

# **Standard for Information Technology— Portable Operating System Interface (POSIX®)**

## **Base Specifications, Issue 7**

Prepared by the Austin Group ([www.opengroup.org/austin](http://www.opengroup.org/austin)).

IMPORTANT NOTICE: This standard is not intended to assure safety, security, health, or environmental protection in all circumstances. Implementors of the standard are responsible for determining appropriate safety, security, environmental, and health practices or regulatory requirements.

This IEEE document is made available for use subject to important notices and legal disclaimers. These notices and disclaimers appear in all publications containing this document and may be found under the heading “Important Notice” or “Important Notices and Disclaimers Concerning IEEE Documents”. They can also be obtained on request from IEEE or viewed at <http://standards.ieee.org/IPR/disclaimers.html>.

# Contents

<b>Volume</b>	<b>1</b>	<b>Base Definitions, Issue 7.....</b>	<b>1</b>
<b>Chapter</b>	<b>1</b>	<b>Introduction.....</b>	<b>3</b>
	1.1	Scope .....	3
	1.2	Conformance.....	4
	1.3	Normative References .....	4
	1.4	Change History .....	5
	1.5	Terminology .....	5
	1.6	Definitions and Concepts.....	6
	1.7	Portability .....	6
	1.7.1	Codes .....	7
	1.7.2	Margin Code Notation .....	13
<b>Chapter</b>	<b>2</b>	<b>Conformance.....</b>	<b>15</b>
	2.1	Implementation Conformance .....	15
	2.1.1	Requirements .....	15
	2.1.2	Documentation .....	16
	2.1.3	POSIX Conformance.....	17
	2.1.4	XSI Conformance .....	19
	2.1.5	Option Groups.....	20
	2.1.6	Options .....	26
	2.2	Application Conformance.....	29
	2.2.1	Strictly Conforming POSIX Application.....	29
	2.2.2	Conforming POSIX Application .....	30
	2.2.3	Conforming POSIX Application Using Extensions.....	30
	2.2.4	Strictly Conforming XSI Application .....	30
	2.2.5	Conforming XSI Application Using Extensions .....	31
	2.3	Language-Dependent Services for the C Programming Language .....	31
	2.4	Other Language-Related Specifications.....	31
<b>Chapter</b>	<b>3</b>	<b>Definitions.....</b>	<b>33</b>
	3.1	Abortive Release.....	33
	3.2	Absolute Pathname.....	33
	3.3	Access Mode .....	33
	3.4	Additional File Access Control Mechanism.....	33
	3.5	Address Space.....	33
	3.6	Advisory Information.....	34
	3.7	Affirmative Response .....	34
	3.8	Alert .....	34
	3.9	Alert Character (<alert>).....	34
	3.10	Alias Name.....	34
	3.11	Alignment .....	35
	3.12	Alternate File Access Control Mechanism .....	35

3.13	Alternate Signal Stack.....	35
3.14	Ancillary Data.....	35
3.15	Angle Brackets.....	35
3.16	Apostrophe Character (<apostrophe>).....	35
3.17	Application.....	35
3.18	Application Address.....	36
3.19	Application Program Interface (API) .....	36
3.20	Appropriate Privileges .....	36
3.21	Argument .....	36
3.22	Arm (a Timer) .....	36
3.23	Asterisk Character (<asterisk>) .....	36
3.24	Async-Cancel-Safe Function.....	37
3.25	Asynchronous Events.....	37
3.26	Asynchronous Input and Output .....	37
3.27	Async-Signal-Safe Function.....	37
3.28	Asynchronously-Generated Signal.....	37
3.29	Asynchronous I/O Completion.....	37
3.30	Asynchronous I/O Operation .....	37
3.31	Authentication .....	38
3.32	Authorization .....	38
3.33	Background Job .....	38
3.34	Background Process.....	38
3.35	Background Process Group (or Background Job).....	38
3.36	Backquote Character.....	38
3.37	Backslash Character (<backslash>) .....	38
3.38	Backspace Character (<backspace>) .....	39
3.39	Barrier .....	39
3.40	Basename.....	39
3.41	Basic Regular Expression (BRE).....	39
3.42	Batch Access List .....	39
3.43	Batch Administrator .....	39
3.44	Batch Client.....	40
3.45	Batch Destination .....	40
3.46	Batch Destination Identifier.....	40
3.47	Batch Directive.....	40
3.48	Batch Job .....	40
3.49	Batch Job Attribute.....	41
3.50	Batch Job Identifier.....	41
3.51	Batch Job Name .....	41
3.52	Batch Job Owner.....	41
3.53	Batch Job Priority .....	41
3.54	Batch Job State .....	41
3.55	Batch Name Service .....	41
3.56	Batch Name Space.....	42
3.57	Batch Node.....	42
3.58	Batch Operator.....	42
3.59	Batch Queue.....	42
3.60	Batch Queue Attribute.....	42
3.61	Batch Queue Position .....	42
3.62	Batch Queue Priority .....	43
3.63	Batch Rerunability.....	43
3.64	Batch Restart .....	43

3.65	Batch Server .....	43
3.66	Batch Server Name.....	43
3.67	Batch Service .....	43
3.68	Batch Service Request.....	43
3.69	Batch Submission .....	44
3.70	Batch System .....	44
3.71	Batch Target User .....	44
3.72	Batch User .....	44
3.73	Bind .....	44
3.74	Blank Character (<blank>).....	44
3.75	Blank Line.....	44
3.76	Blocked Process (or Thread) .....	45
3.77	Blocking .....	45
3.78	Block-Mode Terminal .....	45
3.79	Block Special File.....	45
3.80	Braces .....	45
3.81	Brackets.....	46
3.82	Broadcast .....	46
3.83	Built-In Utility (or Built-In).....	46
3.84	Byte.....	46
3.85	Byte Input/Output Functions .....	46
3.86	Carriage-Return Character (<carriage-return>) .....	46
3.87	Character .....	47
3.88	Character Array .....	47
3.89	Character Class.....	47
3.90	Character Set .....	47
3.91	Character Special File .....	48
3.92	Character String.....	48
3.93	Child Process .....	48
3.94	Circumflex Character (<circumflex>).....	48
3.95	Clock .....	48
3.96	Clock Jump.....	48
3.97	Clock Tick.....	48
3.98	Coded Character Set .....	49
3.99	Codeset .....	49
3.100	Collating Element.....	49
3.101	Collation .....	49
3.102	Collation Sequence.....	49
3.103	Column Position.....	50
3.104	Command.....	50
3.105	Command Language Interpreter .....	50
3.106	Composite Graphic Symbol.....	50
3.107	Condition Variable .....	50
3.108	Connected Socket .....	51
3.109	Connection .....	51
3.110	Connection Mode.....	51
3.111	Connectionless Mode .....	51
3.112	Control Character.....	51
3.113	Control Operator .....	51
3.114	Controlling Process.....	51
3.115	Controlling Terminal .....	52
3.116	Conversion Descriptor .....	52

3.117	Core File.....	52
3.118	CPU Time (Execution Time) .....	52
3.119	CPU-Time Clock.....	52
3.120	CPU-Time Timer.....	52
3.121	Current Job.....	52
3.122	Current Working Directory.....	53
3.123	Cursor Position.....	53
3.124	Datagram.....	53
3.125	Data Segment.....	53
3.126	Deferred Batch Service .....	53
3.127	Device .....	53
3.128	Device ID .....	53
3.129	Directory .....	53
3.130	Directory Entry (or Link) .....	53
3.131	Directory Stream .....	54
3.132	Disarm (a Timer) .....	54
3.133	Display .....	54
3.134	Display Line.....	54
3.135	Dollar-Sign Character (<dollar-sign>) .....	54
3.136	Dot.....	54
3.137	Dot-Dot.....	55
3.138	Double-Quote Character.....	55
3.139	Downshifting.....	55
3.140	Driver .....	55
3.141	Effective Group ID .....	55
3.142	Effective User ID .....	55
3.143	Eight-Bit Transparency .....	55
3.144	Empty Directory.....	56
3.145	Empty Line.....	56
3.146	Empty String (or Null String).....	56
3.147	Empty Wide-Character String.....	56
3.148	Encoding Rule .....	56
3.149	Entire Regular Expression.....	56
3.150	Epoch .....	57
3.151	Equivalence Class.....	57
3.152	Era.....	57
3.153	Event Management.....	57
3.154	Executable File.....	57
3.155	Execute.....	58
3.156	Execution Time .....	58
3.157	Execution Time Monitoring.....	58
3.158	Expand.....	58
3.159	Extended Regular Expression (ERE) .....	58
3.160	Extended Security Controls.....	58
3.161	Feature Test Macro .....	59
3.162	Field.....	59
3.163	FIFO Special File (or FIFO) .....	59
3.164	File .....	59
3.165	File Description .....	59
3.166	File Descriptor .....	60
3.167	File Group Class .....	60
3.168	File Mode.....	60

3.169	File Mode Bits .....	60
3.170	Filename .....	60
3.171	Filename String.....	61
3.172	File Offset .....	61
3.173	File Other Class .....	61
3.174	File Owner Class .....	61
3.175	File Permission Bits.....	61
3.176	File Serial Number .....	61
3.177	File System .....	61
3.178	File Type .....	62
3.179	Filter .....	62
3.180	First Open (of a File) .....	62
3.181	Flow Control .....	62
3.182	Foreground Job.....	62
3.183	Foreground Process .....	62
3.184	Foreground Process Group (or Foreground Job).....	62
3.185	Foreground Process Group ID .....	62
3.186	Form-Feed Character (<form-feed>).....	63
3.187	Graphic Character.....	63
3.188	Group Database.....	63
3.189	Group ID.....	63
3.190	Group Name .....	63
3.191	Hard Limit.....	64
3.192	Hard Link .....	64
3.193	Home Directory .....	64
3.194	Host Byte Order.....	64
3.195	Incomplete Line.....	64
3.196	Inf.....	64
3.197	Instrumented Application .....	64
3.198	Interactive Shell .....	65
3.199	Internationalization .....	65
3.200	Interprocess Communication .....	65
3.201	Invoke .....	65
3.202	Job.....	65
3.203	Job Control .....	65
3.204	Job Control Job ID .....	66
3.205	Last Close (of a File).....	66
3.206	Line.....	66
3.207	Linger .....	66
3.208	Link .....	66
3.209	Link Count .....	66
3.210	Live Process.....	66
3.211	Local Customs .....	67
3.212	Local Interprocess Communication (Local IPC).....	67
3.213	Locale .....	67
3.214	Localization.....	67
3.215	Login .....	67
3.216	Login Name .....	67
3.217	Map .....	67
3.218	Marked Message .....	68
3.219	Matched .....	68
3.220	Memory Mapped Files .....	68

3.221	Memory Object .....	68
3.222	Memory-Resident .....	68
3.223	Message .....	69
3.224	Message Catalog .....	69
3.225	Message Catalog Descriptor .....	69
3.226	Message Queue .....	69
3.227	Mode .....	69
3.228	Monotonic Clock .....	69
3.229	Mount Point .....	70
3.230	Multi-Character Collating Element .....	70
3.231	Multi-Threaded Library .....	70
3.232	Multi-Threaded Process .....	70
3.233	Multi-Threaded Program .....	70
3.234	Mutex .....	70
3.235	Name .....	71
3.236	Named STREAM .....	71
3.237	NaN (Not a Number) .....	71
3.238	Native Language .....	71
3.239	Negative Response .....	71
3.240	Network .....	71
3.241	Network Address .....	71
3.242	Network Byte Order .....	72
3.243	Newline Character (<newline>) .....	72
3.244	Nice Value .....	72
3.245	Non-Blocking .....	72
3.246	Non-Spacing Characters .....	72
3.247	NUL .....	73
3.248	Null Byte .....	73
3.249	Null Pointer .....	73
3.250	Null String .....	73
3.251	Null Wide-Character Code .....	73
3.252	Number-Sign Character (<number-sign>) .....	73
3.253	Object File .....	73
3.254	Octet .....	73
3.255	Offset Maximum .....	74
3.256	Opaque Address .....	74
3.257	Open File .....	74
3.258	Open File Description .....	74
3.259	Operand .....	74
3.260	Operator .....	74
3.261	Option .....	75
3.262	Option-Argument .....	75
3.263	Orientation .....	75
3.264	Orphaned Process Group .....	75
3.265	Page .....	75
3.266	Page Size .....	75
3.267	Parameter .....	76
3.268	Parent Directory .....	76
3.269	Parent Process .....	76
3.270	Parent Process ID .....	76
3.271	Pathname .....	76
3.272	Pathname Component .....	77

3.273	Path Prefix .....	77
3.274	Pattern.....	77
3.275	Period Character (<period>) .....	77
3.276	Permissions .....	78
3.277	Persistence.....	78
3.278	Pipe.....	78
3.279	Polling.....	78
3.280	Portable Character Set .....	78
3.281	Portable Filename.....	79
3.282	Portable Filename Character Set.....	79
3.283	Positional Parameter.....	79
3.284	Preallocation .....	79
3.285	Preempted Process (or Thread).....	79
3.286	Previous Job .....	79
3.287	Printable Character .....	80
3.288	Printable File .....	80
3.289	Priority .....	80
3.290	Priority Band.....	80
3.291	Priority Inversion .....	80
3.292	Priority Scheduling.....	80
3.293	Priority-Based Scheduling .....	80
3.294	Privilege.....	81
3.295	Process .....	81
3.296	Process Group.....	81
3.297	Process Group ID .....	81
3.298	Process Group Leader.....	81
3.299	Process Group Lifetime .....	81
3.300	Process ID.....	82
3.301	Process Lifetime.....	82
3.302	Process Memory Locking.....	82
3.303	Process Termination.....	82
3.304	Process-To-Process Communication .....	82
3.305	Process Virtual Time .....	83
3.306	Program .....	83
3.307	Protocol.....	83
3.308	Pseudo-Terminal .....	83
3.309	Radix Character .....	83
3.310	Read-Only File System .....	83
3.311	Read-Write Lock.....	83
3.312	Real Group ID.....	84
3.313	Real Time .....	84
3.314	Realtime Signal Extension .....	84
3.315	Real User ID .....	84
3.316	Record .....	84
3.317	Redirection .....	84
3.318	Redirection Operator .....	85
3.319	Referenced Shared Memory Object.....	85
3.320	Refresh .....	85
3.321	Regular Expression .....	85
3.322	Region .....	85
3.323	Regular File .....	85
3.324	Relative Pathname .....	86

3.325	Relocatable File.....	86
3.326	Relocation.....	86
3.327	Requested Batch Service .....	86
3.328	(Time) Resolution .....	86
3.329	Robust Mutex.....	86
3.330	Root Directory .....	86
3.331	Runnable Process (or Thread) .....	86
3.332	Running Process (or Thread).....	87
3.333	Saved Resource Limits .....	87
3.334	Saved Set-Group-ID.....	87
3.335	Saved Set-User-ID .....	87
3.336	Scheduling.....	87
3.337	Scheduling Allocation Domain .....	87
3.338	Scheduling Contention Scope .....	87
3.339	Scheduling Policy.....	88
3.340	Screen .....	88
3.341	Scroll.....	88
3.342	Semaphore.....	88
3.343	Session .....	89
3.344	Session Leader .....	89
3.345	Session Lifetime.....	89
3.346	Shared Memory Object.....	89
3.347	Shell.....	89
3.348	Shell, the .....	89
3.349	Shell Script.....	90
3.350	Signal.....	90
3.351	Signal Stack .....	90
3.352	Single-Quote Character .....	90
3.353	Single-Threaded Process .....	90
3.354	Single-Threaded Program.....	90
3.355	Slash Character (<slash>).....	91
3.356	Socket .....	91
3.357	Socket Address .....	91
3.358	Soft Limit .....	91
3.359	Source Code .....	91
3.360	Space Character (<space>).....	92
3.361	Spawn .....	92
3.362	Special Built-In.....	92
3.363	Special Parameter.....	92
3.364	Spin Lock.....	92
3.365	Sporadic Server.....	92
3.366	Standard Error .....	92
3.367	Standard Input.....	92
3.368	Standard Output .....	93
3.369	Standard Utilities .....	93
3.370	Stream .....	93
3.371	STREAM .....	93
3.372	STREAM End.....	93
3.373	STREAM Head .....	93
3.374	STREAMS Multiplexor.....	94
3.375	String.....	94
3.376	Subshell.....	94

3.377	Successfully Transferred .....	94
3.378	Supplementary Group ID .....	94
3.379	Suspended Job .....	94
3.380	Symbolic Constant .....	95
3.381	Symbolic Link .....	95
3.382	Synchronized Input and Output.....	95
3.383	Synchronized I/O Completion .....	95
3.384	Synchronized I/O Data Integrity Completion.....	95
3.385	Synchronized I/O File Integrity Completion .....	96
3.386	Synchronized I/O Operation .....	96
3.387	Synchronous I/O Operation.....	96
3.388	Synchronously-Generated Signal .....	96
3.389	System.....	96
3.390	System Boot.....	96
3.391	System Clock.....	96
3.392	System Console .....	97
3.393	System Crash .....	97
3.394	System Databases.....	97
3.395	System Documentation .....	97
3.396	System Process.....	97
3.397	System Reboot .....	97
3.398	System Trace Event .....	97
3.399	System-Wide .....	98
3.400	Tab Character (<tab>).....	98
3.401	Terminal (or Terminal Device) .....	98
3.402	Text Column.....	98
3.403	Text File.....	98
3.404	Thread .....	99
3.405	Thread ID .....	99
3.406	Thread List .....	99
3.407	Thread-Safe .....	99
3.408	Thread-Specific Data Key.....	99
3.409	Tilde Character (<tilde>).....	99
3.410	Timeouts .....	100
3.411	Timer .....	100
3.412	Timer Overrun .....	100
3.413	Token.....	100
3.414	Trace Analyzer Process.....	100
3.415	Trace Controller Process.....	100
3.416	Trace Event.....	100
3.417	Trace Event Type .....	100
3.418	Trace Event Type Mapping .....	101
3.419	Trace Filter.....	101
3.420	Trace Generation Version .....	101
3.421	Trace Log .....	101
3.422	Trace Point.....	101
3.423	Trace Stream.....	101
3.424	Trace Stream Identifier .....	101
3.425	Trace System .....	101
3.426	Traced Process.....	102
3.427	Tracing Status of a Trace Stream .....	102
3.428	Typed Memory Name Space .....	102

3.429	Typed Memory Object .....	102
3.430	Typed Memory Pool .....	102
3.431	Typed Memory Port .....	102
3.432	Unbind .....	102
3.433	Unit Data .....	102
3.434	Upshifting .....	103
3.435	User Database .....	103
3.436	User ID .....	103
3.437	User Name .....	103
3.438	User Trace Event .....	103
3.439	Utility .....	104
3.440	Variable .....	104
3.441	Vertical-Tab Character (<vertical-tab>) .....	104
3.442	White Space .....	104
3.443	Wide-Character Code (C Language) .....	104
3.444	Wide-Character Input/Output Functions .....	105
3.445	Wide-Character String .....	105
3.446	Word .....	105
3.447	Working Directory (or Current Working Directory) .....	105
3.448	Worldwide Portability Interface .....	105
3.449	Write .....	105
3.450	XSI .....	105
3.451	XSI-Conformant .....	106
3.452	Zombie Process .....	106
3.453	±0 .....	106
<b>Chapter 4</b>	<b>General Concepts .....</b>	<b>107</b>
4.1	Concurrent Execution .....	107
4.2	Default Initialization .....	107
4.3	Directory Protection .....	108
4.4	Extended Security Controls .....	108
4.5	File Access Permissions .....	108
4.6	File Hierarchy .....	109
4.7	Filenames .....	109
4.8	Filename Portability .....	109
4.9	File Times Update .....	109
4.10	Host and Network Byte Orders .....	110
4.11	Measurement of Execution Time .....	110
4.12	Memory Synchronization .....	111
4.13	Pathname Resolution .....	111
4.14	Process ID Reuse .....	113
4.15	Scheduling Policy .....	113
4.16	Seconds Since the Epoch .....	113
4.17	Semaphore .....	114
4.18	Thread-Safety .....	114
4.19	Tracing .....	115
4.20	Treatment of Error Conditions for Mathematical Functions .....	117
4.20.1	Domain Error .....	117
4.20.2	Pole Error .....	117
4.20.3	Range Error .....	118
4.21	Treatment of NaN Arguments for the Mathematical

# Trademarks

The following information is given for the convenience of users of POSIX.1-2008 and does not constitute an endorsement by the IEEE or The Open Group of these products. Equivalent products may be used if they can be shown to lead to the same results.

There may be other products mentioned in the text that might be covered by trademark protection and readers are advised to verify them independently.

AIX<sup>®</sup> and IBM<sup>®</sup> are registered trademarks of International Business Machines Corporation.

ArchiMate<sup>®</sup>, Jericho Forum<sup>®</sup>, Making Standards Work<sup>®</sup>, The Open Group<sup>®</sup>, TOGAF<sup>®</sup>, UNIX<sup>®</sup>, and the “X”<sup>®</sup> device are registered trademarks and Boundaryless Information Flow<sup>™</sup>, DirecNet<sup>™</sup>, FACE<sup>™</sup>, and The Open Group Certification Mark<sup>™</sup> are trademarks of The Open Group.

AT&T<sup>®</sup> is a registered trademark of AT&T in the USA and other countries.

BSD<sup>™</sup> is a trademark of the University of California, Berkeley, USA.

Hewlett-Packard<sup>®</sup>, HP<sup>®</sup>, and HP-UX<sup>®</sup> are registered trademarks of Hewlett-Packard Company.

IEEE<sup>®</sup> and POSIX<sup>®</sup> are registered trademarks, and 754<sup>™</sup>, 854<sup>™</sup>, 1003.0<sup>™</sup>, 1003.1<sup>™</sup>, 1003.1d<sup>™</sup>, 1003.1g<sup>™</sup>, 1003.1j<sup>™</sup>, 1003.1q<sup>™</sup>, 1003.2<sup>™</sup>, 1003.2a<sup>™</sup>, 1003.2d<sup>™</sup>, 1003.9<sup>™</sup>, and 1003.13<sup>™</sup> are trademarks of The Institute of Electrical and Electronic Engineers, Inc.

Linux<sup>®</sup> is a registered trademark of Linus Torvalds.

Sun<sup>®</sup> and Sun Microsystems<sup>®</sup> are registered trademarks of Oracle America, Inc.

/usr/group<sup>®</sup> is a registered trademark of UniForum, the International Network of UNIX System Users.

# *Acknowledgements*

The contributions of the following organizations to the development of POSIX.1-2008 are gratefully acknowledged:

- AT&T for permission to reproduce portions of its copyrighted System V Interface Definition (SVID) and material from the UNIX System V Release 2.0 documentation
- Hewlett-Packard Company, International Business Machines Corporation, Novell Inc., The Open Software Foundation, and Sun Microsystems Inc. for permission to reproduce portions of their copyrighted documentation
- ISO/IEC JTC 1/SC 22/WG 14 C Language Committee
- Red Hat Inc. for permission to reproduce portions of its copyrighted documentation

POSIX.1-2008 was prepared by the Austin Group, a joint working group of the IEEE, The Open Group, and ISO/IEC JTC 1/SC 22.

# Introduction

## 1.1 Scope

POSIX.1-2008 defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. It is intended to be used by both application developers and system implementors.

POSIX.1-2008 comprises four major components (each in an associated volume):

1. General terms, concepts, and interfaces common to all volumes of POSIX.1-2008, including utility conventions and C-language header definitions, are included in the Base Definitions volume of POSIX.1-2008.
2. Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume of POSIX.1-2008.
3. Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume of POSIX.1-2008.
4. Extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of POSIX.1-2008 and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume of POSIX.1-2008.

The following areas are outside of the scope of POSIX.1-2008:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

POSIX.1-2008 describes the external characteristics and facilities that are of importance to application developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

The facilities provided in POSIX.1-2008 are drawn from the following base documents:

- IEEE Std 1003.1, 2004 Edition (POSIX-1) (incorporating IEEE Std 1003.1-2001, IEEE Std 1003.1-2001/Cor 1-2002, and IEEE Std 1003.1-2001/Cor 2-2004)

- The Open Group Technical Standard, 2006, Extended API Set Part 1
- The Open Group Technical Standard, 2006, Extended API Set Part 2
- The Open Group Technical Standard, 2006, Extended API Set Part 3
- The Open Group Technical Standard, 2006, Extended API Set Part 4
- ISO/IEC 9899:1999, Programming Languages — C, including ISO/IEC 9899:1999/Cor.1:2001(E), ISO/IEC 9899:1999/Cor.2:2004(E), and ISO/IEC 9899:1999/Cor.3

Emphasis has been placed on standardizing existing practice for existing users, with changes and additions limited to correcting deficiencies in the following areas:

- Issues raised by Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1, and ISO/IEC defect reports against ISO/IEC 9945
- Issues raised in corrigenda for The Open Group Technical Standards and working group resolutions from The Open Group
- Issues arising from ISO TR 24715:2006, Conflicts between POSIX and the LSB
- Changes to make the text self-consistent with the additional material merged
- Features, marked Legacy or obsolescent in the base documents, have been considered for removal in this version
- A review and reorganization of the options within the standard
- Alignment with the ISO/IEC 9899:1999 standard, including ISO/IEC 9899:1999/Cor.2:2004(E)

## 1.2 Conformance

Conformance requirements for POSIX.1-2008 are defined in [Chapter 2](#) (on page 15).

## 1.3 Normative References

The following standards contain provisions which, through references in POSIX.1-2008, constitute provisions of POSIX.1-2008. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on POSIX.1-2008 are encouraged to investigate the possibility of applying the most recent editions of the standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards.

## 1.4 Change History

Change history is described in the Rationale (Informative) volume of POSIX.1-2008, and in the CHANGE HISTORY section of reference pages.

## 1.5 Terminology

For the purposes of POSIX.1-2008, the following terminology definitions apply:

### **can**

Describes a permissible optional feature or behavior available to the user or application. The feature or behavior is mandatory for an implementation that conforms to POSIX.1-2008. An application can rely on the existence of the feature or behavior.

### **implementation-defined**

Describes a value or behavior that is not defined by POSIX.1-2008 but is selected by an implementor. The value or behavior may vary among implementations that conform to POSIX.1-2008. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations.

The implementor shall document such a value or behavior so that it can be used correctly by an application.

### **legacy**

Describes a feature or behavior that is being retained for compatibility with older applications, but which has limitations which make it inappropriate for developing portable applications. New applications should use alternative means of obtaining equivalent functionality.

### **may**

Describes a feature or behavior that is optional for an implementation that conforms to POSIX.1-2008. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

---

2. ISO/IEC documents can be obtained from the ISO office: 1 Rue de Varembe, Case Postale 56, CH-1211, Genève 20, Switzerland/Suisse

To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

#### **shall**

For an implementation that conforms to POSIX.1-2008, describes a feature or behavior that is mandatory. An application can rely on the existence of the feature or behavior.

For an application or user, describes a behavior that is mandatory.

#### **should**

For an implementation that conforms to POSIX.1-2008, describes a feature or behavior that is recommended but not mandatory. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

For an application, describes a feature or behavior that is recommended programming practice for optimum portability.

#### **undefined**

Describes the nature of a value or behavior not defined by POSIX.1-2008 which results from use of an invalid program construct or invalid data input.

The value or behavior may vary among implementations that conform to POSIX.1-2008. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

#### **unspecified**

Describes the nature of a value or behavior not specified by POSIX.1-2008 which results from use of a valid program construct or valid data input.

The value or behavior may vary among implementations that conform to POSIX.1-2008. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

## **1.6 Definitions and Concepts**

Definitions and concepts are defined in [Chapter 3](#) (on page 33) and [Chapter 4](#) (on page 107).

## **1.7 Portability**

Some of the utilities in the Shell and Utilities volume of POSIX.1-2008 and functions in the System Interfaces volume of POSIX.1-2008 describe functionality that might not be fully portable to systems meeting the requirements for POSIX conformance (see [Chapter 2](#), on page 15).

Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in the margin identifies the nature of the option, extension, or warning (see [Section 1.7.1](#), on page 7). For maximum portability, an application should avoid such functionality.

Unless the primary task of a utility is to produce textual material on its standard output, application developers should not rely on the format or content of any such material that may be produced. Where the primary task *is* to provide such material, but the output format is incompletely specified, the description is marked with the OF margin code and shading. Application developers are warned not to expect that the output of such an interface on one

system is any guide to its behavior on another system.

### 1.7.1 Codes

The codes and their meanings are as follows. See also [Section 1.7.2](#) (on page 13).

#### ADV **Advisory Information**

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ADV margin legend.

#### BE **Batch Environment Services and Utilities**

The functionality described is optional.

Where applicable, utilities are marked with the BE margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the BE margin legend.

#### CD **C-Language Development Utilities**

The functionality described is optional.

Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the CD margin legend.

#### CPT **Process CPU-Time Clocks**

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the CPT margin legend.

#### CX **Extension to the ISO C standard**

The functionality described is an extension to the ISO C standard. Application developers may make use of an extension as it is supported on all POSIX.1-2008-conforming systems.

With each function or header from the ISO C standard, a statement to the effect that “any conflict is unintentional” is included. That is intended to refer to a direct conflict. POSIX.1-2008 acts in part as a profile of the ISO C standard, and it may choose to further constrain behaviors allowed to vary by the ISO C standard. Such limitations and other compatible differences are not considered conflicts, even if a CX mark is missing. The markings are for information only.

Where additional semantics apply to a function or header, the material is identified by use of the CX margin legend.

#### FD **FORTRAN Development Utilities**

The functionality described is optional.

Where applicable, utilities are marked with the FD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the FD margin legend.

#### FR **FORTRAN Runtime Utilities**

The functionality described is optional.

Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section.

200		Where additional semantics apply to a utility, the material is identified by use of the FR margin legend.
201		
202	FSC	<b>File Synchronization</b>
203		The functionality described is optional. The functionality described is also an extension to the
204		ISO C standard.
205		Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section.
206		Where additional semantics apply to a function, the material is identified by use of the FSC
207		margin legend.
208	IP6	<b>IPV6</b>
209		The functionality described is optional. The functionality described is also an extension to the
210		ISO C standard.
211		Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section.
212		Where additional semantics apply to a function, the material is identified by use of the IP6
213		margin legend.
214	MC1	<b>Non-Robust Mutex Priority Protection or Non-Robust Mutex Priority Inheritance or Robust</b>
215		<b>Mutex Priority Protection or Robust Mutex Priority Inheritance</b>
216		The functionality described is optional. The functionality described is also an extension to the
217		ISO C standard.
218		This is a shorthand notation for combinations of multiple option codes.
219		Where applicable, functions are marked with the MC1 margin legend in the SYNOPSIS section.
220		Where additional semantics apply to a function, the material is identified by use of the MC1
221		margin legend.
222		Refer to <a href="#">Section 1.7.2</a> (on page 13).
223	ML	<b>Process Memory Locking</b>
224		The functionality described is optional. The functionality described is also an extension to the
225		ISO C standard.
226		Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section.
227		Where additional semantics apply to a function, the material is identified by use of the ML
228		margin legend.
229	MLR	<b>Range Memory Locking</b>
230		The functionality described is optional. The functionality described is also an extension to the
231		ISO C standard.
232		Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section.
233		Where additional semantics apply to a function, the material is identified by use of the MLR
234		margin legend.
235	MON	<b>Monotonic Clock</b>
236		The functionality described is optional. The functionality described is also an extension to the
237		ISO C standard.
238		Where applicable, functions are marked with the MON margin legend in the SYNOPSIS section.
239		Where additional semantics apply to a function, the material is identified by use of the MON
240		margin legend.
241	MSG	<b>Message Passing</b>
242		The functionality described is optional. The functionality described is also an extension to the
243		ISO C standard.
244		Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section.

Where additional semantics apply to a function, the material is identified by use of the MSG margin legend.

#### MX IEC 60559 Floating-Point

The functionality described is optional. The functionality described is mandated by the ISO C standard only for implementations that define `__STDC_IEC_559__`.

#### MXX IEC 60559 Floating-Point Extension

The functionality described is optional. The functionality described is part of the IEC 60559 Floating-Point option, but is an extension to the ISO C standard.

#### OB Obsolescent

The functionality described may be removed in a future version of this volume of POSIX.1-2008. Strictly Conforming POSIX Applications and Strictly Conforming XSI Applications shall not use obsolescent features.

Where applicable, the material is identified by use of the OB margin legend.

#### OF Output Format Incompletely Specified

The functionality described is an XSI extension. The format of the output produced by the utility is not fully specified. It is therefore not possible to post-process this output in a consistent fashion. Typical problems include unknown length of strings and unspecified field delimiters.

Where applicable, the material is identified by use of the OF margin legend.

#### OH Optional Header

In the SYNOPSIS section of some interfaces in the System Interfaces volume of POSIX.1-2008 an included header is marked as in the following example:

```
#include <sys/types.h>
#include <fcntl.h>
struct open(const char *path, int oflag, ...);
```

The OH margin legend indicates that the optional header defines constants that will be needed if the function is called with certain flag arguments; thus it may be required for some of the functionality described, but is not needed otherwise.

#### PIO Prioritized Input and Output

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the PIO margin legend.

#### PS Process Scheduling

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the PS margin legend.

#### RPI Robust Mutex Priority Inheritance

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the RPI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the RPI margin legend.

290	RPP	<b>Robust Mutex Priority Protection</b>
291		The functionality described is optional. The functionality described is also an extension to the
292		ISO C standard.
293		Where applicable, functions are marked with the RPP margin legend in the SYNOPSIS section.
294		Where additional semantics apply to a function, the material is identified by use of the RPP
295		margin legend.
296	RS	<b>Raw Sockets</b>
297		The functionality described is optional. The functionality described is also an extension to the
298		ISO C standard.
299		Where applicable, functions are marked with the RS margin legend in the SYNOPSIS section.
300		Where additional semantics apply to a function, the material is identified by use of the RS
301		margin legend.
302	SD	<b>Software Development Utilities</b>
303		The functionality described is optional.
304		Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section.
305		Where additional semantics apply to a utility, the material is identified by use of the SD margin
306		legend.
307	SHM	<b>Shared Memory Objects</b>
308		The functionality described is optional. The functionality described is also an extension to the
309		ISO C standard.
310		Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section.
311		Where additional semantics apply to a function, the material is identified by use of the SHM
312		margin legend.
313	SIO	<b>Synchronized Input and Output</b>
314		The functionality described is optional. The functionality described is also an extension to the
315		ISO C standard.
316		Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section.
317		Where additional semantics apply to a function, the material is identified by use of the SIO
318		margin legend.
319	SPN	<b>Spawn</b>
320		The functionality described is optional. The functionality described is also an extension to the
321		ISO C standard.
322		Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section.
323		Where additional semantics apply to a function, the material is identified by use of the SPN
324		margin legend.
325	SS	<b>Process Sporadic Server</b>
326		The functionality described is optional. The functionality described is also an extension to the
327		ISO C standard.
328		Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section.
329		Where additional semantics apply to a function, the material is identified by use of the SS
330		margin legend.
331	TCT	<b>Thread CPU-Time Clocks</b>
332		The functionality described is optional. The functionality described is also an extension to the
333		ISO C standard.
334		Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section.

Where additional semantics apply to a function, the material is identified by use of the TCT margin legend.

#### Trace Event Filter

The functionality described is optional. This functionality is dependent on support for the Trace option. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TEF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TEF margin legend.

#### Non-Robust Mutex Priority Inheritance

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPI margin legend.

#### Non-Robust Mutex Priority Protection

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPP margin legend.

#### Thread Execution Scheduling

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPS margin legend.

#### Trace

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRC margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRC margin legend.

#### Trace Inherit

The functionality described is optional. This functionality is dependent on support for the Trace option. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRI margin legend.

#### Trace Log

The functionality described is optional. This functionality is dependent on support for the Trace option. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRL margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRL margin legend.

379	TSA	<b>Thread Stack Address Attribute</b>
380		The functionality described is optional. The functionality described is also an extension to the
381		ISO C standard.
382		Where applicable, functions are marked with the TSA margin legend for the SYNOPSIS section.
383		Where additional semantics apply to a function, the material is identified by use of the TSA
384		margin legend.
385	TSH	<b>Thread Process-Shared Synchronization</b>
386		The functionality described is optional. The functionality described is also an extension to the
387		ISO C standard.
388		Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section.
389		Where additional semantics apply to a function, the material is identified by use of the TSH
390		margin legend.
391	TSP	<b>Thread Sporadic Server</b>
392		The functionality described is optional. The functionality described is also an extension to the
393		ISO C standard.
394		Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section.
395		Where additional semantics apply to a function, the material is identified by use of the TSP
396		margin legend.
397	TSS	<b>Thread Stack Size Attribute</b>
398		The functionality described is optional. The functionality described is also an extension to the
399		ISO C standard.
400		Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section.
401		Where additional semantics apply to a function, the material is identified by use of the TSS
402		margin legend.
403	TYM	<b>Typed Memory Objects</b>
404		The functionality described is optional. The functionality described is also an extension to the
405		ISO C standard.
406		Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section.
407		Where additional semantics apply to a function, the material is identified by use of the TYM
408		margin legend.
409	UP	<b>User Portability Utilities</b>
410		The functionality described is optional.
411		Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section.
412		Where additional semantics apply to a utility, the material is identified by use of the UP margin
413		legend.
414	UU	<b>UUCP Utilities</b>
415		The functionality described is optional. The functionality described is also an extension to the
416		ISO C standard.
417		Where applicable, functions are marked with the UU margin legend in the SYNOPSIS section.
418		Where additional semantics apply to a function, the material is identified by use of the UU
419		margin legend.
420	XSI	<b>X/Open System Interfaces</b>
421		The functionality described is part of the X/Open Systems Interfaces option. Functionality
422		marked XSI is an extension to the ISO C standard. Application developers may confidently
423		make use of such extensions on all systems supporting the X/Open System Interfaces option.

If an entire SYNOPSIS section is shaded and marked XSI, all the functionality described in that reference page is an extension. See [Section 2.1.4](#) (on page 19).

XSR

**XSI STREAMS**

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the XSR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the XSR margin legend.

**1.7.2 Margin Code Notation**

Some of the functionality described in POSIX.1-2008 depends on support of more than one option, or independently may depend on several options. The following notation for margin codes is used to denote the following cases.

**A Feature Dependent on One or Two Options**

In this case, margin codes have a <space> separator; for example:

SHM

This feature requires support for only the Shared Memory Objects option.

SHM TYM

This feature requires support for both the Shared Memory Objects option and the Typed Memory Objects option; that is, an application which uses this feature is portable only between implementations that provide both options.

**A Feature Dependent on Either of the Options Denoted**

In this case, margin codes have a ' | ' separator to denote the logical OR; for example:

SHM | TYM

This feature is dependent on support for either the Shared Memory Objects option or the Typed Memory Objects option; that is, an application which uses this feature is portable between implementations that provide any (or all) of the options.

**A Feature Dependent on More than Two Options**

The following shorthand notations are used:

MC1

The MC1 margin code is shorthand for TPP | TPI | RPP | RPI. Features which are shaded with this margin code require support of either the Non-Robust Mutex Priority Protection option or the Non-Robust Mutex Priority Inheritance option or the Robust Mutex Priority Protection option or the Robust Mutex Priority Inheritance option.

**Large Sections Dependent on an Option**

Where large sections of text are dependent on support for an option, a lead-in text block is provided and shaded accordingly; for example:

XSI

This section describes extensions to support interprocess communication. The functionality described in this section shall be provided on implementations that support the XSI option (and the rest of this section is not further shaded).

## 2.1 Implementation Conformance

For the purposes of POSIX.1-2008, the implementation conformance requirements given in this section apply.

### 2.1.1 Requirements

A *conforming implementation* shall meet all of the following criteria:

1. The system shall support all utilities, functions, and facilities defined within POSIX.1-2008 that are required for POSIX conformance (see [Section 2.1.3](#), on page 17). These interfaces shall support the functional behavior described herein.
2. The system may support the X/Open System Interfaces (XSI) option as described in [Section 2.1.4](#) (on page 19).
3. The system may support one or more options as described under [Section 2.1.5](#) (on page 20). When an implementation claims that an option is supported, all of its constituent parts shall be provided.
4. The system may provide non-standard extensions. These are features not required by POSIX.1-2008 and may include, but are not limited to:
  - Additional functions
  - Additional headers
  - Additional symbols in standard headers
  - Additional utilities
  - Additional options for standard utilities
  - Additional environment variables
  - Additional file types
  - Non-conforming file systems (for example, legacy file systems for which `_POSIX_NO_TRUNC` is false, case-insensitive file systems, or network file systems)
  - Dynamically populated file systems (for example, `/proc`)
  - Additional character special files with special properties (for example, `/dev/stdin`, `/dev/stdout`, and `/dev/stderr`)

Non-standard extensions of the utilities, functions, or facilities specified in POSIX.1-2008 should be identified as such in the system documentation. Non-standard extensions, when used, may change the behavior of utilities, functions, or facilities defined by POSIX.1-2008. The conformance document shall define an environment in which an application can be run with the behavior specified by POSIX.1-2008. In no case shall such

an environment require modification of a Strictly Conforming POSIX Application (see Section 2.2.1, on page 29).

**Note:** If the documented method of setting up a conforming environment includes the need to set one or more environment variables, then the values of those environment variables cannot include any <space> characters, since the *confstr()* function must be able to return them in a <space>-separated list of variable=value pairs. See XSH *confstr()* (on page 696).

## 2.1.2 Documentation

A conformance document with the following information shall be available for an implementation claiming conformance to POSIX.1-2008. The conformance document shall have the same structure as POSIX.1-2008, with the information presented in the appropriate sections and subsections. Sections and subsections that consist solely of subordinate section titles, with no other information, are not required. The conformance document shall not contain information about extended facilities or capabilities outside the scope of POSIX.1-2008.

The conformance document shall contain a statement that indicates the full name, number, and date of the standard that applies. The conformance document may also list international software standards that are available for use by a Conforming POSIX Application. Applicable characteristics where documentation is required by one of these standards, or by standards of government bodies, may also be included.

The conformance document shall describe the limit values found in the headers *<limits.h>* (on page 270) and *<unistd.h>* (on page 433), stating values, the conditions under which those values may change, and the limits of such variations, if any.

The conformance document shall describe the behavior of the implementation for all implementation-defined features defined in POSIX.1-2008. This requirement shall be met by listing these features and providing either a specific reference to the system documentation or providing full syntax and semantics of these features. When the value or behavior in the implementation is designed to be variable or customized on each instantiation of the system, the implementation provider shall document the nature and permissible ranges of this variation.

The conformance document may specify the behavior of the implementation for those features where POSIX.1-2008 states that implementations may vary or where features are identified as undefined or unspecified.

The conformance document shall not contain documentation other than that specified in the preceding paragraphs except where such documentation is specifically allowed or required by other provisions of POSIX.1-2008.

The phrases “shall document” or “shall be documented” in POSIX.1-2008 mean that documentation of the feature shall appear in the conformance document, as described previously, unless there is an explicit reference in the conformance document to show where the information can be found in the system documentation.

The system documentation should also contain the information found in the conformance document.

### 2.1.3 POSIX Conformance

A conforming implementation shall meet the following criteria for POSIX conformance.

#### 2.1.3.1 POSIX System Interfaces

The following requirements apply to the system interfaces (functions and headers):

- The system shall support all the mandatory functions and headers defined in POSIX.1-2008, and shall set the symbolic constant `_POSIX_VERSION` to the value 200809L.
- Although all implementations conforming to POSIX.1-2008 support all the features described below, there may be system-dependent or file system-dependent configuration procedures that can remove or modify any or all of these features. Such configurations should not be made if strict compliance is required.

The following symbolic constants shall be defined with a value other than `-1`. If a constant is defined with the value zero, applications should use the `sysconf()`, `pathconf()`, or `fpathconf()` functions, or the `getconf` utility, to determine which features are present on the system at that time or for the particular pathname in question.

— `_POSIX_CHOWN_RESTRICTED`

The use of `chown()` is restricted to a process with appropriate privileges, and to changing the group ID of a file only to the effective group ID of the process or to one of its supplementary group IDs.

— `_POSIX_NO_TRUNC`

Pathname components longer than `{NAME_MAX}` generate an error.

- The following symbolic constants shall be defined by the implementation as follows:

— Symbolic constants defined with the value 200809L:

```

_POSIX_ASYNCHRONOUS_IO
_POSIX_BARRIERS
_POSIX_CLOCK_SELECTION
_POSIX_MAPPED_FILES
_POSIX_MEMORY_PROTECTION
_POSIX_READER_WRITER_LOCKS
_POSIX_REALTIME_SIGNALS
_POSIX_SEMAPHORES
_POSIX_SPIN_LOCKS
_POSIX_THREAD_SAFE_FUNCTIONS
_POSIX_THREADS
_POSIX_TIMEOUTS
_POSIX_TIMERS
_POSIX2_C_BIND

```

+

— Symbolic constants defined with a value greater than zero:

```

_POSIX_JOB_CONTROL
_POSIX_REGEX
_POSIX_SAVED_IDS
_POSIX_SHELL

```

+

+

— Symbolic constants defined with a value other than `-1`.

`_POSIX_VDISABLE`

**Note:** The symbols above represent historical options that are no longer allowed as options, but are retained here for backwards-compatibility of applications.

- The system may support one or more options (see [Section 2.1.6](#), on page 26) denoted by the following symbolic constants:

`_POSIX_ADVISORY_INFO`  
`_POSIX_CPUTIME`  
`_POSIX_FSYNC`  
`_POSIX_IPV6`  
`_POSIX_MEMLOCK`  
`_POSIX_MEMLOCK_RANGE`  
`_POSIX_MESSAGE_PASSING`  
`_POSIX_MONOTONIC_CLOCK`  
`_POSIX_PRIORITIZED_IO`  
`_POSIX_PRIORITY_SCHEDULING`  
`_POSIX_RAW_SOCKETS`  
`_POSIX_SHARED_MEMORY_OBJECTS`  
`_POSIX_SPAWN`  
`_POSIX_SPORADIC_SERVER`  
`_POSIX_SYNCHRONIZED_IO`  
`_POSIX_THREAD_ATTR_STACKADDR`  
`_POSIX_THREAD_CPUTIME`  
`_POSIX_THREAD_ATTR_STACKSIZE`  
`_POSIX_THREAD_PRIO_INHERIT`  
`_POSIX_THREAD_PRIO_PROTECT`  
`_POSIX_THREAD_PRIORITY_SCHEDULING`  
`_POSIX_THREAD_PROCESS_SHARED`  
`_POSIX_THREAD_SPAWNING`  
`_POSIX_TRACE`  
`_POSIX_TRACE_EVENT_FILTER`  
`_POSIX_TRACE_INHERIT`  
`_POSIX_TRACE_LOG`  
`_POSIX_TYPED_MEMORY_OBJECTS`  
`_XOPEN_CRYPT`  
`_XOPEN_REALTIME`  
`_XOPEN_REALTIME_THREADS`  
`_XOPEN_STREAMS`  
`_XOPEN_UNIX`

If any of the symbolic constants `_POSIX_TRACE_EVENT_FILTER`, `_POSIX_TRACE_LOG`, or `_POSIX_TRACE_INHERIT` is defined to have a value other than `-1`, then the symbolic constant `_POSIX_TRACE` shall also be defined to have a value other than `-1`.

If the Advisory Information option is supported, there shall be at least one file system that supports the functionality.

2.1.3.2 *POSIX Shell and Utilities*

The following requirements apply to the shell and utilities:

- The system shall provide all the mandatory utilities in the Shell and Utilities volume of POSIX.1-2008 with all the functional behavior described therein.
- The system shall support the Large File capabilities described in the Shell and Utilities volume of POSIX.1-2008.
- The system may support one or more options (see [Section 2.1.6](#), on page 26) denoted by the following symbolic constants. (The literal names below apply to the *getconf* utility.)

```

POSIX2_C_DEV
POSIX2_CHAR_TERM
POSIX2_FORT_DEV
POSIX2_FORT_RUN
POSIX2_LOCALEDEF
POSIX2_PBS
POSIX2_PBS_ACCOUNTING
POSIX2_PBS_LOCATE
POSIX2_PBS_MESSAGE
POSIX2_PBS_TRACK
POSIX2_SW_DEV
POSIX2_UPE
XOPEN_UNIX
XOPEN_UUCP

```

Additional language bindings and development utility options may be provided in other related standards or in a future version of this standard. In the former case, additional symbolic constants of the same general form as shown in this subsection should be defined by the related standard document and made available to the application without requiring POSIX.1-2008 to be updated.

2.1.4 **XSI Conformance**

XSI This section describes the criteria for implementations providing conformance to the X/Open System Interfaces (XSI) option (see [Section 3.450](#), on page 105). The functionality described in this section shall be provided on implementations that support the XSI option (and the rest of this section is not further shaded).

POSIX.1-2008 describes utilities, functions, and facilities offered to application programs by the X/Open System Interfaces (XSI) option. An XSI-conforming implementation shall meet the criteria for POSIX conformance and the following requirements listed in this section.

XSI-conforming implementations shall set the symbolic constant `_XOPEN_UNIX` to a value other than `-1` and shall set the symbolic constant `_XOPEN_VERSION` to the value `700`.

2.1.4.1 *XSI System Interfaces*

The following requirements apply to the system interfaces when the XSI option is supported:

- The system shall support all the functions and headers defined in POSIX.1-2008 as part of the XSI option denoted by the XSI marking in the SYNOPSIS section, and any extensions marked with the XSI option marking (see [Section 1.7.1](#), on page 7) within the text.

- The system shall support the following options defined within POSIX.1-2008 (see [Section 2.1.6](#), on page 26):

```
_POSIX_FSYNC
_POSIX_THREAD_ATTR_STACKADDR
_POSIX_THREAD_ATTR_STACKSIZE
_POSIX_THREAD_PROCESS_SHARED
```

- The system may support the following XSI Option Groups (see [Section 2.1.5.2](#), on page 22) defined within POSIX.1-2008:

```
— Encryption
— Realtime
— Advanced Realtime
— Realtime Threads
— Advanced Realtime Threads
— Tracing
— XSI STREAMS
```

#### 2.1.4.2 XSI Shell and Utilities Conformance

The following requirements apply to the shell and utilities when the XSI option is supported:

- The system shall support all the utilities defined in the Shell and Utilities volume of POSIX.1-2008 as part of the XSI option denoted by the XSI marking in the SYNOPSIS section, and any extensions marked with the XSI option marking (see [Section 1.7.1](#), on page 7) within the text.
- The system shall support the User Portability Utilities option and the Terminal Characteristics option.
- The system shall support creation of locales (see [Chapter 7](#), on page 135).
- The C-language Development utility *c99* shall be supported.
- The XSI Development Utilities option may be supported. It consists of the following software development utilities:

```
admin  delta  rmdel  val
cflow  get    sact   what
ctags  nm     sccs
cxref  prs    unget
```

### 2.1.5 Option Groups

An Option Group is a group of related functions or options defined within the System Interfaces volume of POSIX.1-2008.

If an implementation supports an Option Group, then the system shall support the functional behavior described herein.

If an implementation does not support an Option Group, then the system need not support the functional behavior described herein.

## 2.1.5.1 Subprofiling Considerations

Profiling standards supporting functional requirements less than that required in POSIX.1-2008 may subset both mandatory and optional functionality required for POSIX Conformance (see [Section 2.1.3](#), on page 17) or XSI Conformance (see [Section 2.1.4](#), on page 19). Such profiles shall organize the subsets into Subprofiling Option Groups.

X RAT [Appendix E](#) (on page 3775) describes a representative set of such Subprofiling Option Groups for use by profiles applicable to specialized realtime systems. POSIX.1-2008 does not require that the presence of Subprofiling Option Groups be testable at compile-time (as symbols defined in any header) or at runtime (via *sysconf()* or *getconf()*).

A Subprofiling Option Group may provide basic system functionality that other Subprofiling Option Groups and other options depend upon.<sup>3</sup> If a profile of POSIX.1-2008 does not require an implementation to provide a Subprofiling Option Group that provides features utilized by a required Subprofiling Option Group (or option),<sup>4</sup> the profile shall specify<sup>5</sup> all of the following:

- Restricted or altered behavior of interfaces defined in POSIX.1-2008 that may differ on an implementation of the profile
- Additional behaviors that may produce undefined or unspecified results
- Additional implementation-defined behavior that implementations shall be required to document in the profile's conformance document

if any of the above is a result of the profile not requiring an interface required by POSIX.1-2008.

The following additional rules shall apply to all profiles of POSIX.1-2008:

- Any application that conforms to that profile shall also conform to POSIX.1-2008, unless the application depends on the definition of a profile support indicator macro in **<unistd.h>** (that is, a profile shall not require restricted, altered, or extended behaviors of an implementation of POSIX.1-2008).
- Profiles are permitted to require the definition of a *profile support indicator macro* with a name beginning **\_POSIX\_AEP\_** in **<unistd.h>**.
- Profiles shall require the definition of the macro **\_POSIX\_SUBPROFILE** in **<unistd.h>** on implementations that do not meet all of the requirements of a POSIX.1-conforming implementation.
- Profiles are permitted to add additional requirements to the limits defined in **<limits.h>** and **<stdint.h>**, subject to the following:

For the limits in **<limits.h>** and **<stdint.h>**:

- 
3. As an example, the File System profiling option group provides underlying support for pathname resolution and file creation which are needed by any interface in POSIX.1-2008 that parses a *path* argument. If a profile requires support for the Device Input and Output profiling option group but does not require support for the File System profiling option group, the profile must specify how pathname resolution is to behave in that profile, how the **O\_CREAT** flag to *open()* is to be handled (and the use of the character 'a' in the *mode* argument of *fopen()* when a pathname argument names a file that does not exist), and specify lots of other details.
  4. As an example, POSIX.1-2008 requires that implementations claiming to support the Range Memory Locking option also support the Process Memory Locking option. A profile could require that the Range Memory Locking option had to be supplied without requiring that the Process Memory Locking option be supplied as long as the profile specifies everything an application developer or system implementor would have to know to build an application or implementation conforming to the profile.
  5. Note that the profile could just specify that any use of the features not specified by the profile would produce undefined or unspecified results.

- If the limit is specified as having a fixed value, it shall not be changed by a profile.
- If a limit is specified as having a minimum or maximum acceptable value, it may be changed by a profile as follows:
  - A profile may increase a minimum acceptable value, but shall not make a minimum acceptable value smaller.
  - A profile may reduce a maximum acceptable value, but shall not make a maximum acceptable value larger.
- A profile shall not change a limit specified as having a minimum or maximum value into a limit specified as having a fixed value.
- A profile shall not create new limits.
- Any implementation that conforms to POSIX.1-2008 (including all options and extended limits required by the profile) shall also conform to that profile, except for the possible omission from `<unistd.h>` of a profile support indicator macro required by the profile.

#### 2.1.5.2 XSI Option Groups

XSI This section describes Option Groups to support the definition of XSI conformance within the System Interfaces volume of POSIX.1-2008. The functionality described in this section shall be provided on implementations that support the XSI option and the appropriate Option Group (and the rest of this section is not further shaded).

The following Option Groups are defined.

##### Encryption

The Encryption Option Group is denoted by the symbolic constant `_XOPEN_CRYPT`. It includes the following functions:

`crypt()`, `encrypt()`, `setkey()`

These functions are marked CRYPT.

Due to export restrictions on the decoding algorithm in some countries, implementations may be restricted in making these functions available. All the functions in the Encryption Option Group may therefore return `[ENOSYS]` or, alternatively, `encrypt()` shall return `[ENOSYS]` for the decryption operation.

An implementation that claims conformance to this Option Group shall set `_XOPEN_CRYPT` to a value other than `-1`.

##### Realtime

The Realtime Option Group is denoted by the symbolic constant `_XOPEN_REALTIME`.

This Option Group includes a set of realtime functions drawn from options within POSIX.1-2008 (see [Section 2.1.6](#), on page 26).

Where entire functions are included in the Option Group, the NAME section is marked with REALTIME. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within POSIX.1-2008.

An implementation that claims conformance to this Option Group shall set `_XOPEN_REALTIME` to a value other than `-1`.

This Option Group consists of the set of the following options from within POSIX.1-2008 (see [Section 2.1.6](#), on page 26):

```
_POSIX_FSYNC
_POSIX_MEMLOCK
_POSIX_MEMLOCK_RANGE
_POSIX_MESSAGE_PASSING
_POSIX_PRIORITIZED_IO
_POSIX_PRIORITY_SCHEDULING
_POSIX_SHARED_MEMORY_OBJECTS
_POSIX_SYNCHRONIZED_IO
```

If the symbolic constant `_XOPEN_REALTIME` is defined to have a value other than `-1`, then the following symbolic constants shall be defined by the implementation to have the value 200809L:

```
_POSIX_MEMLOCK
_POSIX_MEMLOCK_RANGE
_POSIX_MESSAGE_PASSING
_POSIX_PRIORITY_SCHEDULING
_POSIX_SHARED_MEMORY_OBJECTS
_POSIX_SYNCHRONIZED_IO
```

The functionality associated with `_POSIX_FSYNC` shall always be supported on XSI-conformant systems.

Support of `_POSIX_PRIORITIZED_IO` on XSI-conformant systems is optional. If `_POSIX_PRIORITIZED_IO` is supported, then asynchronous I/O operations performed by `aio_read()`, `aio_write()`, and `lio_listio()` shall be submitted at a priority equal to the scheduling priority equal to a base scheduling priority minus `aiocbp->aio_reqprio`. If Thread Execution Scheduling is not supported, then the base scheduling priority is that of the calling process; otherwise, the base scheduling priority is that of the calling thread. The implementation shall also document for which files I/O prioritization is supported.

### Advanced Realtime

An implementation that claims conformance to this Option Group shall also support the Realtime Option Group.

Where entire functions are included in the Option Group, the NAME section is marked with **ADVANCED REALTIME**. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within POSIX.1-2008.

This Option Group consists of the set of the following options from within POSIX.1-2008 (see [Section 2.1.6](#), on page 26):

```
_POSIX_ADVISORY_INFO
_POSIX_CPUTIME
_POSIX_MONOTONIC_CLOCK
_POSIX_SPAWN
_POSIX_SPORADIC_SERVER
_POSIX_TYPED_MEMORY_OBJECTS
```

If the implementation supports the Advanced Realtime Option Group, then the following symbolic constants shall be defined by the implementation to have the value 200809L:

824        \_POSIX\_ADVISORY\_INFO  
 825        \_POSIX\_CPUTIME  
 826        \_POSIX\_MONOTONIC\_CLOCK  
 827        \_POSIX\_SPAWN  
 828        \_POSIX\_SPORADIC\_SERVER  
 829        \_POSIX\_TYPED\_MEMORY\_OBJECTS

830        If the symbolic constant \_POSIX\_SPORADIC\_SERVER is defined, then the symbolic constant  
 831        \_POSIX\_PRIORITY\_SCHEDULING shall also be defined by the implementation to have the  
 832        value 200809L.

### 833        **Realtime Threads**

834        The Realtime Threads Option Group is denoted by the symbolic constant  
 835        \_XOPEN\_REALTIME\_THREADS.

836        This Option Group consists of the set of the following options from within POSIX.1-2008 (see  
 837        [Section 2.1.6](#), on page 26):

838        \_POSIX\_THREAD\_PRIO\_INHERIT  
 839        \_POSIX\_THREAD\_PRIO\_PROTECT  
 840        \_POSIX\_THREAD\_PRIORITY\_SCHEDULING  
 841        \_POSIX\_THREAD\_ROBUST\_PRIO\_INHERIT  
 842        \_POSIX\_THREAD\_ROBUST\_PRIO\_PROTECT

843        Where applicable, whole pages are marked REALTIME THREADS, together with the  
 844        appropriate option margin legend for the SYNOPSIS section (see [Section 1.7.1](#), on page 7).

845        An implementation that claims conformance to this Option Group shall set  
 846        \_XOPEN\_REALTIME\_THREADS to a value other than -1.

847        If the symbol \_XOPEN\_REALTIME\_THREADS is defined to have a value other than -1, then the  
 848        following options shall also be defined by the implementation to have the value 200809L:

849        \_POSIX\_THREAD\_PRIO\_INHERIT  
 850        \_POSIX\_THREAD\_PRIO\_PROTECT  
 851        \_POSIX\_THREAD\_PRIORITY\_SCHEDULING  
 852        \_POSIX\_THREAD\_ROBUST\_PRIO\_INHERIT  
 853        \_POSIX\_THREAD\_ROBUST\_PRIO\_PROTECT

### 854        **Advanced Realtime Threads**

855        An implementation that claims conformance to this Option Group shall also support the  
 856        Realtime Threads Option Group.

857        Where entire functions are included in the Option Group, the NAME section is marked with  
 858        ADVANCED REALTIME THREADS. Where additional semantics have been added to existing  
 859        pages, the new material is identified by use of the appropriate margin legend for the underlying  
 860        option defined within POSIX.1-2008.

861        This Option Group consists of the set of the following options from within POSIX.1-2008 (see  
 862        [Section 2.1.6](#), on page 26):

863        \_POSIX\_THREAD\_CPUTIME  
 864        \_POSIX\_THREAD\_SPORADIC\_SERVER

865        If the symbolic constant \_POSIX\_THREAD\_SPORADIC\_SERVER is defined to have the value

200809L, then the symbolic constant `_POSIX_THREAD_PRIORITY_SCHEDULING` shall also be defined by the implementation to have the value 200809L.

If the implementation supports the Advanced Realtime Threads Option Group, then the following symbolic constants shall be defined by the implementation to have the value 200809L:

```
_POSIX_THREAD_CPUTIME
_POSIX_THREAD_SPORADIC_SERVER
```

## Tracing

This Option Group includes a set of tracing functions drawn from options within POSIX.1-2008 (see [Section 2.1.6](#), on page 26).

Where entire functions are included in the Option Group, the NAME section is marked with TRACING. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within POSIX.1-2008.

This Option Group consists of the set of the following options from within POSIX.1-2008 (see [Section 2.1.6](#), on page 26):

```
_POSIX_TRACE
_POSIX_TRACE_EVENT_FILTER
_POSIX_TRACE_LOG
_POSIX_TRACE_INHERIT
```

If the implementation supports the Tracing Option Group, then the following symbolic constants shall be defined by the implementation to have the value 200809L:

```
_POSIX_TRACE
_POSIX_TRACE_EVENT_FILTER
_POSIX_TRACE_LOG
_POSIX_TRACE_INHERIT
```

## XSI STREAMS

OB XSR This section describes the XSI STREAMS Option Group, denoted by the symbolic constant `_XOPEN_STREAMS`. The functionality described in this section shall be provided on implementations that support the XSI STREAMS option (and the rest of this section is not further shaded).

This Option Group includes functionality related to STREAMS, a uniform mechanism for implementing networking services and other character-based I/O as described in XSH [Section 2.6](#) (on page 500).

It includes the following functions:

```
fattach()      ioctl()
fdetach()      isastream()
getmsg()       putmsg()
getpmsg()      putpmsg()
```

and the `<stropts.h>` header.

Where applicable, whole pages are marked STREAMS, together with the appropriate option margin legend for the SYNOPSIS section (see [Section 1.7.1](#), on page 7). Where additional semantics have been added to existing pages, the new material is identified by use of the

appropriate margin legend for the underlying option defined within POSIX.1-2008.

An implementation that claims conformance to this Option Group shall set `_XOPEN_STREAMS` to a value other than `-1`.

## 2.1.6 Options

The symbolic constants defined in `<unistd.h>`, [Constants for Options and Option Groups](#) (on page 433) reflect implementation options for POSIX.1-2008. These symbols can be used by the application to determine which of three categories of support for optional facilities are provided by the implementation.

### 1. Option not supported for compilation.

The implementation advertises at compile time (by defining the constant in `<unistd.h>` with value `-1`, or by leaving it undefined) that the option is not supported for compilation and, at the time of compilation, is not supported for runtime use. In this case, the headers, data types, function interfaces, and utilities required only for the option need not be present. A later runtime check using the `fpathconf()`, `pathconf()`, or `sysconf` functions defined in the System Interfaces volume of POSIX.1-2008 or the `getconf` utility defined in the Shell and Utilities volume of POSIX.1-2008 can in some circumstances indicate that the option is supported at runtime. (For example, an old application binary might be run on a newer implementation to which support for the option has been added.)

### 2. Option always supported.

The implementation advertises at compile time (by defining the constant in `<unistd.h>` with a value greater than zero) that the option is supported both for compilation and for use at runtime. In this case, all headers, data types, function interfaces, and utilities required only for the option shall be available and shall operate as specified. Runtime checks with `fpathconf()`, `pathconf()`, or `sysconf` shall indicate that the option is supported.

### 3. Option might or might not be supported at runtime.

The implementation advertises at compile time (by defining the constant in `<unistd.h>` with value zero) that the option is supported for compilation and might or might not be supported at runtime. In this case, the `fpathconf()`, `pathconf()`, or `sysconf()` functions defined in the System Interfaces volume of POSIX.1-2008 or the `getconf` utility defined in the Shell and Utilities volume of POSIX.1-2008 can be used to retrieve the value of each symbol on each specific implementation to determine whether the option is supported at runtime. All headers, data types, and function interfaces required to compile and execute applications which use the option at runtime (after checking at runtime that the option is supported) shall be provided, but if the option is not supported at runtime they need not operate as specified. Utilities or other facilities required only for the option, but not needed to compile and execute such applications, need not be present.

If an option is not supported for compilation, an application that attempts to use anything associated only with the option is considered to be requiring an extension. Unless explicitly specified otherwise, the behavior of functions associated with an option that is not supported at runtime is unspecified, and an application that uses such functions without first checking `fpathconf()`, `pathconf()`, or `sysconf` is considered to be requiring an extension.

Margin codes are defined for each option (see [Section 1.7.1](#), on page 7).

## 950 2.1.6.1 System Interfaces

951 Refer to **<unistd.h>**, **Constants for Options and Option Groups** (on page 433) for the list of  
 952 options.

## 953 2.1.6.2 Shell and Utilities

954 Each of these symbols shall be considered valid names by the implementation. Refer to  
 955 **<unistd.h>**, **Constants for Options and Option Groups** (on page 433).

956 The literal names shown below apply only to the *getconf* utility.

## 957 CD POSIX2\_C\_DEV

958 The system supports the C-Language Development Utilities option.

959 The utilities in the C-Language Development Utilities option are used for the development  
 960 of C-language applications, including compilation or translation of C source code and  
 961 complex program generators for simple lexical tasks and processing of context-free  
 962 grammars.

963 The utilities listed below may be provided by a conforming system; however, any system  
 964 claiming conformance to the C-Language Development Utilities option shall provide all of  
 965 the utilities listed.

966 *c99*  
 967 *lex*  
 968 *yacc*

## 969 POSIX2\_CHAR\_TERM

970 The system supports the Terminal Characteristics option. This value need not be present on  
 971 a system not supporting the User Portability Utilities option.

972 Where applicable, the dependency is noted within the description of the utility.

973 This option applies only to systems supporting the User Portability Utilities option. If  
 974 supported, then the system supports at least one terminal type capable of all operations  
 975 described in POSIX.1-2008; see **Section 10.2** (on page 198).

## 976 FD POSIX2\_FORT\_DEV

977 The system supports the FORTRAN Development Utilities option.

978 The *fort77* FORTRAN compiler is the only utility in the FORTRAN Development Utilities  
 979 option. This is used for the development of FORTRAN language applications, including  
 980 compilation or translation of FORTRAN source code.

981 The *fort77* utility may be provided by a conforming system; however, any system claiming  
 982 conformance to the FORTRAN Development Utilities option shall provide the *fort77* utility.

## 983 FR POSIX2\_FORT\_RUN

984 The system supports the FORTRAN Runtime Utilities option.

985 The *asa* utility is the only utility in the FORTRAN Runtime Utilities option.

986 The *asa* utility may be provided by a conforming system; however, any system claiming  
 987 conformance to the FORTRAN Runtime Utilities option shall provide the *asa* utility.

## 988 POSIX2\_LOCALEDEF

989 The system supports the Locale Creation Utilities option.

990 If supported, the system supports the creation of locales as described in the *localedef* utility.

991 The *localedef* utility may be provided by a conforming system; however, any system  
 992 claiming conformance to the Locale Creation Utilities option shall provide the *localedef*  
 993 utility.

#### 994 OB BE POSIX2\_PBS

995 The system supports the Batch Environment Services and Utilities option (see XCU [Chapter](#)  
 996 [3](#), on page 2417).

997 **Note:** The Batch Environment Services and Utilities option is a combination of mandatory and  
 998 optional batch services and utilities. The POSIX2\_PBS symbolic constant implies the system  
 999 supports all the mandatory batch services and utilities.

#### 1000 POSIX2\_PBS\_ACCOUNTING

1001 The system supports the Batch Accounting option.

#### 1002 POSIX2\_PBS\_CHECKPOINT

1003 The system supports the Batch Checkpoint/Restart option.

#### 1004 POSIX2\_PBS\_LOCATE

1005 The system supports the Locate Batch Job Request option.

#### 1006 POSIX2\_PBS\_MESSAGE

1007 The system supports the Batch Job Message Request option.

#### 1008 POSIX2\_PBS\_TRACK

1009 The system supports the Track Batch Job Request option.

#### 1010 SD POSIX2\_SW\_DEV

1011 The system supports the Software Development Utilities option.

1012 The utilities in the Software Development Utilities option are used for the development of  
 1013 applications, including compilation or translation of source code, the creation and  
 1014 maintenance of library archives, and the maintenance of groups of inter-dependent  
 1015 programs.

1016 The utilities listed below may be provided by the conforming system; however, any system  
 1017 claiming conformance to the Software Development Utilities option shall provide all of the  
 1018 utilities listed here.

1019 *ar*  
 1020 *make*  
 1021 *nm*  
 1022 *strip*

#### 1023 UP POSIX2\_UPE

1024 The system supports the User Portability Utilities option.

1025 The utilities in the User Portability Utilities option shall be implemented on all systems that  
 1026 claim conformance to this option, except for the *vi* utility which is noted as having features  
 1027 that cannot be implemented on all terminal types; if the POSIX2\_CHAR\_TERM option is  
 1028 supported, the system shall support all such features on at least one terminal type; see  
 1029 [Section 10.2](#) (on page 198).

1030 The list of utilities in the User Portability Utilities option is as follows:

1031 *bg* *fc* *jobs* *talk*  
 1032 *ex* *fg* *more* *vi*

1033	XSI	XOPEN_UNIX
1034		The system supports the X/Open System Interfaces (XSI) option (see <a href="#">Section 2.1.4</a> , on page
1035		19).
1036	UU	XOPEN_UUCP
1037		The system supports the UUCP Utilities option.
1038		The list of utilities in the UUCP Utilities option is as follows:
1039		<i>uucp</i>
1040		<i>uustat</i>
1041		<i>uux</i>

## 1042 2.2 Application Conformance

1043 For the purposes of POSIX.1-2008, the application conformance requirements given in this  
1044 section apply.

1045 All applications claiming conformance to POSIX.1-2008 shall use only language-dependent  
1046 services for the C programming language described in [Section 2.3](#) (on page 31), shall use only  
1047 the utilities and facilities defined in the Shell and Utilities volume of POSIX.1-2008, and shall fall  
1048 within one of the following categories.

### 1049 2.2.1 Strictly Conforming POSIX Application

1050 A Strictly Conforming POSIX Application is an application that requires only the facilities  
1051 described in POSIX.1-2008. Such an application:

- 1052 1. Shall accept any implementation behavior that results from actions it takes in areas  
1053 described in POSIX.1-2008 as *implementation-defined* or *unspecified*, or where POSIX.1-2008  
1054 indicates that implementations may vary
- 1055 2. Shall not perform any actions that are described as producing *undefined* results
- 1056 3. For symbolic constants, shall accept any value in the range permitted by POSIX.1-2008,  
1057 but shall not rely on any value in the range being greater than the minimums listed or  
1058 being less than the maximums listed in POSIX.1-2008
- 1059 4. Shall not use facilities designated as *obsolescent*
- 1060 5. Is required to tolerate and permitted to adapt to the presence or absence of optional  
1061 facilities whose availability is indicated by [Section 2.1.3](#) (on page 17)
- 1062 6. For the C programming language, shall not produce any output dependent on any  
1063 behavior described in the ISO/IEC 9899:1999 standard as *unspecified*, *undefined*, or  
1064 *implementation-defined*, unless the System Interfaces volume of POSIX.1-2008 specifies the  
1065 behavior
- 1066 7. For the C programming language, shall not exceed any minimum implementation limit  
1067 defined in the ISO/IEC 9899:1999 standard, unless the System Interfaces volume of  
1068 POSIX.1-2008 specifies a higher minimum implementation limit
- 1069 8. For the C programming language, shall define `_POSIX_C_SOURCE` to be 200809L before  
1070 any header is included

1071 Within POSIX.1-2008, any restrictions placed upon a Conforming POSIX Application shall

restrict a Strictly Conforming POSIX Application.

## 2.2.2 Conforming POSIX Application

### 2.2.2.1 ISO/IEC Conforming POSIX Application

An ISO/IEC Conforming POSIX Application is an application that uses only the facilities described in POSIX.1-2008 and approved Conforming Language bindings for any ISO or IEC standard. Such an application shall include a statement of conformance that documents all options and limit dependencies, and all other ISO or IEC standards used.

### 2.2.2.2 <National Body> Conforming POSIX Application

A <National Body> Conforming POSIX Application differs from an ISO/IEC Conforming POSIX Application in that it also may use specific standards of a single ISO/IEC member body referred to here as <National Body>. Such an application shall include a statement of conformance that documents all options and limit dependencies, and all other <National Body> standards used.

## 2.2.3 Conforming POSIX Application Using Extensions

A Conforming POSIX Application Using Extensions is an application that differs from a Conforming POSIX Application only in that it uses non-standard facilities that are consistent with POSIX.1-2008. Such an application shall fully document its requirements for these extended facilities, in addition to the documentation required of a Conforming POSIX Application. A Conforming POSIX Application Using Extensions shall be either an ISO/IEC Conforming POSIX Application Using Extensions or a <National Body> Conforming POSIX Application Using Extensions (see [Section 2.2.2.1](#) and [Section 2.2.2.2](#)).

## 2.2.4 Strictly Conforming XSI Application

A Strictly Conforming XSI Application is an application that requires only the facilities described in POSIX.1-2008. Such an application:

1. Shall accept any implementation behavior that results from actions it takes in areas described in POSIX.1-2008 as *implementation-defined* or *unspecified*, or where POSIX.1-2008 indicates that implementations may vary
2. Shall not perform any actions that are described as producing *undefined* results
3. For symbolic constants, shall accept any value in the range permitted by POSIX.1-2008, but shall not rely on any value in the range being greater than the minimums listed or being less than the maximums listed in POSIX.1-2008
4. Shall not use facilities designated as *obsolescent*
5. Is required to tolerate and permitted to adapt to the presence or absence of optional facilities whose availability is indicated by [Section 2.1.4](#) (on page 19)

6. For the C programming language, shall not produce any output dependent on any behavior described in the ISO C standard as *unspecified*, *undefined*, or *implementation-defined*, unless the System Interfaces volume of POSIX.1-2008 specifies the behavior
7. For the C programming language, shall not exceed any minimum implementation limit defined in the ISO C standard, unless the System Interfaces volume of POSIX.1-2008 specifies a higher minimum implementation limit
8. For the C programming language, shall define `_XOPEN_SOURCE` to be 700 before any header is included

Within POSIX.1-2008, any restrictions placed upon a Conforming POSIX Application shall restrict a Strictly Conforming XSI Application.

### 2.2.5 Conforming XSI Application Using Extensions

A Conforming XSI Application Using Extensions is an application that differs from a Strictly Conforming XSI Application only in that it uses non-standard facilities that are consistent with POSIX.1-2008. Such an application shall fully document its requirements for these extended facilities, in addition to the documentation required of a Strictly Conforming XSI Application.

## 2.3 Language-Dependent Services for the C Programming Language

Implementors seeking to claim conformance using the ISO C standard shall claim POSIX conformance as described in [Section 2.1.3](#) (on page 17).

## 2.4 Other Language-Related Specifications

POSIX.1-2008 is currently specified in terms of the shell command language and ISO C. Bindings to other programming languages are being developed.

If conformance to POSIX.1-2008 is claimed for implementation of any programming language, the implementation of that language shall support the use of external symbols distinct to at least 31 bytes in length in the source program text. (That is, identifiers that differ at or before the thirty-first byte shall be distinct.) If a national or international standard governing a language defines a maximum length that is less than this value, the language-defined maximum shall be supported. External symbols that differ only by case shall be distinct when the character set in use distinguishes uppercase and lowercase characters and the language permits (or requires) uppercase and lowercase characters to be distinct in external symbols.

Chapter 3

## Definitions

For the purposes of POSIX.1-2008, the following terms and definitions apply. The Authoritative Dictionary of IEEE Standards Terms, Seventh Edition should be referenced for terms not defined in this section.

**Note:** No shading to denote extensions or options occurs in this chapter. Where the terms and definitions given in this chapter are used elsewhere in text related to extensions and options, they are shaded as appropriate.

### 3.1 Abortive Release

An abrupt termination of a network connection that may result in the loss of data.

### 3.2 Absolute Pathname

A pathname beginning with a single or more than two <slash> characters; see also [Section 3.271](#) (on page 76).

**Note:** Pathname Resolution is defined in detail in [Section 4.13](#) (on page 111).

### 3.3 Access Mode

A particular form of access permitted to a file.

### 3.4 Additional File Access Control Mechanism

An implementation-defined mechanism that is layered upon the access control mechanisms defined here, but which do not grant permissions beyond those defined herein, although they may further restrict them.

**Note:** File Access Permissions are defined in detail in [Section 4.5](#) (on page 108).

### 3.5 Address Space

The memory locations that can be referenced by a process or the threads of a process.

### 3.6 Advisory Information

An interface that advises the implementation on (portable) application behavior so that it can optimize the system.

### 3.7 Affirmative Response

An input string that matches one of the responses acceptable to the *LC\_MESSAGES* category keyword **yesexpr**, matching an extended regular expression in the current locale.

**Note:** The *LC\_MESSAGES* category is defined in detail in [Section 7.3.6](#) (on page 165).

### 3.8 Alert

To cause the user's terminal to give some audible or visual indication that an error or some other event has occurred. When the standard output is directed to a terminal device, the method for alerting the terminal user is unspecified. When the standard output is not directed to a terminal device, the alert is accomplished by writing the alert to standard output (unless the utility description indicates that the use of standard output produces undefined results in this case).

### 3.9 Alert Character (<alert>)

A character that in the output stream should cause a terminal to alert its user via a visual or audible notification. It is the character designated by '`\a`' in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the alert function.

### 3.10 Alias Name

In the shell command language, a word consisting solely of underscores, digits, and alphabetic characters from the portable character set and any of the following characters: '`!`', '`%`', '`'`', '`,`', '`@`'.

Implementations may allow other characters within alias names as an extension.

**Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

### 3.11 Alignment

A requirement that objects of a particular type be located on storage boundaries with addresses that are particular multiples of a byte address.

