Thus, a thread  
123948 attempting to unlock a recursive mutex which another thread has locked returns with an  
123949 error. A thread attempting to unlock a recursive mutex that is not locked returns with an  
123950 error. Never use a recursive mutex with condition variables because the implicit unlock  
123951 performed by `pthread_cond_wait()` or `pthread_cond_timedwait()` will not actually release the  
123952 mutex if it had been locked multiple times.

123953 *Errorcheck* mutexes provide error checking and are useful primarily as a debugging aid. A  
123954 thread attempting to relock an errorcheck mutex without first unlocking it returns with an  
123955 error. Again, this type of mutex maintains the concept of an owner. Thus, a thread  
123956 attempting to unlock an errorcheck mutex which another thread has locked returns with  
123957 an error. A thread attempting to unlock an errorcheck mutex that is not locked also returns  
123958 with an error. It should be noted that errorcheck mutexes will almost always be much  
123959 slower than normal mutexes due to the extra state checks performed.

123960 The default mutex type provides implementation-defined error checking. The default  
123961 mutex may be mapped to one of the other defined types or may be something entirely  
123962 different. This enables each vendor to provide the mutex semantics which the vendor feels  
123963 will be most useful to their target users. Most vendors will probably choose to make  
123964 normal mutexes the default so as to give applications the benefit of the fastest type of

123965 mutexes available on their platform. Check your implementation's documentation.

123966 An application developer can use any of the mutex types almost interchangeably as long  
 123967 as the application does not depend upon the implementation detecting (or failing to  
 123968 detect) any particular errors. Note that a recursive mutex can be used with condition  
 123969 variable waits as long as the application never recursively locks the mutex.

123970 Two functions are provided for manipulating the *type* attribute of a mutex attributes object.  
 123971 This attribute is set or returned in the *type* parameter of these functions. The  
 123972 *pthread\_mutexattr\_settype()* function is used to set a specific type value while  
 123973 *pthread\_mutexattr\_gettype()* is used to return the type of the mutex. Setting the *type*  
 123974 attribute of a mutex attributes object affects only mutexes initialized using that mutex  
 123975 attributes object. Changing the *type* attribute does not affect mutexes previously initialized  
 123976 using that mutex attributes object.

123977 • Read-Write Locks and Attributes

123978 The read-write locks introduced have been harmonized with those in IEEE Std  
 123979 1003.1j-2000; see also [Section B.2.9.6](#) (on page 3648).

123980 Read-write locks (also known as reader-writer locks) allow a thread to exclusively lock  
 123981 some shared data while updating that data, or allow any number of threads to have  
 123982 simultaneous read-only access to the data.

123983 Unlike a mutex, a read-write lock distinguishes between reading data and writing data. A  
 123984 mutex excludes all other threads. A read-write lock allows other threads access to the data,  
 123985 providing no thread is modifying the data. Thus, a read-write lock is less primitive than  
 123986 either a mutex-condition variable pair or a semaphore.

123987 Application developers should consider using a read-write lock rather than a mutex to  
 123988 protect data that is frequently referenced but seldom modified. Most threads (readers) will  
 123989 be able to read the data without waiting and will only have to block when some other  
 123990 thread (a writer) is in the process of modifying the data. Conversely a thread that wants to  
 123991 change the data is forced to wait until there are no readers. This type of lock is often used  
 123992 to facilitate parallel access to data on multi-processor platforms or to avoid context  
 123993 switches on single processor platforms where multiple threads access the same data.

123994 If a read-write lock becomes unlocked and there are multiple threads waiting to acquire  
 123995 the write lock, the implementation's scheduling policy determines which thread acquires  
 123996 the read-write lock for writing. If there are multiple threads blocked on a read-write lock  
 123997 for both read locks and write locks, it is unspecified whether the readers or a writer  
 123998 acquire the lock first. However, for performance reasons, implementations often favor  
 123999 writers over readers to avoid potential writer starvation.

124000 A read-write lock object is an implementation-defined opaque object of type  
 124001 **pthread\_rwlock\_t** as defined in **<pthread.h>**. There are two different sorts of locks  
 124002 associated with a read-write lock: a read lock and a write lock.

124003 The *pthread\_rwlockattr\_init()* function initializes a read-write lock attributes object with the  
 124004 default value for all the attributes defined in the implementation. After a read-write lock  
 124005 attributes object has been used to initialize one or more read-write locks, changes to the  
 124006 read-write lock attributes object, including destruction, do not affect previously initialized  
 124007 read-write locks.

124008 Implementations must provide at least the read-write lock attribute *process-shared*. This  
 124009 attribute can have the following values:

124010 PTHREAD\_PROCESS\_SHARED  
124011 Any thread of any process that has access to the memory where the read-write lock  
124012 resides can manipulate the read-write lock.

124013 PTHREAD\_PROCESS\_PRIVATE  
124014 Only threads created within the same process as the thread that initialized the read-  
124015 write lock can manipulate the read-write lock. This is the default value.

124016 The *pthread\_rwlockattr\_setpshared()* function is used to set the *process-shared* attribute of an  
124017 initialized read-write lock attributes object while the function  
124018 *pthread\_rwlockattr\_getpshared()* obtains the current value of the *process-shared* attribute.

124019 A read-write lock attributes object is destroyed using the *pthread\_rwlockattr\_destroy()*  
124020 function. The effect of subsequent use of the read-write lock attributes object is undefined.

124021 A thread creates a read-write lock using the *pthread\_rwlock\_init()* function. The attributes  
124022 of the read-write lock can be specified by the application developer; otherwise, the default  
124023 implementation-defined read-write lock attributes are used if the pointer to the read-write  
124024 lock attributes object is NULL. In cases where the default attributes are appropriate, the  
124025 PTHREAD\_RWLOCK\_INITIALIZER macro can be used to initialize read-write locks.

124026 A thread which wants to apply a read lock to the read-write lock can use either  
124027 *pthread\_rwlock\_rdlock()* or *pthread\_rwlock\_tryrdlock()*. If *pthread\_rwlock\_rdlock()* is used, the  
124028 thread acquires a read lock if a writer does not hold the write lock and there are no writers  
124029 blocked on the write lock. If a read lock is not acquired, the calling thread blocks until it  
124030 can acquire a lock. However, if *pthread\_rwlock\_tryrdlock()* is used, the function returns  
124031 immediately with the error [EBUSY] if any thread holds a write lock or there are blocked  
124032 writers waiting for the write lock.

124033 A thread which wants to apply a write lock to the read-write lock can use either of two  
124034 functions: *pthread\_rwlock\_wrlock()* or *pthread\_rwlock\_trywrlock()*. If *pthread\_rwlock\_wrlock()*  
124035 is used, the thread acquires the write lock if no other reader or writer threads hold the  
124036 read-write lock. If the write lock is not acquired, the thread blocks until it can acquire the  
124037 write lock. However, if *pthread\_rwlock\_trywrlock()* is used, the function returns  
124038 immediately with the error [EBUSY] if any thread is holding either a read or a write lock.

124039 The *pthread\_rwlock\_unlock()* function is used to unlock a read-write lock object held by the  
124040 calling thread. Results are undefined if the read-write lock is not held by the calling thread.  
124041 If there are other read locks currently held on the read-write lock object, the read-write  
124042 lock object remains in the read locked state but without the current thread as one of its  
124043 owners. If this function releases the last read lock for this read-write lock object, the read-  
124044 write lock object is put in the unlocked read state. If this function is called to release a write  
124045 lock for this read-write lock object, the read-write lock object is put in the unlocked state.

124046 • Thread Concurrency Level

124047 On threads implementations that multiplex user threads onto a smaller set of kernel  
124048 execution entities, the system attempts to create a reasonable number of kernel execution  
124049 entities for the application upon application startup.

124050 On some implementations, these kernel entities are retained by user threads that block in  
124051 the kernel. Other implementations do not *timeslice* user threads so that multiple compute-  
124052 bound user threads can share a kernel thread. On such implementations, some  
124053 applications may use up all the available kernel execution entities before their user-space  
124054 threads are used up. The process may be left with user threads capable of doing work for  
124055 the application but with no way to schedule them.

124056 The *pthread\_setconcurrency()* function enables an application to request more kernel

entities; that is, specify a desired concurrency level. However, this function merely provides a hint to the implementation. The implementation is free to ignore this request or to provide some other number of kernel entities. If an implementation does not multiplex user threads onto a smaller number of kernel execution entities, the *pthread\_setconcurrency()* function has no effect.

The *pthread\_setconcurrency()* function may also have an effect on implementations where the kernel mode and user mode schedulers cooperate to ensure that ready user threads are not prevented from running by other threads blocked in the kernel.

The *pthread\_getconcurrency()* function always returns the value set by a previous call to *pthread\_setconcurrency()*. However, if *pthread\_setconcurrency()* was not previously called, this function returns zero to indicate that the threads implementation is maintaining the concurrency level.

- Thread Stack Guard Size

DCE threads introduced the concept of a “thread stack guard size”. Most thread implementations add a region of protected memory to a thread’s stack, commonly known as a “guard region”, as a safety measure to prevent stack pointer overflow in one thread from corrupting the contents of another thread’s stack. The default size of the guard regions attribute is {PAGESIZE} bytes and is implementation-defined.

Some application developers may wish to change the stack guard size. When an application creates a large number of threads, the extra page allocated for each stack may strain system resources. In addition to the extra page of memory, the kernel’s memory manager has to keep track of the different protections on adjoining pages. When this is a problem, the application developer may request a guard size of 0 bytes to conserve system resources by eliminating stack overflow protection.

Conversely an application that allocates large data structures such as arrays on the stack may wish to increase the default guard size in order to detect stack overflow. If a thread allocates two pages for a data array, a single guard page provides little protection against thread stack overflows since the thread can corrupt adjoining memory beyond the guard page.

The System Interfaces volume of POSIX.1-2008 defines a new attribute of a thread attributes object; that is, the *guardsize* attribute which allows applications to specify the size of the guard region of a thread’s stack.

Two functions are provided for manipulating a thread’s stack guard size. The *pthread\_attr\_setguardsize()* function sets the thread *guardsize* attribute, and the *pthread\_attr\_getguardsize()* function retrieves the current value.

An implementation may round up the requested guard size to a multiple of the configurable system variable {PAGESIZE}. In this case, *pthread\_attr\_getguardsize()* returns the guard size specified by the previous *pthread\_attr\_setguardsize()* function call and not the rounded up value.

If an application is managing its own thread stacks using the *stackaddr* attribute, the *guardsize* attribute is ignored and no stack overflow protection is provided. In this case, it is the responsibility of the application to manage stack overflow along with stack allocation.

- Parallel I/O

Suppose two or more threads independently issue read requests on the same file. To read specific data from a file, a thread must first call *lseek()* to seek to the proper offset in the file, and then call *read()* to retrieve the required data. If more than one thread does this at the same time, the first thread may complete its seek call, but before it gets a chance to

124104 issue its read call a second thread may complete its seek call, resulting in the first thread  
124105 accessing incorrect data when it issues its read call. One workaround is to lock the file  
124106 descriptor while seeking and reading or writing, but this reduces parallelism and adds  
124107 overhead.

124108 Instead, the System Interfaces volume of POSIX.1-2008 provides two functions to make  
124109 seek/read and seek/write operations atomic. The file descriptor's current offset is  
124110 unchanged, thus allowing multiple read and write operations to proceed in parallel. This  
124111 improves the I/O performance of threaded applications. The *pread()* function is used to do  
124112 an atomic read of data from a file into a buffer. Conversely, the *pwrite()* function does an  
124113 atomic write of data from a buffer to a file.

#### 124114 B.2.9.1 Thread-Safety

124115 All functions required by POSIX.1-2008 need to be thread-safe. Implementations have to  
124116 provide internal synchronization when necessary in order to achieve this goal. In certain cases—  
124117 for example, most floating-point implementations—context switch code may have to manage  
124118 the writable shared state.

124119 While a read from a pipe of {PIPE\_BUF}\*2 bytes may not generate a single atomic and thread-  
124120 safe stream of bytes, it should generate “several” (individually atomic) thread-safe streams of  
124121 bytes. Similarly, while reading from a terminal device may not generate a single atomic and  
124122 thread-safe stream of bytes, it should generate some finite number of (individually atomic) and  
124123 thread-safe streams of bytes. That is, concurrent calls to read for a pipe, FIFO, or terminal device  
124124 are not allowed to result in corrupting the stream of bytes or other internal data. However,  
124125 *read()*, in these cases, is not required to return a single contiguous and atomic stream of bytes.

124126 It is not required that all functions provided by POSIX.1-2008 be either async-cancel-safe or  
124127 async-signal-safe.

124128 As it turns out, some functions are inherently not thread-safe; that is, their interface  
124129 specifications preclude async-signal-safety. For example, some functions (such as *asctime()*)  
124130 return a pointer to a result stored in memory space allocated by the function on a per-process  
124131 basis. Such a function is not thread-safe, because its result can be overwritten by successive  
124132 invocations. Other functions, while not inherently non-thread-safe, may be implemented in  
124133 ways that lead to them not being thread-safe. For example, some functions (such as *rand()*) store  
124134 state information (such as a seed value, which survives multiple function invocations) in  
124135 memory space allocated by the function on a per-process basis. The implementation of such a  
124136 function is not thread-safe if the implementation fails to synchronize invocations of the function  
124137 and thus fails to protect the state information. The problem is that when the state information is  
124138 not protected, concurrent invocations can interfere with one another (for example, applications  
124139 using *rand()* may see the same seed value).

#### 124140 Thread-Safety and Locking of Existing Functions

124141 Originally, POSIX.1 was not designed to work in a multi-threaded environment, and some  
124142 implementations of some existing functions will not work properly when executed concurrently.  
124143 To provide routines that will work correctly in an environment with threads (“thread-safe”), two  
124144 problems need to be solved:

- 124145 1. Routines that maintain or return pointers to static areas internal to the routine (which  
124146 may now be shared) need to be modified. The routines *ttyname()* and *localtime()* are  
124147 examples.
- 124148 2. Routines that access data space shared by more than one thread need to be modified. The  
124149 *malloc()* function and the *stdio* family routines are examples.

There are a variety of constraints on these changes. The first is compatibility with the existing versions of these functions—non-thread-safe functions will continue to be in use for some time, as the original interfaces are used by existing code. Another is that the new thread-safe versions of these functions represent as small a change as possible over the familiar interfaces provided by the existing non-thread-safe versions. The new interfaces should be independent of any particular threads implementation. In particular, they should be thread-safe without depending on explicit thread-specific memory. Finally, there should be minimal performance penalty due to the changes made to the functions.

It is intended that the list of functions from POSIX.1 that cannot be made thread-safe and for which corrected versions are provided be complete.

#### *Thread-Safety and Locking Solutions*

Many of the POSIX.1 functions were thread-safe and did not change at all. However, some functions (for example, the math functions typically found in **libm**) are not thread-safe because of writable shared global state. For instance, in IEEE Std 754-1985 floating-point implementations, the computation modes and flags are global and shared.

Some functions are not thread-safe because a particular implementation is not reentrant, typically because of a non-essential use of static storage. These require only a new implementation.

Thread-safe libraries are useful in a wide range of parallel (and asynchronous) programming environments, not just within pthreads. In order to be used outside the context of pthreads, however, such libraries still have to use some synchronization method. These could either be independent of the pthread synchronization operations, or they could be a subset of the pthread interfaces. Either method results in thread-safe library implementations that can be used without the rest of pthreads.

Some functions, such as the *stdio* family interface and dynamic memory allocation functions such as *malloc()*, are inter-dependent routines that share resources (for example, buffers) across related calls. These require synchronization to work correctly, but they do not require any change to their external (user-visible) interfaces.

In some cases, such as *getc()* and *putc()*, adding synchronization is likely to create an unacceptable performance impact. In this case, slower thread-safe synchronized functions are to be provided, but the original, faster (but unsafe) functions (which may be implemented as macros) are retained under new names. Some additional special-purpose synchronization facilities are necessary for these macros to be usable in multi-threaded programs. This also requires changes in **<stdio.h>**.

The other common reason that functions are unsafe is that they return a pointer to static storage, making the functions non-thread-safe. This has to be changed, and there are three natural choices:

1. Return a pointer to thread-specific storage

This could incur a severe performance penalty on those architectures with a costly implementation of the thread-specific data interface.

A variation on this technique is to use *malloc()* to allocate storage for the function output and return a pointer to this storage. This technique may also have an undesirable performance impact, however, and a simplistic implementation requires that the user program explicitly free the storage object when it is no longer needed. This technique is used by some existing POSIX.1 functions. With careful implementation for infrequently used functions, there may be little or no performance or storage penalty, and the maintenance of already-standardized interfaces is a significant benefit.

2. Return the actual value computed by the function

This technique can only be used with functions that return pointers to structures—routines that return character strings would have to wrap their output in an enclosing structure in order to return the output on the stack. There is also a negative performance impact inherent in this solution in that the output value has to be copied twice before it can be used by the calling function: once from the called routine's local buffers to the top of the stack, then from the top of the stack to the assignment target. Finally, many older compilers cannot support this technique due to a historical tendency to use internal static buffers to deliver the results of structure-valued functions.

3. Have the caller pass the address of a buffer to contain the computed value

The only disadvantage of this approach is that extra arguments have to be provided by the calling program. It represents the most efficient solution to the problem, however, and, unlike the *malloc()* technique, it is semantically clear.

There are some routines (often groups of related routines) whose interfaces are inherently non-thread-safe because they communicate across multiple function invocations by means of static memory locations. The solution is to redesign the calls so that they are thread-safe, typically by passing the needed data as extra parameters. Unfortunately, this may require major changes to the interface as well.

A floating-point implementation using IEEE Std 754-1985 is a case in point. A less problematic example is the *rand48* family of pseudo-random number generators. The functions *getgrgid()*, *getgrnam()*, *getpwnam()*, and *getpwuid()* are another such case.

The problems with *errno* are discussed in [Alternative Solutions for Per-Thread \*errno\*](#) (on page 3564).

Some functions can be thread-safe or not, depending on their arguments. These include the *tmpnam()* and *ctermid()* functions. These functions have pointers to character strings as arguments. If the pointers are not NULL, the functions store their results in the character string; however, if the pointers are NULL, the functions store their results in an area that may be static and thus subject to overwriting by successive calls. These should only be called by multi-thread applications when their arguments are non-NULL.

*Asynchronous Safety and Thread-Safety*

A floating-point implementation has many modes that effect rounding and other aspects of computation. Functions in some math library implementations may change the computation modes for the duration of a function call. If such a function call is interrupted by a signal or cancellation, the floating-point state is not required to be protected.

There is a significant cost to make floating-point operations async-cancel-safe or async-signal-safe; accordingly, neither form of async safety is required.

*Functions Returning Pointers to Static Storage*

For those functions that are not thread-safe because they return values in fixed size statically allocated structures, alternate “\_r” forms are provided that pass a pointer to an explicit result structure. Those that return pointers into library-allocated buffers have forms provided with explicit buffer and length parameters.

For functions that return pointers to library-allocated buffers, it makes sense to provide “\_r” versions that allow the application control over allocation of the storage in which results are returned. This allows the state used by these functions to be managed on an application-specific basis, supporting per-thread, per-process, or other application-specific sharing relationships.

Early proposals had provided “\_r” versions for functions that returned pointers to variable-size

124243 buffers without providing a means for determining the required buffer size. This would have  
 124244 made using such functions exceedingly clumsy, potentially requiring iteratively calling them  
 124245 with increasingly larger guesses for the amount of storage required. Hence, *sysconf()* variables  
 124246 have been provided for such functions that return the maximum required buffer size.

124247 Thus, the rule that has been followed by POSIX.1-2008 when adapting single-threaded non-  
 124248 thread-safe functions is as follows: all functions returning pointers to library-allocated storage  
 124249 should have “\_r” versions provided, allowing the application control over the storage  
 124250 allocation. Those with variable-sized return values accept both a buffer address and a length  
 124251 parameter. The *sysconf()* variables are provided to supply the appropriate buffer sizes when  
 124252 required. Implementors are encouraged to apply the same rule when adapting their own  
 124253 existing functions to a pthreads environment.

#### 124254 B.2.9.2 Thread IDs

124255 Separate applications should communicate through well-defined interfaces and should not  
 124256 depend on each other’s implementation. For example, if a programmer decides to rewrite the  
 124257 *sort* utility using multiple threads, it should be easy to do this so that the interface to the *sort*  
 124258 utility does not change. Consider that if the user causes SIGINT to be generated while the *sort*  
 124259 utility is running, keeping the same interface means that the entire *sort* utility is killed, not just  
 124260 one of its threads. As another example, consider a realtime application that manages a reactor.  
 124261 Such an application may wish to allow other applications to control the priority at which it  
 124262 watches the control rods. One technique to accomplish this is to write the ID of the thread  
 124263 watching the control rods into a file and allow other programs to change the priority of that  
 124264 thread as they see fit. A simpler technique is to have the reactor process accept IPCs  
 124265 (Interprocess Communication messages) from other processes, telling it at a semantic level what  
 124266 priority the program should assign to watching the control rods. This allows the programmer  
 124267 greater flexibility in the implementation. For example, the programmer can change the  
 124268 implementation from having one thread per rod to having one thread watching all of the rods  
 124269 without changing the interface. Having threads live inside the process means that the  
 124270 implementation of a process is invisible to outside processes (excepting debuggers and system  
 124271 management tools).

124272 Threads do not provide a protection boundary. Every thread model allows threads to share  
 124273 memory with other threads and encourages this sharing to be widespread. This means that one  
 124274 thread can wipe out memory that is needed for the correct functioning of other threads that are  
 124275 sharing its memory. Consequently, providing each thread with its own user and/or group IDs  
 124276 would not provide a protection boundary between threads sharing memory.

124277 Some applications make the assumption that the implementation can always detect invalid uses  
 124278 of thread IDs of type **pthread\_t**. This is an invalid assumption. Specifically, if **pthread\_t** is  
 124279 defined as a pointer type, no access check needs to be performed before using the ID.

124280 As with other interfaces that take pointer parameters, the outcome of passing an invalid  
 124281 parameter can result in an invalid memory reference or an attempt to access an undefined  
 124282 portion of a memory object, cause signals to be sent (SIGSEGV or SIGBUS) and possible  
 124283 termination of the process. This is a similar case to passing an invalid buffer pointer to *read()*.  
 124284 Some implementations might implement *read()* as a system call and set an [EFAULT] error  
 124285 condition. Other implementations might contain parts of *read()* at user level and the first  
 124286 attempt to access data at an invalid reference will cause a signal to be sent instead.

124287 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
 124288 that the function should fail and report an [ESRCH] error. This does not imply that  
 124289 implementations are required to return in this case. It is legitimate behavior to send an “invalid  
 124290 memory reference” signal (SIGSEGV or SIGBUS). It is the application’s responsibility to use only

124291 valid thread IDs and to keep track of the lifetime of the underlying threads.

124292 B.2.9.3 *Thread Mutexes*

124293 There is no additional rationale provided for this section.

124294 B.2.9.4 *Thread Scheduling*

124295 • Scheduling Implementation Models

124296 The following scheduling implementation models are presented in terms of threads and  
124297 “kernel entities”. This is to simplify exposition of the models, and it does not imply that  
124298 an implementation actually has an identifiable “kernel entity”.

124299 A kernel entity is not defined beyond the fact that it has scheduling attributes that are used  
124300 to resolve contention with other kernel entities for execution resources. A kernel entity  
124301 may be thought of as an envelope that holds a thread or a separate kernel thread. It is not a  
124302 conventional process, although it shares with the process the attribute that it has a single  
124303 thread of control; it does not necessarily imply an address space, open files, and so on. It is  
124304 better thought of as a primitive facility upon which conventional processes and threads  
124305 may be constructed.

124306 — System Thread Scheduling Model

124307 This model consists of one thread per kernel entity. The kernel entity is solely  
124308 responsible for scheduling thread execution on one or more processors. This model  
124309 schedules all threads against all other threads in the system using the scheduling  
124310 attributes of the thread.

124311 — Process Scheduling Model

124312 A generalized process scheduling model consists of two levels of scheduling. A  
124313 threads library creates a pool of kernel entities, as required, and schedules threads to  
124314 run on them using the scheduling attributes of the threads. Typically, the size of the  
124315 pool is a function of the simultaneously runnable threads, not the total number of  
124316 threads. The kernel then schedules the kernel entities onto processors according to  
124317 their scheduling attributes, which are managed by the threads library. This set model  
124318 potentially allows a wide range of mappings between threads and kernel entities.

124319 • System and Process Scheduling Model Performance

124320 There are a number of important implications on the performance of applications using  
124321 these scheduling models. The process scheduling model potentially provides lower  
124322 overhead for making scheduling decisions, since there is no need to access kernel-level  
124323 information or functions and the set of schedulable entities is smaller (only the threads  
124324 within the process).

124325 On the other hand, since the kernel is also making scheduling decisions regarding the  
124326 system resources under its control (for example, CPU(s), I/O devices, memory), decisions  
124327 that do not take thread scheduling parameters into account can result in unspecified  
124328 delays for realtime application threads, causing them to miss maximum response time  
124329 limits.

124330 • Rate Monotonic Scheduling

124331 Rate monotonic scheduling was considered, but rejected for standardization in the context  
124332 of pthreads. A sporadic server policy is included.

## • Scheduling Options

In POSIX.1-2008, the basic thread scheduling functions are defined under the threads functionality, so that they are required of all threads implementations. However, there are no specific scheduling policies required by this functionality to allow for conforming thread implementations that are not targeted to realtime applications.

Specific standard scheduling policies are defined to be under the Thread Execution Scheduling option, and they are specifically designed to support realtime applications by providing predictable resource-sharing sequences. The name of this option was chosen to emphasize that this functionality is defined as appropriate for realtime applications that require simple priority-based scheduling.

It is recognized that these policies are not necessarily satisfactory for some multi-processor implementations, and work is ongoing to address a wider range of scheduling behaviors. The interfaces have been chosen to create abundant opportunity for future scheduling policies to be implemented and standardized based on this interface. In order to standardize a new scheduling policy, all that is required (from the standpoint of thread scheduling attributes) is to define a new policy name, new members of the thread attributes object, and functions to set these members when the scheduling policy is equal to the new value.

## Scheduling Contention Scope

In order to accommodate the requirement for realtime response, each thread has a scheduling contention scope attribute. Threads with a system scheduling contention scope have to be scheduled with respect to all other threads in the system. These threads are usually bound to a single kernel entity that reflects their scheduling attributes and are directly scheduled by the kernel.

Threads with a process scheduling contention scope need be scheduled only with respect to the other threads in the process. These threads may be scheduled within the process onto a pool of kernel entities. The implementation is also free to bind these threads directly to kernel entities and let them be scheduled by the kernel. Process scheduling contention scope allows the implementation the most flexibility and is the default if both contention scopes are supported and none is specified.

Thus, the choice by implementors to provide one or the other (or both) of these scheduling models is driven by the need of their supported application domains for worst-case (that is, realtime) response, or average-case (non-realtime) response.

## Scheduling Allocation Domain

The SCHED\_FIFO and SCHED\_RR scheduling policies take on different characteristics on a multi-processor. Other scheduling policies are also subject to changed behavior when executed on a multi-processor. The concept of scheduling allocation domain determines the set of processors on which the threads of an application may run. By considering the application's processor scheduling allocation domain for its threads, scheduling policies can be defined in terms of their behavior for varying processor scheduling allocation domain values. It is conceivable that not all scheduling allocation domain sizes make sense for all scheduling policies on all implementations. The concept of scheduling allocation domain, however, is a useful tool for the description of multi-processor scheduling policies.

The "process control" approach to scheduling obtains significant performance advantages from dynamic scheduling allocation domain sizes when it is applicable.

Non-Uniform Memory Access (NUMA) multi-processors may use a system scheduling structure

124379 that involves reassignment of threads among scheduling allocation domains. In NUMA  
124380 machines, a natural model of scheduling is to match scheduling allocation domains to clusters of  
124381 processors. Load balancing in such an environment requires changing the scheduling allocation  
124382 domain to which a thread is assigned.

### 124383 **Scheduling Documentation**

124384 Implementation-provided scheduling policies need to be completely documented in order to be  
124385 useful. This documentation includes a description of the attributes required for the policy, the  
124386 scheduling interaction of threads running under this policy and all other supported policies, and  
124387 the effects of all possible values for processor scheduling allocation domain. Note that for the  
124388 implementor wishing to be minimally-compliant, it is (minimally) acceptable to define the  
124389 behavior as undefined.

### 124390 **Scheduling Contention Scope Attribute**

124391 The scheduling contention scope defines how threads compete for resources. Within  
124392 POSIX.1-2008, scheduling contention scope is used to describe only how threads are scheduled  
124393 in relation to one another in the system. That is, either they are scheduled against all other  
124394 threads in the system ("system scope") or only against those threads in the process ("process  
124395 scope"). In fact, scheduling contention scope may apply to additional resources, including  
124396 virtual timers and profiling, which are not currently considered by POSIX.1-2008.

### 124397 **Mixed Scopes**

124398 If only one scheduling contention scope is supported, the scheduling decision is straightforward.  
124399 To perform the processor scheduling decision in a mixed scope environment, it is necessary to  
124400 map the scheduling attributes of the thread with process-wide contention scope to the same  
124401 attribute space as the thread with system-wide contention scope.

124402 Since a conforming implementation has to support one and may support both scopes, it is useful  
124403 to discuss the effects of such choices with respect to example applications. If an implementation  
124404 supports both scopes, mixing scopes provides a means of better managing system-level (that is,  
124405 kernel-level) and library-level resources. In general, threads with system scope will require the  
124406 resources of a separate kernel entity in order to guarantee the scheduling semantics. On the  
124407 other hand, threads with process scope can share the resources of a kernel entity while  
124408 maintaining the scheduling semantics.

124409 The application is free to create threads with dedicated kernel resources, and other threads that  
124410 multiplex kernel resources. Consider the example of a window server. The server allocates two  
124411 threads per widget: one thread manages the widget user interface (including drawing), while  
124412 the other thread takes any required application action. This allows the widget to be "active"  
124413 while the application is computing. A screen image may be built from thousands of widgets. If  
124414 each of these threads had been created with system scope, then most of the kernel-level  
124415 resources might be wasted, since only a few widgets are active at any one time. In addition,  
124416 mixed scope is particularly useful in a window server where one thread with high priority and  
124417 system scope handles the mouse so that it tracks well. As another example, consider a database  
124418 server. For each of the hundreds or thousands of clients supported by a large server, an  
124419 equivalent number of threads will have to be created. If each of these threads were system scope,  
124420 the consequences would be the same as for the window server example above. However, the  
124421 server could be constructed so that actual retrieval of data is done by several dedicated threads.  
124422 Dedicated threads that do work for all clients frequently justify the added expense of system  
124423 scope. If it were not permissible to mix system and process threads in the same process, this type  
124424 of solution would not be possible.

## Dynamic Thread Scheduling Parameters Access

In many time-constrained applications, there is no need to change the scheduling attributes dynamically during thread or process execution, since the general use of these attributes is to reflect directly the time constraints of the application. Since these time constraints are generally imposed to meet higher-level system requirements, such as accuracy or availability, they frequently should remain unchanged during application execution.

However, there are important situations in which the scheduling attributes should be changed. Generally, this will occur when external environmental conditions exist in which the time constraints change. Consider, for example, a space vehicle major mode change, such as the change from ascent to descent mode, or the change from the space environment to the atmospheric environment. In such cases, the frequency with which many of the sensors or actuators need to be read or written will change, which will necessitate a priority change. In other cases, even the existence of a time constraint might be temporary, necessitating not just a priority change, but also a policy change for ongoing threads or processes. For this reason, it is critical that the interface should provide functions to change the scheduling parameters dynamically, but, as with many of the other realtime functions, it is important that applications use them properly to avoid the possibility of unnecessarily degrading performance.

In providing functions for dynamically changing the scheduling behavior of threads, there were two options: provide functions to get and set the individual scheduling parameters of threads, or provide a single interface to get and set all the scheduling parameters for a given thread simultaneously. Both approaches have merit. Access functions for individual parameters allow simpler control of thread scheduling for simple thread scheduling parameters. However, a single function for setting all the parameters for a given scheduling policy is required when first setting that scheduling policy. Since the single all-encompassing functions are required, it was decided to leave the interface as minimal as possible. Note that simpler functions (such as *pthread\_setprio()* for threads running under the priority-based schedulers) can be easily defined in terms of the all-encompassing functions.

If the *pthread\_setschedparam()* function executes successfully, it will have set all of the scheduling parameter values indicated in *param*; otherwise, none of the scheduling parameters will have been modified. This is necessary to ensure that the scheduling of this and all other threads continues to be consistent in the presence of an erroneous scheduling parameter.

The [EPERM] error value is included in the list of possible *pthread\_setschedparam()* error returns as a reflection of the fact that the ability to change scheduling parameters increases risks to the implementation and application performance if the scheduling parameters are changed improperly. For this reason, and based on some existing practice, it was felt that some implementations would probably choose to define specific permissions for changing either a thread's own or another thread's scheduling parameters. POSIX.1-2008 does not include portable methods for setting or retrieving permissions, so any such use of permissions is completely unspecified.

## Mutex Initialization Scheduling Attributes

In a priority-driven environment, a direct use of traditional primitives like mutexes and condition variables can lead to unbounded priority inversion, where a higher priority thread can be blocked by a lower priority thread, or set of threads, for an unbounded duration of time. As a result, it becomes impossible to guarantee thread deadlines. Priority inversion can be bounded and minimized by the use of priority inheritance protocols. This allows thread deadlines to be guaranteed even in the presence of synchronization requirements.

Two useful but simple members of the family of priority inheritance protocols are the basic priority inheritance protocol and the priority ceiling protocol emulation. Under the Basic

124473 Priority Inheritance protocol (governed by the Non-Robust Mutex Priority Inheritance option), a  
124474 thread that is blocking higher priority threads executes at the priority of the highest priority  
124475 thread that it blocks. This simple mechanism allows priority inversion to be bounded by the  
124476 duration of critical sections and makes timing analysis possible.

124477 Under the Priority Ceiling Protocol Emulation protocol (governed by the Thread Priority  
124478 Protection option), each mutex has a priority ceiling, usually defined as the priority of the  
124479 highest priority thread that can lock the mutex. When a thread is executing inside critical  
124480 sections, its priority is unconditionally increased to the highest of the priority ceilings of all the  
124481 mutexes owned by the thread. This protocol has two very desirable properties in uni-processor  
124482 systems. First, a thread can be blocked by a lower priority thread for at most the duration of one  
124483 single critical section. Furthermore, when the protocol is correctly used in a single processor, and  
124484 if threads do not become blocked while owning mutexes, mutual deadlocks are prevented.

124485 The priority ceiling emulation can be extended to multiple processor environments, in which  
124486 case the values of the priority ceilings will be assigned depending on the kind of mutex that is  
124487 being used: local to only one processor, or global, shared by several processors. Local priority  
124488 ceilings will be assigned the usual way, equal to the priority of the highest priority thread that  
124489 may lock that mutex. Global priority ceilings will usually be assigned a priority level higher  
124490 than all the priorities assigned to any of the threads that reside in the involved processors to  
124491 avoid the effect called remote blocking.

#### 124492 **Change the Priority Ceiling of a Mutex**

124493 In order for the priority protect protocol to exhibit its desired properties of bounding priority  
124494 inversion and avoidance of deadlock, it is critical that the ceiling priority of a mutex be the same  
124495 as the priority of the highest thread that can ever hold it, or higher. Thus, if the priorities of the  
124496 threads using such mutexes never change dynamically, there is no need ever to change the  
124497 priority ceiling of a mutex.

124498 However, if a major system mode change results in an altered response time requirement for one  
124499 or more application threads, their priority has to change to reflect it. It will occasionally be the  
124500 case that the priority ceilings of mutexes held also need to change. While changing priority  
124501 ceilings should generally be avoided, it is important that POSIX.1-2008 provide these interfaces  
124502 for those cases in which it is necessary.

#### 124503 *B.2.9.5 Thread Cancellation*

124504 Many existing threads packages have facilities for canceling an operation or canceling a thread.  
124505 These facilities are used for implementing user requests (such as the CANCEL button in a  
124506 window-based application), for implementing OR parallelism (for example, telling the other  
124507 threads to stop working once one thread has found a forced mate in a parallel chess program), or  
124508 for implementing the ABORT mechanism in Ada.

124509 POSIX programs traditionally have used the signal mechanism combined with either *longjmp()*  
124510 or polling to cancel operations. Many POSIX programmers have trouble using these facilities to  
124511 solve their problems efficiently in a single-threaded process. With the introduction of threads,  
124512 these solutions become even more difficult to use.

124513 The main issues with implementing a cancellation facility are specifying the operation to be  
124514 canceled, cleanly releasing any resources allocated to that operation, controlling when the target  
124515 notices that it has been canceled, and defining the interaction between asynchronous signals and  
124516 cancellation.

## Specifying the Operation to Cancel

Consider a thread that calls through five distinct levels of program abstraction and then, inside the lowest-level abstraction, calls a function that suspends the thread. (An abstraction boundary is a layer at which the client of the abstraction sees only the service being provided and can remain ignorant of the implementation. Abstractions are often layered, each level of abstraction being a client of the lower-level abstraction and implementing a higher-level abstraction.) Depending on the semantics of each abstraction, one could imagine wanting to cancel only the call that causes suspension, only the bottom two levels, or the operation being done by the entire thread. Canceling operations at a finer grain than the entire thread is difficult because threads are active and they may be run in parallel on a multi-processor. By the time one thread can make a request to cancel an operation, the thread performing the operation may have completed that operation and gone on to start another operation whose cancellation is not desired. Thread IDs are not reused until the thread has exited, and either it was created with the *Attr detachstate* attribute set to *PTHREAD\_CREATE\_DETACHED* or the *pthread\_join()* or *pthread\_detach()* function has been called for that thread. Consequently, a thread cancellation will never be misdirected when the thread terminates. For these reasons, the canceling of operations is done at the granularity of the thread. Threads are designed to be inexpensive enough so that a separate thread may be created to perform each separately cancelable operation; for example, each possibly long running user request.

For cancellation to be used in existing code, cancellation scopes and handlers will have to be established for code that needs to release resources upon cancellation, so that it follows the programming discipline described in the text.

## A Special Signal Versus a Special Interface

Two different mechanisms were considered for providing the cancellation interfaces. The first was to provide an interface to direct signals at a thread and then to define a special signal that had the required semantics. The other alternative was to use a special interface that delivered the correct semantics to the target thread.

The solution using signals produced a number of problems. It required the implementation to provide cancellation in terms of signals whereas a perfectly valid (and possibly more efficient) implementation could have both layered on a low-level set of primitives. There were so many exceptions to the special signal (it cannot be used with *kill()*, no POSIX.1 interfaces can be used with it) that it was clearly not a valid signal. Its semantics on delivery were also completely different from any existing POSIX.1 signal. As such, a special interface that did not mandate the implementation and did not confuse the semantics of signals and cancellation was felt to be the better solution.

## Races Between Cancellation and Resuming Execution

Due to the nature of cancellation, there is generally no synchronization between the thread requesting the cancellation of a blocked thread and events that may cause that thread to resume execution. For this reason, and because excess serialization hurts performance, when both an event that a thread is waiting for has occurred and a cancellation request has been made and cancellation is enabled, POSIX.1-2008 explicitly allows the implementation to choose between returning from the blocking call or acting on the cancellation request.

## Interaction of Cancellation with Asynchronous Signals

A typical use of cancellation is to acquire a lock on some resource and to establish a cancellation cleanup handler for releasing the resource when and if the thread is canceled.

A correct and complete implementation of cancellation in the presence of asynchronous signals requires considerable care. An implementation has to push a cancellation cleanup handler on the cancellation cleanup stack while maintaining the integrity of the stack data structure. If an asynchronously-generated signal is posted to the thread during a stack operation, the signal handler cannot manipulate the cancellation cleanup stack. As a consequence, asynchronous signal handlers may not cancel threads or otherwise manipulate the cancellation state of a thread. Threads may, of course, be canceled by another thread that used a *sigwait()* function to wait synchronously for an asynchronous signal.

In order for cancellation to function correctly, it is required that asynchronous signal handlers not change the cancellation state. This requires that some elements of existing practice, such as using *longjmp()* to exit from an asynchronous signal handler implicitly, be prohibited in cases where the integrity of the cancellation state of the interrupt thread cannot be ensured.

## Thread Cancellation Overview

- Cancelability States

The three possible cancelability states (disabled, deferred, and asynchronous) are encoded into two separate bits ((disable, enable) and (deferred, asynchronous)) to allow them to be changed and restored independently. For instance, short code sequences that will not block sometimes disable cancelability on entry and restore the previous state upon exit. Likewise, long or unbounded code sequences containing no convenient explicit cancellation points will sometimes set the cancelability type to asynchronous on entry and restore the previous value upon exit.

- Cancellation Points

Cancellation points are points inside of certain functions where a thread has to act on any pending cancellation request when cancelability is enabled. For functions in the “shall occur” list, a cancellation check must be performed on every call regardless of whether, absent the cancellation, the call would have blocked. For functions in the “may occur” list, a cancellation check may be performed on some calls but not others; i.e., whether or not a cancellation point occurs when one of these functions is being executed can depend on current conditions.

The idea was considered of allowing implementations to define whether blocking calls such as *read()* should be cancellation points. It was decided that it would adversely affect the design of conforming applications if blocking calls were not cancellation points because threads could be left blocked in an uncancelable state.

There are several important blocking routines that are specifically not made cancellation points:

- *pthread\_mutex\_lock()*

If *pthread\_mutex\_lock()* were a cancellation point, every routine that called it would also become a cancellation point (that is, any routine that touched shared state would automatically become a cancellation point). For example, *malloc()*, *free()*, and *rand()* would become cancellation points under this scheme. Having too many cancellation points makes programming very difficult, leading to either much disabling and restoring of cancelability or much difficulty in trying to arrange for reliable cleanup at every possible place.

124605 Since `pthread_mutex_lock()` is not a cancellation point, threads could result in being  
124606 blocked uninterruptibly for long periods of time if mutexes were used as a general  
124607 synchronization mechanism. As this is normally not acceptable, mutexes should only  
124608 be used to protect resources that are held for small fixed lengths of time where not  
124609 being able to be canceled will not be a problem. Resources that need to be held  
124610 exclusively for long periods of time should be protected with condition variables.

124611 — `pthread_barrier_wait()`

124612 Canceling a barrier wait will render a barrier unusable. Similar to a barrier timeout  
124613 (which the standard developers rejected), there is no way to guarantee the  
124614 consistency of a barrier's internal data structures if a barrier wait is canceled.

124615 — `pthread_spin_lock()`

124616 As with mutexes, spin locks should only be used to protect resources that are held for  
124617 small fixed lengths of time where not being cancelable will not be a problem.

124618 Every library routine should specify whether or not it includes any cancellation points.  
124619 Typically, only those routines that may block or compute indefinitely need to include  
124620 cancellation points.

124621 Correctly coded routines only reach cancellation points after having set up a cancellation  
124622 cleanup handler to restore invariants if the thread is canceled at that point. Being  
124623 cancelable only at specified cancellation points allows programmers to keep track of  
124624 actions needed in a cancellation cleanup handler more easily. A thread should only be  
124625 made asynchronously cancelable when it is not in the process of acquiring or releasing  
124626 resources or otherwise in a state from which it would be difficult or impossible to recover.

124627 • Thread Cancellation Cleanup Handlers

124628 The cancellation cleanup handlers provide a portable mechanism, easy to implement, for  
124629 releasing resources and restoring invariants. They are easier to use than signal handlers  
124630 because they provide a stack of cancellation cleanup handlers rather than a single handler,  
124631 and because they have an argument that can be used to pass context information to the  
124632 handler.

124633 The alternative to providing these simple cancellation cleanup handlers (whose only use is  
124634 for cleaning up when a thread is canceled) is to define a general exception package that  
124635 could be used for handling and cleaning up after hardware traps and software-detected  
124636 errors. This was too far removed from the charter of providing threads to handle  
124637 asynchrony. However, it is an explicit goal of POSIX.1-2008 to be compatible with existing  
124638 exception facilities and languages having exceptions.

124639 The interaction of this facility and other procedure-based or language-level exception  
124640 facilities is unspecified in this version of POSIX.1-2008. However, it is intended that it be  
124641 possible for an implementation to define the relationship between these cancellation  
124642 cleanup handlers and Ada, C++, or other language-level exception handling facilities.

124643 It was suggested that the cancellation cleanup handlers should also be called when the  
124644 process exits or calls the `exec` function. This was rejected partly due to the performance  
124645 problem caused by having to call the cancellation cleanup handlers of every thread before  
124646 the operation could continue. The other reason was that the only state expected to be  
124647 cleaned up by the cancellation cleanup handlers would be the intraprocess state. Any  
124648 handlers that are to clean up the interprocess state would be registered with `atexit()`. There  
124649 is the orthogonal problem that the `exec` functions do not honor the `atexit()` handlers, but  
124650 resolving this is beyond the scope of POSIX.1-2008.

- Async-Cancel Safety

A function is said to be async-cancel-safe if it is written in such a way that entering the function with asynchronous cancelability enabled will not cause any invariants to be violated, even if a cancellation request is delivered at any arbitrary instruction. Functions that are async-cancel-safe are often written in such a way that they need to acquire no resources for their operation and the visible variables that they may write are strictly limited.

Any routine that gets a resource as a side-effect cannot be made async-cancel-safe (for example, *malloc()*). If such a routine were called with asynchronous cancelability enabled, it might acquire the resource successfully, but as it was returning to the client, it could act on a cancellation request. In such a case, the application would have no way of knowing whether the resource was acquired or not.

Indeed, because many interesting routines cannot be made async-cancel-safe, most library routines in general are not async-cancel-safe. Every library routine should specify whether or not it is async-cancel safe so that programmers know which routines can be called from code that is asynchronously cancelable.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/8 is applied, adding the *pselect()* function to the list of functions with cancellation points.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/5 is applied, adding the *fdatasync()* function into the table of functions that shall have cancellation points.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/6 is applied, adding the numerous functions into the table of functions that may have cancellation points.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/7 is applied, clarifying the requirements in Thread Cancellation Cleanup Handlers.

#### B.2.9.6 Thread Read-Write Locks

##### Background

Read-write locks are often used to allow parallel access to data on multi-processors, to avoid context switches on uni-processors when multiple threads access the same data, and to protect data structures that are frequently accessed (that is, read) but rarely updated (that is, written). The in-core representation of a file system directory is a good example of such a data structure. One would like to achieve as much concurrency as possible when searching directories, but limit concurrent access when adding or deleting files.

Although read-write locks can be implemented with mutexes and condition variables, such implementations are significantly less efficient than is possible. Therefore, this synchronization primitive is included in POSIX.1-2008 for the purpose of allowing more efficient implementations in multi-processor systems.

##### Queuing of Waiting Threads

The *pthread\_rwlock\_unlock()* function description states that one writer or one or more readers must acquire the lock if it is no longer held by any thread as a result of the call. However, the function does not specify which thread(s) acquire the lock, unless the Thread Execution Scheduling option is supported.

The standard developers considered the issue of scheduling with respect to the queuing of threads blocked on a read-write lock. The question turned out to be whether POSIX.1-2008 should require priority scheduling of read-write locks for threads whose execution scheduling

124695 policy is priority-based (for example, SCHED\_FIFO or SCHED\_RR). There are tradeoffs  
 124696 between priority scheduling, the amount of concurrency achievable among readers, and the  
 124697 prevention of writer and/or reader starvation.

124698 For example, suppose one or more readers hold a read-write lock and the following threads  
 124699 request the lock in the listed order:

124700 pthread\_rwlock\_wrlock() - Low priority thread writer\_a  
 124701 pthread\_rwlock\_rdlock() - High priority thread reader\_a  
 124702 pthread\_rwlock\_rdlock() - High priority thread reader\_b  
 124703 pthread\_rwlock\_rdlock() - High priority thread reader\_c

124704 When the lock becomes available, should *writer\_a* block the high priority readers? Or, suppose a  
 124705 read-write lock becomes available and the following are queued:

124706 pthread\_rwlock\_rdlock() - Low priority thread reader\_a  
 124707 pthread\_rwlock\_rdlock() - Low priority thread reader\_b  
 124708 pthread\_rwlock\_rdlock() - Low priority thread reader\_c  
 124709 pthread\_rwlock\_wrlock() - Medium priority thread writer\_a  
 124710 pthread\_rwlock\_rdlock() - High priority thread reader\_d

124711 If priority scheduling is applied then *reader\_d* would acquire the lock and *writer\_a* would block  
 124712 the remaining readers. But should the remaining readers also acquire the lock to increase  
 124713 concurrency? The solution adopted takes into account that when the Thread Execution  
 124714 Scheduling option is supported, high priority threads may in fact starve low priority threads  
 124715 (the application developer is responsible in this case for designing the system in such a way that  
 124716 this starvation is avoided). Therefore, POSIX.1-2008 specifies that high priority readers take  
 124717 precedence over lower priority writers. However, to prevent writer starvation from threads of  
 124718 the same or lower priority, writers take precedence over readers of the same or lower priority.

124719 Priority inheritance mechanisms are non-trivial in the context of read-write locks. When a high  
 124720 priority writer is forced to wait for multiple readers, for example, it is not clear which subset of  
 124721 the readers should inherit the writer's priority. Furthermore, the internal data structures that  
 124722 record the inheritance must be accessible to all readers, and this implies some sort of  
 124723 serialization that could negate any gain in parallelism achieved through the use of multiple  
 124724 readers in the first place. Finally, existing practice does not support the use of priority  
 124725 inheritance for read-write locks. Therefore, no specification of priority inheritance or priority  
 124726 ceiling is attempted. If reliable priority-scheduled synchronization is absolutely required, it can  
 124727 always be obtained through the use of mutexes.

## 124728 **Comparison to fcntl() Locks**

124729 The read-write locks and the *fcntl()* locks in POSIX.1-2008 share a common goal: increasing  
 124730 concurrency among readers, thus increasing throughput and decreasing delay.

124731 However, the read-write locks have two features not present in the *fcntl()* locks. First, under  
 124732 priority scheduling, read-write locks are granted in priority order. Second, also under priority  
 124733 scheduling, writer starvation is prevented by giving writers preference over readers of equal or  
 124734 lower priority.

124735 Also, read-write locks can be used in systems lacking a file system, such as those conforming to  
 124736 the minimal realtime system profile of IEEE Std 1003.13-1998.

124737      **History of Resolution Issues**

124738      Based upon some balloting objections, early drafts specified the behavior of threads waiting on a  
124739      read-write lock during the execution of a signal handler, as if the thread had not called the lock  
124740      operation. However, this specified behavior would require implementations to establish  
124741      internal signal handlers even though this situation would be rare, or never happen for many  
124742      programs. This would introduce an unacceptable performance hit in comparison to the little  
124743      additional functionality gained. Therefore, the behavior of read-write locks and signals was  
124744      reverted back to its previous mutex-like specification.

124745      *B.2.9.7      Thread Interactions with Regular File Operations*

124746      There is no additional rationale provided for this section.

124747      *B.2.9.8      Use of Application-Managed Thread Stacks*

124748      IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/8 is applied, adding this new section. It  
124749      was added to make it clear that the current standard does not allow an application to determine  
124750      when a stack can be reclaimed. This may be addressed in a future version.

124751      **B.2.10      Sockets**

124752      The base document for the sockets interfaces in POSIX.1-2008 is the XNS, Issue 5.2 specification.  
124753      This was primarily chosen as it aligns with IPv6. Additional material has been added from  
124754      IEEE Std 1003.1g-2000, notably socket concepts, raw sockets, the *pselect()* function, the  
124755      *socketmark()* function, and the **<sys/select.h>** header.

124756      *B.2.10.1      Address Families*

124757      There is no additional rationale provided for this section.

124758      *B.2.10.2      Addressing*

124759      There is no additional rationale provided for this section.

124760      *B.2.10.3      Protocols*

124761      There is no additional rationale provided for this section.

124762      *B.2.10.4      Routing*

124763      There is no additional rationale provided for this section.

124764      *B.2.10.5      Interfaces*

124765      There is no additional rationale provided for this section.

124766 B.2.10.6 *Socket Types*

124767 The type **socklen\_t** was invented to cover the range of implementations seen in the field. The  
 124768 intent of **socklen\_t** is to be the type for all lengths that are naturally bounded in size; that is, that  
 124769 they are the length of a buffer which cannot sensibly become of massive size: network addresses,  
 124770 host names, string representations of these, ancillary data, control messages, and socket options  
 124771 are examples. Truly boundless sizes are represented by **size\_t** as in *read()*, *write()*, and so on.

124772 All **socklen\_t** types were originally (in BSD UNIX) of type **int**. During the development of  
 124773 POSIX.1-2008, it was decided to change all buffer lengths to **size\_t**, which appears at face value  
 124774 to make sense. When dual mode 32/64-bit systems came along, this choice unnecessarily  
 124775 complicated system interfaces because **size\_t** (with **long**) was a different size under ILP32 and  
 124776 LP64 models. Reverting to **int** would have happened except that some implementations had  
 124777 already shipped 64-bit-only interfaces. The compromise was a type which could be defined to be  
 124778 any size by the implementation: **socklen\_t**.

124779 B.2.10.7 *Socket I/O Mode*

124780 There is no additional rationale provided for this section.

124781 B.2.10.8 *Socket Owner*

124782 There is no additional rationale provided for this section.

124783 B.2.10.9 *Socket Queue Limits*

124784 There is no additional rationale provided for this section.

124785 B.2.10.10 *Pending Error*

124786 There is no additional rationale provided for this section.

124787 B.2.10.11 *Socket Receive Queue*

124788 There is no additional rationale provided for this section.

124789 B.2.10.12 *Socket Out-of-Band Data State*

124790 There is no additional rationale provided for this section.

124791 B.2.10.13 *Connection Indication Queue*

124792 There is no additional rationale provided for this section.

124793 B.2.10.14 *Signals*

124794 There is no additional rationale provided for this section.

124795 *B.2.10.15 Asynchronous Errors*

124796 There is no additional rationale provided for this section.

124797 *B.2.10.16 Use of Options*

124798 There is no additional rationale provided for this section.

124799 *B.2.10.17 Use of Sockets for Local UNIX Connections*

124800 There is no additional rationale provided for this section.

124801 *B.2.10.18 Use of Sockets over Internet Protocols*

124802 A raw socket allows privileged users direct access to a protocol; for example, raw access to the  
124803 IP and ICMP protocols is possible through raw sockets. Raw sockets are intended for  
124804 knowledgeable applications that wish to take advantage of some protocol feature not directly  
124805 accessible through the other sockets interfaces.

124806 *B.2.10.19 Use of Sockets over Internet Protocols Based on IPv4*

124807 There is no additional rationale provided for this section.

124808 *B.2.10.20 Use of Sockets over Internet Protocols Based on IPv6*

124809 The Open Group Base Resolution bwg2001-012 is applied, clarifying that IPv6 implementations  
124810 are required to support use of AF\_INET6 sockets over IPv4.

124811 **B.2.11 Tracing**

124812 The organization of the tracing rationale differs from the traditional rationale in that this tracing  
124813 rationale text is written against the trace interface as a whole, rather than against the individual  
124814 components of the trace interface or the normative section in which those components are  
124815 defined. Therefore the sections below do not parallel the sections of normative text in  
124816 POSIX.1-2008.

124817 *B.2.11.1 Objectives*

124818 The intended uses of tracing are application-system debugging during system development, as a  
124819 “flight recorder” for maintenance of fielded systems, and as a performance measurement tool.  
124820 In all of these intended uses, the vendor-supplied computer system and its software are, for this  
124821 discussion, assumed error-free; the intent being to debug the user-written and/or third-party  
124822 application code, and their interactions. Clearly, problems with the vendor-supplied system and  
124823 its software will be uncovered from time to time, but this is a byproduct of the primary activity,  
124824 debugging user code.

124825 Another need for defining a trace interface in POSIX stems from the objective to provide an  
124826 efficient portable way to perform benchmarks. Existing practice shows that such interfaces are  
124827 commonly used in a variety of systems but with little commonality. As part of the benchmarking  
124828 needs, two aspects within the trace interface must be considered.

124829 The first, and perhaps more important one, is the qualitative aspect.

The second is the quantitative aspect.

- Qualitative Aspect

To better understand this aspect, let us consider an example. Suppose that you want to organize a number of actions to be performed during the day. Some of these actions are known at the beginning of the day. Some others, which may be more or less important, will be triggered by reading your mail. During the day you will make some phone calls and synchronously receive some more information. Finally you will receive asynchronous phone calls that also will trigger actions. If you, or somebody else, examines your day at work, you, or he, can discover that you have not efficiently organized your work. For instance, relative to the phone calls you made, would it be preferable to make some of these early in the morning? Or to delay some others until the end of the day? Relative to the phone calls you have received, you might find that somebody you called in the morning has called you 10 times while you were performing some important work. To examine, afterwards, your day at work, you record in sequence all the trace events relative to your work. This should give you a chance of organizing your next day at work.

This is the qualitative aspect of the trace interface. The user of a system needs to keep a trace of particular points the application passes through, so that he can eventually make some changes in the application and/or system configuration, to give the application a chance of running more efficiently.

- Quantitative Aspect

This aspect concerns primarily realtime applications, where missed deadlines can be undesirable. Although there are, in POSIX.1-2008, some interfaces useful for such applications (timeouts, execution time monitoring, and so on), there are no APIs to aid in the tuning of a realtime application's behavior (**timespec** in timeouts, length of message queues, duration of driver interrupt service routine, and so on). The tuning of an application needs a means of recording timestamped important trace events during execution in order to analyze offline, and eventually, to tune some realtime features (redesign the system with less functionalities, readjust timeouts, redesign driver interrupts, and so on).

### Detailed Objectives

Objectives were defined to build the trace interface and are kept for historical interest. Although some objectives are not fully respected in this trace interface, the concept of the POSIX trace interface assumes the following points:

1. It must be possible to trace both system and user trace events concurrently.
2. It must be possible to trace per-process trace events and also to trace system trace events which are unrelated to any particular process. A per-process trace event is either user-initiated or system-initiated.
3. It must be possible to control tracing on a per-process basis from either inside or outside the process.
4. It must be possible to control tracing on a per-thread basis from inside the enclosing process.
5. Trace points must be controllable by trace event type ID from inside and outside of the process. Multiple trace points can have the same trace event type ID, and will be controlled jointly.

- 124874 6. Recording of trace events is dependent on both trace event type ID and the  
124875 process/thread. Both must be enabled in order to record trace events. System trace events  
124876 may or may not be handled differently.
- 124877 7. The API must not mandate the ability to control tracing for more than one process at the  
124878 same time.
- 124879 8. There is no objective for trace control on anything bigger than a process; for example,  
124880 group or session.
- 124881 9. Trace propagation and control:
- 124882     a. Trace propagation across *fork()* is optional; the default is to not trace a child  
124883 process.
- 124884     b. Trace control must span *pthread\_create()* operations; that is, if a process is being  
124885 traced, any thread will be traced as well if this thread allows tracing. The default is  
124886 to allow tracing.
- 124887 10. Trace control must not span *exec* or *posix\_spawn()* operations.
- 124888 11. A triggering API is not required. The triggering API is the ability to command or stop  
124889 tracing based on the occurrence of a specific trace event other than a  
124890 POSIX\_TRACE\_START trace event or a POSIX\_TRACE\_STOP trace event.
- 124891 12. Trace log entries must have timestamps of implementation-defined resolution.  
124892 Implementations are exhorted to support at least microsecond resolution. When a trace  
124893 log entry is retrieved, it must have timestamp, PC address, PID, and TID of the entity that  
124894 generated the trace event.
- 124895 13. Independently developed code should be able to use trace facilities without coordination  
124896 and without conflict.
- 124897 14. Even if the trace points in the trace calls are not unique, the trace log entries (after any  
124898 processing) must be uniquely identified as to trace point.
- 124899 15. There must be a standard API to read the trace stream.
- 124900 16. The format of the trace stream and the trace log is opaque and unspecified.
- 124901 17. It must be possible to read a completed trace, if recorded on some suitable non-volatile  
124902 storage, even subsequent to a power cycle or subsequent cold boot of the system.
- 124903 18. Support of analysis of a trace log while it is being formed is implementation-defined.
- 124904 19. The API must allow the application to write trace stream identification information into  
124905 the trace stream and to be able to retrieve it, without it being overwritten by trace entries,  
124906 even if the trace stream is full.
- 124907 20. It must be possible to specify the destination of trace data produced by trace events.
- 124908 21. It must be possible to have different trace streams, and for the tracing enabled by one  
124909 trace stream to be completely independent of the tracing of another trace stream.
- 124910 22. It must be possible to trace events from threads in different CPUs.
- 124911 23. The API must support one or more trace streams per-system, and one or more trace  
124912 streams per-process, up to an implementation-defined set of per-system and per-process  
124913 maximums.
- 124914 24. It must be possible to determine the order in which the trace events happened, without  
124915 necessarily depending on the clock, up to an implementation-defined time resolution.

- 124916 25. For performance reasons, the trace event point call(s) must be implementable as a macro  
124917 (see the ISO POSIX-1: 1996 standard, 1.3.4, Statement 2).
- 124918 26. POSIX.1-2008 must not define the trace points which a conforming system must  
124919 implement, except for trace points used in the control of tracing.
- 124920 27. The APIs must be thread-safe, and trace points should be lock-free (that is, not require a  
124921 lock to gain exclusive access to some resource).
- 124922 28. The user-provided information associated with a trace event is variable-sized, up to some  
124923 maximum size.
- 124924 29. Bounds on record and trace stream sizes:
- 124925 a. The API must permit the application to declare the upper bounds on the length of  
124926 an application data record. The system must return the limit it used. The limit used  
124927 may be smaller than requested.
- 124928 b. The API must permit the application to declare the upper bounds on the size of  
124929 trace streams. The system must return the limit it used. The limit used may be  
124930 different, either larger or smaller, than requested.
- 124931 30. The API must be able to pass any fundamental data type, and a structured data type  
124932 composed only of fundamental types. The API must be able to pass data by reference,  
124933 given only as an address and a length. Fundamental types are the POSIX.1 types (see the  
124934 `<sys/types.h>` header) plus those defined in the ISO C standard.
- 124935 31. The API must apply the POSIX notions of ownership and permission to recorded trace  
124936 data, corresponding to the sources of that data.

#### 124937 **Comments on Objectives**

124938 **Note:** In the following comments, numbers in square brackets refer to the above objectives.

124939 It is necessary to be able to obtain a trace stream for a complete activity. Thus there is a  
124940 requirement to be able to trace both application and system trace events. A per-process trace  
124941 event is either user-initiated, like the *write()* function, or system-initiated, like a timer expiration.  
124942 There is also a need to be able to trace the activity of an entire process even when it has threads  
124943 in multiple CPUs. To avoid excess trace activity, it is necessary to be able to control tracing on a  
124944 trace event type basis.  
124945 [Objectives 1,2,5,22]

124946 There is a need to be able to control tracing on a per-process basis, both from inside and outside  
124947 the process; that is, a process can start a trace activity on itself or any other process. There is also  
124948 the perceived need to allow the definition of a maximum number of trace streams per system.  
124949 [Objectives 3,23]

124950 From within a process, it is necessary to be able to control tracing on a per-thread basis. This  
124951 provides an additional filtering capability to keep the amount of traced data to a minimum. It  
124952 also allows for less ambiguity as to the origin of trace events. It is recognized that thread-level  
124953 control is only valid from within the process itself. It is also desirable to know the maximum  
124954 number of trace streams per process that can be started. The API should not require thread  
124955 synchronization or mandate priority inversions that would cause the thread to block. However,  
124956 the API must be thread-safe.  
124957 [Objectives 4,23,24,27]

124958 There was no perceived objective to control tracing on anything larger than a process; for  
124959 example, a group or session. Also, the ability to start or stop a trace activity on multiple  
124960 processes atomically may be very difficult or cumbersome in some implementations.  
124961 [Objectives 6,8]

124962 It is also necessary to be able to control tracing by trace event type identifier, sometimes called a  
124963 trace hook ID. However, there is no mandated set of system trace events, since such trace points  
124964 are implementation-defined. The API must not require from the operating system facilities that  
124965 are not standard.  
124966 [Objectives 6,26]

124967 Trace control must span *fork()* and *pthread\_create()*. If not, there will be no way to ensure that an  
124968 application's activity is entirely traced. The newly forked child would not be able to turn on its  
124969 tracing until after it obtained control after the fork, and trace control externally would be even  
124970 more problematic.  
124971 [Objective 9]

124972 Since *exec* and *posix\_spawn()* represent a complete change in the execution of a task (a new  
124973 program), trace control need not persist over an *exec* or *posix\_spawn()*.  
124974 [Objective 10]

124975 Where trace activities are started on multiple processes, these trace activities should not interfere  
124976 with each other.  
124977 [Objective 21]

124978 There is no need for a triggering objective, primarily for performance reasons; see also [Section](#)  
124979 [B.2.11.8](#) (on page 3675), rationale on triggering.  
124980 [Objective 11]

124981 It must be possible to determine the origin of each traced event. The process and thread  
124982 identifiers for each trace event are needed. Also there was a perceived need for a user-specifiable  
124983 origin, but it was felt that this would create too much overhead.  
124984 [Objectives 12,14]

124985 An allowance must be made for trace points to come embedded in software components from  
124986 several different sources and vendors without requiring coordination.  
124987 [Objective 13]

124988 There is a requirement to be able to uniquely identify trace points that may have the same trace  
124989 stream identifier. This is only necessary when a trace report is produced.  
124990 [Objectives 12,14]

124991 Tracing is a very performance-sensitive activity, and will therefore likely be implemented at a  
124992 low level within the system. Hence the interface must not mandate any particular buffering or  
124993 storage method. Therefore, a standard API is needed to read a trace stream. Also the interface  
124994 must not mandate the format of the trace data, and the interface must not assume a trace storage  
124995 method. Due to the possibility of a monolithic kernel and the possible presence of multiple  
124996 processes capable of running trace activities, the two kinds of trace events may be stored in two  
124997 separate streams for performance reasons. A mandatory dump mechanism, common in some  
124998 existing practice, has been avoided to allow the implementation of this set of functions on small  
124999 realtime profiles for which the concept of a file system is not defined. The trace API calls should  
125000 be implemented as macros.  
125001 [Objectives 15,16,25,30]

125002 Since a trace facility is a valuable service tool, the output (or log) of a completed trace stream  
125003 that is written to permanent storage must be readable on other systems of the type that  
125004 produced the trace log. Note that there is no objective to be able to interpret a trace log that was  
125005 not successfully completed.  
125006 [Objectives 17,18,19]

125007 For trace streams written to permanent storage, a way to specify the destination of the trace  
125008 stream is needed.  
125009 [Objective 20]

There is a requirement to be able to depend on the ordering of trace events up to some implementation-defined time interval. For example, there is a need to know the time period during which, if trace events are closer together, their ordering is unspecified. Events that occur within an interval smaller than this resolution may or may not be read back in the correct order. [Objective 24]

The application should be able to know how much data can be traced. When trace event types can be filtered, the application should be able to specify the approximate maximum amount of data that will be traced in a trace event so resources can be more efficiently allocated. [Objectives 28,29]

Users should not be able to trace data to which they would not normally have access. System trace events corresponding to a process/thread should be associated with the ownership of that process/thread. [Objective 31]

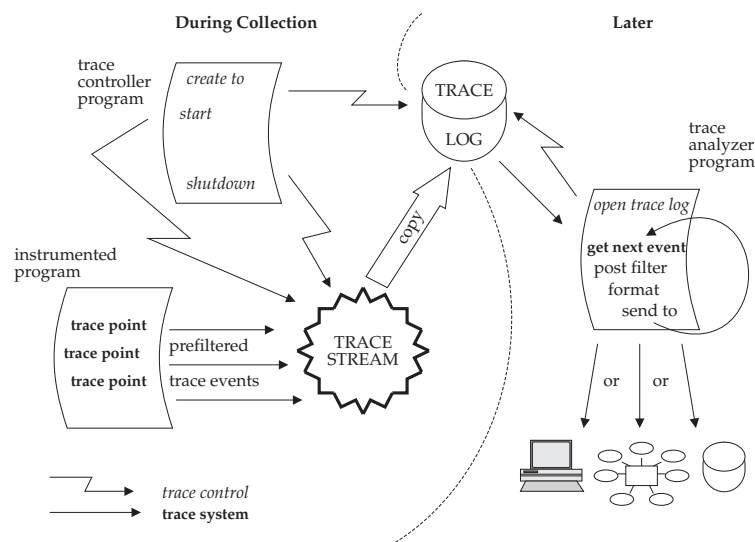

#### B.2.11.2 Trace Model

##### Introduction

The model is based on two base entities: the “Trace Stream” and the “Trace Log”, and a recorded unit called the “Trace Event”. The possibility of using Trace Streams and Trace Logs separately gives two use dimensions and solves both the performance issue and the full-information system issue. In the case of a trace stream without log, specific information, although reduced in quantity, is required to be registered, in a possibly small realtime system, with as little overhead as possible. The Trace Log option has been added for small realtime systems. In the case of a trace stream with log, considerable complex application-specific information needs to be collected.

##### Trace Model Description

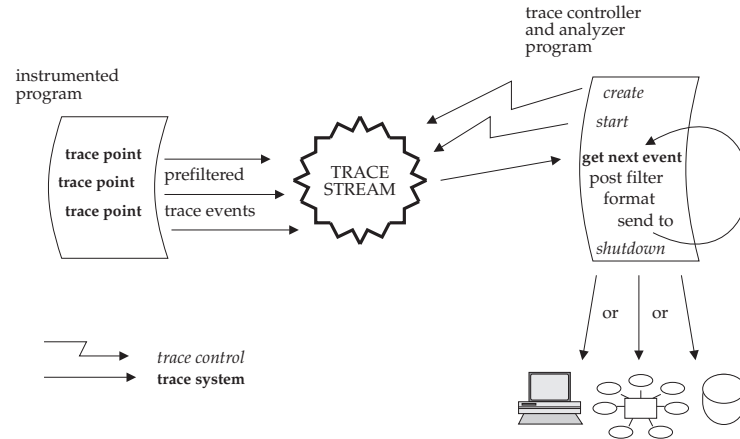

The trace model can be examined for three different subfunctions: Application Instrumentation, Trace Operation Control, and Trace Analysis.

**Figure B-2** Trace System Overview: for Offline Analysis

- 125037 Each of these subfunctions requires specific characteristics of the trace mechanism API.
- 125038 • Application Instrumentation
- 125039 When instrumenting an application, the programmer is not concerned about the future use  
 125040 of the trace events in the trace stream or the trace log, the full policy of the trace stream, or  
 125041 the eventual pre-filtering of trace events. But he is concerned about the correct  
 125042 determination of the specific trace event type identifier, regardless of how many  
 125043 independent libraries are used in the same user application; see [Figure B-2](#) (on page 3657)  
 125044 and [Figure B-3](#) (on page 3659).
- 125045 This trace API provides the necessary operations to accomplish this subfunction. This is  
 125046 done by providing functions to associate a programmer-defined name with an  
 125047 implementation-defined trace event type identifier (see the *posix\_trace\_eventid\_open()*  
 125048 function), and to send this trace event into a potential trace stream (see the  
 125049 *posix\_trace\_event()* function).
- 125050 • Trace Operation Control
- 125051 When controlling the recording of trace events in a trace stream, the programmer is  
 125052 concerned with the correct initialization of the trace mechanism (that is, the sizing of the  
 125053 trace stream), the correct retention of trace events in a permanent storage, the correct  
 125054 dynamic recording of trace events, and so on.
- 125055 This trace API provides the necessary material to permit this efficiently. This is done by  
 125056 providing functions to initialize a new trace stream, and optionally a trace log:
- 125057 — Trace Stream Attributes Object Initialization (see *posix\_trace\_attr\_init()*)
  - 125058 — Functions to Retrieve or Set Information About a Trace Stream (see  
 125059 *posix\_trace\_attr\_getgenversion()*)
  - 125060 — Functions to Retrieve or Set the Behavior of a Trace Stream (see  
 125061 *posix\_trace\_attr\_getinherited()*)
  - 125062 — Functions to Retrieve or Set Trace Stream Size Attributes (see  
 125063 *posix\_trace\_attr\_getmaxusereventsize()*)
  - 125064 — Trace Stream Initialization, Flush, and Shutdown from a Process (see  
 125065 *posix\_trace\_create()*)
  - 125066 — Clear Trace Stream and Trace Log (see *posix\_trace\_clear()*)
- 125067 To select the trace event types that are to be traced:
- 125068 — Manipulate Trace Event Type Identifier (see *posix\_trace\_trid\_eventid\_open()*)
  - 125069 — Iterate over a Mapping of Trace Event Type (see *posix\_trace\_eventtypelist\_getnext\_id()*)
  - 125070 — Manipulate Trace Event Type Sets (see *posix\_trace\_eventset\_empty()*)
  - 125071 — Set Filter of an Initialized Trace Stream (see *posix\_trace\_set\_filter()*)
- 125072 To control the execution of an active trace stream:
- 125073 — Trace Start and Stop (see *posix\_trace\_start()*)
  - 125074 — Functions to Retrieve the Trace Attributes or Trace Statuses (see  
 125075 *posix\_trace\_get\_attr()*)

**Figure B-3** Trace System Overview: for Online Analysis

### • Trace Analysis

Once correctly recorded, on permanent storage or not, an ultimate activity consists of the analysis of the recorded information. If the recorded data is on permanent storage, a specific open operation is required to associate a trace stream to a trace log.

The first intent of the group was to request the presence of a system identification structure in the trace stream attribute. This was, for the application, to allow some portable way to process the recorded information. However, there is no requirement that the **utsname** structure, on which this system identification was based, be portable from one machine to another, so the contents of the attribute cannot be interpreted correctly by an application conforming to POSIX.1-2008.

This modification has been incorporated and requests that some unspecified information be recorded in the trace log in order to fail opening it if the analysis process and the controller process were running in different types of machine, but does not request that this information be accessible to the application. This modification has implied a modification in the `posix_trace_open()` function error code returns.

This trace API provides functions to:

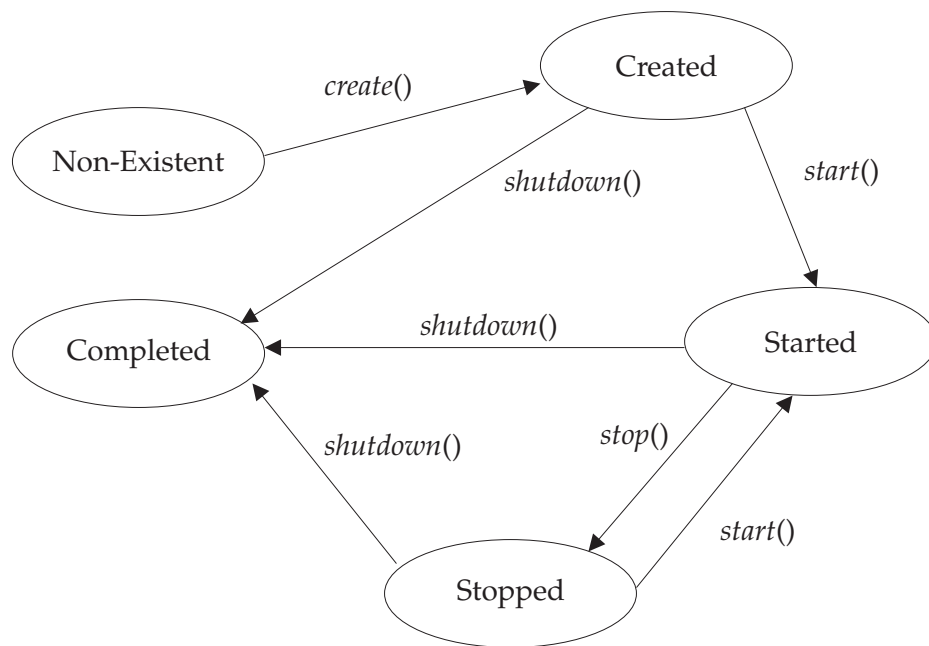

- Extract trace stream identification attributes (see `posix_trace_attr_getgenversion()`)
- Extract trace stream behavior attributes (see `posix_trace_attr_getinherited()`)
- Extract trace event, stream, and log size attributes (see `posix_trace_attr_getmaxusereventsize()`)
- Look up trace event type names (see `posix_trace_eventid_get_name()`)
- Iterate over trace event type identifiers (see `posix_trace_eventtypelist_getnext_id()`)
- Open, rewind, and close a trace log (see `posix_trace_open()`)
- Read trace stream attributes and status (see `posix_trace_get_attr()`)
- Read trace events (see `posix_trace_getnext_event()`)

Due to the following two reasons:

1. The requirement that the trace system must not add unacceptable overhead to the traced process and so that the trace event point execution must be fast
2. The traced application does not care about tracing errors

the trace system cannot return any internal error to the application. Internal error conditions can range from unrecoverable errors that will force the active trace stream to abort, to small errors that can affect the quality of tracing without aborting the trace stream. The group decided to define a system trace event to report to the analysis process such internal errors. It is not the intention of POSIX.1-2008 to require an implementation to report an internal error that corrupts or terminates tracing operation. The implementor is free to decide which internal documented errors, if any, the trace system is able to report.

### States of a Trace Stream

**Figure B-4** Trace System Overview: States of a Trace Stream

Figure B-4 shows the different states an active trace stream passes through. After the `posix_trace_create()` function call, a trace stream becomes CREATED and a trace stream is associated for the future collection of trace events. The status of the trace stream is `POSIX_TRACE_SUSPENDED`. The state becomes STARTED after a call to the `posix_trace_start()` function, and the status becomes `POSIX_TRACE_RUNNING`. In this state, all trace events that are not filtered out will be stored into the trace stream. After a call to `posix_trace_stop()`, the trace stream becomes STOPPED (and the status `POSIX_TRACE_SUSPENDED`). In this state, no new trace events will be recorded in the trace stream, but previously recorded trace events may continue to be read.