**Note:** See also the ISO C standard, Section B3.

### 3.12 Alternate File Access Control Mechanism

An implementation-defined mechanism that is independent of the access control mechanisms defined herein, and which if enabled on a file may either restrict or extend the permissions of a given user. POSIX.1-2008 defines when such mechanisms can be enabled and when they are disabled.

**Note:** File Access Permissions are defined in detail in [Section 4.5](#) (on page 108).

### 3.13 Alternate Signal Stack

Memory associated with a thread, established upon request by the implementation for a thread, separate from the thread signal stack, in which signal handlers responding to signals sent to that thread may be executed.

### 3.14 Ancillary Data

Protocol-specific, local system-specific, or optional information. The information can be both local or end-to-end significant, header information, part of a data portion, protocol-specific, and implementation or system-specific.

### 3.15 Angle Brackets

The characters '`<`' (left-angle-bracket) and '`>`' (right-angle-bracket). When used in the phrase "enclosed in angle brackets", the symbol '`<`' immediately precedes the object to be enclosed, and '`>`' immediately follows it. When describing these characters in the portable character set, the names `<less-than-sign>` and `<greater-than-sign>` are used.

### 3.16 Apostrophe Character (<apostrophe>)

The character designated by '`\'`' in the C language, also known as the single-quote character.

### 3.17 Application

A computer program that performs some desired function.

1208 When the User Portability Utilities option is supported, requirements placed on applications +  
 1209 relating to the use of standard utilities shall also apply to the actions of a user who is entering +  
 1210 shell command language statements into an interactive shell.

### 1211 3.18 Application Address

1212 Endpoint address of a specific application.

### 1213 3.19 Application Program Interface (API)

1214 The definition of syntax and semantics for providing computer system services.

### 1215 3.20 Appropriate Privileges

1216 An implementation-defined means of associating privileges with a process with regard to the  
 1217 function calls, function call options, and the commands that need special privileges. There may  
 1218 be zero or more such means. These means (or lack thereof) are described in the conformance  
 1219 document.

1220 **Note:** Function calls are defined in the System Interfaces volume of POSIX.1-2008, and commands are  
 1221 defined in the Shell and Utilities volume of POSIX.1-2008.

### 1222 3.21 Argument

1223 In the shell command language, a parameter passed to a utility as the equivalent of a single  
 1224 string in the *argv* array created by one of the *exec* functions. An argument is one of the options,  
 1225 option-arguments, or operands following the command name.

1226 **Note:** The Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213) and XCU [Section](#)  
 1227 [2.9.1.1](#) (on page 2357).

1228 In the C language, an expression in a function call expression or a sequence of preprocessing  
 1229 tokens in a function-like macro invocation.

### 1230 3.22 Arm (a Timer)

1231 To start a timer measuring the passage of time, enabling notifying a process when the specified  
 1232 time or time interval has passed.

### 1233 3.23 Asterisk Character (<asterisk>)

1234 The character ' \* '.

### 3.24 Async-Cancel-Safe Function

A function that may be safely invoked by an application while the asynchronous form of cancellation is enabled. No function is async-cancel-safe unless explicitly described as such.

### 3.25 Asynchronous Events

Events that occur independently of the execution of the application.

### 3.26 Asynchronous Input and Output

A functionality enhancement to allow an application process to queue data input and output commands with asynchronous notification of completion.

### 3.27 Async-Signal-Safe Function

A function that can be called, without restriction, from signal-catching functions. Note that, although there is no restriction on the calls themselves, for certain functions there are restrictions on subsequent behavior after the function is called from a signal-catching function. No function is async-signal-safe unless explicitly described as such.

**Note:** Async-signal-safety is defined in detail in XSH [Section 2.4.3](#) (on page 490).

### 3.28 Asynchronously-Generated Signal

A signal that is not attributable to a specific thread. Examples are signals sent via *kill()*, signals sent from the keyboard, and signals delivered to process groups. Being asynchronous is a property of how the signal was generated and not a property of the signal number. All signals may be generated asynchronously.

**Note:** The *kill()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.29 Asynchronous I/O Completion

For an asynchronous read or write operation, when a corresponding synchronous read or write would have completed and when any associated status fields have been updated.

### 3.30 Asynchronous I/O Operation

An I/O operation that does not of itself cause the thread requesting the I/O to be blocked from further use of the processor.

1261 This implies that the process and the I/O operation may be running concurrently.

### 1262 **3.31 Authentication**

1263 The process of validating a user or process to verify that the user or process is not a counterfeit.

### 1264 **3.32 Authorization**

1265 The process of verifying that a user or process has permission to use a resource in the manner  
1266 requested.

1267 To ensure security, the user or process would also need to be authenticated before granting  
1268 access.

### 1269 **3.33 Background Job**

1270 See *Background Process Group* in [Section 3.35](#).

### 1271 **3.34 Background Process**

1272 A process that is a member of a background process group.

### 1273 **3.35 Background Process Group (or Background Job)**

1274 Any process group, other than a foreground process group, that is a member of a session that  
1275 has established a connection with a controlling terminal.

### 1276 **3.36 Backquote Character**

1277 The character ' ` ', also known as <grave-accent>.

### 1278 **3.37 Backslash Character (<backslash>)**

1279 The character designated by ' \\ ' in the C language, also known as reverse solidus.

### 3.38 Backspace Character (<backspace>)

A character that, in the output stream, should cause printing (or displaying) to occur one column position previous to the position about to be printed. If the position about to be printed is at the beginning of the current line, the behavior is unspecified. It is the character designated by '`\b`' in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the backspace function. The backspace defined here is not necessarily the ERASE special character.

**Note:** Special Characters are defined in detail in [Section 11.1.9](#) (on page 204).

### 3.39 Barrier

A synchronization object that allows multiple threads to synchronize at a particular point in their execution.

### 3.40 Basename

For pathnames containing at least one filename: the final, or only, filename in the pathname. For pathnames consisting only of <slash> characters: either '`/`' or '`/"`' if the pathname consists of exactly two <slash> characters, and '`/`' otherwise.

### 3.41 Basic Regular Expression (BRE)

A regular expression (see [Section 3.321](#), on page 85) used by the majority of utilities that select strings from a set of character strings.

**Note:** Basic Regular Expressions are described in detail in [Section 9.3](#) (on page 183).

### 3.42 Batch Access List

A list of user IDs and group IDs of those users and groups authorized to place batch jobs in a batch queue.

A batch access list is associated with a batch queue. A batch server uses the batch access list of a batch queue as one of the criteria in deciding to put a batch job in a batch queue.

### 3.43 Batch Administrator

A user that is authorized to modify all the attributes of queues and jobs and to change the status of a batch server.

### 3.44 Batch Client

A computational entity that utilizes batch services by making requests of batch servers.

Batch clients often provide the means by which users access batch services, although a batch server may act as a batch client by virtue of making requests of another batch server.

### 3.45 Batch Destination

The batch server in a batch system to which a batch job should be sent for processing.

Acceptance of a batch job at a batch destination is the responsibility of a receiving batch server. A batch destination may consist of a batch server-specific portion, a network-wide portion, or both. The batch server-specific portion is referred to as the “batch queue”. The network-wide portion is referred to as a “batch server name”.

### 3.46 Batch Destination Identifier

A string that identifies a specific batch destination.

A string of characters in the portable character set used to specify a particular batch destination.

**Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

### 3.47 Batch Directive

A line from a file that is interpreted by the batch server. The line is usually in the form of a comment and is an additional means of passing options to the *qsub* utility.

**Note:** The *qsub* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

### 3.48 Batch Job

A set of computational tasks for a computing system.

Batch jobs are managed by batch servers.

Once created, a batch job may be executing or pending execution. A batch job that is executing has an associated session leader (a process) that initiates and monitors the computational tasks of the batch job.

### 3.49 Batch Job Attribute

A named data type whose value affects the processing of a batch job.

The values of the attributes of a batch job affect the processing of that job by the batch server that manages the batch job.

### 3.50 Batch Job Identifier

A unique name for a batch job. A name that is unique among all other batch job identifiers in a batch system and that identifies the batch server to which the batch job was originally submitted.

### 3.51 Batch Job Name

A label that is an attribute of a batch job. The batch job name is not necessarily unique.

### 3.52 Batch Job Owner

The *username@hostname* of the user submitting the batch job, where *username* is a user name (see also [Section 3.437](#), on page 103) and *hostname* is a network host name.

### 3.53 Batch Job Priority

A value specified by the user that may be used by an implementation to determine the order in which batch jobs are selected to be executed. Job priority has a numeric value in the range -1 024 to 1 023.

**Note:** The batch job priority is not the execution priority (nice value) of the batch job.

### 3.54 Batch Job State

An attribute of a batch job which determines the types of requests that the batch server that manages the batch job can accept for the batch job. Valid states include QUEUED, RUNNING, HELD, WAITING, EXITING, and TRANSITING.

### 3.55 Batch Name Service

A service that assigns batch names that are unique within the batch name space, and that can translate a unique batch name into the location of the named batch entity.

**3.56 Batch Name Space**

The environment within which a batch name is known to be unique.

**3.57 Batch Node**

A host containing part or all of a batch system.

A batch node is a host meeting at least one of the following conditions:

- Capable of executing a batch client
- Contains a routing batch queue
- Contains an execution batch queue

**3.58 Batch Operator**

A user that is authorized to modify some, but not all, of the attributes of jobs and queues, and may change the status of the batch server.

**3.59 Batch Queue**

A manageable object that represents a set of batch jobs and is managed by a single batch server.

**Note:** A set of batch jobs is called a batch queue largely for historical reasons. Jobs are selected from the batch queue for execution based on attributes such as priority, resource requirements, and hold conditions.

See also XCU [Section 3.1.2](#) (on page 2418).

**3.60 Batch Queue Attribute**

A named data type whose value affects the processing of all batch jobs that are members of the batch queue.

A batch queue has attributes that affect the processing of batch jobs that are members of the batch queue.

**3.61 Batch Queue Position**

The place, relative to other jobs in the batch queue, occupied by a particular job in a batch queue. This is defined in part by submission time and priority; see also [Section 3.62](#) (on page 43).

### 3.62 Batch Queue Priority

The maximum job priority allowed for any batch job in a given batch queue.

The batch queue priority is set and may be changed by users with appropriate privileges. The priority is bounded in an implementation-defined manner.

### 3.63 Batch Rerunability

An attribute of a batch job indicating that it may be rerun after an abnormal termination from the beginning without affecting the validity of the results.

### 3.64 Batch Restart

The action of resuming the processing of a batch job from the point of the last checkpoint. Typically, this is done if the batch job has been interrupted because of a system failure.

### 3.65 Batch Server

A computational entity that provides batch services.

### 3.66 Batch Server Name

A string of characters in the portable character set used to specify a particular server in a network.

**Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

### 3.67 Batch Service

Computational and organizational services performed by a batch system on behalf of batch jobs.

Batch services are of two types: requested and deferred.

**Note:** Batch Services are listed in XCU [Table 3-5](#) (on page 2432).

### 3.68 Batch Service Request

A solicitation of services from a batch client to a batch server.

A batch service request may entail the exchange of any number of messages between the batch client and the batch server.

When naming specific types of service requests, the term “request” is qualified by the type of

1406 request, as in *Queue Batch Job Request* and *Delete Batch Job Request*.

### 1407 **3.69 Batch Submission**

1408 The process by which a batch client requests that a batch server create a batch job via a *Queue Job*  
1409 *Request* to perform a specified computational task.

### 1410 **3.70 Batch System**

1411 A collection of one or more batch servers.

### 1412 **3.71 Batch Target User**

1413 The name of a user on the batch destination batch server.

1414 The target user is the user name under whose account the batch job is to execute on the  
1415 destination batch server.

### 1416 **3.72 Batch User**

1417 A user who is authorized to make use of batch services.

### 1418 **3.73 Bind**

1419 The process of assigning a network address to an endpoint.

### 1420 **3.74 Blank Character (<blank>)**

1421 One of the characters that belong to the **blank** character class as defined via the *LC\_CTYPE*  
1422 category in the current locale. In the POSIX locale, a <blank> character is either a <tab> or a  
1423 <space>.

### 1424 **3.75 Blank Line**

1425 A line consisting solely of zero or more <blank> characters terminated by a <newline>; see also  
1426 [Section 3.145](#) (on page 56).

### 3.76 Blocked Process (or Thread)

A process (or thread) that is waiting for some condition (other than the availability of a processor) to be satisfied before it can continue execution.

### 3.77 Blocking

A property of an open file description that causes function calls associated with it to wait for the requested action to be performed before returning.

### 3.78 Block-Mode Terminal

A terminal device operating in a mode incapable of the character-at-a-time input and output operations described by some of the standard utilities.

**Note:** Output Devices and Terminal Types are defined in detail in [Section 10.2](#) (on page 198).

### 3.79 Block Special File

A file that refers to a device. A block special file is normally distinguished from a character special file by providing access to the device in a manner such that the hardware characteristics of the device are not visible.

### 3.80 Braces

The characters ' { ' (left-curly-bracket) and ' } ' (right-curly-bracket). When used in the phrase "enclosed in (curly) braces" the symbol ' { ' immediately precedes the object to be enclosed, and ' } ' immediately follows it. When describing these characters in the portable character set, the names <left-curly-bracket> and <left-brace> are used for ' { ', and <right-curly-bracket> and <right-brace> are used for ' } '.

### 3.81 Brackets

The characters '[' (left-square-bracket) and ']' (right-square-bracket). When used in the phrase “enclosed in (square) brackets” the symbol '[' immediately precedes the object to be enclosed, and ']' immediately follows it. When describing these characters in the portable character set, the names <left-square-bracket> and <right-square-bracket> are used.

### 3.82 Broadcast

The transfer of data from one endpoint to several endpoints, as described in RFC 919 and RFC 922.

### 3.83 Built-In Utility (or Built-In)

A utility implemented within a shell. The utilities referred to as special built-ins have special qualities. Unless qualified, the term “built-in” includes the special built-in utilities. Regular built-ins are not required to be actually built into the shell on the implementation, but they do have special command-search qualities.

**Note:** Special Built-In Utilities are defined in detail in XCU [Section 2.14](#) (on page 2374).

Regular Built-In Utilities are defined in detail in XCU [Section 2.9.1.1](#) (on page 2357).

### 3.84 Byte

An individually addressable unit of data storage that is exactly an octet, used to store a character or a portion of a character; see also [Section 3.87](#) (on page 47). A byte is composed of a contiguous sequence of 8 bits. The least significant bit is called the “low-order” bit; the most significant is called the “high-order” bit.

**Note:** The definition of byte from the ISO C standard is broader than the above and might accommodate hardware architectures with different sized addressable units than octets.

### 3.85 Byte Input/Output Functions

The functions that perform byte-oriented input from streams or byte-oriented output to streams: *fgetc()*, *fgets()*, *fprintf()*, *fputc()*, *fputs()*, *fread()*, *fscanf()*, *fwrite()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, *printf()*, *putc()*, *putchar()*, *puts()*, *scanf()*, *ungetc()*, *vfprintf()*, and *vprintf()*.

**Note:** Functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.86 Carriage-Return Character (<carriage-return>)

A character that in the output stream indicates that printing should start at the beginning of the

1476 same physical line in which the carriage-return occurred. It is the character designated by '`\r`'  
 1477 in the C language. It is unspecified whether this character is the exact sequence transmitted to an  
 1478 output device by the system to accomplish the movement to the beginning of the line.

### 1479 3.87 Character

1480 A sequence of one or more bytes representing a single graphic symbol or control code.

1481 **Note:** This term corresponds to the ISO C standard term multi-byte character, where a single-byte  
 1482 character is a special case of a multi-byte character. Unlike the usage in the ISO C standard,  
 1483 *character* here has no necessary relationship with storage space, and *byte* is used when storage  
 1484 space is discussed.

1485 See the definition of the portable character set in [Section 6.1](#) (on page 125) for a further  
 1486 explanation of the graphical representations of (abstract) characters, as opposed to character  
 1487 encodings.

### 1488 3.88 Character Array

1489 An array of elements of type **char**.

### 1490 3.89 Character Class

1491 A named set of characters sharing an attribute associated with the name of the class. The classes  
 1492 and the characters that they contain are dependent on the value of the *LC\_CTYPE* category in  
 1493 the current locale.

1494 **Note:** The *LC\_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 139).

### 1495 3.90 Character Set

1496 A finite set of different characters used for the representation, organization, or control of data.

**3.91 Character Special File**

A file that refers to a device (such as a terminal device file) or that has special properties (such as `/dev/null`).

**Note:** The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 199).

**3.92 Character String**

A contiguous sequence of characters terminated by and including the first null byte.

**3.93 Child Process**

A new process created (by `fork()`, `posix_spawn()`, or `posix_spawnp()`) by a given process. A child process remains the child of the creating process as long as both processes continue to exist.

**Note:** The `fork()`, `posix_spawn()`, and `posix_spawnp()` functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

**3.94 Circumflex Character (<circumflex>)**

The character `' ^ '`.

**3.95 Clock**

A software or hardware object that can be used to measure the apparent or actual passage of time.

The current value of the time measured by a clock can be queried and, possibly, set to a value within the legal range of the clock.

**3.96 Clock Jump**

The difference between two successive distinct values of a clock, as observed from the application via one of the “get time” operations.

**3.97 Clock Tick**

An interval of time; an implementation-defined number of these occur each second. Clock ticks are one of the units that may be used to express a value found in type `clock_t`.

### 3.98 Coded Character Set

A set of unambiguous rules that establishes a character set and the one-to-one relationship between each character of the set and its bit representation.

### 3.99 Codeset

The result of applying rules that map a numeric code value to each element of a character set. An element of a character set may be related to more than one numeric code value but the reverse is not true. However, for state-dependent encodings the relationship between numeric code values and elements of a character set may be further controlled by state information. The character set may contain fewer elements than the total number of possible numeric code values; that is, some code values may be unassigned.

**Note:** Character Encoding is defined in detail in [Section 6.2](#) (on page 128).

### 3.100 Collating Element

The smallest entity used to determine the logical ordering of character or wide-character strings; see also [Section 3.102](#). A collating element consists of either a single character, or two or more characters collating as a single entity. The value of the `LC_COLLATE` category in the current locale determines the current set of collating elements.

### 3.101 Collation

The logical ordering of character or wide-character strings according to defined precedence rules. These rules identify a collation sequence between the collating elements, and such additional rules that can be used to order strings consisting of multiple collating elements.

### 3.102 Collation Sequence

The relative order of collating elements as determined by the setting of the `LC_COLLATE` category in the current locale. The collation sequence is used for sorting and is determined from the collating weights assigned to each collating element. In the absence of weights, the collation sequence is the order in which collating elements are specified between **order\_start** and **order\_end** keywords in the `LC_COLLATE` category.

Multi-level sorting is accomplished by assigning elements one or more collation weights, up to the limit `{COLL_WEIGHTS_MAX}`. On each level, elements may be given the same weight (at the primary level, called an equivalence class; see also [Section 3.151](#), on page 57) or be omitted from the sequence. Strings that collate equally using the first assigned weight (primary ordering) are then compared using the next assigned weight (secondary ordering), and so on.

**Note:** `{COLL_WEIGHTS_MAX}` is defined in detail in [<limits.h>](#).

**3.103 Column Position**

A unit of horizontal measure related to characters in a line.

It is assumed that each character in a character set has an intrinsic column width independent of any output device. Each printable character in the portable character set has a column width of one. The standard utilities, when used as described in POSIX.1-2008, assume that all characters have integral column widths. The column width of a character is not necessarily related to the internal representation of the character (numbers of bits or bytes).

The column position of a character in a line is defined as one plus the sum of the column widths of the preceding characters in the line. Column positions are numbered starting from 1.

**3.104 Command**

A directive to the shell to perform a particular task.

**Note:** Shell Commands are defined in detail in XCU [Section 2.9](#) (on page 2355).

**3.105 Command Language Interpreter**

An interface that interprets sequences of text input as commands. It may operate on an input stream or it may interactively prompt and read commands from a terminal. It is possible for applications to invoke utilities through a number of interfaces, which are collectively considered to act as command interpreters. The most obvious of these are the *sh* utility and the *system()* function, although *popen()* and the various forms of *exec* may also be considered to behave as interpreters.

**Note:** The *sh* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

The *system()*, *popen()*, and *exec* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

**3.106 Composite Graphic Symbol**

A graphic symbol consisting of a combination of two or more other graphic symbols in a single character position, such as a diacritical mark and a base character.

**3.107 Condition Variable**

A synchronization object which allows a thread to suspend execution, repeatedly, until some associated predicate becomes true. A thread whose execution is suspended on a condition variable is said to be blocked on the condition variable.

### 3.108 Connected Socket

A connection-mode socket for which a connection has been established, or a connectionless-mode socket for which a peer address has been set. See also [Section 3.109](#), [Section 3.110](#), [Section 3.111](#), and [Section 3.356](#) (on page 91).

### 3.109 Connection

An association established between two or more endpoints for the transfer of data

### 3.110 Connection Mode

The transfer of data in the context of a connection; see also [Section 3.111](#).

### 3.111 Connectionless Mode

The transfer of data other than in the context of a connection; see also [Section 3.110](#) and [Section 3.124](#) (on page 53).

### 3.112 Control Character

A character, other than a graphic character, that affects the recording, processing, transmission, or interpretation of text.

### 3.113 Control Operator

In the shell command language, a token that performs a control function. It is one of the following symbols:

&    &&    (    )    ;    ;;    newline    |    ||

The end-of-input indicator used internally by the shell is also considered a control operator.

**Note:** Token Recognition is defined in detail in XCU [Section 2.3](#) (on page 2337).

### 3.114 Controlling Process

The session leader that established the connection to the controlling terminal. If the terminal subsequently ceases to be a controlling terminal for this session, the session leader ceases to be the controlling process.

### 3.115 Controlling Terminal

A terminal that is associated with a session. Each session may have at most one controlling terminal associated with it, and a controlling terminal is associated with exactly one session. Certain input sequences from the controlling terminal cause signals to be sent to all processes in the foreground process group associated with the controlling terminal.

**Note:** The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 199).

### 3.116 Conversion Descriptor

A per-process unique value used to identify an open codeset conversion.

### 3.117 Core File

A file of unspecified format that may be generated when a process terminates abnormally.

### 3.118 CPU Time (Execution Time)

The time spent executing a process or thread, including the time spent executing system services on behalf of that process or thread. If the Threads option is supported, then the value of the CPU-time clock for a process is implementation-defined. With this definition the sum of all the execution times of all the threads in a process might not equal the process execution time, even in a single-threaded process, because implementations may differ in how they account for time during context switches or for other reasons.

### 3.119 CPU-Time Clock

A clock that measures the execution time of a particular process or thread.

### 3.120 CPU-Time Timer

A timer attached to a CPU-time clock.

### 3.121 Current Job

In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities. There is at most one current job; see also [Section 3.204](#) (on page 66).

### 3.122 Current Working Directory

See *Working Directory* in [Section 3.447](#) (on page 105).

### 3.123 Cursor Position

The line and column position on the screen denoted by the terminal's cursor.

### 3.124 Datagram

A unit of data transferred from one endpoint to another in connectionless mode service.

### 3.125 Data Segment

Memory associated with a process, that can contain dynamically allocated data.

### 3.126 Deferred Batch Service

A service that is performed as a result of events that are asynchronous with respect to requests.

**Note:** Once a batch job has been created, it is subject to deferred services.

### 3.127 Device

A computer peripheral or an object that appears to the application as such.

### 3.128 Device ID

A non-negative integer used to identify a device.

### 3.129 Directory

A file that contains directory entries. No two directory entries in the same directory have the same name.

### 3.130 Directory Entry (or Link)

An object that associates a filename with a file. Several directory entries can associate names

1650 with the same file.

### 1651 **3.131 Directory Stream**

1652 A sequence of all the directory entries in a particular directory. An open directory stream may be  
1653 implemented using a file descriptor.

### 1654 **3.132 Disarm (a Timer)**

1655 To stop a timer from measuring the passage of time, disabling any future process notifications  
1656 (until the timer is armed again).

### 1657 **3.133 Display**

1658 To output to the user's terminal. If the output is not directed to a terminal, the results are  
1659 undefined.

### 1660 **3.134 Display Line**

1661 A line of text on a physical device or an emulation thereof. Such a line will have a maximum  
1662 number of characters which can be presented.

1663 **Note:** This may also be written as "line on the display".

### 1664 **3.135 Dollar-Sign Character (<dollar-sign>)**

1665 The character ' \$ '.

### 1666 **3.136 Dot**

1667 In the context of naming files, the filename consisting of a single <period> character ( ' . ' ).

1668 **Note:** In the context of shell special built-in utilities, see *dot* in XCU [Section 2.14](#) (on page 2374).

1669 Pathname Resolution is defined in detail in [Section 4.13](#) (on page 111).

### 3.137 Dot-Dot

The filename consisting solely of two <period> characters (" . . ").

**Note:** Pathname Resolution is defined in detail in [Section 4.13](#) (on page 111).

### 3.138 Double-Quote Character

The character ' " ', also known as <quotation-mark>.

**Note:** The “double” adjective in this term refers to the two strokes in the character glyph. POSIX.1-2008 never uses the term “double-quote” to refer to two apostrophes or quotation-marks.

### 3.139 Downshifting

The conversion of an uppercase character that has a single-character lowercase representation into this lowercase representation.

### 3.140 Driver

A module that controls data transferred to and received from devices.

**Note:** Drivers are traditionally written to be a part of the system implementation, although they are frequently written separately from the writing of the implementation. A driver may contain processor-specific code, and therefore be non-portable.

### 3.141 Effective Group ID

An attribute of a process that is used in determining various permissions, including file access permissions; see also [Section 3.189](#) (on page 63).

### 3.142 Effective User ID

An attribute of a process that is used in determining various permissions, including file access permissions; see also [Section 3.436](#) (on page 103).

### 3.143 Eight-Bit Transparency

The ability of a software component to process 8-bit characters without modifying or utilizing any part of the character in a way that is inconsistent with the rules of the current coded character set.

**3.144 Empty Directory**

A directory that contains, at most, directory entries for dot and dot-dot, and has exactly one link to it (other than its own dot entry, if one exists), in dot-dot. No other links to the directory may exist. It is unspecified whether an implementation can ever consider the root directory to be empty.

**3.145 Empty Line**

A line consisting of only a <newline>; see also [Section 3.75](#) (on page 44).

**3.146 Empty String (or Null String)**

A string whose first byte is a null byte.

**3.147 Empty Wide-Character String**

A wide-character string whose first element is a null wide-character code.

**3.148 Encoding Rule**

The rules used to convert between wide-character codes and multi-byte character codes.

**Note:** Stream Orientation and Encoding Rules are defined in detail in XSH [Section 2.5.2](#) (on page 498).

**3.149 Entire Regular Expression**

The concatenated set of one or more basic regular expressions or extended regular expressions that make up the pattern specified for string selection.

**Note:** Regular Expressions are defined in detail in [Chapter 9](#) (on page 181).

### 3.150 Epoch

The time zero hours, zero minutes, zero seconds, on January 1, 1970 Coordinated Universal Time (UTC).

**Note:** See also *Seconds Since the Epoch* defined in [Section 4.16](#) (on page 113).

### 3.151 Equivalence Class

A set of collating elements with the same primary collation weight.

Elements in an equivalence class are typically elements that naturally group together, such as all accented letters based on the same base letter.

The collation order of elements within an equivalence class is determined by the weights assigned on any subsequent levels after the primary weight.

### 3.152 Era

A locale-specific method for counting and displaying years.

**Note:** The *LC\_TIME* category is defined in detail in [Section 7.3.5](#) (on page 159).

### 3.153 Event Management

The mechanism that enables applications to register for and be made aware of external events such as data becoming available for reading.

### 3.154 Executable File

A regular file acceptable as a new process image file by the equivalent of the *exec* family of functions, and thus usable as one form of a utility. The standard utilities described as compilers can produce executable files, but other unspecified methods of producing executable files may also be provided. The internal format of an executable file is unspecified, but a conforming application cannot assume an executable file is a text file.

### 3.155 Execute

To perform command search and execution actions, as defined in the Shell and Utilities volume of POSIX.1-2008; see also [Section 3.201](#) (on page 65).

**Note:** Command Search and Execution is defined in detail in XCU [Section 2.9.1.1](#) (on page 2357).

### 3.156 Execution Time

See *CPU Time* in [Section 3.118](#) (on page 52).

### 3.157 Execution Time Monitoring

A set of execution time monitoring primitives that allow online measuring of thread and process execution times.

### 3.158 Expand

In the shell command language, when not qualified, the act of applying word expansions.

**Note:** Word Expansions are defined in detail in XCU [Section 2.6](#) (on page 2343).

### 3.159 Extended Regular Expression (ERE)

A regular expression (see also [Section 3.321](#), on page 85) that is an alternative to the Basic Regular Expression using a more extensive syntax, occasionally used by some utilities.

**Note:** Extended Regular Expressions are described in detail in [Section 9.4](#) (on page 188).

### 3.160 Extended Security Controls

Implementation-defined security controls allowed by the file access permission and appropriate privileges (see also [Section 3.20](#), on page 36) mechanisms, through which an implementation can support different security policies from those described in POSIX.1-2008.

**Note:** See also *Extended Security Controls* defined in [Section 4.4](#) (on page 108).

File Access Permissions are defined in detail in [Section 4.5](#) (on page 108).

### 3.161 Feature Test Macro

A macro used to determine whether a particular set of features is included from a header.

**Note:** See also XSH [Section 2.2](#) (on page 472).

### 3.162 Field

In the shell command language, a unit of text that is the result of parameter expansion, arithmetic expansion, command substitution, or field splitting. During command processing, the resulting fields are used as the command name and its arguments.

**Note:** Parameter Expansion is defined in detail in XCU [Section 2.6.2](#) (on page 2344).

Arithmetic Expansion is defined in detail in XCU [Section 2.6.4](#) (on page 2348).

Command Substitution is defined in detail in XCU [Section 2.6.3](#) (on page 2347).

Field Splitting is defined in detail in XCU [Section 2.6.5](#) (on page 2349).

For further information on command processing, see XCU [Section 2.9.1](#) (on page 2355).

### 3.163 FIFO Special File (or FIFO)

A type of file with the property that data written to such a file is read on a first-in-first-out basis.

**Note:** Other characteristics of FIFOs are described in the System Interfaces volume of POSIX.1-2008, *lseek()*, *open()*, *read()*, and *write()*.

### 3.164 File

An object that can be written to, or read from, or both. A file has certain attributes, including access permissions and type. File types include regular file, character special file, block special file, FIFO special file, symbolic link, socket, and directory. Other types of files may be supported by the implementation.

### 3.165 File Description

See *Open File Description* in [Section 3.258](#) (on page 74).

**3.166 File Descriptor**

A per-process unique, non-negative integer used to identify an open file for the purpose of file access. The value of a newly-created file descriptor is from zero to {OPEN\_MAX}-1. A file descriptor can have a value greater than or equal to {OPEN\_MAX} if the value of {OPEN\_MAX} has decreased (see *sysconf()*) since the file descriptor was opened. File descriptors may also be used to implement message catalog descriptors and directory streams; see also [Section 3.258](#) (on page 74).

**Note:** {OPEN\_MAX} is defined in detail in [<limits.h>](#).

**3.167 File Group Class**

The property of a file indicating access permissions for a process related to the group identification of a process. A process is in the file group class of a file if the process is not in the file owner class and if the effective group ID or one of the supplementary group IDs of the process matches the group ID associated with the file. Other members of the class may be implementation-defined.

**3.168 File Mode**

An object containing the file mode bits and some information about the file type of a file.

**Note:** File mode bits and file types are defined in detail in [<sys/stat.h>](#).

**3.169 File Mode Bits**

A file's file permission bits, set-user-ID-on-execution bit (S\_ISUID), set-group-ID-on-execution bit (S\_ISGID), and, on directories, the restricted deletion flag bit (S\_ISVTX).

**Note:** File Mode Bits are defined in detail in [<sys/stat.h>](#).

**3.170 Filename**

A sequence of bytes consisting of 1 to {NAME\_MAX} bytes used to name a file. The bytes composing the name shall not contain the <NUL> or <slash> characters. In the context of a pathname, each filename shall be followed by a <slash> or a <NUL> character; elsewhere, a filename followed by a <NUL> character forms a string (but not necessarily a character string). The filenames **dot** and **dot-dot** have special meaning. A filename is sometimes referred to as a "pathname component". See also [Section 3.271](#) (on page 76).

**Note:** Pathname Resolution is defined in detail in [Section 4.13](#) (on page 111).

**3.171 Filename String**

A string consisting of a filename followed by a <NUL> character.

**3.172 File Offset**

The byte position in the file where the next I/O operation begins. Each open file description associated with a regular file, block special file, or directory has a file offset. A character special file that does not refer to a terminal device may have a file offset. There is no file offset specified for a pipe or FIFO.

**3.173 File Other Class**

The property of a file indicating access permissions for a process related to the user and group identification of a process. A process is in the file other class of a file if the process is not in the file owner class or file group class.

**3.174 File Owner Class**

The property of a file indicating access permissions for a process related to the user identification of a process. A process is in the file owner class of a file if the effective user ID of the process matches the user ID of the file.

**3.175 File Permission Bits**

Information about a file that is used, along with other information, to determine whether a process has read, write, or execute/search permission to a file. The bits are divided into three parts: owner, group, and other. Each part is used with the corresponding file class of processes. These bits are contained in the file mode.

**Note:** File modes are defined in detail in [<sys/stat.h>](#).

File Access Permissions are defined in detail in [Section 4.5](#) (on page 108).

**3.176 File Serial Number**

A per-file system unique identifier for a file.

**3.177 File System**

A collection of files and certain of their attributes. It provides a name space for file serial numbers referring to those files.

**3.178 File Type**

See *File* in [Section 3.164](#) (on page 59).

**3.179 Filter**

A command whose operation consists of reading data from standard input or a list of input files and writing data to standard output. Typically, its function is to perform some transformation on the data stream.

**3.180 First Open (of a File)**

When a process opens a file that is not currently an open file within any process.

**3.181 Flow Control**

The mechanism employed by a communications provider that constrains a sending entity to wait until the receiving entities can safely receive additional data without loss.

**3.182 Foreground Job**

See *Foreground Process Group* in [Section 3.184](#).

**3.183 Foreground Process**

A process that is a member of a foreground process group.

**3.184 Foreground Process Group (or Foreground Job)**

A process group whose member processes have certain privileges, denied to processes in background process groups, when accessing their controlling terminal. Each session that has established a connection with a controlling terminal has at most one process group of the session as the foreground process group of that controlling terminal.

**Note:** The General Terminal Interface is defined in detail in [Chapter 11](#).

**3.185 Foreground Process Group ID**

The process group ID of the foreground process group.

### 3.186 Form-Feed Character (<form-feed>)

A character that in the output stream indicates that printing should start on the next page of an output device. It is the character designated by ‘\f’ in the C language. If the form-feed is not the first character of an output line, the result is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the next page.

### 3.187 Graphic Character

A member of the **graph** character class of the current locale.

**Note:** The **graph** character class is defined in detail in [Section 7.3.1](#) (on page 139).

### 3.188 Group Database

A system database that contains at least the following information for each group ID:

- Group name
- Numerical group ID
- List of users allowed in the group

The list of users allowed in the group is used by the *newgrp* utility.

**Note:** The *newgrp* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

### 3.189 Group ID

A non-negative integer, which can be contained in an object of type **gid\_t**, that is used to identify a group of system users. Each system user is a member of at least one group. When the identity of a group is associated with a process, a group ID value is referred to as a real group ID, an effective group ID, one of the supplementary group IDs, or a saved set-group-ID. The value (**gid\_t**)-1 shall not be a valid group ID, but does have a defined use in some interfaces defined in this standard.

### 3.190 Group Name

A string that is used to identify a group; see also [Section 3.188](#). To be portable across conforming systems, the value is composed of characters from the portable filename character set. The <hyphen-minus> should not be used as the first character of a portable group name.

**3.191 Hard Limit**

A system resource limitation that may be reset to a lesser or greater limit by a privileged process. A non-privileged process is restricted to only lowering its hard limit.

**3.192 Hard Link**

The relationship between two directory entries that represent the same file; see also [Section 3.130](#) (on page 53). The result of an execution of the *ln* utility (without the *-s* option) or the *link()* function. This term is contrasted against symbolic link; see also [Section 3.381](#) (on page 95).

**3.193 Home Directory**

The directory specified by the *HOME* environment variable.

**3.194 Host Byte Order**

The arrangement of bytes in any integer type when using a specific machine architecture.

**Note:** Two common methods of byte ordering are big-endian and little-endian. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage or transmission of binary data in which the least significant byte is placed first, with the rest in ascending order. See also [Section 4.10](#) (on page 110).

**3.195 Incomplete Line**

A sequence of one or more non-*<newline>* characters at the end of the file.

**3.196 Inf**

A value representing +infinity or a value representing -infinity that can be stored in a floating type. Not all systems support the Inf values.

**3.197 Instrumented Application**

An application that contains at least one call to the trace point function *posix\_trace\_event()*. Each process of an instrumented application has a mapping of trace event names to trace event type identifiers. This mapping is used by the trace stream that is created for that process.

**3.198 Interactive Shell**

A processing mode of the shell that is suitable for direct user interaction.

**3.199 Internationalization**

The provision within a computer program of the capability of making itself adaptable to the requirements of different native languages, local customs, and coded character sets.

**3.200 Interprocess Communication**

A functionality enhancement to add a high-performance, deterministic interprocess communication facility for local communication.

**3.201 Invoke**

To perform command search and execution actions, except that searching for shell functions and special built-in utilities is suppressed; see also [Section 3.155](#) (on page 58).

**Note:** Command Search and Execution is defined in detail in XCU [Section 2.9.1.1](#) (on page 2357).

**3.202 Job**

A set of processes, comprising a shell pipeline, and any processes descended from it, that are all in the same process group.

**Note:** See also XCU [Section 2.9.2](#) (on page 2358).

**3.203 Job Control**

A facility that allows users selectively to stop (suspend) the execution of processes and continue (resume) their execution at a later point. The user typically employs this facility via the interactive interface jointly supplied by the terminal I/O driver and a command interpreter.

**3.204 Job Control Job ID**

A handle that is used to refer to a job. The job control job ID can be any of the forms shown in the following table:

**Table 3-1** Job Control Job ID Formats

Job Control Job ID	Meaning
%%	Current job.
%+	Current job.
%-	Previous job.
% <i>n</i>	Job number <i>n</i> .
% <i>string</i>	Job whose command begins with <i>string</i> .
%? <i>string</i>	Job whose command contains <i>string</i> .

**3.205 Last Close (of a File)**

When a process closes a file, resulting in the file not being an open file within any process.

**3.206 Line**

A sequence of zero or more non-<newline> characters plus a terminating <newline> character.

**3.207 Linger**

The period of time before terminating a connection, to allow outstanding data to be transferred.

**3.208 Link**

See *Directory Entry* in [Section 3.130](#) (on page 53).

**3.209 Link Count**

The number of directory entries that refer to a particular file.

**3.210 Live Process**

An address space with one or more threads executing within that address space, and the required system resources for those threads. +

1957 **Note:** Many of the system resources defined by POSIX.1-2008 are shared among all of the threads +  
 1958 within a process. These include the process ID, the parent process ID, process group ID, session +  
 1959 membership, real, effective, and saved set-user-ID, real, effective, and saved set-group-ID, +  
 1960 supplementary group IDs, current working directory, root directory, file mode creation mask, +  
 1961 and file descriptors. +

### 1962 **3.211 Local Customs**

1963 The conventions of a geographical area or territory for such things as date, time, and currency  
 1964 formats.

### 1965 **3.212 Local Interprocess Communication (Local IPC)**

1966 The transfer of data between processes in the same system.

### 1967 **3.213 Locale**

1968 The definition of the subset of a user's environment that depends on language and cultural  
 1969 conventions.

1970 **Note:** Locales are defined in detail in [Chapter 7](#) (on page 135).

### 1971 **3.214 Localization**

1972 The process of establishing information within a computer system specific to the operation of  
 1973 particular native languages, local customs, and coded character sets.

### 1974 **3.215 Login**

1975 The unspecified activity by which a user gains access to the system. Each login is associated  
 1976 with exactly one login name.

### 1977 **3.216 Login Name**

1978 A user name that is associated with a login.

### 1979 **3.217 Map**

1980 To create an association between a page-aligned range of the address space of a process and  
 1981 some memory object, such that a reference to an address in that range of the address space

1982 results in a reference to the associated memory object. The mapped memory object is not  
 1983 necessarily memory-resident.

### 1984 **3.218 Marked Message**

1985 A STREAMS message on which a certain flag is set. Marking a message gives the application  
 1986 protocol-specific information. An application can use *ioctl()* to determine whether a given  
 1987 message is marked.

1988 **Note:** The *ioctl()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

### 1989 **3.219 Matched**

1990 A state applying to a sequence of zero or more characters when the characters in the sequence  
 1991 correspond to a sequence of characters defined by a basic regular expression or extended regular  
 1992 expression pattern.

1993 **Note:** Regular Expressions are defined in detail in [Chapter 9](#) (on page 181).

### 1994 **3.220 Memory Mapped Files**

1995 A facility to allow applications to access files as part of the address space.

### 1996 **3.221 Memory Object**

1997 One of:

- 1998 • A file (see [Section 3.164](#), on page 59)
- 1999 • A shared memory object (see [Section 3.346](#), on page 89)
- 2000 • A typed memory object (see [Section 3.429](#), on page 102)

2001 When used in conjunction with *mmap()*, a memory object appears in the address space of the  
 2002 calling process.

2003 **Note:** The *mmap()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

### 2004 **3.222 Memory-Resident**

2005 The process of managing the implementation in such a way as to provide an upper bound on  
 2006 memory access times.

### 2007 3.223 Message

2008 In the context of programmatic message passing, information that can be transferred between  
2009 processes or threads by being added to and removed from a message queue. A message consists  
2010 of a fixed-size message buffer.

### 2011 3.224 Message Catalog

2012 In the context of providing natural language messages to the user, a file or storage area  
2013 containing program messages, command prompts, and responses to prompts for a particular  
2014 native language, territory, and codeset.

### 2015 3.225 Message Catalog Descriptor

2016 In the context of providing natural language messages to the user, a per-process unique value  
2017 used to identify an open message catalog. A message catalog descriptor may be implemented  
2018 using a file descriptor.

### 2019 3.226 Message Queue

2020 In the context of programmatic message passing, an object to which messages can be added and  
2021 removed. Messages may be removed in the order in which they were added or in priority order.

### 2022 3.227 Mode

2023 A collection of attributes that specifies a file's type and its access permissions.

2024 **Note:** File Access Permissions are defined in detail in [Section 4.5](#) (on page 108).

### 2025 3.228 Monotonic Clock

2026 A clock measuring real time, whose value cannot be set via `clock_settime()` and which cannot  
2027 have negative clock jumps.

### 2028 3.229 Mount Point

2029 Either the system root directory or a directory for which the *st\_dev* field of structure **stat** differs  
2030 from that of its parent directory.

2031 **Note:** The **stat** structure is defined in detail in [<sys/stat.h>](#).

### 2032 3.230 Multi-Character Collating Element

2033 A sequence of two or more characters that collate as an entity. For example, in some coded  
2034 character sets, an accented character is represented by a non-spacing accent, followed by the  
2035 letter. Other examples are the Spanish elements *ch* and *ll*.

### 2036 3.231 Multi-Threaded Library

2037 A library containing object files that were produced by compiling with *c99* using the flags +  
2038 output by *getconf* POSIX\_V7\_THREADS\_CFLAGS, or by compiling using a non-standard utility +  
2039 with equivalent flags, and which makes use of interfaces that are only made available by *c99* +  
2040 when the **-l pthread** option is used or makes use of SIGEV\_THREAD notifications. +

### 2041 3.232 Multi-Threaded Process

2042 A process that contains more than one thread. +

### 2043 3.233 Multi-Threaded Program

2044 A program whose executable file was produced by compiling with *c99* using the flags output by +  
2045 *getconf* POSIX\_V7\_THREADS\_CFLAGS, and linking with *c99* using the flags output by *getconf* +  
2046 POSIX\_V7\_THREADS\_LDFLAGS and the **-l pthread** option, or by compiling and linking using +  
2047 a non-standard utility with equivalent flags. Execution of a multi-threaded program initially +  
2048 creates a single-threaded process; the process can create additional threads using *pthread\_create()* +  
2049 or SIGEV\_THREAD notifications. +

### 2050 3.234 Mutex

2051 A synchronization object used to allow multiple threads to serialize their access to shared data.  
2052 The name derives from the capability it provides; namely, mutual-exclusion. The thread that has  
2053 locked a mutex becomes its owner and remains the owner until that same thread unlocks the  
2054 mutex.

### 3.235 Name

In the shell command language, a word consisting solely of underscores, digits, and alphabetic characters from the portable character set. The first character of a name is not a digit.

**Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

### 3.236 Named STREAM

A STREAMS-based file descriptor that is attached to a name in the file system name space. All subsequent operations on the named STREAM act on the STREAM that was associated with the file descriptor until the name is disassociated from the STREAM.

### 3.237 NaN (Not a Number)

A set of values that may be stored in a floating type but that are neither Inf nor valid floating-point numbers. Not all systems support NaN values.

### 3.238 Native Language

A computer user's spoken or written language, such as American English, British English, Danish, Dutch, French, German, Italian, Japanese, Norwegian, or Swedish.

### 3.239 Negative Response

An input string that matches one of the responses acceptable to the *LC\_MESSAGES* category keyword **noexpr**, matching an extended regular expression in the current locale.

**Note:** The *LC\_MESSAGES* category is defined in detail in [Section 7.3.6](#) (on page 165).

### 3.240 Network

A collection of interconnected hosts.

**Note:** The term "network" in POSIX.1-2008 is used to refer to the network of hosts. The term "batch system" is used to refer to the network of batch servers.

### 3.241 Network Address

A network-visible identifier used to designate specific endpoints in a network. Specific endpoints on host systems have addresses, and host systems may also have addresses.

### 3.242 Network Byte Order

The way of representing any integer type such that, when transmitted over a network via a network endpoint, the **int** type is transmitted as an appropriate number of octets with the most significant octet first, followed by any other octets in descending order of significance.

**Note:** This order is more commonly known as big-endian ordering. See also [Section 4.10](#) (on page 110).

### 3.243 Newline Character (<newline>)

A character that in the output stream indicates that printing should start at the beginning of the next line. It is the character designated by '`\n`' in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the next line.

### 3.244 Nice Value

A number used as advice to the system to alter process scheduling. Numerically smaller values give a process additional preference when scheduling a process to run. Numerically larger values reduce the preference and make a process less likely to run. Typically, a process with a smaller nice value runs to completion more quickly than an equivalent process with a higher nice value. The symbol {NZERO} specifies the default nice value of the system.

### 3.245 Non-Blocking

A property of an open file description that causes function calls involving it to return without delay when it is detected that the requested action associated with the function call cannot be completed without unknown delay.

**Note:** The exact semantics are dependent on the type of file associated with the open file description. For data reads from devices such as ttys and FIFOs, this property causes the read to return immediately when no data was available. Similarly, for writes, it causes the call to return immediately when the thread would otherwise be delayed in the write operation; for example, because no space was available. For networking, it causes functions not to await protocol events (for example, acknowledgements) to occur. See also XSH [Section 2.10.7](#) (on page 525).

### 3.246 Non-Spacing Characters

A character, such as a character representing a diacritical mark in the ISO/IEC 6937:2001 standard coded graphic character set, which is used in combination with other characters to form composite graphic symbols.

2111 **3.247 NUL**

2112 A character with all bits set to zero.

2113 **3.248 Null Byte**

2114 A byte with all bits set to zero.

2115 **3.249 Null Pointer**

2116 A pointer obtained by converting an integer constant expression with the value 0, or such an  
 2117 expression cast to type **void \***, to a pointer type; for example, **(char \*)0**. The C language  
 2118 guarantees that a null pointer compares unequal to a pointer to any object or function, so it is  
 2119 used by many functions that return pointers to indicate an error.

2120 **3.250 Null String**2121 See *Empty String* in [Section 3.146](#) (on page 56).2122 **3.251 Null Wide-Character Code**

2123 A wide-character code with all bits set to zero.

2124 **3.252 Number-Sign Character (<number-sign>)**

2125 The character ' # ', also known as hash sign.

2126 **3.253 Object File**

2127 A regular file containing the output of a compiler, formatted as input to a linkage editor for  
 2128 linking with other object files into an executable form. The methods of linking are unspecified  
 2129 and may involve the dynamic linking of objects at runtime. The internal format of an object file  
 2130 is unspecified, but a conforming application cannot assume an object file is a text file.

2131 **3.254 Octet**

2132 Unit of data representation that consists of eight contiguous bits.

**2133 3.255 Offset Maximum**

2134 An attribute of an open file description representing the largest value that can be used as a file  
2135 offset.

**2136 3.256 Opaque Address**

2137 An address such that the entity making use of it requires no details about its contents or format.

**2138 3.257 Open File**

2139 A file that is currently associated with a file descriptor.

**2140 3.258 Open File Description**

2141 A record of how a process or group of processes is accessing a file. Each file descriptor refers to  
2142 exactly one open file description, but an open file description can be referred to by more than  
2143 one file descriptor. The file offset, file status, and file access modes are attributes of an open file  
2144 description.

**2145 3.259 Operand**

2146 An argument to a command that is generally used as an object supplying information to a utility  
2147 necessary to complete its processing. Operands generally follow the options in a command line.

2148 **Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213).

**2149 3.260 Operator**

2150 In the shell command language, either a control operator or a redirection operator.

### 3.261 Option

An argument to a command that is generally used to specify changes in the utility's default behavior.

**Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213).

### 3.262 Option-Argument

A parameter that follows certain options. In some cases an option-argument is included within the same argument string as the option—in most cases it is the next argument.

**Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213).

### 3.263 Orientation

A stream has one of three orientations: unoriented, byte-oriented, or wide-oriented.

**Note:** For further information, see XSH [Section 2.5.2](#) (on page 498).

### 3.264 Orphaned Process Group

A process group in which the parent of every member is either itself a member of the group or is not a member of the group's session.

### 3.265 Page

The granularity of process memory mapping or locking.

Physical memory and memory objects can be mapped into the address space of a process on page boundaries and in integral multiples of pages. Process address space can be locked into memory (made memory-resident) on page boundaries and in integral multiples of pages.

### 3.266 Page Size

The size, in bytes, of the system unit of memory allocation, protection, and mapping. On systems that have segment rather than page-based memory architectures, the term "page" means a segment.

**3.267 Parameter**

In the shell command language, an entity that stores values. There are three types of parameters: variables (named parameters), positional parameters, and special parameters. Parameter expansion is accomplished by introducing a parameter with the '\$' character.

**Note:** See also XCU [Section 2.5](#) (on page 2339).

In the C language, an object declared as part of a function declaration or definition that acquires a value on entry to the function, or an identifier following the macro name in a function-like macro definition.

**3.268 Parent Directory**

When discussing a given directory, the directory that both contains a directory entry for the given directory and is represented by the pathname dot-dot in the given directory.

When discussing other types of files, a directory containing a directory entry for the file under discussion.

This concept does not apply to dot and dot-dot.

**3.269 Parent Process**

The process which created (or inherited) the process under discussion.

**3.270 Parent Process ID**

An attribute of a new process identifying the parent of the process. The parent process ID of a process is the process ID of its creator, for the lifetime of the creator. After the creator's lifetime has ended, the parent process ID is the process ID of an implementation-defined system process.

**3.271 Pathname**

A string that is used to identify a file. In the context of POSIX.1-2008, a pathname may be limited to {PATH\_MAX} bytes, including the terminating null byte. It has optional beginning <slash> characters, followed by zero or more filenames separated by <slash> characters. A pathname can optionally contain one or more trailing <slash> characters. Multiple successive <slash> characters are considered to be the same as one <slash>, except for the case of exactly two leading <slash> characters.

**Note:** If a pathname consists of only bytes corresponding to characters from the portable filename character set (see [Section 3.282](#), on page 79), <slash> characters, and a single terminating <NUL> character, the pathname will be usable as a character string in all supported locales; otherwise, the pathname might only be a string (rather than a character string). Additionally, since the single-byte encoding of the <slash> character is required to be the same across all locales and to not occur within a multi-byte character, references to a <slash> character within a pathname are well-defined even when the pathname is not a character string. However, this property does not necessarily hold for the remaining characters within the portable filename

2209 character set.

2210 Pathname Resolution is defined in detail in [Section 4.13](#) (on page 111).

### 2211 3.272 Pathname Component

2212 See *Filename* in [Section 3.170](#) (on page 60).

### 2213 3.273 Path Prefix

2214 The part of a pathname up to, but not including, the last component and any trailing <slash>  
2215 characters, unless the pathname consists entirely of <slash> characters, in which case the path  
2216 prefix is ' / ' for a pathname containing either a single <slash> or three or more <slash>  
2217 characters, and ' / / ' for the pathname //. The path prefix of a pathname containing no <slash>  
2218 characters is empty, but is treated as referring to the current working directory.

2219 **Note:** The term is used both in the sense of identifying part of a pathname that forms the prefix and of  
2220 joining a non-empty path prefix to a filename to form a pathname. In the latter case, the path  
2221 prefix need not have a trailing <slash> (in which case the joining is done with a <slash>  
2222 character).

### 2223 3.274 Pattern

2224 A sequence of characters used either with regular expression notation or for pathname  
2225 expansion, as a means of selecting various character strings or pathnames, respectively.

2226 **Note:** Regular Expressions are defined in detail in [Chapter 9](#) (on page 181).

2227 See also XCU [Section 2.6.6](#) (on page 2350).

2228 The syntaxes of the two types of patterns are similar, but not identical; POSIX.1-2008 always  
2229 indicates the type of pattern being referred to in the immediate context of the use of the term.

### 2230 3.275 Period Character (<period>)

2231 The character ' . '. The term “period” is contrasted with dot (see also [Section 3.136](#), on page 54),  
2232 which is used to describe a specific directory entry.

### 3.276 Permissions

Attributes of an object that determine the privilege necessary to access or manipulate the object.

**Note:** File Access Permissions are defined in detail in [Section 4.5](#) (on page 108).

### 3.277 Persistence

A mode for semaphores, shared memory, and message queues requiring that the object and its state (including data, if any) are preserved after the object is no longer referenced by any process.

Persistence of an object does not imply that the state of the object is maintained across a system crash or a system reboot.

### 3.278 Pipe

An object identical to a FIFO which has no links in the file hierarchy.

**Note:** The *pipe()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.279 Polling

A scheduling scheme whereby the local process periodically checks until the pre-specified events (for example, read, write) have occurred.

### 3.280 Portable Character Set

The collection of characters that are required to be present in all locales supported by conforming systems.

**Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

This term is contrasted against the smaller portable filename character set; see also [Section 3.282](#) (on page 79).

**3.281 Portable Filename**

A filename consisting only of characters from the portable filename character set.

**Note:** Applications should avoid using filenames that have the <hyphen> character as the first character since this may cause problems when filenames are passed as command line arguments.

**3.282 Portable Filename Character Set**

The set of characters from which portable filenames are constructed.

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z  
a b c d e f g h i j k l m n o p q r s t u v w x y z  
0 1 2 3 4 5 6 7 8 9 . \_ -

The last three characters are the <period>, <underscore>, and <hyphen-minus> characters, respectively. See also [Section 3.271](#) (on page 76).

**3.283 Positional Parameter**

In the shell command language, a parameter denoted by a single digit or one or more digits in curly braces.

**Note:** For further information, see XCU [Section 2.5.1](#) (on page 2339).

**3.284 Preallocation**

The reservation of resources in a system for a particular use.

Preallocation does not imply that the resources are immediately allocated to that use, but merely indicates that they are guaranteed to be available in bounded time when needed.

**3.285 Preempted Process (or Thread)**

A running thread whose execution is suspended due to another thread becoming runnable at a higher priority.

**3.286 Previous Job**

In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities if the current job exits. There is at most one previous job; see also [Section 3.204](#) (on page 66).

### 2280 3.287 Printable Character

2281 One of the characters included in the **print** character classification of the *LC\_CTYPE* category in  
2282 the current locale.

2283 **Note:** The *LC\_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 139).

### 2284 3.288 Printable File

2285 A text file consisting only of the characters included in the **print** and **space** character  
2286 classifications of the *LC\_CTYPE* category and the <backspace>, all in the current locale.

2287 **Note:** The *LC\_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 139).

### 2288 3.289 Priority

2289 A non-negative integer associated with processes or threads whose value is constrained to a  
2290 range defined by the applicable scheduling policy. Numerically higher values represent higher  
2291 priorities.

### 2292 3.290 Priority Band

2293 The queuing order applied to normal priority STREAMS messages. High priority STREAMS  
2294 messages are not grouped by priority bands. The only differentiation made by the STREAMS  
2295 mechanism is between zero and non-zero bands, but specific protocol modules may differentiate  
2296 between priority bands.

### 2297 3.291 Priority Inversion

2298 A condition in which a thread that is not voluntarily suspended (waiting for an event or time  
2299 delay) is not running while a lower priority thread is running. Such blocking of the higher  
2300 priority thread is often caused by contention for a shared resource.

### 2301 3.292 Priority Scheduling

2302 A performance and determinism improvement facility to allow applications to determine the  
2303 order in which threads that are ready to run are granted access to processor resources.

### 2304 3.293 Priority-Based Scheduling

2305 Scheduling in which the selection of a running thread is determined by the priorities of the  
2306 runnable processes or threads.

### 3.294 Privilege

See *Appropriate Privileges* in [Section 3.20](#) (on page 36).

### 3.295 Process

A live process (see [Section 3.210](#), on page 66) or a zombie process (see [Section 3.452](#), on page 106). The lifetime of a process is described in [Section 3.301](#) (on page 82).

### 3.296 Process Group

A collection of processes that permits the signaling of related processes. Each process in the system is a member of a process group that is identified by a process group ID. A newly created process joins the process group of its creator.

### 3.297 Process Group ID

The unique positive integer identifier representing a process group during its lifetime.

**Note:** See also *Process Group ID Reuse* defined in [Section 4.14](#) (on page 113).

### 3.298 Process Group Leader

A process whose process ID is the same as its process group ID.

### 3.299 Process Group Lifetime

The period of time that begins when a process group is created and ends when the last remaining process in the group leaves the group, due either to the end of the lifetime of the last process or to the last remaining process calling the *setsid()* or *setpgid()* functions.

**Note:** The *setsid()* and *setpgid()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.300 Process ID

The unique positive integer identifier representing a process during its lifetime.

**Note:** See also *Process ID Reuse* defined in [Section 4.14](#) (on page 113).

### 3.301 Process Lifetime

The period of time that begins when a process is created and ends when its process ID is returned to the system.

See also [Section 3.210](#) (on page 66), [Section 3.303](#), and [Section 3.452](#) (on page 106).

**Note:** Process creation is defined in detail in the descriptions of the *fork()*, *posix\_spawn()*, and *posix\_spawnnp()*, functions in the System Interfaces volume of POSIX.1-2008.

### 3.302 Process Memory Locking

A performance improvement facility to bind application programs into the high-performance random access memory of a computer system. This avoids potential latencies introduced by the operating system in storing parts of a program that were not recently referenced on secondary memory devices.

### 3.303 Process Termination

There are two kinds of process termination:

1. Normal termination occurs by a return from *main()*, when requested with the *exit()*, *\_exit()*, or *\_Exit()* functions; or when the last thread in the process terminates by returning from its start function, by calling the *pthread\_exit()* function, or through cancellation.
2. Abnormal termination occurs when requested by the *abort()* function or when some signals are received.

**Note:** The consequences of process termination can be found in the description of the *\_Exit()* function in the System Interfaces volume of POSIX.1-2008. The *\_exit()*, *\_Exit()*, *abort()*, and *exit()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.304 Process-To-Process Communication

The transfer of data between processes.

### 3.305 Process Virtual Time

The measurement of time in units elapsed by the system clock while a process is executing.

### 3.306 Program

A prepared sequence of instructions to the system to accomplish a defined task. The term “program” in POSIX.1-2008 encompasses applications written in the Shell Command Language, complex utility input languages (for example, *awk*, *lex*, *sed*, and so on), and high-level languages.

### 3.307 Protocol

A set of semantic and syntactic rules for exchanging information.

### 3.308 Pseudo-Terminal

A facility that provides an interface that is identical to the terminal subsystem, except where noted otherwise in POSIX.1-2008. A pseudo-terminal is composed of two devices: the “master device” and a “slave device”. The slave device provides processes with an interface that is identical to the terminal interface, although there need not be hardware behind that interface. Anything written on the master device is presented to the slave as an input and anything written on the slave device is presented as an input on the master side.

### 3.309 Radix Character

The character that separates the integer part of a number from the fractional part.

### 3.310 Read-Only File System

A file system that has implementation-defined characteristics restricting modifications.

**Note:** File Times Update is described in detail in [Section 4.9](#) (on page 109).

### 3.311 Read-Write Lock

Multiple readers, single writer (read-write) locks allow many threads to have simultaneous read-only access to data while allowing only one thread to have write access at any given time. They are typically used to protect data that is read-only more frequently than it is changed.

Read-write locks can be used to synchronize threads in the current process and other processes if they are allocated in memory that is writable and shared among the cooperating processes and have been initialized for this behavior.

### 2381 **3.312 Real Group ID**

2382 The attribute of a process that, at the time of process creation, identifies the group of the user  
2383 who created the process; see also [Section 3.189](#) (on page 63).

### 2384 **3.313 Real Time**

2385 Time measured as total units elapsed by the system clock without regard to which thread is  
2386 executing.

### 2387 **3.314 Realtime Signal Extension**

2388 A determinism improvement facility to enable asynchronous signal notifications to an  
2389 application to be queued without impacting compatibility with the existing signal functions.

### 2390 **3.315 Real User ID**

2391 The attribute of a process that, at the time of process creation, identifies the user who created the  
2392 process; see also [Section 3.436](#) (on page 103).

### 2393 **3.316 Record**

2394 A collection of related data units or words which is treated as a unit.

### 2395 **3.317 Redirection**

2396 In the shell command language, a method of associating files with the input or output of  
2397 commands.

2398 **Note:** For further information, see XCU [Section 2.7](#) (on page 2350).

### 3.318 Redirection Operator

In the shell command language, a token that performs a redirection function. It is one of the following symbols:

<      >      >|      <<      >>      <&      >&      <<-      <>

### 3.319 Referenced Shared Memory Object

A shared memory object that is open or has one or more mappings defined on it.

### 3.320 Refresh

To ensure that the information on the user's terminal screen is up-to-date.

### 3.321 Regular Expression

A pattern that selects specific strings from a set of character strings.

**Note:** Regular Expressions are described in detail in [Chapter 9](#) (on page 181).

### 3.322 Region

In the context of the address space of a process, a sequence of addresses.

In the context of a file, a sequence of offsets.

### 3.323 Regular File

A file that is a randomly accessible sequence of bytes, with no further structure imposed by the system.

### 2416 3.324 Relative Pathname

2417 A pathname not beginning with a <slash> character.

2418 **Note:** Pathname Resolution is defined in detail in [Section 4.13](#) (on page 111).

### 2419 3.325 Relocatable File

2420 A file holding code or data suitable for linking with other object files to create an executable or a  
2421 shared object file.

### 2422 3.326 Relocation

2423 The process of connecting symbolic references with symbolic definitions. For example, when a  
2424 program calls a function, the associated call instruction transfers control to the proper  
2425 destination address at execution.

### 2426 3.327 Requested Batch Service

2427 A service that is either rejected or performed prior to a response from the service to the  
2428 requester.

### 2429 3.328 (Time) Resolution

2430 The minimum time interval that a clock can measure or whose passage a timer can detect.

### 2431 3.329 Robust Mutex

2432 A mutex with the *robust* attribute set.

2433 **Note:** The *robust* attribute is defined in detail by the `pthread_mutexattr_getrobust()` function.

### 2434 3.330 Root Directory

2435 A directory, associated with a process, that is used in pathname resolution for pathnames that  
2436 begin with a <slash> character.

### 2437 3.331 Runnable Process (or Thread)

2438 A thread that is capable of being a running thread, but for which no processor is available.

### 3.332 Running Process (or Thread)

A thread currently executing on a processor. On multi-processor systems there may be more than one such thread in a system at a time.

### 3.333 Saved Resource Limits

An attribute of a process that provides some flexibility in the handling of unrepresentable resource limits, as described in the *exec* family of functions and *setrlimit()*.

**Note:** The *exec* and *setrlimit()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.334 Saved Set-Group-ID

An attribute of a process that allows some flexibility in the assignment of the effective group ID attribute, as described in the *exec* family of functions and *setgid()*.

**Note:** The *exec* and *setgid()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.335 Saved Set-User-ID

An attribute of a process that allows some flexibility in the assignment of the effective user ID attribute, as described in the *exec* family of functions and *setuid()*.

**Note:** The *exec* and *setuid()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.336 Scheduling

The application of a policy to select a runnable process or thread to become a running process or thread, or to alter one or more of the thread lists.

### 3.337 Scheduling Allocation Domain

The set of processors on which an individual thread can be scheduled at any given time.

### 3.338 Scheduling Contention Scope

A property of a thread that defines the set of threads against which that thread competes for resources.

2465 For example, in a scheduling decision, threads sharing scheduling contention scope compete for  
2466 processor resources. In POSIX.1-2008, a thread has scheduling contention scope of either  
2467 PTHREAD\_SCOPE\_SYSTEM or PTHREAD\_SCOPE\_PROCESS.

### 2468 3.339 Scheduling Policy

2469 A set of rules that is used to determine the order of execution of processes or threads to achieve  
2470 some goal.

2471 **Note:** Scheduling Policy is defined in detail in [Section 4.15](#) (on page 113).

### 2472 3.340 Screen

2473 A rectangular region of columns and lines on a terminal display. A screen may be a portion of a  
2474 physical display device or may occupy the entire physical area of the display device.

### 2475 3.341 Scroll

2476 To move the representation of data vertically or horizontally relative to the terminal screen.  
2477 There are two types of scrolling:

- 2478 1. The cursor moves with the data.
- 2479 2. The cursor remains stationary while the data moves.

### 2480 3.342 Semaphore

2481 A minimum synchronization primitive to serve as a basis for more complex synchronization  
2482 mechanisms to be defined by the application program.

2483 **Note:** Semaphores are defined in detail in [Section 4.17](#) (on page 114).

### 3.343 Session

A collection of process groups established for job control purposes. Each process group is a member of a session. A process is considered to be a member of the session of which its process group is a member. A newly created process joins the session of its creator. A process can alter its session membership; see *setsid()*. There can be multiple process groups in the same session.

**Note:** The *setsid()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.344 Session Leader

A process that has created a session.

**Note:** For further information, see the *setsid()* function defined in the System Interfaces volume of POSIX.1-2008.

### 3.345 Session Lifetime

The period between when a session is created and the end of the lifetime of all the process groups that remain as members of the session.

### 3.346 Shared Memory Object

An object that represents memory that can be mapped concurrently into the address space of more than one process.

### 3.347 Shell

A program that interprets sequences of text input as commands. It may operate on an input stream or it may interactively prompt and read commands from a terminal.

### 3.348 Shell, the

The Shell Command Language Interpreter; a specific instance of a shell.

**Note:** For further information, see the *sh* utility defined in the Shell and Utilities volume of POSIX.1-2008.

**3.349 Shell Script**

A file containing shell commands. If the file is made executable, it can be executed by specifying its name as a simple command. Execution of a shell script causes a shell to execute the commands within the script. Alternatively, a shell can be requested to execute the commands in a shell script by specifying the name of the shell script as the operand to the *sh* utility.

**Note:** Simple Commands are defined in detail in XCU [Section 2.9.1](#) (on page 2355).

The *sh* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

**3.350 Signal**

A mechanism by which a process or thread may be notified of, or affected by, an event occurring in the system. Examples of such events include hardware exceptions and specific actions by processes. The term signal is also used to refer to the event itself.

**3.351 Signal Stack**

Memory established for a thread, in which signal handlers catching signals sent to that thread are executed.

**3.352 Single-Quote Character**

The character designated by '`\``' in the C language, also known as <apostrophe>.

**3.353 Single-Threaded Process**

A process that contains a single thread.

**3.354 Single-Threaded Program**

A program whose executable file was produced by compiling with *c99* without using the flags output by *getconf* POSIX\_V7\_THREADS\_CFLAGS and linking with *c99* using neither the flags output by *getconf* POSIX\_V7\_THREADS\_LDFLAGS nor the **-l pthread** option, or by compiling and linking using a non-standard utility with equivalent flags. Execution of a single-threaded program creates a single-threaded process; if the process attempts to create additional threads using *pthread\_create()* or SIGEV\_THREAD notifications, the behavior is undefined. If the process uses *dlopen()* to load a multi-threaded library, the behavior is undefined.

### 2533 3.355 Slash Character (<slash>)

2534 The character ' / ', also known as solidus.

### 2535 3.356 Socket

2536 A file of a particular type that is used as a communications endpoint for process-to-process  
2537 communication as described in the System Interfaces volume of POSIX.1-2008.

### 2538 3.357 Socket Address

2539 An address associated with a socket or remote endpoint, including an address family identifier  
2540 and addressing information specific to that address family. The address may include multiple  
2541 parts, such as a network address associated with a host system and an identifier for a specific  
2542 endpoint.

### 2543 3.358 Soft Limit

2544 A resource limitation established for each process that the process may set to any value less than  
2545 or equal to the hard limit.

### 2546 3.359 Source Code

2547 When dealing with the Shell Command Language, input to the command language interpreter.  
2548 The term “shell script” is synonymous with this meaning.

2549 When dealing with an ISO/IEC-conforming programming language, source code is input to a  
2550 compiler conforming to that ISO/IEC standard.

2551 Source code also refers to the input statements prepared for the following standard utilities: *awk*,  
2552 *bc*, *ed*, *ex*, *lex*, *localedef*, *make*, *sed*, and *yacc*.

2553 Source code can also refer to a collection of sources meeting any or all of these meanings.

2554 **Note:** The *awk*, *bc*, *ed*, *ex*, *lex*, *localedef*, *make*, *sed*, and *yacc* utilities are defined in detail in the Shell and  
2555 Utilities volume of POSIX.1-2008.

**3.360 Space Character (<space>)**

The character defined in the portable character set as <space>. The <space> character is a member of the **space** character class of the current locale, but represents the single character, and not all of the possible members of the class; see also [Section 3.442](#) (on page 104).

**3.361 Spawn**

A process creation primitive useful for systems that have difficulty with *fork()* and as an efficient replacement for *fork()/exec*.

**3.362 Special Built-In**

See *Built-In Utility* in [Section 3.83](#) (on page 46).

**3.363 Special Parameter**

In the shell command language, a parameter named by a single character from the following list:

\* @ # ? ! - \$ 0

**Note:** For further information, see XCU [Section 2.5.2](#) (on page 2340).

**3.364 Spin Lock**

A synchronization object used to allow multiple threads to serialize their access to shared data.

**3.365 Sporadic Server**

A scheduling policy for threads and processes that reserves a certain amount of execution capacity for processing aperiodic events at a given priority level.

**3.366 Standard Error**

An output stream usually intended to be used for diagnostic messages.

**3.367 Standard Input**

An input stream usually intended to be used for primary data input.

### 3.368 Standard Output

An output stream usually intended to be used for primary data output.

### 3.369 Standard Utilities

The utilities described in the Shell and Utilities volume of POSIX.1-2008.

### 3.370 Stream

Appearing in lowercase, a stream is a file access object that allows access to an ordered sequence of characters, as described by the ISO C standard. Such objects can be created by the *fdopen()*, *fmemopen()*, *fopen()*, *open\_memstream()*, or *popen()* functions, and are associated with a file descriptor. A stream provides the additional services of user-selectable buffering and formatted input and output; see also [Section 3.371](#).

**Note:** For further information, see XSH [Section 2.5](#) (on page 495).

The *fdopen()*, *fmemopen()*, *fopen()*, *open\_memstream()*, and *popen()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.371 STREAM

Appearing in uppercase, STREAM refers to a full-duplex connection between a process and an open device or pseudo-device. It optionally includes one or more intermediate processing modules that are interposed between the process end of the STREAM and the device driver (or pseudo-device driver) end of the STREAM; see also [Section 3.370](#).

**Note:** For further information, see XSH [Section 2.6](#) (on page 500).

### 3.372 STREAM End

The STREAM end is the driver end of the STREAM and is also known as the downstream end of the STREAM.

### 3.373 STREAM Head

The STREAM head is the beginning of the STREAM and is at the boundary between the system and the application process. This is also known as the upstream end of the STREAM.

### 3.374 STREAMS Multiplexor

A driver with multiple STREAMS connected to it. Multiplexing with STREAMS connected above is referred to as N-to-1, or “upper multiplexing”. Multiplexing with STREAMS connected below is referred to as 1-to-N or “lower multiplexing”.

### 3.375 String

A contiguous sequence of bytes terminated by and including the first null byte.

### 3.376 Subshell

A shell execution environment, distinguished from the main or current shell execution environment.

**Note:** For further information, see XCU [Section 2.12](#) (on page 2371).

### 3.377 Successfully Transferred

For a write operation to a regular file, when the system ensures that all data written is readable on any subsequent open of the file (even one that follows a system or power failure) in the absence of a failure of the physical storage medium.

For a read operation, when an image of the data on the physical storage medium is available to the requesting process.

### 3.378 Supplementary Group ID

An attribute of a process used in determining file access permissions. A process has up to {NGROUPS\_MAX} supplementary group IDs in addition to the effective group ID. The supplementary group IDs of a process are set to the supplementary group IDs of the parent process when the process is created.

### 3.379 Suspended Job

A job that has received a SIGSTOP, SIGTSTP, SIGTTIN, or SIGTTOU signal that caused the process group to stop. A suspended job is a background job, but a background job is not necessarily a suspended job.

### 3.380 Symbolic Constant

An object-like macro defined with a constant value.

Unless stated otherwise, the following shall apply to every symbolic constant:

- It expands to a compile-time constant expression with an integer type.
- It may be defined as another type of constant—e.g., an enumeration constant—as well as being a macro.
- It need not be usable in `#if` preprocessing directives.

### 3.381 Symbolic Link

A type of file with the property that when the file is encountered during pathname resolution, a string stored by the file is used to modify the pathname resolution. The stored string has a length of {SYMLINK\_MAX} bytes or fewer.

**Note:** Pathname Resolution is defined in detail in [Section 4.13](#) (on page 111).

### 3.382 Synchronized Input and Output

A determinism and robustness improvement mechanism to enhance the data input and output mechanisms, so that an application can ensure that the data being manipulated is physically present on secondary mass storage devices.

### 3.383 Synchronized I/O Completion

The state of an I/O operation that has either been successfully transferred or diagnosed as unsuccessful.

### 3.384 Synchronized I/O Data Integrity Completion

For read, when the operation has been completed or diagnosed if unsuccessful. The read is complete only when an image of the data has been successfully transferred to the requesting process. If there were any pending write requests affecting the data to be read at the time that the synchronized read operation was requested, these write requests are successfully transferred prior to reading the data.

For write, when the operation has been completed or diagnosed if unsuccessful. The write is complete only when the data specified in the write request is successfully transferred and all file system information required to retrieve the data is successfully transferred.

File attributes that are not necessary for data retrieval (access time, modification time, status change time) need not be successfully transferred prior to returning to the calling process.

### 3.385 Synchronized I/O File Integrity Completion

Identical to a synchronized I/O data integrity completion with the addition that all file attributes relative to the I/O operation (including access time, modification time, status change time) are successfully transferred prior to returning to the calling process.

### 3.386 Synchronized I/O Operation

An I/O operation performed on a file that provides the application assurance of the integrity of its data and files.

### 3.387 Synchronous I/O Operation

An I/O operation that causes the thread requesting the I/O to be blocked from further use of the processor until that I/O operation completes.

**Note:** A synchronous I/O operation does not imply synchronized I/O data integrity completion or synchronized I/O file integrity completion.

### 3.388 Synchronously-Generated Signal

A signal that is attributable to a specific thread.

For example, a thread executing an illegal instruction or touching invalid memory causes a synchronously-generated signal. Being synchronous is a property of how the signal was generated and not a property of the signal number.

### 3.389 System

An implementation of POSIX.1-2008.

### 3.390 System Boot

An unspecified sequence of events that may result in the loss of transitory data; that is, data that is not saved in permanent storage. For example, message queues, shared memory, semaphores, and processes.

### 3.391 System Clock

A clock with at least one second resolution that contains seconds since the Epoch.

### 3.392 System Console

A device that receives messages sent by the *syslog()* function, and the *fntmsg()* function when the MM\_CONSOLE flag is set.

**Note:** The *syslog()* and *fntmsg()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.393 System Crash

An interval initiated by an unspecified circumstance that causes all processes (possibly other than special system processes) to be terminated in an undefined manner, after which any changes to the state and contents of files created or written to by an application prior to the interval are undefined, except as required elsewhere in POSIX.1-2008.

### 3.394 System Databases

An implementation provides two system databases: the “group database” (see also [Section 3.188](#), on page 63) and the “user database” (see also [Section 3.435](#), on page 103).

### 3.395 System Documentation

All documentation provided with an implementation except for the conformance document. Electronically distributed documents for an implementation are considered part of the system documentation.

### 3.396 System Process

An object other than a process executing an application, that is provided by the system and has a process ID.

### 3.397 System Reboot

See *System Boot* defined in [Section 3.390](#) (on page 96).

### 3.398 System Trace Event

A trace event that is generated by the implementation, in response either to a system-initiated action or to an application-requested action, except for a call to *posix\_trace\_event()*. When supported by the implementation, a system-initiated action generates a process-independent system trace event and an application-requested action generates a process-dependent system trace event. For a system trace event not defined by POSIX.1-2008, the associated trace event

2711 type identifier is derived from the implementation-defined name for this trace event, and the  
2712 associated data is of implementation-defined content and length.

### 2713 **3.399 System-Wide**

2714 Pertaining to events occurring in all processes existing in an implementation at a given point in  
2715 time.

### 2716 **3.400 Tab Character (<tab>)**

2717 A character that in the output stream indicates that printing or displaying should start at the  
2718 next horizontal tabulation position on the current line. It is the character designated by ‘\t’ in  
2719 the C language. If the current position is at or past the last defined horizontal tabulation  
2720 position, the behavior is unspecified. It is unspecified whether this character is the exact  
2721 sequence transmitted to an output device by the system to accomplish the tabulation.

### 2722 **3.401 Terminal (or Terminal Device)**

2723 A character special file that obeys the specifications of the general terminal interface.

2724 **Note:** The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 199).

### 2725 **3.402 Text Column**

2726 A roughly rectangular block of characters capable of being laid out side-by-side next to other  
2727 text columns on an output page or terminal screen. The widths of text columns are measured in  
2728 column positions.

### 2729 **3.403 Text File**

2730 A file that contains characters organized into zero or more lines. The lines do not contain NUL  
2731 characters and none can exceed {LINE\_MAX} bytes in length, including the <newline>  
2732 character. Although POSIX.1-2008 does not distinguish between text files and binary files (see  
2733 the ISO C standard), many utilities only produce predictable or meaningful output when  
2734 operating on text files. The standard utilities that have such restrictions always specify “text  
2735 files” in their STDIN or INPUT FILES sections.