After a call to `posix_trace_shutdown()`, the trace stream is in the state COMPLETED. The trace stream no longer exists but, if the Trace Log option is supported, all the information contained in it has been logged. If a log object has not been associated with the trace stream at the creation, it

is the responsibility of the trace controller process to not shut the trace stream down while trace events remain to be read in the stream.

### Tracing All Processes

Some implementations have a tracing subsystem with the ability to trace all processes. This is useful to debug some types of device drivers such as those for ATM or X25 adapters. These types of adapters are used by several independent processes, that are not issued from the same process.

The POSIX trace interface does not define any constant or option to create a trace stream tracing all processes. POSIX.1 does not prevent this type of implementation and an implementor is free to add this capability. Nevertheless, the trace interface allows tracing of all the system trace events and all the processes issued from the same process.

If such a tracing system capability has to be implemented, when a trace stream is created, it is recommended that a constant named `POSIX_TRACE_ALLPROC` be used instead of the process identifier in the argument of the `posix_trace_create()` or `posix_trace_create_withlog()` function. A possible value for `POSIX_TRACE_ALLPROC` may be `-1` instead of a real process identifier.

The implementor has to be aware that there is some impact on the tracing behavior as defined in the POSIX trace interface. For example:

- If the default value for the inheritance attribute is set to `POSIX_TRACE_CLOSE_FOR_CHILD`, the implementation has to stop tracing for the child process.
- The trace controller which is creating this type of trace stream must have the appropriate privilege to trace all the processes.

### Trace Storage

The model is based on two types of trace events: system trace events and user-defined trace events. The internal representation of trace events is implementation-defined, and so the implementor is free to choose the more suitable, practical, and efficient way to design the internal management of trace events. For the timestamping operation, the model does not impose the `CLOCK_REALTIME` or any other clock. The buffering allocation and operation follow the same principle. The implementor is free to use one or more buffers to record trace events; the interface assumes only a logical trace stream of sequentially recorded trace events. Regarding flushing of trace events, the interface allows the definition of a trace log object which typically can be a file. But the group was also aware of defining functions to permit the use of this interface in small realtime systems, which may not have general file system capabilities. For instance, the three functions `posix_trace_getnext_event()` (blocking), `posix_trace_timedgetnext_event()` (blocking with timeout), and `posix_trace_trygetnext_event()` (non-blocking) are proposed to read the recorded trace events.

The policy to be used when the trace stream becomes full also relies on common practice:

- For an active trace stream, the `POSIX_TRACE_LOOP` trace stream policy permits automatic overrun (overwrite of oldest trace events) while waiting for some user-defined condition to cause tracing to stop. By contrast, the `POSIX_TRACE_UNTIL_FULL` trace stream policy requires the system to stop tracing when the trace stream is full. However, if the trace stream that is full is at least partially emptied by a call to the `posix_trace_flush()` function or by calls to the `posix_trace_getnext_event()` function, the trace system will automatically resume tracing.

If the Trace Log option is supported, the operation of the `POSIX_TRACE_FLUSH` policy is an extension of the `POSIX_TRACE_UNTIL_FULL` policy. The automatic free operation (by

125173 flushing to the associated trace log) is added.

- 125174 • If a log is associated with the trace stream and this log is a regular file, these policies also
- 125175 apply for the log. One more policy, POSIX\_TRACE\_APPEND, is defined to allow
- 125176 indefinite extension of the log. Since the log destination can be any device or pseudo-
- 125177 device, the implementation may not be able to manipulate the destination as required by
- 125178 POSIX.1-2008. For this reason, the behavior of the log full policy may be unspecified
- 125179 depending on the trace log type.

125180 The current trace interface does not define a service to preallocate space for a trace log file,

125181 because this space can be preallocated by means of a call to the *posix\_fallocate()* function.

125182 This function could be called after the file has been opened, but before the trace stream is

125183 created. The *posix\_fallocate()* function ensures that any required storage for regular file data

125184 is allocated on the file system storage media. If *posix\_fallocate()* returns successfully,

125185 subsequent writes to the specified file data will not fail due to the lack of free space on the

125186 file system storage media. Besides trace events, a trace stream also includes trace attributes

125187 and the mapping from trace event names to trace event type identifiers. The implementor

125188 is free to choose how to store the trace attributes and the trace event type map, but must

125189 ensure that this information is not lost when a trace stream overrun occurs.

### 125190 B.2.11.3 Trace Programming Examples

125191 Several programming examples are presented to show the code of the different possible

125192 subfunctions using a trace subsystem. All these programs need to include the **<trace.h>** header.

125193 In the examples shown, error checking is omitted for more simplicity.

### 125194 Trace Operation Control

125195 These examples show the creation of a trace stream for another process; one which is already

125196 trace instrumented. All the default trace stream attributes are used to simplify programming in

125197 the first example. The second example shows more possibilities.

### 125198 First Example

```

125199 /* Caution. Error checks omitted */
125200 {
125201     trace_attr_t attr;
125202     pid_t pid = traced_process_pid;
125203     int fd;
125204     trace_id_t trid;
125205
125206     - - - - -
125207     /* Initialize trace stream attributes */
125208     posix_trace_attr_init(&attr);
125209     /* Open a trace log */
125210     fd=open("/tmp/mytracelog",...);
125211     /*
125212      * Create a new trace associated with a log
125213      * and with default attributes
125214      */
125215     posix_trace_create_withlog(pid, &attr, fd, &trid);
125216     /* Trace attribute structure can now be destroyed */
125217     posix_trace_attr_destroy(&attr);
125218     /* Start of trace event recording */

```

```

125218         posix_trace_start(trid);
125219         - - - - -
125220         - - - - -
125221         /* Duration of tracing */
125222         - - - - -
125223         - - - - -
125224         /* Stop and shutdown of trace activity */
125225         posix_trace_shutdown(trid);
125226         - - - - -
125227     }

```

## Second Example

Between the initialization of the trace stream attributes and the creation of the trace stream, these trace stream attributes may be modified; see [Trace Stream Attribute Manipulation](#) (on page 3667) for a specific programming example. Between the creation and the start of the trace stream, the event filter may be set; after the trace stream is started, the event filter may be changed. The setting of an event set and the change of a filter is shown in [Create a Trace Event Type Set and Change the Trace Event Type Filter](#) (on page 3667).

```

125235     /* Caution. Error checks omitted */
125236     {
125237         trace_attr_t attr;
125238         pid_t pid = traced_process_pid;
125239         int fd;
125240         trace_id_t trid;
125241         - - - - -
125242         /* Initialize trace stream attributes */
125243         posix_trace_attr_init(&attr);
125244         /* Attr default may be changed at this place; see example */
125245         - - - - -
125246         /* Create and open a trace log with R/W user access */
125247         fd=open("/tmp/mytracelog",O_WRONLY|O_CREAT,S_IRUSR|S_IWUSR);
125248         /* Create a new trace associated with a log */
125249         posix_trace_create_withlog(pid, &attr, fd, &trid);
125250         /*
125251          * If the Trace Filter option is supported
125252          * trace event type filter default may be changed at this place;
125253          * see example about changing the trace event type filter
125254          */
125255         posix_trace_start(trid);
125256         - - - - -
125257
125258         /*
125259          * If you have an uninteresting part of the application
125260          * you can stop temporarily.
125261          *
125262          * posix_trace_stop(trid);
125263          * - - - - -
125264          * - - - - -
125265          * posix_trace_start(trid);
125266          */
125267         - - - - -
125268     }

```

```

125268     * If the Trace Filter option is supported
125269     * the current trace event type filter can be changed
125270     * at any time (see example about how to set
125271     * a trace event type filter)
125272     */
125273     - - - - -
125274     /* Stop the recording of trace events */
125275     posix_trace_stop(trid);
125276     /* Shutdown the trace stream */
125277     posix_trace_shutdown(trid);
125278     /*
125279     * Destroy trace stream attributes; attr structure may have
125280     * been used during tracing to fetch the attributes
125281     */
125282     posix_trace_attr_destroy(&attr);
125283     - - - - -
125284 }

```

## 125285 Application Instrumentation

125286 This example shows an instrumented application. The code is included in a block of instructions,  
125287 perhaps a function from a library. Possibly in an initialization part of the instrumented  
125288 application, two user trace event names are mapped to two trace event type identifiers  
125289 (function *posix\_trace\_eventid\_open()*). Then two trace points are programmed.

```

125290 /* Caution. Error checks omitted */
125291 {
125292     trace_event_id_t eventidl, eventid2;
125293     - - - - -
125294     /* Initialization of two trace event type ids */
125295     posix_trace_eventid_open("my_first_event",&eventidl);
125296     posix_trace_eventid_open("my_second_event",&eventid2);
125297     - - - - -
125298     - - - - -
125299     - - - - -
125300     /* Trace point */
125301     posix_trace_event(eventidl,NULL,0);
125302     - - - - -
125303     /* Trace point */
125304     posix_trace_event(eventid2,NULL,0);
125305     - - - - -
125306 }

```

## 125307 Trace Analyzer

125308 This example shows the manipulation of a trace log resulting from the dumping of a completed  
125309 trace stream. All the default attributes are used to simplify programming, and data associated  
125310 with a trace event is not shown in the first example. The second example shows more  
125311 possibilities.

### First Example

```

/* Caution. Error checks omitted */
{
    int fd;
    trace_id_t trid;
    posix_trace_event_info trace_event;
    char trace_event_name[TRACE_EVENT_NAME_MAX];
    int return_value;
    size_t returndatasize;
    int lost_event_number;

    - - - - -

    /* Open an existing trace log */
    fd=open("/tmp/tracelog", O_RDONLY);
    /* Open a trace stream on the open log */
    posix_trace_open(fd, &trid);
    /* Read a trace event */
    posix_trace_getnext_event(trid, &trace_event,
        NULL, 0, &returndatasize,&return_value);

    /* Read and print all trace event names out in a loop */
    while (return_value == NULL)
    {
        /*
         * Get the name of the trace event associated
         * with trid trace ID
         */
        posix_trace_eventid_get_name(trid, trace_event.event_id,
            trace_event_name);
        /* Print the trace event name out */
        printf("%s\n",trace_event_name);
        /* Read a trace event */
        posix_trace_getnext_event(trid, &trace_event,
            NULL, 0, &returndatasize,&return_value);
    }

    /* Close the trace stream */
    posix_trace_close(trid);
    /* Close the trace log */
    close(fd);
}

```

### Second Example

The complete example includes the two other examples in [Retrieve Information from a Trace Log](#) (on page 3668) and in [Retrieve the List of Trace Event Types Used in a Trace Log](#) (on page 3669). For example, the *maxdatasize* variable is set in [Retrieve the List of Trace Event Types Used in a Trace Log](#) (on page 3669).

```

/* Caution. Error checks omitted */
{
    int fd;
    trace_id_t trid;
    posix_trace_event_info trace_event;

```

```

125360     char trace_event_name[TRACE_EVENT_NAME_MAX];
125361     char * data;
125362     size_t maxdatasize=1024, returndatasize;
125363     int return_value;
125364     - - - - -
125365     /* Open an existing trace log */
125366     fd=open("/tmp/tracelog", O_RDONLY);
125367     /* Open a trace stream on the open log */
125368     posix_trace_open( fd, &trid);
125369     /*
125370      * Retrieve information about the trace stream which
125371      * was dumped in this trace log (see example)
125372      */
125373     - - - - -
125374     /* Allocate a buffer for trace event data */
125375     data=(char *)malloc(maxdatasize);
125376     /*
125377      * Retrieve the list of trace events used in this
125378      * trace log (see example)
125379      */
125380     - - - - -
125381     /* Read and print all trace event names and data out in a loop */
125382     while (1)
125383     {
125384     posix_trace_getnext_event(trid, &trace_event,
125385         data, maxdatasize, &returndatasize,&return_value);
125386         if (return_value != NULL) break;
125387         /*
125388          * Get the name of the trace event type associated
125389          * with trid trace ID
125390          */
125391         posix_trace_eventid_get_name(trid, trace_event.event_id,
125392             trace_event_name);
125393         {
125394         int i;
125395
125396         /* Print the trace event name out */
125397         printf("%s: ", trace_event_name);
125398         /* Print the trace event data out */
125399         for (i=0; i<returndatasize, i++) printf("%02.2X",
125400             (unsigned char)data[i]);
125401         printf("\n");
125402         }
125403     }
125404     /* Close the trace stream */
125405     posix_trace_close(trid);
125406     /* The buffer data is deallocated */
125407     free(data);
125408     /* Now the file can be closed */
125409     close(fd);
125409 }

```

## Several Programming Manipulations

The following examples show some typical sets of operations needed in some contexts.

### Trace Stream Attribute Manipulation

This example shows the manipulation of a trace stream attribute object in order to change the default value provided by a previous *posix\_trace\_attr\_init()* call.

```
/* Caution. Error checks omitted */
{
    trace_attr_t attr;
    size_t logsize=100000;
    - - - - -
    /* Initialize trace stream attributes */
    posix_trace_attr_init(&attr);
    /* Set the trace name in the attributes structure */
    posix_trace_attr_setname(&attr, "my_trace");
    /* Set the trace full policy */
    posix_trace_attr_setstreamfullpolicy(&attr, POSIX_TRACE_LOOP);
    /* Set the trace log size */
    posix_trace_attr_setlogsize(&attr, logsize);
    - - - - -
}
```

### Create a Trace Event Type Set and Change the Trace Event Type Filter

This example is valid only if the Trace Event Filter option is supported. This example shows the manipulation of a trace event type set in order to change the trace event type filter for an existing active trace stream, which may be just-created, running, or suspended. Some sets of trace event types are well-known, such as the set of trace event types not associated with a process, some trace event types are just-built trace event types for this trace stream; one trace event type is the predefined trace event error type which is deleted from the trace event type set.

```
/* Caution. Error checks omitted */
{
    trace_id_t trid = existing_trace;
    trace_event_set_t set;
    trace_event_id_t trace_event1, trace_event2;
    - - - - -
    /* Initialize to an empty set of trace event types */
    /* (not strictly required because posix_trace_event_set_fill() */
    /* will ignore the prior contents of the event set.) */
    posix_trace_eventset_emptyset(&set);
    /*
     * Fill the set with all system trace events
     * not associated with a process
     */
    posix_trace_eventset_fill(&set, POSIX_TRACE_WOPID_EVENTS);

    /*
     * Get the trace event type identifier of the known trace event name
     * my_first_event for the trid trace stream
     */
    posix_trace_trid_eventid_open(trid, "my_first_event", &trace_event1);
}
```

```

125457      /* Add the set with this trace event type identifier */
125458      posix_trace_eventset_add_event(trace_event1, &set);
125459      /*
125460      * Get the trace event type identifier of the known trace event name
125461      * my_second_event for the trid trace stream
125462      */
125463      posix_trace_trid_eventid_open(trid, "my_second_event", &trace_event2);
125464      /* Add the set with this trace event type identifier */
125465      posix_trace_eventset_add_event(trace_event2, &set);
125466      - - - - -
125467      /* Delete the system trace event POSIX_TRACE_ERROR from the set */
125468      posix_trace_eventset_del_event(POSIX_TRACE_ERROR, &set);
125469      - - - - -
125470
125471      /* Modify the trace stream filter making it equal to the new set */
125472      posix_trace_set_filter(trid, &set, POSIX_TRACE_SET_EVENTSET);
125473      - - - - -
125474      /*
125475      * Now trace_event1, trace_event2, and all system trace event types
125476      * not associated with a process, except for the POSIX_TRACE_ERROR
125477      * system trace event type, are filtered out of (not recorded in) the
125478      * existing trace stream.
125479      */
125480      }

```

## Retrieve Information from a Trace Log

This example shows how to extract information from a trace log, the dump of a trace stream. This code:

```

125483      • Asks if the trace stream has lost trace events
125484
125485      • Extracts the information about the version of the trace subsystem which generated this
125486      trace log
125487
125488      • Retrieves the maximum size of trace event data; this may be used to dynamically allocate
125489      an array for extracting trace event data from the trace log without overflow
125490
125491      /* Caution. Error checks omitted */
125492      {
125493          struct posix_trace_status_info statusinfo;
125494          trace_attr_t attr;
125495          trace_id_t trid = existing_trace;
125496          size_t maxdatasize;
125497          char genversion[TRACE_NAME_MAX];
125498          - - - - -
125499          /* Get the trace stream status */
125500          posix_trace_get_status(trid, &statusinfo);
125501          /* Detect an overrun condition */
125502          if (statusinfo.posix_stream_overrun_status == POSIX_TRACE_OVERRUN)
125503              printf("trace events have been lost\n");
125504
125505          /* Get attributes from the trid trace stream */
125506          posix_trace_get_attr(trid, &attr);
125507          /* Get the trace generation version from the attributes */

```

```

125504     posix_trace_attr_getgenversion(&attr, genversion);
125505     /* Print the trace generation version out */
125506     printf("Information about Trace Generator:%s\n",genversion);

125507     /* Get the trace event max data size from the attributes */
125508     posix_trace_attr_getmaxdatasize(&attr, &maxdatasize);
125509     /* Print the trace event max data size out */
125510     printf("Maximum size of associated data:%d\n",maxdatasize);
125511     /* Destroy the trace stream attributes */
125512     posix_trace_attr_destroy(&attr);
125513 }

```

### Retrieve the List of Trace Event Types Used in a Trace Log

This example shows the retrieval of a trace stream's trace event type list. This operation may be very useful if you are interested only in tracking the type of trace events in a trace log.

```

125517 /* Caution. Error checks omitted */
125518 {
125519     trace_id_t trid = existing_trace;
125520     trace_event_id_t event_id;
125521     char event_name[TRACE_EVENT_NAME_MAX];
125522     int return_value;
125523     - - - - -
125524     /*
125525      * In a loop print all existing trace event names out
125526      * for the trid trace stream
125527      */
125528     while (1)
125529     {
125530         posix_trace_eventtypelist_getnext_id(trid, &event_id
125531             &return_value);
125532         if (return_value != NULL) break;
125533         /*
125534          * Get the name of the trace event associated
125535          * with trid trace ID
125536          */
125537         posix_trace_eventid_get_name(trid, event_id, event_name);
125538         /* Print the name out */
125539         printf("%s\n", event_name);
125540     }
125541 }

```

125542 B.2.11.4 Rationale on Trace for Debugging

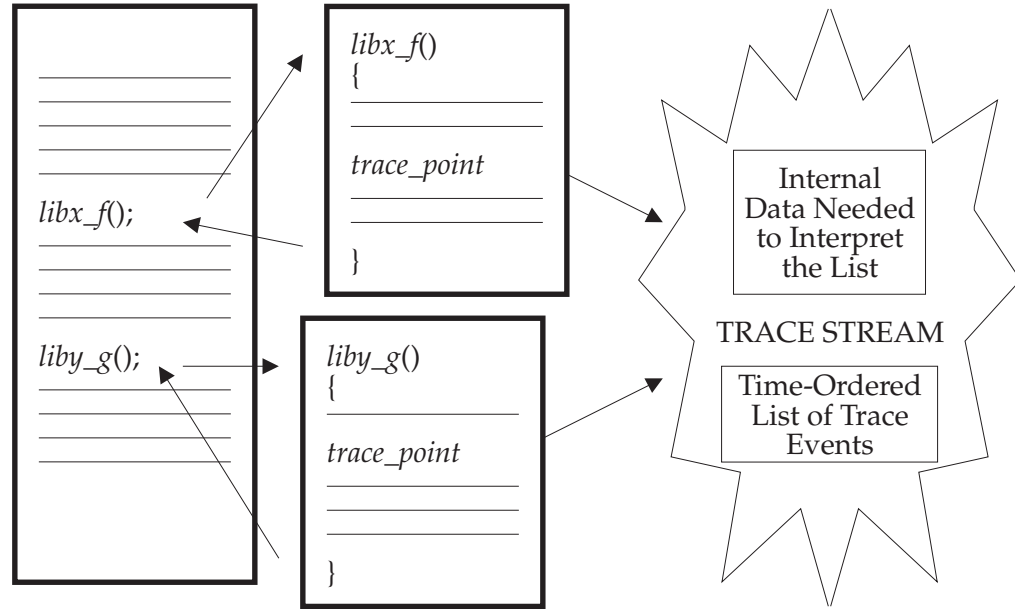

125543 **Figure B-5** Trace Another Process

125544 Among the different possibilities offered by the trace interface defined in POSIX.1-2008, the  
 125545 debugging of an application is the most interesting one. Typical operations in the controlling  
 125546 debugger process are to filter trace event types, to get trace events from the trace stream, to stop  
 125547 the trace stream when the debugged process is executing uninteresting code, to start the trace  
 125548 stream when some interesting point is reached, and so on. The interface defined in POSIX.1-2008  
 125549 should define all the necessary base functions to allow this dynamic debug handling.

125550 **Figure B-5** shows an example in which the trace stream is created after the call to the `fork()`  
 125551 function. If the user does not want to lose trace events, some synchronization mechanism  
 125552 (represented in the figure) may be needed before calling the `exec()` function, to give the parent a  
 125553 chance to create the trace stream before the child begins the execution of its trace points.

125554 B.2.11.5 Rationale on Trace Event Type Name Space

125555 At first, the working group was in favor of the representation of a trace event type by an integer  
 125556 (`event_name`). It seems that existing practice shows the weakness of such a representation. The  
 125557 collision of trace event types is the main problem that cannot be simply resolved using this sort  
 125558 of representation. Suppose, for example, that a third party designs an instrumented library. The  
 125559 user does not have the source of this library and wants to trace his application which uses in  
 125560 some part the third-party library. There is no means for him to know what are the trace event  
 125561 types used in the instrumented library so he has some chance of duplicating some of them and  
 125562 thus to obtain a contaminated tracing of his application.

**Figure B-6** Trace Name Space Overview: With Third-Party Library

There are requirements to allow program images containing pieces from various vendors to be traced without also requiring those of any other vendors to coordinate their uses of the trace facility, and especially the naming of their various trace event types and trace point IDs. The chosen solution is to provide a very large name space, large enough so that the individual vendors can give their trace types and tracepoint IDs sufficiently long and descriptive names making the occurrence of collisions quite unlikely. The probability of collision is thus made sufficiently low so that the problem may, as a practical matter, be ignored. By requirement, the consequence of collisions will be a slight ambiguity in the trace streams; tracing will continue in spite of collisions and ambiguities. “The show must go on”. The *posix\_prog\_address* member of the **posix\_trace\_event\_info** structure is used to allow trace streams to be unambiguously interpreted, despite the fact that trace event types and trace event names need not be unique.

The *posix\_trace\_eventid\_open()* function is required to allow the instrumented third-party library to get a valid trace event type identifier for its trace event names. This operation is, somehow, an allocation, and the group was aware of proposing some deallocation mechanism which the instrumented application could use to recover the resources used by a trace event type identifier. This would have given the instrumented application the benefit of being capable of reusing a possible minimum set of trace event type identifiers, but also the inconvenience to have, possibly in the same trace stream, one trace event type identifier identifying two different trace event types. After some discussions the group decided to not define such a function which would make this API thicker for little benefit, the user having always the possibility of adding identification information in the *data* member of the trace event structure.

The set of the trace event type identifiers the controlling process wants to filter out is initialized in the trace mechanism using the function *posix\_trace\_set\_filter()*, setting the arguments according to the definitions explained in *posix\_trace\_set\_filter()*. This operation can be done statically (when the trace is in the STOPPED state) or dynamically (when the trace is in the STARTED state). The preparation of the filter is normally done using the function defined in *posix\_trace\_eventtypelist\_getnext\_id()* and eventually the function *posix\_trace\_eventtypelist\_rewind()* in order to know (before the recording) the list of the potential

125592 set of trace event types that can be recorded. In the case of an active trace stream, this list may  
125593 not be exhaustive. Actually, the target process may not have yet called the function  
125594 *posix\_trace\_eventid\_open()*. But it is a common practice, for a controlling process, to prepare the  
125595 filtering of a future trace stream before its start. Therefore the user must have a way to get the  
125596 trace event type identifier corresponding to a well-known trace event name before its future  
125597 association by the pre-cited function. This is done by calling the *posix\_trace\_trid\_eventid\_open()*  
125598 function, given the trace stream identifier and the trace name, and described hereafter. Because  
125599 this trace event type identifier is associated with a trace stream identifier, where a unique  
125600 process has initialized two or more traces, the implementation is expected to return the same  
125601 trace event type identifier for successive calls to *posix\_trace\_trid\_eventid\_open()* with different  
125602 trace stream identifiers. The *posix\_trace\_eventid\_get\_name()* function is used by the controller  
125603 process to identify, by the name, the trace event type returned by a call to the  
125604 *posix\_trace\_eventtypelist\_getnext\_id()* function.

125605 Afterwards, the set of trace event types is constructed using the functions defined in  
125606 *posix\_trace\_eventset\_empty()*, *posix\_trace\_eventset\_fill()*, *posix\_trace\_eventset\_add()*, and  
125607 *posix\_trace\_eventset\_del()*.

125608 A set of functions is provided devoted to the manipulation of the trace event type identifier and  
125609 names for an active trace stream. All these functions require the trace stream identifier argument  
125610 as the first parameter. The opacity of the trace event type identifier implies that the user cannot  
125611 associate directly its well-known trace event name with the system-associated trace event type  
125612 identifier.

125613 The *posix\_trace\_trid\_eventid\_open()* function allows the application to get the system trace event  
125614 type identifier back from the system, given its well-known trace event name. This function is  
125615 useful only when a controlling process needs to specify specific events to be filtered.

125616 The *posix\_trace\_eventid\_get\_name()* function allows the application to obtain a trace event name  
125617 given its trace event type identifier. One possible use of this function is to identify the type of a  
125618 trace event retrieved from the trace stream, and print it. The easiest way to implement this  
125619 requirement, is to use a single trace event type map for all the processes whose maps are  
125620 required to be identical. A more difficult way is to attempt to keep multiple maps identical at  
125621 every call to *posix\_trace\_eventid\_open()* and *posix\_trace\_trid\_eventid\_open()*.

#### 125622 B.2.11.6 Rationale on Trace Events Type Filtering

125623 The most basic rationale for runtime and pre-registration filtering (selection/rejection) of trace  
125624 event types is to prevent choking of the trace collection facility, and/or overloading of the  
125625 computer system. Any worthwhile trace facility can bring even the largest computer to its  
125626 knees. Otherwise, everything would be recorded and filtered after the fact; it would be much  
125627 simpler, but impractical.

125628 To achieve debugging, measurement, or whatever the purpose of tracing, the filtering of trace  
125629 event types is an important part of trace analysis. Due to the fact that the trace events are put  
125630 into a trace stream and probably logged afterwards into a file, different levels of filtering—that  
125631 is, rejection of trace event types—are possible.

## **Filtering of Trace Event Types Before Tracing**

This function, represented by the `posix_trace_set_filter()` function in POSIX.1-2008 (see `posix_trace_set_filter()`), selects, before or during tracing, the set of trace event types to be filtered out. It should be possible also (as OSF suggested in their ETAP trace specifications) to select the kernel trace event types to be traced in a system-wide fashion. These two functionalities are called the pre-filtering of trace event types.

The restriction on the actual type used for the `trace_event_set_t` type is intended to guarantee that these objects can always be assigned, have their address taken, and be passed by value as parameters. It is not intended that this type be a structure including pointers to other data structures, as that could impact the portability of applications performing such operations. A reasonable implementation could be a structure containing an array of integer types.

## **Filtering of Trace Event Types at Runtime**

It is possible to build this functionality using the `posix_trace_set_filter()` function. A privileged process or a privileged thread can get trace events from the trace stream of another process or thread, and thus specify the type of trace events to record into a file, using implementation-defined methods and interfaces. This functionality, called inline filtering of trace event types, is used for runtime analysis of trace streams.

## **Post-Mortem Filtering of Trace Event Types**

The word “post-mortem” is used here to indicate that some unanticipated situation occurs during execution that does not permit a pre or inline filtering of trace events and that it is necessary to record all trace event types to have a chance to discover the problem afterwards. When the program stops, all the trace events recorded previously can be analyzed in order to find the solution. This functionality could be named the post-filtering of trace event types.

## **Discussions about Trace Event Type Filtering**

After long discussions with the parties involved in the process of defining the trace interface, it seems that the sensitivity to the filtering problem is different, but everybody agrees that the level of the overhead introduced during the tracing operation depends on the filtering method elected. If the time that it takes the trace event to be recorded can be neglected, the overhead introduced by the filtering process can be classified as follows:

Pre-filtering      System and process/thread-level overhead

Inline-filtering    Process/thread-level overhead

Post-filtering      No overhead; done offline

The pre-filtering could be named “critical realtime” filtering in the sense that the filtering of trace event type is manageable at the user level so the user can lower to a minimum the filtering overhead at some user selected level of priority for the inline filtering, or delay the filtering to after execution for the post-filtering. The counterpart of this solution is that the size of the trace stream must be sufficient to record all the trace events. The advantage of the pre-filtering is that the utilization of the trace stream is optimized.

Only pre-filtering is defined by POSIX.1-2008. However, great care must be taken in specifying pre-filtering, so that it does not impose unacceptable overhead. Moreover, it is necessary to isolate all the functionality relative to the pre-filtering.

The result of this rationale is to define a new option, the Trace Event Filter option, not necessarily implemented in small realtime systems, where system overhead is minimized to the extent possible.

#### 125676 B.2.11.7 Tracing, pthread API

125677 The objective to be able to control tracing for individual threads may be in conflict with the  
 125678 efficiency expected in threads with a *contentionscope* attribute of PTHREAD\_SCOPE\_PROCESS.  
 125679 For these threads, context switches from one thread that has tracing enabled to another thread  
 125680 that has tracing disabled may require a kernel call to inform the kernel whether it has to trace  
 125681 system events executed by that thread or not. For this reason, it was proposed that the ability to  
 125682 enable or disable tracing for PTHREAD\_SCOPE\_PROCESS threads be made optional, through  
 125683 the introduction of a Trace Scope Process option. A trace implementation which did not  
 125684 implement the Trace Scope Process option would not honor the tracing-state attribute of a thread  
 125685 with PTHREAD\_SCOPE\_PROCESS; it would, however, honor the tracing-state attribute of a  
 125686 thread with PTHREAD\_SCOPE\_SYSTEM. This proposal was rejected as:

- 125687 1. Removing desired functionality (per-thread trace control)
- 125688 2. Introducing counter-intuitive behavior for the tracing-state attribute
- 125689 3. Mixing logically orthogonal ideas (thread scheduling and thread tracing)
- 125690 [Objective 4]

125691 Finally, to solve this complex issue, this API does not provide *pthread\_gettracingstate()*,  
 125692 *pthread\_settracingstate()*, *pthread\_attr\_gettracingstate()*, and *pthread\_attr\_settracingstate()*  
 125693 interfaces. These interfaces force the thread implementation to add to the weight of the thread  
 125694 and cause a revision of the threads libraries, just to support tracing. Worse yet,  
 125695 *posix\_trace\_event()* must always test this per-thread variable even in the common case where it is  
 125696 not used at all. Per-thread tracing is easy to implement using existing interfaces where  
 125697 necessary; see the following example.

#### 125698 Example

```

125699 /* Caution. Error checks omitted */
125700 static pthread_key_t my_key;
125701 static trace_event_id_t my_event_id;
125702 static pthread_once_t my_once = PTHREAD_ONCE_INIT;

125703 void my_init(void)
125704 {
125705     (void) pthread_key_create(&my_key, NULL);
125706     (void) posix_trace_eventid_open("my", &my_event_id);
125707 }

125708 int get_trace_flag(void)
125709 {
125710     pthread_once(&my_once, my_init);
125711     return (pthread_getspecific(my_key) != NULL);
125712 }

125713 void set_trace_flag(int f)
125714 {
125715     pthread_once(&my_once, my_init);
125716     pthread_setspecific(my_key, f? &my_event_id: NULL);
125717 }

125718 fn()
125719 {
125720     if (get_trace_flag())
125721         posix_trace_event(my_event_id, ...)
125722 }
```

- 125723 The above example does not implement third-party state setting.
- 125724 Lastly, per-thread tracing works poorly for threads with PTHREAD\_SCOPE\_PROCESS  
125725 contention scope. These “library” threads have minimal interaction with the kernel and would  
125726 have to explicitly set the attributes whenever they are context switched to a new kernel thread in  
125727 order to trace system events. Such state was explicitly avoided in POSIX threads to keep  
125728 PTHREAD\_SCOPE\_PROCESS threads lightweight.
- 125729 The reason that keeping PTHREAD\_SCOPE\_PROCESS threads lightweight is important is that  
125730 such threads can be used not just for simple multi-processors but also for co-routine style  
125731 programming (such as discrete event simulation) without inventing a new threads paradigm.  
125732 Adding extra runtime cost to thread context switches will make using POSIX threads less  
125733 attractive in these situations.
- 125734 *B.2.11.8 Rationale on Triggering*
- 125735 The ability to start or stop tracing based on the occurrence of specific trace event types has been  
125736 proposed as a parallel to similar functionality appearing in logic analyzers. Such triggering, in  
125737 order to be very useful, should be based not only on the trace event type, but on trace event-  
125738 specific data, including tests of user-specified fields for matching or threshold values.
- 125739 Such a facility is unnecessary where the buffering of the stream is not a constraint, since such  
125740 checks can be performed offline during post-mortem analysis.
- 125741 For example, a large system could incorporate a daemon utility to collect the trace records from  
125742 memory buffers and spool them to secondary storage for later analysis. In the instances where  
125743 resources are truly limited, such as embedded applications, the application incorporation of  
125744 application code to test the circumstances of a trace event and call the trace point only if needed  
125745 is usually straightforward.
- 125746 For performance reasons, the *posix\_trace\_event()* function should be implemented using a macro,  
125747 so if the trace is inactive, the trace event point calls are latent code and must cost no more than a  
125748 scalar test.
- 125749 The API proposed in POSIX.1-2008 does not include any triggering functionality.
- 125750 *B.2.11.9 Rationale on Timestamp Clock*
- 125751 It has been suggested that the tracing mechanism should include the possibility of specifying the  
125752 clock to be used in timestamping the trace events. When application trace events must be  
125753 correlated to remote trace events, such a facility could provide a global time reference not  
125754 available from a local clock. Further, the application may be driven by timers based on a clock  
125755 different from that used for the timestamp, and the correlation of the trace to those untraced  
125756 timer activities could be an important part of the analysis of the application.
- 125757 However, the tracing mechanism needs to be fast and just the provision of such an option can  
125758 materially affect its performance. Leaving aside the performance costs of reading some clocks,  
125759 this notion is also ill-defined when kernel trace events are to be traced by two applications  
125760 making use of different tracing clocks. This can even happen within a single application where  
125761 different parts of the application are served by different clocks. Another complication can occur  
125762 when a clock is maintained strictly at the user level and is unavailable at the kernel level.
- 125763 It is felt that the benefits of a selectable trace clock do not match its costs. Applications that wish  
125764 to correlate clocks other than the default tracing clock can include trace events with sample  
125765 values of those other clocks, allowing correlation of timestamps from the various independent  
125766 clocks. In any case, such a technique would be required when applications are sensitive to

125767 multiple clocks.

125768 *B.2.11.10 Rationale on Different Overrun Conditions*

125769 The analysis of the dynamic behavior of the trace mechanism shows that different overrun  
125770 conditions may occur. The API must provide a means to manage such conditions in a portable  
125771 way.

125772 **Overrun in Trace Streams Initialized with POSIX\_TRACE\_LOOP Policy**

125773 In this case, the user of the trace mechanism is interested in using the trace stream with  
125774 POSIX\_TRACE\_LOOP policy to record trace events continuously, but ideally without losing any  
125775 trace events. The online analyzer process must get the trace events at a mean speed equivalent to  
125776 the recording speed. Should the trace stream become full, a trace stream overrun occurs. This  
125777 condition is detected by getting the status of the active trace stream (function  
125778 *posix\_trace\_get\_status()*) and looking at the member *posix\_stream\_overrun\_status* of the read  
125779 **posix\_stream\_status** structure. In addition, two predefined trace event types are defined:

- 125780 1. The beginning of a trace overflow, to locate the beginning of an overflow when reading a  
125781 trace stream
- 125782 2. The end of a trace overflow, to locate the end of an overflow, when reading a trace stream

125783 As a timestamp is associated with these predefined trace events, it is possible to know the  
125784 duration of the overflow.

125785 **Overrun in Dumping Trace Streams into Trace Logs**

125786 The user lets the trace mechanism dump the trace stream initialized with  
125787 POSIX\_TRACE\_FLUSH policy automatically into a trace log. If the dump operation is slower  
125788 than the recording of trace events, the trace stream can overrun. This condition is detected by  
125789 getting the status of the active trace stream (the *posix\_trace\_get\_status()* function) and looking at  
125790 the member *posix\_stream\_overrun\_status* of the read **posix\_stream\_status** structure. This overrun  
125791 indicates that the trace mechanism is not able to operate in this mode at this speed. It is the  
125792 responsibility of the user to modify one of the trace parameters (the stream size or the trace  
125793 event type filter, for instance) to avoid such overrun conditions, if overruns are to be prevented.  
125794 The same already predefined trace event types (see [Overrun in Trace Streams Initialized with  
125795 POSIX\\_TRACE\\_LOOP Policy](#)) are used to detect and to know the duration of an overflow.

125796 **Reading an Active Trace Stream**

125797 Although this trace API allows one to read an active trace stream with log while it is tracing, this  
125798 feature can lead to false overflow origin interpretation: the trace log or the reader of the trace  
125799 stream. Reading from an active trace stream with log is thus non-portable, and has been left  
125800 unspecified.

## 125801 B.2.12 Data Types

### 125802 B.2.12.1 Defined Types

125803 The requirement that additional types defined in this section end in “\_t” was prompted by the  
125804 problem of name space pollution. It is difficult to define a type (where that type is not one  
125805 defined by POSIX.1-2008) in one header file and use it in another without adding symbols to the  
125806 name space of the program. To allow implementors to provide their own types, all conforming  
125807 applications are required to avoid symbols ending in “\_t”, which permits the implementor to  
125808 provide additional types. Because a major use of types is in the definition of structure members,  
125809 which can (and in many cases must) be added to the structures defined in POSIX.1-2008, the  
125810 need for additional types is compelling.

125811 The types, such as **ushort** and **ulong**, which are in common usage, are not defined in  
125812 POSIX.1-2008 (although **ushort\_t** would be permitted as an extension). They can be added to  
125813 **<sys/types.h>** using a feature test macro (see [Section B.2.2.1](#), on page 3556). A suggested symbol  
125814 for these is **\_SYSIII**. Similarly, the types like **u\_short** would probably be best controlled by **\_BSD**.

125815 Some of these symbols may appear in other headers; see [Section B.2.2.2](#) (on page 3557).

125816 **dev\_t** This type may be made large enough to accommodate host-locality considerations  
125817 of networked systems.

125818 This type must be arithmetic. Earlier proposals allowed this to be non-arithmetic  
125819 (such as a structure) and provided a *samefile()* function for comparison.

125820 **gid\_t** Some implementations had separated **gid\_t** from **uid\_t** before POSIX.1 was  
125821 completed. It would be difficult for them to coalesce them when it was  
125822 unnecessary. Additionally, it is quite possible that user IDs might be different from  
125823 group IDs because the user ID might wish to span a heterogeneous network,  
125824 where the group ID might not.

125825 For current implementations, the cost of having a separate **gid\_t** will be only  
125826 lexical.

125827 **mode\_t** This type was chosen so that implementations could choose the appropriate  
125828 integer type, and for compatibility with the ISO C standard. 4.3 BSD uses  
125829 **unsigned short** and the SVID uses **ushort**, which is the same. Historically, only the  
125830 low-order sixteen bits are significant.

125831 **nlink\_t** This type was introduced in place of **short** for *st\_nlink* (see the **<sys/stat.h>** header)  
125832 in response to an objection that **short** was too small.

125833 **off\_t** This type is used to represent a file offset or file size. On systems supporting large  
125834 files, **off\_t** is larger than 32 bits in at least one programming environment. Other  
125835 programming environments may use different sizes for **off\_t**, for compatibility or  
125836 other reasons.

125837 **pid\_t** The inclusion of this symbol was controversial because it is tied to the issue of the  
125838 representation of a process ID as a number. From the point of view of a  
125839 conforming application, process IDs should be “magic cookies”<sup>8</sup> that are produced  
125840 by calls such as *fork()*, used by calls such as *waitpid()* or *kill()*, and not otherwise

---

125841 8. An historical term meaning: “An opaque object, or token, of determinate size, whose significance is known only to the entity which  
125842 created it. An entity receiving such a token from the generating entity may only make such use of the ‘cookie’ as is defined and permitted  
125843 by the supplying entity.”

125844 analyzed (except that the sign is used as a flag for certain operations).

125845 The concept of a {PID\_MAX} value interacted with this in early proposals. Treating  
 125846 process IDs as an opaque type both removes the requirement for {PID\_MAX} and  
 125847 allows systems to be more flexible in providing process IDs that span a large range  
 125848 of values, or a small one.

125849 Since the values in **uid\_t**, **gid\_t**, and **pid\_t** will be numbers generally, and  
 125850 potentially both large in magnitude and sparse, applications that are based on  
 125851 arrays of objects of this type are unlikely to be fully portable in any case. Solutions  
 125852 that treat them as magic cookies will be portable.

125853 {CHILD\_MAX} precludes the possibility of a “toy implementation”, where there  
 125854 would only be one process.

125855 **ssize\_t** This is intended to be a signed analog of **size\_t**. The wording is such that an  
 125856 implementation may either choose to use a longer type or simply to use the signed  
 125857 version of the type that underlies **size\_t**. All functions that return **ssize\_t** (*read()*  
 125858 and *write()*) describe as “implementation-defined” the result of an input exceeding  
 125859 {SSIZE\_MAX}. It is recognized that some implementations might have **ints** that  
 125860 are smaller than **size\_t**. A conforming application would be constrained not to  
 125861 perform I/O in pieces larger than {SSIZE\_MAX}, but a conforming application  
 125862 using extensions would be able to use the full range if the implementation  
 125863 provided an extended range, while still having a single type-compatible interface.

125864 The symbols **size\_t** and **ssize\_t** are also required in **<unistd.h>** to minimize the  
 125865 changes needed for calls to *read()* and *write()*. Implementors are reminded that it  
 125866 must be possible to include both **<sys/types.h>** and **<unistd.h>** in the same  
 125867 program (in either order) without error.

125868 **uid\_t** Before the addition of this type, the data types used to represent these values  
 125869 varied throughout early proposals. The **<sys/stat.h>** header defined these values  
 125870 as type **short**, the **<passwd.h>** file (now **<pwd.h>** and **<grp.h>**) used an **int**, and  
 125871 *getuid()* returned an **int**. In response to a strong objection to the inconsistent  
 125872 definitions, all the types were switched to **uid\_t**.

125873 In practice, those historical implementations that use varying types of this sort can  
 125874 typedef **uid\_t** to **short** with no serious consequences.

125875 The problem associated with this change concerns object compatibility after  
 125876 structure size changes. Since most implementations will define **uid\_t** as a short, the  
 125877 only substantive change will be a reduction in the size of the **passwd** structure.  
 125878 Consequently, implementations with an overriding concern for object  
 125879 compatibility can pad the structure back to its current size. For that reason, this  
 125880 problem was not considered critical enough to warrant the addition of a separate  
 125881 type to POSIX.1.

125882 The types **uid\_t** and **gid\_t** are magic cookies. There is no {UID\_MAX} defined by  
 125883 POSIX.1, and no structure imposed on **uid\_t** and **gid\_t** other than that they be  
 125884 positive arithmetic types. (In fact, they could be **unsigned char**.) There is no  
 125885 maximum or minimum specified for the number of distinct user or group IDs.

125886 B.2.12.2 *The char Type*

125887 POSIX.1-2008 explicitly requires that a **char** type is exactly one byte (8 bits).

125888 **B.2.13 Status Information**

125889 POSIX.1-2008 does not require all matching WNOWAIT threads (threads in a matching call to  
 125890 *waitid()* with the WNOWAIT flag set) to obtain a child's status information because the status  
 125891 information might be discarded (consumed or replaced) before one of the matching WNOWAIT  
 125892 threads is scheduled. If the status information is not discarded, it will remain available, so all of  
 125893 the matching WNOWAIT threads will (eventually) obtain the status information.

125894 **B.2.14 File Descriptor Allocation**

125895 Functions such as *pipe()* and *socketpair()* which allocate two file descriptors are permitted to  
 125896 perform the two allocations independently. This means that other threads or signal handlers  
 125897 may perform operations on file descriptors in between the two allocations and this can result in  
 125898 the two file descriptors not having adjacent values or in the second allocation producing a lower  
 125899 value than the first.

125900 **B.3 System Interfaces**

125901 See the RATIONALE sections on the individual reference pages.

125902 **B.3.1 System Interfaces Removed in this Version**

125903 The following section contains a list of the interfaces removed in POSIX.1-2008, together with  
 125904 advice for application developers on the alternative interfaces that should be used for maximum  
 125905 portability.

125906 B.3.1.1 *bcmp()*

125907 Applications are recommended to use the *memcmp()* function instead of this function.  
 125908 For maximum portability, it is recommended to replace the function call to *bcmp()* as follows:  
 125909 `#define bcmp(b1,b2,len) memcmp((b1), (b2), (size_t)(len))`

125910 B.3.1.2 *bcopy()*

125911 Applications are recommended to use the *memmove()* function instead of this function.  
 125912 The following are approximately equivalent (note the order of the arguments):  
 125913 `bcopy(s1,s2,n) ≈ memmove(s2,s1,n)`  
 125914 For maximum portability, it is recommended to replace the function call to *bcopy()* as follows:  
 125915 `#define bcopy(b1,b2,len) (void)(memmove((b2), (b1), (len)))`

- 125916 B.3.1.3 *bsd\_signal()*
- 125917 Applications are recommended to use the *sigaction()* function instead of this function.
- 125918 The *bsd\_signal()* function was supplied as a migration path for the BSD *signal()* function for  
125919 simple applications that installed a single-argument signal handler function.
- 125920 Historically, the *bsd\_signal()* function differs from *signal()* in that the SA\_RESTART flag is set  
125921 and the SA\_RESETHAND flag is clear when *bsd\_signal()* is used. The state of these flags is not  
125922 specified for *signal()*.
- 125923 B.3.1.4 *bzero()*
- 125924 Applications are recommended to use the *memset()* function instead of this function.
- 125925 For maximum portability, it is recommended to replace the function call to *bzero()* as follows:
- 125926 `#define bzero(b,len) (void)(memset((b), '\0', (len)))`
- 125927 B.3.1.5 *ecvt()*, *fcvt()*, *gcvt()*
- 125928 Applications are recommended to use the *sprintf()* function instead of these functions.
- 125929 The *sprintf()* function is required by ISO C and is thus more portable.
- 125930 B.3.1.6 *ftime()*
- 125931 Applications are recommended to use the *time()* function to determine the current time.  
125932 Realtime applications should use *clock\_gettime()* to determine the current time.
- 125933 B.3.1.7 *getcontext()*, *makecontext()*, *swapcontext()*
- 125934 Due to portability issues with these functions, especially with the manipulation of contexts,  
125935 applications are recommended to be rewritten to use POSIX threads.
- 125936 B.3.1.8 *gethostbyaddr()*, *gethostbyname()*
- 125937 Applications are recommended to use the *getaddrinfo()* and *getnameinfo()* functions instead of  
125938 these functions.
- 125939 The *gethostbyaddr()* and *gethostbyname()* functions may return pointers to static data, which may  
125940 be overwritten by subsequent calls to any of these functions. The suggested replacements do not  
125941 have this problem and are also IPv6-capable.
- 125942 B.3.1.9 *getwd()*
- 125943 Applications are recommended to use the *getcwd()* function to determine the current working  
125944 directory.

125945 B.3.1.10 *h\_errno*

125946 Applications are recommended not to use this error return code. Previously it was set by the  
 125947 *gethostbyaddr()* and *gethostbyname()* functions.

125948 B.3.1.11 *index()*

125949 Applications are recommended to use the *strchr()* function instead of this function.

125950 For maximum portability, it is recommended to replace the function call to *index()* as follows:

125951 `#define index(a,b) strchr((a),(b))`

125952 B.3.1.12 *makecontext()*

125953 Applications using the *getcontext()*, *makecontext()*, and *swapcontext()* functions should be  
 125954 rewritten to use POSIX threads.

125955 B.3.1.13 *mktemp()*

125956 Applications are recommended to use the *mkstemp()* function instead of this function.

125957 The *mktemp()* function makes an application vulnerable to possible security problems since  
 125958 between the time a pathname is created and the file opened, it is possible for some other process  
 125959 to create a file with the same name. The *mkstemp()* function does not have this vulnerability.

125960 B.3.1.14 *pthread\_attr\_getstackaddr()*, *pthread\_attr\_setstackaddr()*

125961 Applications are recommended to use the *pthread\_attr\_setstack()* and *pthread\_attr\_getstack()*  
 125962 functions instead of these functions.

125963 There are a number of ambiguities in the specification of the *stackaddr* attribute that makes  
 125964 portable use of these interfaces impossible.

125965 B.3.1.15 *rindex()*

125966 Applications are recommended to use the *strrchr()* function instead of this function.

125967 For maximum portability, it is recommended to replace the function call to *rindex()* as follows:

125968 `#define rindex(a,b) strrchr((a),(b))`

125969 B.3.1.16 *scalb()*

125970 Applications are recommended to use either *scalbln()*, *scalblnf()*, or *scalblnl()* instead of these  
 125971 functions.

125972 The behavior for the *scalb()* function was only defined when the *n* argument is an integer, a  
 125973 NaN, or Inf. The behavior of other values for the *n* argument was unspecified.

125974 B.3.1.17 *ualarm()*

125975 Applications are recommended to use *timer\_create()*, *timer\_delete()*, *timer\_getoverrun()*,  
125976 *timer\_gettime()*, or *timer\_settime()* instead of this function.

125977 B.3.1.18 *usleep()*

125978 Applications are recommended to use the *nanosleep()* function instead of this function.

125979 B.3.1.19 *vfork()*

125980 Applications are recommended to use the *fork()* function instead of this function.

125981 The *vfork()* function was previously under-specified.

125982 B.3.1.20 *wcswcs()*

125983 Applications are recommended to use the *wcsstr()* function instead of this function.

125984 The *wcsstr()* function is technically equivalent and is portable across all ISO C implementations.

## 125985 B.3.2 System Interfaces Removed in the Previous Version

125986 The following system interfaces, headers, and external variables were removed in the previous  
125987 version of this standard:

125988	<i>advance()</i>	<i>getdtablesize()</i>	<i>re_exec()</i>	<i>ttyslot()</i>	<i>loc1</i>
125989	<i>brk()</i>	<i>getpagesize()</i>	<i>regcmp()</i>	<i>valloc()</i>	<i>__loc1</i>
125990	<i>chroot()</i>	<i>getpass()</i>	<i>regex()</i>	<i>wait3()</i>	<i>loc2</i>
125991	<i>compile()</i>	<i>getw()</i>	<i>sbrk()</i>	<b>&lt;re_comp.h&gt;</b>	<i>locs</i>
125992	<i>cuserid()</i>	<i>putw()</i>	<i>sigstack()</i>	<b>&lt;regexp.h&gt;</b>	
125993	<i>gamma()</i>	<i>re_comp()</i>	<i>step()</i>	<b>&lt;varargs.h&gt;</b>	

## 125994 B.3.3 Examples for Spawn

125995 The following long examples are provided in the Rationale (Informative) volume of  
125996 POSIX.1-2008 as a supplement to the reference page for *posix\_spawn()*.

### 125997 Example Library Implementation of Spawn

125998 The *posix\_spawn()* or *posix\_spawnnp()* functions provide the following:

- 125999 • Simply start a process executing a process image. This is the simplest application for  
126000 process creation, and it may cover most executions of *fork()*.
- 126001 • Support I/O redirection, including pipes.
- 126002 • Run the child under a user and group ID in the domain of the parent.
- 126003 • Run the child at any priority in the domain of the parent.

126004 The *posix\_spawn()* or *posix\_spawnnp()* functions do not cover every possible use of the *fork()*  
126005 function, but they do span the common applications: typical use by a shell and a login utility.

126006 The price for an application is that before it calls *posix\_spawn()* or *posix\_spawnnp()*, the parent  
126007 must adjust to a state that *posix\_spawn()* or *posix\_spawnnp()* can map to the desired state for the

126008 child. Environment changes require the parent to save some of its state and restore it afterwards.  
 126009 The effective behavior of a successful invocation of *posix\_spawn()* is as if the operation were  
 126010 implemented with POSIX operations as follows:

```

126011 #include <sys/types.h>
126012 #include <stdlib.h>
126013 #include <stdio.h>
126014 #include <unistd.h>
126015 #include <sched.h>
126016 #include <fcntl.h>
126017 #include <signal.h>
126018 #include <errno.h>
126019 #include <string.h>
126020 #include <signal.h>

126021 /* #include <spawn.h> */
126022 /*****
126023  * Things that could be defined in spawn.h */
126024  *****/
126025 typedef struct
126026 {
126027     short posix_attr_flags;
126028     #define POSIX_SPAWN_SETPGROUP      0x1
126029     #define POSIX_SPAWN_SETSIGMASK    0x2
126030     #define POSIX_SPAWN_SETSIGDEF     0x4
126031     #define POSIX_SPAWN_SETSCHEDULER  0x8
126032     #define POSIX_SPAWN_SETSCHEDPARAM 0x10
126033     #define POSIX_SPAWN_RESETIDS      0x20
126034     pid_t posix_attr_pgroup;
126035     sigset_t posix_attr_sigmask;
126036     sigset_t posix_attr_sigdefault;
126037     int posix_attr_schedpolicy;
126038     struct sched_param posix_attr_schedparam;
126039 } posix_spawnattr_t;

126040 typedef char *posix_spawn_file_actions_t;

126041 int posix_spawn_file_actions_init(
126042     posix_spawn_file_actions_t *file_actions);
126043 int posix_spawn_file_actions_destroy(
126044     posix_spawn_file_actions_t *file_actions);
126045 int posix_spawn_file_actions_addclose(
126046     posix_spawn_file_actions_t *file_actions, int fildes);
126047 int posix_spawn_file_actions_adddup2(
126048     posix_spawn_file_actions_t *file_actions, int fildes,
126049     int newfildes);
126050 int posix_spawn_file_actions_addopen(
126051     posix_spawn_file_actions_t *file_actions, int fildes,
126052     const char *path, int oflag, mode_t mode);
126053 int posix_spawnattr_init(posix_spawnattr_t *attr);
126054 int posix_spawnattr_destroy(posix_spawnattr_t *attr);
126055 int posix_spawnattr_getflags(const posix_spawnattr_t *attr,
126056     short *lags);
126057 int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
126058 int posix_spawnattr_getpgroup(const posix_spawnattr_t *attr,
```

```

126059     pid_t *pgroup);
126060 int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);
126061 int posix_spawnattr_getschedpolicy(const posix_spawnattr_t *attr,
126062     int *schedpolicy);
126063 int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,
126064     int schedpolicy);

126402     }
126403     int posix_spawnattr_setsigdefault(posix_spawnattr_t *attr,
126404         const sigset_t *sigdefault)
126405     {
126406         attr->posix_attr_sigdefault = *sigdefault;
126407         return 0;
126408     }
```

**I/O Redirection with Spawn**

I/O redirection with `posix_spawn()` or `posix_spawnnp()` is accomplished by crafting a `file_actions` argument to effect the desired redirection. Such a redirection follows the general outline of the following example:

```
/* To redirect new standard output (fd 1) to a file, */  
/* and redirect new standard input (fd 0) from my fd socket_pair[1], */  
/* and close my fd socket_pair[0] in the new process. */  
posix_spawn_file_actions_t file_actions;  
posix_spawn_file_actions_init(&file_actions);  
posix_spawn_file_actions_addopen(&file_actions, 1, "newout", ...);  
posix_spawn_file_actions_dup2(&file_actions, socket_pair[1], 0);  
posix_spawn_file_actions_close(&file_actions, socket_pair[0]);  
posix_spawn_file_actions_close(&file_actions, socket_pair[1]);  
posix_spawn(..., &file_actions, ...);  
posix_spawn_file_actions_destroy(&file_actions);
```

**Spawning a Process Under a New User ID**

Spawning a process under a new user ID follows the outline shown in the following example:

```
Save = getuid();  
setuid(newid);  
posix_spawn(...);  
setuid(Save);
```

# Rationale for Shell and Utilities

## C.1 Introduction

### C.1.1 Change History

The change history is provided as an informative section, to track changes from earlier versions of this standard.

The following sections describe changes made to the Shell and Utilities volume of POSIX.1-2008 since Issue 6 of the base document. The CHANGE HISTORY section for each utility describes technical changes made to that utility from Issue 5. Changes between earlier versions of the base document and Issue 5 are not included.

#### Changes from Issue 6 to Issue 7 (POSIX.1-2008)

The following list summarizes the major changes that were made in the Shell and Utilities volume of POSIX.1-2008 from Issue 6 to Issue 7:

- Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1, and responses to ISO/IEC defect reports against ISO/IEC 9945 are applied.
- The Open Group corrigenda and resolutions are applied.
- Features, marked legacy or obsolescent in the base document, have been considered for removal in this version.
- A review of the use of fixed pathnames within the standard has been undertaken; for example, the *at*, *batch*, and *crontab* utilities previously had a requirement for use of the directory */usr/lib/cron*.
- The options within the standard have been revised.
  - The Batch Environment Services and Utilities option is marked obsolescent.
  - The UUCP utilities option is added.
  - The User Portability Utilities option is revised so that only the *bg*, *ex*, *fc*, *fg*, *jobs*, *more*, *talk*, and *vi* utilities are included, the rest being moved to the Base.

**126461 New Features in Issue 7**

126462 There are no new utilities in Issue 7.

**126463 C.1.2 Relationship to Other Documents****126464 C.1.2.1 System Interfaces**

126465 It has been pointed out that the Shell and Utilities volume of POSIX.1-2008 assumes that a great  
126466 deal of functionality from the System Interfaces volume of POSIX.1-2008 is present, but never  
126467 states exactly how much (and strictly does not need to since both are mandated on a conforming  
126468 system). This section is an attempt to clarify the assumptions.

**126469 File Read, Write, and Creation**

126470 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/2 is applied, updating Table 1-1.

**126471 File Removal**

126472 This is intended to be a summary of the *unlink()* and *rmdir()* requirements. Note that it is  
126473 possible using the *unlink()* function for item 4. to occur.

**126474 C.1.2.2 Concepts Derived from the ISO C Standard**

126475 This section was introduced to address the issue that there was insufficient detail presented by  
126476 such utilities as *awk* or *sh* about their procedural control statements and their methods of  
126477 performing arithmetic functions.

126478 The ISO C standard was selected as a model because most historical implementations of the  
126479 standard utilities were written in C. Thus, it was more likely that they would act in the desired  
126480 manner without modification.

126481 Using the ISO C standard is primarily a notational convenience so that the many procedural  
126482 languages in the Shell and Utilities volume of POSIX.1-2008 would not have to be rigorously  
126483 described in every aspect. Its selection does not require that the standard utilities be written in  
126484 Standard C; they could be written in Common Usage C, Ada, Pascal, assembler language, or  
126485 anything else.

126486 The sizes of the various numeric values refer to C-language data types that are allowed to be  
126487 different sizes by the ISO C standard. Thus, like a C-language application, a shell application  
126488 cannot rely on their exact size. However, it can rely on their minimum sizes expressed in the  
126489 ISO C standard, such as {LONG\_MAX} for a **long** type.

126490 The behavior on overflow is undefined for ISO C standard arithmetic. Therefore, the standard  
126491 utilities can use “bignum” representation for integers so that there is no fixed maximum unless  
126492 otherwise stated in the utility description. Similarly, standard utilities can use infinite-precision  
126493 representations for floating-point arithmetic, as long as these representations exceed the ISO C  
126494 standard requirements.

126495 This section addresses only the issue of semantics; it is not intended to specify syntax. For  
126496 example, the ISO C standard requires that 0L be recognized as an integer constant equal to zero,  
126497 but utilities such as *awk* and *sh* are not required to recognize 0L (though they are allowed to, as  
126498 an extension).

126499 The ISO C standard requires that a C compiler must issue a diagnostic for constants that are too  
 126500 large to represent. Most standard utilities are not required to issue these diagnostics; for  
 126501 example, the command:

126502 `diff -C 2147483648 file1 file2`

126503 has undefined behavior, and the *diff* utility is not required to issue a diagnostic even if the  
 126504 number 2 147 483 648 cannot be represented.

### 126505 C.1.3 Utility Limits

126506 This section grew out of an idea that originated with the original POSIX.1, in the tables of system  
 126507 limits for the *sysconf()* and *pathconf()* functions. The idea being that a conforming application  
 126508 can be written to use the most restrictive values that a minimal system can provide, but it should  
 126509 not have to. The values provided represent compromises so that some vendors can use  
 126510 historically limited versions of UNIX system utilities. They are the highest values that a strictly  
 126511 conforming application can assume, given no other information.

126512 However, by using the *getconf* utility or the *sysconf()* function, the elegant application can be  
 126513 tailored to more liberal values on some of the specific instances of specific implementations.

126514 There is no explicitly stated requirement that an implementation provide finite limits for any of  
 126515 these numeric values; the implementation is free to provide essentially unbounded capabilities  
 126516 (where it makes sense), stopping only at reasonable points such as {ULONG\_MAX} (from the  
 126517 ISO C standard). Therefore, applications desiring to tailor themselves to the values on a  
 126518 particular implementation need to be ready for possibly huge values; it may not be a good idea  
 126519 to allocate blindly a buffer for an input line based on the value of {LINE\_MAX}, for instance.  
 126520 However, unlike the System Interfaces volume of POSIX.1-2008, there is no set of limits that  
 126521 return a special indication meaning “unbounded”. The implementation should always return an  
 126522 actual number, even if the number is very large.

126523 The statement:

126524 “It is not guaranteed that the application ...”

126525 is an indication that many of these limits are designed to ensure that implementors design their  
 126526 utilities without arbitrary constraints related to unimaginative programming. There are certainly  
 126527 conditions under which combinations of options can cause failures that would not render an  
 126528 implementation non-conforming. For example, {EXPR\_NEST\_MAX} and {ARG\_MAX} could  
 126529 collide when expressions are large; combinations of {BC\_SCALE\_MAX} and {BC\_DIM\_MAX}  
 126530 could exceed virtual memory.

126531 In the Shell and Utilities volume of POSIX.1-2008, the notion of a limit being guaranteed for the  
 126532 process lifetime, as it is in the System Interfaces volume of POSIX.1-2008, is not as useful to a  
 126533 shell script. The *getconf* utility is probably a process itself, so the guarantee would be without  
 126534 value. Therefore, the Shell and Utilities volume of POSIX.1-2008 requires the guarantee to be for  
 126535 the session lifetime. This will mean that many vendors will either return very conservative  
 126536 values or possibly implement *getconf* as a built-in.

126537 It may seem confusing to have limits that apply only to a single utility grouped into one global  
 126538 section. However, the alternative, which would be to disperse them out into their utility  
 126539 description sections, would cause great difficulty when *sysconf()* and *getconf* were described.  
 126540 Therefore, the standard developers chose the global approach.

126541 Each language binding could provide symbol names that are slightly different from those shown  
 126542 here. For example, the C-Language Binding option adds a leading <underscore> to the symbols  
 126543 as a prefix.

126544 The following comments describe selection criteria for the symbols and their values:

126545 {ARG\_MAX}

126546 This is defined by the System Interfaces volume of POSIX.1-2008. Unfortunately, it is very

126547 difficult for a conforming application to deal with this value, as it does not know how much

126548 of its argument space is being consumed by the environment variables of the user.

126549 {BC\_BASE\_MAX}

126550 {BC\_DIM\_MAX}

126551 {BC\_SCALE\_MAX}

126552 These were originally one value, {BC\_SCALE\_MAX}, but it was unreasonable to link all

126553 three concepts into one limit.

126554 {CHILD\_MAX}

126555 This is defined by the System Interfaces volume of POSIX.1-2008.

126556 {COLL\_WEIGHTS\_MAX}

126557 The weights assigned to **order** can be considered as “passes” through the collation

126558 algorithm.

126559 {EXPR\_NEST\_MAX}

126560 The value for expression nesting was borrowed from the ISO C standard.

126561 {LINE\_MAX}

126562 This is a global limit that affects all utilities, unless otherwise noted. The {MAX\_CANON}

126563 value from the System Interfaces volume of POSIX.1-2008 may further limit input lines from

126564 terminals. The {LINE\_MAX} value was the subject of much debate and is a compromise

126565 between those who wished to have unlimited lines and those who understood that many

126566 historical utilities were written with fixed buffers. Frequently, utility writers selected the

126567 UNIX system constant BUFSIZ to allocate these buffers; therefore, some utilities were

126568 limited to 512 bytes for I/O lines, while others achieved 4 096 bytes or greater.

126569 It should be noted that {LINE\_MAX} applies only to input line length; there is no

126570 requirement in POSIX.1-2008 that limits the length of output lines. Utilities such as *awk*, *sed*,

126571 and *paste* could theoretically construct lines longer than any of the input lines they received,

126572 depending on the options used or the instructions from the application. They are not

126573 required to truncate their output to {LINE\_MAX}. It is the responsibility of the application

126574 to deal with this. If the output of one of those utilities is to be piped into another of the

126575 standard utilities, line length restrictions will have to be considered; the *fold* utility, among

126576 others, could be used to ensure that only reasonable line lengths reach utilities or

126577 applications.

126578 {LINK\_MAX}

126579 This is defined by the System Interfaces volume of POSIX.1-2008.

126580 {MAX\_CANON}

126581 {MAX\_INPUT}

126582 {NAME\_MAX}

126583 {NGROUPS\_MAX}

126584 {OPEN\_MAX}

126585 {PATH\_MAX}

126586 {PIPE\_BUF}

126587 These limits are defined by the System Interfaces volume of POSIX.1-2008. Note that the

126588 byte lengths described by some of these values continue to represent bytes, even if the

126589 applicable character set uses a multi-byte encoding.

{RE\_DUP\_MAX}

The value selected is consistent with historical practice. Although the name implies that it applies to all REs, only BREs use the interval notation  $\{m,n\}$  addressed by this limit.

{POSIX2\_SYMLINKS}

The {POSIX2\_SYMLINKS} variable indicates that the underlying operating system supports the creation of symbolic links in specific directories. Many of the utilities defined in POSIX.1-2008 that deal with symbolic links do not depend on this value. For example, a utility that follows symbolic links (or does not, as the case may be) will only be affected by a symbolic link if it encounters one. Presumably, a file system that does not support symbolic links will not contain any. This variable does affect such utilities as *ln -s* and *pax* that attempt to create symbolic links.

There are different limits associated with command lines and input to utilities, depending on the method of invocation. In the case of a C program *exec*-ing a utility, {ARG\_MAX} is the underlying limit. In the case of the shell reading a script and *exec*-ing a utility, {LINE\_MAX} limits the length of lines the shell is required to process, and {ARG\_MAX} will still be a limit. If a user is entering a command on a terminal to the shell, requesting that it invoke the utility, {MAX\_INPUT} may restrict the length of the line that can be given to the shell to a value below {LINE\_MAX}.

When an option is supported, *getconf* returns a value of 1. For example, when C development is supported:

```
if [ "$(getconf POSIX2_C_DEV)" -eq 1 ]; then
    echo C supported
fi
```

The *sysconf()* function in the C-Language Binding option would return 1.

The following comments describe selection criteria for the symbols and their values:

POSIX2\_C\_BIND  
 POSIX2\_C\_DEV  
 POSIX2\_FORT\_DEV  
 POSIX2\_FORT\_RUN  
 POSIX2\_SW\_DEV  
 POSIX2\_UPE

It is possible for some (usually privileged) operations to remove utilities that support these options or otherwise to render these options unsupported. The header files, the *sysconf()* function, or the *getconf* utility will not necessarily detect such actions, in which case they should not be considered as rendering the implementation non-conforming. A test suite should not attempt tests such as:

```
rm /usr/bin/c99
getconf POSIX2_C_DEV
```

POSIX2\_LOCALEDEF

This symbol was introduced to allow implementations to restrict supported locales to only those supplied by the implementation.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/2 is applied, deleting the entry for {POSIX2\_VERSION} since it is not a utility limit minimum value.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/3 is applied, changing the text in Utility Limits from: “utility (see *getconf*) through the *sysconf()* function defined in the System Interfaces volume of POSIX.1-2008. The literal names shown in Table 1-3 apply only to the *getconf* utility; the high-level language binding describes the exact form of each name to be used by the

126637 interfaces in that binding.” to: “utility (see *getconf*).”.

#### 126638 **C.1.4 Grammar Conventions**

126639 There is no additional rationale provided for this section.

#### 126640 **C.1.5 Utility Description Defaults**

126641 This section is arranged with headings in the same order as all the utility descriptions. It is a  
126642 collection of related and unrelated information concerning:

- 126643 1. The default actions of utilities
- 126644 2. The meanings of notations used in POSIX.1-2008 that are specific to individual utility  
126645 sections

126646 Although this material may seem out of place here, it is important that this information appear  
126647 before any of the utilities to be described later.

#### 126648 **NAME**

126649 There is no additional rationale provided for this section.

#### 126650 **SYNOPSIS**

126651 There is no additional rationale provided for this section.

#### 126652 **DESCRIPTION**

126653 There is no additional rationale provided for this section.

#### 126654 **OPTIONS**

126655 Although it has not always been possible, the standard developers tried to avoid repeating  
126656 information to reduce the risk that duplicate explanations could each be modified differently.

126657 The need to recognize `--` is required because conforming applications need to shield their  
126658 operands from any arbitrary options that the implementation may provide as an extension. For  
126659 example, if the standard utility *foo* is listed as taking no options, and the application needed to  
126660 give it a pathname with a leading <hyphen-minus>, it could safely do it as:

126661 `foo -- -myfile`

126662 and avoid any problems with `-m` used as an extension.

#### 126663 **OPERANDS**

126664 The usage of `-` is never shown in the SYNOPSIS. Similarly, the usage of `--` is never shown.

126665 The requirement for processing operands in command-line order is to avoid a “WeirdNIX”  
126666 utility that might choose to sort the input files alphabetically, by size, or by directory order.  
126667 Although this might be acceptable for some utilities, in general the programmer has a right to  
126668 know exactly what order will be chosen.

126669 Some of the standard utilities take multiple *file* operands and act as if they were processing the  
126670 concatenation of those files. For example:

126671 `asa file1 file2`

126672 and:

126673 `cat file1 file2 | asa`

126674 have similar results when questions of file access, errors, and performance are ignored. Other  
 126675 utilities such as *grep* or *wc* have completely different results in these two cases. This latter type of  
 126676 utility is always identified in its DESCRIPTION or OPERANDS sections, whereas the former is  
 126677 not. Although it might be possible to create a general assertion about the former case, the  
 126678 following points must be addressed:

- 126679 • Access times for the files might be different in the operand case *versus* the *cat* case.
- 126680 • The utility may have error messages that are cognizant of the input filename, and this  
 126681 added value should not be suppressed. (As an example, *awk* sets a variable with the  
 126682 filename at each file boundary.)

## 126683 STDIN

126684 There is no additional rationale provided for this section.

## 126685 INPUT FILES

126686 A conforming application cannot assume the following three commands are equivalent:

```
126687 tail -n +2 file
126688 (sed -n 1q; cat) < file
126689 cat file | (sed -n 1q; cat)
```

126690 The second command is equivalent to the first only when the file is seekable. In the third  
 126691 command, if the file offset in the open file description were not unspecified, *sed* would have to  
 126692 be implemented so that it read from the pipe 1 byte at a time or it would have to employ some  
 126693 method to seek backwards on the pipe. Such functionality is not defined currently in POSIX.1  
 126694 and does not exist on all historical systems. Other utilities, such as *head*, *read*, and *sh*, have similar  
 126695 properties, so the restriction is described globally in this section.

126696 The definition of “text file” is strictly enforced for input to the standard utilities; very few of  
 126697 them list exceptions to the undefined results called for here. (Of course, “undefined” here does  
 126698 not mean that historical implementations necessarily have to change to start indicating error  
 126699 conditions. Conforming applications cannot rely on implementations succeeding or failing when  
 126700 non-text files are used.)

126701 The utilities that allow line continuation are generally those that accept input languages, rather  
 126702 than pure data. It would be unusual for an input line of this type to exceed {LINE\_MAX} bytes  
 126703 and unreasonable to require that the implementation allow unlimited accumulation of multiple  
 126704 lines, each of which could reach {LINE\_MAX}. Thus, for a conforming application the total of all  
 126705 the continued lines in a set cannot exceed {LINE\_MAX}.

126706 The format description is intended to be sufficiently rigorous to allow other applications to  
 126707 generate these input files. However, since <blank> characters can legitimately be included in  
 126708 some of the fields described by the standard utilities, particularly in locales other than the POSIX  
 126709 locale, this intent is not always realized.

**126710 ENVIRONMENT VARIABLES**

126711 There is no additional rationale provided for this section.

**126712 ASYNCHRONOUS EVENTS**

126713 Because there is no language prohibiting it, a utility is permitted to catch a signal, perform some  
126714 additional processing (such as deleting temporary files), restore the default signal action (or  
126715 action inherited from the parent process), and resignal itself.

**126716 STDOUT**

126717 The format description is intended to be sufficiently rigorous to allow post-processing of output  
126718 by other programs, particularly by an *awk* or *lex* parser.

**126719 STDERR**

126720 This section does not describe error messages that refer to incorrect operation of the utility.  
126721 Consider a utility that processes program source code as its input. This section is used to  
126722 describe messages produced by a correctly operating utility that encounters an error in the  
126723 program source code on which it is processing. However, a message indicating that the utility  
126724 had insufficient memory in which to operate would not be described.

126725 Some utilities have traditionally produced warning messages without returning a non-zero exit  
126726 status; these are specifically noted in their sections. Other utilities shall not write to standard  
126727 error if they complete successfully, unless the implementation provides some sort of extension to  
126728 increase the verbosity or debugging level.

126729 The format descriptions are intended to be sufficiently rigorous to allow post-processing of  
126730 output by other programs.

**126731 OUTPUT FILES**

126732 The format description is intended to be sufficiently rigorous to allow post-processing of output  
126733 by other programs, particularly by an *awk* or *lex* parser.

126734 Receipt of the SIGQUIT signal should generally cause termination (unless in some debugging  
126735 mode) that would bypass any attempted recovery actions.

**126736 EXTENDED DESCRIPTION**

126737 There is no additional rationale provided for this section.

**126738 EXIT STATUS**

126739 Note the additional discussion of exit values in *Exit Status for Commands* in the *sh* utility. It  
126740 describes requirements for returning exit values greater than 125.

126741 A utility may list zero as a successful return, 1 as a failure for a specific reason, and greater than  
126742 1 as “an error occurred”. In this case, unspecified conditions may cause a 2 or 3, or other value,  
126743 to be returned. A strictly conforming application should be written so that it tests for successful  
126744 exit status values (zero in this case), rather than relying upon the single specific error value listed  
126745 in POSIX.1-2008. In that way, it will have maximum portability, even on implementations with  
126746 extensions.

126747 The standard developers are aware that the general non-enumeration of errors makes it difficult  
126748 to write test suites that test the *incorrect* operation of utilities. There are some historical  
126749 implementations that have expended effort to provide detailed status messages and a helpful  
126750 environment to bypass or explain errors, such as prompting, retrying, or ignoring unimportant

126751 syntax errors; other implementations have not. Since there is no realistic way to mandate system  
 126752 behavior in cases of undefined application actions or system problems—in a manner acceptable  
 126753 to all cultures and environments—attention has been limited to the correct operation of utilities  
 126754 by the conforming application. Furthermore, the conforming application does not need detailed  
 126755 information concerning errors that it caused through incorrect usage or that it cannot correct.

126756 There is no description of defaults for this section because all of the standard utilities specify  
 126757 something (or explicitly state “Unspecified”) for exit status.

## 126758 CONSEQUENCES OF ERRORS

126759 Several actions are possible when a utility encounters an error condition, depending on the  
 126760 severity of the error and the state of the utility. Included in the possible actions of various  
 126761 utilities are: deletion of temporary or intermediate work files; deletion of incomplete files; and  
 126762 validity checking of the file system or directory.

126763 The text about recursive traversing is meant to ensure that utilities such as *find* process as many  
 126764 files in the hierarchy as they can. They should not abandon all of the hierarchy at the first error  
 126765 and resume with the next command-line operand, but should attempt to keep going.

126766 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0001 [150] is applied.

## 126767 APPLICATION USAGE

126768 This section provides additional caveats, issues, and recommendations to the developer.

## 126769 EXAMPLES

126770 This section provides sample usage.

## 126771 RATIONALE

126772 There is no additional rationale provided for this section.

## 126773 FUTURE DIRECTIONS

126774 FUTURE DIRECTIONS sections act as pointers to related work that may impact the interface in  
 126775 the future, and often cautions the developer to architect the code to account for a change in this  
 126776 area. Note that a future directions statement should not be taken as a commitment to adopt a  
 126777 feature or interface in the future.

## 126778 SEE ALSO

126779 There is no additional rationale provided for this section.

## 126780 CHANGE HISTORY

126781 There is no additional rationale provided for this section.

**C.1.6 Considerations for Utilities in Support of Files of Arbitrary Size**

This section is intended to clarify the requirements for utilities in support of large files.