### 3.404 Thread

A single flow of control within a process. Each thread has its own thread ID, scheduling priority and policy, *errno* value, floating point environment, thread-specific key/value bindings, and the required system resources to support a flow of control. Anything whose address may be determined by a thread, including but not limited to static variables, storage obtained via *malloc()*, directly addressable storage obtained through implementation-defined functions, and automatic variables, are accessible to all threads in the same process.

**Note:** The *malloc()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.405 Thread ID

Each thread in a process is uniquely identified during its lifetime by a value of type **pthread\_t** called a thread ID.

### 3.406 Thread List

An ordered set of runnable threads that all have the same ordinal value for their priority.

The ordering of threads on the list is determined by a scheduling policy or policies. The set of thread lists includes all runnable threads in the system.

### 3.407 Thread-Safe

A thread-safe function can be safely invoked concurrently with other calls to the same function, or with calls to any other thread-safe functions, by multiple threads. Each function defined in the System Interfaces volume of POSIX.1-2008 is thread-safe unless explicitly stated otherwise. Examples are any “pure” function, a function which holds a mutex locked while it is accessing static storage, or objects shared among threads.

### 3.408 Thread-Specific Data Key

A process global handle of type **pthread\_key\_t** which is used for naming thread-specific data.

Although the same key value may be used by different threads, the values bound to the key by *pthread\_setspecific()* and accessed by *pthread\_getspecific()* are maintained on a per-thread basis and persist for the life of the calling thread.

**Note:** The *pthread\_getspecific()* and *pthread\_setspecific()* functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.409 Tilde Character (<tilde>)

The character ‘~’.

### 2766 3.410 Timeouts

2767 A method of limiting the length of time an interface will block; see also [Section 3.76](#) (on page 45).

### 2768 3.411 Timer

2769 A mechanism that can notify a thread when the time as measured by a particular clock has  
2770 reached or passed a specified value, or when a specified amount of time has passed.

### 2771 3.412 Timer Overrun

2772 A condition that occurs each time a timer, for which there is already an expiration signal queued  
2773 to the process, expires.

### 2774 3.413 Token

2775 In the shell command language, a sequence of characters that the shell considers as a single unit  
2776 when reading input. A token is either an operator or a word.

2777 **Note:** The rules for reading input are defined in detail in XCU [Section 2.3](#) (on page 2337).

### 2778 3.414 Trace Analyzer Process

2779 A process that extracts trace events from a trace stream to retrieve information about the  
2780 behavior of an application.

### 2781 3.415 Trace Controller Process

2782 A process that creates a trace stream for tracing a process.

### 2783 3.416 Trace Event

2784 A data object that represents an action executed by the system, and that is recorded in a trace  
2785 stream.

### 2786 3.417 Trace Event Type

2787 A data object type that defines a class of trace event.

**2788 3.418 Trace Event Type Mapping**

2789 A one-to-one mapping between trace event types and trace event names.

**2790 3.419 Trace Filter**

2791 A filter that allows the trace controller process to specify those trace event types that are to be  
2792 ignored; that is, not generated.

**2793 3.420 Trace Generation Version**

2794 A data object that is an implementation-defined character string, generated by the trace system  
2795 and describing the origin and version of the trace system.

**2796 3.421 Trace Log**

2797 The flushed image of a trace stream, if the trace stream is created with a trace log.

**2798 3.422 Trace Point**

2799 An action that may cause a trace event to be generated.

**2800 3.423 Trace Stream**

2801 An opaque object that contains trace events plus internal data needed to interpret those trace  
2802 events.

**2803 3.424 Trace Stream Identifier**

2804 A handle to manage tracing operations in a trace stream.

**2805 3.425 Trace System**

2806 A system that allows both system and user trace events to be generated into a trace stream.  
2807 These trace events can be retrieved later.

**2808 3.426 Traced Process**

2809 A process for which at least one trace stream has been created. A traced process is also called a  
2810 target process.

**2811 3.427 Tracing Status of a Trace Stream**

2812 A status that describes the state of an active trace stream. The tracing status of a trace stream can  
2813 be retrieved from the trace stream attributes. An active trace stream can be in one of two states:  
2814 running or suspended.

**2815 3.428 Typed Memory Name Space**

2816 A system-wide name space that contains the names of the typed memory objects present in the  
2817 system. It is configurable for a given implementation.

**2818 3.429 Typed Memory Object**

2819 A combination of a typed memory pool and a typed memory port. The entire contents of the  
2820 pool are accessible from the port. The typed memory object is identified through a name that  
2821 belongs to the typed memory name space.

**2822 3.430 Typed Memory Pool**

2823 An extent of memory with the same operational characteristics. Typed memory pools may be  
2824 contained within each other.

**2825 3.431 Typed Memory Port**

2826 A hardware access path to one or more typed memory pools.

**2827 3.432 Unbind**

2828 Remove the association between a network address and an endpoint.

**2829 3.433 Unit Data**

2830 See *Datagram* in [Section 3.124](#) (on page 53).

### 3.434 Upshifting

The conversion of a lowercase character that has a single-character uppercase representation into this uppercase representation.

### 3.435 User Database

A system database that contains at least the following information for each user ID:

- User name
- Numerical user ID
- Initial numerical group ID
- Initial working directory
- Initial user program

The initial numerical group ID is used by the *newgrp* utility. Any other circumstances under which the initial values are operative are implementation-defined.

If the initial user program field is null, an implementation-defined program is used.

If the initial working directory field is null, the interpretation of that field is implementation-defined.

**Note:** The *newgrp* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

### 3.436 User ID

A non-negative integer that is used to identify a system user. When the identity of a user is associated with a process, a user ID value is referred to as a real user ID, an effective user ID, or a saved set-user-ID.

### 3.437 User Name

A string that is used to identify a user; see also [Section 3.435](#). To be portable across systems conforming to POSIX.1-2008, the value is composed of characters from the portable filename character set. The <hyphen> character should not be used as the first character of a portable user name.

### 3.438 User Trace Event

A trace event that is generated explicitly by the application as a result of a call to *posix\_trace\_event()*.

### 3.439 Utility

A program, excluding special built-in utilities provided as part of the Shell Command Language, that can be called by name from a shell to perform a specific task, or related set of tasks.

**Note:** For further information on special built-in utilities, see XCU [Section 2.14](#) (on page 2374).

### 3.440 Variable

In the shell command language, a named parameter.

**Note:** For further information, see XCU [Section 2.5](#) (on page 2339).

### 3.441 Vertical-Tab Character (<vertical-tab>)

A character that in the output stream indicates that printing should start at the next vertical tabulation position. It is the character designated by '`\v`' in the C language. If the current position is at or past the last defined vertical tabulation position, the behavior is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the tabulation.

### 3.442 White Space

A sequence of one or more characters that belong to the **space** character class as defined via the `LC_CTYPE` category in the current locale.

In the POSIX locale, white space consists of one or more <blank> (<space> and <tab> characters), <newline>, <carriage-return>, <form-feed>, and <vertical-tab> characters.

### 3.443 Wide-Character Code (C Language)

An integer value corresponding to a single graphic symbol or control code.

**Note:** C Language Wide-Character Codes are defined in detail in [Section 6.3](#) (on page 129).

### 3.444 Wide-Character Input/Output Functions

The functions that perform wide-oriented input from streams or wide-oriented output to streams: *fgetwc()*, *fgetws()*, *fputwc()*, *fputws()*, *fwprintf()*, *fwscanf()*, *getwc()*, *getwchar()*, *putwc()*, *putwchar()*, *ungetwc()*, *vfwprintf()*, *vfwscanf()*, *vwprintf()*, *vwscanf()*, *wprintf()*, and *wscanf()*.

**Note:** These functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

### 3.445 Wide-Character String

A contiguous sequence of wide-character codes terminated by and including the first null wide-character code.

### 3.446 Word

In the shell command language, a token other than an operator. In some cases a word is also a portion of a word token: in the various forms of parameter expansion, such as *\${name-word}*, and variable assignment, such as *name=word*, the word is the portion of the token depicted by *word*. The concept of a word is no longer applicable following word expansions—only fields remain.

**Note:** For further information, see XCU [Section 2.6.2](#) (on page 2344) and [Section 2.6](#) (on page 2343).

### 3.447 Working Directory (or Current Working Directory)

A directory, associated with a process, that is used in pathname resolution for pathnames that do not begin with a <slash> character.

### 3.448 Worldwide Portability Interface

Functions for handling characters in a codeset-independent manner.

### 3.449 Write

To output characters to a file, such as standard output or standard error. Unless otherwise stated, standard output is the default output destination for all uses of the term “write”; see the distinction between display and write in [Section 3.133](#) (on page 54).

### 3.450 XSI

The X/Open System Interfaces (XSI) option is the core application programming interface for C and *sh* programming for systems conforming to the Single UNIX Specification. This is a

2907 superset of the mandatory requirements for conformance to POSIX.1-2008.

### 2908 **3.451 XSI-Conformant**

2909 A system which allows an application to be built using a set of services that are consistent across  
2910 all systems that conform to POSIX.1-2008 and that support the XSI option.

2911 **Note:** See also [Chapter 2](#) (on page 15).

### 2912 **3.452 Zombie Process**

2913 The remains of a live process (see [Section 3.210](#), on page 66) after it terminates (see [Section 3.303](#),  
2914 on page 82) and before its status information (see XSH [Section 2.13](#), on page 548) is consumed by  
2915 its parent process.

### 2916 **3.453 $\pm 0$**

2917 The algebraic sign provides additional information about any variable that has the value zero  
2918 when the representation allows the sign to be determined.

2919

Chapter 4

2920

# General Concepts

2921

For the purposes of POSIX.1-2008, the general concepts given in [Chapter 4](#) apply.

2922

**Note:** No shading to denote extensions or options occurs in this chapter. Where the terms and definitions given in this chapter are used elsewhere in text related to extensions and options, they are shaded as appropriate.

2924

2925

## 4.1 Concurrent Execution

2926

Functions that suspend the execution of the calling thread shall not cause the execution of other threads to be indefinitely suspended.

2927

2928

## 4.2 Default Initialization

2929

Default initialization causes an object to be initialized according to these rules:

2930

- If it has pointer type, it is initialized to a null pointer.

2931

- If it has arithmetic type, it is initialized to (positive or unsigned) zero.

2932

- If it is an aggregate, every member is initialized (recursively) according to these rules.

2933

- If it is a union, the first named member is initialized (recursively) according to these rules.

2934

For an object of aggregate type with an explicit initializer, the initialization shall occur in initializer list order, each initializer provided for a particular subobject overriding any previously listed initializer for the same subobject; all subobjects that are not initialized explicitly shall be initialized implicitly according to the rules for default initialization.

2935

2936

2937

2938

Objects with static storage duration but no explicit initializer shall be initialized implicitly according to the rules for default initialization.

2939

2940

An explicit initializer of `{ 0 }` works to perform explicit default initialization for any object of scalar or aggregate type, and for any storage duration.

2941

2942

**Notes:**

2943

1. The ISO C standard does not require a compiler to set any field alignment padding bits in a structure or array definition to a particular value. Because of this, a structure initialized using `{ 0 }` might not *memcmp()* as equal to the same structure initialized using *memset()* to zero. For consistent results, portable applications comparing structures should test each field individually.

2944

2945

2946

2947

2948

2. If an implementation treats the all-zero bit pattern of a pointer object as a null pointer, and the all-zero bit pattern of a floating-point object as equivalent to positive 0, then *memset()* to zero and *calloc()* have the same effects as default initialization for all named members of a structure. Implementations that define `__STDC_IEC_559__` guarantee that the all-zero bit pattern of a floating-point object represents 0.0.

2949

2950

2951

MX

2952

### 4.3 Directory Protection

If a directory is writable and the mode bit `S_ISVTX` is set on the directory, a process may remove or rename files within that directory only if one or more of the following is true:

- The effective user ID of the process is the same as that of the owner ID of the file.
- The effective user ID of the process is the same as that of the owner ID of the directory.
- The process has appropriate privileges.
- Optionally, the file is writable by the process. Whether or not files that are writable by the process can be removed or renamed is implementation-defined.

If the `S_ISVTX` bit is set on a non-directory file, the behavior is unspecified.

### 4.4 Extended Security Controls

An implementation may provide implementation-defined extended security controls (see [Section 3.160](#), on page 58). These permit an implementation to provide security mechanisms to implement different security policies than those described in POSIX.1-2008. These mechanisms shall not alter or override the defined semantics of any of the interfaces in POSIX.1-2008.

### 4.5 File Access Permissions

The standard file access control mechanism uses the file permission bits, as described below.

Implementations may provide *additional* or *alternate* file access control mechanisms, or both. An additional access control mechanism shall only further restrict the access permissions defined by the file permission bits. An alternate file access control mechanism shall:

- Specify file permission bits for the file owner class, file group class, and file other class of that file, corresponding to the access permissions.
- Be enabled only by explicit user action, on a per-file basis by the file owner or a user with appropriate privileges.
- Be disabled for a file after the file permission bits are changed for that file with `chmod()`. The disabling of the alternate mechanism need not disable any additional mechanisms supported by an implementation.

Whenever a process requests file access permission for read, write, or execute/search, if no additional mechanism denies access, access shall be determined as follows:

- If a process has appropriate privileges:
  - If read, write, or directory search permission is requested, access shall be granted.
  - If execute permission is requested, access shall be granted if execute permission is granted to at least one user by the file permission bits or by an alternate access control mechanism; otherwise, access shall be denied.
- Otherwise:
  - The file permission bits of a file contain read, write, and execute/search permissions for the file owner class, file group class, and file other class.

2989 — Access shall be granted if an alternate access control mechanism is not enabled and  
 2990 the requested access permission bit is set for the class (file owner class, file group  
 2991 class, or file other class) to which the process belongs, or if an alternate access control  
 2992 mechanism is enabled and it allows the requested access; otherwise, access shall be  
 2993 denied.

## 2994 4.6 File Hierarchy

2995 Files in the system are organized in a hierarchical structure in which all of the non-terminal  
 2996 nodes are directories and all of the terminal nodes are any other type of file. Since multiple  
 2997 directory entries may refer to the same file, the hierarchy is properly described as a “directed  
 2998 graph”.

## 2999 4.7 Filenames

3000 Uppercase and lowercase letters shall retain their unique identities between conforming  
 3001 implementations.

## 3002 4.8 Filename Portability

3003 For a filename to be portable across implementations conforming to POSIX.1-2008, it shall  
 3004 consist only of the portable filename character set as defined in [Section 3.282](#) (on page 79).

3005 **Note:** Applications should avoid using filenames that have the <hyphen-minus> character as the first  
 3006 character since this may cause problems when filenames are passed as command line  
 3007 arguments.

## 3008 4.9 File Times Update

3009 Many operations have requirements to update file timestamps. These requirements do not apply +  
 3010 to streams that have no underlying file description (for example, memory streams created by +  
 3011 `open_memstream()` have no underlying file description). +

3012 Each file has three distinct associated timestamps: the time of last data access, the time of last  
 3013 data modification, and the time the file status last changed. These values are returned in the file  
 3014 characteristics structure **struct stat**, as described in [<sys/stat.h>](#) (on page 391).

3015 Each function or utility in POSIX.1-2008 that reads or writes data (even if the data does not  
 3016 change) or performs an operation to change file status (even if the file status does not change)  
 3017 indicates which of the appropriate timestamps shall be marked for update. If an implementation  
 3018 of such a function or utility marks for update one of these timestamps in a place or time not  
 3019 specified by POSIX.1-2008, this shall be documented, except that any changes caused by  
 3020 pathname resolution need not be documented. For the other functions or utilities in  
 3021 POSIX.1-2008 (those that are not explicitly required to read or write file data or change file  
 3022 status, but that in some implementations happen to do so), the effect is unspecified.

3023 An implementation may update timestamps that are marked for update immediately, or it may

update such timestamps periodically. At the point in time when an update occurs, any marked timestamps shall be set to the current time and the update marks shall be cleared. All timestamps that are marked for update shall be updated when the file ceases to be open by any process or before a *fstat()*, *fstatat()*, *fsync()*, *futimens()*, *lstat()*, *stat()*, *utime()*, *utimensat()*, or *utimes()* is successfully performed on the file. Other times at which updates are done are unspecified. Marks for update, and updates themselves, shall not be done for files on read-only file systems; see [Section 3.310](#) (on page 83).

The resolution of timestamps of files in a file system is implementation-defined, but shall be no coarser than one-second resolution. The three timestamps shall always have values that are supported by the file system. Whenever any of a file's timestamps are to be set to a value *V* according to the rules of the preceding paragraphs of this section, the implementation shall immediately set the timestamp to the greatest value supported by the file system that is not greater than *V*.

## 4.10 Host and Network Byte Orders

When data is transmitted over the network, it is sent as a sequence of octets (8-bit unsigned values). If an entity (such as an address or a port number) can be larger than 8 bits, it needs to be stored in several octets. The convention is that all such values are stored with 8 bits in each octet, and with the first (lowest-addressed) octet holding the most-significant bits. This is called "network byte order".

Network byte order may not be convenient for processing actual values. For this, it is more sensible for values to be stored as ordinary integers. This is known as "host byte order". In host byte order:

- The most significant bit might not be stored in the first byte in address order.
- Bits might not be allocated to bytes in any obvious order at all.

8-bit values stored in `uint8_t` objects do not require conversion to or from host byte order, as they have the same representation. 16 and 32-bit values can be converted using the *htonl()*, *htons()*, *ntohl()*, and *ntohs()* functions. When reading data that is to be converted to host byte order, it should either be received directly into a `uint16_t` or `uint32_t` object or should be copied from an array of bytes using *memcpy()* or similar. Passing the data through other types could cause the byte order to be changed. Similar considerations apply when sending data.

## 4.11 Measurement of Execution Time

The mechanism used to measure execution time shall be implementation-defined. The implementation shall also define to whom the CPU time that is consumed by interrupt handlers and system services on behalf of the operating system will be charged. See [Section 3.118](#) (on page 52).

## 4.12 Memory Synchronization

Applications shall ensure that access to any memory location by more than one thread of control (threads or processes) is restricted such that no thread of control can read or modify a memory location while another thread of control may be modifying it. Such access is restricted using functions that synchronize thread execution and also synchronize memory with respect to other threads. The following functions synchronize memory with respect to other threads:

<code>fork()</code>	<code>pthread_mutex_trylock()</code>	<code>pthread_rwlock_unlock()</code>
<code>pthread_barrier_wait()</code>	<code>pthread_mutex_unlock()</code>	<code>pthread_rwlock_wrlock()</code>
<code>pthread_cond_broadcast()</code>	<code>pthread_spin_lock()</code>	<code>sem_post()</code>
<code>pthread_cond_signal()</code>	<code>pthread_spin_trylock()</code>	<code>sem_timedwait()</code>
<code>pthread_cond_timedwait()</code>	<code>pthread_spin_unlock()</code>	<code>sem_trywait()</code>
<code>pthread_cond_wait()</code>	<code>pthread_rwlock_rdlock()</code>	<code>sem_wait()</code>
<code>pthread_create()</code>	<code>pthread_rwlock_timedrdlock()</code>	<code>semctl()</code>
<code>pthread_join()</code>	<code>pthread_rwlock_timedwrlock()</code>	<code>semop()</code>
<code>pthread_mutex_lock()</code>	<code>pthread_rwlock_tryrdlock()</code>	<code>wait()</code>
<code>pthread_mutex_timedlock()</code>	<code>pthread_rwlock_trywrlock()</code>	<code>waitpid()</code>

The `pthread_once()` function shall synchronize memory for the first call in each thread for a given **pthread\_once\_t** object. If the *init\_routine* called by `pthread_once()` is a cancellation point and is canceled, a call to `pthread_once()` or the same **pthread\_once\_t** object made from a cancellation cleanup handler shall also synchronize memory.

The `pthread_mutex_lock()` function need not synchronize memory if the mutex type is `PTHREAD_MUTEX_RECURSIVE` and the calling thread already owns the mutex. The `pthread_mutex_unlock()` function need not synchronize memory if the mutex type is `PTHREAD_MUTEX_RECURSIVE` and the mutex has a lock count greater than one.

Unless explicitly stated otherwise, if one of the above functions returns an error, it is unspecified whether the invocation causes memory to be synchronized.

Applications may allow more than one thread of control to read a memory location simultaneously.

## 4.13 Pathname Resolution

Pathname resolution is performed for a process to resolve a pathname to a particular directory entry for a file in the file hierarchy. There may be multiple pathnames that resolve to the same directory entry, and multiple directory entries for the same file. When a process resolves a pathname of an existing directory entry, the entire pathname shall be resolved as described below. When a process resolves a pathname of a directory entry that is to be created immediately after the pathname is resolved, pathname resolution terminates when all components of the path prefix of the last component have been resolved. It is then the responsibility of the process to create the final component.

Each filename in the pathname is located in the directory specified by its predecessor (for example, in the pathname fragment **a/b**, file **b** is located in directory **a**). Pathname resolution shall fail if this cannot be accomplished. If the pathname begins with a <slash>, the predecessor of the first filename in the pathname shall be taken to be the root directory of the process (such pathnames are referred to as “absolute pathnames”). If the pathname does not begin with a <slash>, the predecessor of the first filename of the pathname shall be taken to be either the current working directory of the process or for certain interfaces the directory identified by a file descriptor passed to the interface (such pathnames are referred to as “relative pathnames”).

The interpretation of a pathname component is dependent on the value of {NAME\_MAX} and \_POSIX\_NO\_TRUNC associated with the path prefix of that component. If any pathname component is longer than {NAME\_MAX}, the implementation shall consider this an error.

A pathname that contains at least one non-`<slash>` character and that ends with one or more trailing `<slash>` characters shall not be resolved successfully unless the last pathname component before the trailing `<slash>` characters names an existing directory or a directory entry that is to be created for a directory immediately after the pathname is resolved. Interfaces using pathname resolution may specify additional constraints<sup>6</sup> when a pathname that does not name an existing directory contains at least one non-`<slash>` character and contains one or more trailing `<slash>` characters.

If a symbolic link is encountered during pathname resolution, the behavior shall depend on whether the pathname component is at the end of the pathname and on the function being performed. If all of the following are true, then pathname resolution is complete:

1. This is the last pathname component of the pathname.
2. The pathname has no trailing `<slash>`.
3. The function is required to act on the symbolic link itself, or certain arguments direct that the function act on the symbolic link itself.

In all other cases, the system shall prefix the remaining pathname, if any, with the contents of the symbolic link, except that if the contents of the symbolic link is the empty string, then either pathname resolution shall fail with functions reporting an [ENOENT] error and utilities writing an equivalent diagnostic message, or the pathname of the directory containing the symbolic link shall be used in place of the contents of the symbolic link. If the contents of the symbolic link consist solely of `<slash>` characters, then all leading `<slash>` characters of the remaining pathname shall be omitted from the resulting combined pathname, leaving only the leading `<slash>` characters from the symbolic link contents. In the cases where prefixing occurs, if the combined length exceeds {PATH\_MAX}, and the implementation considers this to be an error, pathname resolution shall fail with functions reporting an [ENAMETOOLONG] error and utilities writing an equivalent diagnostic message. Otherwise, the resolved pathname shall be the resolution of the pathname just created. If the resulting pathname does not begin with a `<slash>`, the predecessor of the first filename of the pathname is taken to be the directory containing the symbolic link.

If the system detects a loop in the pathname resolution process, pathname resolution shall fail with functions reporting an [ELOOP] error and utilities writing an equivalent diagnostic message. The same may happen if during the resolution process more symbolic links were followed than the implementation allows. This implementation-defined limit shall not be smaller than {SYMLOOP\_MAX}.

The special filename dot shall refer to the directory specified by its predecessor. The special filename dot-dot shall refer to the parent directory of its predecessor directory. As a special case, in the root directory, dot-dot may refer to the root directory itself.

A pathname consisting of a single `<slash>` shall resolve to the root directory of the process. A null pathname shall not be successfully resolved. If a pathname begins with two successive `<slash>` characters, the first component following the leading `<slash>` characters may be interpreted in an implementation-defined manner, although more than two leading `<slash>` characters shall be treated as a single `<slash>` character.

Pathname resolution for a given pathname shall yield the same results when used by any

6. The only interfaces that further constrain pathnames in POSIX.1-2008 are the `rename()` and `renameat()` functions (see XSH `rename()`) and the `mv` utility (see XCU `mv`).

3151 interface in POSIX.1-2008 as long as there are no changes to any files evaluated during pathname  
3152 resolution for the given pathname between resolutions.

#### 3153 4.14 Process ID Reuse

3154 A process group ID shall not be reused by the system until the process group lifetime ends.

3155 A process ID shall not be reused by the system until the process lifetime ends. In addition, if  
3156 there exists a process group whose process group ID is equal to that process ID, the process ID  
3157 shall not be reused by the system until the process group lifetime ends. A process that is not a  
3158 system process shall not have a process ID of 1.

#### 3159 4.15 Scheduling Policy

3160 A scheduling policy affects process or thread ordering:

- 3161 • When a process or thread is a running thread and it becomes a blocked thread
- 3162 • When a process or thread is a running thread and it becomes a preempted thread
- 3163 • When a process or thread is a blocked thread and it becomes a runnable thread
- 3164 • When a running thread calls a function that can change the priority or scheduling policy of  
3165 a process or thread
- 3166 • In other scheduling policy-defined circumstances

3167 Conforming implementations shall define the manner in which each of the scheduling policies  
3168 may modify the priorities or otherwise affect the ordering of processes or threads at each of the  
3169 occurrences listed above. Additionally, conforming implementations shall define in what other  
3170 circumstances and in what manner each scheduling policy may modify the priorities or affect  
3171 the ordering of processes or threads.

#### 3172 4.16 Seconds Since the Epoch

3173 A value that approximates the number of seconds that have elapsed since the Epoch. A  
3174 Coordinated Universal Time name (specified in terms of seconds (*tm\_sec*), minutes (*tm\_min*),  
3175 hours (*tm\_hour*), days since January 1 of the year (*tm\_yday*), and calendar year minus 1900  
3176 (*tm\_year*)) is related to a time represented as seconds since the Epoch, according to the  
3177 expression below.

3178 If the year is <1970 or the value is negative, the relationship is undefined. If the year is ≥1970 and  
3179 the value is non-negative, the value is related to a Coordinated Universal Time name according  
3180 to the C-language expression, where *tm\_sec*, *tm\_min*, *tm\_hour*, *tm\_yday*, and *tm\_year* are all  
3181 integer types:

3182 
$$tm\_sec + tm\_min*60 + tm\_hour*3600 + tm\_yday*86400 +$$
  
3183 
$$(tm\_year-70)*31536000 + ((tm\_year-69)/4)*86400 -$$
  
3184 
$$((tm\_year-1)/100)*86400 + ((tm\_year+299)/400)*86400$$

3185 The relationship between the actual time of day and the current value for seconds since the  
3186 Epoch is unspecified.

How any changes to the value of seconds since the Epoch are made to align to a desired relationship with the current actual time is implementation-defined. As represented in seconds since the Epoch, each and every day shall be accounted for by exactly 86 400 seconds.

**Note:** The last three terms of the expression add in a day for each year that follows a leap year starting with the first leap year since the Epoch. The first term adds a day every 4 years starting in 1973, the second subtracts a day back out every 100 years starting in 2001, and the third adds a day back in every 400 years starting in 2001. The divisions in the formula are integer divisions; that is, the remainder is discarded leaving only the integer quotient.

## 4.17 Semaphore

A minimum synchronization primitive to serve as a basis for more complex synchronization mechanisms to be defined by the application program.

For the semaphores associated with the Semaphores option, a semaphore is represented as a shareable resource that has a non-negative integer value. When the value is zero, there is a (possibly empty) set of threads awaiting the availability of the semaphore.

For the semaphores associated with the X/Open System Interfaces (XSI) option, a semaphore is a positive integer (0 through 32767). The *semget()* function can be called to create a set or array of semaphores. A semaphore set can contain one or more semaphores up to an implementation-defined value.

### Semaphore Lock Operation

An operation that is applied to a semaphore. If, prior to the operation, the value of the semaphore is zero, the semaphore lock operation shall cause the calling thread to be blocked and added to the set of threads awaiting the semaphore; otherwise, the value shall be decremented.

### Semaphore Unlock Operation

An operation that is applied to a semaphore. If, prior to the operation, there are any threads in the set of threads awaiting the semaphore, then some thread from that set shall be removed from the set and becomes unblocked; otherwise, the semaphore value shall be incremented.

## 4.18 Thread-Safety

Refer to XSH [Section 2.9](#) (on page 512).

## 4.19 Tracing

The trace system allows a traced process to have a selection of events created for it. Traces consist of streams of trace event types.

A trace event type is identified on the one hand by a trace event type name, also referenced as a trace event name, and on the other hand by a trace event type identifier. A trace event name is a human-readable string. A trace event type identifier is an opaque identifier used by the trace system. There shall be a one-to-one relationship between trace event type identifiers and trace event names for a given trace stream and also for a given traced process. The trace event type identifier shall be generated automatically from a trace event name by the trace system either when a trace controller process invokes *posix\_trace\_trid\_eventid\_open()* or when an instrumented application process invokes *posix\_trace\_eventid\_open()*. Trace event type identifiers are used to filter trace event types, to allow interpretation of user data, and to identify the kind of trace point that generated a trace event.

Each trace event shall be of a particular trace event type, and associated with a trace event type identifier. The execution of a trace point shall generate a trace event if a trace stream has been created and started for the process that executed the trace point and if the corresponding trace event type identifier is not ignored by filtering.

A generated trace event shall be recorded in a trace stream, and optionally also in a trace log if a trace log is associated with the trace stream, except that:

- For a trace stream, if no resources are available for the event, the event is lost.
- For a trace log, if no resources are available for the event, or a flush operation does not succeed, the event is lost.

A trace event recorded in an active trace stream may be retrieved by an application having appropriate privileges.

A trace event recorded in a trace log may be retrieved by an application having appropriate privileges after opening the trace log as a pre-recorded trace stream, with the function *posix\_trace\_open()*.

When a trace event is reported it is possible to retrieve the following:

- A trace event type identifier
- A timestamp
- The process ID of the traced process, if the trace event is process-dependent
- Any optional trace event data including its length
- If the Threads option is supported, the thread ID, if the trace event is process-dependent
- The program address at which the trace point was invoked

Trace events may be mapped from trace event types to trace event names. One such mapping shall be associated with each trace stream. An active trace stream is associated with a traced process, and also with its children if the Trace Inherit option is supported and also the inheritance policy is set to *\_POSIX\_TRACE\_INHERIT*. Therefore each traced process has a mapping of the trace event names to trace event type identifiers that have been defined for that process.

Traces can be recorded into either trace streams or trace logs.

The implementation and format of a trace stream are unspecified. A trace stream need not be and generally is not persistent. A trace stream may be either active or pre-recorded:

- An active trace stream is a trace stream that has been created and has not yet been shut down. It can be of one of the two following classes:

1. An active trace stream without a trace log that was created with the *posix\_trace\_create()* function
2. If the Trace Log option is supported, an active trace stream with a trace log that was created with the *posix\_trace\_create\_withlog()* function

- A pre-recorded trace stream is a trace stream that was opened from a trace log object using the *posix\_trace\_open()* function.

An active trace stream can loop. This behavior means that when the resources allocated by the trace system for the trace stream are exhausted, the trace system reuses the resources associated with the oldest recorded trace events to record new trace events.

If the Trace Log option is supported, an active trace stream with a trace log can be flushed. This operation causes the trace system to write trace events from the trace stream to the associated trace log, following the defined policies or using an explicit function call. After this operation, the trace system may reuse the resources associated with the flushed trace events.

An active trace stream with or without a trace log can be cleared. This operation shall cause all the resources associated with this trace stream to be reinitialized. The trace stream shall behave as if it was returning from its creation, except that the mapping of trace event type identifiers to trace event names shall not be cleared. If a trace log was associated with this trace stream, the trace log shall also be reinitialized.

A trace log shall be recorded when the *posix\_trace\_shutdown()* operation is invoked or during tracing, depending on the tracing strategy which is defined by a log policy. After the trace stream has been shut down, the trace information can be retrieved from the associated trace log using the same interface used to retrieve information from an active trace stream.

For a traced process, if the Trace Inherit option is supported and the trace stream's inheritance attribute is `_POSIX_TRACE_INHERIT`, the initial targeted traced process shall be traced together with all of its future children. The *posix\_pid* member of each trace event in a trace stream shall be the process ID of the traced process.

Each trace point may be an implementation-defined action such as a context switch, or an application-programmed action such as a call to a specific operating system service (for example, *fork()*) or a call to *posix\_trace\_event()*.

Trace points may be filtered. The operation of the filter is to filter out (ignore) selected trace events. By default, no trace events are filtered.

The results of the tracing operations can be analyzed and monitored by a trace controller process or a trace analyzer process.

Only the trace controller process has control of the trace stream it has created. The control of the operation of a trace stream is done using its corresponding trace stream identifier. The trace controller process is able to:

- Initialize the attributes of a trace stream
- Create the trace stream
- Start and stop tracing
- Know the mapping of the traced process

- If the Trace Event Filter option is supported, filter the type of trace events to be recorded
- Shut the trace stream down

A traced process may also be a trace controller process. Only the trace controller process can control its trace stream(s). A trace stream created by a trace controller process shall be shut down if its controller process terminates or executes another file.

A trace controller process may also be a trace analyzer process. Trace analysis can be done concurrently with the traced process or can be done off-line, in the same or in a different platform.

## 4.20 Treatment of Error Conditions for Mathematical Functions

For all the functions in the `<math.h>` header, an application wishing to check for error situations should set `errno` to 0 and call `feclearexcept(FE_ALL_EXCEPT)` before calling the function. On return, if `errno` is non-zero or `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-zero, an error has occurred.

On implementations that support the IEC 60559 Floating-Point option, whether or when functions in the `<math.h>` header raise an undeserved underflow floating-point exception is unspecified. Otherwise, as implied by XSH `feraiseexcept()`, the `<math.h>` functions do not raise spurious floating-point exceptions (detectable by the user), other than the inexact floating-point exception.

The following error conditions are defined for all functions in the `<math.h>` header.

### 4.20.1 Domain Error

A “domain error” shall occur if an input argument is outside the domain over which the mathematical function is defined. The description of each function lists any required domain errors; an implementation may define additional domain errors, provided that such errors are consistent with the mathematical definition of the function.

On a domain error, the function shall return an implementation-defined value; if the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero, `errno` shall be set to [EDOM]; if the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero, the “invalid” floating-point exception shall be raised.

### 4.20.2 Pole Error

A “pole error” occurs if the mathematical result of the function is an exact infinity (for example, `log(0.0)`).

On a pole error, the function shall return the value of the macro `HUGE_VAL`, `HUGE_VALF`, or `HUGE_VALL` according to the return type, with the same sign as the correct value of the function; if the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero, `errno` shall be set to [ERANGE]; if the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero, the “divide-by-zero” floating-point exception shall be raised.

### 4.20.3 Range Error

A “range error” shall occur if the finite mathematical result of the function cannot be represented in an object of the specified type, due to extreme magnitude.

#### 4.20.3.1 Result Overflows

A floating result overflows if the magnitude of the mathematical result is finite but so large that the mathematical result cannot be represented without extraordinary roundoff error in an object of the specified type. If a floating result overflows and default rounding is in effect, then the function shall return the value of the macro `HUGE_VAL`, `HUGE_VALF`, or `HUGE_VALL` according to the return type, with the same sign as the correct value of the function; if the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero, `errno` shall be set to `[ERANGE]`; if the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero, the “overflow” floating-point exception shall be raised.

#### 4.20.3.2 Result Underflows

The result underflows if the magnitude of the mathematical result is so small that the mathematical result cannot be represented, without extraordinary roundoff error, in an object of the specified type. If the result underflows, the function shall return an implementation-defined value whose magnitude is no greater than the smallest normalized positive number in the specified type; if the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero, whether `errno` is set to `[ERANGE]` is implementation-defined; if the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero, whether the “underflow” floating-point exception is raised is implementation-defined.

## 4.21 Treatment of NaN Arguments for the Mathematical Functions

For functions called with a NaN argument, no errors shall occur and a NaN shall be returned, except where stated otherwise.

If a function with one or more NaN arguments returns a NaN result, the result should be the same as one of the NaN arguments (after possible type conversion), except perhaps for the sign.

On implementations that support the IEC 60559:1989 standard floating point, functions with signaling NaN argument(s) shall be treated as if the function were called with an argument that is a required domain error and shall return a quiet NaN result, except where stated otherwise.

**Note:** The function might never see the signaling NaN, since it might trigger when the arguments are evaluated during the function call.

On implementations that support the IEC 60559:1989 standard floating point, for those functions that do not have a documented domain error, the following shall apply:

These functions shall fail if:

Domain Error Any argument is a signaling NaN.

Either, the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero and `errno` shall be set to `[EDOM]`, or the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero and the invalid floating-point exception shall be raised.

## 4.22 Utility

A utility program shall be either an executable file, such as might be produced by a compiler or linker system from computer source code, or a file of shell source code, directly interpreted by the shell. The program may have been produced by the user, provided by the system implementor, or acquired from an independent distributor.

The system may implement certain utilities as shell functions (see XCU [Section 2.9.5](#), on page 2364) or built-in utilities, but only an application that is aware of the command search order (as described in XCU [Section 2.9.1.1](#), on page 2357) or of performance characteristics can discern differences between the behavior of such a function or built-in utility and that of an executable file.

## 4.23 Variable Assignment

In the shell command language, a word consisting of the following parts:

*varname=value*

When used in a context where assignment is defined to occur and at no other time, the *value* (representing a word or field) shall be assigned as the value of the variable denoted by *varname*.

**Note:** For further information, see XCU [Section 2.9.1](#) (on page 2355).

The *varname* and *value* parts shall meet the requirements for a name and a word, respectively, except that they are delimited by the embedded unquoted <equals-sign>, in addition to other delimiters.

**Note:** Additional delimiters are described in XCU [Section 2.3](#) (on page 2337).

When a variable assignment is done, the variable shall be created if it did not already exist. If *value* is not specified, the variable shall be given a null value.

**Note:** An alternative form of variable assignment:

*symbol=value*

(where *symbol* is a valid word delimited by an <equals-sign>, but not a valid name) produces unspecified results. The form *symbol=value* is used by the KornShell *name[expression]=value* syntax.

## File Format Notation

The STDIN, STDOUT, STDERR, INPUT FILES, and OUTPUT FILES sections of the utility descriptions use a syntax to describe the data organization within the files, when that organization is not otherwise obvious. The syntax is similar to that used by the System Interfaces volume of POSIX.1-2008 *printf()* function, as described in this chapter. When used in STDIN or INPUT FILES sections of the utility descriptions, this syntax describes the format that could have been used to write the text to be read, not a format that could be used by the System Interfaces volume of POSIX.1-2008 *scanf()* function to read the input file.

The description of an individual record is as follows:

"<format>", [<arg1>, <arg2>, . . . , <argn>]

The *format* is a character string that contains three types of objects defined below:

1. *Characters* that are not "escape sequences" or "conversion specifications", as described below, shall be copied to the output.
2. *Escape Sequences* represent non-graphic characters and the escape character (<backslash>).
3. *Conversion Specifications* specify the output format of each argument; see below.

The following characters have the following special meaning in the format string:

' ' (An empty character position.) Represents one or more <blank> characters.

Δ Represents exactly one <space> character.

Table 5-1 lists escape sequences and associated actions on display devices capable of the action.

**Table 5-1** Escape Sequences and Associated Actions

Escape Sequence	Represents Character	Terminal Action
\\	<backslash>	Print the <backslash> character.
\a	<alert>	Attempt to alert the user through audible or visible notification.
\b	<backspace>	Move the printing position to one column before the current position, unless the current position is the start of a line.
\f	<form-feed>	Move the printing position to the initial printing position of the next logical page.
\n	<newline>	Move the printing position to the start of the next line.
\r	<carriage-return>	Move the printing position to the start of the current line.
\t	<tab>	Move the printing position to the next tab position on the current line. If there are no more tab positions remaining on the line, the behavior is undefined.
\v	<vertical-tab>	Move the printing position to the start of the next <vertical-tab> position. If there are no more <vertical-tab> positions left on the page, the behavior is undefined.

Each conversion specification is introduced by the <percent-sign> character ('%'). After the character '%', the following shall appear in sequence:

*flags* Zero or more *flags*, in any order, that modify the meaning of the conversion specification.

*field width* An optional string of decimal digits to specify a minimum field width. For an output field, if the converted value has fewer bytes than the field width, it shall be padded on the left (or right, if the left-adjustment flag ('-'), described below, has been given) to the field width.

*precision* Gives the minimum number of digits to appear for the d, o, i, u, x, or X conversion specifiers (the field is padded with leading zeros), the number of digits to appear after the radix character for the e and f conversion specifiers, the maximum number of significant digits for the g conversion specifier; or the maximum number of bytes to be written from a string in the s conversion specifier. The precision shall take the form of a <period> ('.') followed by a decimal digit string; a null digit string is treated as zero.

*conversion specifier characters*

A conversion specifier character (see below) that indicates the type of conversion to be applied.

The *flag* characters and their meanings are:

– The result of the conversion shall be left-justified within the field.

– The result of a signed conversion shall always begin with a sign ('+' or '-').

<space> If the first character of a signed conversion is not a sign, a <space> shall be prefixed to the result. This means that if the <space> and '+' flags both appear, the <space> flag shall be ignored.

# The value shall be converted to an alternative form. For c, d, i, u, and s conversion specifiers, the behavior is undefined. For the o conversion specifier, it shall increase the precision to force the first digit of the result to be a zero. For x or X conversion specifiers, a non-zero result has 0x or 0X prefixed to it, respectively. For a, A, e, E, f, F, g, and G conversion specifiers, the result shall always contain a radix character, even if no digits follow the radix character. For g and G conversion specifiers, trailing zeros shall not be removed from the result as they usually are.

0 For a, A, d, e, E, f, F, g, G, i, o, u, x, and X conversion specifiers, leading zeros (following any indication of sign or base) shall be used to pad to the field width rather than performing space padding, except when converting an infinity or NaN. If the '0' and '-' flags both appear, the '0' flag shall be ignored. For d, i, o, u, x, and X conversion specifiers, if a precision is specified, the '0' flag shall be ignored. For other conversion specifiers, the behavior is undefined.

Each conversion specifier character shall result in fetching zero or more arguments. The results are undefined if there are insufficient arguments for the format. If the format is exhausted while arguments remain, the excess arguments shall be ignored.

The conversion specifiers and their meanings are:

a,A The floating-point number argument representing a floating-point number shall be converted in the style "[–]0xh.hhhhp±d", where there is one hexadecimal digit (which shall be non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point character and the number of hexadecimal digits after it is equal to the precision; if the precision is missing

3484		and FLT_RADIX is a power of 2, then the precision shall be sufficient for an exact
3485		representation of the value; if the precision is missing and FLT_RADIX is not a
3486		power of 2, then the precision shall be sufficient to distinguish different floating-
3487		point values in the internal representation used by the utility, except that trailing
3488		zeros may be omitted; if the precision is zero and the # flag is not specified, no
3489		decimal-point character shall appear. The letters "abcdef" shall be used for a
3490		conversion and the letters "ABCDEF" for A conversion. The A conversion specifier
3491		produces a number with X and P instead of x and p. The exponent shall always
3492		contain at least one digit, and only as many more digits as necessary to represent
3493		the decimal exponent of 2. If the value is zero, the exponent shall be zero. A
3494		floating-point number argument representing an infinity or NaN shall be
3495		converted in the style of an f or F conversion specifier.
3496	d,i,o,u,x,X	The integer argument shall be written as signed decimal (d or i), unsigned octal
3497		(o), unsigned decimal (u), or unsigned hexadecimal notation (x and X). The d and
3498		i specifiers shall convert to signed decimal in the style "[−]dddd". The x
3499		conversion specifier shall use the numbers and letters "0123456789abcdef" and
3500		the X conversion specifier shall use the numbers and letters
3501		"0123456789ABCDEF". The <i>precision</i> component of the argument shall specify
3502		the minimum number of digits to appear. If the value being converted can be
3503		represented in fewer digits than the specified minimum, it shall be expanded with
3504		leading zeros. The default precision shall be 1. The result of converting a zero
3505		value with a precision of 0 shall be no characters. If both the field width and
3506		precision are omitted, the implementation may precede, follow, or precede and
3507		follow numeric arguments of types d, i, and u with <blank> characters; arguments
3508		of type o (octal) may be preceded with leading zeros.
3509	f,F	The floating-point number argument shall be written in decimal notation in the
3510		style [−]ddd.ddd, where the number of digits after the radix character (shown here
3511		as a decimal point) shall be equal to the <i>precision</i> specification. The LC_NUMERIC
3512		locale category shall determine the radix character to use in this format. If the
3513		<i>precision</i> is omitted from the argument, six digits shall be written after the radix
3514		character; if the <i>precision</i> is explicitly 0, no radix character shall appear.
3515		A floating-point number argument representing an infinity shall be converted in
3516		one of the styles "[−]inf" or "[−]infinity"; which style is implementation-
3517		defined. A floating-point number argument representing a NaN shall be converted
3518		in one of the styles "[−]nan( <i>n-char-sequence</i> )" or "[−]nan"; which style,
3519		and the meaning of any <i>n-char-sequence</i> , is implementation-defined. The F
3520		conversion specifier produces "INF", "INFINITY", or "NAN" instead of "inf",
3521		"infinity", or "nan", respectively.
3522	e,E	The floating-point number argument shall be written in the style [−]d.ddde±dd (the
3523		symbol '±' indicates either a <plus-sign> or <hyphen-minus>), where there is one
3524		digit before the radix character (shown here as a decimal point) and the number of
3525		digits after it is equal to the precision. The LC_NUMERIC locale category shall
3526		determine the radix character to use in this format. When the precision is missing,
3527		six digits shall be written after the radix character; if the precision is 0, no radix
3528		character shall appear. The E conversion specifier shall produce a number with E
3529		instead of e introducing the exponent. The exponent shall always contain at least
3530		two digits. However, if the value to be written requires an exponent greater than
3531		two digits, additional exponent digits shall be written as necessary.
3532		A floating-point number argument representing an infinity or NaN shall be
3533		converted in the style of an f or F conversion specifier.

3534	g,G	The floating-point number argument shall be written in style <code>f</code> or <code>e</code> (or in style <code>F</code> or <code>E</code> in the case of a <code>G</code> conversion specifier), with the precision specifying the number of significant digits. The style used depends on the value converted: style <code>e</code> (or <code>E</code> ) shall be used only if the exponent resulting from the conversion is less than $-4$ or greater than or equal to the precision. Trailing zeros are removed from the result. A radix character shall appear only if it is followed by a digit.
3535		
3536		
3537		
3538		
3539		
3540		A floating-point number argument representing an infinity or NaN shall be converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
3541		
3542	c	The single-byte character argument shall be written.
3543	s	The argument shall be taken to be a string and bytes from the string shall be written until the end of the string or the number of bytes indicated by the <i>precision</i> specification of the argument is reached. If the precision is omitted from the argument, it shall be taken to be infinite, so all bytes up to the end of the string shall be written.
3544		
3545		
3546		
3547		
3548	%	Write a ' % ' character; no argument is converted.
3549		In no case does a nonexistent or insufficient field width cause truncation of a field; if the result of a conversion is wider than the field width, the field is simply expanded to contain the conversion result. The term “field width” should not be confused with the term “precision” used in the description of <code>%s</code> .
3550		
3551		
3552		

### Examples

To represent the output of a program that prints a date and time in the form Sunday, July 3, 10:02, where *weekday* and *month* are strings:

```
"%s,%s,%d,%d:%.2d\n" <weekday>, <month>, <day>, <hour>, <min>
```

To show '  $\pi$  ' written to 5 decimal places:

```
"pi=%f\n", <value of  $\pi$ >
```

To show an input file format consisting of five <colon>-separated fields:

```
"%s:%s:%s:%s:%s\n", <arg1>, <arg2>, <arg3>, <arg4>, <arg5>
```

## 6.1 Portable Character Set

Conforming implementations shall support one or more coded character sets. Each supported locale shall include the *portable character set*, which is the set of symbolic names for characters in Table 6-1. This is used to describe characters within the text of POSIX.1-2008. The first eight entries in Table 6-1 and all characters in Table 6-2 (on page 130) are defined in the ISO/IEC 6429:1992 standard. The rest of the characters in Table 6-1 are defined in the ISO/IEC 10646-1:2000 standard.

**Table 6-1** Portable Character Set

Symbolic Name(s)	Glyph	UCS	Description
<NUL>		<U0000>	NULL (NUL)
<alert>, <BEL>		<U0007>	BELL
<backspace>, <BS>		<U0008>	BACKSPACE
<tab>, <HT>		<U0009>	CHARACTER TABULATION
<newline>, <LF>		<U000A>	LINE FEED (LF)
<vertical-tab>, <VT>		<U000B>	LINE TABULATION
<form-feed>, <FF>		<U000C>	FORM FEED (FF)
<carriage-return>, <CR>		<U000D>	CARRIAGE RETURN (CR)
<space>		<U0020>	SPACE
<exclamation-mark>	!	<U0021>	EXCLAMATION MARK
<quotation-mark>	"	<U0022>	QUOTATION MARK

3666	<t>	t	<U0074>	LATIN SMALL LETTER T
3667	<u>	u	<U0075>	LATIN SMALL LETTER U
3668	<v>	v	<U0076>	LATIN SMALL LETTER V
3669	<w>	w	<U0077>	LATIN SMALL LETTER W
3670	<x>	x	<U0078>	LATIN SMALL LETTER X
3671	<y>	y	<U0079>	LATIN SMALL LETTER Y
3672	<z>	z	<U007A>	LATIN SMALL LETTER Z
3673	<left-brace>, <left-curly-bracket>	{	<U007B>	LEFT CURLY BRACKET
3674	<vertical-line>		<U007C>	VERTICAL LINE
3675	<right-brace>, <right-curly-bracket>	}	<U007D>	RIGHT CURLY BRACKET
3676	<tilde>	~	<U007E>	TILDE

POSIX.1-2008 uses character names other than the above, but only in an informative way; for example, in examples to illustrate the use of characters beyond the portable character set with the facilities of POSIX.1-2008.

**Table 6-1** (on page 125) defines the characters in the portable character set and the corresponding symbolic character names used to identify each character in a character set description file. Characters defined in **Table 6-2** (on page 130) may also be used in character set description files.

POSIX.1-2008 places only the following requirements on the encoded values of the characters in the portable character set:

- If the encoded values associated with each member of the portable character set are not invariant across all locales supported by the implementation, if an application uses any pair of locales where the character encodings differ, or accesses data from an application using a locale which has different encodings from the locales used by the application, the results are unspecified.
- The encoded values associated with the digits 0 to 9 shall be such that the value of each character after 0 shall be one greater than the value of the previous character.
- A null character, NUL, which has all bits set to zero, shall be in the set of characters.
- The encoded values associated with <period>, <slash>, <newline>, and <carriage-return> shall be invariant across all locales supported by the implementation.
- The encoded values associated with <slash> and <period> shall be invariant across all locales supported by the implementation.
- The encoded values associated with the members of the portable character set are each represented in a single byte. Moreover, if the value is stored in an object of C-language type **char**, it is guaranteed to be positive (except the NUL, which is always zero).

Conforming implementations shall support certain character and character set attributes, as

defined in [Section 7.2](#) (on page 136).

## 6.2 Character Encoding

The POSIX locale shall contain 256 single-byte characters including the characters in [Table 6-1](#) (on page 125) and [Table 6-2](#) (on page 130), which have the properties listed in [Section 7.3.1](#) (on page 139). It is unspecified whether characters not listed in those two tables are classified as **punct** or **cntrl**, or neither. Other locales shall contain the characters in [Table 6-1](#) (on page 125) and may contain any or all of the control characters identified in [Table 6-2](#) (on page 130); the presence, meaning, and representation of any additional characters are locale-specific.

In locales other than the POSIX locale, a character may have a state-dependent encoding. There are two types of these encodings:

- A single-shift encoding (where each character not in the initial shift state is preceded by a shift code) can be defined if each shift-code and character sequence is considered a multi-byte character. This is done using the concatenated-constant format in a character set description file, as described in [Section 6.4](#) (on page 129). If the implementation supports a character encoding of this type, all of the standard utilities in the Shell and Utilities volume of POSIX.1-2008 shall support it. Use of a single-shift encoding with any of the functions in the System Interfaces volume of POSIX.1-2008 that do not specifically mention the effects of state-dependent encoding is implementation-defined.
- A locking-shift encoding (where the state of the character is determined by a shift code that may affect more than the single character following it) cannot be defined with the current character set description file format. Use of a locking-shift encoding with any of the standard utilities in the Shell and Utilities volume of POSIX.1-2008 or with any of the functions in the System Interfaces volume of POSIX.1-2008 that do not specifically mention the effects of state-dependent encoding is implementation-defined.

While in the initial shift state, all characters in the portable character set shall retain their usual interpretation and shall not alter the shift state. The interpretation for subsequent bytes in the sequence shall be a function of the current shift state. A byte with all bits zero shall be interpreted as the null character independent of shift state. Such a byte shall not occur as part of any other character. Likewise, the byte values used to encode <period>, <slash>, <newline>, and <carriage-return> shall not occur as part of any other character in any locale.

The maximum allowable number of bytes in a character in the current locale shall be indicated by {MB\_CUR\_MAX}, defined in the [<stdlib.h>](#) header and by the [<mb\\_cur\\_max>](#) value in a character set description file; see [Section 6.4](#) (on page 129). The implementation's maximum number of bytes in a character shall be defined by the C-language macro {MB\_LEN\_MAX}.

## 6.3 C Language Wide-Character Codes

In the shell, the standard utilities are written so that the encodings of characters are described by the locale's `LC_CTYPE` definition (see [Section 7.3.1](#), on page 139) and there is no differentiation between characters consisting of single octets (8-bit bytes) or multiple bytes. However, in the C language, a differentiation is made. To ease the handling of variable length characters, the C language has introduced the concept of wide-character codes.

All wide-character codes in a given process consist of an equal number of bits. This is in contrast to characters, which can consist of a variable number of bytes. The byte or byte sequence that represents a character can also be represented as a wide-character code. Wide-character codes thus provide a uniform size for manipulating text data. A wide-character code having all bits zero is the null wide-character code (see [Section 3.251](#), on page 73), and terminates wide-character strings (see [Section 3.443](#), on page 104). The wide-character value for each member of the portable character set shall equal its value when used as the lone character in an integer character constant. Wide-character codes for other characters are locale and implementation-defined. State shift bytes shall not have a wide-character code representation. POSIX.1-2008 provides no means of defining a wide-character codeset.

## 6.4 Character Set Description File

Implementations shall provide a character set description file for at least one coded character set supported by the implementation. These files are referred to elsewhere in POSIX.1-2008 as *charmap* files. It is implementation-defined whether or not users or applications can provide additional character set description files.

POSIX.1-2008 does not require that multiple character sets or codesets be supported. Although multiple *charmap* files are supported, it is the responsibility of the implementation to provide the file or files; if only one is provided, only that one is accessible using the *localedef* utility's `-f` option.

Each character set description file, except those that use the ISO/IEC 10646-1:2000 standard position values as the encoding values, shall define characteristics for the coded character set and the encoding for the characters specified in [Table 6-1](#) (on page 125), and may define encoding for additional characters supported by the implementation. Other information about the coded character set may also be in the file. Coded character set character values shall be defined using symbolic character names followed by character encoding values.

Each symbolic name specified in [Table 6-1](#) (on page 125) shall be included in the file. Each character in [Table 6-1](#) (on page 125) (each row in the table) shall be mapped to a unique coding value. For each character in [Table 6-2](#) (on page 130) that exists in the character set described by the file, the character's symbolic name(s) from [Table 6-2](#) (on page 130) and the character's single-byte encoding value shall be included in the file.

3798

3799

3800

The following declarations can precede the character definitions. Each shall consist of the symbol shown in the following list, starting in column 1, including the surrounding brackets, followed by one or more <blank> characters, followed by the value to be assigned to the symbol.

3801

3802

3803

3804

**<code\_set\_name>** The name of the coded character set for which the character set description file is defined. The characters of the name shall be taken from the set of characters with visible glyphs defined in Table 6-1 (on page 125).

3805

3806

**<mb\_cur\_max>** The maximum number of bytes in a multi-byte character. This shall default to 1.

3807

3808

3809

XSI

**<mb\_cur\_min>** An unsigned positive integer value that defines the minimum number of bytes in a character for the encoded character set. On XSI-conformant systems, <mb\_cur\_min> shall always be 1.

3810

3811

3812

3813

**<escape\_char>** The character used to indicate that the characters following shall be interpreted in a special way, as defined later in this section. This shall default to <backslash> ('\\'), which is the character used in all the following text and examples, unless otherwise noted.

3814

3815

3816

**<comment\_char>** The character that, when placed in column 1 of a charmap line, is used to indicate that the line shall be ignored. The default character shall be the <number-sign> ('#').

3817

The character set mapping definitions shall be all the lines immediately following an identifier

line containing the string "CHARMAP" starting in column 1, and preceding a trailer line containing the string "END CHARMAP" starting in column 1. Empty lines and lines containing a **<comment\_char>** in the first column shall be ignored. Each non-comment line of the character set mapping definition (that is, between the "CHARMAP" and "END CHARMAP" lines of the file) shall be in either of two forms:

```
"%s %s %s\n", <symbolic-name>, <encoding>, <comments>
```

or:

```
"%s...%s %s %s\n", <symbolic-name>, <symbolic-name>,  
    <encoding>, <comments>
```

In the first format, the line in the character set mapping definition shall define a single symbolic name and a corresponding encoding. A symbolic name is one or more characters from the set shown with visible glyphs in [Table 6-1](#) (on page 125), enclosed between angle brackets. A character following an escape character is interpreted as itself; for example, the sequence "<\\>" represents the symbolic name ">" enclosed between angle brackets.

In the second format, the line in the character set mapping definition shall define a range of one or more symbolic names. In this form, the symbolic names shall consist of zero or more non-numeric characters from the set shown with visible glyphs in [Table 6-1](#) (on page 125), followed by an integer formed by one or more decimal digits. Both integers shall contain the same number of digits. The characters preceding the integer shall be identical in the two symbolic names, and the integer formed by the digits in the second symbolic name shall be equal to or greater than the integer formed by the digits in the first name. This shall be interpreted as a series of symbolic names formed from the common part and each of the integers between the first and the second integer, inclusive. As an example, <j0101>...<j0104> is interpreted as the symbolic names <j0101>, <j0102>, <j0103>, and <j0104>, in that order.

A character set mapping definition line shall exist for all symbolic names specified in [Table 6-1](#) (on page 125), and shall define the coded character value that corresponds to the character indicated in the table, or the coded character value that corresponds to the control character symbolic name. If the control characters commonly associated with the symbolic names in [Table 6-2](#) (on page 130) are supported by the implementation, the symbolic name and the corresponding encoding value shall be included in the file. Additional unique symbolic names may be included. A coded character value can be represented by more than one symbolic name.

The encoding part is expressed as one (for single-byte character values) or more concatenated decimal, octal, or hexadecimal constants in the following formats:

```
"%cd%u", <escape_char>, <decimal byte value>
```

```
"%cx%x", <escape_char>, <hexadecimal byte value>
```

```
"%co", <escape_char>, <octal byte value>
```

Decimal constants shall be represented by two or three decimal digits, preceded by the escape character and the lowercase letter 'd'; for example, "\d05", "\d97", or "\d143". Hexadecimal constants shall be represented by two hexadecimal digits, preceded by the escape character and the lowercase letter 'x'; for example, "\x05", "\x61", or "\x8f". Octal constants shall be represented by two or three octal digits, preceded by the escape character; for example, "\05", "\141", or "\217". In a portable charmap file, each constant represents an 8-bit byte. When constants are concatenated for multi-byte character values, they shall be of the same type, and interpreted in sequence from first to last with the first byte of the multi-byte character specified by the first byte in the sequence. The manner in which these constants are represented in the character stored in the system is implementation-defined. (This notation was chosen for reasons of portability. There is no requirement that the internal representation in the computer memory be in this same order.) Omitting bytes from a multi-byte character

definition produces undefined results.

In lines defining ranges of symbolic names, the encoded value shall be the value for the first symbolic name in the range (the symbolic name preceding the ellipsis). Subsequent symbolic names defined by the range shall have encoding values in increasing order. Bytes shall be treated as unsigned octets, and carry shall be propagated between the bytes as necessary to represent the range. However, because this causes a null byte in the second or subsequent bytes of a character, such a declaration should not be specified. For example, the line:

```
<j0101>...<j0104> \d129\d254
```

is interpreted as:

```
<j0101>          \d129\d254
<j0102>          \d129\d255
<j0103>          \d130\d00
<j0104>          \d130\d01
```

The expanded declaration of the symbol <j0103> in the above example is an invalid specification, because it contains a null byte in the second byte of a character.

The comment is optional.

POSIX.1-2008 provides no means of defining a wide-character codeset.

The following declarations can follow the character set mapping definitions (after the "END CHARMAP" statement). Each shall consist of the keyword shown in the following list, starting in column 1, followed by the value(s) to be associated to the keyword, as defined below.

**WIDTH** A non-negative integer value defining the column width (see [Section 3.103](#), on page 50) for the printable characters in the coded character set specified in [Table 6-1](#) (on page 125) and [Table 6-2](#) (on page 130). Coded character set character values shall be defined using symbolic character names followed by column width values. Defining a character with more than one **WIDTH** produces undefined results. The **END WIDTH** keyword shall be used to terminate the **WIDTH** definitions. Specifying the width of a non-printable character in a **WIDTH** declaration produces undefined results.

#### **WIDTH\_DEFAULT**

A non-negative integer value defining the default column width for any printable character not listed by one of the **WIDTH** keywords. If no **WIDTH\_DEFAULT** keyword is included in the charmap, the default character width shall be 1.

#### **Example**

After the "END CHARMAP" statement, a syntax for a width definition would be:

```
WIDTH
<A> 1
<B> 1
<C>...<Z> 1
...
<fool>...<foon> 2
...
END WIDTH
```

In this example, the numerical code point values represented by the symbols <A> and <B> are assigned a width of 1. The code point values <C> to <Z> inclusive (<C>, <D>, <E>, and so on) are also assigned a width of 1. Using <A>...<Z> would have required fewer lines, but the

alternative was shown to demonstrate flexibility. The keyword **WIDTH\_DEFAULT** could have been added as appropriate.

#### 6.4.1 State-Dependent Character Encodings

This section addresses the use of state-dependent character encodings (that is, those in which the encoding of a character is dependent on one or more shift codes that may precede it).

A single-shift encoding (where each character not in the initial shift state is preceded by a shift code) can be defined in the charmap format if each shift-code/character sequence is considered a multi-byte character, defined using the concatenated-constant format described in [Section 6.4](#) (on page 129). If the implementation supports a character encoding of this type, all of the standard utilities shall support it. A locking-shift encoding (where the state of the character is determined by a shift code that may affect more than the single character following it) could be defined with an extension to the charmap format described in [Section 6.4](#) (on page 129).

If the implementation supports a character encoding of this type, any of the standard utilities that describe character (*versus* byte) or text-file manipulation shall have the following characteristics:

1. The utility shall process the statefully encoded data as a concatenation of state-independent characters. The presence of redundant locking shifts shall not affect the comparison of two statefully encoded strings.
2. A utility that divides, truncates, or extracts substrings from statefully encoded data shall produce output that contains locking shifts at the beginning or end of the resulting data, if appropriate, to retain correct state information.

## 7.1 General

A locale is the definition of the subset of a user's environment that depends on language and cultural conventions. It is made up from one or more categories. Each category is identified by its name and controls specific aspects of the behavior of components of the system. Category names correspond to the following environment variable names:

*LC\_CTYPE* Character classification and case conversion.

*LC\_COLLATE* Collation order.

*LC\_MONETARY* Monetary formatting.

*LC\_NUMERIC* Numeric, non-monetary formatting.

*LC\_TIME* Date and time formats.

*LC\_MESSAGES* Formats of informative and diagnostic messages and interactive responses.

The standard utilities in the Shell and Utilities volume of POSIX.1-2008 shall base their behavior on the current locale, as defined in the ENVIRONMENT VARIABLES section for each utility. The behavior of some of the C-language functions defined in the System Interfaces volume of POSIX.1-2008 shall also be modified based on a locale selection. The locale to be used by these functions can be selected in the following ways:

1. For functions such as *isalnum\_l()* that take a locale object as an argument, a locale object can be obtained from *newlocale()* or *duplocale()* and passed to the function.
2. For functions that do not take a locale object as an argument, the current locale for the thread can be set by calling *uselocale()* or the global locale for the process can be set by calling *setlocale()*. Such functions shall use the current locale of the calling thread if one has been set for that thread; otherwise, they shall use the global locale.

Locales other than those supplied by the implementation can be created via the *localedef* utility, provided that the *\_POSIX2\_LOCALEDEF* symbol is defined on the system. Even if *localedef* is not provided, all implementations conforming to the System Interfaces volume of POSIX.1-2008 shall provide one or more locales that behave as described in this chapter. The input to the utility is described in [Section 7.3](#) (on page 136). The value that is used to specify a locale when using environment variables shall be the string specified as the *name* operand to the *localedef* utility when the locale was created. The strings "C" and "POSIX" are reserved as identifiers for the POSIX locale (see [Section 7.2](#), on page 136). When the value of a locale environment variable begins with a <slash> (' / '), it shall be interpreted as the pathname of the locale definition; the type of file (regular, directory, and so on) used to store the locale definition is implementation-defined. If the value does not begin with a <slash>, the mechanism used to locate the locale is implementation-defined.

If different character sets are used by the locale categories, the results achieved by an application utilizing these categories are undefined. Likewise, if different codesets are used for the data

being processed by interfaces whose behavior is dependent on the current locale, or the codeset is different from the codeset assumed when the locale was created, the result is also undefined.

Applications can select the desired locale by calling the *newlocale()* or *setlocale()* function with the appropriate value. If the function is invoked with an empty string, such as:

```
newlocale(LC_ALL_MASK, "", (locale_t)0);
```

or:

```
setlocale(LC_ALL, "");
```

the value of the corresponding environment variable is used. If the environment variable is unset or is set to the empty string, the implementation shall set the appropriate environment as defined in [Chapter 8](#) (on page 173).

## 7.2 POSIX Locale

Conforming systems shall provide a POSIX locale, also known as the C locale. In POSIX.1 the requirements for the POSIX locale are more extensive than the requirements for the C locale as specified in the ISO C standard. However, in a conforming POSIX implementation, the POSIX locale and the C locale are identical. The behavior of standard utilities and functions in the POSIX locale shall be as if the locale was defined via the *localedef* utility with input data from the POSIX locale tables in [Section 7.3](#).

For C-language programs, the POSIX locale shall be the default locale when the *setlocale()* function is not called.

The POSIX locale can be specified by assigning to the appropriate environment variables the values "C" or "POSIX".

All implementations shall define a locale as the default locale, to be invoked when no environment variables are set, or set to the empty string. This default locale can be the POSIX locale or any other implementation-defined locale. Some implementations may provide facilities for local installation administrators to set the default locale, customizing it for each location. POSIX.1-2008 does not require such a facility.

## 7.3 Locale Definition

The capability to specify additional locales to those provided by an implementation is optional, denoted by the `_POSIX2_LOCALEDEF` symbol. If the option is not supported, only implementation-supplied locales are available. Such locales shall be documented using the format specified in this section.

Locales can be described with the file format presented in this section. The file format is that accepted by the *localedef* utility. For the purposes of this section, the file is referred to as the "locale definition file", but no locales shall be affected by this file unless it is processed by *localedef* or some similar mechanism. Any requirements in this section imposed upon the utility shall apply to *localedef* or to any other similar utility used to install locale information using the locale definition file format described here.

The locale definition file shall contain one or more locale category source definitions, and shall not contain more than one definition for the same locale category. If the file contains source definitions for more than one category, implementation-defined categories, if present, shall

appear after the categories defined by [Section 7.1](#) (on page 135). A category source definition contains either the definition of a category or a **copy** directive. For a description of the **copy** directive, see *localedef*. In the event that some of the information for a locale category, as specified in this volume of POSIX.1-2008, is missing from the locale source definition, the behavior of that category, if it is referenced, is unspecified.

A category source definition shall consist of a category header, a category body, and a category trailer. A category header shall consist of the character string naming of the category, beginning with the characters *LC\_*. The category trailer shall consist of the string "END", followed by one or more <blank> characters and the string used in the corresponding category header.

The category body shall consist of one or more lines of text. Each line shall contain an identifier, optionally followed by one or more operands. Identifiers shall be either keywords, identifying a particular locale element, or collating elements. In addition to the keywords defined in this volume of POSIX.1-2008, the source can contain implementation-defined keywords. Each keyword within a locale shall have a unique name (that is, two categories cannot have a commonly-named keyword); no keyword shall start with the characters *LC\_*. Identifiers shall be separated from the operands by one or more <blank> characters.

Operands shall be characters, collating elements, or strings of characters. Strings shall be enclosed in double-quotes. Literal double-quotes within strings shall be preceded by the <escape character>, described below. When a keyword is followed by more than one operand, the operands shall be separated by <semicolon> characters; <blank> characters shall be allowed both before and after a <semicolon>.

The first category header in the file can be preceded by a line modifying the comment character. It shall have the following format, starting in column 1:

```
"comment_char %c\n", <comment character>
```

The comment character shall default to the <number-sign> ('#'). Blank lines and lines containing the <comment character> in the first position shall be ignored.

The first category header in the file can be preceded by a line modifying the escape character to be used in the file. It shall have the following format, starting in column 1:

```
"escape_char %c\n", <escape character>
```

The escape character shall default to <backslash>, which is the character used in all examples shown in this volume of POSIX.1-2008.

A line can be continued by placing an escape character as the last character on the line; this continuation character shall be discarded from the input. Although the implementation need not accept any one portion of a continued line with a length exceeding {LINE\_MAX} bytes, it shall place no limits on the accumulated length of the continued line. Comment lines shall not be continued on a subsequent line using an escaped <newline>.

Individual characters, characters in strings, and collating elements shall be represented using symbolic names, as defined below. In addition, characters can be represented using the characters themselves or as octal, hexadecimal, or decimal constants. When non-symbolic notation is used, the resultant locale definitions are in many cases not portable between systems. The left angle bracket ('<') is a reserved symbol, denoting the start of a symbolic name; when used to represent itself it shall be preceded by the escape character. The following rules apply to character representation:

1. A character can be represented via a symbolic name, enclosed within angle brackets '<' and '>'. The symbolic name, including the angle brackets, shall exactly match a symbolic name defined in the charmap file specified via the *localedef* -f option, and it shall be replaced by a character value determined from the value associated with the symbolic

name in the charmap file. The use of a symbolic name not found in the charmap file shall constitute an error, unless the category is *LC\_CTYPE* or *LC\_COLLATE*, in which case it shall constitute a warning condition (see *localedef* for a description of actions resulting from errors and warnings). The specification of a symbolic name in a **collating-element** or **collating-symbol** section that duplicates a symbolic name in the charmap file (if present) shall be an error. Use of the escape character or a right angle bracket within a symbolic name is invalid unless the character is preceded by the escape character.

For example:

```
<c>;<c-cedilla>  "<M><a><y>"
```

2. A character in the portable character set can be represented by the character itself, in which case the value of the character is implementation-defined. (Implementations may allow other characters to be represented as themselves, but such locale definitions are not portable.) Within a string, the double-quote character, the escape character, and the right angle bracket character shall be escaped (preceded by the escape character) to be interpreted as the character itself. Outside strings, the characters:

```
,      ;      <      >      escape_char
```

shall be escaped to be interpreted as the character itself.

For example:

```
c      "May"
```

3. A character can be represented as an octal constant. An octal constant shall be specified as the escape character followed by two or three octal digits. Each constant shall represent a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

For example:

```
\143;\347;\143\150  "\115\141\171"
```

4. A character can be represented as a hexadecimal constant. A hexadecimal constant shall be specified as the escape character followed by an 'x' followed by two hexadecimal digits. Each constant shall represent a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

For example:

```
\x63;\xe7;\x63\x68  "\x4d\x61\x79"
```

5. A character can be represented as a decimal constant. A decimal constant shall be specified as the escape character followed by a 'd' followed by two or three decimal digits. Each constant represents a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

For example:

```
\d99;\d231;\d99\d104  "\d77\d97\d121"
```

Implementations may accept single-digit octal, decimal, or hexadecimal constants following the escape character. Only characters existing in the character set for which the locale definition is created shall be specified, whether using symbolic names, the characters themselves, or octal, decimal, or hexadecimal constants. If a charmap file is present, only characters defined in the charmap can be specified using octal, decimal, or hexadecimal constants. Symbolic names not

present in the charmap file can be specified and shall be ignored, as specified under item 1 above.

### 7.3.1 LC\_CTYPE

The *LC\_CTYPE* category shall define character classification, case conversion, and other character attributes. In addition, a series of characters can be represented by three adjacent <period> characters representing an ellipsis symbol ("..."). The ellipsis specification shall be interpreted as meaning that all values between the values preceding and following it represent valid characters. The ellipsis specification shall be valid only within a single encoded character set; that is, within a group of characters of the same size. An ellipsis shall be interpreted as including in the list all characters with an encoded value higher than the encoded value of the character preceding the ellipsis and lower than the encoded value of the character following the ellipsis.

For example:

```
\x30; ... ;\x39;
```

includes in the character class all characters with encoded values between the endpoints.

The following keywords shall be recognized. In the descriptions, the term “automatically included” means that it shall not be an error either to include or omit any of the referenced characters; the implementation provides them if missing (even if the entire keyword is missing) and accepts them silently if present. When the implementation automatically includes a missing character, it shall have an encoded value dependent on the charmap file in effect (see the description of the *localedef -f* option); otherwise, it shall have a value derived from an implementation-defined character mapping.

The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included characters. These only need to be specified if the character values (that is, encoding) differ from the implementation default values. It is not possible to define a locale without these automatically included characters unless some implementation extension is used to prevent their inclusion. Such a definition would not be a proper superset of the C or POSIX locale and, thus, it might not be possible for conforming applications to work properly.

**copy** Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

**upper** Define characters to be classified as uppercase letters.

In the POSIX locale, only:

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

shall be included:

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** shall be specified. The uppercase letters <A> to <Z>, as defined in [Section 6.4](#) (on page 129) (the portable character set), are automatically included in this class.

**lower** Define characters to be classified as lowercase letters.

In the POSIX locale, only:

a b c d e f g h i j k l m n o p q r s t u v w x y z

shall be included.

4143		In a locale definition file, no character specified for the keywords <b>cntrl</b> , <b>digit</b> ,
4144		<b>punct</b> , or <b>space</b> shall be specified. The lowercase letters <a> to <z> of the
4145		portable character set are automatically included in this class.
4146	<b>alpha</b>	Define characters to be classified as letters.
4147		In the POSIX locale, only characters in the classes <b>upper</b> and <b>lower</b> shall be
4148		included.
4149		In a locale definition file, no character specified for the keywords <b>cntrl</b> , <b>digit</b> ,
4150		<b>punct</b> , or <b>space</b> shall be specified. Characters classified as either <b>upper</b> or
4151		<b>lower</b> are automatically included in this class.
4152	<b>digit</b>	Define the characters to be classified as numeric digits.
4153		In the POSIX locale, only:
4154		0 1 2 3 4 5 6 7 8 9
4155		shall be included.
4156		In a locale definition file, only the digits <zero>, <one>, <two>, <three>,
4157		<four>, <five>, <six>, <seven>, <eight>, and <nine> shall be specified, and in
4158		contiguous ascending sequence by numerical value. The digits <zero> to
4159		<nine> of the portable character set are automatically included in this class.
4160	<b>alnum</b>	Define characters to be classified as letters and numeric digits. Only the
4161		characters specified for the <b>alpha</b> and <b>digit</b> keywords shall be specified.
4162		Characters specified for the keywords <b>alpha</b> and <b>digit</b> are automatically
4163		included in this class.
4164	<b>space</b>	Define characters to be classified as white-space characters.
4165		In the POSIX locale, exactly <space>, <form-feed>, <newline>, <carriage-
4166		return>, <tab>, and <vertical-tab> shall be included.
4167		In a locale definition file, no character specified for the keywords <b>upper</b> ,
4168		<b>lower</b> , <b>alpha</b> , <b>digit</b> , <b>graph</b> , or <b>xdigit</b> shall be specified. The <space>, <form-
4169		feed>, <newline>, <carriage-return>, <tab>, and <vertical-tab> of the portable
4170		character set, and any characters included in the class <b>blank</b> are automatically
4171		included in this class.
4172	<b>cntrl</b>	Define characters to be classified as control characters.
4173		In the POSIX locale, no characters in classes <b>alpha</b> or <b>punct</b> shall be included.
4174		In a locale definition file, no character specified for the keywords <b>upper</b> ,
4175		<b>lower</b> , <b>alpha</b> , <b>digit</b> , <b>punct</b> , <b>graph</b> , <b>print</b> , or <b>xdigit</b> shall be specified.
4176	<b>punct</b>	Define characters to be classified as punctuation characters.
4177		In the POSIX locale, neither the <space> nor any characters in classes <b>alpha</b> ,
4178		<b>digit</b> , or <b>cntrl</b> shall be included.
4179		In a locale definition file, no character specified for the keywords <b>upper</b> ,
4180		<b>lower</b> , <b>alpha</b> , <b>digit</b> , <b>cntrl</b> , <b>xdigit</b> , or as the <space> shall be specified.
4181	<b>graph</b>	Define characters to be classified as printable characters, not including the
4182		<space>.
4183		In the POSIX locale, all characters in classes <b>alpha</b> , <b>digit</b> , and <b>punct</b> shall be
4184		included; no characters in class <b>cntrl</b> shall be included.

4185		In a locale definition file, characters specified for the keywords <b>upper</b> , <b>lower</b> ,
4186		<b>alpha</b> , <b>digit</b> , <b>xdigit</b> , and <b>punct</b> are automatically included in this class. No
4187		character specified for the keyword <b>cntrl</b> shall be specified.
4188	<b>print</b>	Define characters to be classified as printable characters, including the
4189		<space>.
4190		In the POSIX locale, all characters in class <b>graph</b> shall be included; no
4191		characters in class <b>cntrl</b> shall be included.
4192		In a locale definition file, characters specified for the keywords <b>upper</b> , <b>lower</b> ,
4193		<b>alpha</b> , <b>digit</b> , <b>xdigit</b> , <b>punct</b> , <b>graph</b> , and the <space> are automatically included
4194		in this class. No character specified for the keyword <b>cntrl</b> shall be specified.
4195	<b>xdigit</b>	Define the characters to be classified as hexadecimal digits.
4196		In the POSIX locale, only:
4197		0 1 2 3 4 5 6 7 8 9 A B C D E F a b c d e f
4198		shall be included.
4199		In a locale definition file, only the characters defined for the class <b>digit</b> shall be
4200		specified, in contiguous ascending sequence by numerical value, followed by
4201		one or more sets of six characters representing the hexadecimal digits 10 to 15
4202		inclusive, with each set in ascending order (for example, <A>, <B>, <C>, <D>,
4203		<E>, <F>, <a>, <b>, <c>, <d>, <e>, <f>). The digits <zero> to <nine>, the
4204		uppercase letters <A> to <F>, and the lowercase letters <a> to <f> of the
4205		portable character set are automatically included in this class.
4206	<b>blank</b>	Define characters to be classified as <blank> characters.
4207		In the POSIX locale, only the <space> and <tab> shall be included.
4208		In a locale definition file, the <space> and <tab> are automatically included in
4209		this class.
4210	<b>charclass</b>	Define one or more locale-specific character class names as strings separated
4211		by <semicolon> characters. Each named character class can then be defined
4212		subsequently in the <i>LC_CTYPE</i> definition. A character class name shall consist
4213		of at least one and at most {CHARCLASS_NAME_MAX} bytes of
4214		alphanumeric characters from the portable filename character set. The first
4215		character of a character class name shall not be a digit. The name shall not
4216		match any of the <i>LC_CTYPE</i> keywords defined in this volume of
4217		POSIX.1-2008. Future versions of this standard will not specify any <i>LC_CTYPE</i>
4218		keywords containing uppercase letters.
4219	<i>charclass-name</i>	Define characters to be classified as belonging to the named locale-specific
4220		character class. In the POSIX locale, locale-specific named character classes
4221		need not exist.
4222		If a class name is defined by a <b>charclass</b> keyword, but no characters are
4223		subsequently assigned to it, this is not an error; it represents a class without
4224		any characters belonging to it.
4225		The <i>charclass-name</i> can be used as the <i>property</i> argument to the <i>wctype()</i>
4226		function, in regular expression and shell pattern-matching bracket
4227		expressions, and by the <i>tr</i> command.

4228           **toupper**           Define the mapping of lowercase letters to uppercase letters.

4229                           In the POSIX locale, the 26 lowercase characters: |

4230                           a b c d e f g h i j k l m n o p q r s t u v w x y z

4231                           shall be mapped to the corresponding 26 uppercase characters:

4232                           A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

4233                           In a locale definition file, the operand shall consist of character pairs,  
 4234                           separated by <semicolon> characters. The characters in each character pair  
 4235                           shall be separated by a <comma> and the pair enclosed by parentheses. The  
 4236                           first character in each pair is the lowercase letter, the second the corresponding  
 4237                           uppercase letter. Only characters specified for the keywords **lower** and **upper**  
 4238                           shall be specified. The lowercase letters <a> to <z>, and their corresponding  
 4239                           uppercase letters <A> to <Z>, of the portable character set are automatically  
 4240                           included in this mapping, but only when the **toupper** keyword is omitted  
 4241                           from the locale definition.

4242           **tolower**           Define the mapping of uppercase letters to lowercase letters.

4243                           In the POSIX locale, the 26 uppercase characters: |

4244                           A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

4245                           shall be mapped to the corresponding 26 lowercase characters:

4246                           a b c d e f g h i j k l m n o p q r s t u v w x y z

4247                           In a locale definition file, the operand shall consist of character pairs,  
 4248                           separated by <semicolon> characters. The characters in each character pair  
 4249                           shall be separated by a <comma> and the pair enclosed by parentheses. The  
 4250                           first character in each pair is the uppercase letter, the second the  
 4251                           corresponding lowercase letter. Only characters specified for the keywords  
 4252                           **lower** and **upper** shall be specified. If the **tolower** keyword is omitted from  
 4253                           the locale definition, the mapping is the reverse mapping of the one specified  
 4254                           for **toupper**.

4255           The following table shows the character class combinations allowed:

4256                           **Table 7-1** Valid Character Class Combinations

In Class	Can Also Belong To										
	upper	lower	alpha	digit	space	cntrl	punct	graph	print	xdigit	blank
4259 <b>upper</b>		—	A	x	x	x	x	A	A	—	x
4260 <b>lower</b>	—		A	x	x	x	x	A	A	—	x
4261 <b>alpha</b>	—	—		x	x	x	x	A	A	—	x
4262 <b>digit</b>	x	x	x		x	x	x	A	A	A	x
4263 <b>space</b>	x	x	x	x		—	*	*	*	x	—
4264 <b>cntrl</b>	x	x	x	x	—		x	x	x	x	—
4265 <b>punct</b>	x	x	x	x	—	x		A	A	x	—
4266 <b>graph</b>	—	—	—	—	—	x	—		A	—	—
4267 <b>print</b>	—	—	—	—	—	x	—	—		—	—
4268 <b>xdigit</b>	—	—	—	—	x	x	x	A	A		x
4269 <b>blank</b>	x	x	x	x	A	—	*	*	*	x	

**Notes:**

1. Explanation of codes:
  - A Automatically included; see text.
  - Permitted.
  - x Mutually-exclusive.
  - \* See note 2.
2. The <space>, which is part of the **space** and **blank** classes, cannot belong to **punct** or **graph**, but shall automatically belong to the **print** class. Other **space** or **blank** characters can be classified as any of **punct**, **graph**, or **print**.

## 7.3.1.1 LC\_CTYPE Category in the POSIX Locale

The minimum character classifications for the POSIX locale follow; the code listing depicts the *localedef* input, and the table represents the same information, sorted by character. Implementations may add additional characters to the **cntrl** and **punct** classifications but shall not make any other additions.

```
LC_CTYPE
# The following is the minimum POSIX locale LC_CTYPE.
# "alpha" is by definition "upper" and "lower"
# "alnum" is by definition "alpha" and "digit"
# "print" is by definition "alnum", "punct", and the <space>
# "graph" is by definition "alnum" and "punct"
#
upper    <A>;<B>;<C>;<D>;<E>;<F>;<G>;<H>;<I>;<J>;<K>;<L>;<M>;\
         <N>;<O>;<P>;<Q>;<R>;<S>;<T>;<U>;<V>;<W>;<X>;<Y>;<Z>
#
lower    <a>;<b>;<c>;<d>;<e>;<f>;<g>;<h>;<i>;<j>;<k>;<l>;<m>;\

### 7.3.2 LC\_COLLATE

The *LC\_COLLATE* category provides a collation sequence definition for numerous utilities in the Shell and Utilities volume of POSIX.1-2008 (*ls*, *sort*, and so on), regular expression matching (see Chapter 9, on page 181), and the *strcoll()*, *strxfrm()*, *wcscoll()*, and *wcsxfrm()* functions in the System Interfaces volume of POSIX.1-2008.

A collation sequence definition shall define the relative order between collating elements (characters and multi-character collating elements) in the locale. This order is expressed in terms of collation values; that is, by assigning each element one or more collation values (also known as collation weights). This does not imply that implementations shall assign such values, but that ordering of strings using the resultant collation definition in the locale behaves as if such assignment is done and used in the collation process. At least the following capabilities are provided:

1. **Multi-character collating elements.** Specification of multi-character collating elements (that is, sequences of two or more characters to be collated as an entity).
2. **User-defined ordering of collating elements.** Each collating element shall be assigned a collation value defining its order in the character (or basic) collation sequence. This ordering is used by regular expressions and pattern matching and, unless collation weights are explicitly specified, also as the collation weight to be used in sorting.
3. **Multiple weights and equivalence classes.** Collating elements can be assigned one or more (up to the limit {*COLL\_WEIGHTS\_MAX*}, as defined in *<limits.h>*) collating weights for use in sorting. The first weight is hereafter referred to as the primary weight.
4. **One-to-many mapping.** A single character is mapped into a string of collating elements.
5. **Equivalence class definition.** Two or more collating elements have the same collation value (primary weight).
6. **Ordering by weights.** When two strings are compared to determine their relative order, the two strings are first broken up into a series of collating elements; the elements in each successive pair of elements are then compared according to the relative primary weights for the elements. If equal, and more than one weight has been assigned, then the pairs of collating elements are re-compared according to the relative subsequent weights, until either a pair of collating elements compare unequal or the weights are exhausted.

All implementation-provided locales (either preinstalled or provided as locale definitions which can be installed later) should define a collation sequence that has a total ordering of all characters unless the locale name has an '@' modifier indicating that it has a special collation sequence (for example, @*icase* could indicate that each upper and lowercase character pair collates equally).

#### Notes:

1. A future version of this standard may require these locales to define a collation sequence that has a total ordering of all characters (by changing “should” to “shall”).
2. Users installing their own locales should ensure that they define a collation sequence with a total ordering of all characters unless an '@' modifier in the locale name (such as @*icase*) indicates that it has a special collation sequence.

The following keywords shall be recognized in a collation sequence definition. They are described in detail in the following sections.

**copy** Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

4514	<b>collating-element</b>	Define a collating-element symbol representing a multi-character collating element. This keyword is optional.
4515		
4516	<b>collating-symbol</b>	Define a collating symbol for use in collation order statements. This keyword is optional.
4517		
4518	<b>order_start</b>	Define collation rules. This statement shall be followed by one or more collation order statements, assigning character collation values and collation weights to collating elements.
4519		
4520		
4521	<b>order_end</b>	Specify the end of the collation-order statements.

#### 4522 7.3.2.1 The collating-element Keyword

4523 In addition to the collating elements in the character set, the **collating-element** keyword can be  
 4524 used to define multi-character collating elements. The syntax is as follows:

```
4525 "collating-element %s from \"%s\"\\n", <collating-symbol>, <string>
```

4526 The <collating-symbol> operand shall be a symbolic name, enclosed between angle brackets ('<' and '>'), and shall not duplicate any symbolic name in the current charmap file (if any), or any other symbolic name defined in this collation definition. The string operand is a string of two or more characters that collates as an entity. A <collating-element> defined via this keyword is only recognized with the LC\_COLLATE category.

4531 For example:

```
4532 collating-element <ch> from "<c><h>"
4533 collating-element <e-acute> from "<acute><e>"
4534 collating-element <ll> from "ll"
```

#### 4535 7.3.2.2 The collating-symbol Keyword

4536 This keyword shall be used to define symbols for use in collation sequence statements; that is,  
 4537 between the **order\_start** and the **order\_end** keywords. The syntax is as follows:

```
4538 "collating-symbol %s\\n", <collating-symbol>
```

4539 The <collating-symbol> shall be a symbolic name, enclosed between angle brackets ('<' and '>'), and shall not duplicate any symbolic name in the current charmap file (if any), or any other symbolic name defined in this collation definition. A <collating-symbol> defined via this keyword is only recognized within the LC\_COLLATE category.

4543 For example:

```
4544 collating-symbol <UPPER_CASE>
4545 collating-symbol <HIGH>
```

4546 The **collating-symbol** keyword defines a symbolic name that can be associated with a relative position in the character order sequence. While such a symbolic name does not represent any collating element, it can be used as a weight.

7.3.2.3 The *order\_start* Keyword

The **order\_start** keyword shall precede collation order entries and also define the number of weights for this collation sequence definition and other collation rules. The syntax is as follows:

```
"order_start %s;%s:...;%s\n", <sort-rules>, <sort-rules> ...
```

The operands to the **order\_start** keyword are optional. If present, the operands define rules to be applied when strings are compared. The number of operands define how many weights each element is assigned; if no operands are present, one **forward** operand is assumed. If present, the first operand defines rules to be applied when comparing strings using the first (primary) weight; the second when comparing strings using the second weight, and so on. Operands shall be separated by <semicolon> characters (';'). Each operand shall consist of one or more collation directives, separated by <comma> characters (',''). If the number of operands exceeds the {COLL\_WEIGHTS\_MAX} limit, the utility shall issue a warning message. The following directives shall be supported:

**forward** Specifies that comparison operations for the weight level shall proceed from start of string towards the end of string.

**backward** Specifies that comparison operations for the weight level shall proceed from end of string towards the beginning of string.

**position** Specifies that comparison operations for the weight level shall consider the relative position of elements in the strings not subject to **IGNORE**. The string containing an element not subject to **IGNORE** after the fewest collating elements subject to **IGNORE** from the start of the compare shall collate first. If both strings contain a character not subject to **IGNORE** in the same relative position, the collating values assigned to the elements shall determine the ordering. In case of equality, subsequent characters not subject to **IGNORE** shall be considered in the same manner.

The directives **forward** and **backward** are mutually-exclusive.

If no operands are specified, a single **forward** operand shall be assumed.

For example:

```
order_start    forward;backward
```

## 7.3.2.4 Collation Order

The **order\_start** keyword shall be followed by collating identifier entries. The syntax for the collating element entries is as follows:

```
"%s %s;%s:...;%s\n", <collating-identifier>, <weight>, <weight>, ...
```

Each *collating-identifier* shall consist of either a character (in any of the forms defined in [Section 7.3](#), on page 136), a *collating-element*, a *collating-symbol*, an ellipsis, or the special symbol **UNDEFINED**. The order in which collating elements are specified determines the character order sequence, such that each collating element shall compare less than the elements following it.

A *collating-element* shall be used to specify multi-character collating elements, and indicates that the character sequence specified via the *collating-element* is to be collated as a unit and in the relative order specified by its place.

A *collating-symbol* can be used to define a position in the relative order for use in weights. No weights shall be specified with a *collating-symbol*.

The ellipsis symbol specifies that a sequence of characters shall collate according to their encoded character values. It shall be interpreted as indicating that all characters with a coded character set value higher than the value of the character in the preceding line, and lower than the coded character set value for the character in the following line, in the current coded character set, shall be placed in the character collation order between the previous and the following character in ascending order according to their coded character set values. An initial ellipsis shall be interpreted as if the preceding line specified the NUL character, and a trailing ellipsis as if the following line specified the highest coded character set value in the current coded character set. An ellipsis shall be treated as invalid if the preceding or following lines do not specify characters in the current coded character set. The use of the ellipsis symbol ties the definition to a specific coded character set and may preclude the definition from being portable between implementations.

The symbol **UNDEFINED** shall be interpreted as including all coded character set values not specified explicitly or via the ellipsis symbol. Such characters shall be inserted in the character collation order at the point indicated by the symbol, and in ascending order according to their coded character set values. If no **UNDEFINED** symbol is specified, and the current coded character set contains characters not specified in this section, the utility shall issue a warning message and place such characters at the end of the character collation order.

The optional operands for each collation-element shall be used to define the primary, secondary, or subsequent weights for the collating element. The first operand specifies the relative primary weight, the second the relative secondary weight, and so on. Two or more collation-elements can be assigned the same weight; they belong to the same “equivalence class” if they have the same primary weight. Collation shall behave as if, for each weight level, elements subject to **IGNORE** are removed, unless the **position** collation directive is specified for the corresponding level with the **order\_start** keyword. Then each successive pair of elements shall be compared according to the relative weights for the elements. If the two strings compare equal, the process shall be repeated for the next weight level, up to the limit {**COLL\_WEIGHTS\_MAX**}.

Weights should be assigned such that the collation sequence has a total ordering of all characters unless an '@' modifier in the locale name indicates that it has a special collation sequence.

**Note:** A future version of this standard may require a total ordering of all characters for implementation-provided locales that do not have an '@' modifier in the locale name. See [Section 7.3.2](#) (on page 147).

Weights shall be expressed as characters (in any of the forms specified in [Section 7.3](#), on page 136), *<collating-symbol>*s, *<collating-element>*s, an ellipsis, or the special symbol **IGNORE**. A single character, a *<collating-symbol>*, or a *<collating-element>* shall represent the relative position in the character collating sequence of the character or symbol, rather than the character or characters themselves. Thus, rather than assigning absolute values to weights, a particular weight is expressed using the relative order value assigned to a collating element based on its order in the character collation sequence.

One-to-many mapping is indicated by specifying two or more concatenated characters or symbolic names. For example, if the *<eszet>* is given the string "*<s><s>*" as a weight, comparisons are performed as if all occurrences of the *<eszet>* are replaced by "*<s><s>*" (assuming that "*<s>*" has the collating weight "*<s>*"). If it is necessary to define *<eszet>* and "*<s><s>*" as an equivalence class, then a collating element must be defined for the string "*ss*".

All characters specified via an ellipsis shall by default be assigned unique weights, equal to the relative order of characters. Characters specified via an explicit or implicit **UNDEFINED** special symbol shall by default be assigned the same primary weight (that is, they belong to the same equivalence class) if the collation order has more than one weight level. If the collation order has only one weight level, these characters should be assigned unique primary weights, equal to the relative order of their character in the character collation sequence, but may be assigned the

same primary weight.

**Note:** A future version of this standard may require these characters to be assigned unique primary weights if the collation order has only one weight level.

An ellipsis symbol as a weight shall be interpreted to mean that each character in the sequence shall have unique weights, equal to the relative order of their character in the character collation sequence. The use of the ellipsis as a weight shall be treated as an error if the collating element is neither an ellipsis nor the special symbol **UNDEFINED**.

The special keyword **IGNORE** as a weight shall indicate that when strings are compared using the weights at the level where **IGNORE** is specified, the collating element shall be ignored; that is, as if the string did not contain the collating element. In regular expressions and pattern matching, all characters that are subject to **IGNORE** in their primary weight form an equivalence class.

An empty operand shall be interpreted as the collating element itself.

For example, the order statement:

```
<a>      <a> i <a>
```

is equal to:

```
<a>
```

An ellipsis can be used as an operand if the collating element was an ellipsis, and shall be interpreted as the value of each character defined by the ellipsis.

The collation order as defined in this section affects the interpretation of bracket expressions in regular expressions (see [Section 9.3.5](#), on page 184).

For example:

```
order_start  forward;backward
<LOW>
<space>      <LOW> i <space>
...          <LOW> i ...
<a>          <a> i <a>
<a-acute>    <a> i <a-acute>
<a-grave>    <a> i <a-grave>
<A>          <a> i <A>
<A-acute>    <a> i <A-acute>
<A-grave>    <a> i <A-grave>
<ch>         <ch> i <ch>
<Ch>         <ch> i <Ch>
<s>          <s> i <s>
<eszet>      "<s><s>" i "<eszet><eszet>"
UNDEFINED    IGNORE; ...
order_end
```

This example is interpreted as follows:

1. All characters between <space> and 'a' shall have the same primary equivalence class and individual secondary weights based on their ordinal encoded values.
2. All characters based on the uppercase or lowercase character 'a' belong to the same primary equivalence class.

- 4685           3. The multi-character collating element <ch> is represented by the collating symbol <ch>  
 4686           and belongs to the same primary equivalence class as the multi-character collating  
 4687           element <Ch>.
- 4688           4. The **UNDEFINED** means that all characters not specified in this definition (explicitly or  
 4689           via the ellipsis) shall be ignored when comparing primary weights, and have individual  
 4690           secondary weights based on their ordinal encoded values.

#### 4691   7.3.2.5   The order\_end Keyword

4692           The collating order entries shall be terminated with an **order\_end** keyword.

#### 4693   7.3.2.6   LC\_COLLATE Category in the POSIX Locale

4694           The minimum collation sequence definition of the POSIX locale follows; the code listing depicts  
 4695           the *localedef* input. All characters not explicitly listed here shall be inserted in the character  
 4696           collation order after the listed characters and shall be assigned unique primary weights. If the  
 4697           listed characters have ASCII encoding, the other characters shall be in ascending order according  
 4698           to their coded character set values; otherwise, the order of the other characters is unspecified.  
 4699           The collation sequence shall not include any multi-character collating elements.

```

### 7.3.3 LC\_MONETARY

The *LC\_MONETARY* category shall define the rules and symbols that are used to format monetary numeric information.

This information is available through the *localeconv()* function and is used by the *strfmon()* function.

Some of the information is also available in an alternative form via the *nl\_langinfo()* function (see CRNCYSTR in [<langinfo.h>](#)).

The following items are defined in this category of the locale. The item names are the keywords recognized by the *localedef* utility when defining a locale. They are also similar to the member names of the *lconv* structure defined in [<locale.h>](#); see [<locale.h>](#) for the exact symbols in the header. The *localeconv()* function returns {CHAR\_MAX} for unspecified integer items and the empty string (" ") for unspecified or size zero string items.

In a locale definition file, the operands are strings, formatted as indicated by the grammar in [Section 7.4](#) (on page 166). For some keywords, the strings can contain only integers. Keywords that are not provided, string values set to the empty string (" "), or integer keywords set to -1, are used to indicate that the value is not available in the locale. The following keywords shall be recognized:

**copy** Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

**Note:** This is a *localedef* utility keyword, unavailable through *localeconv()*.

**int\_curr\_symbol** The international currency symbol. The operand shall be a four-character string, with the first three characters containing the alphabetic international currency symbol. The international currency symbol should be chosen in accordance with those specified in the ISO 4217 standard. The fourth character shall be the character used to separate the international currency symbol from the monetary quantity.

**currency\_symbol** The string that shall be used as the local currency symbol.

**mon\_decimal\_point** The operand is a string containing the symbol that shall be used as the decimal delimiter (radix character) in monetary formatted quantities.

**mon\_thousands\_sep** The operand is a string containing the symbol that shall be used as a separator for groups of digits to the left of the decimal delimiter in formatted monetary quantities.

**mon\_grouping** Define the size of each group of digits in formatted monetary quantities. The operand is a sequence of integers separated by <semicolon> characters. Each integer specifies the number of digits in each group, with the initial integer defining the size of the group immediately preceding the decimal delimiter, and the following integers defining the preceding groups. If the last integer is not -1, then the size of the previous group (if any) shall be repeatedly used for the remainder of the digits. If the last integer is -1, then no further grouping shall be performed.

**positive\_sign** A string that shall be used to indicate a non-negative-valued formatted monetary quantity.

**negative\_sign** A string that shall be used to indicate a negative-valued formatted monetary quantity.

4881	<b>int_frac_digits</b>	An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using <b>int_curr_symbol</b> .
4882		
4883		
4884	<b>frac_digits</b>	An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using <b>currency_symbol</b> .
4885		
4886		
4887	<b>p_cs_precedes</b>	An integer set to 1 if the <b>currency_symbol</b> precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.
4888		
4889		
4890	<b>p_sep_by_space</b>	Set to a value indicating the separation of the <b>currency_symbol</b> , the sign string, and the value for a non-negative formatted monetary quantity.
4891		
4892		The values of <b>p_sep_by_space</b> , <b>n_sep_by_space</b> , <b>int_p_sep_by_space</b> , and <b>int_n_sep_by_space</b> are interpreted according to the following:
4893		
4894		0 No <space> separates the currency symbol and value.
4895		1 If the currency symbol and sign string are adjacent, a <space> separates them from the value; otherwise, a <space> separates the currency symbol from the value.
4896		
4897		
4898		2 If the currency symbol and sign string are adjacent, a <space> separates them; otherwise, a <space> separates the sign string from the value.
4899		
4900		
4901	<b>n_cs_precedes</b>	An integer set to 1 if the <b>currency_symbol</b> precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.
4902		
4903		
4904	<b>n_sep_by_space</b>	Set to a value indicating the separation of the <b>currency_symbol</b> , the sign string, and the value for a negative formatted monetary quantity.
4905		
4906	<b>p_sign_posn</b>	An integer set to a value indicating the positioning of the <b>positive_sign</b> for a monetary quantity with a non-negative value. The following integer values shall be recognized for <b>int_n_sign_posn</b> , <b>int_p_sign_posn</b> , <b>n_sign_posn</b> , and <b>p_sign_posn</b> :
4907		
4908		
4909		
4910		0 Parentheses enclose the quantity and the <b>currency_symbol</b> .
4911		1 The sign string precedes the quantity and the <b>currency_symbol</b> .
4912		2 The sign string succeeds the quantity and the <b>currency_symbol</b> .
4913		3 The sign string precedes the <b>currency_symbol</b> .
4914		4 The sign string succeeds the <b>currency_symbol</b> .
4915	<b>n_sign_posn</b>	An integer set to a value indicating the positioning of the <b>negative_sign</b> for a negative formatted monetary quantity.
4916		
4917	<b>int_p_cs_precedes</b>	An integer set to 1 if the <b>int_curr_symbol</b> precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.
4918		
4919		
4920	<b>int_n_cs_precedes</b>	An integer set to 1 if the <b>int_curr_symbol</b> precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.
4921		
4922		

4923	<b>int_p_sep_by_space</b>	Set to a value indicating the separation of the <b>int_curr_symbol</b> , the sign string, and the value for a non-negative internationally formatted monetary quantity.
4924		
4925		
4926	<b>int_n_sep_by_space</b>	Set to a value indicating the separation of the <b>int_curr_symbol</b> , the sign string, and the value for a negative internationally formatted monetary quantity.
4927		
4928		
4929	<b>int_p_sign_posn</b>	An integer set to a value indicating the positioning of the <b>positive_sign</b> for a positive monetary quantity formatted with the international format.
4930		
4931	<b>int_n_sign_posn</b>	An integer set to a value indicating the positioning of the <b>negative_sign</b> for a negative monetary quantity formatted with the international format.
4932		

### 4933 7.3.3.1 LC\_MONETARY Category in the POSIX Locale

4934 The monetary formatting definitions for the POSIX locale follow; the code listing depicting the  
 4935 *localedef* input, the table representing the same information with the addition of *localeconv()* and  
 4936 *nl\_langinfo()* formats. All values are unspecified in the POSIX locale.

```

4937 LC_MONETARY
4938 # This is the POSIX locale definition for
4939 # the LC_MONETARY category.
4940 #
4941 int_curr_symbol      " "
4942 currency_symbol      " "
4943 mon_decimal_point    " "
4944 mon_thousands_sep   " "
4945 mon_grouping         -1
4946 positive_sign        " "
4947 negative_sign        " "
4948 int_frac_digits      -1
4949 frac_digits          -1
4950 p_cs_precedes        -1
4951 p_sep_by_space       -1
4952 n_cs_precedes        -1
4953 n_sep_by_space       -1
4954 p_sign_posn          -1
4955 n_sign_posn          -1
4956 int_p_cs_precedes    -1
4957 int_p_sep_by_space   -1
4958 int_n_cs_precedes    -1
4959 int_n_sep_by_space   -1
4960 int_p_sign_posn      -1
4961 int_n_sign_posn      -1
4962 #
4963 END LC_MONETARY

```

	Item	langinfo Constant	POSIX Locale Value	localeconv() Value	localedef Value
4964	<b>int_curr_symbol</b>	—	N/A	" "	" "

4984	<b>int_n_sign_posn</b>	—	N/A	{CHAR_MAX}	–1

The entry N/A indicates that the value is not available in the POSIX locale.

### 7.3.4 LC\_NUMERIC

The *LC\_NUMERIC* category shall define the rules and symbols that are used to format non-monetary numeric information. This information is available through the *localeconv()* function.

Some of the information is also available in an alternative form via the *nl\_langinfo()* function.

The following items are defined in this category of the locale. The item names are the keywords recognized by the *localedef* utility when defining a locale. They are also similar to the member names of the **lconv** structure defined in [<locale.h>](#); see [<locale.h>](#) for the exact symbols in the header. The *localeconv()* function returns {CHAR\_MAX} for unspecified integer items and the empty string (" ") for unspecified or size zero string items.

In a locale definition file, the operands are strings, formatted as indicated by the grammar in [Section 7.4](#) (on page 166). For some keywords, the strings can only contain integers. Keywords that are not provided, string values set to the empty string (" "), or integer keywords set to –1, shall be used to indicate that the value is not available in the locale. The following keywords shall be recognized:

**copy** Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

**Note:** This is a *localedef* utility keyword, unavailable through *localeconv()*.

**decimal\_point** The operand is a string containing the symbol that shall be used as the decimal delimiter (radix character) in numeric, non-monetary formatted quantities. This keyword cannot be omitted and cannot be set to the empty string. In contexts where standards limit the **decimal\_point** to a single byte, the result of specifying a multi-byte operand shall be unspecified.

5010       **thousands\_sep**   The operand is a string containing the symbol that shall be used as a separator  
 5011                           for groups of digits to the left of the decimal delimiter in numeric, non-  
 5012                           monetary formatted monetary quantities. In contexts where standards limit  
 5013                           the **thousands\_sep** to a single byte, the result of specifying a multi-byte  
 5014                           operand shall be unspecified.

5015       **grouping**        Define the size of each group of digits in formatted non-monetary quantities.  
 5016                           The operand is a sequence of integers separated by <semicolon> characters.  
 5017                           Each integer specifies the number of digits in each group, with the initial  
 5018                           integer defining the size of the group immediately preceding the decimal  
 5019                           delimiter, and the following integers defining the preceding groups. If the last  
 5020                           integer is not -1, then the size of the previous group (if any) shall be  
 5021                           repeatedly used for the remainder of the digits. If the last integer is -1, then no  
 5022                           further grouping shall be performed.

#### 5023 7.3.4.1 LC\_NUMERIC Category in the POSIX Locale

5024       The non-monetary numeric formatting definitions for the POSIX locale follow; the code listing  
 5025       depicting the *localedef* input, the table representing the same information with the addition of  
 5026       *localeconv()* values, and *nl\_langinfo()* constants.

```
5027 LC_NUMERIC
5028 # This is the POSIX locale definition for
5029 # the LC_NUMERIC category.
5030 #
5031 decimal_point      "<period>"
5032 thousands_sep      " "
5033 grouping           -1
5034 #
5035 END LC_NUMERIC
```

Item	langinfo Constant	POSIX Locale Value	localeconv() Value	localedef Value
<b>decimal_point</b>	RADIXCHAR	"."	"."	.
<b>thousands_sep</b>	THOUSEP	N/A	" "	" "
<b>grouping</b>	—	N/A	" "	-1

5041       The entry N/A indicates that the value is not available in the POSIX locale.

### 5042 7.3.5 LC\_TIME

5043       The *LC\_TIME* category shall define the interpretation of the conversion specifications supported  
 5044       by the *date* utility and shall affect the behavior of the *strftime()*, *wcsftime()*, *strptime()*, and  
 5045       *nl\_langinfo()* functions. Since the interfaces for C-language access and locale definition differ  
 5046       significantly, they are described separately.

#### 5047 7.3.5.1 LC\_TIME Locale Definition

5048       In a locale definition, the following mandatory keywords shall be recognized:

5049       **copy**           Specify the name of an existing locale which shall be used as the definition of  
 5050                           this category. If this keyword is specified, no other keyword shall be specified.

5051	<b>abday</b>	Define the abbreviated weekday names, corresponding to the %a conversion specification (conversion specification in the <i>strptime()</i> , <i>wcsftime()</i> , and <i>strptime()</i> functions). The operand shall consist of seven
5052		<semicolon>-separated strings, each surrounded by double-quotes. The first
5053		string shall be the abbreviated name of the day corresponding to Sunday, the
5054		second the abbreviated name of the day corresponding to Monday, and so on.
5055		
5056		
5057	<b>day</b>	Define the full weekday names, corresponding to the %A conversion
5058		specification. The operand shall consist of seven <semicolon>-separated
5059		strings, each surrounded by double-quotes. The first string is the full name of
5060		the day corresponding to Sunday, the second the full name of the day
5061		corresponding to Monday, and so on.
5062	<b>abmon</b>	Define the abbreviated month names, corresponding to the %b conversion
5063		specification. The operand shall consist of twelve <semicolon>-separated
5064		strings, each surrounded by double-quotes. The first string shall be the
5065		abbreviated name of the first month of the year (January), the second the
5066		abbreviated name of the second month, and so on.
5067	<b>mon</b>	Define the full month names, corresponding to the %B conversion
5068		specification. The operand shall consist of twelve <semicolon>-separated
5069		strings, each surrounded by double-quotes. The first string shall be the full
5070		name of the first month of the year (January), the second the full name of the
5071		second month, and so on.
5072	<b>d_t_fmt</b>	Define the appropriate date and time representation, corresponding to the %c
5073		conversion specification. The operand shall consist of a string containing any
5074		combination of characters and conversion specifications. In addition, the
5075		string can contain escape sequences defined in the table in <a href="#">Table 5-1</a> (on page
5076		121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v').
5077	<b>d_fmt</b>	Define the appropriate date representation, corresponding to the %x
5078		conversion specification. The operand shall consist of a string containing any
5079		combination of characters and conversion specifications. In addition, the
5080		string can contain escape sequences defined in <a href="#">Table 5-1</a> (on page 121).
5081	<b>t_fmt</b>	Define the appropriate time representation, corresponding to the %X
5082		conversion specification. The operand shall consist of a string containing any
5083		combination of characters and conversion specifications. In addition, the
5084		string can contain escape sequences defined in <a href="#">Table 5-1</a> (on page 121).
5085	<b>am_pm</b>	Define the appropriate representation of the <i>ante-meridiem</i> and <i>post-meridiem</i>
5086		strings, corresponding to the %p conversion specification. The operand shall
5087		consist of two strings, separated by a <semicolon>, each surrounded by
5088		double-quotes. The first string shall represent the <i>ante-meridiem</i> designation,
5089		the last string the <i>post-meridiem</i> designation.
5090	<b>t_fmt_ampm</b>	Define the appropriate time representation in the 12-hour clock format with
5091		<b>am_pm</b> , corresponding to the %r conversion specification. The operand shall
5092		consist of a string and can contain any combination of characters and
5093		conversion specifications. If the string is empty, the 12-hour format is not
5094		supported in the locale.
5095	<b>era</b>	Define how years are counted and displayed for each era in a locale. The
5096		operand shall consist of <semicolon>-separated strings. Each string shall be an
5097		era description segment with the format:
5098		<i>direction:offset:start_date:end_date:era_name:era_format</i>

5099		according to the definitions below. There can be as many era description
5100		segments as are necessary to describe the different eras.
5101	<b>Note:</b>	The start of an era might not be the earliest point in the era—it may be the
5102		latest. For example, the Christian era BC starts on the day before January 1,
5103		AD 1, and increases with earlier time.
5104	<i>direction</i>	Either a '+' or a '-' character. The '+' character shall indicate
5105		that years closer to the <i>start_date</i> have lower numbers than those
5106		closer to the <i>end_date</i> . The '-' character shall indicate that years
5107		closer to the <i>start_date</i> have higher numbers than those closer to
5108		the <i>end_date</i> .
5109	<i>offset</i>	The number of the year closest to the <i>start_date</i> in the era,
5110		corresponding to the %Ey conversion specification.
5111	<i>start_date</i>	A date in the form <i>yyyy/mm/dd</i> , where <i>yyyy</i> , <i>mm</i> , and <i>dd</i> are the
5112		year, month, and day numbers respectively of the start of the era.
5113		Years prior to AD 1 shall be represented as negative numbers.
5114	<i>end_date</i>	The ending date of the era, in the same format as the <i>start_date</i> ,
5115		or one of the two special values "-*" or "+*". The value "-*" shall
5116		indicate that the ending date is the beginning of time. The
5117		value "+*" shall indicate that the ending date is the end of time.
5118	<i>era_name</i>	A string representing the name of the era, corresponding to the
5119		%EC conversion specification.
5120	<i>era_format</i>	A string for formatting the year in the era, corresponding to the
5121		%EY conversion specification.
5122	<b>era_d_fmt</b>	Define the format of the date in alternative era notation, corresponding to the
5123		%Ex conversion specification.
5124	<b>era_t_fmt</b>	Define the locale's appropriate alternative time format, corresponding to the
5125		%EX conversion specification.
5126	<b>era_d_t_fmt</b>	Define the locale's appropriate alternative date and time format,
5127		corresponding to the %Ec conversion specification.
5128	<b>alt_digits</b>	Define alternative symbols for digits, corresponding to the %O modified
5129		conversion specification. The operand shall consist of <semicolon>-separated
5130		strings, each surrounded by double-quotes. The first string shall be the
5131		alternative symbol corresponding with zero, the second string the symbol
5132		corresponding with one, and so on. Up to 100 alternative symbol strings can
5133		be specified. The %O modifier shall indicate that the string corresponding to
5134		the value specified via the conversion specification shall be used instead of the
5135		value.
5136	7.3.5.2	<i>LC_TIME</i> C-Language Access
5137		The following constants used to identify items of <i>langinfo</i> data can be used as arguments to the
5138		<i>nl_langinfo()</i> function to access information in the <i>LC_TIME</i> category. These constants are
5139		defined in the <b>&lt;langinfo.h&gt;</b> header.
5140	<b>ABDAY_x</b>	The abbreviated weekday names (for example, Sun), where <i>x</i> is a number
5141		from 1 to 7.

5142	DAY_x	The full weekday names (for example, Sunday), where <i>x</i> is a number from 1 to 7.
5143		
5144	ABMON_x	The abbreviated month names (for example, Jan), where <i>x</i> is a number from 1 to 12.
5145		
5146	MON_x	The full month names (for example, January), where <i>x</i> is a number from 1 to 12.
5147		
5148	D_T_FMT	The appropriate date and time representation.
5149	D_FMT	The appropriate date representation.
5150	T_FMT	The appropriate time representation.
5151	AM_STR	The appropriate ante-meridiem affix.
5152	PM_STR	The appropriate post-meridiem affix.
5153	T_FMT_AMPM	The appropriate time representation in the 12-hour clock format with AM_STR and PM_STR.
5154		
5155	ERA	The era description segments, which describe how years are counted and displayed for each era in a locale. Each era description segment shall have the format:
5156		
5157		
5158		<i>direction:offset:start_date:end_date:era_name:era_format</i>
5159		according to the definitions below. There can be as many era description segments as are necessary to describe the different eras. Era description segments are separated by <semicolon> characters.
5160		
5161		
5162	<i>direction</i>	Either a '+' or a '-' character. The '+' character shall indicate that years closer to the <i>start_date</i> have lower numbers than those closer to the <i>end_date</i> . The '-' character shall indicate that years closer to the <i>start_date</i> have higher numbers than those closer to the <i>end_date</i> .
5163		
5164		
5165		
5166		
5167	<i>offset</i>	The number of the year closest to the <i>start_date</i> in the era.
5168	<i>start_date</i>	A date in the form <i>yyyy/mm/dd</i> , where <i>yyyy</i> , <i>mm</i> , and <i>dd</i> are the year, month, and day numbers respectively of the start of the era. Years prior to AD 1 shall be represented as negative numbers.
5169		
5170		
5171	<i>end_date</i>	The ending date of the era, in the same format as the <i>start_date</i> , or one of the two special values "-*" or "+*". The value "-*" shall indicate that the ending date is the beginning of time. The value "+*" shall indicate that the ending date is the end of time.
5172		
5173		
5174		
5175	<i>era_name</i>	The era, corresponding to the %EC conversion specification.
5176	<i>era_format</i>	The format of the year in the era, corresponding to the %EY conversion specification.
5177		
5178	ERA_D_FMT	The era date format.
5179	ERA_T_FMT	The locale's appropriate alternative time format, corresponding to the %EX conversion specification.
5180		
5181	ERA_D_T_FMT	The locale's appropriate alternative date and time format, corresponding to the %Ec conversion specification.
5182		

5183 ALT\_DIGITS The alternative symbols for digits, corresponding to the %O conversion  
 5184 specification modifier. The value consists of <semicolon>-separated symbols.  
 5185 The first is the alternative symbol corresponding to zero, the second is the  
 5186 symbol corresponding to one, and so on. Up to 100 alternative symbols may  
 5187 be specified.

### 5188 7.3.5.3 LC\_TIME Category in the POSIX Locale

5189 The LC\_TIME category definition of the POSIX locale follows; the code listing depicts the  
 5190 *localedef* input; the table represents the same information with the addition of *localedef* keywords,  
 5191 conversion specifiers used by the *date* utility and the *strftime()*, *wcsftime()*, and *strptime()*  
 5192 functions, and *nl\_langinfo()* constants.

```

5193 LC_TIME
5194 # This is the POSIX locale definition for
5195 # the LC_TIME category.
5196 #
5197 # Abbreviated weekday names (%a)
5198 abday      "<S><u><n>" ; "<M><o><n>" ; "<T><u><e>" ; "<W><e><d>" ; \
5199            "<T><h><u>" ; "<F><r><i>" ; "<S><a><t>"

<b>era_t_fmt</b>	ERA_T_FMT	%EX	N/A
<b>era_d_t_fmt</b>	ERA_D_T_FMT	%Ec	N/A
<b>alt_digits</b>	ALT_DIGITS	%O	N/A

The entry N/A indicates the value is not available in the POSIX locale.

### 7.3.6 LC\_MESSAGES

The *LC\_MESSAGES* category shall define the format and values used by various utilities for affirmative and negative responses. This information is available through the *nl\_langinfo()* function.

The message catalog used by the standard utilities and selected by the *catopen()* function shall be determined by the setting of *NLSPATH*; see [Chapter 8](#) (on page 173). The *LC\_MESSAGES* category can be specified as part of an *NLSPATH* substitution field.

The following keywords shall be recognized as part of the locale definition file.

**copy** Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

**Note:** This is a *localedef* keyword, unavailable through *nl\_langinfo()*.

**yesexpr** The operand consists of an extended regular expression (see [Section 9.4](#), on page 188) that describes acceptable affirmative responses to a question expecting an affirmative or negative response.

**noexpr** The operand consists of an extended regular expression that describes acceptable negative responses to a question expecting an affirmative or negative response.

#### 7.3.6.1 LC\_MESSAGES Category in the POSIX Locale

The format and values for affirmative and negative responses of the POSIX locale follow; the code listing depicting the *localedef* input, the table representing the same information with the addition of *nl\_langinfo()* constants.

```
LC_MESSAGES
# This is the POSIX locale definition for
# the LC_MESSAGES category.
#
yesexpr "<circumflex><left-square-bracket><y><Y><right-square-bracket>"
#
noexpr "<circumflex><left-square-bracket><n><N><right-square-bracket>"
#
END LC_MESSAGES
```

5327	<b>localedef Keyword</b>	<b>langinfo Constant</b>	<b>POSIX Locale Value</b>
5328	<b>yesexpr</b>	YESEXPR	"^[yY]"
5329	<b>noexpr</b>	NOEXPR	"^[nN]"

## 7.4 Locale Definition Grammar

The grammar and lexical conventions in this section shall together describe the syntax for the locale definition source. The general conventions for this style of grammar are described in XCU [Section 1.3](#) (on page 2325). The grammar shall take precedence over the text in this chapter.

### 7.4.1 Locale Lexical Conventions

The lexical conventions for the locale definition grammar are described in this section.

The following tokens shall be processed (in addition to those string constants shown in the grammar):

<b>LOC_NAME</b>	A string of characters representing the name of a locale.
<b>CHAR</b>	Any single character.
<b>NUMBER</b>	A decimal number, represented by one or more decimal digits.
<b>COLLSYMBOL</b>	A symbolic name, enclosed between angle brackets. The string cannot duplicate any charmap symbol defined in the current charmap (if any), or a <b>COLLELEMENT</b> symbol.
<b>COLLELEMENT</b>	A symbolic name, enclosed between angle brackets, which cannot duplicate either any charmap symbol or a <b>COLLSYMBOL</b> symbol.
<b>CHARCLASS</b>	A string of alphanumeric characters from the portable character set, the first of which is not a digit, consisting of at least one and at most {CHARCLASS_NAME_MAX} bytes, and optionally surrounded by double-quotes.
<b>CHARSYMBOL</b>	A symbolic name, enclosed between angle brackets, from the current charmap (if any).
<b>OCTAL_CHAR</b>	One or more octal representations of the encoding of each byte in a single character. The octal representation consists of an escape character (normally a <backslash>) followed by two or more octal digits.
<b>HEX_CHAR</b>	One or more hexadecimal representations of the encoding of each byte in a single character. The hexadecimal representation consists of an escape character followed by the constant <i>x</i> and two or more hexadecimal digits.
<b>DECIMAL_CHAR</b>	One or more decimal representations of the encoding of each byte in a single character. The decimal representation consists of an escape character followed by a character 'd' and two or more decimal digits.

5364	<b>ELLIPSIS</b>	The string "...".
5365	<b>EXTENDED_REG_EXP</b>	An extended regular expression as defined in the grammar in <a href="#">Section 9.5</a> (on page 192).
5366		
5367	<b>EOL</b>	The line termination character <newline>.

#### 5368 7.4.2 Locale Grammar

5597                                     ;
5598     time_keyword_name                : 'abday' | 'day' | 'abmon' | 'mon'
5599                                     ;
5600     time_keyword_fmt                 : 'd_t_fmt' | 'd_fmt' | 't_fmt'
5601                                     | 'am_pm' | 't_fmt_ampm'
5602                                     ;
5603     time_keyword_opt                 : 'era' | 'era_d_fmt' | 'era_t_fmt'
5604                                     | 'era_d_t_fmt' | 'alt_digits'
5605                                     ;
5606     time_list                        : time_list ';' time_string
5607                                     | time_string
5608                                     ;
5609     time_string                      : '"' char_list '"'
5610                                     ;
5611     time_tlr                         : 'END' 'LC_TIME' EOL
5612                                     ;

```

# Environment Variables

## 8.1 Environment Variable Definition

Environment variables defined in this chapter affect the operation of multiple utilities, functions, and applications. There are other environment variables that are of interest only to specific utilities. Environment variables that apply to a single utility only are defined as part of the utility description. See the ENVIRONMENT VARIABLES section of the utility descriptions in the Shell and Utilities volume of POSIX.1-2008 for information on environment variable usage.

The value of an environment variable is a string of characters. For a C-language program, an array of strings called the environment shall be made available when a process begins. The array is pointed to by the external variable *environ*, which is defined as:

```
extern char **environ;
```

These strings have the form *name=value*; *names* shall not contain the character '='. For values to be portable across systems conforming to POSIX.1-2008, the value shall be composed of characters from the portable character set (except NUL and as indicated below). There is no meaning associated with the order of strings in the environment. If more than one string in an environment of a process has the same *name*, the consequences are undefined.

Environment variable names used by the utilities in the Shell and Utilities volume of POSIX.1-2008 consist solely of uppercase letters, digits, and the <underscore> ('\_') from the characters defined in Table 6-1 (on page 125) and do not begin with a digit. Other characters may be permitted by an implementation; applications shall tolerate the presence of such names. Uppercase and lowercase letters shall retain their unique identities and shall not be folded together. The name space of environment variable names containing lowercase letters is reserved for applications. Applications can define any environment variables with names from this name space without modifying the behavior of the standard utilities.

**Note:** Other applications may have difficulty dealing with environment variable names that start with a digit. For this reason, use of such names is not recommended anywhere.

The *values* that the environment variables may be assigned are not restricted except that they are considered to end with a null byte and the total space used to store the environment and the arguments to the process is limited to {ARG\_MAX} bytes.

Other *name=value* pairs may be placed in the environment by, for example, calling any of the *setenv()*, *unsetenv()*, or *putenv()* functions, assigning a new value to the *environ* variable, or by using *envp* arguments when creating a process; see *exec* in the System Interfaces volume of POSIX.1-2008.

If the application modifies the pointers to which *environ* points, the behavior of all interfaces described in the System Interfaces volume of POSIX.1-2008 is undefined.

It is unwise to conflict with certain variables that are frequently exported by widely used command interpreters and applications:

5651	ARFLAGS	IFS	MAILPATH	PS1
5652	CC	LANG	MAILRC	PS2
5653	CDPATH	LC_ALL	MAKEFLAGS	PS3
5654	CFLAGS	LC_COLLATE	MAKESHELL	PS4
5655	CHARSET	LC_CTYPE	MANPATH	PWD
5656	COLUMNS	LC_MESSAGES	MBOX	RANDOM
5657	DATMSK	LC_MONETARY	MORE	SECONDS
5658	DEAD	LC_NUMERIC	MSGVERB	SHELL
5659	EDITOR	LC_TIME	NLSPATH	TERM
5660	ENV	LDFLAGS	NPROC	TERMCAP
5661	EXINIT	LEX	OLDPWD	TERMINFO
5662	FC	LFLAGS	OPTARG	TMPDIR
5663	FCEDIT	LINENO	OPTERR	TZ
5664	FFLAGS	LINES	OPTIND	USER
5665	GET	LISTER	PAGER	VISUAL
5666	GFLAGS	LOGNAME	PATH	YACC
5667	HISTFILE	LPDEST	PPID	YFLAGS
5668	HISTORY	MAIL	PRINTER	
5669	HISTSIZE	MAILCHECK	PROCLANG	
5670	HOME	MAILER	PROJECTDIR	

If the variables in the following two sections are present in the environment during the execution of an application or utility, they shall be given the meaning described below. Some are placed into the environment by the implementation at the time the user logs in; all can be added or changed by the user or any ancestor of the current process. The implementation adds or changes environment variables named in POSIX.1-2008 only as specified in POSIX.1-2008. If they are defined in the application's environment, the utilities in the Shell and Utilities volume of POSIX.1-2008 and the functions in the System Interfaces volume of POSIX.1-2008 assume they have the specified meaning. Conforming applications shall not set these environment variables to have meanings other than as described. See *getenv()* (on page 1024) and XCU Section 2.12 (on page 2371) for methods of accessing these variables.

## 8.2 Internationalization Variables

This section describes environment variables that are relevant to the operation of internationalized interfaces described in POSIX.1-2008.

Users may use the following environment variables to announce specific localization requirements to applications. Applications can retrieve this information using the *setlocale()* function to initialize the correct behavior of the internationalized interfaces. The descriptions of the internationalization environment variables describe the resulting behavior only when the application locale is initialized in this way. The use of the internationalization variables by utilities described in the Shell and Utilities volume of POSIX.1-2008 is described in the ENVIRONMENT VARIABLES section for those utilities in addition to the global effects described in this section.

**LANG** This variable shall determine the locale category for native language, local customs, and coded character set in the absence of the *LC\_ALL* and other *LC\_\** (*LC\_COLLATE*, *LC\_CTYPE*, *LC\_MESSAGES*, *LC\_MONETARY*, *LC\_NUMERIC*, *LC\_TIME*) environment variables. This can be used by applications to determine the language to use for error messages and instructions, collating sequences, date formats, and so on.

5698	<i>LC_ALL</i>	This variable shall determine the values for all locale categories. The value of
5699		the <i>LC_ALL</i> environment variable has precedence over any of the other
5700		environment variables starting with <i>LC_</i> ( <i>LC_COLLATE</i> , <i>LC_CTYPE</i> ,
5701		<i>LC_MESSAGES</i> , <i>LC_MONETARY</i> , <i>LC_NUMERIC</i> , <i>LC_TIME</i> ) and the <i>LANG</i>
5702		environment variable.
5703	<i>LC_COLLATE</i>	This variable shall determine the locale category for character collation. It
5704		determines collation information for regular expressions and sorting,
5705		including equivalence classes and multi-character collating elements, in
5706		various utilities and the <i>strcoll()</i> and <i>strxfrm()</i> functions. Additional semantics
5707		of this variable, if any, are implementation-defined.
5708	<i>LC_CTYPE</i>	This variable shall determine the locale category for character handling
5709		functions, such as <i>tolower()</i> , <i>toupper()</i> , and <i>isalpha()</i> . This environment
5710		variable determines the interpretation of sequences of bytes of text data as
5711		characters (for example, single as opposed to multi-byte characters), the
5712		classification of characters (for example, alpha, digit, graph), and the behavior
5713		of character classes. Additional semantics of this variable, if any, are
5714		implementation-defined.
5715	<i>LC_MESSAGES</i>	This variable shall determine the locale category for processing affirmative
5716		and negative responses and the language and cultural conventions in which
5717		messages should be written. It also affects the behavior of the <i>catopen()</i>
5718		function in determining the message catalog. Additional semantics of this
5719		variable, if any, are implementation-defined. The language and cultural
5720		conventions of diagnostic and informative messages whose format is
5721		unspecified by POSIX.1-2008 should be affected by the setting of
5722		<i>LC_MESSAGES</i> .
5723	<i>LC_MONETARY</i>	This variable shall determine the locale category for monetary-related numeric
5724		formatting information. Additional semantics of this variable, if any, are
5725		implementation-defined.
5726	<i>LC_NUMERIC</i>	This variable shall determine the locale category for numeric formatting (for
5727		example, thousands separator and radix character) information in various
5728		utilities as well as the formatted I/O operations in <i>printf()</i> and <i>scanf()</i> and the
5729		string conversion functions in <i>strtod()</i> . Additional semantics of this variable,
5730		if any, are implementation-defined.
5731	<i>LC_TIME</i>	This variable shall determine the locale category for date and time formatting
5732		information. It affects the behavior of the time functions in <i>strptime()</i> .
5733		Additional semantics of this variable, if any, are implementation-defined.
5734	<i>NLSPATH</i>	This variable shall contain a sequence of templates that the <i>catopen()</i> function
5735		uses when attempting to locate message catalogs. Each template consists of an
5736		optional prefix, one or more conversion specifications, a pathname, and an
5737		optional suffix.
5738		For example:
5739		<i>NLSPATH</i> ="/system/nlslib/%N.cat "
5740		defines that <i>catopen()</i> should look for all message catalogs in the directory
5741		<b>/system/nlslib</b> , where the catalog name should be constructed from the <i>name</i>
5742		parameter passed to <i>catopen()</i> (%N), with the suffix <b>.cat</b> .
5743		Conversion specifications consist of a ' % ' symbol, followed by a single-letter
5744		keyword. The following keywords are currently defined:

5745                    %N   The value of the *name* parameter passed to *catopen()*.

5746                    %L   The value of the *LC\_MESSAGES* category.

5747                    %l   The *language* element from the *LC\_MESSAGES* category.

5748                    %t   The *territory* element from the *LC\_MESSAGES* category.

5749                    %c   The *codeset* element from the *LC\_MESSAGES* category.

5750                    %%   A single '%' character.

5751                    An empty string is substituted if the specified value is not currently defined.

5752                    The separators <underscore> ('\_') and <period> ('.') are not included in

5753                    the %t and %c conversion specifications.

5754                    Templates defined in *NLSPATH* are separated by <colon> characters (':'). A

5755                    leading or two adjacent <colon> characters ("::") is equivalent to specifying

5756                    %N. For example:

5757                    `NLSPATH=":%N.cat:/nlslib/%L/%N.cat"`

5758                    indicates to *catopen()* that it should look for the requested message catalog in

5759                    *name*, *name.cat*, and */nlslib/category/name.cat*, where *category* is the value of the

5760                    *LC\_MESSAGES* category of the current locale.

5761                    Users should not set the *NLSPATH* variable unless they have a specific reason

5762                    to override the default system path. Setting *NLSPATH* to override the default

5763                    system path produces undefined results in the standard utilities and in

5764                    applications with appropriate privileges.

5765                    The environment variables *LANG*, *LC\_ALL*, *LC\_COLLATE*, *LC\_CTYPE*, *LC\_MESSAGES*,

5766                    *LC\_MONETARY*, *LC\_NUMERIC*, *LC\_TIME*, and *NLSPATH* provide for the support of

5767                    internationalized applications. The standard utilities shall make use of these environment

5768                    variables as described in this section and the individual ENVIRONMENT VARIABLES sections

5769                    for the utilities. If these variables specify locale categories that are not based upon the same

5770                    underlying codeset, the results are unspecified.

5771                    The values of locale categories shall be determined by a precedence order; the first condition met

5772                    below determines the value:

- 5773                    1. If the *LC\_ALL* environment variable is defined and is not null, the value of *LC\_ALL* shall
- 5774                    be used.
- 5775                    2. If the *LC\_\** environment variable (*LC\_COLLATE*, *LC\_CTYPE*, *LC\_MESSAGES*,
- 5776                    *LC\_MONETARY*, *LC\_NUMERIC*, *LC\_TIME*) is defined and is not null, the value of the
- 5777                    environment variable shall be used to initialize the category that corresponds to the
- 5778                    environment variable.
- 5779                    3. If the *LANG* environment variable is defined and is not null, the value of the *LANG*
- 5780                    environment variable shall be used.
- 5781                    4. If the *LANG* environment variable is not set or is set to the empty string, the
- 5782                    implementation-defined default locale shall be used.

5783                    If the locale value is "C" or "POSIX", the POSIX locale shall be used and the standard utilities

5784                    behave in accordance with the rules in [Section 7.2](#) (on page 136) for the associated category.

5785                    If the locale value begins with a <slash>, it shall be interpreted as the pathname of a file that was

5786                    created in the output format used by the *localedef* utility; see OUTPUT FILES under *localedef*.

5787                    Referencing such a pathname shall result in that locale being used for the indicated category.

5788 XSI If the locale value has the form:

5789 `language[_territory][.codeset]`

5790 it refers to an implementation-provided locale, where settings of language, territory, and codeset

5791 are implementation-defined.

5792 `LC_COLLATE`, `LC_CTYPE`, `LC_MESSAGES`, `LC_MONETARY`, `LC_NUMERIC`, and `LC_TIME` are

5793 defined to accept an additional field `@modifier`, which allows the user to select a specific instance

5794 of localization data within a single category (for example, for selecting the dictionary as opposed

5795 to the character ordering of data). The syntax for these environment variables is thus defined as:

5796 `[language[_territory][.codeset][@modifier]]`

5797 For example, if a user wanted to interact with the system in French, but required to sort German

5798 text files, `LANG` and `LC_COLLATE` could be defined as:

5799 `LANG=Fr_FR`

5800 `LC_COLLATE=De_DE`

5801 This could be extended to select dictionary collation (say) by use of the `@modifier` field; for

5802 example:

5803 `LC_COLLATE=De_DE@dict`

5804 An implementation may support other formats.

5805 If the locale value is not recognized by the implementation, the behavior is unspecified.

5806 These environment variables are used by the `newlocale()` and `setlocale()` functions, and by the

5807 standard utilities.

5808 Additional criteria for determining a valid locale name are implementation-defined.

### 5809 8.3 Other Environment Variables

5810 **COLUMNS** This variable shall represent a decimal integer >0 used to indicate the user's

5811 preferred width in column positions for the terminal screen or window; see

5812 [Section 3.103](#) (on page 50). If this variable is unset or null, the implementation

5813 determines the number of columns, appropriate for the terminal or window,

5814 in an unspecified manner. When `COLUMNS` is set, any terminal-width

5815 information implied by `TERM` is overridden. Users and conforming

5816 applications should not set `COLUMNS` unless they wish to override the

5817 system selection and produce output unrelated to the terminal characteristics.

5818 Users should not need to set this variable in the environment unless there is a

5819 specific reason to override the implementation's default behavior, such as to

5820 display data in an area arbitrarily smaller than the terminal or window.

5821 XSI **DATEMSK** Indicates the pathname of the template file used by `getdate()`.

5822 **HOME** The system shall initialize this variable at the time of login to be a pathname of

5823 the user's home directory. See [<pwd.h>](#).

5824 **LINES** This variable shall represent a decimal integer >0 used to indicate the user's

5825 preferred number of lines on a page or the vertical screen or window size in

5826 lines. A line in this case is a vertical measure large enough to hold the tallest

5827 character in the character set being displayed. If this variable is unset or null,

5828		the implementation determines the number of lines, appropriate for the
5829		terminal or window (size, terminal baud rate, and so on), in an unspecified
5830		manner. When <i>LINES</i> is set, any terminal-height information implied by
5831		<i>TERM</i> is overridden. Users and conforming applications should not set <i>LINES</i>
5832		unless they wish to override the system selection and produce output
5833		unrelated to the terminal characteristics.
5834		Users should not need to set this variable in the environment unless there is a
5835		specific reason to override the implementation's default behavior, such as to
5836		display data in an area arbitrarily smaller than the terminal or window.
5837	<i>LOGNAME</i>	The system shall initialize this variable at the time of login to be the user's
5838		login name. See <a href="#">&lt;pwd.h&gt;</a> . For a value of <i>LOGNAME</i> to be portable across
5839		implementations of POSIX.1-2008, the value should be composed of characters
5840		from the portable filename character set.
5841	XSI	<i>MSGVERB</i> Describes which message components shall be used in writing messages by
5842		<i>fntmsg()</i> .
5843	<i>PATH</i>	This variable shall represent the sequence of path prefixes that certain
5844		functions and utilities apply in searching for an executable file known only by
5845		a filename. The prefixes shall be separated by a <colon> (':'). When a non-
5846		zero-length prefix is applied to this filename, a <slash> shall be inserted
5847		between the prefix and the filename if the prefix did not end in <slash>. A
5848		zero-length prefix is a legacy feature that indicates the current working
5849		directory. It appears as two adjacent <colon> characters (": :"), as an initial
5850		<colon> preceding the rest of the list, or as a trailing <colon> following the
5851		rest of the list. A strictly conforming application shall use an actual pathname
5852		(such as .) to represent the current working directory in <i>PATH</i> . The list shall
5853		be searched from beginning to end, applying the filename to each prefix, until
5854		an executable file with the specified name and appropriate execution
5855		permissions is found. If the pathname being sought contains a <slash>, the
5856		search through the path prefixes shall not be performed. If the pathname
5857		begins with a <slash>, the specified path is resolved (see <a href="#">Section 4.13</a> , on page
5858		111). If <i>PATH</i> is unset or is set to null, the path search is implementation-
5859		defined.
5860		Since <colon> is a separator in this context, directory names that might be
5861		used in <i>PATH</i> should not include a <colon> character.
5862	<i>PWD</i>	This variable shall represent an absolute pathname of the current working
5863		directory. It shall not contain any components that are dot or dot-dot. The
5864		value is set by the <i>cd</i> utility, and by the <i>sh</i> utility during initialization.
5865	<i>SHELL</i>	This variable shall represent a pathname of the user's preferred command
5866		language interpreter. If this interpreter does not conform to the Shell
5867		Command Language in XCU <a href="#">Chapter 2</a> (on page 2335), utilities may behave
5868		differently from those described in POSIX.1-2008.
5869	<i>TMPDIR</i>	This variable shall represent a pathname of a directory made available for
5870		programs that need a place to create temporary files.
5871	<i>TERM</i>	This variable shall represent the terminal type for which output is to be
5872		prepared. This information is used by utilities and application programs
5873		wishing to exploit special capabilities specific to a terminal. The format and
5874		allowable values of this environment variable are unspecified.

5875            *TZ*            This variable shall represent timezone information. The contents of the  
 5876 environment variable named *TZ* shall be used by the *ctime()*, *ctime\_r()*,  
 5877 *localtime()*, *localtime\_r()*, *strptime()*, *mktime()*, functions, and by various  
 5878 utilities, to override the default timezone. The value of *TZ* has one of the two  
 5879 forms (spaces inserted for clarity):

5880                    *:characters*

5881                    or:

5882                    *std offset dst offset, rule*

5883            If *TZ* is of the first format (that is, if the first character is a <colon>), the  
 5884 characters following the <colon> are handled in an implementation-defined  
 5885 manner.

5886            The expanded format (for all *TZ*s whose value does not have a <colon> as the  
 5887 first character) is as follows:

5888                    *stdoffset[dst[offset][,start[/time],end[/time]]]*

5889            Where:

5890            *std* and *dst*    Indicate no less than three, nor more than {TZNAME\_MAX},  
 5891 bytes that are the designation for the standard (*std*) or the  
 5892 alternative (*dst*—such as Daylight Savings Time) timezone. Only  
 5893 *std* is required; if *dst* is missing, then the alternative time does  
 5894 not apply in this locale.

5895            Each of these fields may occur in either of two formats quoted or  
 5896 unquoted:

5897                    — In the quoted form, the first character shall be the <less-  
 5898 than-sign> ('<') character and the last character shall be  
 5899 the <greater-than-sign> ('>') character. All characters  
 5900 between these quoting characters shall be alphanumeric  
 5901 characters from the portable character set in the current  
 5902 locale, the <plus-sign> ('+') character, or the <hyphen-  
 5903 minus>('−') character. The *std* and *dst* fields in this case  
 5904 shall not include the quoting characters.

5905                    — In the unquoted form, all characters in these fields shall be  
 5906 alphabetic characters from the portable character set in the  
 5907 current locale.

5908            The interpretation of these fields is unspecified if either field is  
 5909 less than three bytes (except for the case when *dst* is missing),  
 5910 more than {TZNAME\_MAX} bytes, or if they contain characters  
 5911 other than those specified.

5912                    *offset*            Indicates the value added to the local time to arrive at  
 5913 Coordinated Universal Time. The *offset* has the form:

5914                    *hh[:mm[:ss]]*

5915            The minutes (*mm*) and seconds (*ss*) are optional. The hour (*hh*)  
 5916 shall be required and may be a single digit. The *offset* following  
 5917 *std* shall be required. If no *offset* follows *dst*, the alternative time  
 5918 is assumed to be one hour ahead of standard time. One or more  
 5919 digits may be used; the value is always interpreted as a decimal

5920		number. The hour shall be between zero and 24, and the minutes
5921		(and seconds)—if present—between zero and 59. The result of
5922		using values outside of this range is unspecified. If preceded by
5923		a '−', the timezone shall be east of the Prime Meridian;
5924		otherwise, it shall be west (which may be indicated by an
5925		optional preceding '+').
5926	<i>rule</i>	Indicates when to change to and back from the alternative time.
5927		The <i>rule</i> has the form:
5928		<i>date</i> [/ <i>time</i> ], <i>date</i> [/ <i>time</i> ]
5929		where the first <i>date</i> describes when the change from standard to
5930		alternative time occurs and the second <i>date</i> describes when the
5931		change back happens. Each <i>time</i> field describes when, in current
5932		local time, the change to the other time is made.
5933		The format of <i>date</i> is one of the following:
5934	<i>Jn</i>	The Julian day <i>n</i> ( $1 \leq n \leq 365$ ). Leap days shall not be
5935		counted. That is, in all years—including leap years—
5936		February 28 is day 59 and March 1 is day 60. It is
5937		impossible to refer explicitly to the occasional February
5938		29.
5939	<i>n</i>	The zero-based Julian day ( $0 \leq n \leq 365$ ). Leap days shall
5940		be counted, and it is possible to refer to February 29.
5941	<i>Mm.n.d</i>	The <i>d</i> 'th day ( $0 \leq d \leq 6$ ) of week <i>n</i> of month <i>m</i> of the
5942		year ( $1 \leq n \leq 5$ , $1 \leq m \leq 12$ , where week 5 means "the last
5943		<i>d</i> day in month <i>m</i> " which may occur in either the fourth
5944		or the fifth week). Week 1 is the first week in which the
5945		<i>d</i> 'th day occurs. Day zero is Sunday.
5946		The <i>time</i> has the same format as <i>offset</i> except that no leading sign
5947		('−' or '+') is allowed. The default, if <i>time</i> is not given, shall be
5948		02:00:00.

# Regular Expressions

Regular Expressions (REs) provide a mechanism to select specific strings from a set of character strings.

Regular expressions are a context-independent syntax that can represent a wide variety of character sets and character set orderings, where these character sets are interpreted according to the current locale. While many regular expressions can be interpreted differently depending on the current locale, many features, such as character class expressions, provide for contextual invariance across locales.

The Basic Regular Expression (BRE) notation and construction rules in [Section 9.3](#) (on page 183) shall apply to most utilities supporting regular expressions. Some utilities, instead, support the Extended Regular Expressions (ERE) described in [Section 9.4](#) (on page 188); any exceptions for both cases are noted in the descriptions of the specific utilities using regular expressions. Both BREs and EREs are supported by the Regular Expression Matching interface in the System Interfaces volume of POSIX.1-2008 under *regcomp()*, *regex()*, and related functions.

## 9.1 Regular Expression Definitions

For the purposes of this section, the following definitions shall apply:

### entire regular expression

The concatenated set of one or more BREs or EREs that make up the pattern specified for string selection.

### matched

A sequence of zero or more characters shall be said to be matched by a BRE or ERE when the characters in the sequence correspond to a sequence of characters defined by the pattern.

Matching shall be based on the bit pattern used for encoding the character, not on the graphic representation of the character. This means that if a character set contains two or more encodings for a graphic symbol, or if the strings searched contain text encoded in more than one codeset, no attempt is made to search for any other representation of the encoded symbol. If that is required, the user can specify equivalence classes containing all variations of the desired graphic symbol.

The search for a matching sequence starts at the beginning of a string and stops when the first sequence matching the expression is found, where “first” is defined to mean “begins earliest in the string”. If the pattern permits a variable number of matching characters and thus there is more than one such sequence starting at that point, the longest such sequence is matched. For example, the BRE “bb\*” matches the second to fourth characters of the string “abbbc”, and the ERE “(wee|week)(knights|night)” matches all ten characters of the string “weeknights”.

Consistent with the whole match being the longest of the leftmost matches, each subpattern, from left to right, shall match the longest possible string. For this purpose, a null string shall be considered to be longer than no match at all. For example, matching the BRE

"\(.\*\).\*" against "abcdef", the subexpression "(\1)" is "abcdef", and matching the BRE "\ (a\*\)" against "bc", the subexpression "(\1)" is the null string.

When a multi-character collating element in a bracket expression (see [Section 9.3.5](#), on page 184) is involved, the longest sequence shall be measured in characters consumed from the string to be matched; that is, the collating element counts not as one element, but as the number of characters it matches.

#### **BRE (ERE) matching a single character**

A BRE or ERE that shall match either a single character or a single collating element.

Only a BRE or ERE of this type that includes a bracket expression (see [Section 9.3.5](#), on page 184) can match a collating element.

#### **BRE (ERE) matching multiple characters**

A BRE or ERE that shall match a concatenation of single characters or collating elements.

Such a BRE or ERE is made up from a BRE (ERE) matching a single character and BRE (ERE) special characters.

#### **invalid**

This section uses the term “invalid” for certain constructs or conditions. Invalid REs shall cause the utility or function using the RE to generate an error condition. When invalid is not used, violations of the specified syntax or semantics for REs produce undefined results: this may entail an error, enabling an extended syntax for that RE, or using the construct in error as literal characters to be matched. For example, the BRE construct "\{1,2,3\}" does not comply with the grammar. A conforming application cannot rely on it producing an error nor matching the literal characters "\{1,2,3\}".

## **9.2 Regular Expression General Requirements**

The requirements in this section shall apply to both basic and extended regular expressions.

The use of regular expressions is generally associated with text processing. REs (BREs and EREs) operate on text strings; that is, zero or more characters followed by an end-of-string delimiter (typically NUL). Some utilities employing regular expressions limit the processing to lines; that is, zero or more characters followed by a <newline>.

In the functions processing regular expressions described in System Interfaces volume of POSIX.1-2008, the <newline> is regarded as an ordinary character and both a <period> and a non-matching list can match one. The Shell and Utilities volume of POSIX.1-2008 specifies within the individual descriptions of those standard utilities employing regular expressions whether they permit matching of <newline> characters; if not stated otherwise, the use of literal <newline> characters or any escape sequence equivalent in either patterns or matched text produces undefined results. Those utilities (like *grep*) that do not allow <newline> characters to match are responsible for eliminating any <newline> from strings before matching against the RE. The *regcomp()* function in the System Interfaces volume of POSIX.1-2008, however, can provide support for such processing without violating the rules of this section.

The interfaces specified in POSIX.1-2008 do not permit the inclusion of a NUL character in an RE or in the string to be matched. If during the operation of a standard utility a NUL is included in the text designated to be matched, that NUL may designate the end of the text string for the purposes of matching.

When a standard utility or function that uses regular expressions specifies that pattern matching shall be performed without regard to the case (uppercase or lowercase) of either data or

patterns, then when each character in the string is matched against the pattern, not only the character, but also its case counterpart (if any), shall be matched. This definition of case-insensitive processing is intended to allow matching of multi-character collating elements as well as characters, as each character in the string is matched using both its cases. For example, in a locale where "Ch" is a multi-character collating element and where a matching list expression matches such elements, the RE "[.Ch.]" when matched against the string "char" is in reality matched against "ch", "Ch", "cH", and "CH".

The implementation shall support any regular expression that does not exceed 256 bytes in length.

## 9.3 Basic Regular Expressions

### 9.3.1 BREs Matching a Single Character or Collating Element

A BRE ordinary character, a special character preceded by a <backslash>, or a <period> shall match a single character. A bracket expression shall match a single character or a single collating element.

### 9.3.2 BRE Ordinary Characters

An ordinary character is a BRE that matches itself: any character in the supported character set, except for the BRE special characters listed in [Section 9.3.3](#).

The interpretation of an ordinary character preceded by an unescaped <backslash> ('\\') is undefined, except for:

- The characters ' ) ' , ' ( ' , ' { ' , and ' } '
- The digits 1 to 9 inclusive (see [Section 9.3.6](#), on page 186)
- A character inside a bracket expression

### 9.3.3 BRE Special Characters

A BRE special character has special properties in certain contexts. Outside those contexts, or when preceded by a <backslash>, such a character is a BRE that matches the special character itself. The BRE special characters and the contexts in which they have their special meaning are as follows:

. [ \ The <period>, <left-square-bracket>, and <backslash> shall be special except when used in a bracket expression (see [Section 9.3.5](#), on page 184). An expression containing a '[' that is unescaped and is not part of a bracket expression produces undefined results.

\* The <asterisk> shall be special except when used:

— In a bracket expression

— As the first character of an entire BRE (after an initial '<sup>^</sup>', if any)

— As the first character of a subexpression (after an initial '<sup>^</sup>', if any); see [Section 9.3.6](#) (on page 186)

<sup>^</sup> The <circumflex> shall be special when used as an anchor (see [Section 9.3.8](#), on page 188). The <circumflex> shall signify a non-matching list expression when it occurs first in a list, immediately following a <left-square-bracket> (see [Section 9.3.5](#)).

<sup>\$</sup> The <dollar-sign> shall be special when used as an anchor.

### 9.3.4 Periods in BREs

A <period> ('<sup>.</sup>'), when used outside a bracket expression, is a BRE that shall match any character in the supported character set except NUL.

### 9.3.5 RE Bracket Expression

A bracket expression (an expression enclosed in square brackets, "[ ]") is an RE that shall match a specific set of single characters, and may match a specific set of multi-character collating elements, based on the non-empty set of list expressions contained in the bracket expression.

The following rules and definitions apply to bracket expressions:

1. A bracket expression is either a matching list expression or a non-matching list expression. It consists of one or more expressions: ordinary characters, collating elements, collating symbols, equivalence classes, character classes, or range expressions. The <right-square-bracket> ('<sup>]</sup>') shall lose its special meaning and represent itself in a bracket expression if it occurs first in the list (after an initial <circumflex> ('<sup>^</sup>'), if any). Otherwise, it shall terminate the bracket expression, unless it appears in a collating symbol (such as "[<sup>.</sup>]<sup>.</sup>"] or is the ending <right-square-bracket> for a collating symbol, equivalence class, or character class. The special characters '<sup>.</sup>', '<sup>\*</sup>', '<sup>[</sup>', and '\\<sup>'</sup>' (<period>, <asterisk>, <left-square-bracket>, and <backslash>, respectively) shall lose their special meaning within a bracket expression.

The character sequences "[<sup>.</sup>]", "[<sup>=</sup>]", and "[<sup>:</sup>]" (<left-square-bracket> followed by a <period>, <equals-sign>, or <colon>) shall be special inside a bracket expression and are used to delimit collating symbols, equivalence class expressions, and character class expressions. These symbols shall be followed by a valid expression and the matching terminating sequence "<sup>]</sup>", "<sup>=</sup>]", or "<sup>:</sup>]", as described in the following items.

2. A matching list expression specifies a list that shall match any single character that is matched by one of the expressions represented in the list. The first character in the list cannot be the <circumflex>. An ordinary character in the list should only match that character, but may match any single character that collates equally with that character; for example, "[abc]" is an RE that should only match one of the characters '<sup>a</sup>', '<sup>b</sup>', or '<sup>c</sup>'.

**Note:** A future version of this standard may require that an ordinary character in the list only matches that character.

It is unspecified whether a matching list expression matches a multi-character collating element that is matched by one of the expressions.

3. A non-matching list expression begins with a <circumflex> ('<sup>^</sup>'), and the matching behavior shall be the logical inverse of the corresponding matching list expression (the same bracket expression but without the leading <circumflex>). For example, if the RE

"[abc]" only matches 'a', 'b', or 'c', then "[^abc]" is an RE that matches any character except 'a', 'b', or 'c'. It is unspecified whether a non-matching list expression matches a multi-character collating element that is not matched by any of the expressions. The <circumflex> shall have this special meaning only when it occurs first in the list, immediately following the <left-square-bracket>.

4. A collating symbol is a collating element enclosed within bracket-period ("[" and ".]") delimiters. Collating elements are defined as described in [Section 7.3.2.4](#) (on page 149). Conforming applications shall represent multi-character collating elements as collating symbols when it is necessary to distinguish them from a list of the individual characters that make up the multi-character collating element. For example, if the string "ch" is a collating element defined using the line:

```
collating-element <ch-digraph> from "<c><h>"
```

in the locale definition, the expression "[.ch.]" shall be treated as an RE containing the collating symbol 'ch', while "[ch]" shall be treated as an RE matching 'c' or 'h'. Collating symbols are recognized only inside bracket expressions. If the string is not a collating element in the current locale, the expression is invalid.

5. An equivalence class expression shall represent the set of collating elements belonging to an equivalence class, as described in [Section 7.3.2.4](#) (on page 149). Only primary equivalence classes shall be recognized. The class shall be expressed by enclosing any one of the collating elements in the equivalence class within bracket-equal ("[" and "=") delimiters. For example, if 'a', 'à', and '^' belong to the same equivalence class, then "[[a=]b]", "[[à=]b]", and "[[^=]b]" are each equivalent to "[aâ^b]". If the collating element does not belong to an equivalence class, the equivalence class expression shall be treated as a collating symbol.

6. A character class expression shall represent the union of two sets:

- a. The set of single characters that belong to the character class, as defined in the *LC\_CTYPE* category in the current locale.
- b. An unspecified set of multi-character collating elements.

All character classes specified in the current locale shall be recognized. A character class expression is expressed as a character class name enclosed within bracket-colon ("[" and " : "]") delimiters.

The following character class expressions shall be supported in all locales:

```
[ :alnum: ]    [ :cntrl: ]    [ :lower: ]    [ :space: ]
[ :alpha: ]    [ :digit: ]    [ :print: ]    [ :upper: ]
[ :blank: ]    [ :graph: ]    [ :punct: ]    [ :xdigit: ]
```

In addition, character class expressions of the form:

```
[ :name: ]
```

are recognized in those locales where the *name* keyword has been given a **charclass** definition in the *LC\_CTYPE* category.

7. In the POSIX locale, a range expression represents the set of collating elements that fall between two elements in the collation sequence, inclusive. In other locales, a range expression has unspecified behavior: strictly conforming applications shall not rely on whether the range expression is valid, or on the set of collating elements matched. A range expression shall be expressed as the starting point and the ending point separated by a <hyphen-minus> ('-').

In the following, all examples assume the POSIX locale.

The starting range point and the ending range point shall be a collating element or collating symbol. An equivalence class expression used as a starting or ending point of a range expression produces unspecified results. An equivalence class can be used portably within a bracket expression, but only outside the range. If the represented set of collating elements is empty, it is unspecified whether the expression matches nothing, or is treated as invalid.

The interpretation of range expressions where the ending range point is also the starting range point of a subsequent range expression (for example, "[a-m-o]") is undefined.

The <hyphen-minus> character shall be treated as itself if it occurs first (after an initial '^', if any) or last in the list, or as an ending range point in a range expression. As examples, the expressions "[ac]" and "[ac-]" are equivalent and match any of the characters 'a', 'c', or '-'; "[^ac]" and "[^ac-]" are equivalent and match any characters except 'a', 'c', or '-'; the expression "[%-]" matches any of the characters between '%' and '-' inclusive; the expression "[-@]" matches any of the characters between '-' and '@' inclusive; and the expression "[a--@]" is either invalid or equivalent to '@', because the letter 'a' follows the symbol '-' in the POSIX locale. To use a <hyphen-minus> as the starting range point, it shall either come first in the bracket expression or be specified as a collating symbol; for example, "[[. . ]-0]", which matches either a <right-square-bracket> or any character or collating element that collates between <hyphen-minus> and 0, inclusive.