The utilities listed in this section are utilities which are used to perform administrative tasks such as to create, move, copy, remove, change the permissions, or measure the resources of a file. They are useful both as end-user tools and as utilities invoked by applications during software installation and operation.

The *chgrp*, *chmod*, *chown*, *ln*, and *rm* utilities probably require use of large file-capable versions of *stat()*, *lstat()*, *ftw()*, and the **stat** structure.

The *cat*, *cksum*, *cmp*, *cp*, *dd*, *mv*, *sum*, and *touch* utilities probably require use of large file-capable versions of *creat()*, *open()*, and *fopen()*.

The *cat*, *cksum*, *cmp*, *dd*, *df*, *du*, *ls*, and *sum* utilities may require writing large integer values. For example:

- The *cat* utility might have a **-n** option which counts <newline> characters.
- The *cksum* and *ls* utilities report file sizes.
- The *cmp* utility reports the line number at which the first difference occurs, and also has a **-l** option which reports file offsets.
- The *dd*, *df*, *du*, *ls*, and *sum* utilities report block counts.

The *dd*, *find*, and *test* utilities may need to interpret command arguments that contain 64-bit values. For *dd*, the arguments include *skip=n*, *seek=n*, and *count=n*. For *find*, the arguments include **-sizen**. For *test*, the arguments are those associated with algebraic comparisons.

The *df* utility might need to access large file systems with *statvfs()*.

The *ulimit* utility will need to use large file-capable versions of *getrlimit()* and *setrlimit()* and be able to read and write large integer values.

**C.1.7 Built-In Utilities**

All of these utilities can be *exec*-ed. There is no requirement that these utilities are actually built into the shell itself, but many shells need the capability to do so because XCU [Section 2.9.1.1](#) (on page 2357) requires that they be found prior to the *PATH* search. The shell could satisfy its requirements by keeping a list of the names and directly accessing the file-system versions regardless of *PATH*. Providing all of the required functionality for those such as *cd* or *read* would be more difficult.

There were originally three justifications for allowing the omission of *exec*-able versions:

1. It would require wasting space in the file system, at the expense of very small systems. However, it has been pointed out that all 16 utilities in the table can be provided with 16 links to a single-line shell script:

```
$0 "$@"
```

2. It is not logical to require invocation of utilities such as *cd* because they have no value outside the shell environment or cannot be useful in a child process. However, counter-examples always seemed to be available for even the most unusual cases:

```
find . -type d -exec cd {} \; -exec foo {} \;
      (which invokes "foo" on accessible directories)
```

```
ps ... | sed ... | xargs kill
```

126823 `find . -exec true \; -a ...`

126824 (where “true” is used for temporary debugging)

- 126825 3. It is confusing to have a utility such as *kill* that can easily be in the file system in the base  
 126826 standard, but that requires built-in status for the User Portability Utilities option (for the  
 126827 % job control job ID notation). It was decided that it was more appropriate to describe the  
 126828 required functionality (rather than the implementation) to the system implementors and  
 126829 let them decide how to satisfy it.

126830 On the other hand, it was realized that any distinction like this between utilities was not useful  
 126831 to applications, and that the cost to correct it was small. These arguments were ultimately the  
 126832 most effective.

126833 There were varying reasons for including utilities in the table of built-ins:

126834 *alias, fc, unalias*

126835 The functionality of these utilities is performed more simply within the shell itself and that  
 126836 is the model most historical implementations have used.

126837 *bg, fg, jobs*

126838 All of the job control-related utilities are eligible for built-in status because that is the model  
 126839 most historical implementations have used.

126840 *cd, getopts, newgrp, read, umask, wait*

126841 The functionality of these utilities is performed more simply within the context of the  
 126842 current process. An example can be taken from the usage of the *cd* utility. The purpose of  
 126843 the *cd* utility is to change the working directory for subsequent operations. The actions of *cd*  
 126844 affect the process in which *cd* is executed and all subsequent child processes of that process.  
 126845 Based on the POSIX standard process model, changes in the process environment of a child  
 126846 process have no effect on the parent process. If the *cd* utility were executed from a child  
 126847 process, the working directory change would be effective only in the child process. Child  
 126848 processes initiated subsequent to the child process that executed the *cd* utility would not  
 126849 have a changed working directory relative to the parent process.

126850 *command*

126851 This utility was placed in the table primarily to protect scripts that are concerned about  
 126852 their *PATH* being manipulated. The “secure” shell script example in the *command* utility in  
 126853 the Shell and Utilities volume of POSIX.1-2008 would not be possible if a *PATH* change  
 126854 retrieved an alien version of *command*. (An alternative would have been to implement  
 126855 *getconf* as a built-in, but the standard developers considered that it carried too many  
 126856 changing configuration strings to require in the shell.)

126857 *kill* Since *kill* provides optional job control functionality using shell notation (%1, %2, and so on),  
 126858 some implementations would find it extremely difficult to provide this outside the shell.

126859 *true, false*

126860 These are in the table as a courtesy to programmers who wish to use the “while true”  
 126861 shell construct without protecting *true* from *PATH* searches. (It is acknowledged that  
 126862 “while :” also works, but the idiom with *true* is historically pervasive.)

126863 All utilities, including those in the table, are accessible via the *system()* and *popen()* functions in  
 126864 the System Interfaces volume of POSIX.1-2008. There are situations where the return  
 126865 functionality of *system()* and *popen()* is not desirable. Applications that require the exit status of  
 126866 the invoked utility will not be able to use *system()* or *popen()*, since the exit status returned is  
 126867 that of the command language interpreter rather than that of the invoked utility. The alternative  
 126868 for such applications is the use of the *exec* family.

## 126869 C.2 Shell Command Language

### 126870 C.2.1 Shell Introduction

126871 The System V shell was selected as the starting point for the Shell and Utilities volume of  
126872 POSIX.1-2008. The BSD C shell was excluded from consideration for the following reasons:

- 126873 • Most historically portable shell scripts assume the Version 7 Bourne shell, from which the  
126874 System V shell is derived.
- 126875 • The majority of tutorial materials on shell programming assume the System V shell.

126876 The construct "#!" is reserved for implementations wishing to provide that extension. If it were  
126877 not reserved, the Shell and Utilities volume of POSIX.1-2008 would disallow it by forcing it to be  
126878 a comment. As it stands, a strictly conforming application must not use "#!" as the first two  
126879 characters of the file.

### 126880 C.2.2 Quoting

126881 There is no additional rationale provided for this section.

#### 126882 C.2.2.1 Escape Character (Backslash)

126883 There is no additional rationale provided for this section.

#### 126884 C.2.2.2 Single-Quotes

126885 A <backslash> cannot be used to escape a single-quote in a single-quoted string. An embedded  
126886 quote can be created by writing, for example: "'a'\''b'", which yields "a'b". (See XCU  
126887 [Section 2.6.5](#) (on page 2349) for a better understanding of how portions of words are either split  
126888 into fields or remain concatenated.) A single token can be made up of concatenated partial  
126889 strings containing all three kinds of quoting or escaping, thus permitting any combination of  
126890 characters.

#### 126891 C.2.2.3 Double-Quotes

126892 The escaped <newline> used for line continuation is removed entirely from the input and is not  
126893 replaced by any white space. Therefore, it cannot serve as a token separator.

126894 In double-quoting, if a <backslash> is immediately followed by a character that would be  
126895 interpreted as having a special meaning, the <backslash> is deleted and the subsequent  
126896 character is taken literally. If a <backslash> does not precede a character that would have a  
126897 special meaning, it is left in place unmodified and the character immediately following it is also  
126898 left unmodified. Thus, for example:

126899 "\$" -> \$

126900 "\a" -> \a

126901 It would be desirable to include the statement "The characters from an enclosed "\${ to the  
126902 matching '}' shall not be affected by the double-quotes", similar to the one for "\$()".  
126903 However, historical practice in the System V shell prevents this.

126904 The requirement that double-quotes be matched inside "\${...}" within double-quotes and the  
126905 rule for finding the matching '}' in XCU [Section 2.6.2](#) (on page 2344) eliminate several subtle  
126906 inconsistencies in expansion for historical shells in rare cases; for example:

126907 "\$ {foo-bar} "

126908 yields **bar** when **foo** is not defined, and is an invalid substitution when **foo** is defined, in many  
126909 historical shells. The differences in processing the "\${...}" form have led to inconsistencies  
126910 between historical systems. A consequence of this rule is that single-quotes cannot be used to  
126911 quote the '}' within "\${...}"; for example:

126912 unset bar  
126913 foo="\$ {bar-' }' "

126914 is invalid because the "\${...}" substitution contains an unpaired unescaped single-quote. The  
126915 <backslash> can be used to escape the '}' in this example to achieve the desired result:

126916 unset bar  
126917 foo="\$ {bar-\} }" "

126918 The differences in processing the "\${...}" form have led to inconsistencies between the  
126919 historical System V shell, BSD, and KornShells, and the text in the Shell and Utilities volume of  
126920 POSIX.1-2008 is an attempt to converge them without breaking too many applications. The only  
126921 alternative to this compromise between shells would be to make the behavior unspecified  
126922 whenever the literal characters single-quote, '{', '}', and '"' appear within "\${...}". To  
126923 write a portable script that uses these values, a user would have to assign variables; for example:

126924 squote='\ ' dquote=\" lbrace='{ ' rbrace=' }'  
126925 \${foo-\$squote\$rbrace\$squote}

126926 rather than:

126927 \${foo-" ' }' ' ' }

126928 Some implementations have allowed the end of the word to terminate the backquoted command  
126929 substitution, such as in:

126930 "`echo hello"

126931 This usage is undefined; the matching backquote is required by the Shell and Utilities volume of  
126932 POSIX.1-2008. The other undefined usage can be illustrated by the example:

126933 sh -c '` echo "foo`'

126934 The description of the recursive actions involving command substitution can be illustrated with  
126935 an example. Upon recognizing the introduction of command substitution, the shell parses input  
126936 (in a new context), gathering the source for the command substitution until an unbalanced ')' or  
126937 or '`' is located. For example, in the following:

126938 echo "\$(date; echo "  
126939 one" )"

126940 the double-quote following the *echo* does not terminate the first double-quote; it is part of the  
126941 command substitution script. Similarly, in:

126942 echo "\$(echo \*)" "

126943 the <asterisk> is not quoted since it is inside command substitution; however:

126944 echo "\$(echo " \* ") "

126945 is quoted (and represents the <asterisk> character itself).

## C.2.3 Token Recognition

The "(" and ")" symbols are control operators in the KornShell, used for an alternative syntax of an arithmetic expression command. A conforming application cannot use "(" as a single token (with the exception of the "\$(" form for shell arithmetic).

On some implementations, the symbol "(" is a control operator; its use produces unspecified results. Applications that wish to have nested subshells, such as:

```
((echo Hello);(echo World))
```

must separate the "(" characters into two tokens by including white space between them. Some systems may treat these as invalid arithmetic expressions instead of subshells.

Certain combinations of characters are invalid in portable scripts, as shown in the grammar. Implementations may use these combinations (such as "|&") as valid control operators. Portable scripts cannot rely on receiving errors in all cases where this volume of POSIX.1-2008 indicates that a syntax is invalid.

The (3) rule about combining characters to form operators is not meant to preclude systems from extending the shell language when characters are combined in otherwise invalid ways. Conforming applications cannot use invalid combinations, and test suites should not penalize systems that take advantage of this fact. For example, the unquoted combination "|&" is not valid in a POSIX script, but has a specific KornShell meaning.

The (10) rule about '#' as the current character is the first in the sequence in which a new token is being assembled. The '#' starts a comment only when it is at the beginning of a token. This rule is also written to indicate that the search for the end-of-comment does not consider escaped <newline> specially, so that a comment cannot be continued to the next line.

### C.2.3.1 Alias Substitution

The alias capability was added because it is widely used in historical implementations by interactive users.

The definition of "alias name" precludes an alias name containing a <slash> character. Since the text applies to the command words of simple commands, reserved words (in their proper places) cannot be confused with aliases.

The placement of alias substitution in token recognition makes it clear that it precedes all of the word expansion steps.

An example concerning trailing <blank> characters and reserved words follows. If the user types:

```
$ alias foo="/bin/ls "  
$ alias while="/"
```

The effect of executing:

```
$ while true  
> do  
> echo "Hello, World"  
> done
```

is a never-ending sequence of "Hello, World" strings to the screen. However, if the user types:

```
$ foo while
```

126988 the result is an *ls* listing of */*. Since the alias substitution for **foo** ends in a <space>, the next word  
126989 is checked for alias substitution. The next word, **while**, has also been aliased, so it is substituted  
126990 as well. Since it is not in the proper position as a command word, it is not recognized as a  
126991 reserved word.

126992 If the user types:

126993 **\$** foo; while

126994 **while** retains its normal reserved-word properties.

## 126995 C.2.4 Reserved Words

126996 All reserved words are recognized syntactically as such in the contexts described. However, note  
126997 that **in** is the only meaningful reserved word after a **case** or **for**; similarly, **in** is not meaningful as  
126998 the first word of a simple command.

126999 Reserved words are recognized only when they are delimited (that is, meet the definition of XBD  
127000 Section 3.446, on page 105), whereas operators are themselves delimiters. For instance, ' ( ' and  
127001 ' ) ' are control operators, so that no <space> is needed in (*list*). However, ' { ' and ' } ' are  
127002 reserved words in { *list*; }, so that in this case the leading <space> and <semicolon> are required.

127003 The list of unspecified reserved words is from the KornShell, so conforming applications cannot  
127004 use them in places a reserved word would be recognized. This list contained **time** in early  
127005 proposals, but it was removed when the *time* utility was selected for the Shell and Utilities  
127006 volume of POSIX.1-2008.

127007 There was a strong argument for promoting braces to operators (instead of reserved words), so  
127008 they would be syntactically equivalent to subshell operators. Concerns about compatibility  
127009 outweighed the advantages of this approach. Nevertheless, conforming applications should  
127010 consider quoting ' { ' and ' } ' when they represent themselves.

127011 The restriction on ending a name with a <colon> is to allow future implementations that support  
127012 named labels for flow control; see the RATIONALE for the *break* built-in utility.

127013 It is possible that a future version of the Shell and Utilities volume of POSIX.1-2008 may require  
127014 that ' { ' and ' } ' be treated individually as control operators, although the token " { } " will  
127015 probably be a special-case exemption from this because of the often-used *find*{ } construct.

## 127016 C.2.5 Parameters and Variables

### 127017 C.2.5.1 Positional Parameters

127018 There is no additional rationale provided for this section.

### 127019 C.2.5.2 Special Parameters

127020 Most historical implementations implement subshells by forking; thus, the special parameter  
127021 ' \$ ' does not necessarily represent the process ID of the shell process executing the commands  
127022 since the subshell execution environment preserves the value of ' \$ '.

127023 If a subshell were to execute a background command, the value of " \$ ! " for the parent would  
127024 not change. For example:

```
127025 (
127026 date &
127027 echo $!
127028 )
127029 echo $!
```

127030 would echo two different values for "\$!".

127031 The "\$-" special parameter can be used to save and restore *set* options:

```
127032 Save=$(echo $- | sed 's/[ics]//g')
127033 ...
127034 set +aCefnuvx
127035 if [ -n "$Save" ]; then
127036     set -$Save
127037 fi
```

127038 The three options are removed using *sed* in the example because they may appear in the value of  
127039 "\$-" (from the *sh* command line), but are not valid options to *set*.

127040 The descriptions of parameters '\*' and '@' assume the reader is familiar with the field  
127041 splitting discussion in XCU [Section 2.6.5](#) (on page 2349) and understands that portions of the  
127042 word remain concatenated unless there is some reason to split them into separate fields.

127043 The following examples illustrate some of the ways in which '\*' and '@' can be expanded:

```
127044 set "abc" "def ghi" "jkl"
127045 unset novar
127046 IFS=' ' # a space
127047 printf '%s\n' $*
127048 abc
127049 def
127050 ghi
127051 jkl
127052 printf '%s\n' "$*"
127053 abc def ghi jkl
127054 printf '%s\n' xx$*yy
127055 xxabc
127056 def
127057 ghi
127058 jklyy
127059 printf '%s\n' "xx$*yy"
127060 xxabc def ghi jklyy
127061 printf '%s\n' $@
127062 abc
127063 def
127064 ghi
127065 jkl
127066 printf '%s\n' "$@"
127067 abc
127068 def ghi
127069 jkl
127070 printf '%s\n' ${1+"$@"}
127071 abc
127072 def ghi
127073 jkl
```

```
127074 printf 's\n' ${novar-"$@"}
127075 abc
127076 def ghi
127077 jkl
127078 printf 's\n' xx$@yy
127079 xxabc
127080 def
127081 ghi
127082 jklyy
127083 printf 's\n' "xx$@yy"
127084 xxabc
127085 def ghi
127086 jklyy
127087 printf 's\n' @$@$
127088 abc
127089 def
127090 ghi
127091 jklabc
127092 def
127093 ghi
127094 jkl
127095 printf 's\n' "$@$@"
127096 abc
127097 def ghi
127098 jklabc
127099 def ghi
127100 jkl
127101 IFS=:
127102 printf 's\n' "$*"
127103 abc:def ghi: jkl
127104 var=$*; printf 's\n' "$var"
127105 abc:def ghi: jkl
127106 var="$*"; printf 's\n' "$var"
127107 abc:def ghi: jkl
127108 unset var
127109 printf 's\n' ${var-$*}
127110 abc
127111 def ghi
127112 jkl
127113 printf 's\n' "${var-$*}"
127114 abc:def ghi: jkl
127115 printf 's\n' ${var-"$*"}
127116 abc:def ghi: jkl
127117 printf 's\n' ${var=$*}
127118 abc
127119 def ghi
127120 jkl
127121 printf 'var=%s\n' "$var"
127122 var=abc:def ghi: jkl
127123 unset var
127124 printf 's\n' "${var=$*}"
127125 abc:def ghi: jkl
127126 printf 'var=%s\n' "$var"
```

```

127127      var=abc:def ghi:jkl
127128      IFS=' ' # null
127129      printf '%s\n' "$*"
127130      abcdef ghijkl
127131      var=$*; printf '%s\n' "$var"
127132      abcdef ghijkl
127133      var="$*"; printf '%s\n' "$var"
127134      abcdef ghijkl
127135      unset var
127136      printf '%s\n' "${var-$*}"
127137      abcdef ghijkl
127138      printf '%s\n' "${var-$*}"
127139      abcdef ghijkl
127140      printf '%s\n' "${var-$*}"
127141      abcdef ghijkl
127142      printf '%s\n' "${var=$*}"
127143      abcdef ghijkl
127144      printf 'var=%s\n' "$var"
127145      var=abcdef ghijkl
127146      unset var
127147      printf '%s\n' "${var=$*}"
127148      abcdef ghijkl
127149      printf 'var=%s\n' "$var"
127150      var=abcdef ghijkl
127151      printf '%s\n' "$@"
127152      abc
127153      def ghi
127154      jkl

127155      unset IFS
127156      printf '%s\n' "$*"
127157      abc def ghi jkl
127158      var=$*; printf '%s\n' "$var"
127159      abc def ghi jkl
127160      var="$*"; printf '%s\n' "$var"
127161      abc def ghi jkl
127162      unset var
127163      printf '%s\n' "${var-$*}"
127164      abc
127165      def
127166      ghi
127167      jkl
127168      printf '%s\n' "${var-$*}"
127169      abc def ghi jkl
127170      printf '%s\n' "${var-$*}"
127171      abc def ghi jkl
127172      printf '%s\n' "${var=$*}"
127173      abc
127174      def
127175      ghi
127176      jkl
127177      printf 'var=%s\n' "$var"
127178      var=abc def ghi jkl

```

```

127179      unset var
127180      printf '%s\n' "${var=$*}"
127181      abc def ghi jkl
127182      printf 'var=%s\n' "$var"
127183      var=abc def ghi jkl
127184      printf '%s\n' "$@"
127185      abc
127186      def ghi
127187      jkl

127188      set one "" three
127189      printf ' [%s]\n' $*
127190      [one]
127191      [ ] (this line of output is optional)
127192      [three]
127193      printf ' [%s]\n' $@
127194      [one]
127195      [ ] (this line of output is optional)
127196      [three]

127197      set --
127198      printf ' [%s]\n' foo "$*"
127199      [foo]
127200      [ ]
127201      printf ' [%s]\n' foo "$novar$*(echo)"
127202      [foo]
127203      [ ]
127204      printf ' [%s]\n' foo $@
127205      [foo]
127206      printf ' [%s]\n' foo "$@"
127207      [foo]
127208      printf ' [%s]\n' foo '$@'
127209      [foo]
127210      [ ]
127211      printf ' [%s]\n' foo '"$@"'
127212      [foo]
127213      [ ]
127214      printf ' [%s]\n' foo "$novar$@(echo)"
127215      [foo]
127216      [ ] (this line of output is optional)
127217      printf ' [%s]\n' foo '"$novar$@(echo)"'
127218      [foo]
127219      [ ]

127220      In all of the following commands the results of the expansion of '@' (if performed) are
127221      unspecified:

127222      var=$@
127223      var="$@"
127224      printf '%s\n' ${var=$@}
127225      printf '%s\n' "${var=$@}"
127226      printf '%s\n' ${var="$@"}
127227      printf '%s\n' ${var?@$}
127228      printf '%s\n' "${var?@$}"
127229      printf '%s\n' ${var?"$@"}

```

```

127230 printf '%s\n' "${#@}
127231 printf '%s\n' "${#@}"
127232 printf '%s\n' "${@%foo}"
127233 printf '%s\n' "${@%foo}"
127234 printf '%s\n' "${@#foo}"
127235 printf '%s\n' "${@#foo}"
127236 printf '%s\n' "${var%$@}"
127237 printf '%s\n' "${var%$@}"
127238 printf '%s\n' "${var%"$@"}"
127239 printf '%s\n' "${var%%$@}"
127240 printf '%s\n' "${var%%$@}"
127241 printf '%s\n' "${var%%"$@"}"
127242 printf '%s\n' "${var#$@}"
127243 printf '%s\n' "${var#$@}"
127244 printf '%s\n' "${var#"$@"}"
127245 printf '%s\n' "${var##$@}"
127246 printf '%s\n' "${var##$@}"
127247 printf '%s\n' "${var##"$@"}"
    
```

#### 127248 C.2.5.3 Shell Variables

127249 See the discussion of *IFS* in [Section C.2.6.5](#) (on page 3722) and the RATIONALE for the *sh* utility.

127250 The prohibition on *LC\_CTYPE* changes affecting lexical processing protects the shell  
 127251 implementor (and the shell programmer) from the ill effects of changing the definition of  
 127252 <blank> or the set of alphabetic characters in the current environment. It would probably not be  
 127253 feasible to write a compiled version of a shell script without this rule. The rule applies only to  
 127254 the current invocation of the shell and its subshells—invoking a shell script or performing *exec*  
 127255 *sh* would subject the new shell to the changes in *LC\_CTYPE*.

127256 Other common environment variables used by historical shells are not specified by the Shell and  
 127257 Utilities volume of POSIX.1-2008, but they should be reserved for the historical uses.

127258 Tilde expansion for components of *PATH* in an assignment such as:

127259 `PATH=~hlj/bin:~dwc/bin:$PATH`

127260 is a feature of some historical shells and is allowed by the wording of XCU [Section 2.6.1](#) (on page  
 127261 2344). Note that the <tilde> characters are expanded during the assignment to *PATH*, not when  
 127262 *PATH* is accessed during command search.

127263 The following entries represent additional information about variables included in the Shell and  
 127264 Utilities volume of POSIX.1-2008, or rationale for common variables in use by shells that have  
 127265 been excluded:

127266 — (Underscore.) While <underscore> is historical practice, its overloaded usage  
 127267 in the KornShell is confusing, and it has been omitted from the Shell and  
 127268 Utilities volume of POSIX.1-2008.

127269 **ENV** This variable can be used to set aliases and other items local to the invocation  
 127270 of a shell. The file referred to by *ENV* differs from **\$HOME/.profile** in that  
 127271 **.profile** is typically executed at session start-up, whereas the *ENV* file is  
 127272 executed at the beginning of each shell invocation. The *ENV* value is  
 127273 interpreted in a manner similar to a dot script, in that the commands are  
 127274 executed in the current environment and the file needs to be readable, but not  
 127275 executable. However, unlike dot scripts, no *PATH* searching is performed. This

127276		is used as a guard against Trojan Horse security breaches.
127277	<i>ERRNO</i>	This variable was omitted from the Shell and Utilities volume of POSIX.1-2008
127278		because the values of error numbers are not defined in POSIX.1-2008 in a
127279		portable manner.
127280	<i>FCEDIT</i>	Since this variable affects only the <i>fc</i> utility, it has been omitted from this more
127281		global place. The value of <i>FCEDIT</i> does not affect the command-line editing
127282		mode in the shell; see the description of <i>set -o vi</i> in the <i>set</i> built-in utility.
127283	<i>PS1</i>	This variable is used for interactive prompts. Historically, the “superuser”
127284		has had a prompt of ‘#’. Since privileges are not required to be monolithic, it
127285		is difficult to define which privileges should cause the alternate prompt.
127286		However, a sufficiently powerful user should be reminded of that power by
127287		having an alternate prompt.
127288	<i>PS3</i>	This variable is used by the KornShell for the <i>select</i> command. Since the POSIX
127289		shell does not include <i>select</i> , <i>PS3</i> was omitted.
127290	<i>PS4</i>	This variable is used for shell debugging. For example, the following script:
127291		<pre>PS4=' [ \${LINENO} ]+ '</pre>
127292		<pre>set -x</pre>
127293		<pre>echo Hello</pre>
127294		writes the following to standard error:
127295		<pre>[3]+ echo Hello</pre>
127296	<i>RANDOM</i>	This pseudo-random number generator was not seen as being useful to
127297		interactive users.
127298	<i>SECONDS</i>	Although this variable is sometimes used with <i>PS1</i> to allow the display of the
127299		current time in the prompt of the user, it is not one that would be manipulated
127300		frequently enough by an interactive user to include in the Shell and Utilities
127301		volume of POSIX.1-2008.
127302		POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0002 [152] is applied.

## 127303 C.2.6 Word Expansions

127304	Step (2) refers to the “portions of fields generated by step (1)”. For example, if the word being
127305	expanded were “\$x+\$y” and <i>IFS</i> =+, the word would be split only if “\$x” or “\$y” contained
127306	‘+’; the ‘+’ in the original word was not generated by step (1).
127307	<i>IFS</i> is used for performing field splitting on the results of parameter and command substitution;
127308	it is not used for splitting all fields. Earlier versions of the shell used it for splitting all fields
127309	during field splitting, but this has severe problems because the shell can no longer parse its own
127310	script. There are also important security implications caused by this behavior. All useful
127311	applications of <i>IFS</i> use it for parsing input of the <i>read</i> utility and for splitting the results of
127312	parameter and command substitution.
127313	The rule concerning expansion to a single field requires that if <b>foo=abc</b> and <b>bar=def</b> , that:
127314	<code>"\$foo" "\$bar"</code>

127315 expands to the single field:

127316 abcdef

127317 The rule concerning empty fields can be illustrated by:

```
127318 $ unset foo
127319 $ set $foo bar ' ' xyz "$foo" abc
127320 $ for i
127321 > do
127322 >     echo "-$i-"
127323 > done
127324 -bar-
127325 --
127326 -xyz-
127327 --
127328 -abc-
```

127329 Step (1) indicates that parameter expansion, command substitution, and arithmetic expansion  
127330 are all processed simultaneously as they are scanned. For example, the following is valid  
127331 arithmetic:

```
127332 x=1
127333 echo $(( $(echo 3)+$x ))
```

127334 An early proposal stated that tilde expansion preceded the other steps, but this is not the case in  
127335 known historical implementations; if it were, and if a referenced home directory contained a '\$'  
127336 character, expansions would result within the directory name.

127337 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0003 [49,430] is applied.

#### 127338 C.2.6.1 Tilde Expansion

127339 Tilde expansion generally occurs only at the beginning of words, but an exception based on  
127340 historical practice has been included:

```
127341 PATH=/posix/bin:~dgg/bin
```

127342 This is eligible for tilde expansion because <tilde> follows a <colon> and none of the relevant  
127343 characters is quoted. Consideration was given to prohibiting this behavior because any of the  
127344 following are reasonable substitutes:

```
127345 PATH=$(printf %s ~karels/bin : ~bostic/bin)
127346 for Dir in ~maat/bin ~srb/bin ...
127347 do
127348     PATH=${PATH:+$PATH:}$Dir
127349 done
```

127350 In the first command, explicit <colon> characters are used for each directory. In all cases, the  
127351 shell performs tilde expansion on each directory because all are separate words to the shell.

127352 Note that expressions in operands such as:

```
127353 make -k mumble LIBDIR=~chet/lib
```

127354 do not qualify as shell variable assignments, and tilde expansion is not performed (unless the  
127355 command does so itself, which *make* does not).

127356 Because of the requirement that the word is not quoted, the following are not equivalent; only  
127357 the last causes tilde expansion:

127358        \~hlj/    ~h\lj/    ~"hlj"/    ~hlj\    ~hlj/

127359        In an early proposal, tilde expansion occurred following any unquoted <equals-sign> or  
127360        <colon>, but this was removed because of its complexity and to avoid breaking commands such  
127361        as:

127362        rcp hostname:~marc/.profile .

127363        System administrators on systems where // has an implementation-defined meaning which is  
127364        different to /, should not create users with a home directory of / or //, since this may lead to  
127365        unexpected filename resolution on those systems.

127366        A suggestion was made that the special sequence "\$~" should be allowed to force tilde  
127367        expansion anywhere. Since this is not historical practice, it has been left for future  
127368        implementations to evaluate. (The description in XCU [Section 2.2](#) (on page 2336) requires that a  
127369        <dollar-sign> be quoted to represent itself, so the "\$~" combination is already unspecified.)

127370        The results of giving <tilde> with an unknown login name are undefined because the KornShell  
127371        "~+" and "~-" constructs make use of this condition, but in general it is an error to give an  
127372        incorrect login name with <tilde>. The results of having *HOME* unset are unspecified because  
127373        some historical shells treat this as an error.

127374        Historically, the Korn shell performed field splitting and pathname expansion on the results of  
127375        tilde expansion, and earlier versions of this standard reflected this. However, tilde expansion  
127376        results in a pathname, and performing field splitting and pathname expansion on something  
127377        that is already a pathname is at best redundant and at worst will change the value from the  
127378        correct pathname to one or more incorrect ones. Later versions of the Korn shell do not perform  
127379        these expansions and POSIX.1-2008 has been updated to match. Note that although pathname  
127380        expansion is not performed on the results of tilde expansion, this does not prevent other parts of  
127381        the same word from being expanded. For example, ~/a\* expands to all files in *\$HOME*  
127382        beginning with 'a'.

#### 127383 C.2.6.2 *Parameter Expansion*

127384        The rule for finding the closing '}' in "\${...}" is the one used in the KornShell and is  
127385        upwardly-compatible with the Bourne shell, which does not determine the closing '}' until the  
127386        word is expanded. The advantage of this is that incomplete expansions, such as:

127387        \${foo

127388        can be determined during tokenization, rather than during expansion.

127389        For rationale regarding expansion of "\${...}" within double-quotes, see [Section C.2.2.3](#) (on  
127390        page 3706).

127391        The string length and substring capabilities were included because of the demonstrated need for  
127392        them, based on their usage in other shells, such as C shell and KornShell.

127393        Historical versions of the KornShell have not performed tilde expansion on the word part of  
127394        parameter expansion; however, it is more consistent to do so.

127395        POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0004 [458], XCU/TC1-2008/0005  
127396        [458], XCU/TC1-2008/0006 [457], XCU/TC1-2008/0007 [457], XCU/TC1-2008/0008 [417],  
127397        XCU/TC1-2008/0009 [457], XCU/TC1-2008/0010 [457], XCU/TC1-2008/0011 [457],  
127398        XCU/TC1-2008/0012 [457], XCU/TC1-2008/0013 [457], XCU/TC1-2008/0014 [457],  
127399        XCU/TC1-2008/0015 [457], XCU/TC1-2008/0016 [457], XCU/TC1-2008/0017 [457], and  
127400        XCU/TC1-2008/0018 [458] are applied.

127401 C.2.6.3 Command Substitution

127402 The "\$ ( )" form of command substitution solves a problem of inconsistent behavior when using  
 127403 backquotes. For example:

127404	Command	Output
127405	echo `\\$x`	\\$x
127406	echo `echo `\\$x``	\$x
127407	echo \$(echo `\\$x`)	\\$x

127408 Additionally, the backquoted syntax has historical restrictions on the contents of the embedded  
 127409 command. While the newer "\$ ( )" form can process any kind of valid embedded script, the  
 127410 backquoted form cannot handle some valid scripts that include backquotes. For example, these  
 127411 otherwise valid embedded scripts do not work in the left column, but do work on the right:

127412	echo `	echo \$(
127413	cat <<\eof	cat <<\eof
127414	a here-doc with `	a here-doc with )
127415	eof	eof
127416	`	)
127417	echo `	echo \$(
127418	echo abc # a comment with `	echo abc # a comment with )
127419	`	)
127420	echo `	echo \$(
127421	echo ` `	echo ` )`
127422	`	)

127423 Because of these inconsistent behaviors, the backquoted variety of command substitution is not  
 127424 recommended for new applications that nest command substitutions or attempt to embed  
 127425 complex scripts.

127426 The KornShell feature:

127427 If *command* is of the form <word>, word is expanded to generate a pathname, and the value  
 127428 of the command substitution is the contents of this file with any trailing <newline>  
 127429 characters deleted.

127430 was omitted from the Shell and Utilities volume of POSIX.1-2008 because \$(cat word) is an  
 127431 appropriate substitute. However, to prevent breaking numerous scripts relying on this feature, it  
 127432 is unspecified to have a script within "\$ ( )" that has only redirections.

127433 Arithmetic expansions have precedence over command substitutions. That is, if the shell can  
 127434 parse an expansion beginning with "\$ ( ( )" as an arithmetic expansion then it will do so. It will  
 127435 only parse the expansion as a command substitution (that starts with a subshell) if it determines  
 127436 that it cannot parse the expansion as an arithmetic expansion. If the syntax is valid for neither  
 127437 type of expansion, then it is unspecified what kind of syntax error the shell reports.

127438 How well the shell performs this determination is a quality of implementation issue. Current  
 127439 shell implementations use heuristics. In particular, the shell need not evaluate nested expansions  
 127440 when determining whether it can parse an expansion beginning with "\$ ( ( )" as an arithmetic  
 127441 expansion. For example:

127442 \$( (a \$op b) )

127443 is always an arithmetic expansion if "\$op" expands to, say, '+', but if "\$op" expands to '( '  
 127444 then the shell might still parse the expansion as an arithmetic expansion (resulting in a syntax  
 127445 error due to unbalanced parentheses) or it might perform a command substitution.

127446 This standard requires that conforming applications always separate the "\$(" and '( ' with  
127447 white space when a command substitution starts with a subshell. This is because  
127448 implementations may support extensions in arithmetic expressions which could result in the  
127449 shell parsing the input as an arithmetic expansion even though a minimally conforming shell  
127450 would not. For example, many shells support arrays with the array index (which can be an  
127451 expression) in square brackets. Therefore, the presence of "myfile[0-9]" within an expansion  
127452 beginning "\$(" is no guarantee that it will be parsed as a command substitution.

127453 The ambiguity is not restricted to the simple case of a single subshell. More complicated  
127454 ambiguous cases are possible (even with just the standard shell syntax), such as:

```
127455 $(( cat <<EOH  
127456 + ( (  
127457 EOH  
127458 ) && ( cat <<EOH  
127459 ) ) + 1 +  
127460 EOH  
127461 ) )
```

127462 This can be parsed as an arithmetic expansion, with *cat* and *EOH* as the names of shell variables.  
127463 Ambiguous cases also exist where the end of the expansion is at a different location for the  
127464 arithmetic expansion and the command substitution:

```
127465 $(( cat <<EOF  
127466 + ( ( ( (  
127467 EOF  
127468 ) && (  
127469 cat <<EOF  
127470 +  
127471 EOF  
127472 ) )
```

127473 This is an incomplete arithmetic expansion, but would have been a (complete) command  
127474 substitution if it could not have been parsed as an arithmetic expansion. If this expansion occurs  
127475 at the end of input then the shell reports a syntax error; it does not parse it as a command  
127476 substitution.

127477 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/4 is applied, changing the text from: "If a  
127478 command substitution occurs inside double-quotes, it shall not be performed on the results of  
127479 the substitution." to: "If a command substitution occurs inside double-quotes, field splitting and  
127480 pathname expansion shall not be performed on the results of the substitution.". The  
127481 replacement text taken from the ISO POSIX-2:1993 standard is clearer about the items that are  
127482 not performed.

127483 SD5-XCU-ERN-84 is applied, clarifying how the search for the matching backquote is satisfied.

127484 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0019 [217] is applied.

#### 127485 C.2.6.4 *Arithmetic Expansion*

127486 The standard developers agreed that there was a strong desire for some kind of arithmetic  
127487 evaluator to provide functionality similar to *expr*, that relating it to '\$ ' makes it work well with  
127488 the standard shell language and provides access to arithmetic evaluation in places where  
127489 accessing a utility would be inconvenient.

127490 The syntax and semantics for arithmetic were revised for the ISO/IEC 9945-2:1993 standard.  
127491 The language represents a simple subset of the previous arithmetic language (which was

derived from the KornShell "`(( ))`" construct). The syntax was changed from that of a command denoted by `((expression))` to an expansion denoted by `$(expression)`. The new form is a dollar expansion (`'$'`) that evaluates the expression and substitutes the resulting value. Objections to the previous style of arithmetic included that it was too complicated, did not fit in well with the use of variables in the shell, and its syntax conflicted with subshells. The justification for the new syntax is that the shell is traditionally a macro language, and if a new feature is to be added, it should be accomplished by extending the capabilities presented by the current model of the shell, rather than by inventing a new one outside the model; adding a new dollar expansion was perceived to be the most intuitive and least destructive way to add such a new capability.

The standard requires assignment operators to be supported (as listed in XCU [Section 1.1.2](#), on page 2321), and since arithmetic expansions are not specified to be evaluated in a subshell environment, changes to variables there have to be in effect after the arithmetic expansion, just as in the parameter expansion `"${x=value}"`.

Note, however, that `"$( ( x=5 ) )"` need not be equivalent to `"$( ( $x=5 ) )"`. If the value of the environment variable `x` is the string `"y="`, the expansion of `"$( ( x=5 ) )"` would set `x` to 5 and output 5, but `"$( ( $x=5 ) )"` would output 0 if the value of the environment variable `y` is not 5 and would output 1 if the environment variable `y` is 5. Similarly, if the value of the environment variable is 4, the expansion of `"$( ( x=5 ) )"` would still set `x` to 5 and output 5, but `"$( ( $x=5 ) )"` (which would be equivalent to `"$( ( 4=5 ) )"`) would yield a syntax error.