If a bracket expression specifies both '-' and ']', the ']' shall be placed first (after the '^', if any) and the '-' last within the bracket expression.

8. If a bracket expression contains at least three list elements, where the first and last list elements are the same single-character element of <period>, <equals-sign>, or <colon>, then it is unspecified whether the bracket expression will be treated as a collating symbol, equivalence class, or character class, respectively; treated as a matching list expression; or rejected as an error.

### 9.3.6 BREs Matching Multiple Characters

The following rules can be used to construct BREs matching multiple characters from BREs matching a single character:

1. The concatenation of BREs shall match the concatenation of the strings matched by each component of the BRE.
2. A subexpression can be defined within a BRE by enclosing it between the character pairs "\(" and "\)". Such a subexpression shall match whatever it would have matched without the "\(" and "\)", except that anchoring within subexpressions is optional behavior; see [Section 9.3.8](#) (on page 188). Subexpressions can be arbitrarily nested.
3. The back-reference expression '\n' shall match the same (possibly empty) string of characters as was matched by a subexpression enclosed between "\(" and "\)" preceding the '\n'. The character 'n' shall be a digit from 1 through 9, specifying the *n*th subexpression (the one that begins with the *n*th "\(" from the beginning of the pattern and ends with the corresponding paired "\)"). The expression is invalid if less than *n* subexpressions precede the '\n'. The string matched by a contained subexpression shall be within the string matched by the containing subexpression. If the containing subexpression does not match, or if there is no match for the contained subexpression within the string matched by the containing subexpression, then back-

reference expressions corresponding to the contained subexpression shall not match. When a subexpression matches more than one string, a back-reference expression corresponding to the subexpression shall refer to the last matched string. For example, the expression `"^\. *\) \1$"` matches strings consisting of two adjacent appearances of the same substring, and the expression `"^(a\) * \1"` fails to match `'a'`, the expression `"\ (a \(b\) *\) * \2"` fails to match `'abab'`, and the expression `"^ \(ab *\) * \1$"` matches `'ababbabb'`, but fails to match `'ababbab'`.

4. When a BRE matching a single character, a subexpression, or a back-reference is followed by the special character `<asterisk>` (`' * '`), together with that `<asterisk>` it shall match what zero or more consecutive occurrences of the BRE would match. For example, `"[ab] *"` and `"[ab][ab]"` are equivalent when matching the string `"ab"`.

5. When a BRE matching a single character, a subexpression, or a back-reference is followed by an interval expression of the format `"\{m\}"`, `"\{m,\}"`, or `"\{m,n\}"`, together with that interval expression it shall match what repeated consecutive occurrences of the BRE would match. The values of  $m$  and  $n$  are decimal integers in the range  $0 \leq m \leq n \leq \{RE\_DUP\_MAX\}$ , where  $m$  specifies the exact or minimum number of occurrences and  $n$  specifies the maximum number of occurrences. The expression `"\{m\}"` shall match exactly  $m$  occurrences of the preceding BRE, `"\{m,\}"` shall match at least  $m$  occurrences, and `"\{m,n\}"` shall match any number of occurrences between  $m$  and  $n$ , inclusive.

For example, in the string `"abababcccccd"` the BRE `"c\{3\}"` is matched by characters seven to nine, the BRE `"\ (ab\) \{4,\}"` is not matched at all, and the BRE `"c\{1,3\}d"` is matched by characters ten to thirteen.

The behavior of multiple adjacent duplication symbols (`' * '` and intervals) produces undefined results.

A subexpression repeated by an `<asterisk>` (`' * '`) or an interval expression shall not match a null expression unless this is the only match for the repetition or it is necessary to satisfy the exact or minimum number of occurrences for the interval expression.

### 9.3.7 BRE Precedence

The order of precedence shall be as shown in the following table:

BRE Precedence (from high to low)	
Collation-related bracket symbols	<code>[==]</code> <code>[::]</code> <code>[..]</code>
Escaped characters	<code>\&lt;special character&gt;</code>
Bracket expression	<code>[]</code>
Subexpressions/back-references	<code>\( \)</code> <code>\n</code>
Single-character-BRE duplication	<code>* \{m,n\}</code>
Concatenation	
Anchoring	<code>^</code> <code>\$</code>

### 9.3.8 BRE Expression Anchoring

A BRE can be limited to matching expressions that begin or end a string; this is called “anchoring”. The <circumflex> and <dollar-sign> special characters shall be considered BRE anchors in the following contexts:

1. A <circumflex> ( ' ^ ' ) shall be an anchor when used as the first character of an entire BRE. The implementation may treat the <circumflex> as an anchor when used as the first character of a subexpression. The <circumflex> shall anchor the expression (or optionally subexpression) to the beginning of a string; only sequences starting at the first character of a string shall be matched by the BRE. For example, the BRE " ^ ab " matches " ab " in the string " abcdef ", but fails to match in the string " cdefab ". The BRE " \ ( ^ ab \ ) " may match the former string. A portable BRE shall escape a leading <circumflex> in a subexpression to match a literal circumflex.
2. A <dollar-sign> ( ' \$ ' ) shall be an anchor when used as the last character of an entire BRE. The implementation may treat a <dollar-sign> as an anchor when used as the last character of a subexpression. The <dollar-sign> shall anchor the expression (or optionally subexpression) to the end of the string being matched; the <dollar-sign> can be said to match the end-of-string following the last character.
3. A BRE anchored by both ' ^ ' and ' \$ ' shall match only an entire string. For example, the BRE " ^ abcdef \$ " matches strings consisting only of " abcdef ".

## 9.4 Extended Regular Expressions

The extended regular expression (ERE) notation and construction rules shall apply to utilities defined as using extended regular expressions; any exceptions to the following rules are noted in the descriptions of the specific utilities using EREs.

### 9.4.1 EREs Matching a Single Character or Collating Element

An ERE ordinary character, a special character preceded by a <backslash> or a <period> shall match a single character. A bracket expression shall match a single character or a single collating element. An ERE matching a single character enclosed in parentheses shall match the same as the ERE without parentheses would have matched.

### 9.4.2 ERE Ordinary Characters

An ordinary character is an ERE that matches itself. An ordinary character is any character in the supported character set, except for the ERE special characters listed in [Section 9.4.3](#) (on page 189). The interpretation of an ordinary character preceded by an unescaped <backslash> ( ' \ ' ) is undefined, except in the context of a bracket expression (see [Section 9.4.5](#), on page 189).

### 9.4.3 ERE Special Characters

An ERE special character has special properties in certain contexts. Outside those contexts, or when preceded by a <backslash>, such a character shall be an ERE that matches the special character itself. The extended regular expression special characters and the contexts in which they shall have their special meaning are as follows:

- . [ \ ( The <period>, <left-square-bracket>, <backslash>, and <left-parenthesis> shall be special except when used in a bracket expression (see [Section 9.3.5](#), on page 184). Outside a bracket expression, a <left-parenthesis> immediately followed by a <right-parenthesis> produces undefined results. A <left-square-bracket> that is unescaped + and is not part of a bracket expression also produces undefined results.
- ) The <right-parenthesis> shall be special when matched with a preceding <left-parenthesis>, both outside a bracket expression.
- \* + ? { The <asterisk>, <plus-sign>, <question-mark>, and <left-brace> shall be special except when used in a bracket expression (see [Section 9.3.5](#), on page 184). Any of the following uses produce undefined results:
  - If these characters appear first in an ERE, or immediately following an unescaped | <vertical-line>, <circumflex>, <dollar-sign>, or <left-parenthesis>
  - If a <left-brace> is not part of a valid interval expression (see [Section 9.4.6](#), on page 190)
- | The <vertical-line> is special except when used in a bracket expression (see [Section 9.3.5](#), on page 184). A <vertical-line> appearing first or last in an ERE, or immediately following a <vertical-line> or a <left-parenthesis>, or immediately preceding a <right-parenthesis>, produces undefined results.
- ^ The <circumflex> shall be special when used as an anchor (see [Section 9.4.9](#), on page 191). The <circumflex> shall signify a non-matching list expression when it occurs first | in a list, immediately following a <left-square-bracket> (see [Section 9.3.5](#), on page 184).
- \$ The <dollar-sign> shall be special when used as an anchor.

### 9.4.4 Periods in EREs

A <period> ( ' . ' ), when used outside a bracket expression, is an ERE that shall match any character in the supported character set except NUL.

### 9.4.5 ERE Bracket Expression

The rules for ERE Bracket Expressions are the same as for Basic Regular Expressions; see [Section 9.3.5](#) (on page 184).

#### 9.4.6 EREs Matching Multiple Characters

The following rules shall be used to construct EREs matching multiple characters from EREs matching a single character:

1. A concatenation of EREs shall match the concatenation of the character sequences matched by each component of the ERE. A concatenation of EREs enclosed in parentheses shall match whatever the concatenation without the parentheses matches. For example, both the ERE "cd" and the ERE "(cd)" are matched by the third and fourth character of the string "abcdefabcdef".
2. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character <plus-sign> ('+'), together with that <plus-sign> it shall match what one or more consecutive occurrences of the ERE would match. For example, the ERE "b+(bc)" matches the fourth to seventh characters in the string "acabbbbcde". And, "[ab]+" and "[ab][ab]\*" are equivalent.
3. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character <asterisk> ('\*'), together with that <asterisk> it shall match what zero or more consecutive occurrences of the ERE would match. For example, the ERE "b\*c" matches the first character in the string "cabbbbcde", and the ERE "b\*cd" matches the third to seventh characters in the string "cabbbbcdebbbbbbbcdbc". And, "[ab]\*" and "[ab][ab]" are equivalent when matching the string "ab".
4. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character <question-mark> ('?'), together with that <question-mark> it shall match what zero or one consecutive occurrences of the ERE would match. For example, the ERE "b?c" matches the second character in the string "acabbbbcde".
5. When an ERE matching a single character or an ERE enclosed in parentheses is followed by an interval expression of the format "{m}", "{m,}", or "{m,n}", together with that interval expression it shall match what repeated consecutive occurrences of the ERE would match. The values of *m* and *n* are decimal integers in the range  $0 \leq m \leq n \leq \text{RE\_DUP\_MAX}$ , where *m* specifies the exact or minimum number of occurrences and *n* specifies the maximum number of occurrences. The expression "{m}" matches exactly *m* occurrences of the preceding ERE, "{m,}" matches at least *m* occurrences, and "{m,n}" matches any number of occurrences between *m* and *n*, inclusive.  
  
For example, in the string "abababcccccccd" the ERE "c{3}" is matched by characters seven to nine and the ERE "(ab){2,}" is matched by characters one to six.

The behavior of multiple adjacent duplication symbols ('+', '\*', '?', and intervals) produces undefined results.

An ERE matching a single character repeated by an '\*', '?', or an interval expression shall not match a null expression unless this is the only match for the repetition or it is necessary to satisfy the exact or minimum number of occurrences for the interval expression.

#### 9.4.7 ERE Alternation

Two EREs separated by the special character <vertical-line> ( ' | ' ) shall match a string that is matched by either. For example, the ERE "a( (bc) | d )" matches the string "abc" and the string "ad". Single characters, or expressions matching single characters, separated by the <vertical-line> and enclosed in parentheses, shall be treated as an ERE matching a single character.

#### 9.4.8 ERE Precedence

The order of precedence shall be as shown in the following table:

ERE Precedence (from high to low)	
Collation-related bracket symbols	[==] [::] [..]
Escaped characters	\<special character>
Bracket expression	[ ]
Grouping	( )
Single-character-ERE duplication	* + ? {m,n}
Concatenation	
Anchoring	^ \$
Alternation	

For example, the ERE "abba|cde" matches either the string "abba" or the string "cde" (rather than the string "abbade" or "abbcde", because concatenation has a higher order of precedence than alternation).

#### 9.4.9 ERE Expression Anchoring

An ERE can be limited to matching expressions that begin or end a string; this is called "anchoring". The <circumflex> and <dollar-sign> special characters shall be considered ERE anchors when used anywhere outside a bracket expression. This shall have the following effects:

1. A <circumflex> ( ' ^ ' ) outside a bracket expression shall anchor the expression or subexpression it begins to the beginning of a string; such an expression or subexpression can match only a sequence starting at the first character of a string. For example, the EREs " ^ ab " and " ( ^ ab )" match "ab" in the string "abcdef", but fail to match in the string "cdefab", and the ERE "a ^ b" is valid, but can never match because the 'a' prevents the expression " ^ b" from matching starting at the first character.
2. A <dollar-sign> ( ' \$ ' ) outside a bracket expression shall anchor the expression or subexpression it ends to the end of a string; such an expression or subexpression can match only a sequence ending at the last character of a string. For example, the EREs " ef \$ " and " ( ef \$ )" match "ef" in the string "abcdef", but fail to match in the string "cdefab", and the ERE "e \$ f" is valid, but can never match because the 'f' prevents the expression "e \$ " from matching ending at the last character.

## 9.5 Regular Expression Grammar

Grammars describing the syntax of both basic and extended regular expressions are presented in this section. The grammar takes precedence over the text. See XCU [Section 1.3](#) (on page 2325).

### 9.5.1 BRE/ERE Grammar Lexical Conventions

The lexical conventions for regular expressions are as described in this section.

Except as noted, the longest possible token or delimiter beginning at a given point is recognized.

The following tokens are processed (in addition to those string constants shown in the grammar):

<b>COLL_ELEM_SINGLE</b>	Any single-character collating element, unless it is a <b>META_CHAR</b> .
<b>COLL_ELEM_MULTI</b>	Any multi-character collating element.
<b>BACKREF</b>	Applicable only to basic regular expressions. The character string consisting of a <backslash> character followed by a single-digit numeral, '1' to '9'.
<b>DUP_COUNT</b>	Represents a numeric constant. It shall be an integer in the range 0 ≤ <b>DUP_COUNT</b> ≤ { <b>RE_DUP_MAX</b> }. This token is only recognized when the context of the grammar requires it. At all other times, digits not preceded by a <backslash> character are treated as <b>ORD_CHAR</b> .
<b>META_CHAR</b>	One of the characters: <ul style="list-style-type: none"> <li>^ When found first in a bracket expression</li> <li>– When found anywhere but first (after an initial '^', if any) or last in a bracket expression, or as the ending range point in a range expression</li> <li>] When found anywhere but first (after an initial '^', if any) in a bracket expression</li> </ul>
<b>L_ANCHOR</b>	Applicable only to basic regular expressions. The character '^' when it appears as the first character of a basic regular expression and when not <b>QUOTED_CHAR</b> . The '^' may be recognized as an anchor elsewhere; see <a href="#">Section 9.3.8</a> (on page 188).
<b>ORD_CHAR</b>	A character, other than one of the special characters in <b>SPEC_CHAR</b> .
<b>QUOTED_CHAR</b>	In a BRE, one of the character sequences: <ul style="list-style-type: none"> <li>\^ \. \* \[ \\$ \\</li> </ul> In an ERE, one of the character sequences: <ul style="list-style-type: none"> <li>\^ \. \[ \\$ \( \) \ </li> <li>\* \+ \? \{ \\</li> </ul>
<b>R_ANCHOR</b>	(Applicable only to basic regular expressions.) The character '\$' when it appears as the last character of a basic regular expression and when not <b>QUOTED_CHAR</b> . The '\$' may be recognized as an anchor elsewhere; see <a href="#">Section 9.3.8</a> (on page 188).

6416       **SPEC\_CHAR**                   For basic regular expressions, one of the following special characters:

6417                   .           Anywhere outside bracket expressions

6418                   \           Anywhere outside bracket expressions

6419                   [           Anywhere outside bracket expressions

6420                   ^           When used as an anchor (see [Section 9.3.8](#), on page 188)       -

6421                   \$           When used as an anchor

6422                   \*           Anywhere except first in an entire RE, anywhere in a

6423                               bracket expression, directly following "\(", directly

6424                               following an anchoring '^'

6425                   For extended regular expressions, shall be one of the following

6426                   special characters found anywhere outside bracket expressions:

6427                   ^       .       [       \$       (       )       |

6428                   \*       +       ?       {       \

6429                   (The close-parenthesis shall be considered special in this context only

6430                   if matched with a preceding open-parenthesis.)

## 6431   **9.5.2 RE and Bracket Expression Grammar**

6432       This section presents the grammar for basic regular expressions, including the bracket

6433       expression grammar that is common to both BREs and EREs.

6434       %token     ORD\_CHAR QUOTED\_CHAR DUP\_COUNT

6435       %token     BACKREF L\_ANCHOR R\_ANCHOR

6515     collating_symbol : Open_dot COLL_ELEM_SINGLE Dot_close
6516         | Open_dot COLL_ELEM_MULTI Dot_close
6517         | Open_dot META_CHAR Dot_close
6518         ;
6519     equivalence_class : Open_equal COLL_ELEM_SINGLE Equal_close
6520         | Open_equal COLL_ELEM_MULTI Equal_close
6521         ;
6522     character_class  : Open_colon class_name Colon_close
6523         ;

```

The BRE grammar does not permit **L\_ANCHOR** or **R\_ANCHOR** inside "**\(**" and "**\)**" (which implies that '**^**' and '**\$**' are ordinary characters). This reflects the semantic limits on the application, as noted in [Section 9.3.8](#) (on page 188). Implementations are permitted to extend the language to interpret '**^**' and '**\$**' as anchors in these locations, and as such, conforming applications cannot use unescaped '**^**' and '**\$**' in positions inside "**\(**" and "**\)**" that might be interpreted as anchors.

### 9.5.3 ERE Grammar

This section presents the grammar for extended regular expressions, excluding the bracket expression grammar.

**Note:** The bracket expression grammar and the associated **%token** lines are identical between BREs and EREs. It has been omitted from the ERE section to avoid unnecessary editorial duplication.

```

6535 %token  ORD_CHAR QUOTED_CHAR DUP_COUNT
6536 %start  extended_reg_exp
6537 %%
6538 /* -----
6539     Extended Regular Expression
6540     -----
6541 */
6542 extended_reg_exp      : ERE_branch
6543         | extended_reg_exp '|' ERE_branch
6544         ;
6545 ERE_branch            : ERE_expression
6546         | ERE_branch ERE_expression
6547         ;
6548 ERE_expression        : one_char_or_coll_elem_ERE
6549         | '^'
6550         | '$'
6551         | '(' extended_reg_exp ')'
6552         | ERE_expression ERE_dupl_symbol
6553         ;
6554 one_char_or_coll_elem_ERE : ORD_CHAR
6555         | QUOTED_CHAR
6556         | '.'

```

```

6557         | bracket_expression
6558         ;
6559 ERE_dupl_symbol : ' * '
6560                 | ' + '
6561                 | ' ? '
6562                 | ' { ' DUP_COUNT ' } '
6563                 | ' { ' DUP_COUNT ' , ' ' } '
6564                 | ' { ' DUP_COUNT ' , ' DUP_COUNT ' } '
6565                 ;

```

The ERE grammar does not permit several constructs that previous sections specify as having undefined results. Additionally, there are some constructs which the grammar permits but which still give undefined results:

- **ORD\_CHAR** preceded by an unescaped <backslash> character
- One or more *ERE\_dupl\_symbols* appearing first in an ERE, or immediately following ' | ', '^ ', ' ( ', or ' \$ '
- ' { ' not part of a valid *ERE\_dupl\_symbol*
- ' | ' appearing first or last in an ERE, or immediately following ' | ' or ' ( ', or immediately preceding ' ) '

Implementations are permitted to extend the language to allow these. Strictly Conforming applications cannot use such constructs.

6577

Chapter 10

6578

# Directory Structure and Devices

6579

## 10.1 Directory Structure and Files

6580

6581

6582

The following directories shall exist on conforming systems and conforming applications shall make use of them only as described. Strictly conforming applications shall not assume the ability to create files in any of these directories, unless specified below.

6583

**/** The root directory.

6584

**/dev** Contains **/dev/console**, **/dev/null**, and **/dev/tty**, described below.

6585

The following directory shall exist on conforming systems and shall be used as described:

6586

6587

6588

**/tmp** A directory made available for applications that need a place to create temporary files. Applications shall be allowed to create files in this directory, but shall not assume that such files are preserved between invocations of the application.

6589

The following files shall exist on conforming systems and shall be both readable and writable:

6590

6591

**/dev/null** An empty data source and infinite data sink. Data written to **/dev/null** shall be discarded. Reads from **/dev/null** shall always return end-of-file (EOF).

6592

6593

6594

6595

6596

6597

**/dev/tty** In each process, a synonym for the controlling terminal associated with the process group of that process, if any. It is useful for programs or shell procedures that wish to be sure of writing messages to or reading data from the terminal no matter how output has been redirected. It can also be used for applications that demand the name of a file for output, when typed output is desired and it is tiresome to find out what terminal is currently in use.

6598

The following file shall exist on conforming systems and need not be readable or writable:

6599

6600

6601

6602

**/dev/console** The **/dev/console** file is a generic name given to the system console (see [Section 3.392](#), on page 97). It is usually linked to an implementation-defined special file. It shall provide an interface to the system console conforming to the requirements of [Chapter 11](#) (on page 199).

## 10.2 Output Devices and Terminal Types

The utilities in the Shell and Utilities volume of POSIX.1-2008 historically have been implemented on a wide range of terminal types, but a conforming implementation need not support all features of all utilities on every conceivable terminal. POSIX.1-2008 states which features are optional for certain classes of terminals in the individual utility description sections. The implementation shall document in the system documentation which terminal types it supports and which of these features and utilities are not supported by each terminal.

When a feature or utility is not supported on a specific terminal type, as allowed by POSIX.1-2008, and the implementation considers such a condition to be an error preventing use of the feature or utility, the implementation shall indicate such conditions through diagnostic messages or exit status values or both (as appropriate to the specific utility description) that inform the user that the terminal type lacks the appropriate capability.

POSIX.1-2008 uses a notational convention based on historical practice that identifies some of the control characters defined in [Section 7.3.1](#) (on page 139) in a manner easily remembered by users on many terminals. The correspondence between this “<control>-char” notation and the actual control characters is shown in the following table. When POSIX.1-2008 refers to a character by its <control>-name, it is referring to the actual control character shown in the Value column of the table, which is not necessarily the exact control key sequence on all terminals. Some terminals have keyboards that do not allow the direct transmission of all the non-alphanumeric characters shown. In such cases, the system documentation shall describe which data sequences transmitted by the terminal are interpreted by the system as representing the special characters.

**Table 10-1** Control Character Names

Name	Value	Name	Value
<control>-A	<SOH>	<control>-Q	<DC1>
<control>-B	<STX>	<control>-R	<DC2>
<control>-C	<ETX>	<control>-S	<DC3>
<control>-D	<EOT>	<control>-T	<DC4>
<control>-E	<ENQ>	<control>-U	<NAK>
<control>-F	<ACK>	<control>-V	<SYN>
<control>-G	<BEL>	<control>-W	<ETB>
<control>-H	<BS>	<control>-X	<CAN>
<control>-I	<HT>	<control>-Y	<EM>
<control>-J	<LF>	<control>-Z	<SUB>
<control>-K	<VT>	<control>-[	<ESC>
<control>-L	<FF>	<control>-\ <control>-]	<FS>
<control>-M	<CR>	<control>-^	<GS>
<control>-N	<SO>	<control>-_	<RS>
<control>-O	<SI>	<control>-?	<US>
<control>-P	<DLE>		<DEL>

**Note:** The notation uses uppercase letters for arbitrary editorial reasons. There is no implication that the keystrokes represent control-shift-letter sequences.

# General Terminal Interface

This chapter describes a general terminal interface that shall be provided. It shall be supported on any asynchronous communications ports if the implementation provides them. It is implementation-defined whether it supports network connections or synchronous ports, or both.

## 11.1 Interface Characteristics

### 11.1.1 Opening a Terminal Device File

When a terminal device file is opened, it normally causes the thread to wait until a connection is established. In practice, application programs seldom open these files; they are opened by special programs and become an application's standard input, output, and error files.

Cases where applications do open a terminal device are as follows:

1. Opening `/dev/tty`, or the pathname returned by `ctermid()`, in order to obtain a file descriptor for the controlling terminal; see [Section 11.1.3](#) (on page 200).
2. Opening the slave side of a pseudo-terminal; see XSH [ptsname\(\)](#).
3. Opening a modem or similar piece of equipment connected by a serial line. In this case, the terminal parameters (see [Section 11.2](#), on page 205) may be initialized to default settings by the implementation in between the last close of the device by any process and the next open of the device, or they may persist from one use to the next. The terminal parameters can be set to values that ensure the terminal behaves in a conforming manner by means of the `O_TTY_INIT` open flag when opening a terminal device that is not already open in any process, or by executing the `stty` utility with the operand `sane`.

As described in `open()`, opening a terminal device file with the `O_NONBLOCK` flag clear shall cause the thread to block until the terminal device is ready and available. If `CLOCAL` mode is not set, this means blocking until a connection is established. If `CLOCAL` mode is set in the terminal, or the `O_NONBLOCK` flag is specified in the `open()`, the `open()` function shall return a file descriptor without waiting for a connection to be established.

### 11.1.2 Process Groups

A terminal may have a foreground process group associated with it. This foreground process group plays a special role in handling signal-generating input characters, as discussed in [Section 11.1.9](#) (on page 204).

A command interpreter process supporting job control can allocate the terminal to different jobs, or process groups, by placing related processes in a single process group and associating this process group with the terminal. A terminal's foreground process group may be set or examined by a process, assuming the permission requirements are met; see *tcgetpgrp()* and *tcsetpgrp()*. The terminal interface aids in this allocation by restricting access to the terminal by processes that are not in the current process group; see [Section 11.1.4](#) (on page 201).

When there is no longer any process whose process ID or process group ID matches the foreground process group ID, the terminal shall have no foreground process group. It is unspecified whether the terminal has a foreground process group when there is a process whose process ID matches the foreground process group ID, but whose process group ID does not. No actions defined in POSIX.1-2008, other than allocation of a controlling terminal or a successful call to *tcsetpgrp()*, shall cause a process group to become the foreground process group of the terminal.

### 11.1.3 The Controlling Terminal

A terminal may belong to a process as its controlling terminal. Each process of a session that has a controlling terminal has the same controlling terminal. A terminal may be the controlling terminal for at most one session. The controlling terminal for a session is allocated by the session leader in an implementation-defined manner. If a session leader has no controlling terminal, and opens a terminal device file that is not already associated with a session without using the *O\_NOCTTY* option (see *open()*), it is implementation-defined whether the terminal becomes the controlling terminal of the session leader. If a process which is not a session leader opens a terminal file, or the *O\_NOCTTY* option is used on *open()*, then that terminal shall not become the controlling terminal of the calling process. When a controlling terminal becomes associated with a session, its foreground process group shall be set to the process group of the session leader.

The controlling terminal is inherited by a child process during a *fork()* function call. A process relinquishes its controlling terminal when it creates a new session with the *setsid()* function; other processes remaining in the old session that had this terminal as their controlling terminal continue to have it. Upon the close of the last file descriptor in the system (whether or not it is in the current session) associated with the controlling terminal, it is unspecified whether all processes that had that terminal as their controlling terminal cease to have any controlling terminal. Whether and how a session leader can reacquire a controlling terminal after the controlling terminal has been relinquished in this fashion is unspecified. A process does not relinquish its controlling terminal simply by closing all of its file descriptors associated with the controlling terminal if other processes continue to have it open.

When a controlling process terminates, the controlling terminal is dissociated from the current session, allowing it to be acquired by a new session leader. Subsequent access to the terminal by other processes in the earlier session may be denied, with attempts to access the terminal treated as if a modem disconnect had been sensed.

#### 11.1.4 Terminal Access Control

If a process is in the foreground process group of its controlling terminal, read operations shall be allowed, as described in [Section 11.1.5](#). Any attempts by a process in a background process group to read from its controlling terminal cause its process group to be sent a SIGTTIN signal unless one of the following special cases applies: if the reading process is ignoring the SIGTTIN signal or the reading thread is blocking the SIGTTIN signal, or if the process group of the reading process is orphaned, the *read()* shall return -1, with *errno* set to [EIO] and no signal shall be sent. The default action of the SIGTTIN signal shall be to stop the process to which it is sent. See [<signal.h>](#).

If a process is in the foreground process group of its controlling terminal, write operations shall be allowed as described in [Section 11.1.8](#) (on page 203). Attempts by a process in a background process group to write to its controlling terminal shall cause the process group to be sent a SIGTTOU signal unless one of the following special cases applies: if TOSTOP is not set, or if TOSTOP is set and the process is ignoring the SIGTTOU signal or the writing thread is blocking the SIGTTOU signal, the process is allowed to write to the terminal and the SIGTTOU signal is not sent. If TOSTOP is set, the process group of the writing process is orphaned, the writing process is not ignoring the SIGTTOU signal, and the writing thread is not blocking the SIGTTOU signal, the *write()* shall return -1, with *errno* set to [EIO] and no signal shall be sent.

Certain calls that set terminal parameters are treated in the same fashion as *write()*, except that TOSTOP is ignored; that is, the effect is identical to that of terminal writes when TOSTOP is set (see [Section 11.2.5](#) (on page 210), *tcdrain()*, *tcflow()*, *tcflush()*, *tcsendbreak()*, *tcsetattr()*, and *tcsetpgrp()*).

#### 11.1.5 Input Processing and Reading Data

A terminal device associated with a terminal device file may operate in full-duplex mode, so that data may arrive even while output is occurring. Each terminal device file has an input queue associated with it, into which incoming data is stored by the system before being read by a process. The system may impose a limit, {MAX\_INPUT}, on the number of bytes that may be stored in the input queue. The behavior of the system when this limit is exceeded is implementation-defined.

Two general kinds of input processing are available, determined by whether the terminal device file is in canonical mode or non-canonical mode. These modes are described in [Section 11.1.6](#) (on page 202) and [Section 11.1.7](#) (on page 202). Additionally, input characters are processed according to the *c\_iflag* (see [Section 11.2.2](#), on page 206) and *c\_lflag* (see [Section 11.2.5](#), on page 210) fields. Such processing can include “echoing”, which in general means transmitting input characters immediately back to the terminal when they are received from the terminal. This is useful for terminals that can operate in full-duplex mode.

The manner in which data is provided to a process reading from a terminal device file is dependent on whether the terminal file is in canonical or non-canonical mode, and on whether or not the O\_NONBLOCK flag is set by *open()* or *fcntl()*.

If the O\_NONBLOCK flag is clear, then the read request shall be blocked until data is available or a signal has been received. If the O\_NONBLOCK flag is set, then the read request shall be completed, without blocking, in one of three ways:

1. If there is enough data available to satisfy the entire request, the *read()* shall complete successfully and shall return the number of bytes read.

2. If there is not enough data available to satisfy the entire request, the `read()` shall complete successfully, having read as much data as possible, and shall return the number of bytes it was able to read.

3. If there is no data available, the `read()` shall return `-1`, with `errno` set to `[EAGAIN]`.

When data is available depends on whether the input processing mode is canonical or non-canonical. [Section 11.1.6](#) and [Section 11.1.7](#) describe each of these input processing modes.

### 11.1.6 Canonical Mode Input Processing

In canonical mode input processing, terminal input is processed in units of lines. A line is delimited by a <newline> character (NL), an end-of-file character (EOF), or an end-of-line (EOL) character. See [Section 11.1.9](#) (on page 204) for more information on EOF and EOL. This means that a read request shall not return until an entire line has been typed or a signal has been received. Also, no matter how many bytes are requested in the `read()` call, at most one line shall be returned. It is not, however, necessary to read a whole line at once; any number of bytes, even one, may be requested in a `read()` without losing information.

If `{MAX_CANON}` is defined for this terminal device, it shall be a limit on the number of bytes in a line. The behavior of the system when this limit is exceeded is implementation-defined. If `{MAX_CANON}` is not defined, there shall be no such limit; see `pathconf()`.

Erase and kill processing occur when either of two special characters, the ERASE and KILL characters (see [Section 11.1.9](#), on page 204), is received. This processing shall affect data in the input queue that has not yet been delimited by an NL, EOF, or EOL character. This un-delimited data makes up the current line. The ERASE character shall delete the last character in the current line, if there is one. The KILL character shall delete all data in the current line, if there is any. The ERASE and KILL characters shall have no effect if there is no data in the current line. The ERASE and KILL characters themselves shall not be placed in the input queue.

### 11.1.7 Non-Canonical Mode Input Processing

In non-canonical mode input processing, input bytes are not assembled into lines, and erase and kill processing shall not occur. The values of the MIN and TIME members of the `c_cc` array are used to determine how to process the bytes received. POSIX.1-2008 does not specify whether the setting of `O_NONBLOCK` takes precedence over MIN or TIME settings. Therefore, if `O_NONBLOCK` is set, `read()` may return immediately, regardless of the setting of MIN or TIME. Also, if no data is available, `read()` may either return 0, or return `-1` with `errno` set to `[EAGAIN]`.

MIN represents the minimum number of bytes that should be received when the `read()` function returns successfully. TIME is a timer of 0.1 second granularity that is used to time out bursty and short-term data transmissions. If MIN is greater than `{MAX_INPUT}`, the response to the request is undefined. The four possible values for MIN and TIME and their interactions are described below.

**Case A: MIN>0, TIME>0**

In case A, TIME serves as an inter-byte timer which shall be activated after the first byte is received. Since it is an inter-byte timer, it shall be reset after a byte is received. The interaction between MIN and TIME is as follows. As soon as one byte is received, the inter-byte timer shall be started. If MIN bytes are received before the inter-byte timer expires (remember that the timer is reset upon receipt of each byte), the read shall be satisfied. If the timer expires before MIN bytes are received, the characters received to that point shall be returned to the user. Note that if TIME expires at least one byte shall be returned because the timer would not have been enabled unless a byte was received. In this case (MIN>0, TIME>0) the read shall block until the MIN and TIME mechanisms are activated by the receipt of the first byte, or a signal is received. If data is in the buffer at the time of the *read()*, the result shall be as if data has been received immediately after the *read()*.

**Case B: MIN>0, TIME=0**

In case B, since the value of TIME is zero, the timer plays no role and only MIN is significant. A pending read shall not be satisfied until MIN bytes are received (that is, the pending read shall block until MIN bytes are received), or a signal is received. A program that uses case B to read record-based terminal I/O may block indefinitely in the read operation.

**Case C: MIN=0, TIME>0**

In case C, since MIN=0, TIME no longer represents an inter-byte timer. It now serves as a read timer that shall be activated as soon as the *read()* function is processed. A read shall be satisfied as soon as a single byte is received or the read timer expires. Note that in case C if the timer expires, no bytes shall be returned. If the timer does not expire, the only way the read can be satisfied is if a byte is received. If bytes are not received, the read shall not block indefinitely waiting for a byte; if no byte is received within TIME\*0.1 seconds after the read is initiated, the *read()* shall return a value of zero, having read no data. If data is in the buffer at the time of the *read()*, the timer shall be started as if data has been received immediately after the *read()*.

**Case D: MIN=0, TIME=0**

The minimum of either the number of bytes requested or the number of bytes currently available shall be returned without waiting for more bytes to be input. If no characters are available, *read()* shall return a value of zero, having read no data.

### 11.1.8 Writing Data and Output Processing

When a process writes one or more bytes to a terminal device file, they are processed according to the *c\_oflag* field (see [Section 11.2.3](#), on page 207). The implementation may provide a buffering mechanism; as such, when a call to *write()* completes, all of the bytes written have been scheduled for transmission to the device, but the transmission has not necessarily completed. See *write()* for the effects of O\_NONBLOCK on *write()*.

**11.1.9 Special Characters**

Certain characters have special functions on input or output or both. These functions are summarized as follows:

**INTR** Special character on input, which is recognized if the ISIG flag is set. Generates a SIGINT signal which is sent to all processes in the foreground process group for which the terminal is the controlling terminal. If ISIG is set, the INTR character shall be discarded when processed.

**QUIT** Special character on input, which is recognized if the ISIG flag is set. Generates a SIGQUIT signal which is sent to all processes in the foreground process group for which the terminal is the controlling terminal. If ISIG is set, the QUIT character shall be discarded when processed.

**ERASE** Special character on input, which is recognized if the ICANON flag is set. Erases the last character in the current line; see [Section 11.1.6](#) (on page 202). It shall not erase beyond the start of a line, as delimited by an NL, EOF, or EOL character. If ICANON is set, the ERASE character shall be discarded when processed.

**KILL** Special character on input, which is recognized if the ICANON flag is set. Deletes the entire line, as delimited by an NL, EOF, or EOL character. If ICANON is set, the KILL character shall be discarded when processed.

**EOF** Special character on input, which is recognized if the ICANON flag is set. When received, all the bytes waiting to be read are immediately passed to the process without waiting for a <newline>, and the EOF is discarded. Thus, if there are no bytes waiting (that is, the EOF occurred at the beginning of a line), a byte count of zero shall be returned from the *read()*, representing an end-of-file indication. If ICANON is set, the EOF character shall be discarded when processed.

**NL** Special character on input, which is recognized if the ICANON flag is set. It is the line delimiter <newline>. It cannot be changed.

**EOL** Special character on input, which is recognized if the ICANON flag is set. It is an additional line delimiter, like NL.

**SUSP** If the ISIG flag is set, receipt of the SUSP character shall cause a SIGTSTP signal to be sent to all processes in the foreground process group for which the terminal is the controlling terminal, and the SUSP character shall be discarded when processed.

**STOP** Special character on both input and output, which is recognized if the IXON (output control) or IXOFF (input control) flag is set. Can be used to suspend output temporarily. It is useful with CRT terminals to prevent output from disappearing before it can be read. If IXON is set, the STOP character shall be discarded when processed.

**START** Special character on both input and output, which is recognized if the IXON (output control) or IXOFF (input control) flag is set. Can be used to resume output that has been suspended by a STOP character. If IXON is set, the START character shall be discarded when processed.

**CR** Special character on input, which is recognized if the ICANON flag is set; it is the <carriage-return> character. When ICANON and ICRNL are set and IGNCR is not set, this character shall be translated into an NL, and shall have the same effect as an NL character. It cannot be changed.

The NL and CR characters cannot be changed. It is implementation-defined whether the START and STOP characters can be changed. The values for INTR, QUIT, ERASE, KILL, EOF, EOL, and SUSP shall be changeable to suit individual tastes. Special character functions associated with

6877 changeable special control characters can be disabled individually.

6878 If two or more special characters have the same value, the function performed when that

6879 character is received is undefined.

6880 A special character is recognized not only by its value, but also by its context; for example, an

6881 implementation may support multi-byte sequences that have a meaning different from the

6882 meaning of the bytes when considered individually. Implementations may also support

6883 additional single-byte functions. These implementation-defined multi-byte or single-byte

6884 functions shall be recognized only if the IEXTEN flag is set; otherwise, data is received without

6885 interpretation, except as required to recognize the special characters defined in this section.

6886 XSI If IEXTEN is set, the ERASE, KILL, and EOF characters can be escaped by a preceding

6887 <backslash> character, in which case no special function shall occur.

#### 6888 11.1.10 Modem Disconnect

6889 If a modem disconnect is detected by the terminal interface for a controlling terminal, and if

6890 CLOCAL is not set in the *c\_cflag* field for the terminal (see [Section 11.2.4](#), on page 209), the

6891 SIGHUP signal shall be sent to the controlling process for which the terminal is the controlling

6892 terminal. Unless other arrangements have been made, this shall cause the controlling process to

6893 terminate (see *exit()*). Any subsequent read from the terminal device shall return the value of

6894 zero, indicating end-of-file; see *read()*. Thus, processes that read a terminal file and test for end-

6895 of-file can terminate appropriately after a disconnect. If the EIO condition as specified in *read()*

6896 also exists, it is unspecified whether on EOF condition or [EIO] is returned. Any subsequent

6897 *write()* to the terminal device shall return -1, with *errno* set to [EIO], until the device is closed.

#### 6898 11.1.11 Closing a Terminal Device File

6899 The last process to close a terminal device file shall cause any output to be sent to the device and

6900 shall cause any input to be discarded. If HUPCL is set in the control modes and the

6901 communications port supports a disconnect function, the terminal device shall perform a

6902 disconnect.

### 6903 11.2 Parameters that Can be Set

#### 6904 11.2.1 The **termios** Structure

6905 Routines that need to control certain terminal I/O characteristics shall do so by using the

6906 **termios** structure as defined in the [<termios.h>](#) header.

6907 Since the **termios** structure may include additional members, and the standard members may

6908 include both standard and non-standard modes, the structure should never be initialized

6909 directly by the application as this may cause the terminal to behave in a non-conforming

6910 manner. When opening a terminal device (other than a pseudo-terminal) that is not already open

6911 in any process, it should be opened with the O\_TTY\_INIT flag before initializing the structure

6912 using *tcgetattr()* to ensure that any non-standard elements of the **termios** structure are set to

6913 values that result in conforming behavior of the terminal interface.

The members of the **termios** structure include (but are not limited to):

Member Type	Array Size	Member Name	Description
<b>tcflag_t</b>	NCCS	<i>c_iflag</i>	Input modes.
<b>tcflag_t</b>		<i>c_oflag</i>	Output modes.
<b>tcflag_t</b>		<i>c_cflag</i>	Control modes.
<b>tcflag_t</b>		<i>c_lflag</i>	Local modes.
<b>cc_t</b>		<i>c_cc[ ]</i>	Control characters.

The **tcflag\_t** and **cc\_t** types are defined in the **<termios.h>** header. They shall be unsigned integer types.

## 11.2.2 Input Modes

Values of the *c\_iflag* field describe the basic terminal input control, and are composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**:

Mask Name	Description
BRKINT	Signal interrupt on break.
ICRNL	Map CR to NL on input.
IGNBRK	Ignore break condition.
IGNCR	Ignore CR.
IGNPAR	Ignore characters with parity errors.
INLCR	Map NL to CR on input.
INPCK	Enable input parity check.
ISTRIP	Strip character.
IXANY	Enable any character to restart output.
IXOFF	Enable start/stop input control.
IXON	Enable start/stop output control.
PARMRK	Mark parity errors.

In the context of asynchronous serial data transmission, a break condition shall be defined as a sequence of zero-valued bits that continues for more than the time to send one byte. The entire sequence of zero-valued bits is interpreted as a single break condition, even if it continues for a time equivalent to more than one byte. In contexts other than asynchronous serial data transmission, the definition of a break condition is implementation-defined.

If IGNBRK is set, a break condition detected on input shall be ignored; that is, not put on the input queue and therefore not read by any process. If IGNBRK is not set and BRKINT is set, the break condition shall flush the input and output queues, and if the terminal is the controlling terminal of a foreground process group, the break condition shall generate a single SIGINT signal to that foreground process group. If neither IGNBRK nor BRKINT is set, a break condition shall be read as a single 0x00, or if PARMRK is set, as 0xff 0x00 0x00.

If IGNPAR is set, a byte with a framing or parity error (other than break) shall be ignored.

If PARMRK is set, and IGNPAR is not set, a byte with a framing or parity error (other than break) shall be given to the application as the three-byte sequence 0xff 0x00 X, where 0xff 0x00 is a two-byte flag preceding each sequence and X is the data of the byte received in error. To avoid ambiguity in this case, if ISTRIP is not set, a valid byte of 0xff is given to the application as 0xff 0xff. If neither PARMRK nor IGNPAR is set, a framing or parity error (other than break) shall be given to the application as a single byte 0x00.

If INPCK is set, input parity checking shall be enabled. If INPCK is not set, input parity checking shall be disabled, allowing output parity generation without input parity errors. Note that whether input parity checking is enabled or disabled is independent of whether parity detection is enabled or disabled (see [Section 11.2.4](#), on page 209). If parity detection is enabled but input parity checking is disabled, the hardware to which the terminal is connected shall recognize the parity bit, but the terminal special file shall not check whether or not this bit is correctly set.

If ISTRIP is set, valid input bytes shall first be stripped to seven bits; otherwise, all eight bits shall be processed.

If INLCR is set, a received NL character shall be translated into a CR character. If IGNCR is set, a received CR character shall be ignored (not read). If IGNCR is not set and ICRNL is set, a received CR character shall be translated into an NL character.

If IXANY is set, any input character shall restart output that has been suspended.

If IXON is set, start/stop output control shall be enabled. A received STOP character shall suspend output and a received START character shall restart output. When IXON is set, START and STOP characters are not read, but merely perform flow control functions. When IXON is not set, the START and STOP characters shall be read.

If IXOFF is set, start/stop input control shall be enabled. The system shall transmit STOP characters, which are intended to cause the terminal device to stop transmitting data, as needed to prevent the input queue from overflowing and causing implementation-defined behavior, and shall transmit START characters, which are intended to cause the terminal device to resume transmitting data, as soon as the device can continue transmitting data without risk of overflowing the input queue. The precise conditions under which STOP and START characters are transmitted are implementation-defined.

The initial input control value after *open()* is implementation-defined.

### 11.2.3 Output Modes

The *c\_oflag* field specifies the terminal interface's treatment of output, and is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in the following table are defined in [<termios.h>](#):

Mask Name	Description
OPOST	Perform output processing.
ONLCR	Map NL to CR-NL on output.
OCRNL	Map CR to NL on output.
ONOCR	No CR output at column 0.
ONLRET	NL performs CR function.
OFILL	Use fill characters for delay.
OFDEL	Fill is DEL, else NUL.
NLDLY	Select newline delays:
NL0	Newline character type 0.
NL1	Newline character type 1.
CRDLY	Select carriage-return delays:
CR0	Carriage-return delay type 0.
CR1	Carriage-return delay type 1.
CR2	Carriage-return delay type 2.
CR3	Carriage-return delay type 3.
TABDLY	Select horizontal-tab delays:
TAB0	Horizontal-tab delay type 0.
TAB1	Horizontal-tab delay type 1.
TAB2	Horizontal-tab delay type 2.
TAB3	Expand tabs to spaces.
BSDLY	Select backspace delays:
BS0	Backspace-delay type 0.
BS1	Backspace-delay type 1.
VTDLY	Select vertical-tab delays:
VT0	Vertical-tab delay type 0.
VT1	Vertical-tab delay type 1.
FFDLY	Select form-feed delays:
FF0	Form-feed delay type 0.
FF1	Form-feed delay type 1.

If OPOST is set, output data shall be post-processed as described below, so that lines of text are modified to appear appropriately on the terminal device; otherwise, characters shall be transmitted without change.

If ONLCR is set, the NL character shall be transmitted as the CR-NL character pair. If OCRNL is set, the CR character shall be transmitted as the NL character. If ONOCR is set, no CR character shall be transmitted when at column 0 (first position). If ONLRET is set, the NL character is assumed to do the carriage-return function; the column pointer shall be set to 0 and the delays specified for CR shall be used. Otherwise, the NL character is assumed to do just the line-feed function; the column pointer remains unchanged. The column pointer shall also be set to 0 if the CR character is actually transmitted.

The delay bits specify how long transmission stops to allow for mechanical or other movement when certain characters are sent to the terminal. In all cases a value of 0 shall indicate no delay. If OFILL is set, fill characters shall be transmitted for delay instead of a timed delay. This is useful for high baud rate terminals which need only a minimal delay. If OFDEL is set, the fill character shall be DEL; otherwise, NUL.

If a <form-feed> or <vertical-tab> delay is specified, it shall last for about 2 seconds.

Newline delay shall last about 0.10 seconds. If ONLRET is set, the carriage-return delays shall be used instead of the newline delays. If OFILL is set, two fill characters shall be transmitted.

Carriage-return delay type 1 shall be dependent on the current column position, type 2 shall be

about 0.10 seconds, and type 3 shall be about 0.15 seconds. If OFILL is set, delay type 1 shall transmit two fill characters, and type 2 four fill characters.

Horizontal-tab delay type 1 shall be dependent on the current column position. Type 2 shall be about 0.10 seconds. Type 3 specifies that <tab> characters shall be expanded into <space> characters. If OFILL is set, two fill characters shall be transmitted for any delay.

Backspace delay shall last about 0.05 seconds. If OFILL is set, one fill character shall be transmitted.

The actual delays depend on line speed and system load.

The initial output control value after *open()* is implementation-defined.

#### 11.2.4 Control Modes

The *c\_cflag* field describes the hardware control of the terminal, and is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in [<termios.h>](#); not all values specified are required to be supported by the underlying hardware (if any). If the terminal is a pseudo-terminal, it is unspecified whether non-default values are unsupported, or are supported and emulated in software, or are handled by *tcsetattr()*, *tcgetattr()*, and the *stty* utility as if they are supported but have no effect on the behavior of the terminal interface.

Mask Name	Description
CLOCAL	Ignore modem status lines.
CREAD	Enable receiver.
CSIZE	Number of bits transmitted or received per byte:
CS5	5 bits
CS6	6 bits
CS7	7 bits
CS8	8 bits.
CSTOPB	Send two stop bits, else one.
HUPCL	Hang up on last close.
PARENB	Parity enable.
PARODD	Odd parity, else even.

In addition, the input and output baud rates are stored in the **termios** structure. The symbols in the following table are defined in [<termios.h>](#). Not all values specified are required to be supported by the underlying hardware (if any). For pseudo-terminals, the input and output baud rates set in the **termios** structure need not affect the speed of data transmission through the terminal interface.

**Note:** The term “baud” is used historically here, but is not technically correct. This is properly “bits per second”, which may not be the same as baud. However, the term is used because of the historical usage and understanding.

Name	Description	Name	Description
B0	Hang up	B600	600 baud
B50	50 baud	B1200	1200 baud
B75	75 baud	B1800	1800 baud
B110	110 baud	B2400	2400 baud
B134	134.5 baud	B4800	4800 baud
B150	150 baud	B9600	9600 baud
B200	200 baud	B19200	19200 baud
B300	300 baud	B38400	38400 baud

The following functions are provided for getting and setting the values of the input and output baud rates in the **termios** structure: `cfgetispeed()`, `cfgetospeed()`, `cfsetispeed()`, and `cfsetospeed()`. The effects on the terminal device shall not become effective and not all errors need be detected until the `tcsetattr()` function is successfully called.

The CSIZE bits shall specify the number of transmitted or received bits per byte. If ISTRIP is not set, the value of all the other bits is unspecified. If ISTRIP is set, the value of all but the 7 low-order bits shall be zero, but the value of any other bits beyond CSIZE is unspecified when read. CSIZE shall not include the parity bit, if any. If CSTOPB is set, two stop bits shall be used; otherwise, one stop bit. For example, at 110 baud, two stop bits are normally used.

If CREAD is set, the receiver shall be enabled; otherwise, no characters shall be received.

If PARENB is set, parity generation and detection shall be enabled and a parity bit is added to each byte. If parity is enabled, PARODD shall specify odd parity if set; otherwise, even parity shall be used.

If HUPCL is set, the modem control lines for the port shall be lowered when the last process with the port open closes the port or the process terminates. The modem connection shall be broken.

If CLOCAL is set, a connection shall not depend on the state of the modem status lines. If CLOCAL is clear, the modem status lines shall be monitored.

Under normal circumstances, a call to the `open()` function shall wait for the modem connection to complete. However, if the `O_NONBLOCK` flag is set (see `open()`) or if CLOCAL has been set, the `open()` function shall return immediately without waiting for the connection.

If the object for which the control modes are set is not an asynchronous serial connection, some of the modes may be ignored; for example, if an attempt is made to set the baud rate on a network connection to a terminal on another host, the baud rate need not be set on the connection between that terminal and the machine to which it is directly connected.

The initial hardware control value after `open()` is implementation-defined.

### 11.2.5 Local Modes

The `c_lflag` field of the argument structure is used to control various functions. It is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in [<termios.h>](#).

Mask Name	Description
ECHO	Enable echo.
ECHOE	Echo ERASE as an error correcting backspace.
ECHOK	Echo KILL.
ECHONL	Echo <newline>.
ICANON	Canonical input (erase and kill processing).
IEXTEN	Enable extended (implementation-defined) functions.
ISIG	Enable signals.
NOFLSH	Disable flush after interrupt, quit, or suspend.
TOSTOP	Send SIGTTOU for background output.

If ECHO is set, input characters shall be echoed back to the terminal. If ECHO is clear, input characters shall not be echoed.

If ECHOE and ICANON are set, the ERASE character shall cause the terminal to erase, if possible, the last character in the current line from the display. If there is no character to erase, an implementation may echo an indication that this was the case, or do nothing.

If ECHOK and ICANON are set, the KILL character shall either cause the terminal to erase the line from the display or shall echo the <newline> character after the KILL character.

If ECHONL and ICANON are set, the <newline> character shall be echoed even if ECHO is not set.

If ICANON is set, canonical processing shall be enabled. This enables the erase and kill edit functions, and the assembly of input characters into lines delimited by NL, EOF, and EOL, as described in [Section 11.1.6](#) (on page 202).

If ICANON is not set, read requests shall be satisfied directly from the input queue. A read shall not be satisfied until at least MIN bytes have been received or the timeout value TIME expired between bytes. The time value represents tenths of a second. See [Section 11.1.7](#) (on page 202) for more details.

If IEXTEN is set, implementation-defined functions shall be recognized from the input data. It is implementation-defined how IEXTEN being set interacts with ICANON, ISIG, IXON, or IXOFF. If IEXTEN is not set, implementation-defined functions shall not be recognized and the corresponding input characters are processed as described for ICANON, ISIG, IXON, and IXOFF.

If ISIG is set, each input character shall be checked against the special control characters INTR, QUIT, and SUSP. If an input character matches one of these control characters, the function associated with that character shall be performed. If ISIG is not set, no checking shall be done. Thus these special input functions are possible only if ISIG is set.

If NOFLSH is set, the normal flush of the input and output queues associated with the INTR, QUIT, and SUSP characters shall not be done.

If TOSTOP is set, the signal SIGTTOU shall be sent to the process group of a process that tries to write to its controlling terminal if it is not in the foreground process group for that terminal. This signal, by default, stops the members of the process group. Otherwise, the output generated by that process shall be output to the current output stream. If the writing process is ignoring the SIGTTOU signal or the writing thread is blocking the SIGTTOU signal, the process is allowed to produce output, and the SIGTTOU signal shall not be sent.

The initial local control value after *open()* is implementation-defined.

## 11.2.6 Special Control Characters

The special control character values shall be defined by the array `c_cc`. The subscript name and description for each element in both canonical and non-canonical modes are as follows:

Subscript Usage		Description
Canonical Mode	Non-Canonical Mode	
VEOF	VINTR	EOF character
VEOL		EOL character
VERASE		ERASE character
VINTR		INTR character
VKILL		KILL character
	VMIN	MIN value
VQUIT	VQUIT	QUIT character
VSUSP	VSUSP	SUSP character
	VTIME	TIME value
VSTART	VSTART	START character
VSTOP	VSTOP	STOP character

The subscript values are unique, except that the VMIN and VTIME subscripts may have the same values as the VEOF and VEOL subscripts, respectively.

Implementations that do not support changing the START and STOP characters may ignore the character values in the `c_cc` array indexed by the VSTART and VSTOP subscripts when `tcsetattr()` is called, but shall return the value in use when `tcgetattr()` is called.

The initial values of all control characters are implementation-defined.

If the value of one of the changeable special control characters (see [Section 11.1.9](#), on page 204) is `_POSIX_VDISABLE`, that function shall be disabled; that is, no input data is recognized as the disabled special character. If ICANON is not set, the value of `_POSIX_VDISABLE` has no special meaning for the VMIN and VTIME entries of the `c_cc` array.

7183

Chapter 12

7184

## Utility Conventions

7185

### 12.1 Utility Argument Syntax

7186

7187

This section describes the argument syntax of the standard utilities and introduces terminology used throughout POSIX.1-2008 for describing the arguments processed by the utilities.

7188

7189

7190

Within POSIX.1-2008, a special notation is used for describing the syntax of a utility's arguments. Unless otherwise noted, all utility descriptions use this notation, which is illustrated by this example (see XCU [Section 2.9.1](#), on page 2355):

7191

7192

```
utility_name[-a][-b][-c option_argument]
          [-d|-e][-f[option_argument]][operand...]
```

7193

7194

The notation used for the SYNOPSIS sections imposes requirements on the implementors of the standard utilities and provides a simple reference for the application developer or system user.

7195

7196

7197

7198

7199

7200

1. The utility in the example is named *utility\_name*. It is followed by options, option-arguments, and operands. The arguments that consist of <hyphen-minus> characters and single letters or digits, such as 'a', are known as "options" (or, historically, "flags"). Certain options are followed by an "option-argument", as shown with [-c *option\_argument*]. The arguments following the last options and option-arguments are named "operands".

7201

7202

7203

7204

7205

7206

7207

7208

2. Option-arguments are shown separated from their options by <blank> characters, except when the option-argument is enclosed in the '[' and ']' notation to indicate that it is optional. This reflects the situation in which an optional option-argument (if present) is included within the same argument string as the option; for a mandatory option-argument, it is the next argument. The Utility Syntax Guidelines in [Section 12.2](#) (on page 216) require that the option be a separate argument from its option-argument and that option-arguments not be optional, but there are some exceptions in POSIX.1-2008 to ensure continued operation of historical applications:

7209

7210

7211

7212

7213

7214

- a. If the SYNOPSIS of a standard utility shows an option with a mandatory option-argument (as with [-c *option\_argument*] in the example), a conforming application shall use separate arguments for that option and its option-argument. However, a conforming implementation shall also permit applications to specify the option and option-argument in the same argument string without intervening <blank> characters.

7215

7216

7217

7218

7219

7220

7221

- b. If the SYNOPSIS shows an optional option-argument (as with [-f[*option\_argument*]] in the example), a conforming application shall place any option-argument for that option directly adjacent to the option in the same argument string, without intervening <blank> characters. If the utility receives an argument containing only the option, it shall behave as specified in its description for an omitted option-argument; it shall not treat the next argument (if any) as the option-argument for that option.

3. Options are usually listed in alphabetical order unless this would make the utility description more confusing. There are no implied relationships between the options based upon the order in which they appear, unless otherwise stated in the OPTIONS section, or unless the exception in Guideline 11 of [Section 12.2](#) (on page 216) applies. If an option that does not have option-arguments is repeated, the results are undefined, unless otherwise stated.

4. Frequently, names of parameters that require substitution by actual values are shown with embedded <underscore> characters. Alternatively, parameters are shown as follows:

`<parameter name>`

The angle brackets are used for the symbolic grouping of a phrase representing a single parameter and conforming applications shall not include them in data submitted to the utility.

5. When a utility has only a few permissible options, they are sometimes shown individually, as in the example. Utilities with many flags generally show all of the individual flags (that do not take option-arguments) grouped, as in:

`utility_name [-abcDxyz][-p arg][operand]`

Utilities with very complex arguments may be shown as follows:

`utility_name [options][operands]`

6. Unless otherwise specified, whenever an operand or option-argument is, or contains, a numeric value:

- The number is interpreted as a decimal integer.
- Numerals in the range 0 to 2 147 483 647 are syntactically recognized as numeric values.
- When the utility description states that it accepts negative numbers as operands or option-arguments, numerals in the range -2 147 483 647 to 2 147 483 647 are syntactically recognized as numeric values.
- When the utility description states that the number is a file size-related value (such as a file size or offset, line number, or block count), numerals in the range 0 to the maximum file size supported by the implementation are syntactically recognized as numeric values (see XCU [Section 1.5](#), on page 2333). Where negative values are permitted, any value in the range -(maximum file size) to the maximum file size is accepted.

- Ranges greater than those listed here are allowed.

This does not mean that all numbers within the allowable range are necessarily semantically correct. A standard utility that accepts an option-argument or operand that is to be interpreted as a number, and for which a range of values smaller than that shown above is permitted by the POSIX.1-2008, describes that smaller range along with the description of the option-argument or operand. If an error is generated, the utility's diagnostic message shall indicate that the value is out of the supported range, not that it is syntactically incorrect.

7. Arguments or option-arguments enclosed in the '*[*' and '*]*' notation are optional and can be omitted. Conforming applications shall not include the '*[*' and '*]*' symbols in data submitted to the utility.

8. Arguments separated by the ' | ' (<vertical-line>) bar notation are mutually-exclusive. Conforming applications shall not include the ' | ' symbol in data submitted to the utility. Alternatively, mutually-exclusive options and operands may be listed with multiple synopsis lines.

For example:

```
utility_name -d[-a][-c option_argument][operand...]
utility_name[-a][-b][operand...]
```

When multiple synopsis lines are given for a utility, it is an indication that the utility has mutually-exclusive arguments. These mutually-exclusive arguments alter the functionality of the utility so that only certain other arguments are valid in combination with one of the mutually-exclusive arguments. Only one of the mutually-exclusive arguments is allowed for invocation of the utility. Unless otherwise stated in an accompanying OPTIONS section, the relationships between arguments depicted in the SYNOPSIS sections are mandatory requirements placed on conforming applications. The use of conflicting mutually-exclusive arguments produces undefined results, unless a utility description specifies otherwise. When an option is shown without the '[' and ']' brackets, it means that option is required for that version of the SYNOPSIS. However, it is not required to be the first argument, as shown in the example above, unless otherwise stated.

9. Ellipses ("...") are used to denote that one or more occurrences of an operand are allowed. When an option or an operand followed by ellipses is enclosed in brackets, zero or more options or operands can be specified. The form:

```
utility_name [-g option_argument]...[operand...]
```

indicates that multiple occurrences of the option and its option-argument preceding the ellipses are valid, with semantics as indicated in the OPTIONS section of the utility. (See also Guideline 11 in [Section 12.2](#) (on page 216).)

The form:

```
utility_name -f option_argument [-f option_argument]... [operand...]
```

indicates that the -f option is required to appear at least once and may appear multiple times.

10. When the synopsis line is too long to be printed on a single line in the Shell and Utilities volume of POSIX.1-2008, the indented lines following the initial line are continuation lines. An actual use of the command would appear on a single logical line.

## 12.2 Utility Syntax Guidelines

The following guidelines are established for the naming of utilities and for the specification of options, option-arguments, and operands. The *getopt()* function in the System Interfaces volume of POSIX.1-2008 assists utilities in handling options and operands that conform to these guidelines.

Operands and option-arguments can contain characters not specified in the portable character set.

The guidelines are intended to provide guidance to the authors of future utilities, such as those written specific to a local system or that are components of a larger application. Some of the standard utilities do not conform to all of these guidelines; in those cases, the OPTIONS sections describe the deviations.

**Guideline 1:** Utility names should be between two and nine characters, inclusive.

**Guideline 2:** Utility names should include lowercase letters (the **lower** character classification) and digits only from the portable character set.

**Guideline 3:** Each option name should be a single alphanumeric character (the **alnum** character classification) from the portable character set. The **-W** (capital-W) option shall be reserved for vendor options.

Multi-digit options should not be allowed.

**Guideline 4:** All options should be preceded by the **'-'** delimiter character.

**Guideline 5:** One or more options without option-arguments, followed by at most one option that takes an option-argument, should be accepted when grouped behind one **'-'** delimiter.

**Guideline 6:** Each option and option-argument should be a separate argument, except as noted in [Section 12.1](#) (on page 213), item (2).

**Guideline 7:** Option-arguments should not be optional.

**Guideline 8:** When multiple option-arguments are specified to follow a single option, they should be presented as a single argument, using **<comma>** characters within that argument or **<blank>** characters within that argument to separate them.

**Guideline 9:** All options should precede operands on the command line.

**Guideline 10:** The first **--** argument that is not an option-argument should be accepted as a delimiter indicating the end of options. Any following arguments should be treated as operands, even if they begin with the **'-'** character.

**Guideline 11:** The order of different options relative to one another should not matter, unless the options are documented as mutually-exclusive and such an option is documented to override any incompatible options preceding it. If an option that has option-arguments is repeated, the option and option-argument combinations should be interpreted in the order specified on the command line.

**Guideline 12:** The order of operands may matter and position-related interpretations should be determined on a utility-specific basis.

**Guideline 13:** For utilities that use operands to represent files to be opened for either reading or writing, the **'-'** operand should be used to mean only standard input (or standard output when it is clear from context that an output file is being specified) or a file named **-**.

**Guideline 14:** If an argument can be identified according to Guidelines 3 through 10 as an option, or as a group of options without option-arguments behind one ‘-’ delimiter, then it should be treated as such.

The utilities in the Shell and Utilities volume of POSIX.1-2008 that claim conformance to these guidelines shall conform completely to these guidelines as if these guidelines contained the term “shall” instead of “should”. On some implementations, the utilities accept usage in violation of these guidelines for backwards-compatibility as well as accepting the required form.

Where a utility described in the Shell and Utilities volume of POSIX.1-2008 as conforming to these guidelines is required to accept, or not to accept, the operand ‘-’ to mean standard input or output, this usage is explained in the OPERANDS section. Otherwise, if such a utility uses operands to represent files, it is implementation-defined whether the operand ‘-’ stands for standard input (or standard output), or for a file named -.

It is recommended that all future utilities and applications use these guidelines to enhance user portability. The fact that some historical utilities could not be changed (to avoid breaking existing applications) should not deter this future goal.

This chapter describes the contents of headers.

Headers contain function prototypes, the definition of symbolic constants, common structures, preprocessor macros, and defined types. Each function in the System Interfaces volume of POSIX.1-2008 specifies the headers that an application shall include in order to use that function. In most cases, only one header is required. These headers are present on an application development system; they need not be present on the target execution system.

### **Format of Entries**

The entries in this chapter are based on a common format as follows. The only sections relating to conformance are the SYNOPSIS and DESCRIPTION.

#### **NAME**

This section gives the name or names of the entry and briefly states its purpose.

#### **SYNOPSIS**

This section summarizes the use of the entry being described.

#### **DESCRIPTION**

This section describes the functionality of the header.

#### **APPLICATION USAGE**

This section is informative. This section gives warnings and advice to application developers about the entry. In the event of conflict between warnings and advice and a normative part of this volume of POSIX.1-2008, the normative material is to be taken as correct.

#### **RATIONALE**

This section is informative. This section contains historical information concerning the contents of this volume of POSIX.1-2008 and why features were included or discarded by the standard developers.

#### **FUTURE DIRECTIONS**

This section is informative. This section provides comments which should be used as a guide to current thinking; there is not necessarily a commitment to adopt these future directions.

#### **SEE ALSO**

This section is informative. This section gives references to related information.

#### **CHANGE HISTORY**

This section is informative. This section shows the derivation of the entry and any significant changes that have been made to it.

**NAME**

aio.h — asynchronous input and output

**SYNOPSIS**

```
#include <aio.h>
```

**DESCRIPTION**

The <aio.h> header shall define the **aio\_cb** structure, which shall include at least the following members:

int	aio_fildes	File descriptor.
off_t	aio_offset	File offset.
volatile void *	aio_buf	Location of buffer.
size_t	aio_nbytes	Length of transfer.
int	aio_reqprio	Request priority offset.
struct sigevent	aio_sigevent	Signal number and value.
int	aio_lio_opcode	Operation to be performed.

The <aio.h> header shall define the **off\_t**, **pthread\_attr\_t**, **size\_t**, and **ssize\_t** types as described in <sys/types.h>.

The <aio.h> header shall define the **struct timespec** structure as described in <time.h>.

The <aio.h> header shall define the **sigevent** structure and **sigval** union as described in <signal.h>.

The <aio.h> header shall define the following symbolic constants:

**AIO\_ALLDONE** A return value indicating that none of the requested operations could be canceled since they are already complete.

**AIO\_CANCELED** A return value indicating that all requested operations have been canceled.

**AIO\_NOTCANCELED** A return value indicating that some of the requested operations could not be canceled since they are in progress.

**LIO\_NOP** A *lio\_listio()* element operation option indicating that no transfer is requested.

**LIO\_NOWAIT** A *lio\_listio()* synchronization operation indicating that the calling thread is to continue execution while the *lio\_listio()* operation is being performed, and no notification is given when the operation is complete.

**LIO\_READ** A *lio\_listio()* element operation option requesting a read.

**LIO\_WAIT** A *lio\_listio()* synchronization operation indicating that the calling thread is to suspend until the *lio\_listio()* operation is complete.

**LIO\_WRITE** A *lio\_listio()* element operation option requesting a write.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int      aio_cancel(int, struct aio_cb *);
int      aio_error(const struct aio_cb *);
FSC|SIO int      aio_fsync(int, struct aio_cb *);
int      aio_read(struct aio_cb *);
ssize_t  aio_return(struct aio_cb *);
int      aio_suspend(const struct aio_cb *const [], int,
```

```

7436             const struct timespec *);
7437 int         aio_write(struct aiocb *);
7438 int         lio_listio(int, struct aiocb *restrict const [restrict], int,
7439             struct sigevent *restrict);

```

7440 Inclusion of the <aio.h> header may make visible symbols defined in the headers <fcntl.h>, <signal.h>, and <time.h>.

7441

7442 **APPLICATION USAGE**

7443 None.

7444 **RATIONALE**

7445 None.

7446 **FUTURE DIRECTIONS**

7447 None.

7448 **SEE ALSO**

7449 <fcntl.h>, <signal.h>, <sys/types.h>, <time.h>

7450 XSH *aio\_cancel()*, *aio\_error()*, *aio\_fsync()*, *aio\_read()*, *aio\_return()*, *aio\_suspend()*, *aio\_write()*, *fsync()*, *lio\_listio()*, *lseek()*, *read()*, *write()*

7451

7452 **CHANGE HISTORY**

7453 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

7454 **Issue 6**

7455 The <aio.h> header is marked as part of the Asynchronous Input and Output option.

7456 The description of the constants is expanded.

7457 The **restrict** keyword is added to the prototype for *lio\_listio()*.

7458 **Issue 7**

7459 The <aio.h> header is moved from the Asynchronous Input and Output option to the Base.

7460 This reference page is clarified with respect to macros and symbolic constants, and type and structure declarations are added.

7461

7462 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0038 [98] is applied.

**NAME**

arpa/inet.h — definitions for internet operations

**SYNOPSIS**

```
#include <arpa/inet.h>
```

**DESCRIPTION**

The <arpa/inet.h> header shall define the **in\_port\_t** and **in\_addr\_t** types as described in <netinet/in.h>.

The <arpa/inet.h> header shall define the **in\_addr** structure as described in <netinet/in.h>.

IP6 The <arpa/inet.h> header shall define the **INET\_ADDRSTRLEN** and **INET6\_ADDRSTRLEN** macros as described in <netinet/in.h>.

The following shall be declared as functions, or defined as macros, or both. If functions are declared, function prototypes shall be provided.

```
uint32_t htonl(uint32_t);
uint16_t htons(uint16_t);
uint32_t ntohl(uint32_t);
uint16_t ntohs(uint16_t);
```

The <arpa/inet.h> header shall define the **uint32\_t** and **uint16\_t** types as described in <inttypes.h>.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
in_addr_t    inet_addr(const char *);
char         *inet_ntoa(struct in_addr);
const char   *inet_ntop(int, const void *restrict, char *restrict,
                        socklen_t);
int          inet_pton(int, const char *restrict, void *restrict);
```

Inclusion of the <arpa/inet.h> header may also make visible all symbols from <netinet/in.h> and <inttypes.h>.

**APPLICATION USAGE**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

<inttypes.h>, <netinet/in.h>

XSH *htonl()*, *inet\_addr()*, *inet\_ntop()*

**CHANGE HISTORY**

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the prototypes for *inet\_ntop()* and *inet\_pton()*.

**Issue 7**

SD5-XBD-ERN-6 is applied.

**NAME**

assert.h — verify program assertion

**SYNOPSIS**

```
#include <assert.h>
```

**DESCRIPTION**

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The <assert.h> header shall define the *assert()* macro. It refers to the macro NDEBUB which is not defined in the header. If NDEBUB is defined as a macro name before the inclusion of this header, the *assert()* macro shall be defined simply as:

```
#define assert(ignore)((void) 0)
```

Otherwise, the macro behaves as described in *assert()*.

The *assert()* macro shall be redefined according to the current state of NDEBUB each time <assert.h> is included.

The *assert()* macro shall be implemented as a macro, not as a function. If the macro definition is suppressed in order to access an actual function, the behavior is undefined.

**APPLICATION USAGE**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

XSH *assert()*

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

The definition of the *assert()* macro is changed for alignment with the ISO/IEC 9899:1999 standard.

## NAME

complex.h — complex arithmetic

## SYNOPSIS

```
#include <complex.h>
```

## DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The <complex.h> header shall define the following macros:

**complex**           Expands to **\_Complex**.

**\_Complex\_I**       Expands to a constant expression of type **const float \_Complex**, with the value of the imaginary unit (that is, a number  $i$  such that  $i^2=-1$ ).

**imaginary**       Expands to **\_Imaginary**.

**\_Imaginary\_I**   Expands to a constant expression of type **const float \_Imaginary** with the value of the imaginary unit.

**I**               Expands to either **\_Imaginary\_I** or **\_Complex\_I**. If **\_Imaginary\_I** is not defined, **I** expands to **\_Complex\_I**.

The macros **imaginary** and **\_Imaginary\_I** shall be defined if and only if the implementation supports imaginary types.

An application may undefine and then, perhaps, redefine the **complex**, **imaginary**, and **I** macros.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
double           cabs(double complex);
float            cabsf(float complex);
long double      cabsl(long double complex);
double complex   cacos(double complex);
float complex    cacosf(float complex);
double complex   cacosh(double complex);
float complex    cacoshf(float complex);
long double complex cacoshl(long double complex);
long double complex cacosl(long double complex);
double           carg(double complex);
float            cargf(float complex);
long double      cargl(long double complex);
double complex   casin(double complex);
float complex    casinf(float complex);
double complex   casinh(double complex);
float complex    casinhf(float complex);
long double complex casinhl(long double complex);
long double complex casinl(long double complex);
double complex   catan(double complex);
float complex    catanf(float complex);
double complex   catanh(double complex);
float complex    catanhf(float complex);
long double complex catanhl(long double complex);
long double complex catanl(long double complex);
```

```

7580     double complex      ccos(double complex);
7581     float complex       ccosf(float complex);
7582     double complex      ccosh(double complex);
7583     float complex       ccoshf(float complex);
7584     long double complex ccoshl(long double complex);
7585     long double complex ccosl(long double complex);
7586     double complex      cexp(double complex);
7587     float complex       cexpf(float complex);
7588     long double complex cexpl(long double complex);
7589     double              cimag(double complex);
7590     float               cimagf(float complex);
7591     long double         cimagl(long double complex);
7592     double complex      clog(double complex);
7593     float complex       clogf(float complex);
7594     long double complex clogl(long double complex);
7595     double complex      conj(double complex);
7596     float complex       conjf(float complex);
7597     long double complex conjl(long double complex);
7598     double complex      cpow(double complex, double complex);
7599     float complex       cpowf(float complex, float complex);
7600     long double complex cpowl(long double complex, long double complex);
7601     double complex      cproj(double complex);
7602     float complex       cprojf(float complex);
7603     long double complex cprojl(long double complex);
7604     double              creal(double complex);
7605     float               crealf(float complex);
7606     long double         creall(long double complex);
7607     double complex      csin(double complex);
7608     float complex       csinf(float complex);
7609     double complex      csinh(double complex);
7610     float complex       csinhf(float complex);
7611     long double complex csinhl(long double complex);
7612     long double complex csinl(long double complex);
7613     double complex      csqrt(double complex);
7614     float complex       csqrtf(float complex);
7615     long double complex csqrtl(long double complex);
7616     double complex      ctan(double complex);
7617     float complex       ctanf(float complex);
7618     double complex      ctanh(double complex);
7619     float complex       ctanhf(float complex);
7620     long double complex ctanhl(long double complex);
7621     long double complex ctanl(long double complex);

```

**APPLICATION USAGE**

Values are interpreted as radians, not degrees.

**RATIONALE**

The choice of *I* instead of *i* for the imaginary unit concedes to the widespread use of the identifier *i* for other purposes. The application can use a different identifier, say *j*, for the imaginary unit by following the inclusion of the <complex.h> header with:

```
#undef I
#define j _Imaginary_I
```

An *I* suffix to designate imaginary constants is not required, as multiplication by *I* provides a sufficiently convenient and more generally useful notation for imaginary terms. The corresponding real type for the imaginary unit is **float**, so that use of *I* for algorithmic or notational convenience will not result in widening types.

On systems with imaginary types, the application has the ability to control whether use of the macro *I* introduces an imaginary type, by explicitly defining *I* to be `_Imaginary_I` or `_Complex_I`. Disallowing imaginary types is useful for some applications intended to run on implementations without support for such types.

The macro `_Imaginary_I` provides a test for whether imaginary types are supported.

The `cis()` function ( $\cos(x) + I\sin(x)$ ) was considered but rejected because its implementation is easy and straightforward, even though some implementations could compute sine and cosine more efficiently in tandem.

**FUTURE DIRECTIONS**

The following function names and the same names suffixed with *f* or *l* are reserved for future use, and may be added to the declarations in the <complex.h> header.

```
cerf()      cexpm1()   clog2()
cerfc()     clog10()  clgamma()
cexp2()     clog1p()  ctgamma()
```

**SEE ALSO**

XSH `cabs()`, `cacos()`, `cacosh()`, `carg()`, `casin()`, `casinh()`, `catan()`, `catanh()`, `ccos()`, `ccosh()`, `cexp()`, `cimag()`, `clog()`, `conj()`, `cpow()`, `cproj()`, `creal()`, `csin()`, `csinh()`, `csqrt()`, `ctan()`, `ctanh()`

**CHANGE HISTORY**

First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

## NAME

cpio.h — cpio archive values

## SYNOPSIS

```
#include <cpio.h>
```

## DESCRIPTION

The <cpio.h> header shall define the symbolic constants needed by the *c\_mode* field of the *cpio* archive format, with the names and values given in the following table:

Name	Description	Value (Octal)
C_IRUSR	Read by owner.	0000400
C_IWUSR	Write by owner.	0000200
C_IXUSR	Execute by owner.	0000100
C_IRGRP	Read by group.	0000040
C_IWGRP	Write by group.	0000020
C_IXGRP	Execute by group.	0000010
C_IROTH	Read by others.	0000004
C_IWOTH	Write by others.	0000002
C_IXOTH	Execute by others.	0000001
C_ISUID	Set user ID.	0004000
C_ISGID	Set group ID.	0002000
C_ISVTX	On directories, restricted deletion flag.	0001000
C_ISDIR	Directory.	0040000
C_ISFIFO	FIFO.	0010000
C_ISREG	Regular file.	0100000
C_ISBLK	Block special.	0060000
C_ISCHR	Character special.	0020000
C_ISCTG	Reserved.	0110000
C_ISLNK	Symbolic link.	0120000
C_ISSOCK	Socket.	0140000

The <cpio.h> header shall define the following symbolic constant as a string:

```
MAGIC      "070707"
```

## APPLICATION USAGE

None.

## RATIONALE

None.

## FUTURE DIRECTIONS

None.

## SEE ALSO

## CHANGE HISTORY

First released in the Headers Interface, Issue 3 specification. Derived from the POSIX.1-1988 standard.

## Issue 6

The SEE ALSO is updated to refer to *pax*.

**Issue 7**

The **<cpio.h>** header is moved from the XSI option to the Base.

This reference page is clarified with respect to macros and symbolic constants.

7699 **NAME**

7700       ctype.h — character types

7701 **SYNOPSIS**

7702       #include &lt;ctype.h&gt;

7703 **DESCRIPTION**

7704 CX       Some of the functionality described on this reference page extends the ISO C standard.  
 7705       Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to  
 7706       enable the visibility of these symbols in this header.

7707       The <ctype.h> header shall define the **locale\_t** type as described in <locale.h>, representing a  
 7708       locale object.

7709       The following shall be declared as functions and may also be defined as macros. Function  
 7710       prototypes shall be provided for use with ISO C standard compilers.

```

7711       int    isalnum(int);
7712 CX       int   isalnum_l(int, locale_t);
7713       int    isalpha(int);
7714 CX       int   isalpha_l(int, locale_t);
7715 OB XSI   int   isascii(int);
7716       int    isblank(int);
7717 CX       int   isblank_l(int, locale_t);
7718       int    iscntrl(int);
7719 CX       int   iscntrl_l(int, locale_t);
7720       int    isdigit(int);
7721 CX       int   isdigit_l(int, locale_t);
7722       int    isgraph(int);
7723 CX       int   isgraph_l(int, locale_t);
7724       int    islower(int);
7725 CX       int   islower_l(int, locale_t);
7726       int    isprint(int);
7727 CX       int   isprint_l(int, locale_t);
7728       int    ispunct(int);
7729 CX       int   ispunct_l(int, locale_t);
7730       int    isspace(int);
7731 CX       int   isspace_l(int, locale_t);
7732       int    isupper(int);
7733 CX       int   isupper_l(int, locale_t);
7734       int    isxdigit(int);
7735 CX       int   isxdigit_l(int, locale_t);
7736 OB XSI   int   toascii(int);
7737       int    tolower(int);
7738 CX       int   tolower_l(int, locale_t);
7739       int    toupper(int);
7740 CX       int   toupper_l(int, locale_t);

```

7741       The <ctype.h> header shall define the following as macros:

```

7742 OB XSI   int   _toupper(int);
7743       int    _tolower(int);

```

7744 **APPLICATION USAGE**

7745 None.

7746 **RATIONALE**

7747 None.

7748 **FUTURE DIRECTIONS**

7749 None.

7750 **SEE ALSO**7751 **<locale.h>**

7752 XSH Section 2.2 (on page 472), *isalnum()*, *isalpha()*, *isascii()*, *isblank()*, *isctrl()*, *isdigit()*,  
7753 *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*, *isxdigit()*, *mblen()*, *mbstowcs()*,  
7754 *mbtowc()*, *setlocale()*, *toascii()*, *tolower()*, *\_tolower()*, *toupper()*, *\_toupper()*, *wcstombs()*, *wctomb()*

7755 **CHANGE HISTORY**

7756 First released in Issue 1. Derived from Issue 1 of the SVID.

7757 **Issue 6**

7758 Extensions beyond the ISO C standard are marked.

7759 **Issue 7**

7760 SD5-XBD-ERN-6 is applied, updating the wording regarding the function declarations for  
7761 consistency.

7762 The \*\_l() functions are added from The Open Group Technical Standard, 2006, Extended API Set  
7763 Part 4.

**NAME**

dirent.h — format of directory entries

**SYNOPSIS**

```
#include <dirent.h>
```

**DESCRIPTION**

The internal format of directories is unspecified.

The <dirent.h> header shall define the following type:

**DIR** A type representing a directory stream. The **DIR** type may be an incomplete type.

It shall also define the structure **dirent** which shall include the following members:

XSI     `ino_t    d_ino`     File serial number.

`char    d_name[]`    Filename string of entry.

XSI     The <dirent.h> header shall define the `ino_t` type as described in <sys/types.h>.

The array `d_name` is of unspecified size, but shall contain a filename of at most {NAME\_MAX} bytes followed by a terminating null byte.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int            alphasort(const struct dirent **, const struct dirent **);
```

```
int            closedir(DIR *);
```

```
int            dirfd(DIR *);
```

```
DIR            *fdopendir(int);
```

```
DIR            *opendir(const char *);
```

```
struct dirent *readdir(DIR *);
```

```
int            readdir_r(DIR *restrict, struct dirent *restrict,
              struct dirent **restrict);
```

```
void           rewinddir(DIR *);
```

```
int            scandir(const char *, struct dirent **,
```

```
              int (*)(const struct dirent *),
```

```
              int (*)(const struct dirent **,
```

```
              const struct dirent **));
```

XSI     `void           seekdir(DIR *, long);`

`long          telldir(DIR *);`

**APPLICATION USAGE**

None.

**RATIONALE**

Information similar to that in the <dirent.h> header is contained in a file <sys/dir.h> in 4.2 BSD and 4.3 BSD. The equivalent in these implementations of **struct dirent** from this volume of POSIX.1-2008 is **struct direct**. The filename was changed because the name <sys/dir.h> was also used in earlier implementations to refer to definitions related to the older access method; this produced name conflicts. The name of the structure was changed because this volume of POSIX.1-2008 does not completely define what is in the structure, so it could be different on some implementations from **struct direct**.

The name of an array of **char** of an unspecified size should not be used as an lvalue. Use of:

```
sizeof(d_name)
```

is incorrect; use:

7808           strlen(d\_name)

7809           instead.

7810           The array of **char** *d\_name* is not a fixed size. Implementations may need to declare **struct dirent**  
7811           with an array size for *d\_name* of 1, but the actual number of bytes provided matches (or only  
7812           slightly exceeds) the length of the filename string.

#### 7813 FUTURE DIRECTIONS

7814           None.

#### 7815 SEE ALSO

7816           <sys/types.h>

7817           XSH *alphasort()*, *closedir()*, *dirfd()*, *fdopendir()*, *readdir()*, *rewinddir()*, *seekdir()*, *telldir()*

#### 7818 CHANGE HISTORY

7819           First released in Issue 2.

#### 7820 Issue 5

7821           The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

#### 7822 Issue 6

7823           The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir\_r()*.

7824           The **restrict** keyword is added to the prototype for *readdir\_r()*.

#### 7825 Issue 7

7826           The *alphasort()*, *dirfd()*, and *scandir()* functions are added from The Open Group Technical  
7827           Standard, 2006, Extended API Set Part 1.

7828           The *fdopendir()* function is added from The Open Group Technical Standard, 2006, Extended API  
7829           Set Part 2.

7830           Austin Group Interpretation 1003.1-2001 #110 is applied, clarifying the definition of the **DIR**  
7831           type.

7832           POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0039 [291], XBD/TC1-2008/0040 [291],  
7833           XBD/TC1-2008/0041 [291], and XBD/TC1-2008/0042 [206] are applied.

**NAME**

dlfcn.h — dynamic linking

**SYNOPSIS**

```
#include <dlfcn.h>
```

**DESCRIPTION**

The <dlfcn.h> header shall define at least the following symbolic constants for use in the construction of a *dlopen()* *mode* argument:

RTLD_LAZY	Relocations are performed at an implementation-defined time.
RTLD_NOW	Relocations are performed when the object is loaded.
RTLD_GLOBAL	All symbols are available for relocation processing of other modules.
RTLD_LOCAL	All symbols are not made available for relocation processing by other modules.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int    dlclose(void *);
char  *dlerror(void);
void  *dlopen(const char *, int);
void  *dlsym(void *restrict, const char *restrict);
```

**APPLICATION USAGE**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

XSH *dlclose()*, *dlerror()*, *dlopen()*, *dlsym()*

**CHANGE HISTORY**

First released in Issue 5.

**Issue 6**

The **restrict** keyword is added to the prototype for *dlsym()*.

**Issue 7**

The <dlfcn.h> header is moved from the XSI option to the Base.

This reference page is clarified with respect to macros and symbolic constants.

7867 **NAME**

7868       errno.h — system error numbers

7869 **SYNOPSIS**

7870       #include &lt;errno.h&gt;

7871 **DESCRIPTION**

7872 CX       Some of the functionality described on this reference page extends the ISO C standard. Any  
 7873       conflict between the requirements described here and the ISO C standard is unintentional. This  
 7874       volume of POSIX.1-2008 defers to the ISO C standard.

7875       The ISO C standard only requires the symbols [EDOM], [EILSEQ], and [ERANGE] to be defined.

7876       The <errno.h> header shall provide a declaration or definition for *errno*. The symbol *errno* shall  
 7877       expand to a modifiable lvalue of type **int**. It is unspecified whether *errno* is a macro or an  
 7878       identifier declared with external linkage. If a macro definition is suppressed in order to access an  
 7879       actual object, or a program defines an identifier with the name *errno*, the behavior is undefined.

7880       The <errno.h> header shall define the following macros which shall expand to integer constant  
 7881       expressions with type **int**, distinct positive values (except as noted below), and which shall be  
 7882       suitable for use in **#if** preprocessing directives:

7883	[E2BIG]	Argument list too long.
7884	[EACCES]	Permission denied.
7885	[EADDRINUSE]	Address in use.
7886	[EADDRNOTAVAIL]	Address not available.
7887	[EAFNOSUPPORT]	Address family not supported.
7888	[EAGAIN]	Resource unavailable, try again (may be the same value as
7889		[EWOULDBLOCK]).
7890	[EALREADY]	Connection already in progress.
7891	[EBADF]	Bad file descriptor.
7892	[EBADMSG]	Bad message.
7893	[EBUSY]	Device or resource busy.
7894	[ECANCELED]	Operation canceled.
7895	[ECHILD]	No child processes.
7896	[ECONNABORTED]	Connection aborted.
7897	[ECONNREFUSED]	Connection refused.
7898	[ECONNRESET]	Connection reset.
7899	[EDEADLK]	Resource deadlock would occur.
7900	[EDESTADDRREQ]	Destination address required.
7901	[EDOM]	Mathematics argument out of domain of function.
7902	[EDQUOT]	Reserved.
7903	[EEXIST]	File exists.

7904		[EFAULT]	Bad address.
7905		[EFBIG]	File too large.
7906		[EHOSTUNREACH]	Host is unreachable.
7907		[EIDRM]	Identifier removed.
7908		[EILSEQ]	Illegal byte sequence.
7909		[EINPROGRESS]	Operation in progress.
7910		[EINTR]	Interrupted function.
7911		[EINVAL]	Invalid argument.
7912		[EIO]	I/O error.
7913		[EISCONN]	Socket is connected.
7914		[EISDIR]	Is a directory.
7915		[ELOOP]	Too many levels of symbolic links.
7916		[EMFILE]	File descriptor value too large.
7917		[EMLINK]	Too many links.
7918		[EMSGSIZE]	Message too large.
7919		[EMULTIHOP]	Reserved.
7920		[ENAMETOOLONG]	Filename too long.
7921		[ENETDOWN]	Network is down.
7922		[ENETRESET]	Connection aborted by network.
7923		[ENETUNREACH]	Network unreachable.
7924		[ENFILE]	Too many files open in system.
7925		[ENOBUFS]	No buffer space available.
7926	OB XSR	[ENODATA]	No message is available on the STREAM head read queue.
7927		[ENODEV]	No such device.
7928		[ENOENT]	No such file or directory.
7929		[ENOEXEC]	Executable file format error.
7930		[ENOLCK]	No locks available.
7931		[ENOLINK]	Reserved.
7932		[ENOMEM]	Not enough space.
7933		[ENOMSG]	No message of the desired type.
7934		[ENOPROTOOPT]	Protocol not available.
7935		[ENOSPC]	No space left on device.
7936	OB XSR	[ENOSR]	No STREAM resources.

7937	OB XSR	[ENOSTR]	Not a STREAM.
7938		[ENOSYS]	Functionality not supported.
7939		[ENOTCONN]	The socket is not connected.
7940		[ENOTDIR]	Not a directory or a symbolic link to a directory.
7941		[ENOTEMPTY]	Directory not empty.
7942		[ENOTRECOVERABLE]	
7943			State not recoverable.
7944		[ENOTSOCK]	Not a socket.
7945		[ENOTSUP]	Not supported (may be the same value as [EOPNOTSUPP]).
7946		[ENOTTY]	Inappropriate I/O control operation.
7947		[ENXIO]	No such device or address.
7948		[EOPNOTSUPP]	Operation not supported on socket (may be the same value as [ENOTSUP]).
7949			
7950		[EOVERFLOW]	Value too large to be stored in data type.
7951		[EOWNERDEAD]	Previous owner died.
7952		[EPERM]	Operation not permitted.
7953		[EPIPE]	Broken pipe.
7954		[EPROTO]	Protocol error.
7955		[EPROTONOSUPPORT]	
7956			Protocol not supported.
7957		[EPROTOTYPE]	Protocol wrong type for socket.
7958		[ERANGE]	Result too large.
7959		[EROFS]	Read-only file system.
7960		[ESPIPE]	Invalid seek.
7961		[ESRCH]	No such process.
7962		[ESTALE]	Reserved.
7963	OB XSR	[ETIME]	Stream <i>ioctl()</i> timeout.
7964		[ETIMEDOUT]	Connection timed out.
7965		[ETXTBSY]	Text file busy.
7966		[EWOULDBLOCK]	Operation would block (may be the same value as [EAGAIN]).
7967		[EXDEV]	Cross-device link.

**APPLICATION USAGE**

Additional error numbers may be defined on conforming systems; see the System Interfaces volume of POSIX.1-2008.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

XSH [Section 2.3](#) (on page 481)

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

Updated for alignment with the POSIX Realtime Extension.

**Issue 6**

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The majority of the error conditions previously marked as extensions are now mandatory, except for the STREAMS-related error conditions.

Values for *errno* are now required to be distinct positive values rather than non-zero values. This change is for alignment with the ISO/IEC 9899: 1999 standard.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #050 is applied, allowing [ENOTSUP] and [EOPNOTSUPP] to be the same values.

The [ENOTRECOVERABLE] and [EOWNERDEAD] errors are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to the XSI STREAMS option is marked obsolescent.

Functionality relating to the Threads option is moved to the Base.

This reference page is clarified with respect to macros and symbolic constants.

POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0043 [324] is applied.

7997 **NAME**

7998       fcntl.h — file control options

7999 **SYNOPSIS**

8000       #include &lt;fcntl.h&gt;

8001 **DESCRIPTION**

8002       The <fcntl.h> header shall define the following symbolic constants for the *cmd* argument used  
 8003       by *fcntl()*. The values shall be unique and shall be suitable for use in **#if** preprocessing  
 8004       directives.

8005       F\_DUPFD       Duplicate file descriptor.

8006       F\_DUPFD\_CLOEXEC

8007       Duplicate file descriptor with the close-on-exec flag FD\_CLOEXEC set.

8008       F\_GETFD       Get file descriptor flags.

8009       F\_SETFD       Set file descriptor flags.

8010       F\_GETFL       Get file status flags and file access modes.

8011       F\_SETFL       Set file status flags.

8012       F\_GETLK       Get record locking information.

8013       F\_SETLK       Set record locking information.

8014       F\_SETLKW      Set record locking information; wait if blocked.

8015       F\_GETOWN      Get process or process group ID to receive SIGURG signals.

8016       F\_SETOWN      Set process or process group ID to receive SIGURG signals.

8017       The <fcntl.h> header shall define the following symbolic constant used for the *fcntl()* file  
 8018       descriptor flags, which shall be suitable for use in **#if** preprocessing directives.

8019       FD\_CLOEXEC    Close the file descriptor upon execution of an *exec* family function.

8020       The <fcntl.h> header shall also define the following symbolic constants for the *l\_type* argument  
 8021       used for record locking with *fcntl()*. The values shall be unique and shall be suitable for use in  
 8022       **#if** preprocessing directives.

8023       F\_RDLCK       Shared or read lock.

8024       F\_UNLCK       Unlock.

8025       F\_WRLCK       Exclusive or write lock.

8026       The <fcntl.h> header shall define the values used for *l\_whence*, SEEK\_SET, SEEK\_CUR, and  
 8027       SEEK\_END as described in <stdio.h>.

8028       The <fcntl.h> header shall define the following symbolic constants as file creation flags for use  
 8029       in the *oflag* value to *open()* and *openat()*. The values shall be bitwise-distinct and shall be  
 8030       suitable for use in **#if** preprocessing directives.

8031       O\_CLOEXEC      The FD\_CLOEXEC flag associated with the new descriptor shall be set to close  
 8032       the file descriptor upon execution of an *exec* family function.

8033       O\_CREAT        Create file if it does not exist.

8034       O\_DIRECTORY   Fail if file is a non-directory file.

8035		O_EXCL	Exclusive use flag.
8036		O_NOCTTY	Do not assign controlling terminal.
8037		O_NOFOLLOW	Do not follow symbolic links.
8038		O_TRUNC	Truncate flag.
8039		O_TTY_INIT	Set the <b>termios</b> structure terminal parameters to a state that provides conforming behavior; see <a href="#">Section 11.2</a> (on page 205).
8041		The O_TTY_INIT flag can have the value zero and in this case it need not be bitwise-distinct from the other flags.	
8043		The <fcntl.h> header shall define the following symbolic constants for use as file status flags for <i>open()</i> , <i>openat()</i> , and <i>fcntl()</i> . The values shall be suitable for use in <b>#if</b> preprocessing directives.	
8045		O_APPEND	Set append mode.
8046	SIO	O_DSYNC	Write according to synchronized I/O data integrity completion.
8047		O_NONBLOCK	Non-blocking mode.
8048	SIO	O_RSYNC	Synchronized read I/O operations.
8049		O_SYNC	Write according to synchronized I/O file integrity completion.
8050		The <fcntl.h> header shall define the following symbolic constant for use as the mask for file access modes. The value shall be suitable for use in <b>#if</b> preprocessing directives.	
8052		O_ACCMODE	Mask for file access modes.
8053		The <fcntl.h> header shall define the following symbolic constants for use as the file access modes for <i>open()</i> , <i>openat()</i> , and <i>fcntl()</i> . The values shall be unique, except that O_EXEC and O_SEARCH may have equal values. The values shall be suitable for use in <b>#if</b> preprocessing directives.	
8057		O_EXEC	Open for execute only (non-directory files). The result is unspecified if this flag is applied to a directory.
8059		O_RDONLY	Open for reading only.
8060		O_RDWR	Open for reading and writing.
8061		O_SEARCH	Open directory for search only. The result is unspecified if this flag is applied to a non-directory file.
8063		O_WRONLY	Open for writing only.
8064		The <fcntl.h> header shall define the symbolic constants for file modes for use as values of <b>mode_t</b> as described in <sys/stat.h>.	
8066		The <fcntl.h> header shall define the following symbolic constant as a special value used in place of a file descriptor for the <i>*at()</i> functions which take a directory file descriptor as a parameter:	
8069		AT_FDCWD	Use the current working directory to determine the target of relative file paths.
8070		The <fcntl.h> header shall define the following symbolic constant as a value for the <i>flag</i> used by <i>faccessat()</i> :	
8072		AT_EACCESS	Check access using effective user and group ID.
8073		The <fcntl.h> header shall define the following symbolic constant as a value for the <i>flag</i> used by	

8074 *fstatat()*, *fchmodat()*, *fchownat()*, and *utimensat()*:

8075 AT\_SYMLINK\_NOFOLLOW

8076 Do not follow symbolic links.

8077 The <fcntl.h> header shall define the following symbolic constant as a value for the flag used by *linkat()*:

8079 AT\_SYMLINK\_FOLLOW

8080 Follow symbolic link.

8081 The <fcntl.h> header shall define the following symbolic constant as a value for the flag used by *unlinkat()*:

8083 AT\_REMOVEDIR

8084 Remove directory instead of file.

8085 ADV The <fcntl.h> header shall define the following symbolic constants for the *advice* argument used by *posix\_fadvise()*:

8087 POSIX\_FADV\_DONTNEED

8088 The application expects that it will not access the specified data in the near future.

8089 POSIX\_FADV\_NOREUSE

8090 The application expects to access the specified data once and then not reuse it thereafter.

8091 POSIX\_FADV\_NORMAL

8092 The application has no advice to give on its behavior with respect to the specified data. It is the default characteristic if no advice is given for an open file.

8094 POSIX\_FADV\_RANDOM

8095 The application expects to access the specified data in a random order.

8096 POSIX\_FADV\_SEQUENTIAL

8097 The application expects to access the specified data sequentially from lower offsets to higher offsets.

8099 POSIX\_FADV\_WILLNEED

8100 The application expects to access the specified data in the near future.

8101 The <fcntl.h> header shall define the **flock** structure describing a file lock. It shall include the following members:

8103 short l\_type Type of lock; F\_RDLCK, F\_WRLCK, F\_UNLCK.

8104 short l\_whence Flag for starting offset.

8105 off\_t l\_start Relative offset in bytes.

8106 off\_t l\_len Size; if 0 then until EOF.

8107 pid\_t l\_pid Process ID of the process holding the lock; returned with F\_GETLK.

8108 The <fcntl.h> header shall define the **mode\_t**, **off\_t**, and **pid\_t** types as described in <sys/types.h>.

8110 The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

8112 int creat(const char \*, mode\_t);

8113 int fcntl(int, int, ...);

8114 int open(const char \*, int, ...);

8115 int openat(int, const char \*, int, ...);

```
8116 ADV int posix_fadvise(int, off_t, off_t, int);
8117 int posix_fallocate(int, off_t, off_t);
```

8118 Inclusion of the <fcntl.h> header may also make visible all symbols from <sys/stat.h> and  
8119 <unistd.h>.

## 8120 APPLICATION USAGE

8121 Although no existing implementation defines AT\_SYMLINK\_FOLLOW and  
8122 AT\_SYMLINK\_NOFOLLOW as the same numeric value, POSIX.1-2008 does not prohibit that as  
8123 the two constants are not used with the same interfaces.

## 8124 RATIONALE

8125 While many of the symbolic constants introduced in the <fcntl.h> header do not strictly need to  
8126 be used in #if preprocessor directives, widespread historic practice has defined them as macros  
8127 that are usable in such constructs, and examination of existing applications has shown that they  
8128 are occasionally used in such a way. Therefore it was decided to retain this requirement on an  
8129 implementation in POSIX.1-2008.

## 8130 FUTURE DIRECTIONS

8131 None.

## 8132 SEE ALSO

8134 XSH *creat()*, *exec*, *fcntl()*, *futimens()*, *open()*, *posix\_fadvise()*, *posix\_fallocate()*, *posix\_madvise()*

## 8135 CHANGE HISTORY

8136 First released in Issue 1. Derived from Issue 1 of the SVID.

### 8137 Issue 5

8138 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

### 8139 Issue 6

8140 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 8141 • O\_DSYNC and O\_RSYNC are marked as part of the Synchronized Input and Output  
8142 option.

8143 The following new requirements on POSIX implementations derive from alignment with the  
8144 Single UNIX Specification:

- 8145 • The definition of the **mode\_t**, **off\_t**, and **pid\_t** types is mandated.

8146 The F\_GETOWN and F\_SETOWN values are added for sockets.

8147 The *posix\_fadvise()*, *posix\_fallocate()*, and *posix\_madvise()* functions are added for alignment with  
8148 IEEE Std 1003.1d-1999.

8149 IEEE PASC Interpretation 1003.1 #102 is applied, moving the prototype for *posix\_madvise()* to  
8150 <sys/mman.h>.

8151 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/18 is applied, updating the prototypes for  
8152 *posix\_fadvise()* and *posix\_fallocate()* to be large file-aware, using **off\_t** instead of **size\_t**.

### 8153 Issue 7

8154 Austin Group Interpretation 1003.1-2001 #144 is applied, adding the O\_TTY\_INIT flag.

8155 Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the  
8156 FD\_CLOEXEC flag atomically at *open()*, and adding the F\_DUPFD\_CLOEXEC flag.

8157 The *openat()* function is added from The Open Group Technical Standard, 2006, Extended API  
8158 Set Part 2.

8159 Additional flags are added to support *faccessat()*, *fchmodat()*, *fchownat()*, *fstatat()*, *linkat()*,  
8160 *open()*, *openat()*, and *unlinkat()*.

8161 This reference page is clarified with respect to macros and symbolic constants.

8162 Changes are made related to support for finegrained timestamps.

8163 Changes are made to allow a directory to be opened for searching.

8164 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0044 [274] and XBD/TC1-2008/0045  
8165 [78,432] are applied.

**NAME**

fenv.h — floating-point environment

**SYNOPSIS**

#include &lt;fenv.h&gt;

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The <fenv.h> header shall define the following data types through **typedef**:

**fenv\_t** Represents the entire floating-point environment. The floating-point environment refers collectively to any floating-point status flags and control modes supported by the implementation.

**fexcept\_t** Represents the floating-point status flags collectively, including any status the implementation associates with the flags. A floating-point status flag is a system variable whose value is set (but never cleared) when a floating-point exception is raised, which occurs as a side-effect of exceptional floating-point arithmetic to provide auxiliary information. A floating-point control mode is a system variable whose value may be set by the user to affect the subsequent behavior of floating-point arithmetic.

The <fenv.h> header shall define each of the following macros if and only if the implementation supports the floating-point exception by means of the floating-point functions *feclearexcept()*, *fegetexceptflag()*, *feraiseexcept()*, *fesetexceptflag()*, and *fetestexcept()*. The defined macros shall expand to integer constant expressions with values that are bitwise-distinct.

```
FE_DIVBYZERO
FE_INEXACT
FE_INVALID
FE_OVERFLOW
FE_UNDERFLOW
```

If the implementation supports the IEC 60559 Floating-Point option, all five macros shall be defined. Additional implementation-defined floating-point exceptions with macros beginning with FE\_ and an uppercase letter may also be specified by the implementation.

The <fenv.h> header shall define the macro FE\_ALL\_EXCEPT as the bitwise-inclusive OR of all floating-point exception macros defined by the implementation, if any. If no such macros are defined, then the macro FE\_ALL\_EXCEPT shall be defined as zero.

The <fenv.h> header shall define each of the following macros if and only if the implementation supports getting and setting the represented rounding direction by means of the *fegetround()* and *fesetround()* functions. The defined macros shall expand to integer constant expressions whose values are distinct non-negative values.

```
FE_DOWNWARD
FE_TONEAREST
FE_TOWARDZERO
FE_UPWARD
```

If the implementation supports the IEC 60559 Floating-Point option, all four macros shall be defined. Additional implementation-defined rounding directions with macros beginning with FE\_ and an uppercase letter may also be specified by the implementation.

The <fenv.h> header shall define the following macro, which represents the default floating-point environment (that is, the one installed at program startup) and has type pointer to const-qualified **fenv\_t**. It can be used as an argument to the functions within the <fenv.h> header that manage the floating-point environment.

```
FE_DFL_ENV
```

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int  feclearexcept(int);
int  fegetenv(fenv_t *);
int  fegetexceptflag(fexcept_t *, int);
int  fegetround(void);
int  feholdexcept(fenv_t *);
int  feraiseexcept(int);
int  fesetenv(const fenv_t *);
int  fesetexceptflag(const fexcept_t *, int);
int  fesetround(int);
int  fetestexcept(int);
int  feupdateenv(const fenv_t *);
```

The FENV\_ACCESS pragma provides a means to inform the implementation when an application might access the floating-point environment to test floating-point status flags or run under non-default floating-point control modes. The pragma shall occur either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another FENV\_ACCESS pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another FENV\_ACCESS pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined. If part of an application tests floating-point status flags, sets floating-point control modes, or runs under non-default mode settings, but was translated with the state for the FENV\_ACCESS pragma off, the behavior is undefined. The default state (on or off) for the pragma is implementation-defined. (When execution passes from a part of the application translated with FENV\_ACCESS off to a part translated with FENV\_ACCESS on, the state of the floating-point status flags is unspecified and the floating-point control modes have their default settings.)

## APPLICATION USAGE

This header is designed to support the floating-point exception status flags and directed-rounding control modes required by the IEC 60559:1989 standard, and other similar floating-point state information. Also it is designed to facilitate code portability among all systems.

Certain application programming conventions support the intended model of use for the floating-point environment:

- A function call does not alter its caller's floating-point control modes, clear its caller's floating-point status flags, nor depend on the state of its caller's floating-point status flags unless the function is so documented.
- A function call is assumed to require default floating-point control modes, unless its documentation promises otherwise.

- A function call is assumed to have the potential for raising floating-point exceptions, unless its documentation promises otherwise.

With these conventions, an application can safely assume default floating-point control modes (or be unaware of them). The responsibilities associated with accessing the floating-point environment fall on the application that does so explicitly.

Even though the rounding direction macros may expand to constants corresponding to the values of FLT\_ROUNDS, they are not required to do so.

For example:

```
#include <fenv.h>
void f(double x)
{
    #pragma STDC FENV_ACCESS ON
    void g(double);
    void h(double);
    /* ... */
    g(x + 1);
    h(x + 1);
    /* ... */
}
```

If the function `g()` might depend on status flags set as a side-effect of the first `x+1`, or if the second `x+1` might depend on control modes set as a side-effect of the call to function `g()`, then the application shall contain an appropriately placed invocation as follows:

```
#pragma STDC FENV_ACCESS ON
```

## RATIONALE

### The `fexcept_t` Type

`fexcept_t` does not have to be an integer type. Its values must be obtained by a call to `fegetexceptflag()`, and cannot be created by logical operations from the exception macros. An implementation might simply implement `fexcept_t` as an `int` and use the representations reflected by the exception macros, but is not required to; other representations might contain extra information about the exceptions. `fexcept_t` might be a `struct` with a member for each exception (that might hold the address of the first or last floating-point instruction that caused that exception). The ISO/IEC 9899:1999 standard makes no claims about the internals of an `fexcept_t`, and so the user cannot inspect it.

### Exception and Rounding Macros

Macros corresponding to unsupported modes and rounding directions are not defined by the implementation and must not be defined by the application. An application might use `#ifdef` to test for this.

## FUTURE DIRECTIONS

None.

## SEE ALSO

XSH [`feclearexcept\(\)`](#), [`fegetenv\(\)`](#), [`fegetexceptflag\(\)`](#), [`fegetround\(\)`](#), [`feholdexcept\(\)`](#), [`feraiseexcept\(\)`](#), [`fetestexcept\(\)`](#), [`feupdateenv\(\)`](#)

**CHANGE HISTORY**

First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

The return types for *feclearexcept()*, *fegetexceptflag()*, *feraiseexcept()*, *fesetexceptflag()*, *fegetenv()*, *fesetenv()*, and *feupdateenv()* are changed from **void** to **int** for alignment with the ISO/IEC 9899:1999 standard, Defect Report 202.

**Issue 7**

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #37 (SD5-XBD-ERN-49) is applied.

ISO/IEC 9899:1999 standard, Technical Corrigendum 3 #36 is applied.

SD5-XBD-ERN-48 and SD5-XBD-ERN-69 are applied.

This reference page is clarified with respect to macros and symbolic constants.

**NAME**

float.h — floating types

**SYNOPSIS**

#include &lt;float.h&gt;

**DESCRIPTION**

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The characteristics of floating types are defined in terms of a model that describes a representation of floating-point numbers and values that provide information about an implementation's floating-point arithmetic.

The following parameters are used to define the model for each floating-point type:

*s* Sign ( $\pm 1$ ).

*b* Base or radix of exponent representation (an integer  $> 1$ ).

*e* Exponent (an integer between a minimum  $e_{\min}$  and a maximum  $e_{\max}$ ).

*p* Precision (the number of base-*b* digits in the significand).

*f<sub>k</sub>* Non-negative integers less than *b* (the significand digits).

A floating-point number *x* is defined by the following model:

$$x = sb^e \sum_{k=1}^p f_k b^{-k}, e_{\min} \leq e \leq e_{\max}$$

In addition to normalized floating-point numbers ( $f_1 > 0$  if  $x \neq 0$ ), floating types may be able to contain other kinds of floating-point numbers, such as subnormal floating-point numbers ( $x \neq 0$ ,  $e = e_{\min}$ ,  $f_1 = 0$ ) and unnormalized floating-point numbers ( $x \neq 0$ ,  $e > e_{\min}$ ,  $f_1 = 0$ ), and values that are not floating-point numbers, such as infinities and NaNs. A NaN is an encoding signifying Not-a-Number. A *quiet NaN* propagates through almost every arithmetic operation without raising a floating-point exception; a *signaling NaN* generally raises a floating-point exception when occurring as an arithmetic operand.

An implementation may give zero and non-numeric values, such as infinities and NaNs, a sign, or may leave them unsigned. Wherever such values are unsigned, any requirement in POSIX.1-2008 to retrieve the sign shall produce an unspecified sign and any requirement to set the sign shall be ignored.

The accuracy of the floating-point operations ('+', '-', '\*', '/') and of the functions in <math.h> and <complex.h> that return floating-point results is implementation-defined, as is the accuracy of the conversion between floating-point internal representations and string representations performed by the functions in <stdio.h>, <stdlib.h>, and <wchar.h>. The implementation may state that the accuracy is unknown.

All integer values in the <float.h> header, except FLT\_ROUNDS, shall be constant expressions suitable for use in #if preprocessing directives; all floating values shall be constant expressions. All except DECIMAL\_DIG, FLT\_EVAL\_METHOD, FLT\_RADIX, and FLT\_ROUNDS have separate names for all three floating-point types. The floating-point model representation is provided for all values except FLT\_EVAL\_METHOD and FLT\_ROUNDS.

The rounding mode for floating-point addition is characterized by the implementation-defined

8349 value of FLT\_ROUNDS:

- 8350 -1 Indeterminable.
- 8351 0 Toward zero.
- 8352 1 To nearest.
- 8353 2 Toward positive infinity.
- 8354 3 Toward negative infinity.

8355 All other values for FLT\_ROUNDS characterize implementation-defined rounding behavior.

8356 The values of operations with floating operands and values subject to the usual arithmetic  
 8357 conversions and of floating constants are evaluated to a format whose range and precision may  
 8358 be greater than required by the type. The use of evaluation formats is characterized by the  
 8359 implementation-defined value of FLT\_EVAL\_METHOD:

- 8360 -1 Indeterminable.
- 8361 0 Evaluate all operations and constants just to the range and precision of the type.
- 8362 1 Evaluate operations and constants of type **float** and **double** to the range and precision of  
 8363 the **double** type; evaluate **long double** operations and constants to the range and precision  
 8364 of the **long double** type.
- 8365 2 Evaluate all operations and constants to the range and precision of the **long double** type.

8366 All other negative values for FLT\_EVAL\_METHOD characterize implementation-defined  
 8367 behavior.

8368 The <float.h> header shall define the following values as constant expressions with  
 8369 implementation-defined values that are greater or equal in magnitude (absolute value) to those  
 8370 shown, with the same sign.

- 8371 • Radix of exponent representation,  $b$ .  
 8372 FLT\_RADIX 2
- 8373 • Number of base-FLT\_RADIX digits in the floating-point significand,  $p$ .  
 8374 FLT\_MANT\_DIG  
 8375 DBL\_MANT\_DIG  
 8376 LDBL\_MANT\_DIG
- 8377 • Number of decimal digits,  $n$ , such that any floating-point number in the widest supported  
 8378 floating type with  $p_{\max}$  radix  $b$  digits can be rounded to a floating-point number with  $n$   
 8379 decimal digits and back again without change to the value.

$$\begin{cases} p_{\max} \log_{10} b & \text{if } b \text{ is a power of } 10 \\ \left\lceil 1 + p_{\max} \log_{10} b \right\rceil & \text{otherwise} \end{cases}$$

8380 DECIMAL\_DIG 10

- 8381 • Number of decimal digits,  $q$ , such that any floating-point number with  $q$  decimal digits can  
8382 be rounded into a floating-point number with  $p$  radix  $b$  digits and back again without  
8383 change to the  $q$  decimal digits.

$$\begin{cases} p \log_{10} b & \text{if } b \text{ is a power of } 10 \\ \left\lceil (p-1) \log_{10} b \right\rceil & \text{otherwise} \end{cases}$$

8384 FLT\_DIG 6

8385 DBL\_DIG 10

8386 LDBL\_DIG 10

- 8387 • Minimum negative integer such that FLT\_RADIX raised to that power minus 1 is a  
8388 normalized floating-point number,  $e_{\min}$ .

8389 FLT\_MIN\_EXP

8390 DBL\_MIN\_EXP

8391 LDBL\_MIN\_EXP

- 8392 • Minimum negative integer such that 10 raised to that power is in the range of normalized  
8393 floating-point numbers.

$$\left\lceil \log_{10} b^{e_{\min}-1} \right\rceil$$

8394 FLT\_MIN\_10\_EXP -37

8395 DBL\_MIN\_10\_EXP -37

8396 LDBL\_MIN\_10\_EXP -37

- 8397 • Maximum integer such that FLT\_RADIX raised to that power minus 1 is a representable  
8398 finite floating-point number,  $e_{\max}$ .

8399 FLT\_MAX\_EXP

8400 DBL\_MAX\_EXP

8401 LDBL\_MAX\_EXP

8402 CX Additionally, FLT\_MAX\_EXP shall be at least as large as FLT\_MANT\_DIG,  
8403 DBL\_MAX\_EXP shall be at least as large as DBL\_MANT\_DIG, and LDBL\_MAX\_EXP shall  
8404 be at least as large as LDBL\_MANT\_DIG; which has the effect that FLT\_MAX, DBL\_MAX,  
8405 and LDBL\_MAX are integral.

- 8406 • Maximum integer such that 10 raised to that power is in the range of representable finite  
8407 floating-point numbers.

$$\left\lceil \log_{10}((1 - b^{-p}) b^{e_{\max}}) \right\rceil$$

8408 FLT\_MAX\_10\_EXP +37

8409 DBL\_MAX\_10\_EXP +37

8410 LDBL\_MAX\_10\_EXP +37

8411 The <float.h> header shall define the following values as constant expressions with  
8412 implementation-defined values that are greater than or equal to those shown:

- 8413
- Maximum representable finite floating-point number.

$$(1 - b^{-p}) b^{\epsilon_{\max}}$$

8414 FLT\_MAX 1E+37

8415 DBL\_MAX 1E+37

8416 LDBL\_MAX 1E+37

8417 The <float.h> header shall define the following values as constant expressions with  
8418 implementation-defined (positive) values that are less than or equal to those shown:

- 8419
- The difference between 1 and the least value greater than 1 that is representable in the  
8420 given floating-point type,  $b^{1-p}$ .

8421 FLT\_EPSILON 1E-5

8422 DBL\_EPSILON 1E-9

8423 LDBL\_EPSILON 1E-9

- 8424
- Minimum normalized positive floating-point number,  $b^{\epsilon_{\min}-1}$ .

8425 FLT\_MIN 1E-37

8426 DBL\_MIN 1E-37

8427 LDBL\_MIN 1E-37

## 8428 APPLICATION USAGE

8429 None.

## 8430 RATIONALE

8431 All known hardware floating-point formats satisfy the property that the exponent range is larger  
8432 than the number of mantissa digits. The ISO C standard permits a floating-point format where  
8433 this property is not true, such that the largest finite value would not be integral; however, it is  
8434 unlikely that there will ever be hardware support for such a floating-point format, and it  
8435 introduces boundary cases that portable programs should not have to be concerned with (for  
8436 example, a non-integral DBL\_MAX means that *ceil()* would have to worry about overflow).  
8437 Therefore, this standard imposes an additional requirement that the largest representable finite  
8438 value is integral.

## 8439 FUTURE DIRECTIONS

8440 None.

**NAME**

fmtmsg.h — message display structures

**SYNOPSIS**XSI `#include <fmtmsg.h>`**DESCRIPTION**

The &lt;fmtmsg.h&gt; header shall define the following symbolic constants:

MM_HARD	Source of the condition is hardware.
MM_SOFT	Source of the condition is software.
MM_FIRM	Source of the condition is firmware.
MM_APPL	Condition detected by application.
MM_UTIL	Condition detected by utility.
MM_OPSYS	Condition detected by operating system.
MM_RECOVER	Recoverable error.
MM_NRECOV	Non-recoverable error.
MM_HALT	Error causing application to halt.
MM_ERROR	Application has encountered a non-fatal fault.
MM_WARNING	Application has detected unusual non-error condition.
MM_INFO	Informative message.
MM_NOSEV	No severity level provided for the message.
MM_PRINT	Display message on standard error.
MM_CONSOLE	Display message on system console.

The table below indicates the null values and identifiers for *fmtmsg()* arguments. The <fmtmsg.h> header shall define the symbolic constants in the **Identifier** column, which shall have the type indicated in the **Type** column:

Argument	Type	Null-Value	Identifier
<i>label</i>	<b>char *</b>	(char*)0	MM_NULLLBL
<i>severity</i>	<b>int</b>	0	MM_NULLSEV
<i>class</i>	<b>long</b>	0L	MM_NULLMC
<i>text</i>	<b>char *</b>	(char*)0	MM_NULLTXT
<i>action</i>	<b>char *</b>	(char*)0	MM_NULLACT
<i>tag</i>	<b>char *</b>	(char*)0	MM_NULLTAG

The <fmtmsg.h> header shall also define the following symbolic constants for use as return values for *fmtmsg()*:

MM_OK	The function succeeded.
MM_NOTOK	The function failed completely.
MM_NOMSG	The function was unable to generate a message on standard error, but otherwise succeeded.

8490 MM\_NOCON The function was unable to generate a console message, but otherwise  
8491 succeeded.

8492 The following shall be declared as a function and may also be defined as a macro. A function  
8493 prototype shall be provided.

8494 int fmtmsg(long, const char \*, int,  
8495 const char \*, const char \*, const char \*);

**NAME**

ftw.h — file tree traversal

**SYNOPSIS**XSI `#include <ftw.h>`**DESCRIPTION**

The <ftw.h> header shall define the **FTW** structure, which shall include at least the following members:

```
int  base
int  level
```

The <ftw.h> header shall define the following symbolic constants for use as values of the third argument to the application-supplied function that is passed as the second argument to *ftw()* and *nftw()*:

```
FTW_F      Non-directory file.
FTW_D      Directory.
FTW_DNR    Directory without read permission.
FTW_DP     Directory with subdirectories visited.
FTW_NS     Unknown type; stat() failed.
FTW_SL     Symbolic link.
FTW_SLN    Symbolic link that names a nonexistent file.
```

The <ftw.h> header shall define the following symbolic constants for use as values of the fourth argument to *nftw()*:

```
FTW_PHYS    Physical walk, does not follow symbolic links. Otherwise, nftw() follows
links but does not walk down any path that crosses itself.
FTW_MOUNT   The walk does not cross a mount point.
FTW_DEPTH   All subdirectories are visited before the directory itself.
FTW_CHDIR   The walk changes to each directory before reading it.
```

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
OB int ftw(const char *, int (*)(const char *, const struct stat *,
int), int);
int nftw(const char *, int (*)(const char *, const struct stat *,
int, struct FTW *), int, int);
```

The <ftw.h> header shall define the **stat** structure and the symbolic names for *st\_mode* and the file type test macros as described in <sys/stat.h>.

Inclusion of the <ftw.h> header may also make visible all symbols from <sys/stat.h>.

**NAME**

glob.h — pathname pattern-matching types

**SYNOPSIS**

```
#include <glob.h>
```

**DESCRIPTION**

The <glob.h> header shall define the structures and symbolic constants used by the *glob()* function.

The <glob.h> header shall define the **glob\_t** structure type, which shall include at least the following members:

```
size_t    gl_pathc  Count of paths matched by pattern.
char      **gl_pathv Pointer to a list of matched pathnames.
size_t    gl_offs   Slots to reserve at the beginning of gl_pathv.
```

The <glob.h> header shall define the **size\_t** type as described in <sys/types.h>.

The <glob.h> header shall define the following symbolic constants as values for the *flags* argument:

GLOB_APPEND	Append generated pathnames to those previously obtained.
GLOB_DOOFFS	Specify how many null pointers to add to the beginning of <i>gl_pathv</i> .
GLOB_ERR	Cause <i>glob()</i> to return on error.
GLOB_MARK	Each pathname that is a directory that matches <i>pattern</i> has a <slash> appended.
GLOB_NOCHECK	If <i>pattern</i> does not match any pathname, then return a list consisting of only <i>pattern</i> .
GLOB_NOESCAPE	Disable backslash escaping.
GLOB_NOSORT	Do not sort the pathnames returned.

The <glob.h> header shall define the following symbolic constants as error return values:

GLOB_ABORTED	The scan was stopped because GLOB_ERR was set or (*errfunc)() returned non-zero.
GLOB_NOMATCH	The pattern does not match any existing pathname, and GLOB_NOCHECK was not set in <i>flags</i> .
GLOB_NOSPACE	An attempt to allocate memory failed.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int  glob(const char *restrict, int, int (*)(const char *, int),
         glob_t *restrict);
void globfree(glob_t *);
```

8624 **APPLICATION USAGE**

8625       None.

8626 **RATIONALE**

8627       None.

8628 **FUTURE DIRECTIONS**

8629       None.

8630 **SEE ALSO**

8631       &lt;sys/types.h&gt;

8632       XSH *glob()*8633 **CHANGE HISTORY**

8634       First released in Issue 4. Derived from the ISO POSIX-2 standard.

8635 **Issue 6**8636       The **restrict** keyword is added to the prototype for *glob()*.

8637       The GLOB\_NOSYS constant is marked obsolescent.

8638       IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/8 is applied, correcting the *glob()*  
8639       prototype definition by removing the **restrict** qualifier from the function pointer argument.8640 **Issue 7**8641       SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size\_t**

8642       The obsolescent GLOB\_NOSYS constant is removed.

8643       This reference page is clarified with respect to macros and symbolic constants.

**NAME**

grp.h — group structure

**SYNOPSIS**

```
#include <grp.h>
```

**DESCRIPTION**

The <grp.h> header shall declare the **group** structure, which shall include the following members:

```
char    *gr_name  The name of the group.
gid_t   gr_gid    Numerical group ID.
char    **gr_mem  Pointer to a null-terminated array of character
                  pointers to member names.
```

The <grp.h> header shall define the **gid\_t** and **size\_t** types as described in <sys/types.h>.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
XSI void      endgrent(void);
      struct group *getgrent(void);
      struct group *getgrgid(gid_t);
      int          getgrgid_r(gid_t, struct group *, char *,
                              size_t, struct group **);
      struct group *getgrnam(const char *);
      int          getgrnam_r(const char *, struct group *, char *,
                              size_t, struct group **);
XSI void      setgrent(void);
```

**APPLICATION USAGE**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

<sys/types.h>

XSH *endgrent()*, *getgrgid()*, *getgrnam()*

**CHANGE HISTORY**

First released in Issue 1.

**Issue 5**

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

**Issue 6**

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The definition of **gid\_t** is mandated.
- The *getgrgid\_r()* and *getgrnam\_r()* functions are marked as part of the Thread-Safe Functions option.

**Issue 7**

SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **size\_t** type.  
POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0049 [24] is applied.

8689 **NAME**

8690 iconv.h — codeset conversion facility

8691 **SYNOPSIS**

8692 #include <iconv.h>

8693 **DESCRIPTION**

8694 The <iconv.h> header shall define the following types:

8695 **iconv\_t** Identifies the conversion from one codeset to another.

8696 **size\_t** As described in <sys/types.h>.

8697 The following shall be declared as functions and may also be defined as macros. Function  
8698 prototypes shall be provided.

8699 size\_t iconv(iconv\_t, char \*\*restrict, size\_t \*restrict,  
8700 char \*\*restrict, size\_t \*restrict);  
8701 int iconv\_close(iconv\_t);  
8702 iconv\_t iconv\_open(const char \*, const char \*);

8703 **APPLICATION USAGE**

8704 None.

8705 **RATIONALE**

8706 None.

8707 **FUTURE DIRECTIONS**

8708 None.

8709 **SEE ALSO**

8712 **CHANGE HISTORY**

8713 First released in Issue 4.

8714 **Issue 6**

8715 The **restrict** keyword is added to the prototype for *iconv()*.

8716 **Issue 7**

8717 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size\_t** type.

8718 The <iconv.h> header is moved from the XSI option to the Base.

## 8719 NAME

8720 inttypes.h — fixed size integer types

## 8721 SYNOPSIS

8722 #include &lt;inttypes.h&gt;

## 8723 DESCRIPTION

8724 CX Some of the functionality described on this reference page extends the ISO C standard.  
 8725 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 472) to  
 8726 enable the visibility of these symbols in this header.

8727 The &lt;inttypes.h&gt; header shall include the &lt;stdint.h&gt; header.

8728 The &lt;inttypes.h&gt; header shall define at least the following types:

8729 **imaxdiv\_t** Structure type that is the type of the value returned by the *imaxdiv()* function.8730 CX **wchar\_t** As described in <stddef.h>.

8731 The <inttypes.h> header shall define the following macros. Each expands to a character string  
 8732 literal containing a conversion specifier, possibly modified by a length modifier, suitable for use  
 8733 within the *format* argument of a formatted input/output function when converting the  
 8734 corresponding integer type. These macros have the general form of PRI (character string literals  
 8735 for the *fprintf()* and *fwprintf()* family of functions) or SCN (character string literals for the  
 8736 *fscanf()* and *fwscanf()* family of functions), followed by the conversion specifier, followed by a  
 8737 name corresponding to a similar type name in <stdint.h>. In these names, *N* represents the  
 8738 width of the type as described in <stdint.h>. For example, *PRIdFAST32* can be used in a format  
 8739 string to print the value of an integer of type **int\_fast32\_t**.

8740 The *fprintf()* macros for signed integers are:

8741	<b>PRIdN</b>	<b>PRIdLEASTN</b>	<b>PRIdFASTN</b>	<b>PRIdMAX</b>	<b>PRIdPTR</b>
8742	<b>PRiN</b>	<b>PRiLEASTN</b>	<b>PRiFASTN</b>	<b>PRiMAX</b>	<b>PRiPTR</b>

8743 The *fprintf()* macros for unsigned integers are:

8744	<b>PRIoN</b>	<b>PRIoLEASTN</b>	<b>PRIoFASTN</b>	<b>PRIoMAX</b>	<b>PRIoPTR</b>
8745	<b>PRiUN</b>	<b>PRiULEASTN</b>	<b>PRiUFASTN</b>	<b>PRiUMAX</b>	<b>PRiUPTR</b>
8746	<b>PRiXN</b>	<b>PRiXLEASTN</b>	<b>PRiXFASTN</b>	<b>PRiXMAX</b>	<b>PRiXPTR</b>
8747	<b>PRiXN</b>	<b>PRiXLEASTN</b>	<b>PRiXFASTN</b>	<b>PRiXMAX</b>	<b>PRiXPTR</b>

8748 The *fscanf()* macros for signed integers are:

8749	<b>SCNdN</b>	<b>SCNdLEASTN</b>	<b>SCNdFASTN</b>	<b>SCNdMAX</b>	<b>SCNdPTR</b>
8750	<b>SCNiN</b>	<b>SCNiLEASTN</b>	<b>SCNiFASTN</b>	<b>SCNiMAX</b>	<b>SCNiPTR</b>

8751 The *fscanf()* macros for unsigned integers are:

8752	<b>SCNoN</b>	<b>SCNoLEASTN</b>	<b>SCNoFASTN</b>	<b>SCNoMAX</b>	<b>SCNoPTR</b>
8753	<b>SCNuN</b>	<b>SCNuLEASTN</b>	<b>SCNuFASTN</b>	<b>SCNuMAX</b>	<b>SCNuPTR</b>
8754	<b>SCNxN</b>	<b>SCNxLEASTN</b>	<b>SCNxFASTN</b>	<b>SCNxMAX</b>	<b>SCNxPTR</b>

8755 For each type that the implementation provides in <stdint.h>, the corresponding *fprintf()* and  
 8756 *fwprintf()* macros shall be defined and the corresponding *fscanf()* and *fwscanf()* macros shall be  
 8757 defined unless the implementation does not have a suitable modifier for the type.

8758 The following shall be declared as functions and may also be defined as macros. Function  
 8759 prototypes shall be provided.

```

8760     intmax_t  imaxabs(intmax_t);
8761     imaxdiv_t imaxdiv(intmax_t, intmax_t);
8762     intmax_t  strtoumax(const char *restrict, char **restrict, int);
8763     uintmax_t strtoumax(const char *restrict, char **restrict, int);
8764     intmax_t  wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);
8765     uintmax_t wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);

```

**EXAMPLES**

```

8766     #include <inttypes.h>
8767     #include <wchar.h>
8768     int main(void)
8769     {
8770         uintmax_t i = UINTMAX_MAX; // This type always exists.
8771         wprintf(L"The largest integer value is %020"
8772             PRIxMAX "\n", i);
8773         return 0;
8774     }
8775

```

**APPLICATION USAGE**

8776 The purpose of **<inttypes.h>** is to provide a set of integer types whose definitions are consistent  
8777 across machines and independent of operating systems and other implementation  
8778 idiosyncrasies. It defines, through **typedef**, integer types of various sizes. Implementations are  
8779 free to **typedef** them as ISO C standard integer types or extensions that they support. Consistent  
8780 use of this header will greatly increase the portability of applications across platforms.

**RATIONALE**

8782 The ISO/IEC 9899:1990 standard specified that the language should support four signed and  
8783 unsigned integer data types—**char**, **short**, **int**, and **long**—but placed very little requirement on  
8784 their size other than that **int** and **short** be at least 16 bits and **long** be at least as long as **int** and  
8785 not smaller than 32 bits. For 16-bit systems, most implementations assigned 8, 16, 16, and 32 bits  
8786 to **char**, **short**, **int**, and **long**, respectively. For 32-bit systems, the common practice has been to  
8787 assign 8, 16, 32, and 32 bits to these types. This difference in **int** size can create some problems  
8788 for users who migrate from one system to another which assigns different sizes to integer types,  
8789 because the ISO C standard integer promotion rule can produce silent changes unexpectedly.  
8790 The need for defining an extended integer type increased with the introduction of 64-bit  
8791 systems.

**FUTURE DIRECTIONS**

8793 Macro names beginning with PRI or SCN followed by any lowercase letter or 'X' may be added  
8794 to the macros defined in the **<inttypes.h>** header.

**SEE ALSO**

**CHANGE HISTORY**

8800 First released in Issue 5.

**Issue 6**

8802 The Open Group Base Resolution bwg97-006 is applied.

8803 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

8804 **Issue 7**  
8805

POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0050 [211] is applied.

8806 **NAME**

8807       iso646.h — alternative spellings

8808 **SYNOPSIS**

8809       #include &lt;iso646.h&gt;

8810 **DESCRIPTION**

8811 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 8812       conflict between the requirements described here and the ISO C standard is unintentional. This  
 8813       volume of POSIX.1-2008 defers to the ISO C standard.

8814       The <iso646.h> header shall define the following eleven macros (on the left) that expand to the  
 8815       corresponding tokens (on the right):

8816	and	&&
8817	and_eq	&=
8818	bitand	&
8819	bitor	
8820	compl	~
8821	not	!
8822	not_eq	!=
8823	or	
8824	or_eq	=
8825	xor	^
8826	xor_eq	^=

8832       None.

8833 **SEE ALSO**

8834       None.

8835 **CHANGE HISTORY**

8836       First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

8837 **NAME**

8838 langinfo.h — language information constants

8839 **SYNOPSIS**

8840 #include &lt;langinfo.h&gt;

8841 **DESCRIPTION**8842 The <langinfo.h> header shall define the symbolic constants used to identify items of *langinfo*  
8843 data (see *nl\_langinfo()*).8844 The <langinfo.h> header shall define the **locale\_t** type as described in <locale.h>.8845 The <langinfo.h> header shall define the **nl\_item** type as described in <nl\_types.h>.8846 The <langinfo.h> header shall define the following symbolic constants with type **nl\_item**. The  
8847 entries under **Category** indicate in which *setlocale()* category each item is defined.

Constant	Category	Meaning
CODESET	LC_CTYPE	Codeset name.
D_T_FMT	LC_TIME	String for formatting date and time.
D_FMT	LC_TIME	Date format string.
T_FMT	LC_TIME	Time format string.
T_FMT_AMPM	LC_TIME	a.m. or p.m. time format string.
AM_STR	LC_TIME	Ante-meridiem affix.
PM_STR	LC_TIME	Post-meridiem affix.
DAY_1	LC_TIME	Name of the first day of the week (for example, Sunday).
DAY_2	LC_TIME	Name of the second day of the week (for example, Monday).
DAY_3	LC_TIME	Name of the third day of the week (for example, Tuesday).
DAY_4	LC_TIME	Name of the fourth day of the week
		(for example, Wednesday).
DAY_5	LC_TIME	Name of the fifth day of the week (for example, Thursday).
DAY_6	LC_TIME	Name of the sixth day of the week (for example, Friday).
DAY_7	LC_TIME	Name of the seventh day of the week
		(for example, Saturday).
ABDAY_1	LC_TIME	Abbreviated name of the first day of the week.
ABDAY_2	LC_TIME	Abbreviated name of the second day of the week.
ABDAY_3	LC_TIME	Abbreviated name of the third day of the week.
ABDAY_4	LC_TIME	Abbreviated name of the fourth day of the week.
ABDAY_5	LC_TIME	Abbreviated name of the fifth day of the week.
ABDAY_6	LC_TIME	Abbreviated name of the sixth day of the week.
ABDAY_7	LC_TIME	Abbreviated name of the seventh day of the week.
MON_1	LC_TIME	Name of the first month of the year.
MON_2	LC_TIME	Name of the second month.
MON_3	LC_TIME	Name of the third month.
MON_4	LC_TIME	Name of the fourth month.
MON_5	LC_TIME	Name of the fifth month.
MON_6	LC_TIME	Name of the sixth month.
MON_7	LC_TIME	Name of the seventh month.
MON_8	LC_TIME	Name of the eighth month.
MON_9	LC_TIME	Name of the ninth month.
MON_10	LC_TIME	Name of the tenth month.
MON_11	LC_TIME	Name of the eleventh month.
MON_12	LC_TIME	Name of the twelfth month.
ABMON_1	LC_TIME	Abbreviated name of the first month.

Constant	Category	Meaning
ABMON_2	LC_TIME	Abbreviated name of the second month.
ABMON_3	LC_TIME	Abbreviated name of the third month.
ABMON_4	LC_TIME	Abbreviated name of the fourth month.
ABMON_5	LC_TIME	Abbreviated name of the fifth month.
ABMON_6	LC_TIME	Abbreviated name of the sixth month.
ABMON_7	LC_TIME	Abbreviated name of the seventh month.
ABMON_8	LC_TIME	Abbreviated name of the eighth month.
ABMON_9	LC_TIME	Abbreviated name of the ninth month.
ABMON_10	LC_TIME	Abbreviated name of the tenth month.
ABMON_11	LC_TIME	Abbreviated name of the eleventh month.
ABMON_12	LC_TIME	Abbreviated name of the twelfth month.
ERA	LC_TIME	Era description segments.
ERA_D_FMT	LC_TIME	Era date format string.
ERA_D_T_FMT	LC_TIME	Era date and time format string.
ERA_T_FMT	LC_TIME	Era time format string.
ALT_DIGITS	LC_TIME	Alternative symbols for digits.
RADIXCHAR	LC_NUMERIC	Radix character.
THOUSEP	LC_NUMERIC	Separator for thousands.
YESEXPR	LC_MESSAGES	Affirmative response expression.
NOEXPR	LC_MESSAGES	Negative response expression.
CRNCYSTR	LC_MONETARY	Local currency symbol, preceded by '–' if the symbol should appear before the value, '+' if the symbol should appear after the value, or ' .' if the symbol should replace the radix character. If the local currency symbol is the empty string, implementations may return the empty string (" ").

If the locale's values for **p\_cs\_precedes** and **n\_cs\_precedes** do not match, the value of `nl_langinfo(CRNCYSTR)` and `nl_langinfo_l(CRNCYSTR, loc)` is unspecified.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
char *nl_langinfo(nl_item);
char *nl_langinfo_l(nl_item, locale_t);
```

Inclusion of the <langinfo.h> header may also make visible all symbols from <nl\_types.h>.

## APPLICATION USAGE

Wherever possible, users are advised to use functions compatible with those in the ISO C standard to access items of *langinfo* data. In particular, the `strftime()` function should be used to access date and time information defined in category `LC_TIME`. The `localeconv()` function should be used to access information corresponding to `RADIXCHAR`, `THOUSEP`, and `CRNCYSTR`.

## RATIONALE

None.

## FUTURE DIRECTIONS

None.

8970 The **\_\_loc1** symbol and the *regcmp()* and *regex()* functions are removed.

**NAME**

limits.h — implementation-defined constants

**SYNOPSIS**

```
#include <limits.h>
```

**DESCRIPTION**

Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to enable the visibility of these symbols in this header.

Many of the symbols listed here are not defined by the ISO/IEC 9899:1999 standard. Such symbols are not shown as CX shaded, except under the heading “Numerical Limits”.

The <limits.h> header shall define macros and symbolic constants for various limits. Different categories of limits are described below, representing various limits on resources that the implementation imposes on applications. All macros and symbolic constants defined in this header shall be suitable for use in #if preprocessing directives.

Implementations may choose any appropriate value for each limit, provided it is not more restrictive than the Minimum Acceptable Values listed below. Symbolic constant names beginning with \_POSIX may be found in <unistd.h>.

Applications should not assume any particular value for a limit. To achieve maximum portability, an application should not require more resource than the Minimum Acceptable Value quantity. However, an application wishing to avail itself of the full amount of a resource available on an implementation may make use of the value given in <limits.h> on that particular implementation, by using the macros and symbolic constants listed below. It should be noted, however, that many of the listed limits are not invariant, and at runtime, the value of the limit may differ from those given in this header, for the following reasons:

- The limit is pathname-dependent.
- The limit differs between the compile and runtime machines.

For these reasons, an application may use the *fpathconf()*, *pathconf()*, and *sysconf()* functions to determine the actual value of a limit at runtime.

The items in the list ending in \_MIN give the most negative values that the mathematical types are guaranteed to be capable of representing. Numbers of a more negative value may be supported on some implementations, as indicated by the <limits.h> header on the implementation, but applications requiring such numbers are not guaranteed to be portable to all implementations. For positive constants ending in \_MIN, this indicates the minimum acceptable value.

**Runtime Invariant Values (Possibly Indeterminate)**

A definition of one of the symbolic constants in the following list shall be omitted from <limits.h> on specific implementations where the corresponding value is equal to or greater than the stated minimum, but is unspecified.

This indetermination might depend on the amount of available memory space on a specific instance of a specific implementation. The actual value supported by a specific instance shall be provided by the *sysconf()* function.

{AIO\_LISTIO\_MAX}

Maximum number of I/O operations in a single list I/O call supported by the implementation.

Minimum Acceptable Value: {\_POSIX\_AIO\_LISTIO\_MAX}

9016 {AIO\_MAX}  
 9017 Maximum number of outstanding asynchronous I/O operations supported by the  
 9018 implementation.  
 9019 Minimum Acceptable Value: {\_POSIX\_AIO\_MAX}

9020 {AIO\_PRIO\_DELTA\_MAX}  
 9021 The maximum amount by which a process can decrease its asynchronous I/O priority level  
 9022 from its own scheduling priority.  
 9023 Minimum Acceptable Value: 0

9024 {ARG\_MAX}  
 9025 Maximum length of argument to the *exec* functions including environment data.  
 9026 Minimum Acceptable Value: {\_POSIX\_ARG\_MAX}

9027 {ATEXIT\_MAX}  
 9028 Maximum number of functions that may be registered with *atexit()*.  
 9029 Minimum Acceptable Value: 32

9030 {CHILD\_MAX}  
 9031 Maximum number of simultaneous processes per real user ID.  
 9032 Minimum Acceptable Value: {\_POSIX\_CHILD\_MAX}

9033 {DELAYTIMER\_MAX}  
 9034 Maximum number of timer expiration overruns.  
 9035 Minimum Acceptable Value: {\_POSIX\_DELAYTIMER\_MAX}

9036 {HOST\_NAME\_MAX}  
 9037 Maximum length of a host name (not including the terminating null) as returned from the  
 9038 *gethostname()* function.  
 9039 Minimum Acceptable Value: {\_POSIX\_HOST\_NAME\_MAX}

9040 XSI {IOV\_MAX}  
 9041 Maximum number of **iovec** structures that one process has available for use with *readv()* or  
 9042 *writev()*.  
 9043 Minimum Acceptable Value: {\_XOPEN\_IOV\_MAX}

9044 {LOGIN\_NAME\_MAX}  
 9045 Maximum length of a login name.  
 9046 Minimum Acceptable Value: {\_POSIX\_LOGIN\_NAME\_MAX}

9047 MSG {MQ\_OPEN\_MAX}  
 9048 The maximum number of open message queue descriptors a process may hold.  
 9049 Minimum Acceptable Value: {\_POSIX\_MQ\_OPEN\_MAX}

9050 MSG {MQ\_PRIO\_MAX}  
 9051 The maximum number of message priorities supported by the implementation.  
 9052 Minimum Acceptable Value: {\_POSIX\_MQ\_PRIO\_MAX}

9053 {OPEN\_MAX}  
 9054 A value one greater than the maximum value that the system may assign to a newly-created  
 9055 file descriptor.  
 9056 Minimum Acceptable Value: {\_POSIX\_OPEN\_MAX}

9057 {PAGESIZE}  
 9058 Size in bytes of a page.  
 9059 Minimum Acceptable Value: 1

9060 XSI {PAGE\_SIZE}  
 9061 Equivalent to {PAGESIZE}. If either {PAGESIZE} or {PAGE\_SIZE} is defined, the other is  
 9062 defined with the same value.

9063 {PTHREAD\_DESTRUCTOR\_ITERATIONS}  
 9064 Maximum number of attempts made to destroy a thread's thread-specific data values on  
 9065 thread exit.  
 9066 Minimum Acceptable Value: {\_POSIX\_THREAD\_DESTRUCTOR\_ITERATIONS}

9067 {PTHREAD\_KEYS\_MAX}  
 9068 Maximum number of data keys that can be created by a process.  
 9069 Minimum Acceptable Value: {\_POSIX\_THREAD\_KEYS\_MAX}

9070 {PTHREAD\_STACK\_MIN}  
 9071 Minimum size in bytes of thread stack storage.  
 9072 Minimum Acceptable Value: 0

9073 {PTHREAD\_THREADS\_MAX}  
 9074 Maximum number of threads that can be created per process.  
 9075 Minimum Acceptable Value: {\_POSIX\_THREAD\_THREADS\_MAX}

9076 {RTSIG\_MAX}  
 9077 Maximum number of realtime signals reserved for application use in this implementation.  
 9078 Minimum Acceptable Value: {\_POSIX\_RTSIG\_MAX}

9079 {SEM\_NSEMS\_MAX}  
 9080 Maximum number of semaphores that a process may have.  
 9081 Minimum Acceptable Value: {\_POSIX\_SEM\_NSEMS\_MAX}

9082 {SEM\_VALUE\_MAX}  
 9083 The maximum value a semaphore may have.  
 9084 Minimum Acceptable Value: {\_POSIX\_SEM\_VALUE\_MAX}

9085 {SIGQUEUE\_MAX}  
 9086 Maximum number of queued signals that a process may send and have pending at the  
 9087 receiver(s) at any time.  
 9088 Minimum Acceptable Value: {\_POSIX\_SIGQUEUE\_MAX}

9089 SS | TSP {SS\_REPL\_MAX}  
 9090 The maximum number of replenishment operations that may be simultaneously pending  
 9091 for a particular sporadic server scheduler.  
 9092 Minimum Acceptable Value: {\_POSIX\_SS\_REPL\_MAX}

9093 {STREAM\_MAX}  
 9094 Maximum number of streams that one process can have open at one time. If defined, it has  
 9095 the same value as {FOPEN\_MAX} (see <stdio.h>).  
 9096 Minimum Acceptable Value: {\_POSIX\_STREAM\_MAX}

9097 {SYMLOOP\_MAX}  
 9098 Maximum number of symbolic links that can be reliably traversed in the resolution of a  
 9099 pathname in the absence of a loop.  
 9100 Minimum Acceptable Value: {\_POSIX\_SYMLOOP\_MAX}

9101 {TIMER\_MAX}  
 9102 Maximum number of timers per process supported by the implementation.  
 9103 Minimum Acceptable Value: {\_POSIX\_TIMER\_MAX}

9104 OB TRC {TRACE\_EVENT\_NAME\_MAX}  
 9105 Maximum length of the trace event name (not including the terminating null).  
 9106 Minimum Acceptable Value: {\_POSIX\_TRACE\_EVENT\_NAME\_MAX}

9107 OB TRC {TRACE\_NAME\_MAX}  
 9108 Maximum length of the trace generation version string or of the trace stream name (not  
 9109 including the terminating null).  
 9110 Minimum Acceptable Value: {\_POSIX\_TRACE\_NAME\_MAX}

9111 OB TRC {TRACE\_SYS\_MAX}  
 9112 Maximum number of trace streams that may simultaneously exist in the system.  
 9113 Minimum Acceptable Value: {\_POSIX\_TRACE\_SYS\_MAX}

9114 OB TRC {TRACE\_USER\_EVENT\_MAX}  
 9115 Maximum number of user trace event type identifiers that may simultaneously exist in a  
 9116 traced process, including the predefined user trace event  
 9117 POSIX\_TRACE\_UNNAMED\_USER\_EVENT.  
 9118 Minimum Acceptable Value: {\_POSIX\_TRACE\_USER\_EVENT\_MAX}

9119 {TTY\_NAME\_MAX}  
 9120 Maximum length of terminal device name.  
 9121 Minimum Acceptable Value: {\_POSIX\_TTY\_NAME\_MAX}

9122 {TZNAME\_MAX}  
 9123 Maximum number of bytes supported for the name of a timezone (not of the TZ variable).  
 9124 Minimum Acceptable Value: {\_POSIX\_TZNAME\_MAX}

9125 **Note:** The length given by {TZNAME\_MAX} does not include the quoting characters mentioned in  
 9126 [Section 8.3](#) (on page 177).

### 9127 Pathname Variable Values

9128 The values in the following list may be constants within an implementation or may vary from  
 9129 one pathname to another. For example, file systems or directories may have different  
 9130 characteristics.

9131 A definition of one of the symbolic constants in the following list shall be omitted from the  
 9132 <limits.h> header on specific implementations where the corresponding value is equal to or  
 9133 greater than the stated minimum, but where the value can vary depending on the file to which it  
 9134 is applied. The actual value supported for a specific pathname shall be provided by the  
 9135 *pathconf()* function.

9136 {FILESIZEBITS}  
 9137 Minimum number of bits needed to represent, as a signed integer value, the maximum size  
 9138 of a regular file allowed in the specified directory.  
 9139 Minimum Acceptable Value: 32

9140 {LINK\_MAX}  
 9141 Maximum number of links to a single file.  
 9142 Minimum Acceptable Value: {\_POSIX\_LINK\_MAX}

9143 {MAX\_CANON}  
 9144 Maximum number of bytes in a terminal canonical input line.  
 9145 Minimum Acceptable Value: {\_POSIX\_MAX\_CANON}

9146 {MAX\_INPUT}  
 9147 Minimum number of bytes for which space is available in a terminal input queue; therefore,  
 9148 the maximum number of bytes a conforming application may require to be typed as input

9149 before reading them.  
 9150 Minimum Acceptable Value: {\_POSIX\_MAX\_INPUT}

9151 {NAME\_MAX}  
 9152 Maximum number of bytes in a filename (not including the terminating null of a filename  
 9153 string).  
 9154 Minimum Acceptable Value: {\_POSIX\_NAME\_MAX}

9155 XSI Minimum Acceptable Value: {\_XOPEN\_NAME\_MAX}

9156 {PATH\_MAX}  
 9157 Maximum number of bytes the implementation will store as a pathname in a user-supplied  
 9158 buffer of unspecified size, including the terminating null character. Minimum number the  
 9159 implementation will accept as the maximum number of bytes in a pathname.  
 9160 Minimum Acceptable Value: {\_POSIX\_PATH\_MAX}

9161 XSI Minimum Acceptable Value: {\_XOPEN\_PATH\_MAX}

9162 {PIPE\_BUF}  
 9163 Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.  
 9164 Minimum Acceptable Value: {\_POSIX\_PIPE\_BUF}

9165 ADV {POSIX\_ALLOC\_SIZE\_MIN}  
 9166 Minimum number of bytes of storage actually allocated for any portion of a file.  
 9167 Minimum Acceptable Value: Not specified.

9168 ADV {POSIX\_REC\_INCR\_XFER\_SIZE}  
 9169 Recommended increment for file transfer sizes between the  
 9170 {POSIX\_REC\_MIN\_XFER\_SIZE} and {POSIX\_REC\_MAX\_XFER\_SIZE} values.  
 9171 Minimum Acceptable Value: Not specified.

9172 ADV {POSIX\_REC\_MAX\_XFER\_SIZE}  
 9173 Maximum recommended file transfer size.  
 9174 Minimum Acceptable Value: Not specified.

9175 ADV {POSIX\_REC\_MIN\_XFER\_SIZE}  
 9176 Minimum recommended file transfer size.  
 9177 Minimum Acceptable Value: Not specified.

9178 ADV {POSIX\_REC\_XFER\_ALIGN}  
 9179 Recommended file transfer buffer alignment.  
 9180 Minimum Acceptable Value: Not specified.

9181 {SYMLINK\_MAX}  
 9182 Maximum number of bytes in a symbolic link.  
 9183 Minimum Acceptable Value: {\_POSIX\_SYMLINK\_MAX}

### 9184 Runtime Increaseable Values

9185 The magnitude limitations in the following list shall be fixed by specific implementations. An  
 9186 application should assume that the value of the symbolic constant defined by <limits.h> in a  
 9187 specific implementation is the minimum that pertains whenever the application is run under  
 9188 that implementation. A specific instance of a specific implementation may increase the value  
 9189 relative to that supplied by <limits.h> for that implementation. The actual value supported by a  
 9190 specific instance shall be provided by the *sysconf*( ) function.

9191 {BC\_BASE\_MAX}  
 9192 Maximum *obase* values allowed by the *bc* utility.  
 9193 Minimum Acceptable Value: {\_POSIX2\_BC\_BASE\_MAX}

9194 {BC\_DIM\_MAX}  
 9195 Maximum number of elements permitted in an array by the *bc* utility.  
 9196 Minimum Acceptable Value: {\_POSIX2\_BC\_DIM\_MAX}

9197 {BC\_SCALE\_MAX}  
 9198 Maximum *scale* value allowed by the *bc* utility.  
 9199 Minimum Acceptable Value: {\_POSIX2\_BC\_SCALE\_MAX}

9200 {BC\_STRING\_MAX}  
 9201 Maximum length of a string constant accepted by the *bc* utility.  
 9202 Minimum Acceptable Value: {\_POSIX2\_BC\_STRING\_MAX}

9203 {CHARCLASS\_NAME\_MAX}  
 9204 Maximum number of bytes in a character class name.  
 9205 Minimum Acceptable Value: {\_POSIX2\_CHARCLASS\_NAME\_MAX}

9206 {COLL\_WEIGHTS\_MAX}  
 9207 Maximum number of weights that can be assigned to an entry of the *LC\_COLLATE* **order**  
 9208 keyword in the locale definition file; see [Chapter 7](#) (on page 135).  
 9209 Minimum Acceptable Value: {\_POSIX2\_COLL\_WEIGHTS\_MAX}

9210 {EXPR\_NEST\_MAX}  
 9211 Maximum number of expressions that can be nested within parentheses by the *expr* utility.  
 9212 Minimum Acceptable Value: {\_POSIX2\_EXPR\_NEST\_MAX}

9213 {LINE\_MAX}  
 9214 Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either  
 9215 standard input or another file), when the utility is described as processing text files. The  
 9216 length includes room for the trailing <newline>.  
 9217 Minimum Acceptable Value: {\_POSIX2\_LINE\_MAX}

9218 {NGROUPS\_MAX}  
 9219 Maximum number of simultaneous supplementary group IDs per process.  
 9220 Minimum Acceptable Value: {\_POSIX\_NGROUPS\_MAX}

9221 {RE\_DUP\_MAX}  
 9222 Maximum number of repeated occurrences of a BRE or ERE interval expression; see [Section 9.3.6](#) (on page 186) and [Section 9.4.6](#) (on page 190).  
 9223 [Section 9.3.6](#) (on page 186) and [Section 9.4.6](#) (on page 190).  
 9224 Minimum Acceptable Value: {\_POSIX\_RE\_DUP\_MAX}

## Maximum Values

The <limits.h> header shall define the following symbolic constants with the values shown. These are the most restrictive values for certain features on an implementation. A conforming implementation shall provide values no larger than these values. A conforming application must not require a smaller value for correct operation.

9230 {\_POSIX\_CLOCKRES\_MIN}  
 9231 The resolution of the CLOCK\_REALTIME clock, in nanoseconds.  
 9232 Value: 20 000 000

9233 MON If the Monotonic Clock option is supported, the resolution of the CLOCK\_MONOTONIC  
 9234 clock, in nanoseconds, is represented by {\_POSIX\_CLOCKRES\_MIN}.

**Minimum Values**

The <limits.h> header shall define the following symbolic constants with the values shown. These are the most restrictive values for certain features on an implementation conforming to this volume of POSIX.1-2008. Related symbolic constants are defined elsewhere in this volume of POSIX.1-2008 which reflect the actual implementation and which need not be as restrictive. For each of these limits, a conforming implementation shall provide a value at least this large or shall have no limit. A strictly conforming application must not require a larger value for correct operation.

{\_POSIX\_AIO\_LISTIO\_MAX}

The number of I/O operations that can be specified in a list I/O call.

Value: 2

{\_POSIX\_AIO\_MAX}

The number of outstanding asynchronous I/O operations.

Value: 1

{\_POSIX\_ARG\_MAX}

Maximum length of argument to the *exec* functions including environment data.

Value: 4 096

{\_POSIX\_CHILD\_MAX}

Maximum number of simultaneous processes per real user ID.

Value: 25

{\_POSIX\_DELAYTIMER\_MAX}

The number of timer expiration overruns.

Value: 32

{\_POSIX\_HOST\_NAME\_MAX}

Maximum length of a host name (not including the terminating null) as returned from the *gethostname()* function.

Value: 255

{\_POSIX\_LINK\_MAX}

Maximum number of links to a single file.

Value: 8

{\_POSIX\_LOGIN\_NAME\_MAX}

The size of the storage required for a login name, in bytes (including the terminating null).

Value: 9

{\_POSIX\_MAX\_CANON}

Maximum number of bytes in a terminal canonical input queue.

Value: 255

{\_POSIX\_MAX\_INPUT}

Maximum number of bytes allowed in a terminal input queue.

Value: 255

{\_POSIX\_MQ\_OPEN\_MAX}

The number of message queues that can be open for a single process.

Value: 8

{\_POSIX\_MQ\_PRIO\_MAX}

The maximum number of message priorities supported by the implementation.

Value: 32

9280        { \_POSIX\_NAME\_MAX}  
 9281           Maximum number of bytes in a filename (not including the terminating null of a filename  
 9282           string).  
 9283           Value: 14

9284        { \_POSIX\_NGROUPS\_MAX}  
 9285           Maximum number of simultaneous supplementary group IDs per process.  
 9286           Value: 8

9287        { \_POSIX\_OPEN\_MAX}  
 9288           A value one greater than the maximum value that the system may assign to a newly-created  
 9289           file descriptor.  
 9290           Value: 20

9291        { \_POSIX\_PATH\_MAX}  
 9292           Minimum number the implementation will accept as the maximum number of bytes in a  
 9293           pathname.  
 9294           Value: 256

9295        { \_POSIX\_PIPE\_BUF}  
 9296           Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.  
 9297           Value: 512

9298        { \_POSIX\_RE\_DUP\_MAX}  
 9299           Maximum number of repeated occurrences of a BRE or ERE interval expression; see [Section 9.3.6](#) (on page 186) and [Section 9.4.6](#) (on page 190).  
 9300           Value: 255

9301        { \_POSIX\_RTSIG\_MAX}  
 9302           The number of realtime signal numbers reserved for application use.  
 9303           Value: 8

9304        { \_POSIX\_SEM\_NSEMS\_MAX}  
 9305           The number of semaphores that a process may have.  
 9306           Value: 256

9307        { \_POSIX\_SEM\_VALUE\_MAX}  
 9308           The maximum value a semaphore may have.  
 9309           Value: 32 767

9310        { \_POSIX\_SIGQUEUE\_MAX}  
 9311           The number of queued signals that a process may send and have pending at the receiver(s)  
 9312           at any time.  
 9313           Value: 32

9314        { \_POSIX\_SSIZE\_MAX}  
 9315           The value that can be stored in an object of type **ssize\_t**.  
 9316           Value: 32 767

9317        { \_POSIX\_SS\_REPL\_MAX}  
 9318           The number of replenishment operations that may be simultaneously pending for a  
 9319           particular sporadic server scheduler.  
 9320           Value: 4

9321        { \_POSIX\_STREAM\_MAX}  
 9322           The number of streams that one process can have open at one time.  
 9323           Value: 8

9324

9325           { \_POSIX\_SYMLINK\_MAX}  
 9326           The number of bytes in a symbolic link.  
 9327           Value: 255

9328           { \_POSIX\_SYMLOOP\_MAX}  
 9329           The number of symbolic links that can be traversed in the resolution of a pathname in the  
 9330           absence of a loop.  
 9331           Value: 8

9332           { \_POSIX\_THREAD\_DESTRUCTOR\_ITERATIONS}  
 9333           The number of attempts made to destroy a thread's thread-specific data values on thread  
 9334           exit.  
 9335           Value: 4

9336           { \_POSIX\_THREAD\_KEYS\_MAX}  
 9337           The number of data keys per process.  
 9338           Value: 128

9339           { \_POSIX\_THREAD\_THREADS\_MAX}  
 9340           The number of threads per process.  
 9341           Value: 64

9342           { \_POSIX\_TIMER\_MAX}  
 9343           The per-process number of timers.  
 9344           Value: 32

9345 OB TRC { \_POSIX\_TRACE\_EVENT\_NAME\_MAX}  
 9346           The length in bytes of a trace event name (not including the terminating null).  
 9347           Value: 30

9348 OB TRC { \_POSIX\_TRACE\_NAME\_MAX}  
 9349           The length in bytes of a trace generation version string or a trace stream name (not  
 9350           including the terminating null).  
 9351           Value: 8

9352 OB TRC { \_POSIX\_TRACE\_SYS\_MAX}  
 9353           The number of trace streams that may simultaneously exist in the system.  
 9354           Value: 8

9355 OB TRC { \_POSIX\_TRACE\_USER\_EVENT\_MAX}  
 9356           The number of user trace event type identifiers that may simultaneously exist in a traced  
 9357           process, including the predefined user trace event  
 9358           \_POSIX\_TRACE\_UNNAMED\_USER\_EVENT.  
 9359           Value: 32

9360           { \_POSIX\_TTY\_NAME\_MAX}  
 9361           The size of the storage required for a terminal device name, in bytes (including the  
 9362           terminating null).  
 9363           Value: 9

9364           { \_POSIX\_TZNAME\_MAX}  
 9365           Maximum number of bytes supported for the name of a timezone (not of the TZ variable).  
 9366           Value: 6

9367           **Note:**   The length given by { \_POSIX\_TZNAME\_MAX} does not include the quoting characters  
 9368           mentioned in [Section 8.3](#) (on page 177).

9369		{_POSIX2_BC_BASE_MAX}
9370		Maximum <i>obase</i> values allowed by the <i>bc</i> utility.
9371		Value: 99
9372		{_POSIX2_BC_DIM_MAX}
9373		Maximum number of elements permitted in an array by the <i>bc</i> utility.
9374		Value: 2 048
9375		{_POSIX2_BC_SCALE_MAX}
9376		Maximum <i>scale</i> value allowed by the <i>bc</i> utility.
9377		Value: 99
9378		{_POSIX2_BC_STRING_MAX}
9379		Maximum length of a string constant accepted by the <i>bc</i> utility.
9380		Value: 1 000
9381		{_POSIX2_CHARCLASS_NAME_MAX}
9382		Maximum number of bytes in a character class name.
9383		Value: 14
9384		{_POSIX2_COLL_WEIGHTS_MAX}
9385		Maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> <b>order</b>
9386		keyword in the locale definition file; see <a href="#">Chapter 7</a> (on page 135).
9387		Value: 2
9388		{_POSIX2_EXPR_NEST_MAX}
9389		Maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.
9390		Value: 32
9391		{_POSIX2_LINE_MAX}
9392		Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either
9393		standard input or another file), when the utility is described as processing text files. The
9394		length includes room for the trailing <newline>.
9395		Value: 2 048
9396		{_POSIX2_RE_DUP_MAX}
9397		Maximum number of repeated occurrences of a BRE or ERE interval expression; see <a href="#">Section 9.3.6</a> (on page 186) and <a href="#">Section 9.4.6</a> (on page 190).
9398		Value: 255
9399		
9400	XSI	{_XOPEN_IOV_MAX}
9401		Maximum number of <b>iovec</b> structures that one process has available for use with <i>readv()</i> or
9402		<i>writev()</i> .
9403		Value: 16
9404	XSI	{_XOPEN_NAME_MAX}
9405		Maximum number of bytes in a filename (not including the terminating null of a filename
9406		string).
9407		Value: 255
9408	XSI	{_XOPEN_PATH_MAX}
9409		Minimum number the implementation will accept as the maximum number of bytes in a
9410		pathname.
9411		Value: 1 024

**Numerical Limits**

The <limits.h> header shall define the following macros and, except for {CHAR\_BIT}, {LONG\_BIT}, {MB\_LEN\_MAX}, and {WORD\_BIT}, they shall be replaced by expressions that have the same type as would an expression that is an object of the corresponding type converted according to the integer promotions.

If the value of an object of type **char** is treated as a signed integer when used in an expression, the value of {CHAR\_MIN} is the same as that of {SCHAR\_MIN} and the value of {CHAR\_MAX} is the same as that of {SCHAR\_MAX}. Otherwise, the value of {CHAR\_MIN} is 0 and the value of {CHAR\_MAX} is the same as that of {UCHAR\_MAX}.

{CHAR\_BIT}

Number of bits in a type **char**.

Value: 8

{CHAR\_MAX}

Maximum value for an object of type **char**.

Value: {UCHAR\_MAX} or {SCHAR\_MAX}

{CHAR\_MIN}

Minimum value for an object of type **char**.

Value: {SCHAR\_MIN} or 0

{INT\_MAX}

Maximum value for an object of type **int**.

Minimum Acceptable Value: 2 147 483 647

{INT\_MIN}

Minimum value for an object of type **int**.

Maximum Acceptable Value: -2 147 483 647

{LLONG\_MAX}

Maximum value for an object of type **long long**.

Minimum Acceptable Value: +9 223 372 036 854 775 807

{LLONG\_MIN}

Minimum value for an object of type **long long**.

Maximum Acceptable Value: -9 223 372 036 854 775 807

{LONG\_BIT}

Number of bits in an object of type **long**.

Minimum Acceptable Value: 32

{LONG\_MAX}

Maximum value for an object of type **long**.

Minimum Acceptable Value: +2 147 483 647

{LONG\_MIN}

Minimum value for an object of type **long**.

Maximum Acceptable Value: -2 147 483 647

{MB\_LEN\_MAX}

Maximum number of bytes in a character, for any supported locale.

Minimum Acceptable Value: 1

{SCHAR\_MAX}

Maximum value for an object of type **signed char**.

9456	CX	Value: +127
9457		{SCHAR_MIN}
9458		Minimum value for an object of type <b>signed char</b> .
9459	CX	Value: -128
9460		{SHRT_MAX}
9461		Maximum value for an object of type <b>short</b> .
9462		Minimum Acceptable Value: +32 767
9463		{SHRT_MIN}
9464		Minimum value for an object of type <b>short</b> .
9465		Maximum Acceptable Value: -32 767
9466	CX	{SSIZE_MAX}
9467		Maximum value for an object of type <b>ssize_t</b> .
9468		Minimum Acceptable Value: {_POSIX_SSIZE_MAX}
9469		{UCHAR_MAX}
9470		Maximum value for an object of type <b>unsigned char</b> .
9471	CX	Value: 255
9472		{UINT_MAX}
9473		Maximum value for an object of type <b>unsigned</b> .
9474	CX	Minimum Acceptable Value: 4 294 967 295
9475		{ULLONG_MAX}
9476		Maximum value for an object of type <b>unsigned long long</b> .
9477		Minimum Acceptable Value: 18 446 744 073 709 551 615
9478		{ULONG_MAX}
9479		Maximum value for an object of type <b>unsigned long</b> .
9480		Minimum Acceptable Value: 4 294 967 295
9481		{USHRT_MAX}
9482		Maximum value for an object of type <b>unsigned short</b> .
9483		Minimum Acceptable Value: 65 535
9484	CX	{WORD_BIT}
9485		Number of bits in an object of type <b>int</b> .
9486		Minimum Acceptable Value: 32
9487		<b>Other Invariant Values</b>
9488		The <limits.h> header shall define the following symbolic constants:
9489		{NL_ARGMAX}
9490		Maximum value of <i>n</i> in conversion specifications using the "%n\$" sequence in calls to the <i>printf()</i> and <i>scanf()</i> families of functions.
9491		Minimum Acceptable Value: 9
9492		
9493	XSI	{NL_LANGMAX}
9494		Maximum number of bytes in a <i>LANG</i> name.
9495		Minimum Acceptable Value: 14
9496		{NL_MSGMAX}
9497		Maximum message number.
9498		Minimum Acceptable Value: 32 767

9499 {NL\_SETMAX}  
9500 Maximum set number.  
9501 Minimum Acceptable Value: 255

9502 {NL\_TEXTMAX}  
9503 Maximum number of bytes in a message string.  
9504 Minimum Acceptable Value: {\_POSIX2\_LINE\_MAX}

9505 XSI {NZERO}  
9506 Default process priority.  
9507 Minimum Acceptable Value: 20

## APPLICATION USAGE

None.

## RATIONALE

A request was made to reduce the value of {\_POSIX\_LINK\_MAX} from the value of 8 specified for it in the POSIX.1-1990 standard to 2. The standard developers decided to deny this request for several reasons:

- They wanted to avoid making any changes to the standard that could break conforming applications, and the requested change could have that effect.
- The use of multiple hard links to a file cannot always be replaced with use of symbolic links. Symbolic links are semantically different from hard links in that they associate a pathname with another pathname rather than a pathname with a file. This has implications for access control, file permanence, and transparency.
- The original standard developers had considered the issue of allowing for implementations that did not in general support hard links, and decided that this would reduce consensus on the standard.

Systems that support historical versions of the development option of the ISO POSIX-2 standard retain the name {\_POSIX2\_RE\_DUP\_MAX} as an alias for {\_POSIX\_RE\_DUP\_MAX}.

{PATH\_MAX}  
IEEE PASC Interpretation 1003.1 #15 addressed the inconsistency in the standard with the definition of pathname and the description of {PATH\_MAX}, allowing application developers to allocate either {PATH\_MAX} or {PATH\_MAX}+1 bytes. The inconsistency has been removed by correction to the {PATH\_MAX} definition to include the null character. With this change, applications that previously allocated {PATH\_MAX} bytes will continue to succeed.

{SYMLINK\_MAX}  
This symbol refers to space for data that is stored in the file system, as opposed to {PATH\_MAX} which is the length of a name that can be passed to a function. In some existing implementations, the pathnames pointed to by symbolic links are stored in the *inodes* of the links, so it is important that {SYMLINK\_MAX} not be constrained to be as large as {PATH\_MAX}.

## FUTURE DIRECTIONS

None.

XSH Section 2.2 (on page 472), *fpathconf()*, *sysconf()*

## CHANGE HISTORY

First released in Issue 1.

### Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

{FILESIZEBITS} is added for the Large File Summit extensions.

The minimum acceptable values for {INT\_MAX}, {INT\_MIN}, and {UINT\_MAX} are changed to make 32-bit values the minimum requirement.

The entry is restructured to improve readability.

### Issue 6

The Open Group Corrigendum U033/4 is applied. The wording is made clear for {CHAR\_MIN}, {INT\_MIN}, {LONG\_MIN}, {SCHAR\_MIN}, and {SHRT\_MIN} that these are maximum acceptable values.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The minimum value for {CHILD\_MAX} is 25. This is a FIPS requirement.
- The minimum value for {OPEN\_MAX} is 20. This is a FIPS requirement.
- The minimum value for {NGROUPS\_MAX} is 8. This is also a FIPS requirement.

Symbolic constants are added for {\_POSIX\_SYMLINK\_MAX}, {\_POSIX\_SYMLOOP\_MAX}, {\_POSIX\_RE\_DUP\_MAX}, {RE\_DUP\_MAX}, {SYMLOOP\_MAX}, and {SYMLINK\_MAX}.

The following values are added for alignment with IEEE Std 1003.1d-1999:

```
{_POSIX_SS_REPL_MAX}
{SS_REPL_MAX}
{POSIX_ALLOC_SIZE_MIN}
{POSIX_REC_INCR_XFER_SIZE}
{POSIX_REC_MAX_XFER_SIZE}
{POSIX_REC_MIN_XFER_SIZE}
{POSIX_REC_XFER_ALIGN}
```

Reference to CLOCK\_MONOTONIC is added in the description of {\_POSIX\_CLOCKRES\_MIN} for alignment with IEEE Std 1003.1j-2000.

The constants {LLONG\_MIN}, {LLONG\_MAX}, and {ULLONG\_MAX} are added for alignment with the ISO/IEC 9899:1999 standard.

The following values are added for alignment with IEEE Std 1003.1q-2000:

```
{_POSIX_TRACE_EVENT_NAME_MAX}
{_POSIX_TRACE_NAME_MAX}
{_POSIX_TRACE_SYS_MAX}
{_POSIX_TRACE_USER_EVENT_MAX}
{TRACE_EVENT_NAME_MAX}
{TRACE_NAME_MAX}
{TRACE_SYS_MAX}
{TRACE_USER_EVENT_MAX}
```

The new limits {\_XOPEN\_NAME\_MAX} and {\_XOPEN\_PATH\_MAX} are added as minimum

values for {PATH\_MAX} and {NAME\_MAX} limits on XSI-conformant systems.

The LEGACY symbols {PASS\_MAX} and {TMP\_MAX} are removed.

The values for the limits {CHAR\_BIT}, {SCHAR\_MAX}, and {UCHAR\_MAX} are now required to be 8, +127, and 255, respectively.

The value for the limit {CHAR\_MAX} is now {UCHAR\_MAX} or {SCHAR\_MAX}.

The value for the limit {CHAR\_MIN} is now {SCHAR\_MIN} or zero.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/10 is applied, correcting the value of {\_POSIX\_CHILD\_MAX} from 6 to 25. This is for FIPS 151-2 alignment.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/19 is applied, updating the values for {INT\_MAX}, {UINT\_MAX}, and {INT\_MIN} to be CX extensions over the ISO C standard, and correcting {WORD\_BIT} from 16 to 32.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/20 is applied, removing {CHARCLASS\_NAME\_MAX} from the “Other Invariant Values” section (it also occurs under “Runtime Increaseable Values”).

#### Issue 7

Austin Group Interpretations 1003.1-2001 #143 and #160 are applied.

Austin Group Interpretation 1003.1-2001 #173 is applied, updating the descriptions of {TRACE\_EVENT\_NAME\_MAX} and {TRACE\_NAME\_MAX} to not include the terminating null.

SD5-XBD-ERN-36 is applied, changing the description of {RE\_DUP\_MAX}.

SD5-XBD-ERN-90 is applied.

{NL\_NMAX} is removed; it should have been removed in Issue 6.

The Trace option values are marked obsolescent.

The {ATEXIT\_MAX}, {LONG\_BIT}, {NL\_MSGMAX}, {NL\_SETMAX}, {NL\_TEXTMAX}, and {WORD\_BIT} values are moved from the XSI option to the Base.

The AIO\_\* and \_POSIX\_AIO\_\* values are moved from the Asynchronous Input and Output option to the Base.

The {\_POSIX\_RTSIG\_MAX}, {\_POSIX\_SIGQUEUE\_MAX}, {RTSIG\_MAX}, and {SIGQUEUE\_MAX} values are moved from the Realtime Signals Extension option to the Base.

Functionality relating to the Threads and Timers options is moved to the Base.

This reference page is clarified with respect to macros and symbolic constants.

POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0052 [108], XBD/TC1-2008/0053 [291], XBD/TC1-2008/0054 [182,427], XBD/TC1-2008/0055 [291], XBD/TC1-2008/0056 [371], XBD/TC1-2008/0057 [291], XBD/TC1-2008/0058 [108], and XBD/TC1-2008/0059 [291] are applied.

**NAME**

locale.h — category macros

**SYNOPSIS**

#include &lt;locale.h&gt;

**DESCRIPTION**

Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to enable the visibility of these symbols in this header.

The <locale.h> header shall define the **lconv** structure, which shall include at least the following members. (See the definitions of *LC\_MONETARY* in [Section 7.3.3](#) (on page 155) and [Section 7.3.4](#) (on page 158).)

```
char    *currency_symbol
char    *decimal_point
char    frac_digits
char    *grouping
char    *int_curr_symbol
char    int_frac_digits
char    int_n_cs_precedes
char    int_n_sep_by_space
char    int_n_sign_posn
char    int_p_cs_precedes
char    int_p_sep_by_space
char    int_p_sign_posn
char    *mon_decimal_point
char    *mon_grouping
char    *mon_thousands_sep
char    *negative_sign
char    n_cs_precedes
char    n_sep_by_space
char    n_sign_posn
char    *positive_sign
char    p_cs_precedes
char    p_sep_by_space
char    p_sign_posn
char    *thousands_sep
```

The <locale.h> header shall define NULL (as described in <stddef.h>) and at least the following as macros:

```
LC_ALL
LC_COLLATE
LC_CTYPE
LC_MESSAGES
LC_MONETARY
LC_NUMERIC
LC_TIME
```

which shall expand to integer constant expressions with distinct values for use as the first argument to the *setlocale()* function.

Additional macro definitions, beginning with the characters *LC\_* and an uppercase letter, may also be specified by the implementation.

9668 CX The <locale.h> header shall contain at least the following macros representing bitmasks for use  
 9669 with the *newlocale()* function for each supported locale category:

9670 LC\_COLLATE\_MASK  
 9671 LC\_CTYPE\_MASK  
 9672 LC\_MESSAGES\_MASK  
 9673 LC\_MONETARY\_MASK  
 9674 LC\_NUMERIC\_MASK  
 9675 LC\_TIME\_MASK

9676 In addition, a macro to set the bits for all categories set shall be defined:

9677 LC\_ALL\_MASK

9678 The <locale.h> header shall define LC\_GLOBAL\_LOCALE, a special locale object descriptor  
 9679 used by the *duplocale()* and *uselocale()* functions.

9680 The <locale.h> header shall define the **locale\_t** type, representing a locale object.

9681 The following shall be declared as functions and may also be defined as macros. Function  
 9682 prototypes shall be provided for use with ISO C standard compilers.

9683 CX locale\_t duplocale(locale\_t);  
 9684 void freelocale(locale\_t);  
 9685 struct lconv \*localeconv(void);

9686 CX locale\_t newlocale(int, const char \*, locale\_t);  
 9687 char \*setlocale(int, const char \*);

9688 CX locale\_t uselocale (locale\_t);

## 9689 APPLICATION USAGE

9690 None.

## 9691 RATIONALE

9692 It is suggested that each category macro name for use in *setlocale()* have a corresponding macro  
 9693 name ending in *\_MASK* for use in *newlocale()*.

## 9694 FUTURE DIRECTIONS

9695 None.

## 9696 SEE ALSO

9697 Chapter 8 (on page 173), <stddef.h>

9698 XSH *duplocale()*, *freelocale()*, *localeconv()*, *newlocale()*, *setlocale()*, *uselocale()*

## 9699 CHANGE HISTORY

9700 First released in Issue 3.

9701 Included for alignment with the ISO C standard.

## 9702 Issue 6

9703 The **lconv** structure is expanded with new members (**int\_n\_cs\_precedes**, **int\_n\_sep\_by\_space**,  
 9704 **int\_n\_sign\_posn**, **int\_p\_cs\_precedes**, **int\_p\_sep\_by\_space**, and **int\_p\_sign\_posn**) for alignment  
 9705 with the ISO/IEC 9899:1999 standard.

9706 Extensions beyond the ISO C standard are marked.

9707 **Issue 7**

9708 The *duplocale()*, *freelocale()*, *newlocale()*, and *uselocale()* functions are added from The Open  
9709 Group Technical Standard, 2006, Extended API Set Part 4.

9710 This reference page is clarified with respect to macros and symbolic constants.

9711 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0060 [301,427] is applied.

## 9712 NAME

9713 math.h — mathematical declarations

## 9714 SYNOPSIS

9715 #include &lt;math.h&gt;

## 9716 DESCRIPTION

9717 CX Some of the functionality described on this reference page extends the ISO C standard.  
 9718 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 472) to  
 9719 enable the visibility of these symbols in this header.

9720 The &lt;math.h&gt; header shall define at least the following types:

9721 **float\_t** A real-floating type at least as wide as **float**.9722 **double\_t** A real-floating type at least as wide as **double**, and at least as wide as **float\_t**.

9723 If FLT\_EVAL\_METHOD equals 0, **float\_t** and **double\_t** shall be **float** and **double**, respectively; if  
 9724 FLT\_EVAL\_METHOD equals 1, they shall both be **double**; if FLT\_EVAL\_METHOD equals 2,  
 9725 they shall both be **long double**; for other values of FLT\_EVAL\_METHOD, they are otherwise  
 9726 implementation-defined.

9727 The <math.h> header shall define the following macros, where real-floating indicates that the  
 9728 argument shall be an expression of real-floating type:

```
9729 int fpclassify(real-floating x);
9730 int isfinite(real-floating x);
9731 int isgreater(real-floating x, real-floating y);
9732 int isgreaterequal(real-floating x, real-floating y);
9733 int isinf(real-floating x);
9734 int isless(real-floating x, real-floating y);
9735 int islessequal(real-floating x, real-floating y);
9736 int islessgreater(real-floating x, real-floating y);
9737 int isnan(real-floating x);
9738 int isnormal(real-floating x);
9739 int isunordered(real-floating x, real-floating y);
9740 int signbit(real-floating x);
```

9741 The <math.h> header shall define the following symbolic constants. The values shall have type  
 9742 **double** and shall be accurate to at least the precision of the **double** type.

9743	XSI	<b>M_E</b>	Value of $e$
9744	XSI	<b>M_LOG2E</b>	Value of $\log_2 e$
9745	XSI	<b>M_LOG10E</b>	Value of $\log_{10} e$
9746	XSI	<b>M_LN2</b>	Value of $\log_e 2$
9747	XSI	<b>M_LN10</b>	Value of $\log_e 10$
9748	XSI	<b>M_PI</b>	Value of $\pi$
9749	XSI	<b>M_PI_2</b>	Value of $\pi/2$
9750	XSI	<b>M_PI_4</b>	Value of $\pi/4$
9751	XSI	<b>M_1_PI</b>	Value of $1/\pi$
9752	XSI	<b>M_2_PI</b>	Value of $2/\pi$

9753	XSI	<b>M_2_SQRTPI</b>	Value of $2/\sqrt{\pi}$
9754	XSI	<b>M_SQRT2</b>	Value of $\sqrt{2}$
9755	XSI	<b>M_SQRT1_2</b>	Value of $1/\sqrt{2}$
9756		The <math.h> header shall define the following symbolic constant:	
9757	OB XSI	<b>MAXFLOAT</b>	Same value as FLT_MAX in <float.h>.
9758		The <math.h> header shall define the following macros:	
9759		<b>HUGE_VAL</b>	A positive <b>double</b> constant expression, not necessarily representable as a
9760			<b>float</b> . Used as an error value returned by the mathematics library.
9761			HUGE_VAL evaluates to +infinity on systems supporting IEEE Std 754-1985.
9762		<b>HUGE_VALF</b>	A positive <b>float</b> constant expression. Used as an error value returned by the
9763			mathematics library. HUGE_VALF evaluates to +infinity on systems
9764			supporting IEEE Std 754-1985.
9765		<b>HUGE_VALL</b>	A positive <b>long double</b> constant expression. Used as an error value returned
9766			by the mathematics library. HUGE_VALL evaluates to +infinity on systems
9767			supporting IEEE Std 754-1985.
9768		<b>INFINITY</b>	A constant expression of type <b>float</b> representing positive or unsigned infinity,
9769			if available; else a positive constant of type <b>float</b> that overflows at translation
9770			time.
9771		<b>NAN</b>	A constant expression of type <b>float</b> representing a quiet NaN. This macro is
9772			only defined if the implementation supports quiet NaNs for the <b>float</b> type.
9773		The following macros shall be defined for number classification. They represent the mutually-	
9774		exclusive kinds of floating-point values. They expand to integer constant expressions with	
9775		distinct values. Additional implementation-defined floating-point classifications, with macro	
9776		definitions beginning with FP_ and an uppercase letter, may also be specified by the	
9777		implementation.	
9778		<b>FP_INFINITE</b>	
9779		<b>FP_NAN</b>	
9780		<b>FP_NORMAL</b>	
9781		<b>FP_SUBNORMAL</b>	
9782		<b>FP_ZERO</b>	
9783		The following optional macros indicate whether the <i>fma()</i> family of functions are fast compared	
9784		with direct code:	
9785		<b>FP_FAST_FMA</b>	
9786		<b>FP_FAST_FMAF</b>	
9787		<b>FP_FAST_FMAL</b>	
9788		If defined, the FP_FAST_FMA macro shall expand to the integer constant 1 and shall indicate	
9789		that the <i>fma()</i> function generally executes about as fast as, or faster than, a multiply and an add	
9790		of <b>double</b> operands. If undefined, the speed of execution is unspecified. The other macros have	
9791		the equivalent meaning for the <b>float</b> and <b>long double</b> versions.	
9792		The following macros shall expand to integer constant expressions whose values are returned by	
9793		<i>ilogb(x)</i> if <i>x</i> is zero or NaN, respectively. The value of FP_ILOGB0 shall be either {INT_MIN} or	
9794		-{INT_MAX}. The value of FP_ILOGBNAN shall be either {INT_MAX} or {INT_MIN}.	

9795           FP\_ILOGB0  
 9796           FP\_ILOGBNAN

9797           The following macros shall expand to the integer constants 1 and 2, respectively;

9798           MATH\_ERRNO  
 9799           MATH\_ERREXCEPT

9800           The following macro shall expand to an expression that has type **int** and the value  
 9801           MATH\_ERRNO, MATH\_ERREXCEPT, or the bitwise-inclusive OR of both:

9802           math\_errhandling

9803           The value of math\_errhandling is constant for the duration of the program. It is unspecified  
 9804           whether math\_errhandling is a macro or an identifier with external linkage. If a macro definition  
 9805           is suppressed or a program defines an identifier with the name math\_errhandling, the behavior  
 9806           is undefined. If the expression (math\_errhandling & MATH\_ERREXCEPT) can be non-zero, the  
 9807           implementation shall define the macros FE\_DIVBYZERO, FE\_INVALID, and FE\_OVERFLOW in  
 9808           <fenv.h>.

9809           The following shall be declared as functions and may also be defined as macros. Function  
 9810           prototypes shall be provided.

9811           double       acos(double);  
 9812           float        acosf(float);  
 9813           double       acosh(double);  
 9814           float        acoshf(float);  
 9815           long double  acoshl(long double);  
 9816           long double  acosl(long double);  
 9817           double       asin(double);  
 9818           float        asinf(float);  
 9819           double       asinh(double);  
 9820           float        asinhf(float);  
 9821           long double  asinh1(long double);  
 9822           long double  asin1(long double);  
 9823           double       atan(double);  
 9824           double       atan2(double, double);  
 9825           float        atan2f(float, float);  
 9826           long double  atan2l(long double, long double);  
 9827           float        atanf(float);  
 9828           double       atanh(double);  
 9829           float        atanhf(float);  
 9830           long double  atanh1(long double);  
 9831           long double  atan1(long double);  
 9832           double       cbrt(double);  
 9833           float        cbrtf(float);  
 9834           long double  cbrt1(long double);  
 9835           double       ceil(double);  
 9836           float        ceilf(float);  
 9837           long double  ceill(long double);  
 9838           double       copysign(double, double);  
 9839           float        copysignf(float, float);  
 9840           long double  copysignl(long double, long double);  
 9841           double       cos(double);

```

9842     float      cosf(float);
9843     double     cosh(double);
9844     float      coshf(float);
9845     long double coshl(long double);
9846     long double cosl(long double);
9847     double     erf(double);
9848     double     erfc(double);
9849     float      erfcf(float);
9850     long double erfcl(long double);
9851     float      erff(float);
9852     long double erfl(long double);
9853     double     exp(double);

9983     float        truncf(float);
9984     long double  trunc1(long double);
9985     XSI double    y0(double);
9986     double       y1(double);
9987     double       yn(int, double);

```

9988 The following external variable shall be defined:

```

9989 XSI extern int signgam;

```

9990 The behavior of each of the functions defined in <math.h> is specified in the System Interfaces  
9991 volume of POSIX.1-2008 for all representable values of its input arguments, except where stated  
9992 otherwise. Each function shall execute as if it were a single operation without generating any  
9993 externally visible exceptional conditions.

**APPLICATION USAGE**

The FP\_CONTRACT pragma can be used to allow (if the state is on) or disallow (if the state is off) the implementation to contract expressions. Each pragma can occur either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another FP\_CONTRACT pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another FP\_CONTRACT pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined. The default state (on or off) for the pragma is implementation-defined.

Applications should use FLT\_MAX as described in the <float.h> header instead of the obsolescent MAXFLOAT.

Note that if FLT\_EVAL\_METHOD is neither 0 nor 1, then some constants might not compare + equal as expected; for example, (double)M\_PI == M\_PI can fail.

**RATIONALE**

Before the ISO/IEC 9899:1999 standard, the math library was defined only for the floating type **double**. All the names formed by appending 'f' or 'l' to a name in <math.h> were reserved to allow for the definition of **float** and **long double** libraries; and the ISO/IEC 9899:1999 standard provides for all three versions of math functions.

The functions *ecvt()*, *fcvt()*, and *gcvt()* have been dropped from the ISO C standard since their capability is available through *sprintf()*.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 1.

**Issue 6**

This reference page is updated to align with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/21 is applied, making it clear that the meaning of the FP\_FAST\_FMA macro is unspecified if the macro is undefined.

**Issue 7**

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #47 (SD5-XBD-ERN-52) is applied, clarifying the wording of the FP\_FAST\_FMA macro.

The MAXFLOAT constant is marked obsolescent.

This reference page is clarified with respect to macros and symbolic constants.

10038 **NAME**

10039       monetary.h — monetary types

10040 **SYNOPSIS**

10041       #include &lt;monetary.h&gt;

10042 **DESCRIPTION**10043       The <monetary.h> header shall define the **locale\_t** type as described in <locale.h>.10044       The <monetary.h> header shall define the **size\_t** type as described in <stddef.h>.10045       The <monetary.h> header shall define the **ssize\_t** type as described in <sys/types.h>.10046       The following shall be declared as functions and may also be defined as macros. Function  
10047       prototypes shall be provided for use with ISO C standard compilers.10048       **ssize\_t**   strfmon(char \*restrict, size\_t, const char \*restrict, ...);10049       **ssize\_t**   strfmon\_l(char \*restrict, size\_t, locale\_t,

10050                   const char \*restrict, ...);

10051 **APPLICATION USAGE**

10052       None.

10053 **RATIONALE**

10054       None.

10055 **FUTURE DIRECTIONS**

10056       None.

10057 **SEE ALSO**

10058       &lt;locale.h&gt;, &lt;stddef.h&gt;, &lt;sys/types.h&gt;

10059       XSH *strfmon()*10060 **CHANGE HISTORY**

10061       First released in Issue 4.

10062 **Issue 6**10063       The **restrict** keyword is added to the prototype for *strfmon()*.10064 **Issue 7**

10065       The &lt;monetary.h&gt; header is moved from the XSI option to the Base.

10066       The *strfmon\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
10067       Set Part 4.10068       A declaration for the **locale\_t** type is added.

10069 **NAME**10070       mqueue.h — message queues (**REALTIME**)10071 **SYNOPSIS**

10072 MSG    #include &lt;mqueue.h&gt;

10073 **DESCRIPTION**10074       The <mqueue.h> header shall define the **mqd\_t** type, which is used for message queue  
10075       descriptors. This is not an array type.10076       The <mqueue.h> header shall define the **pthread\_attr\_t**, **size\_t**, and **ssize\_t** types as described  
10077       in <sys/types.h>.10078       The <mqueue.h> header shall define the **struct timespec** structure as described in <time.h>.10079       The tag **sigevent** shall be declared as naming an incomplete structure type, the contents of which  
10080       are described in the <signal.h> header.10081       The <mqueue.h> header shall define the **mq\_attr** structure, which is used in getting and setting  
10082       the attributes of a message queue. Attributes are initially set when the message queue is created.  
10083       An **mq\_attr** structure shall have at least the following fields:

10084	long	mq_flags	Message queue flags.
10085	long	mq_maxmsg	Maximum number of messages.
10086	long	mq_msgsize	Maximum message size.
10087	long	mq_curmsgs	Number of messages currently queued.

10088       The following shall be declared as functions and may also be defined as macros. Function  
10089       prototypes shall be provided.

```

10090     int      mq_close(mqd_t);
10091     int      mq_getattr(mqd_t, struct mq_attr *);
10092     int      mq_notify(mqd_t, const struct sigevent *);
10093     mqd_t    mq_open(const char *, int, ...);
10094     ssize_t  mq_receive(mqd_t, char *, size_t, unsigned *);
10095     int      mq_send(mqd_t, const char *, size_t, unsigned);
10096     int      mq_setattr(mqd_t, const struct mq_attr *restrict,
10097                        struct mq_attr *restrict);
10098     ssize_t  mq_timedreceive(mqd_t, char *restrict, size_t,
10099                        unsigned *restrict, const struct timespec *restrict);
10100     int      mq_timedsend(mqd_t, const char *, size_t, unsigned,
10101                        const struct timespec *);
10102     int      mq_unlink(const char *);

```

10103       Inclusion of the <mqueue.h> header may make visible symbols defined in the headers  
10104       <fcntl.h>, <signal.h>, and <time.h>.10105 **APPLICATION USAGE**

10106       None.

10107 **RATIONALE**

10108       None.

10109 **FUTURE DIRECTIONS**

10110       None.

10111 **SEE ALSO**

10114 [mq\\_unlink\(\)](#)

10115 **CHANGE HISTORY**

10116 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

10117 **Issue 6**

10118 The **<mqueue.h>** header is marked as part of the Message Passing option.

10119 The [mq\\_timedreceive\(\)](#) and [mq\\_timedsend\(\)](#) functions are added for alignment with IEEE Std  
10120 1003.1d-1999.

10121 The **restrict** keyword is added to the prototypes for [mq\\_setattr\(\)](#) and [mq\\_timedreceive\(\)](#).

10122 **Issue 7**

10123 Type and structure declarations are added.

10124 **NAME**

10125 ndbm.h — definitions for ndbm database operations

10126 **SYNOPSIS**10127 XSI `#include <ndbm.h>`10128 **DESCRIPTION**10129 The <ndbm.h> header shall define the **datum** type as a structure, which shall include at least the  
10130 following members:10131 `void *dptr` A pointer to the application's data.  
10132 `size_t dsize` The size of the object pointed to by *dptr*.10133 The <ndbm.h> header shall define the **size\_t** type as described in <stddef.h>.10134 The <ndbm.h> header shall define the **DBM** type.10135 The <ndbm.h> header shall define the following symbolic constants as possible values for the  
10136 *store\_mode* argument to *dbm\_store()*:10137 **DBM\_INSERT** Insertion of new entries only.10138 **DBM\_REPLACE** Allow replacing existing entries.10139 The following shall be declared as functions and may also be defined as macros. Function  
10140 prototypes shall be provided.10141 `int dbm_clearerr(DBM *);`  
10142 `void dbm_close(DBM *);`  
10143 `int dbm_delete(DBM *, datum);`  
10144 `int dbm_error(DBM *);`  
10145 `datum dbm_fetch(DBM *, datum);`  
10146 `datum dbm_firstkey(DBM *);`  
10147 `datum dbm_nextkey(DBM *);`  
10148 `DBM *dbm_open(const char *, int, mode_t);`  
10149 `int dbm_store(DBM *, datum, datum, int);`10150 The <ndbm.h> header shall define the **mode\_t** type through **typedef**, as described in  
10151 <sys/types.h>.10152 **APPLICATION USAGE**

10153 None.

10154 **RATIONALE**

10155 None.

10156 **FUTURE DIRECTIONS**

10160 XSH *dbm\_clearerr()*10161 **CHANGE HISTORY**

10162 First released in Issue 4, Version 2.

10163 **Issue 5**

10164 References to the definitions of **size\_t** and **mode\_t** are added to the DESCRIPTION.

10165 **Issue 7**

10166 This reference page is clarified with respect to macros and symbolic constants.

10167 **NAME**

10168 net/if.h — sockets local interfaces

10169 **SYNOPSIS**

10170 #include &lt;net/if.h&gt;

10171 **DESCRIPTION**10172 The <net/if.h> header shall define the **if\_nameindex** structure, which shall include at least the  
10173 following members:10174 unsigned if\_index Numeric index of the interface.  
10175 char \*if\_name Null-terminated name of the interface.10176 The <net/if.h> header shall define the following symbolic constant for the length of a buffer  
10177 containing an interface name (including the terminating NULL character):

10178 IF\_NAMESIZE Interface name length.

10179 The following shall be declared as functions and may also be defined as macros. Function  
10180 prototypes shall be provided.10181 void if\_freenameindex(struct if\_nameindex \*);  
10182 char \*if\_indextoname(unsigned, char \*);  
10183 struct if\_nameindex \*if\_nameindex(void);  
10184 unsigned if\_nametoindex(const char \*);10185 **APPLICATION USAGE**

10186 None.

10195 **Issue 7**

10196 This reference page is clarified with respect to macros and symbolic constants.

10197 **NAME**

10198 netdb.h — definitions for network database operations

10199 **SYNOPSIS**

10200 #include <netdb.h>

10201 **DESCRIPTION**

10202 The <netdb.h> header may define the **in\_port\_t** type and the **in\_addr\_t** type as described in  
10203 <netinet/in.h>.

10204 The <netdb.h> header shall define the **hostent** structure, which shall include at least the  
10205 following members:

10206	char	*h_name	Official name of the host.
10207	char	**h_aliases	A pointer to an array of pointers to 10208 alternative host names, terminated by a 10209 null pointer.
10210	int	h_addrtype	Address type.
10211	int	h_length	The length, in bytes, of the address.
10212	char	**h_addr_list	A pointer to an array of pointers to network 10213 addresses (in network byte order) for the host, 10214 terminated by a null pointer.

10215 The <netdb.h> header shall define the **netent** structure, which shall include at least the  
10216 following members:

10217	char	*n_name	Official, fully-qualified (including the 10218 domain) name of the host.
10219	char	**n_aliases	A pointer to an array of pointers to 10220 alternative network names, terminated by a 10221 null pointer.
10222	int	n_addrtype	The address type of the network.
10223	uint32_t	n_net	The network number, in host byte order.

10224 The <netdb.h> header shall define the **uint32\_t** type as described in <inttypes.h>.

10225 The <netdb.h> header shall define the **protoent** structure, which shall include at least the  
10226 following members:

10227	char	*p_name	Official name of the protocol.
10228	char	**p_aliases	A pointer to an array of pointers to 10229 alternative protocol names, terminated by 10230 a null pointer.
10231	int	p_proto	The protocol number.

10232 The <netdb.h> header shall define the **servent** structure, which shall include at least the  
10233 following members:

10234	char	*s_name	Official name of the service.
10235	char	**s_aliases	A pointer to an array of pointers to 10236 alternative service names, terminated by 10237 a null pointer.
10238	int	s_port	A value which, when converted to uint16_t, 10239 yields the port number in network byte order 10240 at which the service resides.
10241	char	*s_proto	The name of the protocol to use when 10242 contacting the service.

10243 The <netdb.h> header shall define the IPPORT\_RESERVED symbolic constant with the value of  
10244 the highest reserved Internet port number.

#### 10245 Address Information Structure

10246 The <netdb.h> header shall define the **addrinfo** structure, which shall include at least the  
10247 following members:

10248	int	ai_flags	Input flags.
10249	int	ai_family	Address family of socket.
10250	int	ai_socktype	Socket type.
10251	int	ai_protocol	Protocol of socket.
10252	socklen_t	ai_addrlen	Length of socket address.
10253	struct sockaddr	*ai_addr	Socket address of socket.
10254	char	*ai_canonname	Canonical name of service location.
10255	struct addrinfo	*ai_next	Pointer to next in list.

10256 The <netdb.h> header shall define the following symbolic constants that evaluate to bitwise-  
10257 distinct integer constants for use in the *flags* field of the **addrinfo** structure:

10258	AI_PASSIVE	Socket address is intended for <i>bind()</i> .
10259	AI_CANONNAME	Request for canonical name.
10260	AI_NUMERICHOST	Return numeric host address as name.
10261	AI_NUMERICSERV	Inhibit service name resolution.
10262	AI_V4MAPPED	If no IPv6 addresses are found, query for IPv4 addresses and return them 10263 to the caller as IPv4-mapped IPv6 addresses.
10264	AI_ALL	Query for both IPv4 and IPv6 addresses.
10265	AI_ADDRCONFIG	Query for IPv4 addresses only when an IPv4 address is configured; query 10266 for IPv6 addresses only when an IPv6 address is configured.

10267 The <netdb.h> header shall define the following symbolic constants that evaluate to bitwise-  
10268 distinct integer constants for use in the *flags* argument to *getnameinfo()*:

10269	NI_NOFQDN	Only the nodename portion of the FQDN is returned for local hosts.
10270	NI_NUMERICHOST	The numeric form of the node's address is returned instead of its name.
10271	NI_NAMEREQD	Return an error if the node's name cannot be located in the database.
10272	NI_NUMERICSERV	The numeric form of the service address is returned instead of its name.
10273	NI_NUMERICSCOPE	
10274		For IPv6 addresses, the numeric form of the scope identifier is returned 10275 instead of its name.
10276	NI_DGRAM	Indicates that the service is a datagram service (SOCK_DGRAM).

## Address Information Errors

The <netdb.h> header shall define the following symbolic constants for use as error values for *getaddrinfo()* and *getnameinfo()*. The values shall be suitable for use in *#if* preprocessing directives.

EAI_AGAIN	The name could not be resolved at this time. Future attempts may succeed.
EAI_BADFLAGS	The flags had an invalid value.
EAI_FAIL	A non-recoverable error occurred.
EAI_FAMILY	The address family was not recognized or the address length was invalid for the specified family.
EAI_MEMORY	There was a memory allocation failure.
EAI_NONAME	The name does not resolve for the supplied parameters.
	NI_NAMEREQD is set and the host's name cannot be located, or both <i>nodename</i> and <i>servname</i> were null.
EAI_SERVICE	The service passed was not recognized for the specified socket type.
EAI_SOCKTYPE	The intended socket type was not recognized.
EAI_SYSTEM	A system error occurred. The error code can be found in <i>errno</i> .
EAI_OVERFLOW	An argument buffer overflowed.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

void	<i>endhostent</i> (void);
void	<i>endnetent</i> (void);
void	<i>endprotoent</i> (void);
void	<i>endservent</i> (void);
void	<i>freeaddrinfo</i> (struct <i>addrinfo</i> *);
const char	* <i>gai_strerror</i> (int);
int	<i>getaddrinfo</i> (const char *restrict, const char *restrict, const struct <i>addrinfo</i> *restrict, struct <i>addrinfo</i> **restrict);
struct <i>hostent</i>	* <i>gethostent</i> (void);
int	<i>getnameinfo</i> (const struct <i>sockaddr</i> *restrict, <i>socklen_t</i> , char *restrict, <i>socklen_t</i> , char *restrict, <i>socklen_t</i> , int);
struct <i>netent</i>	* <i>getnetbyaddr</i> ( <i>uint32_t</i> , int);
struct <i>netent</i>	* <i>getnetbyname</i> (const char *);
struct <i>netent</i>	* <i>getnetent</i> (void);
struct <i>protoent</i>	* <i>getprotobyname</i> (const char *);
struct <i>protoent</i>	* <i>getprotobynumber</i> (int);
struct <i>protoent</i>	* <i>getprotoent</i> (void);
struct <i>servent</i>	* <i>getservbyname</i> (const char *, const char *);
struct <i>servent</i>	* <i>getservbyport</i> (int, const char *);
struct <i>servent</i>	* <i>getservent</i> (void);
void	<i>sethostent</i> (int);
void	<i>setnetent</i> (int);
void	<i>setprotoent</i> (int);

10322           void                       setservent(int);

10323           The <netdb.h> header shall define the **socklen\_t** type through **typedef**, as described in  
10324           <sys/socket.h>.

10325           Inclusion of the <netdb.h> header may also make visible all symbols from <netinet/in.h>,  
10326           <sys/socket.h>, and <inttypes.h>.

#### 10327 APPLICATION USAGE

10328           None.

#### 10329 RATIONALE

10330           None.

#### 10331 FUTURE DIRECTIONS

10332           None.

#### 10333 SEE ALSO

10334           <inttypes.h>, <netinet/in.h>, <sys/socket.h>

10335           XSH *bind()*, *endhostent()*, *endnetent()*, *endprotoent()*, *endservent()*, *freeaddrinfo()*, *gai\_strerror()*,  
10336           *getnameinfo()*

#### 10337 CHANGE HISTORY

10338           First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

10339           The Open Group Base Resolution bwg2001-009 is applied, which changes the return type for  
10340           *gai\_strerror()* from **char \*** to **const char \***. This is for coordination with the IPnG Working Group.

10341           IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/11 is applied, adding a description of the  
10342           NI\_NUMERICSCOPE macro and correcting the *getnameinfo()* function prototype. These changes  
10343           are for alignment with IPv6.

#### 10344 Issue 7

10345           SD5-XBD-ERN-14 is applied, changing the description of the *s\_port* member of the **servent**  
10346           structure.

10347           The obsolescent *h\_errno* external integer, and the obsolescent *gethostbyaddr()* and *gethostbyname()*  
10348           functions are removed, along with the HOST\_NOT\_FOUND, NO\_DATA, NO\_RECOVERY, and  
10349           TRY\_AGAIN macros.

10350           This reference page is clarified with respect to macros and symbolic constants.

10351 **NAME**10352        `netinet/in.h` — Internet address family10353 **SYNOPSIS**10354        `#include <netinet/in.h>`10355 **DESCRIPTION**10356        The `<netinet/in.h>` header shall define the following types:10357        **in\_port\_t**    Equivalent to the type **uint16\_t** as described in `<inttypes.h>`.10358        **in\_addr\_t**    Equivalent to the type **uint32\_t** as described in `<inttypes.h>`.10359        The `<netinet_in.h>` header shall define the **sa\_family\_t** type as described in `<sys/socket.h>`.10360        The `<netinet_in.h>` header shall define the **uint8\_t** and **uint32\_t** types as described in  
10361 `<inttypes.h>`. Inclusion of the `<netinet/in.h>` header may also make visible all symbols from  
10362 `<inttypes.h>` and `<sys/socket.h>`.10363        The `<netinet/in.h>` header shall define the **in\_addr** structure, which shall include at least the  
10364 following member:10365        `in_addr_t    s_addr`10366        The `<netinet/in.h>` header shall define the **sockaddr\_in** structure, which shall include at least  
10367 the following members:10368        `sa_family_t        sin_family        AF_INET.`  
10369        `in_port_t           sin_port        Port number.`  
10370        `struct in_addr       sin_addr        IP address.`10371        The `sin_port` and `sin_addr` members shall be in network byte order.10372        The **sockaddr\_in** structure is used to store addresses for the Internet address family. Pointers to  
10373 this type shall be cast by applications to **struct sockaddr \*** for use with socket functions.10374 **IPv6**        The `<netinet/in.h>` header shall define the **in6\_addr** structure, which shall include at least the  
10375 following member:10376        `uint8_t    s6_addr[16]`

10377        This array is used to contain a 128-bit IPv6 address, stored in network byte order.

10378        The `<netinet/in.h>` header shall define the **sockaddr\_in6** structure, which shall include at least  
10379 the following members:10380        `sa_family_t        sin6_family        AF_INET6.`  
10381        `in_port_t           sin6_port        Port number.`  
10382        `uint32_t           sin6_flowinfo    IPv6 traffic class and flow information.`  
10383        `struct in6_addr       sin6_addr        IPv6 address.`  
10384        `uint32_t           sin6_scope_id    Set of interfaces for a scope.`10385        The `sin6_port` and `sin6_addr` members shall be in network byte order.10386        Prior to calling a function in this standard which reads values from a **sockaddr\_in6** structure (for  
10387 example, `bind()` or `connect()`), the application shall ensure that all members of the structure,  
10388 including any additional non-standard members, if any, are initialized. If the **sockaddr\_in6**  
10389 structure has a non-standard member, and that member has a value other than the value that  
10390 would result from default initialization, the behavior of any function in this standard that reads  
10391 values from the **sockaddr\_in6** structure is implementation-defined. All functions in this  
10392 standard that return data in a **sockaddr\_in6** structure (for example, `getaddrinfo()` or `accept()`)  
10393 shall initialize the structure in a way that meets the above requirements, and shall ensure that

each non-standard member, if any, has a value that produces the same behavior as default initialization would in all functions in this standard which read values from a **sockaddr\_in6** structure.

The *sin6\_scope\_id* field is a 32-bit integer that identifies a set of interfaces as appropriate for the scope of the address carried in the *sin6\_addr* field. For a link scope *sin6\_addr*, the application shall ensure that *sin6\_scope\_id* is a link index. For a site scope *sin6\_addr*, the application shall ensure that *sin6\_scope\_id* is a site index. The mapping of *sin6\_scope\_id* to an interface or set of interfaces is implementation-defined.

The <netinet/in.h> header shall declare the following external variable:

```
const struct in6_addr in6addr_any
```

This variable is initialized by the system to contain the wildcard IPv6 address. The <netinet/in.h> header also defines the IN6ADDR\_ANY\_INIT macro. This macro must be constant at compile time and can be used to initialize a variable of type **struct in6\_addr** to the IPv6 wildcard address.

The <netinet/in.h> header shall declare the following external variable:

```
const struct in6_addr in6addr_loopback
```

This variable is initialized by the system to contain the loopback IPv6 address. The <netinet/in.h> header also defines the IN6ADDR\_LOOPBACK\_INIT macro. This macro must be constant at compile time and can be used to initialize a variable of type **struct in6\_addr** to the IPv6 loopback address.

The <netinet/in.h> header shall define the **ipv6\_mreq** structure, which shall include at least the following members:

```
struct in6_addr  ipv6mr_multiaddr  IPv6 multicast address.
unsigned        ipv6mr_interface  Interface index.
```

The <netinet/in.h> header shall define the following symbolic constants for use as values of the *level* argument of *getsockopt()* and *setsockopt()*:

IPPROTO_IP	Internet protocol.
IPPROTO_IPV6	Internet Protocol Version 6.

IPPROTO_ICMP	Control message protocol.
--------------	---------------------------

IPPROTO_RAW	Raw IP Packets Protocol.
-------------	--------------------------

IPPROTO_TCP	Transmission control protocol.
-------------	--------------------------------

IPPROTO_UDP	User datagram protocol.
-------------	-------------------------

The <netinet/in.h> header shall define the following symbolic constant for use as a local address in the structure passed to *bind()*:

INADDR_ANY	IPv4 wildcard address.
------------	------------------------

The <netinet/in.h> header shall define the following symbolic constant for use as a destination address in the structures passed to *connect()*, *sendmsg()*, and *sendto()*:

INADDR_BROADCAST	IPv4 broadcast address.
------------------	-------------------------

The <netinet/in.h> header shall define the following symbolic constant, with the value specified, to help applications declare buffers of the proper size to store IPv4 addresses in string

10434		form:
10435		INET_ADDRSTRLEN      16. Length of the string form for IP.
10436		The <i>htonl()</i> , <i>htons()</i> , <i>ntohl()</i> , and <i>ntohs()</i> functions shall be available as described in
10437		<arpa/inet.h>. Inclusion of the <netinet/in.h> header may also make visible all symbols from
10438		<arpa/inet.h>.
10439	IP6	The <netinet/in.h> header shall define the following symbolic constant, with the value
10440		specified, to help applications declare buffers of the proper size to store IPv6 addresses in string
10441		form:
10442		INET6_ADDRSTRLEN      46. Length of the string form for IPv6.
10443	IP6	The <netinet/in.h> header shall define the following symbolic constants, with distinct integer
10444		values, for use in the <i>option_name</i> argument in the <i>getsockopt()</i> or <i>setsockopt()</i> functions at
10445		protocol level IPPROTO_IPV6:
10446		IPV6_JOIN_GROUP      Join a multicast group.
10447		IPV6_LEAVE_GROUP      Quit a multicast group.
10448		IPV6_MULTICAST_HOPS
10449		Multicast hop limit.
10450		IPV6_MULTICAST_IF      Interface to use for outgoing multicast packets.
10451		IPV6_MULTICAST_LOOP
10452		Multicast packets are delivered back to the local application.
10453		IPV6_UNICAST_HOPS      Unicast hop limit.
10454		IPV6_V6ONLY            Restrict AF_INET6 socket to IPv6 communications only.
10455		The <netinet/in.h> header shall define the following macros that test for special IPv6 addresses.
10456		Each macro is of type <b>int</b> and takes a single argument of type <b>const struct in6_addr *</b> :
10457		IN6_IS_ADDR_UNSPECIFIED
10458		Unspecified address.
10459		IN6_IS_ADDR_LOOPBACK
10460		Loopback address.
10461		IN6_IS_ADDR_MULTICAST
10462		Multicast address.
10463		IN6_IS_ADDR_LINKLOCAL
10464		Unicast link-local address.
10465		IN6_IS_ADDR_SITELOCAL
10466		Unicast site-local address.
10467		IN6_IS_ADDR_V4MAPPED
10468		IPv4 mapped address.
10469		IN6_IS_ADDR_V4COMPAT
10470		IPv4-compatible address.
10471		IN6_IS_ADDR_MC_NODELOCAL
10472		Multicast node-local address.

```

10473 IN6_IS_ADDR_MC_LINKLOCAL
10474     Multicast link-local address.
10475 IN6_IS_ADDR_MC_SITELOCAL
10476     Multicast site-local address.
10477 IN6_IS_ADDR_MC_ORGLOCAL
10478     Multicast organization-local address.
10479 IN6_IS_ADDR_MC_GLOBAL
10480     Multicast global address.

```

## APPLICATION USAGE

Although applications are required to initialize all members (including any non-standard ones) of a **sockaddr\_in6** structure, the same is not required for the **sockaddr\_in** structure, since historically many applications only initialized the standard members. Despite this, applications are encouraged to initialize **sockaddr\_in** structures in a manner similar to the required initialization of **sockaddr\_in6** structures.

Although it is common practice to initialize a **sockaddr\_in6** structure using:

```

struct sockaddr_in6 sa;
memset(&sa, 0, sizeof sa);

```

this method is not portable according to this standard, because the structure can contain pointer or floating-point members that are not required to have an all-bits-zero representation after default initialization. Portable methods make use of default initialization; for example:

```

struct sockaddr_in6 sa = { 0 };

```

or:

```

static struct sockaddr_in6 sa_init;
struct sockaddr_in6 sa = sa_init;

```

A future version of this standard may require that a pointer object with an all-bits-zero representation is a null pointer, and that **sockaddr\_in6** does not have any floating-point members if a floating-point object with an all-bits-zero representation does not have the value 0.0.

## RATIONALE

The INADDR\_ANY and INADDR\_BROADCAST values are byte-order-neutral and thus their byte order is not specified. Many implementations have additional constants as extensions, such as INADDR\_LOOPBACK, that are not byte-order-neutral. Traditionally, these constants are in host byte order, requiring the use of *htonl()* when using them in a **sockaddr\_in** structure.

## FUTURE DIRECTIONS

None.

## SEE ALSO

## CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The *sin\_zero* member was removed from the **sockaddr\_in** structure as per The Open Group Base Resolution bwg2001-004.

- 10515 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/12 is applied, adding **const** qualifiers to  
 10516 the *in6addr\_any* and *in6addr\_loopback* external variables.
- 10517 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/22 is applied, making it clear which  
 10518 structure members are in network byte order.
- 10519 **Issue 7**
- 10520 This reference page is clarified with respect to macros and symbolic constants.
- 10521 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0061 [355] is applied.

10522 **NAME**

10523       netinet/tcp.h — definitions for the Internet Transmission Control Protocol (TCP)

10524 **SYNOPSIS**

10525       #include &lt;netinet/tcp.h&gt;

10526 **DESCRIPTION**10527       The <netinet/tcp.h> header shall define the following symbolic constant for use as a socket  
10528       option at the IPPROTO\_TCP level:

10529       TCP\_NODELAY   Avoid coalescing of small segments.

10530       The implementation need not allow the value of the option to be set via *setsockopt()* or retrieved  
10531       via *getsockopt()*.10532 **APPLICATION USAGE**

10533       None.

10534 **RATIONALE**

10535       None.

10536 **FUTURE DIRECTIONS**

10537       None.

10538 **SEE ALSO**

10539       &lt;sys/socket.h&gt;

10540       XSH *getsockopt()*, *setsockopt()*10541 **CHANGE HISTORY**

10542       First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

10543 **Issue 7**

10544       This reference page is clarified with respect to macros and symbolic constants.

10545 **NAME**

10546 nl\_types.h — data types

10547 **SYNOPSIS**

10548 #include &lt;nl\_types.h&gt;

10549 **DESCRIPTION**

10550 The &lt;nl\_types.h&gt; header shall define at least the following types:

10551 **nl\_catd** Used by the message catalog functions *catopen()*, *catgets()*, and *catclose()*  
 10552 to identify a catalog descriptor.

10553 **nl\_item** Used by *nl\_langinfo()* to identify items of *langinfo* data. Values of objects  
 10554 of type **nl\_item** are defined in <langinfo.h>.

10555 The &lt;nl\_types.h&gt; header shall define at least the following symbolic constants:

10556 **NL\_SETD** Used by *gencat* when no *\$set* directive is specified in a message text source  
 10557 file. This constant can be passed as the value of *set\_id* on subsequent calls  
 10558 to *catgets()* (that is, to retrieve messages from the default message set).  
 10559 The value of **NL\_SETD** is implementation-defined.

10560 **NL\_CAT\_LOCALE** Value that must be passed as the *oflag* argument to *catopen()* to ensure that  
 10561 message catalog selection depends on the *LC\_MESSAGES* locale category,  
 10562 rather than directly on the *LANG* environment variable.

10563 The following shall be declared as functions and may also be defined as macros. Function  
 10564 prototypes shall be provided.

```
10565 int      catclose(nl_catd);
10566 char     *catgets(nl_catd, int, int, const char *);
10567 nl_catd  catopen(const char *, int);
```

10568 **APPLICATION USAGE**

10569 None.

10570 **RATIONALE**

10571 None.

10579 First released in Issue 2.

10580 **Issue 7**

10581 The &lt;nl\_types.h&gt; header is moved from the XSI option to the Base.

10582 This reference page is clarified with respect to macros and symbolic constants.

10583 **NAME**

10584 poll.h — definitions for the poll() function

10585 **SYNOPSIS**

10586 #include &lt;poll.h&gt;

10587 **DESCRIPTION**10588 The <poll.h> header shall define the **pollfd** structure, which shall include at least the following  
10589 members:

10590 int fd The following descriptor being polled.

10591 short events The input event flags (see below).

10592 short revents The output event flags (see below).

10593 The <poll.h> header shall define the following type through **typedef**:10594 **nfds\_t** An unsigned integer type used for the number of file descriptors.10595 The implementation shall support one or more programming environments in which the width  
10596 of **nfds\_t** is no greater than the width of type **long**. The names of these programming  
10597 environments can be obtained using the *confstr()* function or the *getconf* utility.10598 The <poll.h> header shall define the following symbolic constants, zero or more of which may  
10599 be OR'ed together to form the *events* or *revents* members in the **pollfd** structure:

10600 POLLIN Data other than high-priority data may be read without blocking.

10601 POLLRDNORM Normal data may be read without blocking.

10602 POLLRDBAND Priority data may be read without blocking.

10603 POLLPRI High priority data may be read without blocking.

10604 POLLOUT Normal data may be written without blocking.

10605 POLLWRNORM Equivalent to POLLOUT.

10606 POLLWRBAND Priority data may be written.

10607 POLLERR An error has occurred (*revents* only).10608 POLLHUP Device has been disconnected (*revents* only).10609 POLLNVAL Invalid *fd* member (*revents* only).10610 The significance and semantics of normal, priority, and high-priority data are file and device-  
10611 specific.10612 The following shall be declared as a function and may also be defined as a macro. A function  
10613 prototype shall be provided.

10614 int poll(struct pollfd [], nfds\_t, int);

10615 **APPLICATION USAGE**

10616 None.

10624 **CHANGE HISTORY**

10625 First released in Issue 4, Version 2.

10626 **Issue 6**

10627 The description of the symbolic constants is updated to match the *poll()* function.

10628 Text related to STREAMS has been moved to the *poll()* reference page.

10629 A note is added to the DESCRIPTION regarding the significance and semantics of normal,  
10630 priority, and high-priority data.

10631 **Issue 7**

10632 The <poll.h> header is moved from the XSI option to the Base.

10633 **NAME**

10634 pthread.h — threads

10635 **SYNOPSIS**

10636 #include &lt;pthread.h&gt;

10637 **DESCRIPTION**

10638 The &lt;pthread.h&gt; header shall define the following symbolic constants:

10639 PTHREAD\_BARRIER\_SERIAL\_THREAD  
 10640 PTHREAD\_CANCEL\_ASYNCHRONOUS  
 10641 PTHREAD\_CANCEL\_ENABLE  
 10642 PTHREAD\_CANCEL\_DEFERRED  
 10643 PTHREAD\_CANCEL\_DISABLE  
 10644 PTHREAD\_CANCELED  
 10645 PTHREAD\_CREATE\_DETACHED  
 10646 PTHREAD\_CREATE\_JOINABLE  
 10647 TPS PTHREAD\_EXPLICIT\_SCHED  
 10648 PTHREAD\_INHERIT\_SCHED  
 10649 PTHREAD\_MUTEX\_DEFAULT  
 10650 PTHREAD\_MUTEX\_ERRORCHECK  
 10651 PTHREAD\_MUTEX\_NORMAL  
 10652 PTHREAD\_MUTEX\_RECURSIVE  
 10653 PTHREAD\_MUTEX\_ROBUST  
 10654 PTHREAD\_MUTEX\_STALLED  
 10655 PTHREAD\_ONCE\_INIT  
 10656 RPI | TPI PTHREAD\_PRIO\_INHERIT  
 10657 MC1 PTHREAD\_PRIO\_NONE  
 10658 RPP | TPP PTHREAD\_PRIO\_PROTECT  
 10659 PTHREAD\_PROCESS\_SHARED  
 10660 PTHREAD\_PROCESS\_PRIVATE  
 10661 TPS PTHREAD\_SCOPE\_PROCESS  
 10662 PTHREAD\_SCOPE\_SYSTEM

10663 The <pthread.h> header shall define the following compile-time constant expressions valid as  
 10664 initializers for the following types:

Name	Initializer for Type
PTHREAD_COND_INITIALIZER	pthread_cond_t
PTHREAD_MUTEX_INITIALIZER	pthread_mutex_t
PTHREAD_RWLOCK_INITIALIZER	pthread_rwlock_t

10669 The <pthread.h> header shall define the pthread\_attr\_t, pthread\_barrier\_t,  
 10670 pthread\_barrierattr\_t, pthread\_cond\_t, pthread\_condattr\_t, pthread\_key\_t, pthread\_mutex\_t,  
 10671 pthread\_mutexattr\_t, pthread\_once\_t, pthread\_rwlock\_t, pthread\_rwlockattr\_t,  
 10672 pthread\_spinlock\_t, and pthread\_t types as described in <sys/types.h>.

10673 The following shall be declared as functions and may also be defined as macros. Function  
 10674 prototypes shall be provided.

```
10675 int pthread_atfork(void (*)(void), void (*)(void),
10676                  void (*)(void));
10677 int pthread_attr_destroy(pthread_attr_t *);
10678 int pthread_attr_getdetachstate(const pthread_attr_t *, int *);
10679 int pthread_attr_getguardsize(const pthread_attr_t *restrict,
```

```

10680         size_t *restrict);
10681 TPS    int    pthread_attr_getinheritsched(const pthread_attr_t *restrict,
10682         int *restrict);
10683         int    pthread_attr_getschedparam(const pthread_attr_t *restrict,
10684         struct sched_param *restrict);
10685 TPS    int    pthread_attr_getschedpolicy(const pthread_attr_t *restrict,
10686         int *restrict);
10687         int    pthread_attr_getscope(const pthread_attr_t *restrict,
10688         int *restrict);
10689 TSA TSS int    pthread_attr_getstack(const pthread_attr_t *restrict,
10690         void **restrict, size_t *restrict);
10691 TSS    int    pthread_attr_getstacksize(const pthread_attr_t *restrict,
10692         size_t *restrict);
10693         int    pthread_attr_init(pthread_attr_t *);
10694         int    pthread_attr_setdetachstate(pthread_attr_t *, int);
10695         int    pthread_attr_setguardsize(pthread_attr_t *, size_t);
10696 TPS    int    pthread_attr_setinheritsched(pthread_attr_t *, int);
10697         int    pthread_attr_setschedparam(pthread_attr_t *restrict,
10698         const struct sched_param *restrict);
10699 TPS    int    pthread_attr_setschedpolicy(pthread_attr_t *, int);
10700         int    pthread_attr_setscope(pthread_attr_t *, int);
10701 TSA TSS int    pthread_attr_setstack(pthread_attr_t *, void *, size_t);
10702 TSS    int    pthread_attr_setstacksize(pthread_attr_t *, size_t);

## CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

### Issue 6

The RTT margin markers are broken out into their POSIX options.

The Open Group Corrigendum U021/9 is applied, correcting the prototype for the *pthread\_cond\_wait()* function.

The Open Group Corrigendum U026/2 is applied, correcting the prototype for the *pthread\_setschedparam()* function so that its second argument is of type **int**.

The *pthread\_getcpuclockid()* and *pthread\_mutex\_timedlock()* functions are added for alignment with IEEE Std 1003.1d-1999.

The following functions are added for alignment with IEEE Std 1003.1j-2000:

*pthread\_barrier\_destroy(), pthread\_barrier\_init(), pthread\_barrier\_wait(), pthread\_barrierattr\_destroy(), pthread\_barrierattr\_getpshared(), pthread\_barrierattr\_init(), pthread\_barrierattr\_setpshared(), pthread\_condattr\_getclock(), pthread\_condattr\_setclock(), pthread\_rwlock\_timedrdlock(), pthread\_rwlock\_timedwrlock(), pthread\_spin\_destroy(), pthread\_spin\_init(), pthread\_spin\_lock(), pthread\_spin\_trylock(), and pthread\_spin\_unlock()*.

PTHREAD\_RWLOCK\_INITIALIZER is removed for alignment with IEEE Std 1003.1j-2000.

Functions previously marked as part of the Read-Write Locks option are now moved to the Threads option.

The **restrict** keyword is added to the prototypes for *pthread\_attr\_getguardsize(), pthread\_attr\_getinheritsched(), pthread\_attr\_getschedparam(), pthread\_attr\_getschedpolicy(), pthread\_attr\_getscope(), pthread\_attr\_getstackaddr(), pthread\_attr\_getstacksize(), pthread\_attr\_setschedparam(), pthread\_barrier\_init(), pthread\_barrierattr\_getpshared(), pthread\_cond\_init(), pthread\_cond\_signal(), pthread\_cond\_timedwait(), pthread\_cond\_wait(), pthread\_condattr\_getclock(), pthread\_condattr\_getpshared(), pthread\_create(), pthread\_getschedparam(), pthread\_mutex\_getprioceiling(), pthread\_mutex\_init(), pthread\_mutex\_setprioceiling(), pthread\_mutexattr\_getprioceiling(), pthread\_mutexattr\_getprotocol(), pthread\_mutexattr\_getpshared(), pthread\_mutexattr\_gettype(), pthread\_rwlock\_init(), pthread\_rwlock\_timedrdlock(), pthread\_rwlock\_timedwrlock(), pthread\_rwlockattr\_getpshared(), and pthread\_sigmask()*.

IEEE PASC Interpretation 1003.1 #86 is applied, allowing the symbols from <sched.h> and <time.h> to be made visible when <pthread.h> is included. Previously this was an XSI option.

IEEE PASC Interpretation 1003.1c #42 is applied, removing the requirement for prototypes for the *pthread\_kill()* and *pthread\_sigmask()* functions. These are required to be in the <signal.h> header. They are allowed here through the name space rules.

IEEE PASC Interpretation 1003.1 #96 is applied, adding the *pthread\_setschedprio()* function.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/13 is applied, correcting shading errors that were in contradiction with the System Interfaces volume of POSIX.1-2008.

**Issue 7**

SD5-XBD-ERN-55 is applied, adding the **restrict** keyword to the *pthread\_mutex\_timedlock()* function prototype.

SD5-XBD-ERN-62 is applied.

Austin Group Interpretation 1003.1-2001 #048 is applied, reinstating the PTHREAD\_RWLOCK\_INITIALIZER symbol.

The <pthread.h> header is moved from the Threads option to the Base.

The following extended mutex types are moved from the XSI option to the Base:

```
PTHREAD_MUTEX_NORMAL
PTHREAD_MUTEX_ERRORCHECK
PTHREAD_MUTEX_RECURSIVE
PTHREAD_MUTEX_DEFAULT
```

The PTHREAD\_MUTEX\_ROBUST and PTHREAD\_MUTEX\_STALLED symbols and the *pthread\_mutex\_consistent()*, *pthread\_mutexattr\_getrobust()*, and *pthread\_mutexattr\_setrobust()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to the Thread Priority Protection and Thread Priority Inheritance options is changed to be Non-Robust Mutex or Robust Mutex Priority Protection and Non-Robust Mutex or Robust Mutex Priority Inheritance, respectively.

This reference page is clarified with respect to macros and symbolic constants.

10895 **NAME**

10896       pwd.h — password structure

10897 **SYNOPSIS**

10898       #include &lt;pwd.h&gt;

10899 **DESCRIPTION**10900       The <pwd.h> header shall define the **struct passwd**, structure, which shall include at least the  
10901       following members:

10902	char	*pw_name	User's login name.
10903	uid_t	pw_uid	Numerical user ID.
10904	gid_t	pw_gid	Numerical group ID.
10905	char	*pw_dir	Initial working directory.
10906	char	*pw_shell	Program to use as shell.

10907       The <pwd.h> header shall define the **gid\_t**, **uid\_t**, and **size\_t** types as described in  
10908       <sys/types.h>.10909       The following shall be declared as functions and may also be defined as macros. Function  
10910       prototypes shall be provided.

10911	XSI	void	endpwent(void);
10912		struct passwd *	getpwent(void);
10913		struct passwd *	getpwnam(const char *);
10914		int	getpwnam_r(const char *, struct passwd *, char *,
10915			size_t, struct passwd **);
10916		struct passwd *	getpwuid(uid_t);
10917		int	getpwuid_r(uid_t, struct passwd *, char *,
10918			size_t, struct passwd **);
10919	XSI	void	setpwent(void);

10927       &lt;sys/types.h&gt;

10928       XSH *endpwent()*, *getpwnam()*, *getpwuid()*10929 **CHANGE HISTORY**

10930       First released in Issue 1.

10931 **Issue 5**

10932       The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

10933 **Issue 6**10934       The following new requirements on POSIX implementations derive from alignment with the  
10935       Single UNIX Specification:

- 10936
- The **gid\_t** and **uid\_t** types are mandated.

- 10937
- 10938
- The `getpwnam_r()` and `getpwuid_r()` functions are marked as part of the Thread-Safe Functions option.
- 10939 **Issue 7**
- 10940 SD5-XBD-ERN-56 is applied, adding a reference to `<sys/types.h>` for the `size_t` type.

10941 **NAME**

10942       regex.h — regular expression matching types

10943 **SYNOPSIS**

10944       #include &lt;regex.h&gt;

10945 **DESCRIPTION**10946       The <regex.h> header shall define the structures and symbolic constants used by the *regcomp()*,  
10947       *regexexec()*, *regerror()*, and *regfree()* functions.10948       The <regex.h> header shall define the **regex\_t** structure type, which shall include at least the  
10949       following member:

10950       size\_t       re\_nsub       Number of parenthesized subexpressions.

10951       The <regex.h> header shall define the **size\_t** type as described in <sys/types.h>.10952       The <regex.h> header shall define the **regoff\_t** type as a signed integer type that can hold the  
10953       largest value that can be stored in either a **ptrdiff\_t** type or a **ssize\_t** type.10954       The <regex.h> header shall define the **regmatch\_t** structure type, which shall include at least the  
10955       following members:

10956	regoff_t	rm_so	Byte offset from start of string
10957			to start of substring.
10958	regoff_t	rm_eo	Byte offset from start of string of the
10959			first character after the end of substring.

10960       The <regex.h> header shall define the following symbolic constants for the *cflags* parameter to  
10961       the *regcomp()* function:

10962	REG_EXTENDED	Use Extended Regular Expressions.
10963	REG_ICASE	Ignore case in match.
10964	REG_NOSUB	Report only success or fail in <i>regexexec()</i> .
10965	REG_NEWLINE	Change the handling of <newline>.

10966       The <regex.h> header shall define the following symbolic constants for the *eflags* parameter to  
10967       the *regexexec()* function:

10968	REG_NOTBOL	The <circumflex> character ('^'), when taken as a special character, does
10969		not match the beginning of <i>string</i> .
10970	REG_NOTEOL	The <dollar-sign> ('\$'), when taken as a special character, does not
10971		match the end of <i>string</i> .

10972       The &lt;regex.h&gt; header shall define the following symbolic constants as error return values:

10973	REG_NOMATCH	<i>regexexec()</i> failed to match.
10974	REG_BADPAT	Invalid regular expression.
10975	REG_ECOLLATE	Invalid collating element referenced.
10976	REG_ETYPE	Invalid character class type referenced.
10977	REG_EESCAPE	Trailing <backslash> character in pattern.
10978	REG_ESUBREG	Number in \digit invalid or in error.

10979	REG_EBRACK	" [ ] " imbalance.
10980	REG_EPAREN	" \ ( \ ) " or " ( ) " imbalance.
10981	REG_EBRACE	" \ { \ } " imbalance.
10982	REG_BADBR	Content of " \ { \ } " invalid: not a number, number too large, more than
10983		two numbers, first larger than second.
10984	REG_ERANGE	Invalid endpoint in range expression.
10985	REG_ESPACE	Out of memory.
10986	REG_BADRPT	' ? ', ' * ', or ' + ' not preceded by valid regular expression.
10987	The following shall be declared as functions and may also be defined as macros. Function	
10988	prototypes shall be provided.	
10989	<code>int regcomp(regex_t *restrict, const char *restrict, int);</code>	
10990	<code>size_t regerror(int, const regex_t *restrict, char *restrict, size_t);</code>	
10991	<code>int regexec(const regex_t *restrict, const char *restrict, size_t,</code>	
10992	<code>regmatch_t [restrict], int);</code>	
10993	<code>void regfree(regex_t *);</code>	
10994	The implementation may define additional macros or constants using names beginning with	
10995	REG_.	
10996	<b>APPLICATION USAGE</b>	
10997	None.	
10998	<b>RATIONALE</b>	
10999	None.	
11000	<b>FUTURE DIRECTIONS</b>	
11001	None.	
11002	<b>SEE ALSO</b>	
11003	<a href="#">&lt;sys/types.h&gt;</a>	
11004	XSH <a href="#">regcomp()</a>	
11005	<b>CHANGE HISTORY</b>	
11006	First released in Issue 4.	
11007	Originally derived from the ISO POSIX-2 standard.	
11008	<b>Issue 6</b>	
11009	The REG_ENOSYS constant is marked obsolescent.	
11010	The <b>restrict</b> keyword is added to the prototypes for <i>regcomp()</i> , <i>regerror()</i> , and <i>regexec()</i> .	
11011	A statement is added that the <b>size_t</b> type is defined as described in <a href="#">&lt;sys/types.h&gt;</a> .	
11012	<b>Issue 7</b>	
11013	SD5-XBD-ERN-60 is applied.	
11014	The obsolescent REG_ENOSYS constant is removed.	
11015	This reference page is clarified with respect to macros and symbolic constants.	

11016 **NAME**

11017 sched.h — execution scheduling

11018 **SYNOPSIS**

11019 #include &lt;sched.h&gt;

11020 **DESCRIPTION**11021 PS The <sched.h> header shall define the **pid\_t** type as described in <sys/types.h>.11022 SS|TSP The <sched.h> header shall define the **time\_t** type as described in <sys/types.h>.11023 The <sched.h> header shall define the **timespec** structure as described in <time.h>.

11024 The <sched.h> header shall define the **sched\_param** structure, which shall include the  
 11025 scheduling parameters required for implementation of each supported scheduling policy. This  
 11026 structure shall include at least the following member:

11027 int sched\_priority Process or thread execution scheduling priority.

11028 SS|TSP The **sched\_param** structure defined in <sched.h> shall include the following members in  
 11029 addition to those specified above:

11030 int sched\_ss\_low\_priority Low scheduling priority for  
 11031 sporadic server.

11032 struct timespec sched\_ss\_repl\_period Replenishment period for  
 11033 sporadic server.

11034 struct timespec sched\_ss\_init\_budget Initial budget for sporadic server.

11035 int sched\_ss\_max\_repl Maximum pending replenishments for  
 11036 sporadic server.

11037 Each process or thread is controlled by an associated scheduling policy and priority. Associated  
 11038 with each policy is a priority range. Each policy definition specifies the minimum priority range  
 11039 for that policy. The priority ranges for each policy may overlap the priority ranges of other  
 11040 policies.