In early proposals, a form `$(expression)` was used. It was functionally equivalent to the `"$( )"` of the current text, but objections were lodged that the 1988 KornShell had already implemented `"$( )"` and there was no compelling reason to invent yet another syntax. Furthermore, the `"$[ ]"` syntax had a minor incompatibility involving the patterns in **case** statements.

The portion of the ISO C standard arithmetic operations selected corresponds to the operations historically supported in the KornShell. In addition to the exceptions listed in XCU [Section 2.6.4](#) (on page 2348), the use of the following are explicitly outside the scope of the rules defined in XCU [Section 1.1.2.1](#) (on page 2321):

- The prefix operator `'&'` and the `"[ ]"`, `"->"`, and `'.''` operators.
- Casts

It was concluded that the `test` command (`I`) was sufficient for the majority of relational arithmetic tests, and that tests involving complicated relational expressions within the shell are rare, yet could still be accommodated by testing the value of `"$( )"` itself. For example:

```
# a complicated relational expression
while [ $( ( ($x + $y)/($a * $b)) < ($foo*$bar) ) -ne 0 ]
```

or better yet, the rare script that has many complex relational expressions could define a function like this:

```
val() {
    return $((!$1))
}
```

and complicated tests would be less intimidating:

```
while val $( ( ($x + $y)/($a * $b)) < ($foo*$bar) )
do
    # some calculations
done
```

127538 A suggestion that was not adopted was to modify *true* and *false* to take an optional argument,  
127539 and *true* would exit true only if the argument was non-zero, and *false* would exit false only if the  
127540 argument was non-zero:

```
127541 while true $(( $x > 5 && $y <= 25 ))
```

127542 There is a minor portability concern with the new syntax. The example "`$((2+2))`" could have  
127543 been intended to mean a command substitution of a utility named "2+2" in a subshell. The  
127544 standard developers considered this to be obscure and isolated to some KornShell scripts  
127545 (because "`$()`" command substitution existed previously only in the KornShell). The text on  
127546 command substitution requires that the "`$("`" and "`'(`" be separate tokens if this usage is  
127547 needed.

127548 An example such as:

```
127549 echo $((echo hi);(echo there))
```

127550 should not be misinterpreted by the shell as arithmetic because attempts to balance the  
127551 parentheses pairs would indicate that they are subshells. However, as indicated by XBD [Section](#)  
127552 [3.113](#) (on page 51), a conforming application must separate two adjacent parentheses with white  
127553 space to indicate nested subshells.

127554 The standard is intentionally silent about how a variable's numeric value in an expression is  
127555 determined from its normal "sequence of bytes" value. It could be done as a text substitution, as  
127556 a conversion like that performed by *strtol()*, or even recursive evaluation. Therefore, the only  
127557 cases for which the standard is clear are those for which both conversions produce the same  
127558 result. The cases where they give the same result are those where the sequence of bytes form a  
127559 valid integer constant. Therefore, if a variable does not contain a valid integer constant, the  
127560 behavior is unspecified.

127561 For the commands:

```
127562 x=010; echo $((x += 1))
```

127563 the output must be 9.

127564 For the commands:

```
127565 x=' 1'; echo $((x += 1))
```

127566 the results are unspecified.

127567 For the commands:

```
127568 x=1+1; echo $((x += 1))
```

127569 the results are unspecified.

127570 Although the ISO/IEC 9899:1999 standard now requires support for **long long** and allows  
127571 extended integer types with higher ranks, POSIX.1-2008 only requires arithmetic expansions to  
127572 support **signed long** integer arithmetic. Implementations are encouraged to support signed  
127573 integer values at least as large as the size of the largest file allowed on the implementation.

127574 Implementations are also allowed to perform floating-point evaluations as long as an  
127575 application won't see different results for expressions that would not overflow **signed long**  
127576 integer expression evaluation. (This includes appropriate truncation of results to integer values.)

127577 Changes made in response to IEEE PASC Interpretation 1003.2 #208 removed the requirement  
127578 that the integer constant suffixes `l` and `L` had to be recognized. The ISO POSIX-2: 1993 standard  
127579 did not require the `u`, `uL`, `uL`, `U`, `UL`, `UL`, `Lu`, `LU`, `Lu`, and `LU` suffixes since only signed integer  
127580 arithmetic was required. Since all arithmetic expressions were treated as handling **signed long**  
127581 integer types anyway, the `l` and `L` suffixes were redundant. No known scripts used them and

127582 some historic shells did not support them. When the ISO/IEC 9899:1999 standard was used as  
127583 the basis for the description of arithmetic processing, the `ll` and `LL` suffixes and combinations  
127584 were also not required. Implementations are still free to accept any or all of these suffixes, but  
127585 are not required to do so.

127586 There was also some confusion as to whether the shell was required to recognize character  
127587 constants. Syntactically, character constants were required to be recognized, but the  
127588 requirements for the handling of `<backslash>` and single-quote characters (needed to specify  
127589 character constants) within an arithmetic expansion were ambiguous. Furthermore, no known  
127590 shells supported them. Changes made in response to IEEE PASC Interpretation 1003.2 #208  
127591 removed the requirement to support them (if they were indeed required before). POSIX.1-2008  
127592 clearly does not require support for character constants.

127593 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/3 is applied, clarifying arithmetic  
127594 expressions.

127595 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0020 [50] is applied.

#### 127596 C.2.6.5 *Field Splitting*

127597 The operation of field splitting using *IFS*, as described in early proposals, was based on the way  
127598 the KornShell splits words, but it is incompatible with other common versions of the shell.  
127599 However, each has merit, and so a decision was made to allow both. If the *IFS* variable is unset  
127600 or is `<space><tab><newline>`, the operation is equivalent to the way the System V shell splits  
127601 words. Using characters outside the `<space><tab><newline>` set yields the KornShell behavior,  
127602 where each of the non-`<space><tab><newline>`s is significant. This behavior, which affords the  
127603 most flexibility, was taken from the way the original *awk* handled field splitting.

127604 Rule (3) can be summarized as a pseudo-ERE:

127605  $(s^*ns^* | s^+)$

127606 where *s* is an *IFS* white-space character and *n* is a character in the *IFS* that is not white space.  
127607 Any string matching that ERE delimits a field, except that the *s+* form does not delimit fields at  
127608 the beginning or the end of a line. For example, if *IFS* is `<space>/<comma>/<tab>`, the string:

127609 `<space><space>red<space><space>, <space>white<space>blue`

127610 yields the three colors as the delimited fields.

#### 127611 C.2.6.6 *Pathname Expansion*

127612 There is no additional rationale provided for this section.

#### 127613 C.2.6.7 *Quote Removal*

127614 There is no additional rationale provided for this section.

## 127615 C.2.7 Redirection

127616 In the System Interfaces volume of POSIX.1-2008, file descriptors are integers in the range  
127617 0–(OPEN\_MAX–1). The file descriptors discussed in XCU [Section 2.7](#) (on page 2350) are that  
127618 same set of small integers.

127619 Having multi-digit file descriptor numbers for I/O redirection can cause some obscure  
127620 compatibility problems. Specifically, scripts that depend on an example command:

127621 `echo 22>/dev/null`

127622 echoing "2" to standard error or "22" to standard output are no longer portable. However, the  
127623 file descriptor number must still be delimited from the preceding text. For example:

127624 `cat file2>foo`

127625 writes the contents of **file2**, not the contents of **file**.

127626 The ">|" format of output redirection was adopted from the KornShell. Along with the  
127627 *noclobber* option, set **–C**, it provides a safety feature to prevent inadvertent overwriting of  
127628 existing files. (See the RATIONALE for the *pathchk* utility for why this step was taken.) The  
127629 restriction on regular files is historical practice.

127630 The System V shell and the KornShell have differed historically on pathname expansion of *word*;  
127631 the former never performed it, the latter only when the result was a single field (file). As a  
127632 compromise, it was decided that the KornShell functionality was useful, but only as a shorthand  
127633 device for interactive users. No reasonable shell script would be written with a command such  
127634 as:

127635 `cat foo > a*`

127636 Thus, shell scripts are prohibited from doing it, while interactive users can select the shell with  
127637 which they are most comfortable.

127638 The construct "2>&1" is often used to redirect standard error to the same file as standard  
127639 output. Since the redirections take place beginning to end, the order of redirections is significant.  
127640 For example:

127641 `ls > foo 2>&1`

127642 directs both standard output and standard error to file **foo**. However:

127643 `ls 2>&1 > foo`

127644 only directs standard output to file **foo** because standard error was duplicated as standard  
127645 output before standard output was directed to file **foo**.

127646 Applications should not use the `[n]<&–` or `[n]>&–` operators to execute a utility or application  
127647 with file descriptor 0 not open for reading or with file descriptor 1 or 2 not open for writing, as  
127648 this might cause the executed program (or shell built-in) to misbehave. In order not to pass on  
127649 these file descriptors to an executed utility or application, applications should not just close  
127650 them but should reopen them on, for example, **/dev/null**. Some implementations may reopen  
127651 them automatically, but applications should not rely on this being done.

127652 The "<>" operator could be useful in writing an application that worked with several terminals,  
127653 and occasionally wanted to start up a shell. That shell would in turn be unable to run  
127654 applications that run from an ordinary controlling terminal unless it could make use of "<>"  
127655 redirection. The specific example is a historical version of the pager *more*, which reads from  
127656 standard error to get its commands, so standard input and standard output are both available  
127657 for their usual usage. There is no way of saying the following in the shell without "<>":

127658 `cat food | more – >/dev/tty03 2<>/dev/tty03`

127659 Another example of "<>" is one that opens **/dev/tty** on file descriptor 3 for reading and writing:

127660 `exec 3<> /dev/tty`

127661 An example of creating a lock file for a critical code region:

127662 `set -C`  
127663 `until 2> /dev/null > lockfile`  
127664 `do sleep 30`  
127665 `done`  
127666 `set +C`  
127667 *perform critical function*  
127668 `rm lockfile`

127669 Since **/dev/null** is not a regular file, no error is generated by redirecting to it in *noclobber* mode.

127670 Tilde expansion is not performed on a here-document because the data is treated as if it were  
127671 enclosed in double-quotes.

127672 C.2.7.1 *Redirecting Input*

127673 There is no additional rationale provided for this section.

127674 C.2.7.2 *Redirecting Output*

127675 There is no additional rationale provided for this section.

127676 C.2.7.3 *Appending Redirected Output*

127677 Note that when a file is opened (even with the `O_APPEND` flag set), the initial file offset for that  
127678 file is set to the beginning of the file. Some historic shells set the file offset to the current end-of-  
127679 file when **append** mode shell redirection was used, but this is not allowed by POSIX.1-2008.

127680 C.2.7.4 *Here-Document*

127681 There is no additional rationale provided for this section.

127682 C.2.7.5 *Duplicating an Input File Descriptor*

127683 There is no additional rationale provided for this section.

127684 C.2.7.6 *Duplicating an Output File Descriptor*

127685 There is no additional rationale provided for this section.

127686 C.2.7.7 *Open File Descriptors for Reading and Writing*

127687 There is no additional rationale provided for this section.

127688 **C.2.8 Exit Status and Errors**

127689 There is no additional rationale provided for this section.

127690 C.2.8.1 *Consequences of Shell Errors*

127691 There is no additional rationale provided for this section.

127692 C.2.8.2 *Exit Status for Commands*

127693 There is a historical difference in *sh* and *ksh* non-interactive error behavior. When a command  
127694 named in a script is not found, some implementations of *sh* exit immediately, but *ksh* continues  
127695 with the next command. Thus, the Shell and Utilities volume of POSIX.1-2008 says that the shell  
127696 “may” exit in this case. This puts a small burden on the programmer, who has to test for  
127697 successful completion following a command if it is important that the next command not be  
127698 executed if the previous command was not found. If it is important for the command to have  
127699 been found, it was probably also important for it to complete successfully. The test for successful  
127700 completion would not need to change.

127701 Historically, shells have returned an exit status of  $128+n$ , where  $n$  represents the signal number.  
127702 Since signal numbers are not standardized, there is no portable way to determine which signal  
127703 caused the termination. Also, it is possible for a command to exit with a status in the same range  
127704 of numbers that the shell would use to report that the command was terminated by a signal.  
127705 Implementations are encouraged to choose exit values greater than 256 to indicate programs that  
127706 terminate by a signal so that the exit status cannot be confused with an exit status generated by a  
127707 normal termination.

127708 Historical shells make the distinction between “utility not found” and “utility found but cannot  
127709 execute” in their error messages. By specifying two seldomly used exit status values for these  
127710 cases, 127 and 126 respectively, this gives an application the opportunity to make use of this  
127711 distinction without having to parse an error message that would probably change from locale to  
127712 locale. The *command*, *env*, *nohup*, and *xargs* utilities in the Shell and Utilities volume of  
127713 POSIX.1-2008 have also been specified to use this convention.

127714 When a command fails during word expansion or redirection, most historical implementations  
127715 exit with a status of 1. However, there was some sentiment that this value should probably be  
127716 much higher so that an application could distinguish this case from the more normal exit status  
127717 values. Thus, the language “greater than zero” was selected to allow either method to be  
127718 implemented.

127719 **C.2.9 Shell Commands**

127720 A description of an “empty command” was removed from an early proposal because it is only  
127721 relevant in the cases of *sh -c " "*, *system(" ")*, or an empty shell-script file (such as the  
127722 implementation of *true* on some historical systems). Since it is no longer mentioned in the Shell  
127723 and Utilities volume of POSIX.1-2008, it falls into the silently unspecified category of behavior  
127724 where implementations can continue to operate as they have historically, but conforming  
127725 applications do not construct empty commands. (However, note that *sh* does explicitly state an  
127726 exit status for an empty string or file.) In an interactive session or a script with other commands,  
127727 extra <newline> or <semicolon> characters, such as:

127728 \$ false  
127729 \$  
127730 \$ echo \$?

127731 1  
127732 would not qualify as the empty command described here because they would be consumed by  
127733 other parts of the grammar.

127734 C.2.9.1 *Simple Commands*

127735 The enumerated list is used only when the command is actually going to be executed. For  
127736 example, in:

127737 `true || $foo *`

127738 no expansions are performed.

127739 The following example illustrates both how a variable assignment without a command name  
127740 affects the current execution environment, and how an assignment with a command name only  
127741 affects the execution environment of the command:

```
127742 $ x=red
127743 $ echo $x
127744 red
127745 $ export x
127746 $ sh -c 'echo $x'
127747 red
127748 $ x=blue sh -c 'echo $x'
127749 blue
127750 $ echo $x
127751 red
```

127752 This next example illustrates that redirections without a command name are still performed:

```
127753 $ ls foo
127754 ls: foo: no such file or directory
127755 $ > foo
127756 $ ls foo
127757 foo
```

127758 A command without a command name, but one that includes a command substitution, has an  
127759 exit status of the last command substitution that the shell performed. For example:

```
127760 if      x=$(command)
127761 then    ...
127762 fi
```

127763 An example of redirections without a command name being performed in a subshell shows that  
127764 the here-document does not disrupt the standard input of the **while** loop:

```
127765 IFS=:
127766 while read a b
127767 do     echo $a
127768       <<-eof
127769       Hello
127770       eof
127771 done </etc/passwd
```

127772 Following are examples of commands without command names in AND-OR lists:

```
127773 > foo || {
127774     echo "error: foo cannot be created" >&2
```

```
127775         exit 1
127776     }
127777     # set saved if /vmunix.save exists
127778     test -f /vmunix.save && saved=1
```

127779 Command substitution and redirections without command names both occur in subshells, but  
127780 they are not necessarily the same ones. For example, in:

```
127781     exec 3> file
127782     var=$(echo foo >&3) 3>&1
```

127783 it is unspecified whether **foo** is echoed to the file or to standard output.

127784 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0021 [255] is applied.

## 127785 Command Search and Execution

127786 This description requires that the shell can execute shell scripts directly, even if the underlying  
127787 system does not support the common "#!" interpreter convention. That is, if file **foo** contains  
127788 shell commands and is executable, the following executes **foo**:

```
127789 ./foo
```

127790 The command search shown here does not match all historical implementations. A more typical  
127791 sequence has been:

- 127792 • Any built-in (special or regular)
- 127793 • Functions
- 127794 • Path search for executable files

127795 But there are problems with this sequence. Since the programmer has no idea in advance which  
127796 utilities might have been built into the shell, a function cannot be used to override portably a  
127797 utility of the same name. (For example, a function named *cd* cannot be written for many  
127798 historical systems.) Furthermore, the *PATH* variable is partially ineffective in this case, and only  
127799 a pathname with a <slash> can be used to ensure a specific executable file is invoked.

127800 After the *execve()* failure described, the shell normally executes the file as a shell script. Some  
127801 implementations, however, attempt to detect whether the file is actually a script and not an  
127802 executable from some other architecture. The method used by the KornShell is allowed by the  
127803 text that indicates non-text files may be bypassed.

127804 The sequence selected for the Shell and Utilities volume of POSIX.1-2008 acknowledges that  
127805 special built-ins cannot be overridden, but gives the programmer full control over which  
127806 versions of other utilities are executed. It provides a means of suppressing function lookup (via  
127807 the *command* utility) for the user's own functions and ensures that any regular built-ins or  
127808 functions provided by the implementation are under the control of the path search. The  
127809 mechanisms for associating built-ins or functions with executable files in the path are not  
127810 specified by the Shell and Utilities volume of POSIX.1-2008, but the wording requires that if  
127811 either is implemented, the application is not able to distinguish a function or built-in from an  
127812 executable (other than in terms of performance, presumably). The implementation ensures that  
127813 all effects specified by the Shell and Utilities volume of POSIX.1-2008 resulting from the  
127814 invocation of the regular built-in or function (interaction with the environment, variables, traps,  
127815 and so on) are identical to those resulting from the invocation of an executable file.

127816 Various historical implementations have used the names in item 1.b. as built-ins or reserved +  
127817 words. This standard does not specify their behavior, but their existence means that it is +  
127818 important for portable applications to avoid giving functions (or utilities in *PATH*) those names +

127819 because the function (or utility in *PATH*) might not be executed as expected. +  
 127820 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/4 is applied, updating the case where  
 127821 *execve()* fails due to an error equivalent to the [ENOEXEC] error.

127822 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0022 [168], XCU/TC1-2008/0023  
 127823 [168], XCU/TC1-2008/0024 [168], XCU/TC1-2008/0025 [168], XCU/TC1-2008/0026 [168,430],  
 127824 XCU/TC1-2008/0027 [168,430], and XCU/TC1-2008/0028 [173] are applied.

## 127825 Examples

127826 Consider three versions of the *ls* utility:

- 127827 1. The application includes a shell function named *ls*.
- 127828 2. The user writes a utility named *ls* and puts it in **/fred/bin**.
- 127829 3. The example implementation provides *ls* as a regular shell built-in that is invoked (either  
 127830 by the shell or directly by *exec*) when the path search reaches the directory **/posix/bin**.

127831 If *PATH*=**/posix/bin**, various invocations yield different versions of *ls*:

Invocation	Version of <i>ls</i>
<i>ls</i> (from within application script)	(1) function
<i>command ls</i> (from within application script)	(3) built-in
<i>ls</i> (from within makefile called by application)	(3) built-in
<i>system("ls")</i>	(3) built-in
<i>PATH="/fred/bin:\$PATH" ls</i>	(2) user's version

## 127838 C.2.9.2 Pipelines

127839 Because pipeline assignment of standard input or standard output or both takes place before  
 127840 redirection, it can be modified by redirection. For example:

127841 **\$ command1 2>&1 | command2**

127842 sends both the standard output and standard error of *command1* to the standard input of  
 127843 *command2*.

127844 The reserved word **!** allows more flexible testing using AND and OR lists. The behavior of **!(** is +  
 127845 unspecified because in the Korn Shell this introduces a negated pathname expansion. Portable +  
 127846 applications need to separate the **!** and **(** to ensure the command is treated as a negated subshell.

127847 It was suggested that it would be better to return a non-zero value if any command in the  
 127848 pipeline terminates with non-zero status (perhaps the bitwise-inclusive OR of all return values).  
 127849 However, the choice of the last-specified command semantics are historical practice and would  
 127850 cause applications to break if changed. An example of historical behavior:

127851 **\$ sleep 5 | (exit 4)**  
 127852 **\$ echo \$?**  
 127853 **4**  
 127854 **\$ (exit 4) | sleep 5**  
 127855 **\$ echo \$?**  
 127856 **0**

127857 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0029 [205] is applied.

## Exit Status

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0030 [52] is applied.

### C.2.9.3 Lists

The equal precedence of "&&" and "||" is historical practice. The standard developers evaluated the model used more frequently in high-level programming languages, such as C, to allow the shell logical operators to be used for complex expressions in an unambiguous way, but they could not allow historical scripts to break in the subtle way unequal precedence might cause. Some arguments were posed concerning the "{" or "(" groupings that are required historically. There are some disadvantages to these groupings:

- The "(" can be expensive, as they spawn other processes on some implementations. This performance concern is primarily an implementation issue.
- The "{" braces are not operators (they are reserved words) and require a trailing <space> after each '{', and a <semicolon> before each '}'. Most programmers (and certainly interactive users) have avoided braces as grouping constructs because of the problematic syntax required. Braces were not changed to operators because that would generate compatibility issues even greater than the precedence question; braces appear outside the context of a keyword in many shell scripts.

IEEE PASC Interpretation 1003.2 #204 is applied, clarifying that the operators "&&" and "||" are evaluated with left associativity.

POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0031 [45] and XCU/TC1-2008/0032 [45] are applied.

## Asynchronous Lists

The grammar treats a construct such as:

```
foo & bar & bam &
```

as one "asynchronous list", but since the status of each element is tracked by the shell, the term "element of an asynchronous list" was introduced to identify just one of the **foo**, **bar**, or **bam** portions of the overall list.

Unless the implementation has an internal limit, such as {CHILD\_MAX}, on the retained process IDs, it would require unbounded memory for the following example:

```
while true
do    foo & echo $!
done
```

The treatment of the signals SIGINT and SIGQUIT with asynchronous lists is described in XCU [Section 2.11](#) (on page 2371).

Since the connection of the input to the equivalent of **/dev/null** is considered to occur before redirections, the following script would produce no output:

```
exec < /etc/passwd
cat <&0 &
wait
```

## 127897 Sequential Lists

127898 There is no additional rationale provided for this section.

## 127899 AND Lists

127900 There is no additional rationale provided for this section.

## 127901 OR Lists

127902 There is no additional rationale provided for this section.

## 127903 C.2.9.4 Compound Commands

### 127904 Grouping Commands

127905 The semicolon shown in *{compound-list;}* is an example of a control operator delimiting the }  
127906 reserved word. Other delimiters are possible, as shown in XCU [Section 2.10](#) (on page 2365);  
127907 <newline> is frequently used.

127908 A proposal was made to use the <do-done> construct in all cases where command grouping in  
127909 the current process environment is performed, identifying it as a construct for the grouping  
127910 commands, as well as for shell functions. This was not included because the shell already has a  
127911 grouping construct for this purpose ("{"}), and changing it would have been counter-  
127912 productive.

127913 The requirement for conforming applications to separate two leading ' ' characters with white  
127914 space if a grouping command would be parsed as an arithmetic expansion if preceded by a '\$'  
127915 is to allow shells which implement the "(( arithmetic expression ))" extension to  
127916 apply the same disambiguation rules consistently to \$(...) and ((...)). See [Section](#)  
127917 [C.2.6.3](#) (on page 3718).

127918 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0033 [217] is applied.

### 127919 For Loop

127920 The format is shown with generous usage of <newline> characters. See the grammar in XCU  
127921 [Section 2.10](#) (on page 2365) for a precise description of where <newline> and <semicolon>  
127922 characters can be interchanged.

127923 Some historical implementations support '{' and '}' as substitutes for **do** and **done**. The  
127924 standard developers chose to omit them, even as an obsolescent feature. (Note that these  
127925 substitutes were only for the **for** command; the **while** and **until** commands could not use them  
127926 historically because they are followed by compound-lists that may contain "{...}" grouping  
127927 commands themselves.)

127928 The reserved word pair **do ... done** was selected rather than **do ... od** (which would have  
127929 matched the spirit of **if ... fi** and **case ... esac**) because *od* is already the name of a standard  
127930 utility.

127931 PASC Interpretation 1003.2 #169 has been applied changing the grammar.

## Case Conditional Construct

An optional <left-parenthesis> before *pattern* was added to allow numerous historical KornShell scripts to conform. At one time, using the leading parenthesis was required if the **case** statement was to be embedded within a "\$ ( )" command substitution; this is no longer the case with the POSIX shell. Nevertheless, many historical scripts use the <left-parenthesis>, if only because it makes matching-parenthesis searching easier in *vi* and other editors. This is a relatively simple implementation change that is upwards-compatible for all scripts.

Consideration was given to requiring *break* inside the *compound-list* to prevent falling through to the next pattern action list. This was rejected as being nonexistent practice. An interesting undocumented feature of the KornShell is that using ";" instead of ";;" as a terminator causes the exact opposite behavior—the flow of control continues with the next *compound-list*.

The pattern '\*', given as the last pattern in a **case** construct, is equivalent to the default case in a C-language **switch** statement.

The grammar shows that reserved words can be used as patterns, even if one is the first word on a line. Obviously, the reserved word **esac** cannot be used in this manner.

## If Conditional Construct

The precise format for the command syntax is described in XCU [Section 2.10](#) (on page 2365).

## While Loop

The precise format for the command syntax is described in XCU [Section 2.10](#) (on page 2365).

## Until Loop

The precise format for the command syntax is described in XCU [Section 2.10](#) (on page 2365).

### C.2.9.5 Function Definition Command

The description of functions in an early proposal was based on the notion that functions should behave like miniature shell scripts; that is, except for sharing variables, most elements of an execution environment should behave as if they were a new execution environment, and changes to these should be local to the function. For example, traps and options should be reset on entry to the function, and any changes to them do not affect the traps or options of the caller. There were numerous objections to this basic idea, and the opponents asserted that functions were intended to be a convenient mechanism for grouping common commands that were to be executed in the current execution environment, similar to the execution of the *dot* special built-in.

It was also pointed out that the functions described in that early proposal did not provide a local scope for everything a new shell script would, such as the current working directory, or *umask*, but instead provided a local scope for only a few select properties. The basic argument was that if a local scope is needed for the execution environment, the mechanism already existed: the application can put the commands in a new shell script and call that script. All historical shells that implemented functions, other than the KornShell, have implemented functions that operate in the current execution environment. Because of this, traps and options have a global scope within a shell script. Local variables within a function were considered and included in another early proposal (controlled by the special built-in *local*), but were removed because they do not fit the simple model developed for functions and because there was some opposition to adding yet another new special built-in that was not part of historical practice. Implementations should reserve the identifier *local* (as well as *typeset*, as used in the KornShell) in case this local variable mechanism is adopted in a future version of this standard.

A separate issue from the execution environment of a function is the availability of that function to child shells. A few objectors maintained that just as a variable can be shared with child shells by exporting it, so should a function. In early proposals, the *export* command therefore had a *-f* flag for exporting functions. Functions that were exported were to be put into the environment as *name( )=value* pairs, and upon invocation, the shell would scan the environment for these and automatically define these functions. This facility was strongly opposed and was omitted. Some of the arguments against exportable functions were as follows:

- There was little historical practice. The Ninth Edition shell provided them, but there was controversy over how well it worked.
- There are numerous security problems associated with functions appearing in the environment of a user and overriding standard utilities or the utilities owned by the application.
- There was controversy over requiring *make* to import functions, where it has historically used an *exec* function for many of its command line executions.
- Functions can be big and the environment is of a limited size. (The counter-argument was that functions are no different from variables in terms of size: there can be big ones, and there can be small ones—and just as one does not export huge variables, one does not export huge functions. However, this might not apply to the average shell-function writer, who typically writes much larger functions than variables.)

As far as can be determined, the functions in the Shell and Utilities volume of POSIX.1-2008 match those in System V. Earlier versions of the KornShell had two methods of defining functions:

```
function fname { compound-list }
```

and:

```
fname() { compound-list }
```

The latter used the same definition as the Shell and Utilities volume of POSIX.1-2008, but differed in semantics, as described previously. The current edition of the KornShell aligns the latter syntax with the Shell and Utilities volume of POSIX.1-2008 and keeps the former as is.

The name space for functions is limited to that of a *name* because of historical practice. Complications in defining the syntactic rules for the function definition command and in dealing with known extensions such as the *"@()"* usage in the KornShell prevented the name space from being widened to a *word*. Using functions to support synonyms such as the *"!!"* and *'%'* usage in the C shell is thus disallowed to conforming applications, but acceptable as an extension. For interactive users, the aliasing facilities in the Shell and Utilities volume of POSIX.1-2008 should be adequate for this purpose. It is recognized that the name space for utilities in the file system is wider than that currently supported for functions, if the portable filename character set guidelines are ignored, but it did not seem useful to mandate extensions in systems for so little benefit to conforming applications.

The *"()"* in the function definition command consists of two operators. Therefore, intermixing <blank> characters with the *fname*, *'( '*, and *')* is allowed, but unnecessary.

An example of how a function definition can be used wherever a simple command is allowed:

```
# If variable i is equal to "yes",
# define function foo to be ls -l
#
[ "$i" = yes ] && foo() {
    ls -l
```

128022            }  
128023            POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0034 [383] and XCU/TC1-2008/0035  
128024            [214] are applied.

## 128025 C.2.10 Shell Grammar

128026            There are several subtle aspects of this grammar where conventional usage implies rules about  
128027            the grammar that in fact are not true.

128028            For *compound\_list*, only the forms that end in a *separator* allow a reserved word to be recognized,  
128029            so usually only a *separator* can be used where a compound list precedes a reserved word (such as  
128030            **Then**, **Else**, **Do**, and **Rbrace**). Explicitly requiring a separator would disallow such valid (if rare)  
128031            statements as:

128032            if (false) then (echo x) else (echo y) fi

128033            See the Note under special grammar rule (1).

128034            Concerning the third sentence of rule (1) (“Also, if the parser ...”):

128035            

- This sentence applies rather narrowly: when a compound list is terminated by some clear  
128036            delimiter (such as the closing **fi** of an inner **if\_clause**) then it would apply; where the  
128037            compound list might continue (as in after a ‘;’), rule (7a) (and consequently the first  
128038            sentence of rule (1)) would apply. In many instances the two conditions are identical, but  
128039            this part of rule (1) does not give license to treating a **WORD** as a reserved word unless it  
128040            is in a place where a reserved word has to appear.

128041            

- The statement is equivalent to requiring that when the LR(1) lookahead set contains  
128042            exactly one reserved word, it must be recognized if it is present. (Here “LR(1)” refers to the  
128043            theoretical concepts, not to any real parser generator.)

128044            For example, in the construct below, and when the parser is at the point marked with ‘^’,  
128045            the only next legal token is **then** (this follows directly from the grammar rules):

128046            if if...fi then ... fi  
128047                                 ^

128048            At that point, the **then** must be recognized as a reserved word.

128049            (Depending on the parser generator actually used, “extra” reserved words may be in some  
128050            lookahead sets. It does not really matter if they are recognized, or even if any possible  
128051            reserved word is recognized in that state, because if it is recognized and is not in the  
128052            (theoretical) LR(1) lookahead set, an error is ultimately detected. In the example above, if  
128053            some other reserved word (for example, **while**) is also recognized, an error occurs later.

128054            This is approximately equivalent to saying that reserved words are recognized after other  
128055            reserved words (because it is after a reserved word that this condition occurs), but avoids  
128056            the “except for ...” list that would be required for **case**, **for**, and so on. (Reserved words  
128057            are of course recognized anywhere a *simple\_command* can appear, as well. Other rules take  
128058            care of the special cases of non-recognition, such as rule (4) for **case** statements.)

128059            Note that the body of here-documents are handled by token recognition (see XCU [Section 2.3](#), on  
128060            page 2337) and do not appear in the grammar directly. (However, the here-document I/O  
128061            redirection operator is handled as part of the grammar.)

128062 C.2.10.1 Shell Grammar Lexical Conventions

128063 There is no additional rationale provided for this section.

128064 C.2.10.2 Shell Grammar Rules

128065 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0036 [44] is applied.

128066 **C.2.11 Signals and Error Handling**

128067 Historically, some shell implementations silently ignored attempts to use *trap* to set SIGINT or +  
128068 SIGQUIT to the default action or to set a trap for them after they have been set to be ignored by +  
128069 the shell when it executes an asynchronous subshell (and job control is disabled). This behavior +  
128070 is not conforming. For example, if a shell script containing the following line is run in the +  
128071 foreground at a terminal: +

128072 `(trap - INT; exec sleep 10) & wait` +

128073 and is then terminated by typing the interrupt character, this standard requires that the *sleep* +  
128074 command is terminated by the SIGINT signal. +

128075 SD5-XCU-ERN-93 is applied, updating the first paragraph of XCU [Section 2.11](#) (on page 2371).

128076 **C.2.12 Shell Execution Environment**

128077 Some implementations have implemented the last stage of a pipeline in the current environment  
128078 so that commands such as:

128079 `command | read foo`

128080 set variable **foo** in the current environment. This extension is allowed, but not required;  
128081 therefore, a shell programmer should consider a pipeline to be in a subshell environment, but  
128082 not depend on it.

128083 In early proposals, the description of execution environment failed to mention that each  
128084 command in a multiple command pipeline could be in a subshell execution environment. For  
128085 compatibility with some historical shells, the wording was phrased to allow an implementation  
128086 to place any or all commands of a pipeline in the current environment. However, this means that  
128087 a POSIX application must assume each command is in a subshell environment, but not depend  
128088 on it.

128089 The wording about shell scripts is meant to convey the fact that describing “trap actions” can  
128090 only be understood in the context of the shell command language. Outside of this context, such  
128091 as in a C-language program, signals are the operative condition, not traps.

128092 POSIX.1-2008, Technical Corrigendum 1, XCU/TC1-2008/0037 [238] is applied.

## 128093 C.2.13 Pattern Matching Notation

128094 Pattern matching is a simpler concept and has a simpler syntax than REs, as the former is  
128095 generally used for the manipulation of filenames, which are relatively simple collections of  
128096 characters, while the latter is generally used to manipulate arbitrary text strings of potentially  
128097 greater complexity. However, some of the basic concepts are the same, so this section points  
128098 liberally to the detailed descriptions in XBD [Chapter 9](#) (on page 181).

### 128099 C.2.13.1 Patterns Matching a Single Character

128100 Both quoting and escaping are described here because pattern matching must work in three  
128101 separate circumstances:

- 128102 1. Calling directly upon the shell, such as in pathname expansion or in a **case** statement. All  
128103 of the following match the string or file **abc**:

128104 `abc "abc" a"b" c a\bc a[b]c a["b"]c a[\b]c a["\b"]c a?c a*c`

128105 The following do not:

128106 `"a?c" a*c a\[b]c`

- 128107 2. Calling a utility or function without going through a shell, as described for *find* and the  
128108 *fnmatch()* function defined in the System Interfaces volume of POSIX.1-2008.

- 128109 3. Calling utilities such as *find*, *cpio*, *tar*, or *pax* through the shell command line. In this case,  
128110 shell quote removal is performed before the utility sees the argument. For example, in:

128111 `find /bin -name "e\c[\h]o" -print`

128112 after quote removal, the <backslash> characters are presented to *find* and it treats them as  
128113 escape characters. Both precede ordinary characters, so the *c* and *h* represent themselves  
128114 and *echo* would be found on many historical systems (that have it in **/bin**). To find a  
128115 filename that contained shell special characters or pattern characters, both quoting and  
128116 escaping are required, such as:

128117 `pax -r ... "a\(\?"`

128118 to extract a filename ending with "a(?".

128119 Conforming applications are required to quote or escape the shell special characters (sometimes  
128120 called metacharacters). If used without this protection, syntax errors can result or  
128121 implementation extensions can be triggered. For example, the KornShell supports a series of  
128122 extensions based on parentheses in patterns.

128123 The restriction on a <circumflex> in a bracket expression is to allow implementations that  
128124 support pattern matching using the <circumflex> as the negation character in addition to the  
128125 <exclamation-mark>. A conforming application must use something like "[\^!]" to match  
128126 either character.

### 128127 C.2.13.2 Patterns Matching Multiple Characters

128128 Since each <asterisk> matches zero or more occurrences, the patterns "a\*b" and "a\*\*b" have  
128129 identical functionality.

128130       **Examples**

- |        |       |  |
|--------|-------|--|
| 128131 | a[bc] | Matches the strings "ab" and "ac".                                     |
| 128132 | a*d   | Matches the strings "ad", "abd", and "abcd", but not the string "abc". |
| 128133 | a*d*  | Matches the strings "ad", "abcd", "abcdef", "aaaad", and "adddd".      |
| 128134 | *a*d  | Matches the strings "ad", "abcd", "efabcd", "aaaad", and "adddd".      |

128135   C.2.13.3   *Patterns Used for Filename Expansion*

128136       The caveat about a <slash> within a bracket expression is derived from historical practice. The  
128137       pattern "a[b/c]d" does not match such pathnames as **abd** or **a/d**. On some implementations  
128138       (including those conforming to the Single UNIX Specification), it matched a pathname of  
128139       literally "a[b/c]d". On other systems, it produced an undefined condition (an unescaped '['  
128140       used outside a bracket expression). In this version, the XSI behavior is now required.

128141       Filenames beginning with a <period> historically have been specially protected from view on  
128142       UNIX systems. A proposal to allow an explicit <period> in a bracket expression to match a  
128143       leading <period> was considered; it is allowed as an implementation extension, but a  
128144       conforming application cannot make use of it. If this extension becomes popular in the future, it  
128145       will be considered for a future version of the Shell and Utilities volume of POSIX.1-2008.

128146       Historical systems have varied in their permissions requirements. To match **f\*/bar** has required  
128147       read permissions on the **f\*** directories in the System V shell, but the Shell and Utilities volume of  
128148       POSIX.1-2008, the C shell, and KornShell require only search permissions.

128149   **C.2.14   Special Built-In Utilities**

128150       See the RATIONALE sections on the individual reference pages.

128151   **C.3       Batch Environment Services and Utilities**

128152       **Scope of the Batch Environment Services and Utilities Option**

128153       This section summarizes the deliberations of the IEEE P1003.15 (Batch Environment) working  
128154       group in the development of the Batch Environment Services and Utilities option, which covers  
128155       a set of services and utilities defining a batch processing system.

128156       This informative section contains historical information concerning the contents of the  
128157       amendment and describes why features were included or discarded by the working group.

128158       **History of Batch Systems**

128159       The supercomputing technical committee began as a "Birds Of a Feather" (BOF) at the January  
128160       1987 Usenix meeting. There was enough general interest to form a supercomputing attachment  
128161       to the /usr/group working groups. Several subgroups rapidly formed. Of those subgroups, the  
128162       batch group was the most ambitious. The first early meetings were spent evaluating user needs  
128163       and existing batch implementations.

128164       To evaluate user needs, individuals from the supercomputing community came and presented  
128165       their needs. Common requests were flexibility, interoperability, control of resources, and ease-of-  
128166       use. Backward-compatibility was not an issue. The working group then evaluated some existing  
128167       systems. The following different systems were evaluated:

- 128168 • PROD
- 128169 • Convex Distributed Batch
- 128170 • NQS
- 128171 • CTSS
- 128172 • MDQS from Ballistics Research Laboratory (BRL)

128173 Finally, NQS was chosen as a model because it satisfied not only the most user requirements, but  
 128174 because it was public domain, already implemented on a variety of hardware platforms, and  
 128175 network-based.

## 128176 **Historical Implementations of Batch Systems**

128177 Deferred processing of work under the control of a scheduler has been a feature of most  
 128178 proprietary operating systems from the earliest days of multi-user systems in order to maximize  
 128179 utilization of the computer.

128180 The arrival of UNIX systems proved to be a dilemma to many hardware providers and users  
 128181 because it did not include the sophisticated batch facilities offered by the proprietary systems.  
 128182 This omission was rectified in 1986 by NASA Ames Research Center who developed the  
 128183 Network Queuing System (NQS) as a portable UNIX application that allowed the routing and  
 128184 processing of batch “jobs” in a network. To encourage its usage, the product was later put into  
 128185 the public domain. It was promptly picked up by UNIX hardware providers, and ported and  
 128186 developed for their respective hardware and UNIX implementations.

128187 Many major vendors, who traditionally offer a batch-dominated environment, ported the  
 128188 public-domain product to their systems, customized it to support the capabilities of their  
 128189 systems, and added many customer-requested features.

128190 Due to the strong hardware provider and customer acceptance of NQS, it was decided to use  
 128191 NQS as the basis for the POSIX Batch Environment amendment in 1987. Other batch systems  
 128192 considered at the time included CTSS, MDQS (a forerunner of NQS from the Ballistics Research  
 128193 Laboratory), and PROD (a Los Alamos Labs development). None were thought to have both the  
 128194 functionality and acceptability of NQS.

## 128195 **NQS Differences from the *at* utility**

128196 The base standard *at* and *batch* utilities are not sufficient to meet the batch processing needs in a  
 128197 supercomputing environment and additional functionality in the areas of resource management,  
 128198 job scheduling, system management, and control of output is required.

## 128199 **Batch Environment Services and Utilities Option Definitions**

128200 The concept of a batch job is closely related to a session with a session leader. The main  
 128201 difference is that a batch job does not have a controlling terminal. There has been much debate  
 128202 over whether to use the term “request” or “job”. Job was the final choice because of the  
 128203 historical use of this term in the batch environment.

128204 The current definition for job identifiers is not sufficient with the model of destinations. The  
 128205 current definition is:

128206 `sequence_number.originating_host`

128207 Using the model of destination, a host may include multiple batch nodes, the location of which  
 128208 is identified uniquely by a name or directory service. If the current definition is used, batch  
 128209 nodes running on the same host would have to coordinate their use of sequence numbers, as  
 128210 sequence numbers are assigned by the originating host. The alternative is to use the originating

- 128211 batch node name instead of the originating host name.
- 128212 The reasons for wishing to run more than one batch system per host could be the following.
- 128213 A test and production batch system are maintained on a single host. This is most likely in a  
128214 development facility, but could also arise when a site is moving from one version to another. The  
128215 new batch system could be installed as a test version that is completely separate from the  
128216 production batch system, so that problems can be isolated to the test system. Requiring the batch  
128217 nodes to coordinate their use of sequence numbers creates a dependency between the two  
128218 nodes, and that defeats the purpose of running two nodes.
- 128219 A site has multiple departments using a single host, with different management policies. An  
128220 example of contention might be in job selection algorithms. One group might want a FIFO type  
128221 of selection, while another group wishes to use a more complex algorithm based on resource  
128222 availability. Again, requiring the batch nodes to coordinate is an unnecessary binding.
- 128223 The proposal eventually accepted was to replace originating host with originating batch node.  
128224 This supplies sufficient granularity to ensure unique job identifiers. If more than one batch node  
128225 is on a particular host, they each have their own unique name.
- 128226 The queue portion of a destination is not part of the job identifier as these are not required to be  
128227 unique between batch nodes. For instance, two batch nodes may both have queues called small,  
128228 medium, and large. It is only the batch node name that is uniquely identifiable throughout the  
128229 batch system. The queue name has no additional function in this context.
- 128230 Assume there are three batch nodes, each of which has its own name server. On batch node one,  
128231 there are no queues. On batch node two, there are fifty queues. On batch node three, there are  
128232 forty queues. The system administrator for batch node one does not have to configure queues,  
128233 because there are none implemented. However, if a user wishes to send a job to either batch  
128234 node two or three, the system administrator for batch node one must configure a destination  
128235 that maps to the appropriate batch node and queue. If every queue is to be made accessible from  
128236 batch node one, the system administrator has to configure ninety destinations.
- 128237 To avoid requiring this, there should be a mechanism to allow a user to separate the destination  
128238 into a batch node name and a queue name. Then, an implementation that is configured to get to  
128239 all the batch nodes does not need any more configuration to allow a user to get to all of the  
128240 queues on all of the batch nodes. The node name is used to locate the batch node, while the  
128241 queue name is sent unchanged to that batch node.
- 128242 The following are requirements that a destination identifier must be capable of providing:
- 128243 • The ability to direct a job to a queue in a particular batch node.
  - 128244 • The ability to direct a job to a particular batch node.
  - 128245 • The ability to group at a higher level than just one queue. This includes grouping similar  
128246 queues across multiple batch nodes (this is a pipe queue).
  - 128247 • The ability to group batch nodes. This allows a user to submit a job to a group name with  
128248 no knowledge of the batch node configuration. This also provides aliasing as a special  
128249 case. Aliasing is a group containing only one batch node name. The group name is the  
128250 alias.
- 128251 In addition, the administrator has the following requirements:
- 128252 • The ability to control access to the queues.
  - 128253 • The ability to control access to the batch nodes.

- The ability to control access to groups of queues (pipe queues).
- The ability to configure retry time intervals and durations.

The requirements of the user are met by destination as explained in the following.

The user has the ability to specify a queue name, which is known only to the batch node specified. There is no configuration of these queues required on the submitting node.

The user has the ability to specify a batch node whose name is network-unique. The configuration required is that the batch node be defined as an application, just as other applications such as FTP are configured.

Once a job reaches a queue, it can again become a user of the batch system. The batch node can choose to send the job to another batch node or queue or both. In other words, the routing is at an application level, and it is up to the batch system to choose where the job will be sent. Configuration is up to the batch node where the queue resides. This provides grouping of queues across batch nodes or within a batch node. The user submits the job to a queue, which by definition routes the job to other queues or nodes or both.

A node name may be given to a naming service, which returns multiple addresses as opposed to just one. This provides grouping at a batch node level. This is a local issue, meaning that the batch node must choose only one of these addresses. The list of addresses is not sent with the job, and once the job is accepted on another node, there is no connection between the list and the job. The requirements of the administrator are met by destination as explained in the following.

The control of queues is a batch system issue, and will be done using the batch administrative utilities.

The control of nodes is a network issue, and will be done through whatever network facilities are available.

The control of access to groups of queues (pipe queues) is covered by the control of any other queue. The fact that the job may then be sent to another destination is not relevant.

The propagation of a job across more than one point-to-point connection was dropped because of its complexity and because all of the issues arising from this capability could not be resolved. It could be provided as additional functionality at some time in the future.

The addition of *network* as a defined term was done to clarify the difference between a network of batch nodes as opposed to a network of hosts. A network of batch nodes is referred to as a batch system. The network refers to the actual host configuration. A single host may have multiple batch nodes.

In the absence of a standard network naming convention, this option establishes its own convention for the sake of consistency and expediency. This is subject to change, should a future working group develop a standard naming convention for network pathnames.

### **C.3.1 Batch General Concepts**

During the development of the Batch Environment Services and Utilities option, a number of topics were discussed at length which influenced the wording of the normative text but could not be included in the final text. The following items are some of the most significant terms and concepts of those discussed:

- Small and Consistent Command Set

Often, conventional utilities from UNIX systems have a very complicated utility syntax and usage. This can often result in confusion and errors when trying to use them. The

- 128297 Batch Environment Services and Utilities option utility set, on the other hand, has been  
128298 paired to a small set of robust utilities with an orthogonal calling sequence.
- 128299 • Checkpoint/Restart
- 128300 This feature permits an already executing process to checkpoint or save its contents. Some  
128301 implementations permit this at both the batch utility level (for example, checkpointing this  
128302 job upon its abnormal termination) or from within the job itself via a system call. Support  
128303 of checkpoint/restart is optional. A conscious, careful effort was made to make the *qsub*  
128304 utility consistently refer to checkpoint/restart as optional functionality.
- 128305 • Rerunability
- 128306 When a user submits a job for batch processing, they can designate it “rerunnable” in that  
128307 it will automatically resume execution from the start of the job if the machine on which it  
128308 was executing crashes for some reason. The decision on whether the job will be rerun or  
128309 not is entirely up to the submitter of the job and no decisions will be made within the batch  
128310 system. A job that is rerunnable and has been submitted with the proper  
128311 checkpoint/restart switch will first be checkpointed and execution begun from that point.  
128312 Furthermore, use of the implementation-defined checkpoint/restart feature will not be  
128313 defined in this context.
- 128314 • Error Codes
- 128315 All utilities exit with error status zero (0) if successful, one (1) if a user error occurred, and  
128316 two (2) for an internal Batch Environment Services and Utilities option error.
- 128317 • Level of Portability
- 128318 Portability is specified at both the user, operator, and administrator levels. A conforming  
128319 batch implementation prevents identical functionality and behavior at all these levels.  
128320 Additionally, portable batch shell scripts with embedded Batch Environment Services and  
128321 Utilities option utilities add an additional level of portability.
- 128322 • Resource Specification
- 128323 A small set of globally understood resources, such as memory and CPU time, is specified.  
128324 All conforming batch implementations are able to process them in a manner consistent  
128325 with the yet-to-be-developed resource management model. Resources not in this  
128326 amendment set are ignored and passed along as part of the argument stream of the utility.
- 128327 • Queue Position
- 128328 Queue position is the place a job occupies in a queue. It is dependent on a variety of factors  
128329 such as submission time and priority. Since priority may be affected by the implementation  
128330 of fair share scheduling, the definition of queue position is implementation-defined.
- 128331 • Queue ID
- 128332 A numerical queue ID is an external requirement for purposes of accounting. The  
128333 identification number was chosen over queue name for processing convenience.
- 128334 • Job ID
- 128335 A common notion of “jobs” is a collection of processes whose process group cannot be  
128336 altered and is used for resource management and accounting. This concept is  
128337 implementation-defined and, as such, has been omitted from the batch amendment.
- 128338 • Bytes *versus* Words
- 128339 Except for one case, bytes are used as the standard unit for memory size. Furthermore, the  
128340 definition of a word varies from machine to machine. Therefore, bytes will be the default

- 128341 unit of memory size.
- 128342 • Regular Expressions
- 128343 The standard definition of regular expressions is much too broad to be used in the batch  
128344 utility syntax. All that is needed is a simple concept of “all”; for example, delete all my jobs  
128345 from the named queue. For this reason, regular expressions have been eliminated from the  
128346 batch amendment.
- 128347 • Display Privacy
- 128348 How much data should be displayed locally through functions? Local policy dictates the  
128349 amount of privacy. Library functions must be used to create and enforce local policy.  
128350 Network and local *qstats* must reflect the policy of the server machine.
- 128351 • Remote Host Naming Convention
- 128352 It was decided that host names would be a maximum of 255 characters in length, with at  
128353 most 15 characters being shown in displays. The 255 character limit was chosen because it  
128354 is consistent with BSD. The 15-character limit was an arbitrary decision.
- 128355 • Network Administration
- 128356 Network administration is important, but is outside the scope of the batch amendment.  
128357 Network administration could be done with *rsh*. However, authentication becomes two-  
128358 sided.
- 128359 • Network Administration Philosophy
- 128360 Keep it simple. Centralized management should be possible. For example, Los Alamos  
128361 needs a dumb set of CPUs to be managed by a central system *versus* several  
128362 independently-managed systems as is the general case for the Batch Environment Services  
128363 and Utilities option.
- 128364 • Operator Utility Defaults (that is, Default Host, User, Account, and so on)
- 128365 It was decided that usability would override orthogonality and syntactic consistency.
- 128366 • The Batch System Manager and Operator Distinction
- 128367 The distinction between manager and operator is that operators can only control the flow  
128368 of jobs. A manager can alter the batch system configuration in addition to job flow. POSIX  
128369 makes a distinction between user and system administrator but goes no further. The  
128370 concepts of manager and operator privileges fall under local policy. The distinction  
128371 between manager and operator is historical in batch environments, and the Batch  
128372 Environment Services and Utilities option has continued that distinction.
- 128373 • The Batch System Administrator
- 128374 An administrator is equivalent to a batch system manager.

### 128375 C.3.2 Batch Services

- 128376 This rationale is provided as informative rather than normative text, to avoid placing  
128377 requirements on implementors regarding the use of symbolic constants, but at the same time to  
128378 give implementors a preferred practice for assigning values to these constants to promote  
128379 interoperability.
- 128380 The *Checkpoint* and *Minimum\_Cpu\_Interval* attributes induce a variety of behavior depending  
128381 upon their values. Some jobs cannot or should not be checkpointed. Other users will simply  
128382 need to ensure job continuation across planned downtimes; for example, scheduled preventive

128383 maintenance. For users consuming expensive resources, or for jobs that run longer than the  
 128384 mean time between failures, however, periodic checkpointing may be essential. However,  
 128385 system administrators must be able to set minimum checkpoint intervals on a queue-by-queue  
 128386 basis to guard against, for example, naive users specifying interval values too small on memory-  
 128387 intensive jobs. Otherwise, system overhead would adversely affect performance.

128388 The use of symbolic constants, such as `NO_CHECKPOINT`, was introduced to lend a degree of  
 128389 formalism and portability to this option.

128390 Support for checkpointing is optional for servers. However, clients must provide for the `-c`  
 128391 option, since in a distributed environment the job may run on a server that does provide such  
 128392 support, even if the host of the client does not support the checkpoint feature.

128393 If the user does not specify the `-c` option, the default action is left unspecified by this option.  
 128394 Some implementations may wish to do checkpointing by default; others may wish to checkpoint  
 128395 only under an explicit request from the user.

128396 The *Priority* attribute has been made non-optional. All clients already had been required to  
 128397 support the `-p` option. The concept of prioritization is common in historical implementations.  
 128398 The default priority is left to the server to establish.

128399 The *Hold\_Types* attribute has been modified to allow for implementation-defined hold types to  
 128400 be passed to a batch server.

128401 It was the intent of the IEEE P1003.15 working group to mandate the support for the  
 128402 *Resource\_List* attribute in this option by referring to another amendment, specifically the  
 128403 IEEE P1003.1a draft standard. However, during the development of the IEEE P1003.1a draft  
 128404 standard this was excluded. As such this requirement has been removed from the normative  
 128405 text.

128406 The *Shell\_Path* attribute has been modified to accept a list of shell paths that are associated with  
 128407 a host. The name of the attribute has been changed to *Shell\_Path\_List*.

### 128408 **C.3.3 Common Behavior for Batch Environment Utilities**

128409 This section was defined to meet the goal of a “Small and Consistent Command Set” for this  
 128410 option.

## 128411 **C.4 Utilities**

128412 For the utilities included in POSIX.1-2008, see the RATIONALE sections on the individual  
 128413 reference pages.

### 128414 **C.4.1 Utilities Removed in this Version**

128415 None.

128416 **C.4.2 Utilities Removed in the Previous Version**

128417 The following utilities were removed in the previous version of this standard:

128418	<i>calendar</i>	<i>cu</i>	<i>line</i>	<i>pcat</i>	<i>unpack</i>
128419	<i>cancel</i>	<i>dircmp</i>	<i>lint</i>	<i>pg</i>	<i>uulog</i>
128420	<i>cc</i>	<i>dis</i>	<i>lpstat</i>	<i>spell</i>	<i>uuname</i>
128421	<i>col</i>	<i>egrep</i>	<i>mail</i>	<i>sum</i>	<i>uupick</i>
128422	<i>cpio</i>	<i>fgrep</i>	<i>pack</i>	<i>tar</i>	<i>uuto</i>

128423 **C.4.3 Exclusion of Utilities**

128424 The set of utilities contained in POSIX.1-2008 is drawn from the base documents for IEEE Std  
 128425 1003.2-1992, with one addition: the *c99* utility. This section contains rationale for some of the  
 128426 deliberations that led to this set of utilities, and why certain utilities were excluded.

128427 Many utilities were evaluated by the standard developers; more historical utilities were  
 128428 excluded from the base documents for IEEE Std 1003.2-1992 than included. The following list  
 128429 contains many common UNIX system utilities that were not included as mandatory utilities, in  
 128430 the User Portability Utilities option, in the XSI option, or in one of the software development  
 128431 groups. It is logistically difficult for this rationale to distribute correctly the reasons for not  
 128432 including a utility among the various utility options. Therefore, this section covers the reasons  
 128433 for all utilities not included in POSIX.1-2008.

128434 This rationale is limited to a discussion of only those utilities actively or indirectly evaluated by  
 128435 the IEEE Std 1003.2-1992 standard developers, rather than the list of all known UNIX utilities  
 128436 from all its variants.

128437 *adb* The intent of the various software development utilities was to assist in the  
 128438 installation (rather than the actual development and debugging) of applications.  
 128439 This utility is primarily a debugging tool. Furthermore, many useful aspects of *adb*  
 128440 are very hardware-specific.

128441 *as* Assemblers are hardware-specific and are included implicitly as part of the  
 128442 compilers in POSIX.1-2008.

128443 *banner* The only known use of this command is as part of the *lp* printer header pages. It  
 128444 was decided that the format of the header is implementation-defined, so this utility  
 128445 is superfluous to application portability.

128446 *calendar* This reminder service program is not useful to conforming applications.

128447 *cancel* The *lp* (line printer spooling) system specified is the most basic possible and did  
 128448 not need this level of application control.

128449 *chroot* This is primarily of administrative use, requiring superuser privileges.

128450 *col* No utilities defined in POSIX.1-2008 produce output requiring such a filter. The  
 128451 *nroff* text formatter is present on many historical systems and will continue to  
 128452 remain as an extension; *col* is expected to be shipped by all the systems that ship  
 128453 *nroff*.

128454 *cpio* This has been replaced by *pax*, for reasons explained in the rationale for that utility.

128455 *cpp* This is subsumed by *c99*.

128456	<i>cu</i>	This utility is terminal-oriented and is not useful from shell scripts or typical application programs.
128457		
128458	<i>dc</i>	The functionality of this utility can be provided by the <i>bc</i> utility; <i>bc</i> was selected because it was easier to use and had superior functionality. Although the historical versions of <i>bc</i> are implemented using <i>dc</i> as a base, POSIX.1-2008 prescribes the interface and not the underlying mechanism used to implement it.
128459		
128460		
128461		
128462	<i>dircmp</i>	Although a useful concept, the historical output of this directory comparison program is not suitable for processing in application programs. Also, the <i>diff -r</i> command gives equivalent functionality.
128463		
128464		
128465	<i>dis</i>	Disassemblers are hardware-specific.
128466	<i>emacs</i>	The community of <i>emacs</i> editing enthusiasts was adamant that the full <i>emacs</i> editor not be included in IEEE Std 1003.2-1992 because they were concerned that an attempt to standardize this very powerful environment would encourage vendors to ship versions conforming strictly to the standard, but lacking the extensibility required by the community. The author of the original <i>emacs</i> program also expressed his desire to omit the program. Furthermore, there were a number of historical UNIX systems that did not include <i>emacs</i> , or included it without supporting it, but there were very few that did not include and support <i>vi</i> .
128467		
128468		
128469		
128470		
128471		
128472		
128473		
128474	<i>ld</i>	This is subsumed by <i>c99</i> .
128475	<i>line</i>	The functionality of <i>line</i> can be provided with <i>read</i> .
128476	<i>lint</i>	This technology is partially subsumed by <i>c99</i> . It is also hard to specify the degree of checking for possible error conditions in programs in any compiler, and specifying what <i>lint</i> would do in these cases is equally difficult.
128477		
128478		
128479		It is fairly easy to specify what a compiler does. It requires specifying the language, what it does with that language, and stating that the interpretation of any incorrect program is unspecified. Unfortunately, any description of <i>lint</i> is required to specify what to do with erroneous programs. Since the number of possible errors and questionable programming practices is infinite, one cannot require <i>lint</i> to detect all errors of any given class.
128480		
128481		
128482		
128483		
128484		
128485		Additionally, some vendors complained that since many compilers are distributed in a binary form without a <i>lint</i> facility (because the ISO C standard does not require one), implementing the standard as a stand-alone product will be much harder. Rather than being able to build upon a standard compiler component (simply by providing <i>c99</i> as an interface), source to that compiler would most likely need to be modified to provide the <i>lint</i> functionality. This was considered a major burden on system providers for a very small gain to developers (users).
128486		
128487		
128488		
128489		
128490		
128491		
128492	<i>login</i>	This utility is terminal-oriented and is not useful from shell scripts or typical application programs.
128493		
128494	<i>lorder</i>	This utility is an aid in creating an implementation-defined detail of object libraries that the standard developers did not feel required standardization.
128495		
128496	<i>lpstat</i>	The <i>lp</i> system specified is the most basic possible and did not need this level of application control.
128497		
128498	<i>mail</i>	This utility was omitted in favor of <i>mailx</i> because there was a considerable functionality overlap between the two.
128499		

128500	<i>mknod</i>	This was omitted in favor of <i>mkfifo</i> , as <i>mknod</i> has too many implementation-defined functions.
128501		
128502	<i>news</i>	This utility is terminal-oriented and is not useful from shell scripts or typical application programs.
128503		
128504	<i>pack</i>	This compression program was considered inferior to <i>compress</i> .
128505	<i>passwd</i>	This utility was proposed in an early draft of the IEEE Std 1003.2-1992 UPE but
128506		met with too many objections to be included. There were various reasons:
128507		<ul style="list-style-type: none"> <li>• Changing a password should not be viewed as a command, but as part of the login sequence. Changing a password should only be done while a trusted path is in effect.</li> </ul>
128508		
128509		
128510		<ul style="list-style-type: none"> <li>• Even though the text in early drafts was intended to allow a variety of implementations to conform, the security policy for one site may differ from another site running with identical hardware and software. One site might use password authentication while the other did not. Vendors could not supply a <i>passwd</i> utility that would conform to POSIX.1-2008 for all sites using their system.</li> </ul>
128511		
128512		
128513		
128514		
128515		
128516		<ul style="list-style-type: none"> <li>• This is really a subject for a system administration working group or a security working group.</li> </ul>
128517		
128518	<i>pcat</i>	This compression program was considered inferior to <i>zcat</i> .
128519	<i>pg</i>	This duplicated many of the features of the <i>more</i> pager, which was preferred by the standard developers.
128520		
128521	<i>prof</i>	The intent of the various software development utilities was to assist in the installation (rather than the actual development and debugging) of applications.
128522		This utility is primarily a debugging tool.
128523		
128524	RCS	RCS was originally considered as part of a version control utilities portion of the scope. However, this aspect was abandoned by the standard developers. SCCS is now included as an optional part of the XSI option.
128525		
128526		
128527	<i>red</i>	Restricted editor. This was not considered by the standard developers because it never provided the level of security restriction required.
128528		
128529	<i>rsh</i>	Restricted shell. This was not considered by the standard developers because it does not provide the level of security restriction that is implied by historical documentation.
128530		
128531		
128532	<i>sdb</i>	The intent of the various software development utilities was to assist in the installation (rather than the actual development and debugging) of applications.
128533		This utility is primarily a debugging tool. Furthermore, some useful aspects of <i>sdb</i> are very hardware-specific.
128534		
128535		
128536	<i>sdiff</i>	The “side-by-side <i>diff</i> ” utility from System V was omitted because it is used infrequently, and even less so by conforming applications. Despite being in System V, it is not in the SVID or XPG.
128537		
128538		
128539	<i>shar</i>	Any of the numerous “shell archivers” were excluded because they did not meet the requirement of existing practice.
128540		
128541	<i>shl</i>	This utility is terminal-oriented and is not useful from shell scripts or typical application programs. The job control aspects of the shell command language are generally more useful.
128542		
128543		

128544	<i>size</i>	The intent of the various software development utilities was to assist in the installation (rather than the actual development and debugging) of applications. This utility is primarily a debugging tool.
128545		
128546		
128547	<i>spell</i>	This utility is not useful from shell scripts or typical application programs. The <i>spell</i> utility was considered, but was omitted because there is no known technology that can be used to make it recognize general language for user-specified input without providing a complete dictionary along with the input file.
128548		
128549		
128550		
128551	<i>su</i>	This utility is not useful from shell scripts or typical application programs. (There was also sentiment to avoid security-related utilities.)
128552		
128553	<i>sum</i>	This utility was renamed <i>cksum</i> .
128554	<i>tar</i>	This has been replaced by <i>pax</i> , for reasons explained in the rationale for that utility.
128555	<i>unpack</i>	This compression program was considered inferior to <i>uncompress</i> .
128556	<i>wall</i>	This utility is terminal-oriented and is not useful in shell scripts or typical applications. It is generally used only by system administrators.
128557		

128558

# *Rationale (Informative)*

128559

## **Part D:**

128560

## **Portability Considerations**

128561

*The Open Group*

128562

*The Institute of Electrical and Electronics Engineers, Inc.*

## Portability Considerations (Informative)

This section contains information to satisfy various international requirements:

- [Section D.1](#) describes perceived user requirements.
- [Section D.2](#) (on page 3753) indicates how the facilities of POSIX.1-2008 satisfy those requirements.
- [Section D.3](#) (on page 3761) offers guidance to writers of profiles on how the configurable options, limits, and optional behavior of POSIX.1-2008 should be cited in profiles.

### D.1 User Requirements

This section describes the user requirements that were perceived by the standard developers. The primary source for these requirements was an analysis of historical practice in widespread use, as typified by the base documents for the ISO POSIX-1: 1996 standard.

POSIX.1-2008 addresses the needs of users requiring open systems solutions for source code portability of applications. It currently addresses users requiring open systems solutions for source-code portability of applications involving multi-programming and process management (creating processes, signaling, and so on); access to files and directories in a hierarchy of file systems (opening, reading, writing, deleting files, and so on); access to asynchronous communications ports and other special devices; access to information about other users of the system; facilities supporting applications requiring bounded (realtime) response.

The following users are identified for POSIX.1-2008:

- Those employing applications written in high-level languages, such as C, Ada, or FORTRAN.
- Users who desire conforming applications that do not necessarily require the characteristics of high-level languages (for example, the speed of execution of compiled languages or the relative security of source code intellectual property inherent in the compilation process).
- Users who desire conforming applications that can be developed quickly and can be modified readily without the use of compilers and other system components that may be unavailable on small systems or those without special application development capabilities.
- Users who interact with a system to achieve general-purpose time-sharing capabilities common to most business or government offices or academic environments: editing, filing, inter-user communications, printing, and so on.
- Users who develop applications for POSIX-conformant systems.
- Users who develop applications for UNIX systems.

An acknowledged restriction on applicable users is that they are limited to the group of individuals who are familiar with the style of interaction characteristic of historically-derived systems based on one of the UNIX operating systems (as opposed to other historical systems

128601 with different models, such as MS/DOS, Macintosh, VMS, MVS, and so on). Typical users  
 128602 would include program developers, engineers, or general-purpose time-sharing users.

128603 The requirements of users of POSIX.1-2008 can be summarized as a single goal: *application source*  
 128604 *portability*. The requirements of the user are stated in terms of the requirements of portability of  
 128605 applications. This in turn becomes a requirement for a standardized set of syntax and semantics  
 128606 for operations commonly found on many operating systems.

128607 The following sections list the perceived requirements for application portability.

#### 128608 **D.1.1 Configuration Interrogation**

128609 An application must be able to determine whether and how certain optional features are  
 128610 provided and to identify the system upon which it is running, so that it may appropriately adapt  
 128611 to its environment.

128612 Applications must have sufficient information to adapt to varying behaviors of the system.

#### 128613 **D.1.2 Process Management**

128614 An application must be able to manage itself, either as a single process or as multiple processes.  
 128615 Applications must be able to manage other processes when appropriate.

128616 Applications must be able to identify, control, create, and delete processes, and there must be  
 128617 communication of information between processes and to and from the system.

128618 Applications must be able to use multiple flows of control with a process (threads) and  
 128619 synchronize operations between these flows of control.

#### 128620 **D.1.3 Access to Data**

128621 Applications must be able to operate on the data stored on the system, access it, and transmit it  
 128622 to other applications. Information must have protection from unauthorized or accidental access  
 128623 or modification.

#### 128624 **D.1.4 Access to the Environment**

128625 Applications must be able to access the external environment to communicate their input and  
 128626 results.

#### 128627 **D.1.5 Access to Determinism and Performance Enhancements**

128628 Applications must have sufficient control of resource allocation to ensure the timeliness of  
 128629 interactions with external objects.

128630 **D.1.6 Operating System-Dependent Profile**

128631 The capabilities of the operating system may make certain optional characteristics of the base  
128632 language in effect no longer optional, and this should be specified.

128633 **D.1.7 I/O Interaction**

128634 The interaction between the C language I/O subsystem (*stdio*) and the I/O subsystem of  
128635 POSIX.1-2008 must be specified.

128636 **D.1.8 Internationalization Interaction**

128637 The effects of the environment of POSIX.1-2008 on the internationalization facilities of the C  
128638 language must be specified.

128639 **D.1.9 C-Language Extensions**

128640 Certain functions in the C language must be extended to support the additional capabilities  
128641 provided by POSIX.1-2008.

128642 **D.1.10 Command Language**

128643 Users should be able to define procedures that combine simple tools and/or applications into  
128644 higher-level components that perform to the specific needs of the user. The user should be able  
128645 to store, recall, use, and modify these procedures. These procedures should employ a powerful  
128646 command language that is used for recurring tasks in conforming applications (scripts) in the  
128647 same way that it is used interactively to accomplish one-time tasks. The language and the  
128648 utilities that it uses must be consistent between systems to reduce errors and retraining.

128649 **D.1.11 Interactive Facilities**

128650 Use the system to accomplish individual tasks at an interactive terminal. The interface should be  
128651 consistent, intuitive, and offer usability enhancements to increase the productivity of terminal  
128652 users, reduce errors, and minimize retraining costs. Online documentation or usage assistance  
128653 should be available.

128654 **D.1.12 Accomplish Multiple Tasks Simultaneously**

128655 Access applications and interactive facilities from a single terminal without requiring serial  
128656 execution: switch between multiple interactive tasks; schedule one-time or periodic background  
128657 work; display the status of all work in progress or scheduled; influence the priority scheduling  
128658 of work, when authorized.

**128659 D.1.13 Complex Data Manipulation**

128660 Manipulate data in files in complex ways: sort, merge, compare, translate, edit, format, pattern  
 128661 match, select subsets (strings, columns, fields, rows, and so on). These facilities should be  
 128662 available to both conforming applications and interactive users.

**128663 D.1.14 File Hierarchy Manipulation**

128664 Create, delete, move/rename, copy, backup/archive, and display files and directories. These  
 128665 facilities should be available to both conforming applications and interactive users.

**128666 D.1.15 Locale Configuration**

128667 Customize applications and interactive sessions for the cultural and language conventions of the  
 128668 user. Employ a wide variety of standard character encodings. These facilities should be available  
 128669 to both conforming applications and interactive users.

**128670 D.1.16 Inter-User Communication**

128671 Send messages or transfer files to other users on the same system or other systems on a network.  
 128672 These facilities should be available to both conforming applications and interactive users.

**128673 D.1.17 System Environment**

128674 Display information about the status of the system (activities of users and their interactive and  
 128675 background work, file system utilization, system time, configuration, and presence of optional  
 128676 facilities) and the environment of the user (terminal characteristics, and so on). Inform the  
 128677 system operator/administrator of problems. Control access to user files and other resources.

**128678 D.1.18 Printing**

128679 Output files on a variety of output device classes, accessing devices on local or network-  
 128680 connected systems. Control (or influence) the formatting, priority scheduling, and output  
 128681 distribution of work. These facilities should be available to both conforming applications and  
 128682 interactive users.

**128683 D.1.19 Software Development**

128684 Develop (create and manage source files, compile/interpret, debug) portable open systems  
 128685 applications and package them for distribution to, and updating of, other systems.

## D.2 Portability Capabilities

This section describes the significant portability capabilities of POSIX.1-2008 and indicates how the user requirements listed in [Section D.1](#) (on page 3749) are addressed. The capabilities are listed in the same format as the preceding user requirements; they are summarized below:

- Configuration Interrogation
- Process Management
- Access to Data
- Access to the Environment
- Access to Determinism and Performance Enhancements
- Operating System-Dependent Profile
- I/O Interaction
- Internationalization Interaction
- C-Language Extensions
- Command Language
- Interactive Facilities
- Accomplish Multiple Tasks Simultaneously
- Complex Data Manipulation
- File Hierarchy Manipulation
- Locale Configuration
- Inter-User Communication
- System Environment
- Printing
- Software Development

### D.2.1 Configuration Interrogation

The *uname()* operation provides basic identification of the system. The *sysconf()*, *pathconf()*, and *fpathconf()* functions and the *getconf* utility provide means to interrogate the implementation to determine how to adapt to the environment in which it is running. These values can be either static (indicating that all instances of the implementation have the same value) or dynamic (indicating that different instances of the implementation have the different values, or that the value may vary for other reasons, such as reconfiguration).

#### Unsatisfied Requirements

None directly. However, as new areas are added, there will be a need for additional capability in this area.

## 128719 D.2.2 Process Management

128720 The *fork()*, *exec* family, *posix\_spawn()*, and *posix\_spawnp()* functions provide for the creation of  
 128721 new processes or the insertion of new applications into existing processes. The *\_Exit()*, *\_exit()*,  
 128722 *exit()*, and *abort()* functions allow for the termination of a process by itself. The *wait()*, *waitid()*,  
 128723 and *waitpid()* functions allow one process to deal with the termination of another.

128724 The *times()* function allows for basic measurement of times used by a process. Various  
 128725 functions, including *fstat()*, *getegid()*, *geteuid()*, *getgid()*, *getgrgid()*, *getgrnam()*, *getlogin()*,  
 128726 *getpid()*, *getppid()*, *getpwnam()*, *getpwuid()*, *getuid()*, *lstat()*, and *stat()*, provide for access to the  
 128727 identifiers of processes and the identifiers and names of owners of processes (and files).

128728 The various functions operating on environment variables provide for communication of  
 128729 information (primarily user-configurable defaults) from a parent to child processes.

128730 The operations on the current working directory control and interrogate the directory from  
 128731 which relative pathname searches start. The *umask()* function controls the default protections  
 128732 applied to files created by the process.

128733 The *alarm()*, *pause()*, *sleep()*, *ualarm()*, and *usleep()* operations allow the process to suspend until  
 128734 a timer has expired or to be notified when a period of time has elapsed. The *time()* operation  
 128735 interrogates the current time and date.

128736 The signal mechanism provides for communication of events either from other processes or  
 128737 from the environment to the application, and the means for the application to control the effect  
 128738 of these events. The mechanism provides for external termination of a process and for a process  
 128739 to suspend until an event occurs. The mechanism also provides for a value to be associated with  
 128740 an event.

128741 Job control provides a means to group processes and control them as groups, and to control their  
 128742 access to the function between the user and the system (the “controlling terminal”). It also  
 128743 provides the means to suspend and resume processes.

128744 The Process Scheduling option provides control of the scheduling and priority of a process.

128745 The Message Passing option provides a means for interprocess communication involving small  
 128746 amounts of data.

128747 The Memory Management facilities provide control of memory resources and for the sharing of  
 128748 memory. This functionality is mandatory on POSIX-conforming systems.

128749 The Threads facilities provide multiple flows of control with a process (threads),  
 128750 synchronization between threads (including mutexes, barriers, and spin locks), association of  
 128751 data with threads, and controlled cancellation of threads.

128752 The XSI interprocess communications functionality provide an alternate set of facilities to  
 128753 manipulate semaphores, message queues, and shared memory. These are provided on XSI-  
 128754 conformant systems to support conforming applications developed to run on UNIX systems.

## 128755 D.2.3 Access to Data

128756 The *open()*, *close()*, *fclose()*, *fopen()*, and *pipe()* functions provide for access to files and data.  
 128757 Such files may be regular files, interprocess data channels (pipes), or devices. Additional types  
 128758 of objects in the file system are permitted and are being contemplated for standardization.

128759 The *access()*, *chmod()*, *chown()*, *dup()*, *dup2()*, *fchmod()*, *fcntl()*, *fstat()*, *ftruncate()*, *lstat()*,  
 128760 *readlink()*, *realpath()*, *stat()*, and *utime()* functions allow for control and interrogation of file and  
 128761 file-related objects (including symbolic links), and their ownership, protections, and timestamps.

128762 The *fgetc()*, *fputc()*, *fread()*, *fseek()*, *fsetpos()*, *fwrite()*, *getc()*, *getchar()*, *lseek()*, *putchar()*, *putc()*,  
 128763 *read()*, and *write()* functions provide for data transfer from the application to files (in all their  
 128764 forms).

128765 The *closedir()*, *link()*, *mkdir()*, *opendir()*, *readdir()*, *rename()*, *rmdir()*, *rewinddir()*, and *unlink()*  
 128766 functions provide for a complete set of operations on directories. Directories can arbitrarily  
 128767 contain other directories, and a single file can be mentioned in more than one directory.

128768 The *faccessat()*, *openat()*, *fchmodat()*, *fchownat()*, *fstatat()*, *linkat()*, *renameat()*, *readlinkat()*,  
 128769 *symlinkat()*, and *unlinkat()* functions allow for race-free and thread-safe file access. The  
 128770 motivation for the introduction of these functions was as follows:

- 128771 • Interfaces taking a pathname may be limited by the maximum length of a pathname  
 128772 ({PATH\_MAX}). The absolute path of files can far exceed this length. The alternative  
 128773 solution of changing the working directory and using relative pathnames is not thread-  
 128774 safe.
- 128775 • A second motivation is that files accessed outside the current working directory are subject  
 128776 to attacks caused by the race condition created by changing any of the elements of the  
 128777 pathnames used.
- 128778 • A third motivation is to allow application code which makes use of a virtual current  
 128779 working directory for each individual thread. In the alternative model there is only one  
 128780 current working directory for all threads.

128781 The file-locking mechanism provides for advisory locking (protection during transactions) of  
 128782 ranges of bytes (in effect, records) in a file.

128783 The *confstr()*, *fpathconf()*, *pathconf()*, and *sysconf()* functions provide for enquiry as to the  
 128784 behavior of the system where variability is permitted.

128785 The asynchronous input and output functions *aio\_cancel()*, *aio\_error()*, *aio\_fsync()*, *aio\_read()*,  
 128786 *aio\_return()*, *aio\_suspend()*, *aio\_write()*, and *lio\_listio()* provide for initiation and control of  
 128787 asynchronous data transfers.

128788 The Synchronized Input and Output option provides for assured commitment of data to media.

#### 128789 D.2.4 Access to the Environment

128790 The operations and types in XBD are provided for access to asynchronous serial devices. The  
 128791 primary intended use for these is the controlling terminal for the application (the interaction  
 128792 point between the user and the system). They are general enough to be used to control any  
 128793 asynchronous serial device. The functions are also general enough to be used with many other  
 128794 device types as a user interface when some emulation is provided.

128795 Less detailed access is provided for other device types, but in many instances an application  
 128796 need not know whether an object in the file system is a device or a regular file to operate  
 128797 correctly.

128798 **Unsatisfied Requirements**

128799 Detailed control of common device classes, specifically magnetic tape, is not provided.

128800 **D.2.5 Bounded (Realtime) Response**128801 The realtime signal functions *sigqueue()*, *sigtimedwait()*, and *sigwaitinfo()* provide queued signals  
128802 and the prioritization of the handling of signals.128803 The SCHED\_FIFO, SCHED\_SPORADIC, and SCHED\_RR scheduling policies provide control  
128804 over processor allocation.128805 The semaphore functions *sem\_close()*, *sem\_destroy()*, *sem\_getvalue()*, *sem\_init()*, *sem\_open()*,  
128806 *sem\_post()*, *sem\_timedwait()*, *sem\_trywait()*, *sem\_unlink()*, and *sem\_wait()* provide high-  
128807 performance synchronization.128808 The memory management functions provide memory locking for control of memory allocation,  
128809 file mapping for high performance, and shared memory for high-performance interprocess  
128810 communication. The Message Passing option provides for interprocess communication without  
128811 being dependent on shared memory.128812 The timers functions *clock\_getres()*, *clock\_gettime()*, *clock\_settime()*, *nanosleep()*, *timer\_create()*,  
128813 *timer\_delete()*, *timer\_getoverrun()*, *timer\_gettime()*, and *timer\_settime()* provide functionality to  
128814 manipulate clocks and timers and include a high resolution function called *nanosleep()* with a  
128815 finer resolution than the *sleep()* function.128816 The timeout functions — *pthread\_mutex\_timedlock()*, *pthread\_rwlock\_timedrdlock()*,  
128817 *pthread\_rwlock\_timedwrlock()*, and *sem\_timedwait()* — the Typed Memory Objects option and the  
128818 Monotonic Clock option provide further facilities for applications to use to obtain predictable  
128819 bounded response.128820 **D.2.6 Operating System-Dependent Profile**128821 POSIX.1-2008 makes no distinction between text and binary files. The values of EXIT\_SUCCESS  
128822 and EXIT\_FAILURE are further defined.128823 **Unsatisfied Requirements**128824 None known, but the ISO C standard may contain some additional options that could be  
128825 specified.128826 **D.2.7 I/O Interaction**128827 POSIX.1-2008 defines how each of the ISO C standard *stdio* functions interact with the POSIX.1  
128828 operations, typically specifying the behavior in terms of POSIX.1 operations.

128829 **Unsatisfied Requirements**

128830 None.

128831 **D.2.8 Internationalization Interaction**

128832 The POSIX.1-2008 environment operations provide a means to define the environment for  
 128833 *setlocale()* and time functions such as *ctime()*. The *tzset()* function is provided to set time  
 128834 conversion information.

128835 The *nl\_langinfo()* function is provided to query locale-specific cultural settings.

128836 The multiple concurrent locale functions *duplocale()*, *freelocale()*, *is\*\_l()*, *newlocale()*,  
 128837 *strcasemp\_l()*, *strcoll\_l()*, *strfmon\_l()*, *strncasemp\_l()*, *strxfrm\_l()*, *tolower\_l()*, *toupper\_l()*,  
 128838 *towctrans\_l()*, *towlower\_l()*, *towupper\_l()*, *uselocale\_l()*, *wscasemp\_l()*, *wscoll\_l()*, *wscncasemp\_l()*,  
 128839 *wcsxfrm\_l()*, *wctrans\_l()*, and *wctype\_l()* are provide to support per-thread locale information.

128840 **Unsatisfied Requirements**

128841 None.

128842 **D.2.9 C-Language Extensions**

128843 The *setjmp()* and *longjmp()* functions are not defined to be cognizant of the signal masks defined  
 128844 for POSIX.1. The *sigsetjmp()* and *siglongjmp()* functions are provided to fill this gap.

128845 The *\_setjmp()* and *\_longjmp()* functions are provided as XSI options to support historic practice.

128846 **Unsatisfied Requirements**

128847 None.

128848 **D.2.10 Command Language**

128849 The shell command language, as described in XCU [Chapter 2](#) (on page 2335), is a common  
 128850 language useful in batch scripts, through an API to high-level languages (for the C-Language  
 128851 Binding option, *system()* and *popen()*) and through an interactive terminal (see the *sh* utility).  
 128852 The shell language has many of the characteristics of a high-level language, but it has been  
 128853 designed to be more suitable for user terminal entry and includes interactive debugging  
 128854 facilities. Through the use of pipelining, many complex commands can be constructed from  
 128855 combinations of data filters and other common components. Shell scripts can be created, stored,  
 128856 recalled, and modified by the user with simple editors.

128857 In addition to the basic shell language, the following utilities offer features that simplify and  
 128858 enhance programmatic access to the utilities and provide features normally found only in high-  
 128859 level languages: *basename*, *bc*, *command*, *dirname*, *echo*, *env*, *expr*, *false*, *printf*, *read*, *sleep*, *tee*, *test*,  
 128860 *time\**,<sup>9</sup> *true*, *wait*, *xargs*, and all of the special built-in utilities in XCU [Section 2.14](#) (on page 2374).

---

128861 9. The utilities listed with an asterisk here and later in this section are present only on systems which support the User Portability Utilities  
 128862 option. There may be further restrictions on the utilities offered with various configuration option combinations; see the individual utility  
 128863 descriptions.

128864      **Unsatisfied Requirements**

128865      None.

128866      **D.2.11 Interactive Facilities**

128867      The utilities offer a common style of command-line interface through conformance to the Utility  
128868      Syntax Guidelines (see XBD [Section 12.2](#), on page 216) and the common utility defaults (see XCU  
128869      [Section 1.4](#), on page 2326). The *sh* utility offers an interactive command-line history and editing  
128870      facility.

128871      The following utilities can be used interactively as well as by scripts; *alias*, *fc*, *mailx*, *unalias*, and  
128872      *write*.

128873      The following utilities in the User Portability Utilities option provide for interactive use: *ex*, *more*,  
128874      and *vi*; the *man* utility offers online access to system documentation.

128875      **Unsatisfied Requirements**

128876      The command line interface to individual utilities is as intuitive and consistent as historical  
128877      practice allows. Work underway based on graphical user interfaces may be more suitable for  
128878      novice or occasional users of the system.

128879      **D.2.12 Accomplish Multiple Tasks Simultaneously**

128880      The shell command language offers background processing through the asynchronous list  
128881      command form; see XCU [Section 2.9](#) (on page 2355).

128882      The *nohup* utility makes background processing more robust and usable.

128883      The *kill* utility can terminate background jobs.

128884      The following utilities support periodic job scheduling, control, and display: *at*, *batch*, *crontab*,  
128885      *nice*, *ps*, and *renice*.

128886      When the User Portability Utilities option is supported, the following utilities allow  
128887      manipulation of jobs: *bg*, *fg*, and *jobs*.

128888      **Unsatisfied Requirements**

128889      Terminals with multiple windows may be more suitable for some multi-tasking interactive uses  
128890      than the job control approach in POSIX.1-2008. See the comments on graphical user interfaces in  
128891      [Section D.2.11](#). The *nice* and *renice* utilities do not necessarily take advantage of complex system  
128892      scheduling algorithms that are supported by the realtime options within POSIX.1-2008.

128893      **D.2.13 Complex Data Manipulation**

128894      The following utilities address user requirements in this area: *asa*, *awk*, *bc*, *cmp*, *comm*, *csplit*, *cut*,  
128895      *dd*, *diff*, *ed*, *ex\**, *expand*, *expr*, *find*, *fold*, *grep*, *head*, *join*, *od*, *paste*, *pr*, *printf*, *sed*, *sort*, *split*, *tabs*, *tail*, *tr*,  
128896      *unexpand*, *uniq*, *uudecode*, *uuencode*, and *wc*.

128897 **Unsatisfied Requirements**

128898 Sophisticated text formatting utilities, such as *troff* or *TeX*, are not included. Standards work in  
 128899 the area of SGML may satisfy this.

128900 **D.2.14 File Hierarchy Manipulation**

128901 The following utilities address user requirements in this area: *basename*, *cd*, *chgrp*, *chmod*, *chown*,  
 128902 *cksum*, *cp*, *dd*, *df*, *diff*, *dirname*, *du*, *find*, *ls*, *ln*, *mkdir*, *mkfifo*, *mv*, *patch*, *pathchk*, *pax*, *pwd*, *rm*, *rmdir*,  
 128903 *test*, and *touch*.

128904 **Unsatisfied Requirements**

128905 Some graphical user interfaces offer more intuitive file manager components that allow file  
 128906 manipulation through the use of icons for novice users.

128907 **D.2.15 Locale Configuration**

128908 The standard utilities are affected by the various *LC\_* variables to achieve locale-dependent  
 128909 operation: character classification, collation sequences, regular expressions and shell pattern  
 128910 matching, date and time formats, numeric formatting, and monetary formatting. When the  
 128911 POSIX2\_LOCALEDEF option is supported, applications can provide their own locale definition  
 128912 files.

128913 The following utilities address user requirements in this area: *date*, *ed*, *ex\**, *find*, *grep*, *locale*,  
 128914 *localedef*, *more\**, *sed*, *sh*, *sort*, *tr*, *uniq*, and *vi\**.

128915 The *iconv()*, *iconv\_close()*, and *iconv\_open()* functions are available to allow an application to  
 128916 convert character data between supported character sets.

128917 The *gencat* utility and the *catopen()*, *catclose()*, and *catgets()* functions provide for message  
 128918 catalog manipulation.

128919 **Unsatisfied Requirements**

128920 Some aspects of multi-byte character and state-encoded character encodings have not yet been  
 128921 addressed. The C-language functions, such as *getopt()*, are generally limited to single-byte  
 128922 characters. The effect of the *LC\_MESSAGES* variable on message formats is only suggested at  
 128923 this time.

128924 **D.2.16 Inter-User Communication**

128925 The following utilities address user requirements in this area: *cksum*, *mailx*, *mesg*, *patch*, *pax*, *talk*,  
 128926 *uudecode*, *uuencode*, *who*, and *write*.

128927 The historical UUCP utilities are included as a separate UUCP Utilities option.

128928 **Unsatisfied Requirements**

128929 None.

128930 **D.2.17 System Environment**128931 The following utilities address user requirements in this area: *chgrp*, *chmod*, *chown*, *df*, *du*, *env*,  
128932 *getconf*, *id*, *logger*, *logname*, *mesg*, *newgrp*, *ps*, *stty*, *tput*, *tty*, *umask*, *uname*, and *who*.128933 The *closelog()*, *openlog()*, *setlogmask()*, and *syslog()* functions provide system logging facilities on  
128934 XSI-conformant systems; these are analogous to the *logger* utility.128935 **Unsatisfied Requirements**

128936 None.

128937 **D.2.18 Printing**128938 The following utilities address user requirements in this area: *pr* and *lp*.128939 **Unsatisfied Requirements**

128940 There are no features to control the formatting or scheduling of the print jobs.

128941 **D.2.19 Software Development**128942 The following utilities address user requirements in this area: *ar*, *asa*, *awk*, *c99*, *ctags*, *fort77*,  
128943 *getconf*, *getopts*, *lex*, *localedef*, *make*, *nm*, *od*, *patch*, *pax*, *strings*, *strip*, *time*, and *yacc*.128944 The *system()*, *popen()*, *pclose()*, *regcomp()*, *regex()*, *regerror()*, *regfree()*, *fnmatch()*, *getopt()*,  
128945 *glob()*, *globfree()*, *wordexp()*, and *wordfree()* functions allow C-language programmers to access  
128946 some of the interfaces used by the utilities, such as argument processing, regular expressions,  
128947 and pattern matching.128948 The SCCS source-code control system utilities are available on systems supporting the XSI  
128949 Development option.128950 **Unsatisfied Requirements**128951 There are no language-specific development tools related to languages other than C and  
128952 FORTRAN. The C tools are more complete and varied than the FORTRAN tools. There is no  
128953 data dictionary or other CASE-like development tools.128954 **D.2.20 Future Growth**128955 It is arguable whether or not all functionality to support applications is potentially within the  
128956 scope of POSIX.1-2008. As a simple matter of practicality, it cannot be. Areas such as graphics,  
128957 application domain-specific functionality, windowing, and so on, should be in unique standards.  
128958 As such, they are properly “Unsatisfied Requirements” in terms of providing fully conforming  
128959 applications, but ones which are outside the scope of POSIX.1-2008.128960 However, as the standards evolve, certain functionality once considered “exotic” enough to be  
128961 part of a separate standard become common enough to be included in a core standard such as  
128962 this. Realtime and networking, for example, have both moved from separate standards (with

128963 much difficult cross-referencing) into this standard over time, and although no specific areas  
128964 have been identified for inclusion in a future version, such inclusions seem likely.

## 128965 **D.3 Profiling Considerations**

128966 This section offers guidance to writers of profiles on how the configurable options, limits, and  
128967 optional behavior of POSIX.1-2008 should be cited in profiles. Profile writers should consult the  
128968 general guidance in POSIX.0 when writing POSIX Standardized Profiles.

128969 The information in this section is an inclusive list of features that should be considered by profile  
128970 writers. Subsetting of POSIX.1-2008 should follow XBD [Section 2.1.5.1](#) (on page 21). A set of  
128971 profiling options is described in [Appendix E](#) (on page 3775).

### 128972 **D.3.1 Configuration Options**

128973 There are two set of options suggested by POSIX.1-2008: those for POSIX-conforming systems  
128974 and those for X/Open System Interface (XSI) conformance. The requirements for XSI  
128975 conformance are documented in the Base Definitions volume of POSIX.1-2008 and not discussed  
128976 further here, as they superset the POSIX conformance requirements.

### 128977 **D.3.2 Configuration Options (Shell and Utilities)**

128978 There are three broad optional configurations for the Shell and Utilities volume of POSIX.1-2008:  
128979 basic execution system, development system, and user portability interactive system. The  
128980 options to support these, and other minor configuration options, are listed in XBD [Chapter 2](#) (on  
128981 page 15). Profile writers should consult the following list and the comments concerning user  
128982 requirements addressed by various components in [Section D.2](#) (on page 3753).

128983 POSIX2\_UPE

128984 The system supports the User Portability Utilities option.

128985 This option is a requirement for a user portability interactive system. It is required  
128986 frequently except for those systems, such as embedded realtime or dedicated application  
128987 systems, that support little or no interactive time-sharing work by users or operators. XSI-  
128988 conformant systems support this option.

128989 POSIX2\_SW\_DEV

128990 The system supports the Software Development Utilities option.

128991 This option is required by many systems, even those in which actual software development  
128992 does not occur. The *make* utility, in particular, is required by many application software  
128993 packages as they are installed onto the system. If POSIX2\_C\_DEV is supported,  
128994 POSIX2\_SW\_DEV is almost a mandatory requirement because of *ar* and *make*.

128995 POSIX2\_C\_BIND

128996 The system supports the C-Language Bindings option.

128997 This option is required on some implementations developing complex C applications or on  
128998 any system installing C applications in source form that require the functions in this option.  
128999 The *system()* and *popen()* functions, in particular, are widely used by applications; the  
129000 others are rather more specialized.

- 129001 POSIX2\_C\_DEV  
 129002 The system supports the C-Language Development Utilities option.
- 129003 This option is required by many systems, even those in which actual C-language software  
 129004 development does not occur. The *c99* utility, in particular, is required by many application  
 129005 software packages as they are installed onto the system. The *lex* and *yacc* utilities are used  
 129006 less frequently.
- 129007 POSIX2\_FORT\_DEV  
 129008 The system supports the FORTRAN Development Utilities option
- 129009 As with C, this option is needed on any system developing or installing FORTRAN  
 129010 applications in source form.
- 129011 POSIX2\_FORT\_RUN  
 129012 The system supports the FORTRAN Runtime Utilities option.
- 129013 This option is required for some FORTRAN applications that need the *asa* utility to convert  
 129014 Hollerith printing statement output. It is unknown how frequently this occurs.
- 129015 POSIX2\_LOCALEDEF  
 129016 The system supports the creation of locales.
- 129017 This option is needed if applications require their own customized locale definitions to  
 129018 operate. It is presently unknown whether many applications are dependent on this.  
 129019 However, the option is virtually mandatory for systems in which internationalized  
 129020 applications are developed.
- 129021 XSI-conformant systems support this option.
- 129022 POSIX2\_PBS  
 129023 The system supports the Batch Environment Services and Utilities option.
- 129024 POSIX2\_PBS\_ACCOUNTING  
 129025 The system supports the optional feature of accounting within the Batch Environment  
 129026 Services and Utilities option. It will be required in servers that implement the optional  
 129027 feature of accounting.
- 129028 POSIX2\_PBS\_CHECKPOINT  
 129029 The system supports the optional feature of checkpoint/restart within the Batch  
 129030 Environment Services and Utilities option.
- 129031 POSIX2\_PBS\_LOCATE  
 129032 The system supports the optional feature of locating batch jobs within the Batch  
 129033 Environment Services and Utilities option.
- 129034 POSIX2\_PBS\_MESSAGE  
 129035 The system supports the optional feature of sending messages to batch jobs within the Batch  
 129036 Environment Services and Utilities option.
- 129037 POSIX2\_PBS\_TRACK  
 129038 The system supports the optional feature of tracking batch jobs within the Batch  
 129039 Environment Services and Utilities option.
- 129040 POSIX2\_CHAR\_TERM  
 129041 The system supports at least one terminal type capable of all operations described in  
 129042 POSIX.1-2008.
- 129043 On systems with POSIX2\_UPE, this option is almost always required. It was developed  
 129044 solely to allow certain specialized vendors and user applications to bypass the requirement  
 129045 for general-purpose asynchronous terminal support. For example, an application and

129046 system that was suitable for block-mode terminals, such as IBM 3270s, would not need this  
 129047 option.  
 129048 XSI-conformant systems support this option.

### 129049 D.3.3 Configurable Limits

129050 Very few of the limits need to be increased for profiles. No profile can cite lower values.  
 129051 {POSIX2\_BC\_BASE\_MAX}  
 129052 {POSIX2\_BC\_DIM\_MAX}  
 129053 {POSIX2\_BC\_SCALE\_MAX}  
 129054 {POSIX2\_BC\_STRING\_MAX}  
 129055 No increase is anticipated for any of these *bc* values, except for very specialized applications  
 129056 involving huge numbers.  
 129057 {POSIX2\_COLL\_WEIGHTS\_MAX}  
 129058 Some natural languages with complex collation requirements require an increase from the  
 129059 default 2 to 4; no higher numbers are anticipated.  
 129060 {POSIX2\_EXPR\_NEST\_MAX}  
 129061 No increase is anticipated.  
 129062 {POSIX2\_LINE\_MAX}  
 129063 This number is much larger than most historical applications have been able to use. At some  
 129064 future time, applications may be rewritten to take advantage of even larger values.  
 129065 {POSIX2\_RE\_DUP\_MAX}  
 129066 No increase is anticipated.  
 129067 {POSIX2\_VERSION}  
 129068 This is actually not a limit, but a standard version stamp. Generally, a profile should specify  
 129069 XCU [Chapter 2](#) (on page 2335) by name in the normative references section, not this value.

### 129070 D.3.4 Configuration Options (System Interfaces)

129071 {NGROUPS\_MAX}  
 129072 A non-zero value indicates that the implementation supports supplementary groups.  
 129073 This option is needed where there is a large amount of shared use of files, but where a  
 129074 certain amount of protection is needed. Many profiles<sup>10</sup> are known to require this option; it  
 129075 should only be required if needed, but it should never be prohibited.  
 129076 \_POSIX\_ADVISORY\_INFO  
 129077 The system provides advisory information for file management.  
 129078 This option allows the application to specify advisory information that can be used to  
 129079 achieve better or even deterministic response time in file manager or input and output  
 129080 operations.  
 129081 \_POSIX\_ASYNCHRONOUS\_IO  
 129082 Support for asynchronous input and output is mandatory in POSIX.1-2008.

---

129083 10. There are no formally approved profiles of POSIX.1-2008 at the time of publication; the reference here is to various profiles generated by  
 129084 private bodies or governments.

## 129085        \_posix\_barriers

129086        Support for barrier synchronization is mandatory in POSIX.1-2008.

129087        This facility allows efficient synchronization of multiple parallel threads in multi-processor  
129088        systems in which the operation is supported in part by the hardware architecture.

## 129089        \_posix\_chown\_restricted

129090        The system restricts the right to “give away” files to other users. It is mandatory that an  
129091        implementation be able to support this facility in POSIX.1-2008; however, it is recognized  
129092        that implementations need not enable the functionality by default.129093        Some applications expect that they can change the ownership of files in this way. It is  
129094        provided where either security or system account requirements cause this ability to be a  
129095        problem. It is also known to be specified in many profiles.

## 129096        \_posix\_clock\_selection

129097        Support for clock selection is mandatory in POSIX.1-2008.

129098        This facility allows applications to request a high resolution sleep in order to suspend a  
129099        thread during a relative time interval, or until an absolute time value, using the desired  
129100        clock. It also allows the application to select the clock used in a *pthread\_cond\_timedwait()*  
129101        function call.

## 129102        \_posix\_cputime

129103        The system supports the Process CPU-Time Clocks option.

129104        This option allows applications to use a new clock that measures the execution times of  
129105        processes or threads, and the possibility to create timers based upon these clocks, for  
129106        runtime detection (and treatment) of execution time overruns.

## 129107        \_posix\_fsync

129108        The system supports file synchronization requests.

129109        This option was created to support historical systems that did not provide the feature.  
129110        Applications that are expecting guaranteed completion of their input and output operations  
129111        should require the *\_POSIX\_SYNC\_IO* option. This option should never be prohibited.

129112        XSI-conformant systems support this option.

## 129113        \_posix\_ipv6

129114        The system supports facilities related to Internet Protocol Version 6 (IPv6).

129115        This option was created to allow systems to transition to IPv6.

## 129116        \_posix\_job\_control

129117        Support for job control is mandatory in POSIX.1-2008.

129118        Most applications that use it can run when it is not present, although with a degraded level  
129119        of user convenience.

## 129120        \_posix\_mapped\_files

129121        Support for memory mapped files is mandatory in POSIX.1-2008.

129122        This facility provides for the mapping of regular files into the process address space.

129123        Both this facility and the Shared Memory Objects option provide shared access to memory  
129124        objects in the process address space. The *mmap()* and *munmap()* functions provide the  
129125        functionality of existing practice for mapping regular files. This functionality was deemed  
129126        unnecessary, if not inappropriate, for embedded systems applications and is expected to be  
129127        optional in subprofiles.

129128 `_POSIX_MEMLOCK`

129129 The system supports the locking of the address space.

129130 This option was created to support historical systems that did not provide the feature. It  
129131 should only be required if needed, but it should never be prohibited.129132 `_POSIX_MEMLOCK_RANGE`

129133 The system supports the locking of specific ranges of the address space.

129134 For applications that have well-defined sections that need to be locked and others that do  
129135 not, POSIX.1-2008 supports an optional set of functions to lock or unlock a range of process  
129136 addresses. The following are two reasons for having a means to lock down a specific range:

- 129137 1. An asynchronous event handler function that must respond to external events in a  
129138 deterministic manner such that page faults cannot be tolerated
- 129139 2. An input/output “buffer” area that is the target for direct-to-process I/O, and the  
129140 overhead of implicit locking and unlocking for each I/O call cannot be tolerated

129141 It should only be required if needed, but it should never be prohibited.

129142 `_POSIX_MEMORY_PROTECTION`

129143 Support for memory protection is mandatory in POSIX.1-2008.

129144 The provision of this facility typically imposes additional hardware requirements.

129145 `_POSIX_PRIORITIZED_IO`

129146 The system provides prioritization for input and output operations.

129147 The use of this option may interfere with the ability of the system to optimize input and  
129148 output throughput. It should only be required if needed, but it should never be prohibited.129149 `_POSIX_MESSAGE_PASSING`

129150 The system supports the passing of messages between processes.

129151 This option was created to support historical systems that did not provide the feature. The  
129152 functionality adds a high-performance XSI interprocess communication facility for local  
129153 communication. It should only be required if needed, but it should never be prohibited.129154 `_POSIX_MONOTONIC_CLOCK`

129155 The system supports the Monotonic Clock option.

129156 This option allows realtime applications to rely on a monotonically increasing clock that  
129157 does not jump backwards, and whose value does not change except for the regular ticking  
129158 of the clock.129159 `_POSIX_PRIORITY_SCHEDULING`

129160 The system provides priority-based process scheduling.

129161 Support of this option provides predictable scheduling behavior, allowing applications to  
129162 determine the order in which processes that are ready to run are granted access to a  
129163 processor. It should only be required if needed, but it should never be prohibited.129164 `_POSIX_REALTIME_SIGNALS`

129165 Support for realtime signals is mandatory in POSIX.1-2008.

129166 This facility provides prioritized, queued signals with associated data values.

129167 `_POSIX_REGEX`

129168 Support for regular expression facilities is mandatory in POSIX.1-2008.

- 129169 `_POSIX_SAVED_IDS`  
 129170 Support for this feature is mandatory in POSIX.1-2008.
- 129171 Certain classes of applications rely on it for proper operation, and there is no alternative  
 129172 short of giving the application root privileges on most implementations that did not provide  
 129173 `_POSIX_SAVED_IDS`.
- 129174 `_POSIX_SEMAPHORES`  
 129175 Support for counting semaphores is mandatory in POSIX.1-2008.
- 129176 `_POSIX_SHARED_MEMORY_OBJECTS`  
 129177 The system supports the mapping of shared memory objects into the process address space.
- 129178 Both this option and the Memory Mapped Files option provide shared access to memory  
 129179 objects in the process address space. The functions defined under this option provide the  
 129180 functionality of existing practice for shared memory objects. This functionality was deemed  
 129181 appropriate for embedded systems applications and, hence, is provided under this option.  
 129182 It should only be required if needed, but it should never be prohibited.
- 129183 `_POSIX_SHELL`  
 129184 Support for the *sh* utility command line interpreter is mandatory in POSIX.1-2008.
- 129185 `_POSIX_SPAWN`  
 129186 The system supports the spawn option.
- 129187 This option provides applications with an efficient mechanism to spawn execution of a new  
 129188 process.
- 129189 `_POSIX_SPINLOCKS`  
 129190 Support for spin locks is mandatory in POSIX.1-2008.
- 129191 This facility provides a simple and efficient synchronization mechanism for threads  
 129192 executing in multi-processor systems.
- 129193 `_POSIX_SPORADIC_SERVER`  
 129194 The system supports the sporadic server scheduling policy.
- 129195 This option provides applications with a new scheduling policy for scheduling aperiodic  
 129196 processes or threads in hard realtime applications.
- 129197 `_POSIX_SYNCHRONIZED_IO`  
 129198 The system supports guaranteed file synchronization.
- 129199 This option was created to support historical systems that did not provide the feature.  
 129200 Applications that are expecting guaranteed completion of their input and output operations  
 129201 should require this option, rather than the File Synchronization option. It should only be  
 129202 required if needed, but it should never be prohibited.
- 129203 `_POSIX_THREADS`  
 129204 Support for multiple threads of control within a single process is mandatory in  
 129205 POSIX.1-2008.
- 129206 `_POSIX_THREAD_ATTR_STACKADDR`  
 129207 The system supports specification of the stack address for a created thread.
- 129208 Applications may take advantage of support of this option for performance benefits, but  
 129209 dependence on this feature should be minimized. This option should never be prohibited.
- 129210 XSI-conformant systems support this option.

129211 `_POSIX_THREAD_ATTR_STACKSIZE`

129212 The system supports specification of the stack size for a created thread.

129213 Applications may require this option in order to ensure proper execution, but such usage  
129214 limits portability and dependence on this feature should be minimized. It should only be  
129215 required if needed, but it should never be prohibited.

129216 XSI-conformant systems support this option.

129217 `_POSIX_THREAD_PRIORITY_SCHEDULING`

129218 The system provides priority-based thread scheduling.

129219 Support of this option provides predictable scheduling behavior, allowing applications to  
129220 determine the order in which threads that are ready to run are granted access to a processor.  
129221 It should only be required if needed, but it should never be prohibited.

129222 `_POSIX_THREAD_PRIO_INHERIT`

129223 The system provides mutual-exclusion operations with priority inheritance.

129224 Support of this option provides predictable scheduling behavior, allowing applications to  
129225 determine the order in which threads that are ready to run are granted access to a processor.  
129226 It should only be required if needed, but it should never be prohibited.

129227 `_POSIX_THREAD_PRIO_PROTECT`

129228 The system supports a priority ceiling emulation protocol for mutual-exclusion operations.

129229 Support of this option provides predictable scheduling behavior, allowing applications to  
129230 determine the order in which threads that are ready to run are granted access to a processor.  
129231 It should only be required if needed, but it should never be prohibited.

129232 `_POSIX_THREAD_PROCESS_SHARED`

129233 The system provides shared access among multiple processes to synchronization objects.

129234 This option was created to support historical systems that did not provide the feature. It  
129235 should only be required if needed, but it should never be prohibited.

129236 XSI-conformant systems support this option.

129237 `_POSIX_THREAD_SAFE_FUNCTIONS`

129238 Support for thread-safe functions is mandatory in POSIX.1-2008.

129239 `_POSIX_THREAD_SPORADIC_SERVER`

129240 The system supports the thread sporadic server scheduling policy.

129241 Support for this option provides applications with a new scheduling policy for scheduling  
129242 aperiodic threads in hard realtime applications.

129243 `_POSIX_TIMEOUTS`

129244 Support for timeouts for some blocking services is mandatory in POSIX.1-2008.

129245 `_POSIX_TIMERS`

129246 Support for higher resolution clocks with multiple timers per process is mandatory in  
129247 POSIX.1-2008.

129248 This facility is appropriate for applications requiring higher resolution timestamps or  
129249 needing to control the timing of multiple activities.

129250 `_POSIX_TRACE`

129251 The system supports the Trace option.

129252 This option was created to allow applications to perform tracing.

- 129253 `_POSIX_TRACE_EVENT_FILTER`  
 129254 The system supports the Trace Event Filter option.  
 129255 This option is dependent on support of the Trace option.
- 129256 `_POSIX_TRACE_INHERIT`  
 129257 The system supports the Trace Inherit option.  
 129258 This option is dependent on support of the Trace option.
- 129259 `_POSIX_TRACE_LOG`  
 129260 The system supports the Trace Log option.  
 129261 This option is dependent on support of the Trace option.
- 129262 `_POSIX_TYPED_MEMORY_OBJECTS`  
 129263 The system supports the Typed Memory Objects option.  
 129264 This option was created to allow realtime applications to access different kinds of physical  
 129265 memory, and allow processes in these applications to share portions of this memory.

### 129266 D.3.5 Configurable Limits

- 129267 In general, the configurable limits in the `<limits.h>` header defined in the Base Definitions  
 129268 volume of POSIX.1-2008 have been set to minimal values; many applications or implementations  
 129269 may require larger values. No profile can cite lower values.
- 129270 `{AIO_LISTIO_MAX}`  
 129271 The current minimum is likely to be inadequate for most applications. It is expected that  
 129272 this value will be increased by profiles requiring support for list input and output  
 129273 operations.
- 129274 `{AIO_MAX}`  
 129275 The current minimum is likely to be inadequate for most applications. It is expected that  
 129276 this value will be increased by profiles requiring support for asynchronous input and  
 129277 output operations.
- 129278 `{AIO_PRIO_DELTA_MAX}`  
 129279 The functionality associated with this limit is needed only by sophisticated applications. It  
 129280 is not expected that this limit would need to be increased under a general-purpose profile.
- 129281 `{ARG_MAX}`  
 129282 The current minimum is likely to need to be increased for profiles, particularly as larger  
 129283 amounts of information are passed through the environment. Many implementations are  
 129284 believed to support larger values.
- 129285 `{CHILD_MAX}`  
 129286 The current minimum is suitable only for systems where a single user is not running  
 129287 applications in parallel. It is significantly too low for any system also requiring windows,  
 129288 and if `_POSIX_JOB_CONTROL` is specified, it should be raised.
- 129289 `{CLOCKRES_MIN}`  
 129290 It is expected that profiles will require a finer granularity clock, perhaps as fine as 1  $\mu$ s,  
 129291 represented by a value of 1 000 for this limit.
- 129292 `{DELAYTIMER_MAX}`  
 129293 It is believed that most implementations will provide larger values.

129294	{LINK_MAX}
129295	For most applications and usage, the current minimum is adequate. Many implementations
129296	have a much larger value, but this should not be used as a basis for raising the value unless
129297	the applications to be used require it.
129298	{LOGIN_NAME_MAX}
129299	This is not actually a limit, but an implementation parameter. No profile should impose a
129300	requirement on this value.
129301	{MAX_CANON}
129302	For most purposes, the current minimum is adequate. Unless high-speed burst serial
129303	devices are used, it should be left as is.
129304	{MAX_INPUT}
129305	See {MAX_CANON}.
129306	{MQ_OPEN_MAX}
129307	The current minimum should be adequate for most profiles.
129308	{MQ_PRIO_MAX}
129309	The current minimum corresponds to the required number of process scheduling priorities.
129310	Many realtime practitioners believe that the number of message priority levels ought to be
129311	the same as the number of execution scheduling priorities.
129312	{NAME_MAX}
129313	Many implementations now support larger values, and many applications and users
129314	assume that larger names can be used. Many existing profiles also specify a larger value.
129315	Specifying this value will reduce the number of conforming implementations, although this
129316	might not be a significant consideration over time. Values greater than 255 should not be
129317	required.
129318	{NGROUPS_MAX}
129319	The value selected will typically be 8 or larger.
129320	{OPEN_MAX}
129321	The historically common value for this has been 20. Many implementations support larger
129322	values. If applications that use larger values are anticipated, an appropriate value should be
129323	specified.
129324	{PAGESIZE}
129325	This is not actually a limit, but an implementation parameter. No profile should impose a
129326	requirement on this value.
129327	{PATH_MAX}
129328	Historically, the minimum has been either 1024 or indefinite, depending on the
129329	implementation. Few applications actually require values larger than 256, but some users
129330	may create file hierarchies that must be accessed with longer paths. This value should only
129331	be changed if there is a clear requirement.
129332	{PIPE_BUF}
129333	The current minimum is adequate for most applications. Historically, it has been larger. If
129334	applications that write single transactions larger than this are anticipated, it should be
129335	increased. Applications that write lines of text larger than this probably do not need it
129336	increased, as the text line is delimited by a <newline>.
129337	{POSIX_VERSION}
129338	This is actually not a limit, but a standard version stamp. Generally, a profile should specify
129339	POSIX.1-2008 by a name in the normative references section, not this value.

129340 {PTHREAD\_DESTRUCTOR\_ITERATIONS}  
 129341 It is unlikely that applications will need larger values to avoid loss of memory resources.

129342 {PTHREAD\_KEYS\_MAX}  
 129343 The current value should be adequate for most profiles.

129344 {PTHREAD\_STACK\_MIN}  
 129345 This should not be treated as an actual limit, but as an implementation parameter. No  
 129346 profile should impose a requirement on this value.

129347 {PTHREAD\_THREADS\_MAX}  
 129348 It is believed that most implementations will provide larger values.

129349 {RTSIG\_MAX}  
 129350 The current limit was chosen so that the set of POSIX.1 signal numbers can fit within a  
 129351 32-bit field. It is recognized that most existing implementations define many more signals  
 129352 than are specified in POSIX.1 and, in fact, many implementations have already exceeded 32  
 129353 signals (including the “null signal”). Support of {\_POSIX\_RTSIG\_MAX} additional signals  
 129354 may push some implementations over the single 32-bit word line, but is unlikely to push  
 129355 any implementations that are already over that line beyond the 64 signal line.

129356 {SEM\_NSEMS\_MAX}  
 129357 The current value should be adequate for most profiles.

129358 {SEM\_VALUE\_MAX}  
 129359 The current value should be adequate for most profiles.

129360 {SSIZE\_MAX}  
 129361 This limit reflects fundamental hardware characteristics (the size of an integer), and should  
 129362 not be specified unless it is clearly required. Extreme care should be taken to assure that  
 129363 any value that might be specified does not unnecessarily eliminate implementations  
 129364 because of accidents of hardware design.

129365 {STREAM\_MAX}  
 129366 This limit is very closely related to {OPEN\_MAX}. It should never be larger than  
 129367 {OPEN\_MAX}, but could reasonably be smaller for application areas where most files are  
 129368 not accessed through *stdio*. Some implementations may limit {STREAM\_MAX} to 20 but  
 129369 allow {OPEN\_MAX} to be considerably larger. Such implementations should be allowed for  
 129370 if the applications permit.

129371 {TIMER\_MAX}  
 129372 The current limit should be adequate for most profiles, but it may need to be larger for  
 129373 applications with a large number of asynchronous operations.

129374 {TTY\_NAME\_MAX}  
 129375 This is not actually a limit, but an implementation parameter. No profile should impose a  
 129376 requirement on this value.

129377 {TZNAME\_MAX}  
 129378 The minimum has been historically adequate, but if longer timezone names are anticipated  
 129379 (particularly such values as UTC-1), this should be increased.

129380 **D.3.6 Optional Behavior**

129381 In POSIX.1-2008, there are no instances of the terms unspecified, undefined, implementation-  
129382 defined, or with the verbs “may” or “need not”, that the standard developers anticipate or  
129383 sanction as suitable for profile or test method citation. All of these are merely warnings to  
129384 conforming applications to avoid certain areas that can vary from system to system, and even  
129385 over time on the same system. In many cases, these terms are used explicitly to support  
129386 extensions, but profiles should not anticipate and require such extensions; future versions of this  
129387 standard may do so.

129388

# *Rationale (Informative)*

129389

## **Part E:**

129390

## **Subprofiling Considerations**

## Subprofiling Considerations (Informative)

129395  
129396  
129397  
129398

This section contains further information to satisfy the requirement that the project scope enable subprofiling of POSIX.1-2008. The approach taken is to include a general requirement in normative text regarding subprofiling and to include an informative section (here) containing a proposed set of subprofiling options.

### E.1 Subprofiling Option Groups

129400  
129401  
129402  
129403

The following Option Groups<sup>11</sup> are defined to support profiling. Systems claiming support to POSIX.1-2008 need not implement these options apart from the requirements stated in XBD Section 2.1.3 (on page 17). These Option Groups allow profiles to subset the System Interfaces volume of POSIX.1-2008 by collecting sets of related functions.

129404  
129405