11041 Four scheduling policies are defined; others may be defined by the implementation. The four  
 11042 standard policies are indicated by the values of the following symbolic constants:

11043 PS|TPS **SCHED\_FIFO** First in-first out (FIFO) scheduling policy.

11044 PS|TPS **SCHED\_RR** Round robin scheduling policy.

11045 SS|TSP **SCHED\_SPORADIC** Sporadic server scheduling policy.

11046 PS|TPS **SCHED\_OTHER** Another scheduling policy.

11047 The values of these constants are distinct.

11048 The following shall be declared as functions and may also be defined as macros. Function  
 11049 prototypes shall be provided.

11050 PS|TPS int sched\_get\_priority\_max(int);

11051 int sched\_get\_priority\_min(int);

11052 PS int sched\_getparam(pid\_t, struct sched\_param \*);

11053 int sched\_getscheduler(pid\_t);

11054 PS|TPS int sched\_rr\_get\_interval(pid\_t, struct timespec \*);

11055 PS int sched\_setparam(pid\_t, const struct sched\_param \*);

11056 int sched\_setscheduler(pid\_t, int, const struct sched\_param \*);

11057 int sched\_yield(void);

11058 Inclusion of the <sched.h> header may make visible all symbols from the <time.h> header.

11059 **APPLICATION USAGE**

11060 None.

11061 **RATIONALE**

11062 None.

11063 **FUTURE DIRECTIONS**

11064 None.

11065 **SEE ALSO**

11066 <sys/types.h>, <time.h>

11067 XSH *sched\_get\_priority\_max()*, *sched\_getparam()*, *sched\_getscheduler()*, *sched\_rr\_get\_interval()*,  
11068 *sched\_setparam()*, *sched\_setscheduler()*, *sched\_yield()*

11069 **CHANGE HISTORY**

11070 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

11071 **Issue 6**

11072 The <sched.h> header is marked as part of the Process Scheduling option.

11073 Sporadic server members are added to the **sched\_param** structure, and the SCHED\_SPORADIC  
11074 scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

11075 IEEE PASC Interpretation 1003.1 #108 is applied, correcting the **sched\_param** structure whose  
11076 members *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* should be type **struct timespec** and not  
11077 **timespec**.

11078 Symbols from <time.h> may be made visible when <sched.h> is included.

11079 IEEE Std 1003.1-2001/Cor 1-2002, items XSH/TC1/D6/52 and XSH/TC1/D6/53 are applied,  
11080 aligning the function prototype shading and margin codes with the System Interfaces volume of  
11081 IEEE Std 1003.1-2001.

11082 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/23 is applied, updating the  
11083 DESCRIPTION to differentiate between thread and process execution.

11084 **Issue 7**

11085 SD5-XBD-ERN-13 is applied.

11086 Austin Group Interpretation 1003.1-2001 #064 is applied, correcting the options markings.

11087 The <sched.h> headers is moved from the Threads option to the Base.

11088 Declarations for the **pid\_t** and **time\_t** types and the **timespec** structure are added.

11089 **NAME**

11090 search.h — search tables

11091 **SYNOPSIS**11092 XSI `#include <search.h>`11093 **DESCRIPTION**

11094 The <search.h> header shall define the **ENTRY** type for structure **entry** which shall include the  
 11095 following members:

```
11096 char    *key
11097 void     *data
```

11098 and shall define **ACTION** and **VISIT** as enumeration data types through type definitions as  
 11099 follows:

```
11100 enum { FIND, ENTER } ACTION;
11101 enum { preorder, postorder, endorder, leaf } VISIT;
```

11102 The <search.h> header shall define the **size\_t** type as described in <sys/types.h>.

11103 The following shall be declared as functions and may also be defined as macros. Function  
 11104 prototypes shall be provided.

```
11105 int      hcreate(size_t);
11106 void     hdestroy(void);
11107 ENTRY *hsearch(ENTRY, ACTION);
11108 void     insque(void *, void *);
11109 void     *lfind(const void *, const void *, size_t *,
11110               size_t, int (*)(const void *, const void *));
11111 void     *lsearch(const void *, void *, size_t *,
11112               size_t, int (*)(const void *, const void *));
11113 void     remque(void *);
11114 void     *tdelete(const void *restrict, void **restrict,
11115               int (*)(const void *, const void *));
11116 void     *tfind(const void *, void *const *,
11117               int (*)(const void *, const void *));
11118 void     *tsearch(const void *, void **,
11119               int (*)(const void *, const void *));
11120 void     twalk(const void *,
11121               void (*)(const void *, VISIT, int ));
```

11122 **APPLICATION USAGE**

11123 None.

11124 **RATIONALE**

11125 None.

11126 **FUTURE DIRECTIONS**

11127 None.

11128 **SEE ALSO**11129 [<sys/types.h>](#)11130 XSH [hcreate\(\)](#), [insque\(\)](#), [lsearch\(\)](#), [tdelete\(\)](#)

11131 **CHANGE HISTORY**

11132 First released in Issue 1. Derived from Issue 1 of the SVID.

11133 **Issue 6**

11134 The Open Group Corrigendum U021/6 is applied, updating the prototypes for *tdelete()* and  
11135 *tsearch()*.

11136 The **restrict** keyword is added to the prototype for *tdelete()*.

11137 **NAME**

11138 semaphore.h — semaphores

11139 **SYNOPSIS**

11140 #include &lt;semaphore.h&gt;

11141 **DESCRIPTION**

11142 The <semaphore.h> header shall define the **sem\_t** type, used in performing semaphore  
 11143 operations. The semaphore may be implemented using a file descriptor, in which case  
 11144 applications are able to open up at least a total of {OPEN\_MAX} files and semaphores.

11145 The <semaphore.h> header shall define the symbolic constant SEM\_FAILED which shall have  
 11146 type **sem\_t** \*.

11147 The following shall be declared as functions and may also be defined as macros. Function  
 11148 prototypes shall be provided.

```

11149 int    sem_close(sem_t *);
11150 int    sem_destroy(sem_t *);
11151 int    sem_getvalue(sem_t *restrict, int *restrict);
11152 int    sem_init(sem_t *, int, unsigned);
11153 sem_t *sem_open(const char *, int, ...);
11154 int    sem_post(sem_t *);
11155 int    sem_timedwait(sem_t *restrict, const struct timespec *restrict);
11156 int    sem_trywait(sem_t *);
11157 int    sem_unlink(const char *);
11158 int    sem_wait(sem_t *);

```

11159 Inclusion of the <semaphore.h> header may make visible symbols defined in the <fcntl.h> and  
 11160 <time.h> headers.

11161 **APPLICATION USAGE**

11162 None.

11163 **RATIONALE**

11164 None.

11165 **FUTURE DIRECTIONS**

11166 None.

11167 **SEE ALSO**

11168 &lt;fcntl.h&gt;, &lt;sys/types.h&gt;, &lt;time.h&gt;

11169 XSH *sem\_close()*, *sem\_destroy()*, *sem\_getvalue()*, *sem\_init()*, *sem\_open()*, *sem\_post()*,  
 11170 *sem\_timedwait()*, *sem\_trywait()*, *sem\_unlink()*

11171 **CHANGE HISTORY**

11172 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

11173 **Issue 6**

11174 The &lt;semaphore.h&gt; header is marked as part of the Semaphores option.

11175 The Open Group Corrigendum U021/3 is applied, adding a description of SEM\_FAILED.

11176 The *sem\_timedwait()* function is added for alignment with IEEE Std 1003.1d-1999.11177 The **restrict** keyword is added to the prototypes for *sem\_getvalue()* and *sem\_timedwait()*.

11178 **Issue 7**

11179 SD5-XBD-ERN-57 is applied, allowing the header to make visible symbols from the **<time.h>**  
11180 header.

11181 The **<semaphore.h>** header is moved from the Semaphores option to the Base.

11182 This reference page is clarified with respect to macros and symbolic constants.

11183 **NAME**

11184 setjmp.h — stack environment declarations

11185 **SYNOPSIS**

11186 #include &lt;setjmp.h&gt;

11187 **DESCRIPTION**

11188 CX Some of the functionality described on this reference page extends the ISO C standard.  
 11189 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to  
 11190 enable the visibility of these symbols in this header.

11191 CX The <setjmp.h> header shall define the array types **jmp\_buf** and **sigjmp\_buf**.

11192 The following shall be declared as functions and may also be defined as macros. Function  
 11193 prototypes shall be provided.

11194 OB XSI void \_longjmp(jmp\_buf, int);

11195 void longjmp(jmp\_buf, int);

11196 CX void siglongjmp(sigjmp\_buf, int);

11197 The following may be declared as functions, or defined as macros, or both. If functions are  
 11198 declared, function prototypes shall be provided.

11199 OB XSI int \_setjmp(jmp\_buf);

11200 int setjmp(jmp\_buf);

11201 CX int sigsetjmp(sigjmp\_buf, int);

11202 **APPLICATION USAGE**

11203 None.

11204 **RATIONALE**

11205 None.

11206 **FUTURE DIRECTIONS**

11207 None.

11208 **SEE ALSO**11209 XSH [Section 2.2](#) (on page 472), [\\_longjmp\(\)](#), [longjmp\(\)](#), [setjmp\(\)](#), [siglongjmp\(\)](#), [sigsetjmp\(\)](#)11210 **CHANGE HISTORY**

11211 First released in Issue 1.

11212 **Issue 6**

11213 Extensions beyond the ISO C standard are marked.

11214 **Issue 7**

11215 SD5-XBD-ERN-6 is applied.

11216 **NAME**

11217       signal.h — signals

11218 **SYNOPSIS**

11219       #include &lt;signal.h&gt;

11220 **DESCRIPTION**

11221 CX       Some of the functionality described on this reference page extends the ISO C standard.  
 11222       Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to  
 11223       enable the visibility of these symbols in this header.

11224       The <signal.h> header shall define the following macros, which shall expand to constant  
 11225       expressions with distinct values that have a type compatible with the second argument to, and  
 11226       the return value of, the *signal()* function, and whose values shall compare unequal to the  
 11227       address of any declarable function.

11228       SIG\_DFL               Request for default signal handling.

11229       SIG\_ERR               Return value from *signal()* in case of error.

11230 OB XSI   SIG\_HOLD       Request that signal be held.

11231       SIG\_IGN               Request that signal be ignored.

11232 CX       The <signal.h> header shall define the **pthread\_t**, **size\_t**, and **uid\_t** types as described in  
 11233       <sys/types.h>.

11234       The <signal.h> header shall define the **timespec** structure as described in <time.h>.

11235       The <signal.h> header shall define the following data types:

11236       **sig\_atomic\_t**       Possibly volatile-qualified integer type of an object that can be accessed as  
 11237       an atomic entity, even in the presence of asynchronous interrupts.

11238 CX       **sigset\_t**       Integer or structure type of an object used to represent sets of signals.

11239 CX       **pid\_t**           As described in <sys/types.h>.

11240 CX       The <signal.h> header shall define the **pthread\_attr\_t** type as described in <sys/types.h>.

11241       The <signal.h> header shall define the **sigevent** structure, which shall include at least the  
 11242       following members:

11243	int	sigev_notify	Notification type.
11244	int	sigev_signo	Signal number.
11245	union sigval	sigev_value	Signal value.
11246	void	(*sigev_notify_function)(union sigval)	Notification function.
11247			
11248	pthread_attr_t *	sigev_notify_attributes	Notification attributes.

11249       The <signal.h> header shall define the following symbolic constants for the values of  
 11250       *sigev\_notify*:

11251       SIGEV\_NONE       No asynchronous notification is delivered when the event of interest  
 11252       occurs.

11253       SIGEV\_SIGNAL      A queued signal, with an application-defined value, is generated when  
 11254       the event of interest occurs.

11255       SIGEV\_THREAD      A notification function is called to perform notification.

11256 The **signal** union shall be defined as:

11257     int     sival\_int     Integer signal value.

11258     void   \*sival\_ptr     Pointer signal value.

11259 The <**signal.h**> header shall declare the SIGRTMIN and SIGRTMAX macros, which shall expand

11260 to positive integer expressions with type **int**, but which need not be constant expressions. These

11261 macros specify a range of signal numbers that are reserved for application use and for which the

11262 realtime signal behavior specified in this volume of POSIX.1-2008 is supported. The signal

11263 numbers in this range do not overlap any of the signals specified in the following table.

11264 The range SIGRTMIN through SIGRTMAX inclusive shall include at least {RTSIG\_MAX} signal

11265 numbers.

11266 It is implementation-defined whether realtime signal behavior is supported for other signals.

11267 The <**signal.h**> header shall define the following macros that are used to refer to the signals that

11268 occur in the system. Signals defined here begin with the letters SIG followed by an uppercase

11269 letter. The macros shall expand to positive integer constant expressions with type **int** and

11270 distinct values. The value 0 is reserved for use as the null signal (see *kill()*). Additional

11271 implementation-defined signals may occur in the system.

11272 The ISO C standard only requires the signal names SIGABRT, SIGFPE, SIGILL, SIGINT, |

11273 SIGSEGV, and SIGTERM to be defined. An implementation need not generate any of these six |

11274 CX signals, except as a result of explicit use of interfaces that generate signals, such as *raise()*, *kill()*, |

11275 the General Terminal Interface (see [Section 11.1.9](#), on page 204), and the *kill* utility, unless |

11276 otherwise stated (see, for example, XSH [Section 2.8.3.3](#), on page 505).

11277 The following signals shall be supported on all implementations (default actions are explained

11278 below the table):

	Signal	Default Action	Description
11279			
11280	SIGABRT	A	Process abort signal.
11281	SIGALRM	T	Alarm clock.
11282	SIGBUS	A	Access to an undefined portion of a memory object.
11283	SIGCHLD	I	Child process terminated, stopped,
11284	XSI		or continued.
11285	SIGCONT	C	Continue executing, if stopped.
11286	SIGFPE	A	Erroneous arithmetic operation.
11287	SIGHUP	T	Hangup.
11288	SIGILL	A	Illegal instruction.
11289	SIGINT	T	Terminal interrupt signal.
11290	SIGKILL	T	Kill (cannot be caught or ignored).
11291	SIGPIPE	T	Write on a pipe with no one to read it.
11292	SIGQUIT	A	Terminal quit signal.
11293	SIGSEGV	A	Invalid memory reference.
11294	SIGSTOP	S	Stop executing (cannot be caught or ignored).
11295	SIGTERM	T	Termination signal.
11296	SIGTSTP	S	Terminal stop signal.
11297	SIGTTIN	S	Background process attempting read.
11298	SIGTTOU	S	Background process attempting write.
11299	SIGUSR1	T	User-defined signal 1.
11300	SIGUSR2	T	User-defined signal 2.
11301	OB XSR	T	Pollable event.
11302	OB XSI	T	Profiling timer expired.
11303	XSI	A	Bad system call.
11304		A	Trace/breakpoint trap.
11305	SIGURG	I	High bandwidth data is available at a socket.
11306	XSI	T	Virtual timer expired.
11307		A	CPU time limit exceeded.
11308		A	File size limit exceeded.

11309 The default actions are as follows:

- 11310 T Abnormal termination of the process.
- 11311 XSI A Abnormal termination of the process with additional actions.
- 11312 I Ignore the signal.
- 11313 S Stop the process.
- 11314 C Continue the process, if it is stopped; otherwise, ignore the signal.

11315 The effects on the process in each case are described in XSH [Section 2.4.3](#) (on page 490).

11316 CX The <signal.h> header shall declare the **sigaction** structure, which shall include at least the

11317 following members:

```

11318 void    (*sa_handler)(int)  Pointer to a signal-catching function
11319                                or one of the SIG_IGN or SIG_DFL.
11320 sigset_t sa_mask            Set of signals to be blocked during execution
11321                                of the signal handling function.
11322 int      sa_flags            Special flags.
11323 void    (*sa_sigaction)(int, siginfo_t *, void *)
11324                                Pointer to a signal-catching function.
```

11325 CX The storage occupied by *sa\_handler* and *sa\_sigaction* may overlap, and a conforming application  
11326 shall not use both simultaneously.

11327 The <signal.h> header shall define the following macros which shall expand to integer constant  
11328 expressions that need not be usable in **#if** preprocessing directives:

11329 CX **SIG\_BLOCK** The resulting set is the union of the current set and the signal set pointed  
11330 to by the argument *set*.

11331 CX **SIG\_UNBLOCK** The resulting set is the intersection of the current set and the complement  
11332 of the signal set pointed to by the argument *set*.

11333 CX **SIG\_SETMASK** The resulting set is the signal set pointed to by the argument *set*.

11334 The <signal.h> header shall also define the following symbolic constants:

11335 CX **SA\_NOCLDSTOP** Do not generate SIGCHLD when children stop  
11336 XSI or stopped children continue.

11337 XSI **SA\_ONSTACK** Causes signal delivery to occur on an alternate stack.

11338 CX **SA\_RESETHAND** Causes signal dispositions to be set to SIG\_DFL on entry to signal  
11339 handlers.

11340 CX **SA\_RESTART** Causes certain functions to become restartable.

11341 CX **SA\_SIGINFO** Causes extra information to be passed to signal handlers at the time of  
11342 receipt of a signal.

11343 XSI **SA\_NOCLDWAIT** Causes implementations not to create zombie processes or status  
11344 information on child termination. See *sigaction()*.

11345 CX **SA\_NODEFER** Causes signal not to be automatically blocked on entry to signal handler.

11346 XSI **SS\_ONSTACK** Process is executing on an alternate signal stack.

11347 XSI **SS\_DISABLE** Alternate signal stack is disabled.

11348 XSI **MINSIGSTKSZ** Minimum stack size for a signal handler.

11349 XSI **SIGSTKSZ** Default size in bytes for the alternate signal stack.

11350 CX The <signal.h> header shall define the **mcontext\_t** type through **typedef**.

11351 CX The <signal.h> header shall define the **ucontext\_t** type as a structure that shall include at least  
11352 the following members:

11353	<b>ucontext_t</b>	<b>*uc_link</b>	Pointer to the context that is resumed
11354			when this context returns.
11355	<b>sigset_t</b>	<b>uc_sigmask</b>	The set of signals that are blocked when this
11356			context is active.
11357	<b>stack_t</b>	<b>uc_stack</b>	The stack used by this context.
11358	<b>mcontext_t</b>	<b>uc_mcontext</b>	A machine-specific representation of the saved
11359			context.

11360 The <signal.h> header shall define the **stack\_t** type as a structure, which shall include at least  
11361 the following members:

11362	<b>void</b>	<b>*ss_sp</b>	Stack base or pointer.
11363	<b>size_t</b>	<b>ss_size</b>	Stack size.
11364	<b>int</b>	<b>ss_flags</b>	Flags.

11365	CX	The <signal.h> header shall define the <b>siginfo_t</b> type as a structure, which shall include at least		
11366		the following members:		
11367	CX	int	si_signo	Signal number.
11368		int	si_code	Signal code.
11369	XSI	int	si_errno	If non-zero, an <i>errno</i> value associated with
11370				this signal, as described in <errno.h>.
11371	CX	pid_t	si_pid	Sending process ID.
11372		uid_t	si_uid	Real user ID of sending process.
11373		void	*si_addr	Address of faulting instruction.
11374		int	si_status	Exit value or signal.
11375	OB XSR	long	si_band	Band event for SIGPOLL.
11376	CX	union sigval	si_value	Signal value.
11377	CX	The <signal.h> header shall define the symbolic constants in the <b>Code</b> column of the following		
11378		table for use as values of <i>si_code</i> that are signal-specific or non-signal-specific reasons why the		
11379		signal was generated.		

Signal	Code	Reason
CX	SIGILL	ILL_ILLOPC Illegal opcode. ILL_ILLOPN Illegal operand. ILL_ILLADR Illegal addressing mode. ILL_ILLTRP Illegal trap. ILL_PRVOPC Privileged opcode. ILL_PRVREG Privileged register. ILL_COPROC Coprocessor error. ILL_BADSTK Internal stack error.
	SIGFPE	FPE_INTDIV Integer divide by zero. FPE_INTOVF Integer overflow. FPE_FLTDIV Floating-point divide by zero. FPE_FLTOVF Floating-point overflow. FPE_FLTUND Floating-point underflow. FPE_FLTRES Floating-point inexact result. FPE_FLTINV Invalid floating-point operation. FPE_FLTSUB Subscript out of range.
	SIGSEGV	SEGV_MAPERR Address not mapped to object. SEGV_ACCERR Invalid permissions for mapped object.
	SIGBUS	BUS_ADRALN Invalid address alignment. BUS_ADRERR Nonexistent physical address. BUS_OBJERR Object-specific hardware error.
	SIGTRAP	TRAP_BRKPT Process breakpoint. TRAP_TRACE Process trace trap.
	SIGCHLD	CLD_EXITED Child has exited. CLD_KILLED Child has terminated abnormally and did not create a <b>core</b> file. CLD_DUMPED Child has terminated abnormally and created a <b>core</b> file. CLD_TRAPPED Traced child has trapped. CLD_STOPPED Child has stopped. CLD_CONTINUED Stopped child has continued.
	SIGPOLL	POLL_IN Data input available. POLL_OUT Output buffers available. POLL_MSG Input message available. POLL_ERR I/O error. POLL_PRI High priority input available. POLL_HUP Device disconnected.
	Any	SI_USER Signal sent by <i>kill()</i> . SI_QUEUE Signal sent by <i>sigqueue()</i> . SI_TIMER Signal generated by expiration of a timer set by <i>timer_settime()</i> . SI_ASYNCIO Signal generated by completion of an asynchronous I/O request. SI_MESGQ Signal generated by arrival of a message on an empty message queue
CX	Implementations may support additional <i>si_code</i> values not included in this list, may generate values included in this list under circumstances other than those described in this list, and may contain extensions or limitations that prevent some values from being generated. Implementations do not generate a different value from the ones described in this list for circumstances described in this list.	

11428 CX In addition, the following signal-specific information shall be available:

Signal	Member	Value
SIGILL SIGFPE	<b>void * <i>si_addr</i></b>	Address of faulting instruction.
SIGSEGV SIGBUS	<b>void * <i>si_addr</i></b>	Address of faulting memory reference.
SIGCHLD	<b>pid_t <i>si_pid</i></b> <b>int <i>si_status</i></b>  <b>uid_t <i>si_uid</i></b>	Child process ID. If <i>si_code</i> is equal to CLD_EXITED, then <i>si_status</i> holds the exit value of the process; otherwise, it is equal to the signal that caused the process to change state. The exit value in <i>si_status</i> shall be equal to the full exit value (that is, the value passed to <i>_exit()</i> , <i>_Exit()</i> , or <i>exit()</i> , or returned from <i>main()</i> ); it shall not be limited to the least significant eight bits of the value. Real user ID of the process that sent the signal.
SIGPOLL	<b>long <i>si_band</i></b>	Band event for POLL_IN, POLL_OUT, or POLL_MSG

11443 For some implementations, the value of *si\_addr* may be inaccurate.

11444 The following shall be declared as functions and may also be defined as macros. Function  
11445 prototypes shall be provided.

```

11446 CX int kill(pid_t, int);
11447 XSI int killpg(pid_t, int);
11448 CX void psiginfo(const siginfo_t *, const char *);
11449 void psignal(int, const char *);
11450 int pthread_kill(pthread_t, int);
11451 int pthread_sigmask(int, const sigset_t *restrict,
11452 sigset_t *restrict);
11453 int raise(int);
11454 CX int sigaction(int, const struct sigaction *restrict,
11455 struct sigaction *restrict);
11456 int sigaddset(sigset_t *, int);
11457 XSI int sigaltstack(const stack_t *restrict, stack_t *restrict);
11458 CX int sigdelset(sigset_t *, int);
11459 int sigemptyset(sigset_t *);
11460 int sigfillset(sigset_t *);
11461 OB XSI int sighold(int);
11462 int sigignore(int);
11463 int siginterrupt(int, int);
11464 CX int sigismember(const sigset_t *, int);
11465 void (*signal(int, void (*)(int)))(int);
11466 OB XSI int sigpause(int);
11467 CX int sigpending(sigset_t *);
11468 int sigprocmask(int, const sigset_t *restrict, sigset_t *restrict);
11469 int sigqueue(pid_t, int, union sigval);
11470 OB XSI int sigrelse(int);
11471 void (*sigset(int, void (*)(int)))(int);
11472 CX int sigsuspend(const sigset_t *);
11473 int sigtimedwait(const sigset_t *restrict, siginfo_t *restrict,
11474 const struct timespec *restrict);
11475 int sigwait(const sigset_t *restrict, int *restrict);
11476 int sigwaitinfo(const sigset_t *restrict, siginfo_t *restrict);

```

11477 CX Inclusion of the <signal.h> header may make visible all symbols from the <time.h> header.

## 11478 APPLICATION USAGE

11479 On systems not supporting the XSI option, the *si\_pid* and *si\_uid* members of **siginfo\_t** are only  
 11480 required to be valid when *si\_code* is SI\_USER or SI\_QUEUE. On XSI-conforming systems, they  
 11481 are also valid for all *si\_code* values less than or equal to 0; however, it is unspecified whether  
 11482 SI\_USER and SI\_QUEUE have values less than or equal to zero, and therefore XSI applications  
 11483 should check whether *si\_code* has the value SI\_USER or SI\_QUEUE or is less than or equal to 0 to  
 11484 tell whether *si\_pid* and *si\_uid* are valid.

## 11485 RATIONALE

11486 None.

## 11487 FUTURE DIRECTIONS

11488 The SIGPOLL and SIGPROF signals may be removed in a future version.

## 11496 CHANGE HISTORY

11497 First released in Issue 1.

### 11498 Issue 5

11499 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
 11500 Threads Extension.

11501 The default action for SIGURG is changed from i to iii. The function prototype for *sigmask()* is  
 11502 removed.

### 11503 Issue 6

11504 The Open Group Corrigendum U035/2 is applied. In the DESCRIPTION, the wording for  
 11505 abnormal termination is clarified.

11506 The Open Group Corrigendum U028/8 is applied, correcting the prototype for the *sigset()*  
 11507 function.

11508 The Open Group Corrigendum U026/3 is applied, correcting the type of the *sigev\_notify\_function*  
 11509 function member of the **sigevent** structure.

11510 The following new requirements on POSIX implementations derive from alignment with the  
 11511 Single UNIX Specification:

- 11512 • The SIGCHLD, SIGCONT, SIGSTOP, SIGTSTP, SIGTTIN, and SIGTTOU signals are now  
 11513 mandated. This is also a FIPS requirement.
- 11514 • The **pid\_t** definition is mandated.

11515 The RT markings are changed to RTS to denote that the semantics are part of the Realtime  
 11516 Signals Extension option.

11517 The **restrict** keyword is added to the prototypes for *sigaction()*, *sigaltstack()*, *sigprocmask()*,  
 11518 *sigtimedwait()*, *sigwait()*, and *sigwaitinfo()*.

11519 IEEE PASC Interpretation 1003.1 #85 is applied, adding the statement that symbols from  
 11520 <time.h> may be made visible when <signal.h> is included.

11521 Extensions beyond the ISO C standard are marked.

11522 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/14 is applied, changing the descriptive  
 11523 text for members of the **sigaction** structure.

11524 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/15 is applied, correcting the definition of  
 11525 the *sa\_sigaction* member of the **sigaction** structure.

11526 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/24 is applied, reworking the ordering of  
 11527 the **siginfo\_t** type structure in the DESCRIPTION. This is an editorial change and no normative  
 11528 change is intended.

11529 **Issue 7**

11530 SD5-XBD-ERN-5 is applied.

11531 SD5-XBD-ERN-39 is applied, removing the **sigstack** structure which should have been removed  
 11532 at the same time as the LEGACY *sigstack()* function.

11533 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size\_t** type.

11534 Austin Group Interpretation 1003.1-2001 #034 is applied.

11535 The **ucontext\_t** and **mcontext\_t** structures are added here from the obsolescent <ucontext.h>  
 11536 header.

11537 The *psiginfo()* and *psignal()* functions are added from The Open Group Technical Standard, 2006,  
 11538 Extended API Set Part 1.

11539 The SIGPOLL and SIGPROF signals and text relating to the XSI STREAMS option are marked  
 11540 obsolescent.

11541 The SA\_RESETHAND, SA\_RESTART, SA\_SIGINFO, SA\_NOCLDWAIT, and SA\_NODEFER  
 11542 constants are moved from the XSI option to the Base.

11543 Functionality relating to the Realtime Signals Extension option is moved to the Base.

11544 This reference page is clarified with respect to macros and symbolic constants, and declarations  
 11545 for the **pthread\_attr\_t**, **pthread\_t**, and **uid\_t** types and the **timespec** structure are added.

11546 SIGRTMIN and SIGRTMAX are required to be positive integer expressions.

11547 The APPLICATION USAGE section is updated to describe the *si\_pid* and *si\_uid* members of  
 11548 **siginfo\_t**.

11549 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0062 [208], XBD/TC1-2008/0063 [80],  
 11550 and XBD/TC1-2008/0064 [157] are applied.

## 11551 NAME

11552 spawn.h — spawn (ADVANCED REALTIME)

## 11553 SYNOPSIS

11554 SPN `#include <spawn.h>`

## 11555 DESCRIPTION

11556 The <spawn.h> header shall define the **posix\_spawnattr\_t** and **posix\_spawn\_file\_actions\_t**  
 11557 types used in performing spawn operations.

11558 The <spawn.h> header shall define the **mode\_t** and **pid\_t** types as described in <sys/types.h>.

11559 The <spawn.h> header shall define the **sigset\_t** type as described in <signal.h>.

11560 The tag **sched\_param** shall be declared as naming an incomplete structure type, the contents of  
 11561 which are described in the <sched.h> header.

11562 The <spawn.h> header shall define the following symbolic constants for use as the flags that  
 11563 may be set in a **posix\_spawnattr\_t** object using the *posix\_spawnattr\_setflags()* function:

11564 POSIX\_SPAWN\_RESETIDS  
 11565 POSIX\_SPAWN\_SETPGROUP  
 11566 PS POSIX\_SPAWN\_SETSCHEDPARAM  
 11567 POSIX\_SPAWN\_SETSCHEDULER  
 11568 POSIX\_SPAWN\_SETSIGDEF  
 11569 POSIX\_SPAWN\_SETSIGMASK

11570 The following shall be declared as functions and may also be defined as macros. Function  
 11571 prototypes shall be provided.

```

11572 int    posix_spawn(pid_t *restrict, const char *restrict,
11573                  const posix_spawn_file_actions_t *,
11574                  const posix_spawnattr_t *restrict, char *const [restrict],
11575                  char *const [restrict]);
11576 int    posix_spawn_file_actions_addclose(posix_spawn_file_actions_t *,
11577                  int);
11578 int    posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t *,
11579                  int, int);
11580 int    posix_spawn_file_actions_addopen(posix_spawn_file_actions_t *restrict,
11581                  int, const char *restrict, int, mode_t);
11582 int    posix_spawn_file_actions_destroy(posix_spawn_file_actions_t *);
11583 int    posix_spawn_file_actions_init(posix_spawn_file_actions_t *);
11584 int    posix_spawnattr_destroy(posix_spawnattr_t *);
11585 int    posix_spawnattr_getflags(const posix_spawnattr_t *restrict,
11586                  short *restrict);
11587 int    posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict,
11588                  pid_t *restrict);
11589 PS int    posix_spawnattr_getschedparam(const posix_spawnattr_t *restrict,
11590                  struct sched_param *restrict);
11591 int    posix_spawnattr_getschedpolicy(const posix_spawnattr_t *restrict,
11592                  int *restrict);
11593 int    posix_spawnattr_getsigdefault(const posix_spawnattr_t *restrict,
11594                  sigset_t *restrict);
11595 int    posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict,
11596                  sigset_t *restrict);
11597 int    posix_spawnattr_init(posix_spawnattr_t *);

```

```

11598     int    posix_spawnattr_setflags(posix_spawnattr_t *, short);
11599     int    posix_spawnattr_setpgroup(posix_spawnattr_t *, pid_t);
11600 PS     int    posix_spawnattr_setschedparam(posix_spawnattr_t *restrict,
11601         const struct sched_param *restrict);
11602     int    posix_spawnattr_setschedpolicy(posix_spawnattr_t *, int);
11603     int    posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict,
11604         const sigset_t *restrict);
11605     int    posix_spawnattr_setsigmask(posix_spawnattr_t *restrict,
11606         const sigset_t *restrict);
11607     int    posix_spawn(pid_t *restrict, const char *restrict,
11608         const posix_spawn_file_actions_t *,
11609         const posix_spawnattr_t *restrict,
11610         char *const [restrict], char *const [restrict]);
11611
11612     Inclusion of the <spawn.h> header may make visible symbols defined in the <sched.h> and
     <signal.h> headers.

```

#### 11613 APPLICATION USAGE

11631 [posix\\_spawnattr\\_setsigmask\(\)](#), and [posix\\_spawnnp\(\)](#).

#### 11632 Issue 7

11633 This reference page is clarified with respect to macros and symbolic constants, and declarations  
11634 for the **mode\_t**, **pid\_t**, and **sigset\_t** types are added.

## 11635 NAME

11636        `stdarg.h` — handle variable argument list

## 11637 SYNOPSIS

```
11638        #include <stdarg.h>
11639
11639        void va_start(va_list ap, argN);
11640        void va_copy(va_list dest, va_list src);
11641        type va_arg(va_list ap, type);
11642        void va_end(va_list ap);
```

## 11643 DESCRIPTION

11644 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
 11645        conflict between the requirements described here and the ISO C standard is unintentional. This  
 11646        volume of POSIX.1-2008 defers to the ISO C standard.

11647        The **<stdarg.h>** header shall contain a set of macros which allows portable functions that accept  
 11648        variable argument lists to be written. Functions that have variable argument lists (such as  
 11649        `printf()`) but do not use these macros are inherently non-portable, as different systems use  
 11650        different argument-passing conventions.

11651        The **<stdarg.h>** header shall define the **va\_list** type for variables used to traverse the list.

11652        The `va_start()` macro is invoked to initialize *ap* to the beginning of the list before any calls to  
 11653        `va_arg()`.

11654        The `va_copy()` macro initializes *dest* as a copy of *src*, as if the `va_start()` macro had been applied  
 11655        to *dest* followed by the same sequence of uses of the `va_arg()` macro as had previously been used  
 11656        to reach the present state of *src*. Neither the `va_copy()` nor `va_start()` macro shall be invoked to  
 11657        reinitialize *dest* without an intervening invocation of the `va_end()` macro for the same *dest*.

11658        The object *ap* may be passed as an argument to another function; if that function invokes the  
 11659        `va_arg()` macro with parameter *ap*, the value of *ap* in the calling function is unspecified and shall  
 11660        be passed to the `va_end()` macro prior to any further reference to *ap*. The parameter *argN* is the  
 11661        identifier of the rightmost parameter in the variable parameter list in the function definition (the  
 11662        one just before the `...`). If the parameter *argN* is declared with the **register** storage class, with a  
 11663        function type or array type, or with a type that is not compatible with the type that results after  
 11664        application of the default argument promotions, the behavior is undefined.

11665        The `va_arg()` macro shall return the next argument in the list pointed to by *ap*. Each invocation  
 11666        of `va_arg()` modifies *ap* so that the values of successive arguments are returned in turn. The *type*  
 11667        parameter shall be a type name specified such that the type of a pointer to an object that has the  
 11668        specified type can be obtained simply by postfixing a `'*'` to type. If there is no actual next  
 11669        argument, or if *type* is not compatible with the type of the actual next argument (as promoted  
 11670        according to the default argument promotions), the behavior is undefined, except for the  
 11671        following cases:

- 11672            • One type is a signed integer type, the other type is the corresponding unsigned integer  
 11673            type, and the value is representable in both types.
- 11674            • One type is a pointer to **void** and the other is a pointer to a character type.
- 11675 XSI        • Both types are pointers.

11676        Different types can be mixed, but it is up to the routine to know what type of argument is  
 11677        expected.

11678        The `va_end()` macro is used to clean up; it invalidates *ap* for use (unless `va_start()` or `va_copy()` is  
 11679        invoked again).

Each invocation of the *va\_start()* and *va\_copy()* macros shall be matched by a corresponding invocation of the *va\_end()* macro in the same function.

Multiple traversals, each bracketed by *va\_start()* ... *va\_end()*, are possible.

#### EXAMPLES

This example is a possible implementation of *execl()*:

```
#include <stdarg.h>

#define MAXARGS 31

/*
 * execl is called by
 * execl(file, arg1, arg2, ..., (char *) (0));
 */
int execl(const char *file, const char *args, ...)
{
    va_list ap;
    char *array[MAXARGS + 1];
    int argno = 0;

    va_start(ap, args);
    while (args != 0 && argno < MAXARGS)
    {
        array[argno++] = args;
        args = va_arg(ap, const char *);
    }
    array[argno] = (char *) 0;
    va_end(ap);
    return execv(file, array);
}
```

#### APPLICATION USAGE

It is up to the calling routine to communicate to the called routine how many arguments there are, since it is not always possible for the called routine to determine this in any other way. For example, *execl()* is passed a null pointer to signal the end of the list. The *printf()* function can tell how many arguments are there by the *format* argument.

#### RATIONALE

None.

#### FUTURE DIRECTIONS

None.

XSH *exec*, *fprintf()*

#### CHANGE HISTORY

First released in Issue 4. Derived from the ANSI C standard.

#### Issue 6

This reference page is updated to align with the ISO/IEC 9899:1999 standard.

11721 **NAME**

11722       stdbool.h — boolean type and values

11723 **SYNOPSIS**

11724       #include &lt;stdbool.h&gt;

11725 **DESCRIPTION**

11726 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
11727       conflict between the requirements described here and the ISO C standard is unintentional. This  
11728       volume of POSIX.1-2008 defers to the ISO C standard.

11729       The &lt;stdbool.h&gt; header shall define the following macros:

11730       bool       Expands to **\_Bool**.

11731       true       Expands to the integer constant 1.

11732       false       Expands to the integer constant 0.

11733       \_\_bool\_true\_false\_are\_defined

11734       Expands to the integer constant 1.

11735       An application may undefine and then possibly redefine the macros bool, true, and false.

11736 **APPLICATION USAGE**

11737       None.

11738 **RATIONALE**

11739       None.

11740 **FUTURE DIRECTIONS**

11741       The ability to undefine and redefine the macros bool, true, and false is an obsolescent feature  
11742       and may be removed in a future version.

11743 **SEE ALSO**

11744       None.

11745 **CHANGE HISTORY**

11746       First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

11747 **NAME**11748        `stddef.h` — standard type definitions11749 **SYNOPSIS**11750        `#include <stddef.h>`11751 **DESCRIPTION**

11752 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
 11753            conflict between the requirements described here and the ISO C standard is unintentional. This  
 11754            volume of POSIX.1-2008 defers to the ISO C standard.

11755        The `<stddef.h>` header shall define the following macros:

11756 CX        **NULL**        Null pointer constant. The macro shall expand to an integer constant expression  
 11757            with the value 0 cast to type `void *`.

11758        `offsetof(type, member-designator)`

11759            Integer constant expression of type `size_t`, the value of which is the offset in bytes  
 11760            to the structure member (*member-designator*), from the beginning of its structure  
 11761            (*type*).

11762        The `<stddef.h>` header shall define the following types:11763        **ptrdiff\_t**        Signed integer type of the result of subtracting two pointers.

11764        **wchar\_t**        Integer type whose range of values can represent distinct codes for all members of  
 11765            the largest extended character set specified among the supported locales; the null  
 11766            character shall have the code value zero. Each member of the basic character set  
 11767            shall have a code value equal to its value when used as the lone character in an  
 11768            integer character constant if an implementation does not define  
 11769            `__STDC_MB_MIGHT_NEQ_WC__`.

11770        **size\_t**        Unsigned integer type of the result of the `sizeof` operator.

11771        The implementation shall support one or more programming environments in which the widths  
 11772        of `ptrdiff_t`, `size_t`, and `wchar_t` are no greater than the width of type `long`. The names of these  
 11773        programming environments can be obtained using the `confstr()` function or the `getconf` utility.

11774 **APPLICATION USAGE**

11775        None.

11776 **RATIONALE**

11777        The ISO C standard does not require the `NULL` macro to include the cast to type `void *` and  
 11778        specifies that the `NULL` macro be implementation-defined. POSIX.1-2008 requires the cast and  
 11779        therefore need not be implementation-defined.

11780 **FUTURE DIRECTIONS**

11781        None.

11782 **SEE ALSO**11783        `<sys/types.h>`, `<wchar.h>`11784        XSH `confstr()`11785        XCU `getconf`11786 **CHANGE HISTORY**

11787        First released in Issue 4. Derived from the ANSI C standard.

11788 **Issue 7**

11789 This reference page is clarified with respect to macros and symbolic constants.

11790 SD5-XBD-ERN-53 is applied, updating the definition of **wchar\_t** to align with  
11791 ISO/IEC 9899:1999 standard, Technical Corrigendum 3.

11792 **NAME**

11793       stdint.h — integer types

11794 **SYNOPSIS**

11795       #include <stdint.h>

11796 **DESCRIPTION**

11797 CX       Some of the functionality described on this reference page extends the ISO C standard.  
11798       Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to  
11799       enable the visibility of these symbols in this header.

11800       The <stdint.h> header shall declare sets of integer types having specified widths, and shall  
11801       define corresponding sets of macros. It shall also define macros that specify limits of integer  
11802       types corresponding to types defined in other standard headers.

11803       **Note:**     The “width” of an integer type is the number of bits used to store its value in a pure binary  
11804       system; the actual type may use more bits than that (for example, a 28-bit type could be stored  
11805       in 32 bits of actual storage). An  $N$ -bit signed type has values in the range  $-2^{N-1}$  or  $1-2^{N-1}$  to  
11806        $2^{N-1}-1$ , while an  $N$ -bit unsigned type has values in the range 0 to  $2^N-1$ .

11807       Types are defined in the following categories:

- 11808       • Integer types having certain exact widths
- 11809       • Integer types having at least certain specified widths
- 11810       • Fastest integer types having at least certain specified widths
- 11811       • Integer types wide enough to hold pointers to objects
- 11812       • Integer types having greatest width

11813       (Some of these types may denote the same type.)

11814       Corresponding macros specify limits of the declared types and construct suitable constants.

11815       For each type described herein that the implementation provides, the <stdint.h> header shall  
11816       declare that **typedef** name and define the associated macros. Conversely, for each type described  
11817       herein that the implementation does not provide, the <stdint.h> header shall not declare that  
11818       **typedef** name, nor shall it define the associated macros. An implementation shall provide those  
11819       types described as required, but need not provide any of the others (described as optional).

11820 **Integer Types**

11821       When **typedef** names differing only in the absence or presence of the initial  $u$  are defined, they  
11822       shall denote corresponding signed and unsigned types as described in the ISO/IEC 9899:1999  
11823       standard, Section 6.2.5; an implementation providing one of these corresponding types shall also  
11824       provide the other.

11825       In the following descriptions, the symbol  $N$  represents an unsigned decimal integer with no  
11826       leading zeros (for example, 8 or 24, but not 04 or 048).

- 11827       • Exact-width integer types

11828       The **typedef** name **int $N$ \_t** designates a signed integer type with width  $N$ , no padding bits,  
11829       and a two’s-complement representation. Thus, **int8\_t** denotes a signed integer type with a  
11830       width of exactly 8 bits.

11831       The **typedef** name **uint $N$ \_t** designates an unsigned integer type with width  $N$ . Thus,  
11832       **uint24\_t** denotes an unsigned integer type with a width of exactly 24 bits.

11833 CX The following types are required:

11834 **int8\_t**  
 11835 **int16\_t**  
 11836 **int32\_t**  
 11837 **uint8\_t**  
 11838 **uint16\_t**  
 11839 **uint32\_t**

11840 If an implementation provides integer types with width 64 that meet these requirements,  
 11841 then the following types are required:

11842 **int64\_t**  
 11843 **uint64\_t**

11844 CX In particular, this will be the case if any of the following are true:

- 11845 — The implementation supports the `_POSIX_V7_ILP32_OFFBIG` programming  
 11846 environment and the application is being built in the `_POSIX_V7_ILP32_OFFBIG`  
 11847 programming environment (see the Shell and Utilities volume of POSIX.1-2008, c99,  
 11848 Programming Environments).
- 11849 — The implementation supports the `_POSIX_V7_LP64_OFF64` programming  
 11850 environment and the application is being built in the `_POSIX_V7_LP64_OFF64`  
 11851 programming environment.
- 11852 — The implementation supports the `_POSIX_V7_LPBIG_OFFBIG` programming  
 11853 environment and the application is being built in the `_POSIX_V7_LPBIG_OFFBIG`  
 11854 programming environment.

11855 All other types of this form are optional.

11856 • Minimum-width integer types

11857 The **typedef** name **int\_leastN\_t** designates a signed integer type with a width of at least *N*,  
 11858 such that no signed integer type with lesser size has at least the specified width. Thus,  
 11859 **int\_least32\_t** denotes a signed integer type with a width of at least 32 bits.

11860 The **typedef** name **uint\_leastN\_t** designates an unsigned integer type with a width of at  
 11861 least *N*, such that no unsigned integer type with lesser size has at least the specified width.  
 11862 Thus, **uint\_least16\_t** denotes an unsigned integer type with a width of at least 16 bits.

11863 The following types are required:

11864 **int\_least8\_t**  
 11865 **int\_least16\_t**  
 11866 **int\_least32\_t**  
 11867 **int\_least64\_t**  
 11868 **uint\_least8\_t**  
 11869 **uint\_least16\_t**  
 11870 **uint\_least32\_t**  
 11871 **uint\_least64\_t**

11872 All other types of this form are optional.

- 11873
- Fastest minimum-width integer types
- 11874 Each of the following types designates an integer type that is usually fastest to operate  
11875 with among all integer types that have at least the specified width.
- 11876 The designated type is not guaranteed to be fastest for all purposes; if the implementation  
11877 has no clear grounds for choosing one type over another, it will simply pick some integer  
11878 type satisfying the signedness and width requirements.
- 11879 The **typedef** name **int\_fastN\_t** designates the fastest signed integer type with a width of at  
11880 least *N*. The **typedef** name **uint\_fastN\_t** designates the fastest unsigned integer type with  
11881 a width of at least *N*.
- 11882 The following types are required:
- 11883 **int\_fast8\_t**  
11884 **int\_fast16\_t**  
11885 **int\_fast32\_t**  
11886 **int\_fast64\_t**  
11887 **uint\_fast8\_t**  
11888 **uint\_fast16\_t**  
11889 **uint\_fast32\_t**  
11890 **uint\_fast64\_t**
- 11891 All other types of this form are optional.
- 11892
- Integer types capable of holding object pointers
- 11893 The following type designates a signed integer type with the property that any valid  
11894 pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and  
11895 the result will compare equal to the original pointer:
- 11896 **intptr\_t**
- 11897 The following type designates an unsigned integer type with the property that any valid  
11898 pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and  
11899 the result will compare equal to the original pointer:
- 11900 **uintptr\_t**
- 11901 XSI On XSI-conformant systems, the **intptr\_t** and **uintptr\_t** types are required; otherwise, they  
11902 are optional.
- 11903
- Greatest-width integer types
- 11904 The following type designates a signed integer type capable of representing any value of  
11905 any signed integer type:
- 11906 **intmax\_t**
- 11907 The following type designates an unsigned integer type capable of representing any value  
11908 of any unsigned integer type:
- 11909 **uintmax\_t**
- 11910 These types are required.

11911 **Note:** Applications can test for optional types by using the corresponding limit macro from [Limits of](#)  
 11912 [Specified-Width Integer Types](#).

### 11913 **Limits of Specified-Width Integer Types**

11914 The following macros specify the minimum and maximum limits of the types declared in the  
 11915 **<stdint.h>** header. Each macro name corresponds to a similar type name in [Integer Types](#) (on  
 11916 page 347).

11917 Each instance of any defined macro shall be replaced by a constant expression suitable for use in  
 11918 **#if** preprocessing directives, and this expression shall have the same type as would an  
 11919 expression that is an object of the corresponding type converted according to the integer  
 11920 promotions. Its implementation-defined value shall be equal to or greater in magnitude  
 11921 (absolute value) than the corresponding value given below, with the same sign, except where  
 11922 stated to be exactly the given value.

- 11923 • Limits of exact-width integer types
  - 11924 — Minimum values of exact-width signed integer types:
    - 11925 {INTN\_MIN} Exactly  $-(2^{N-1})$
  - 11926 — Maximum values of exact-width signed integer types:
    - 11927 {INTN\_MAX} Exactly  $2^{N-1} - 1$
  - 11928 — Maximum values of exact-width unsigned integer types:
    - 11929 {UINTN\_MAX} Exactly  $2^N - 1$
- 11930 • Limits of minimum-width integer types
  - 11931 — Minimum values of minimum-width signed integer types:
    - 11932 {INT\_LEASTN\_MIN}  $-(2^{N-1} - 1)$
  - 11933 — Maximum values of minimum-width signed integer types:
    - 11934 {INT\_LEASTN\_MAX}  $2^{N-1} - 1$
  - 11935 — Maximum values of minimum-width unsigned integer types:
    - 11936 {UINT\_LEASTN\_MAX}  $2^N - 1$
- 11937 • Limits of fastest minimum-width integer types
  - 11938 — Minimum values of fastest minimum-width signed integer types:
    - 11939 {INT\_FASTN\_MIN}  $-(2^{N-1} - 1)$
  - 11940 — Maximum values of fastest minimum-width signed integer types:
    - 11941 {INT\_FASTN\_MAX}  $2^{N-1} - 1$
  - 11942 — Maximum values of fastest minimum-width unsigned integer types:
    - 11943 {UINT\_FASTN\_MAX}  $2^N - 1$
- 11944 • Limits of integer types capable of holding object pointers
  - 11945 — Minimum value of pointer-holding signed integer type:
    - 11946 {INTPTR\_MIN}  $-(2^{15} - 1)$

- 11947 — Maximum value of pointer-holding signed integer type:
- 11948 {INTPTR\_MAX}  $2^{15} - 1$
- 11949 — Maximum value of pointer-holding unsigned integer type:
- 11950 {UINTPTR\_MAX}  $2^{16} - 1$
- 11951 • Limits of greatest-width integer types
- 11952 — Minimum value of greatest-width signed integer type:
- 11953 {INTMAX\_MIN}  $-(2^{63} - 1)$
- 11954 — Maximum value of greatest-width signed integer type:
- 11955 {INTMAX\_MAX}  $2^{63} - 1$
- 11956 — Maximum value of greatest-width unsigned integer type:
- 11957 {UINTMAX\_MAX}  $2^{64} - 1$

### Limits of Other Integer Types

The following macros specify the minimum and maximum limits of integer types corresponding to types defined in other standard headers.

Each instance of these macros shall be replaced by a constant expression suitable for use in `#if` preprocessing directives, and this expression shall have the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. Its implementation-defined value shall be equal to or greater in magnitude (absolute value) than the corresponding value given below, with the same sign.

- 11966 • Limits of **ptrdiff\_t**:
- 11967 {PTRDIFF\_MIN}  $-65\,535$
- 11968 {PTRDIFF\_MAX}  $+65\,535$
- 11969 • Limits of **sig\_atomic\_t**:
- 11970 {SIG\_ATOMIC\_MIN} See below.
- 11971 {SIG\_ATOMIC\_MAX} See below.
- 11972 • Limit of **size\_t**:
- 11973 {SIZE\_MAX}  $65\,535$
- 11974 • Limits of **wchar\_t**:
- 11975 {WCHAR\_MIN} See below.
- 11976 {WCHAR\_MAX} See below.
- 11977 • Limits of **wint\_t**:
- 11978 {WINT\_MIN} See below.
- 11979 {WINT\_MAX} See below.

If **sig\_atomic\_t** (see the `<signal.h>` header) is defined as a signed integer type, the value of {SIG\_ATOMIC\_MIN} shall be no greater than  $-127$  and the value of {SIG\_ATOMIC\_MAX} shall be no less than  $127$ ; otherwise, **sig\_atomic\_t** shall be defined as an unsigned integer type, and the value of {SIG\_ATOMIC\_MIN} shall be  $0$  and the value of {SIG\_ATOMIC\_MAX} shall be no

11984 less than 255.

11985 If **wchar\_t** (see the <stddef.h> header) is defined as a signed integer type, the value of  
11986 {WCHAR\_MIN} shall be no greater than -127 and the value of {WCHAR\_MAX} shall be no less  
11987 than 127; otherwise, **wchar\_t** shall be defined as an unsigned integer type, and the value of  
11988 {WCHAR\_MIN} shall be 0 and the value of {WCHAR\_MAX} shall be no less than 255.

11989 If **wint\_t** (see the <wchar.h> header) is defined as a signed integer type, the value of  
11990 {WINT\_MIN} shall be no greater than -32767 and the value of {WINT\_MAX} shall be no less  
11991 than 32767; otherwise, **wint\_t** shall be defined as an unsigned integer type, and the value of  
11992 {WINT\_MIN} shall be 0 and the value of {WINT\_MAX} shall be no less than 65535.

### 11993 **Macros for Integer Constant Expressions**

11994 The following macros expand to integer constant expressions suitable for initializing objects that  
11995 have integer types corresponding to types defined in the <stdint.h> header. Each macro name  
11996 corresponds to a similar type name listed under *Minimum-width integer types* and *Greatest-width*  
11997 *integer types*.

11998 Each invocation of one of these macros shall expand to an integer constant expression suitable  
11999 for use in #if preprocessing directives. The type of the expression shall have the same type as  
12000 would an expression that is an object of the corresponding type converted according to the  
12001 integer promotions. The value of the expression shall be that of the argument.

12002 The argument in any instance of these macros shall be an unsuffixed integer constant with a  
12003 value that does not exceed the limits for the corresponding type.

- 12004 • Macros for minimum-width integer constant expressions

12005 The macro **INTN\_C(value)** shall expand to an integer constant expression corresponding to  
12006 the type **int\_leastN\_t**. The macro **UINTN\_C(value)** shall expand to an integer constant  
12007 expression corresponding to the type **uint\_leastN\_t**. For example, if **uint\_least64\_t** is a  
12008 name for the type **unsigned long long**, then **UINT64\_C(0x123)** might expand to the integer  
12009 constant 0x123ULL.

- 12010 • Macros for greatest-width integer constant expressions

12011 The following macro expands to an integer constant expression having the value specified  
12012 by its argument and the type **intmax\_t**:

12013 **INTMAX\_C(value)**

12014 The following macro expands to an integer constant expression having the value specified  
12015 by its argument and the type **uintmax\_t**:

12016 **UINTMAX\_C(value)**

### 12017 **APPLICATION USAGE**

12018 None.

### 12019 **RATIONALE**

12020 The <stdint.h> header is a subset of the <inttypes.h> header more suitable for use in  
12021 freestanding environments, which might not support the formatted I/O functions. In some  
12022 environments, if the formatted conversion support is not wanted, using this header instead of  
12023 the <inttypes.h> header avoids defining such a large number of macros.

12024 As a consequence of adding **int8\_t**, the following are true:

12025     • A byte is exactly 8 bits.

12026     • {CHAR\_BIT} has the value 8, {SCHAR\_MAX} has the value 127, {SCHAR\_MIN} has the

12027       value -128, and {UCHAR\_MAX} has the value 255.

12028     (The POSIX standard explicitly requires 8-bit char and two's-complement arithmetic.)

12029 **FUTURE DIRECTIONS**

12030     **typedef** names beginning with **int** or **uint** and ending with **\_t** may be added to the types defined

12031     in the **<stdint.h>** header. Macro names beginning with **INT** or **UINT** and ending with **\_MAX**,

12032     **\_MIN**, or **\_C** may be added to the macros defined in the **<stdint.h>** header.

12033 **SEE ALSO**

12036 **CHANGE HISTORY**

12037     First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

12038     ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is applied.

12039 **Issue 7**

12040     ISO/IEC 9899:1999 standard, Technical Corrigendum 3 #40 is applied.

12041     SD5-XBD-ERN-67 is applied.

12042 **NAME**

12043       stdio.h — standard buffered input/output

12044 **SYNOPSIS**

12045       #include &lt;stdio.h&gt;

12046 **DESCRIPTION**

12047 CX       Some of the functionality described on this reference page extends the ISO C standard.  
 12048       Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to  
 12049       enable the visibility of these symbols in this header.

12050       The <stdio.h> header shall define the following data types through **typedef**:12051       **FILE**               A structure containing information about a file.

12052       **fpos\_t**            A non-array type containing all information needed to specify uniquely  
 12053       every position within a file.

12054       **off\_t**             As described in <sys/types.h>.12055       **size\_t**            As described in <stddef.h>.12056 CX       **ssize\_t**       As described in <sys/types.h>.12057 CX       **va\_list**       As described in <stdarg.h>.

12058       The <stdio.h> header shall define the following macros which shall expand to integer constant  
 12059       expressions:

12060 CX       **BUFSIZ**       Size of <stdio.h> buffers.   This shall expand to a positive value.12061 CX       **L\_ctermid**     Maximum size of character array to hold *ctermid()* output.12062 OB       **L\_tmpnam**     Maximum size of character array to hold *tmpnam()* output.

12063       The <stdio.h> header shall define the following macros which shall expand to integer constant  
 12064       expressions with distinct values:

12065       **\_IOFBF**           Input/output fully buffered.12066       **\_IOLBF**           Input/output line buffered.12067       **\_IONBF**           Input/output unbuffered.

12068       The <stdio.h> header shall define the following macros which shall expand to integer constant  
 12069       expressions with distinct values:

12070       **SEEK\_CUR**       Seek relative to current position.12071       **SEEK\_END**       Seek relative to end-of-file.12072       **SEEK\_SET**       Seek relative to start-of-file.

12073       The <stdio.h> header shall define the following macros which shall expand to integer constant  
 12074       expressions denoting implementation limits:

12075       {FILENAME\_MAX}   Maximum size in bytes of the longest pathname that the implementation  
 12076       guarantees can be opened.

12077       {FOPEN\_MAX}     Number of streams which the implementation guarantees can be open  
 12078       simultaneously. The value is at least eight.

12079 OB       {TMP\_MAX}     Minimum number of unique filenames generated by *tmpnam()*.  
 12080       Maximum number of times an application can call *tmpnam()* reliably. The  
 12081       value of {TMP\_MAX} is at least 25.

12082	OB XSI	On XSI-conformant systems, the value of {TMP_MAX} is at least 10 000.
12083		The <stdio.h> header shall define the following macro which shall expand to an integer constant
12084		expression with type <b>int</b> and a negative value:
12085		EOF                      End-of-file return value.
12086		The <stdio.h> header shall define NULL as described in <stddef.h>.
12087		The <stdio.h> header shall define the following macro which shall expand to a string constant:
12088	OB XSI	P_tmpdir                Default directory prefix for <i>tempnam()</i> .
12089		The <stdio.h> header shall define the following macros which shall expand to expressions of
12090		type “pointer to <b>FILE</b> ” that point to the <b>FILE</b> objects associated, respectively, with the standard
12091		error, input, and output streams:
12092		<i>stderr</i> Standard error output stream.
12093		<i>stdin</i> Standard input stream.
12094		<i>stdout</i> Standard output stream.
12095		The following shall be declared as functions and may also be defined as macros. Function
12096		prototypes shall be provided.
12097		void            clearerr(FILE *);
12098	CX	char           *ctermid(char *);
12099		int            dprintf(int, const char *restrict, ...)
12100		int            fclose(FILE *);
12101	CX	FILE          *fdopen(int, const char *);
12102		int            feof(FILE *);
12103		int            ferror(FILE *);
12104		int            fflush(FILE *);
12105		int            fgetc(FILE *);
12106		int            fgetpos(FILE *restrict, fpos_t *restrict);
12107		char          *fgets(char *restrict, int, FILE *restrict);
12108	CX	int            fileno(FILE *);
12109		void          flockfile(FILE *);
12110		FILE          *fmemopen(void *restrict, size_t, const char *restrict);
12111		FILE          *fopen(const char *restrict, const char *restrict);
12112		int            fprintf(FILE *restrict, const char *restrict, ...);
12113		int            fputc(int, FILE *);
12114		int            fputs(const char *restrict, FILE *restrict);
12115		size_t        fread(void *restrict, size_t, size_t, FILE *restrict);
12116		FILE          *freopen(const char *restrict, const char *restrict,
12117		FILE *restrict);
12118		int            fscanf(FILE *restrict, const char *restrict, ...);
12119		int            fseek(FILE *, long, int);
12120	CX	int            fseeko(FILE *, off_t, int);
12121		int            fsetpos(FILE *, const fpos_t *);
12122		long          ftell(FILE *);
12123	CX	off_t         ftello(FILE *);
12124		int            ftrylockfile(FILE *);
12125		void          funlockfile(FILE *);
12126		size_t        fwrite(const void *restrict, size_t, size_t, FILE *restrict);
12127		int            getc(FILE *);

```

12128      int      getchar(void);
12129 CX      int     getc_unlocked(FILE *);
12130      int      getchar_unlocked(void);
12131      ssize_t   getdelim(char **restrict, size_t *restrict, int,
12132                        FILE *restrict);
12133      ssize_t   getline(char **restrict, size_t *restrict, FILE *restrict);
12134 OB      char     *gets(char *);
12135 CX      FILE     *open_memstream(char **, size_t *);
12136      int      pclose(FILE *);
12137      void      perror(const char *);
12138 CX      FILE     *popen(const char *, const char *);
12139      int      printf(const char *restrict, ...);
12140      int      putc(int, FILE *);
12141      int      putchar(int);
12142 CX      int      putc_unlocked(int, FILE *);
12143      int      putchar_unlocked(int);
12144      int      puts(const char *);
12145      int      remove(const char *);
12146      int      rename(const char *, const char *);
12147 CX      int      renameat(int, const char *, int, const char *);
12148      void      rewind(FILE *);
12149      int      scanf(const char *restrict, ...);
12150      void      setbuf(FILE *restrict, char *restrict);
12151      int      setvbuf(FILE *restrict, char *restrict, int, size_t);
12152      int      snprintf(char *restrict, size_t, const char *restrict, ...);
12153      int      sprintf(char *restrict, const char *restrict, ...);
12154      int      sscanf(const char *restrict, const char *restrict, ...);
12155 OB XSI      char  *tempnam(const char *, const char *);
12156      FILE     *tmpfile(void);
12157 OB      char  *tmpnam(char *);
12158      int      ungetc(int, FILE *);
12159 CX      int      vdprintf(int, const char *restrict, va_list);
12160      int      vfprintf(FILE *restrict, const char *restrict, va_list);
12161      int      vfscanf(FILE *restrict, const char *restrict, va_list);
12162      int      vprintf(const char *restrict, va_list);
12163      int      vscanf(const char *restrict, va_list);
12164      int      vsnprintf(char *restrict, size_t, const char *restrict,
12165                        va_list);
12166      int      vsprintf(char *restrict, const char *restrict, va_list);
12167      int      vsscanf(const char *restrict, const char *restrict, va_list);
12168 CX      Inclusion of the <stdio.h> header may also make visible all symbols from <stddef.h>.

```

## 12169 APPLICATION USAGE

12170 Since standard I/O streams may use an underlying file descriptor to access the file associated  
12171 with a stream, application developers need to be aware that {FOPEN\_MAX} streams may not be  
12172 available if file descriptors are being used to access files that are not associated with streams.

## 12173 RATIONALE

12174 There is a conflict between the ISO C standard and the POSIX definition of the {TMP\_MAX}  
12175 macro that is addressed by ISO/IEC 9899:1999 standard, Defect Report 336. The POSIX standard  
12176 is in alignment with the public record of the response to the Defect Report. This change has not  
12177 yet been published as part of the ISO C standard.

12178 **FUTURE DIRECTIONS**

12179 None.

12188 **CHANGE HISTORY**

12189 First released in Issue 1. Derived from Issue 1 of the SVID.

12190 **Issue 5**

12191 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

12192 Large File System extensions are added.

12193 The constant `L_cuserid` and the external variables `optarg`, `opterr`, `optind`, and `optopt` are marked as  
 12194 extensions and LEGACY.

12195 The `cuserid()` and `getopt()` functions are marked LEGACY.12196 **Issue 6**

12197 The constant `L_cuserid` and the external variables `optarg`, `opterr`, `optind`, and `optopt` are removed  
 12198 as they were previously marked LEGACY.

12199 The `cuserid()`, `getopt()`, and `getw()` functions are removed as they were previously marked  
 12200 LEGACY.

12201 Several functions are marked as part of the Thread-Safe Functions option.

12202 This reference page is updated to align with the ISO/IEC 9899:1999 standard. Note that the  
 12203 description of the `fpos_t` type is now explicitly updated to exclude array types.

12204 Extensions beyond the ISO C standard are marked.

12205 **Issue 7**

12206 Austin Group Interpretation 1003.1-2001 #172 is applied, adding rationale about a conflict for the  
 12207 definition of `{TMP_MAX}` with the ISO C standard.

12208 SD5-XBD-ERN-99 is applied, adding APPLICATION USAGE.

12209 The `dprintf()`, `fmemopen()`, `getdelim()`, `getline()`, `open_memstream()`, and `vdprintf()` functions are  
 12210 added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

12211 The `renameat()` function is added from The Open Group Technical Standard, 2006, Extended API  
 12212 Set Part 2.

12213 The `gets()`, `tmpnam()`, and `tempnam()` functions and the `L_tmpnam` macro are marked  
 12214 obsolescent.

12215 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
 12216 for the `off_t` type is added.

12217 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0065 [291,427] is applied.

12218 **NAME**

12219        stdlib.h — standard library definitions

12220 **SYNOPSIS**

12221        #include &lt;stdlib.h&gt;

12222 **DESCRIPTION**

12223 CX       Some of the functionality described on this reference page extends the ISO C standard.  
 12224       Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to  
 12225       enable the visibility of these symbols in this header.

12226       The <stdlib.h> header shall define the following macros which shall expand to integer constant  
 12227       expressions:

12228       EXIT\_FAILURE   Unsuccessful termination for *exit()*; evaluates to a non-zero value.

12229       EXIT\_SUCCESS   Successful termination for *exit()*; evaluates to 0.

12230       {RAND\_MAX}     Maximum value returned by *rand()*; at least 32 767.

12231       The <stdlib.h> header shall define the following macro which shall expand to a positive integer  
 12232       expression with type **size\_t**:

12233       {MB\_CUR\_MAX}   Maximum number of bytes in a character specified by the current locale  
 12234       (category *LC\_CTYPE*).

12235 CX       In the POSIX locale the value of {MB\_CUR\_MAX} shall be 1.       +

12236       The <stdlib.h> header shall define NULL as described in <stddef.h>.

12237       The <stdlib.h> header shall define the following data types through **typedef**:

12238       **div\_t**           Structure type returned by the *div()* function.

12239       **ldiv\_t**          Structure type returned by the *ldiv()* function.

12240       **lldiv\_t**         Structure type returned by the *lldiv()* function.

12241       **size\_t**          As described in <stddef.h>.

12242       **wchar\_t**         As described in <stddef.h>.

12243 CX       In addition, the <stdlib.h> header shall define the following symbolic constants and macros as  
 12244       described in <sys/wait.h>:

12245       WEXITSTATUS

12246       WIFEXITED

12247       WIFSIGNALED

12248       WIFSTOPPED

12249       WNOHANG

12250       WSTOPSIG

12251       WTERMSIG

12252       WUNTRACED

12253       The following shall be declared as functions and may also be defined as macros. Function  
 12254       prototypes shall be provided.

12255       void            \_Exit(int);

12256 XSI       long       a64l(const char \*);

12257       void            abort(void);

12258       int             abs(int);

```

12259     int          atexit(void (*)(void));
12260     double        atof(const char *);
12261     int           atoi(const char *);
12262     long          atol(const char *);
12263     long long     atoll(const char *);
12264     void          *bsearch(const void *, const void *, size_t, size_t,
12265                             int (*)(const void *, const void *));
12266     void          *calloc(size_t, size_t);
12267     div_t         div(int, int);
12268 XSI     double        drand48(void);
12269     double        erand48(unsigned short [3]);
12270     void          exit(int);
12271     void          free(void *);
12272     char          *getenv(const char *);
12273 CX     int           getsubopt(char **, char *const *, char **);
12274 XSI     int           grantpt(int);
12275     char          *initstate(unsigned, char *, size_t);
12276     long          jrand48(unsigned short [3]);
12277     char          *l64a(long);
12278     long          labs(long);
12279 XSI     void          lcong48(unsigned short [7]);
12280     ldiv_t        ldiv(long, long);
12281     long long     llabs(long long);
12282     lldiv_t       lldiv(long long, long long);
12283 XSI     long          lrand48(void);
12284     void          *malloc(size_t);
12285     int           mblen(const char *, size_t);
12286     size_t        mbstowcs(wchar_t *restrict, const char *restrict, size_t);
12287     int           mbtowc(wchar_t *restrict, const char *restrict, size_t);
12288 CX     char          *mkdtemp(char *);
12289     int           mkstemp(char *);
12290 XSI     long          mrand48(void);
12291     long          nrand48(unsigned short [3]);
12292 ADV     int           posix_memalign(void **, size_t, size_t);
12293 XSI     int           posix_openpt(int);
12294     char          *ptsname(int);
12295     int           putenv(char *);
12296     void          qsort(void *, size_t, size_t, int (*)(const void *,
12297                                                         const void *));
12298     int           rand(void);
12299 OB CX     int          rand_r(unsigned *);
12300 XSI     long          random(void);
12301     void          *realloc(void *, size_t);
12302 XSI     char          *realpath(const char *restrict, char *restrict);
12303     unsigned short *seed48(unsigned short [3]);
12304 CX     int           setenv(const char *, const char *, int);
12305 XSI     void          setkey(const char *);
12306     char          *setstate(char *);
12307     void          srand(unsigned);
12308 XSI     void          srand48(long);
12309     void          srandom(unsigned);
12310     double        strtod(const char *restrict, char **restrict);

```

```

12311 float      strtouf(const char *restrict, char **restrict);
12312 long       strtoul(const char *restrict, char **restrict, int);
12313 long double strtold(const char *restrict, char **restrict);
12314 long long  strtoll(const char *restrict, char **restrict, int);
12315 unsigned long strtoul(const char *restrict, char **restrict, int);
12316 unsigned long long
12317 strtoull(const char *restrict, char **restrict, int);
12318 int        system(const char *);
12319 XSI int     unlockpt(int);
12320 CX int     unsetenv(const char *);
12321 size_t     wcstombs(char *restrict, const wchar_t *restrict, size_t);
12322 int        wctomb(char *, wchar_t);

12323 CX Inclusion of the <stdlib.h> header may also make visible all symbols from <stddef.h>,
12324 <limits.h>, <math.h>, and <sys/wait.h>.

```

## 12325 APPLICATION USAGE

## 12338 CHANGE HISTORY

12339 First released in Issue 3.

### 12340 Issue 5

12341 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

12342 The [ttypslot\(\)](#) and [valloc\(\)](#) functions are marked LEGACY.

12343 The type of the third argument to [initstate\(\)](#) is changed from **int** to **size\_t**. The type of the return  
12344 value from [setstate\(\)](#) is changed from **char \*** to **char \***, and the type of the first argument is  
12345 changed from **char \*** to **const char \***.

### 12346 Issue 6

12347 The Open Group Corrigendum U021/1 is applied, correcting the prototype for [realpath\(\)](#) to be  
12348 consistent with the reference page.

12349 The Open Group Corrigendum U028/13 is applied, correcting the prototype for [putenv\(\)](#) to be  
12350 consistent with the reference page.

12351 The [rand\\_r\(\)](#) function is marked as part of the Thread-Safe Functions option.

12352 Function prototypes for [setenv\(\)](#) and [unsetenv\(\)](#) are added.

12353 The [posix\\_memalign\(\)](#) function is added for alignment with IEEE Std 1003.1d-1999.

12354 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

- 12355 The *ecvt()*, *fcvt()*, *gcvt()*, and *mktemp()* functions are marked LEGACY.
- 12356 The *ttyslot()* and *valloc()* functions are removed as they were previously marked LEGACY.
- 12357 Extensions beyond the ISO C standard are marked.
- 12358 **Issue 7**
- 12359 SD5-XBD-ERN-79 and SD5-XBD-ERN-105 are applied.
- 12360 The LEGACY functions are removed.
- 12361 The *mkdtemp()* function is added from The Open Group Technical Standard, 2006, Extended API
- 12362 Set Part 1.
- 12363 The *rand\_r()* function is marked obsolescent.
- 12364 This reference page is clarified with respect to macros and symbolic constants.
- 12365 The type of the first argument to *setstate()* is changed from **const char \*** to **char \***.
- 12366 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0066 [197] is applied.

## 12367 NAME

12368 string.h — string operations

## 12369 SYNOPSIS

12370 #include &lt;string.h&gt;

## 12371 DESCRIPTION

12372 CX Some of the functionality described on this reference page extends the ISO C standard.  
 12373 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 472) to  
 12374 enable the visibility of these symbols in this header.

12375 The <string.h> header shall define NULL and size\_t as described in <stddef.h>.

12376 CX The <string.h> header shall define the locale\_t type as described in <locale.h>.

12377 The following shall be declared as functions and may also be defined as macros. Function  
 12378 prototypes shall be provided for use with ISO C standard compilers.

```

12379 XSI void *memcpy(void *restrict, const void *restrict, int, size_t);
12380 void *memchr(const void *, int, size_t);
12381 int memcmp(const void *, const void *, size_t);
12382 void *memcpy(void *restrict, const void *restrict, size_t);
12383 void *memmove(void *, const void *, size_t);
12384 void *memset(void *, int, size_t);
12385 CX char *strcpy(char *restrict, const char *restrict);
12386 char *strncpy(char *restrict, const char *restrict, size_t);
12387 char *strcat(char *restrict, const char *restrict);
12388 char *strchr(const char *, int);
12389 int strcmp(const char *, const char *);
12390 int strcoll(const char *, const char *);
12391 CX int strcoll_l(const char *, const char *, locale_t);
12392 char *strcpy(char *restrict, const char *restrict);
12393 size_t strcspn(const char *, const char *);
12394 CX char *strdup(const char *);
12395 char *strerror(int);
12396 CX char *strerror_l(int, locale_t);
12397 int strerror_r(int, char *, size_t);
12398 size_t strlen(const char *);
12399 char *strncat(char *restrict, const char *restrict, size_t);
12400 int strncmp(const char *, const char *, size_t);
12401 char *strncpy(char *restrict, const char *restrict, size_t);
12402 CX char *strndup(const char *, size_t);
12403 size_t strnlen(const char *, size_t);
12404 char *strpbrk(const char *, const char *);
12405 char *strrchr(const char *, int);
12406 CX char *strsignal(int);
12407 size_t strspn(const char *, const char *);
12408 char *strstr(const char *, const char *);
12409 char *strtok(char *restrict, const char *restrict);
12410 CX char *strtok_r(char *restrict, const char *restrict, char **restrict);
12411 size_t strxfrm(char *restrict, const char *restrict, size_t);
12412 CX size_t strxfrm_l(char *restrict, const char *restrict,
12413 size_t, locale_t);

```

12414	CX	Inclusion of the <string.h> header may also make visible all symbols from <stddef.h>.

12426		<b>CHANGE HISTORY</b>
12427		First released in Issue 1. Derived from Issue 1 of the SVID.
12428	<b>Issue 5</b>	
12429		The DESCRIPTION is updated for alignment with the POSIX Threads Extension.
12430	<b>Issue 6</b>	
12431		The <i>strtok_r()</i> function is marked as part of the Thread-Safe Functions option.
12432		This reference page is updated to align with the ISO/IEC 9899:1999 standard.
12433		The <i>strerror_r()</i> function is added in response to IEEE PASC Interpretation 1003.1c #39.
12434	<b>Issue 7</b>	
12435		SD5-XBD-ERN-15 is applied, correcting the prototype for the <i>strerror_r()</i> function.
12436		The <i>stpncpy()</i> , <i>stpncpy()</i> , <i>strndup()</i> , <i>strnlen()</i> , and <i>strsignal()</i> functions are added from The Open
12437		Group Technical Standard, 2006, Extended API Set Part 1.
12438		The <i>strcoll_l()</i> , <i>strerror_l()</i> , and <i>strxfrm_l()</i> functions are added from The Open Group Technical
12439		Standard, 2006, Extended API Set Part 4.
12440		This reference page is clarified with respect to macros and symbolic constants, and a declaration
12441		for the <i>locale_t</i> type is added.

12442 **NAME**

12443 strings.h — string operations

12444 **SYNOPSIS**

12445 #include &lt;strings.h&gt;

12446 **DESCRIPTION**

12447 The following shall be declared as functions and may also be defined as macros. Function  
 12448 prototypes shall be provided for use with ISO C standard compilers.

```
12449 XSI      int      ffs(int);
12450          int      strcasecmp(const char *, const char *);
12451          int      strcasecmp_l(const char *, const char *, locale_t);
12452          int      strncasecmp(const char *, const char *, size_t);
12453          int      strncasecmp_l(const char *, const char *, size_t, locale_t);
```

12454 The <strings.h> header shall define the **locale\_t** type as described in <locale.h>.12455 The <strings.h> header shall define the **size\_t** type as described in <sys/types.h>.12456 **APPLICATION USAGE**

12457 None.

12458 **RATIONALE**

12459 None.

12460 **FUTURE DIRECTIONS**

12461 None.

12462 **SEE ALSO**

12463 &lt;locale.h&gt;, &lt;sys/types.h&gt;

12464 XSH *ffs()*, *strcasecmp()*12465 **CHANGE HISTORY**

12466 First released in Issue 4, Version 2.

12467 **Issue 6**

12468 The Open Group Corrigendum U021/2 is applied, correcting the prototype for *index()* to be  
 12469 consistent with the reference page.

12470 The *bcmp()*, *bcopy()*, *bzero()*, *index()*, and *rindex()* functions are marked LEGACY.12471 **Issue 7**12472 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size\_t** type.

12473 The LEGACY functions are removed.

12474 The &lt;strings.h&gt; header is moved from the XSI option to the Base.

12475 The *strcasecmp\_l()* and *strncasecmp\_l()* functions are added from The Open Group Technical  
 12476 Standard, 2006, Extended API Set Part 4.

12477 A declaration for the **locale\_t** type is added.

12478 **NAME**

12479       stropts.h — STREAMS interface (**STREAMS**)

12480 **SYNOPSIS**

12481 OB XSR   #include <stropts.h>

12482 **DESCRIPTION**

12483       The <stropts.h> header shall define the **bandinfo** structure, which shall include at least the  
12484       following members:

12485       int                bi\_flag    Flushing type.  
12486       unsigned char    bi\_pri    Priority band.

12487       The <stropts.h> header shall define the **strpeek** structure, which shall include at least the  
12488       following members:

12489       struct strbuf    ctlbuf    The control portion of the message.  
12490       struct strbuf    databuf   The data portion of the message.  
12491       t\_uscalar\_t     flags     RS\_HIPRI or 0.

12492       The <stropts.h> header shall define the **strbuf** structure, which shall include at least the  
12493       following members:

12494       char   \*buf       Pointer to buffer.  
12495       int    len        Length of data.  
12496       int    maxlen    Maximum buffer length.

12497       The <stropts.h> header shall define the **strfdinsert** structure, which shall include at least the  
12498       following members:

12499       struct strbuf    ctlbuf    The control portion of the message.  
12500       struct strbuf    databuf   The data portion of the message.  
12501       int             fildes     File descriptor of the other STREAM.  
12502       t\_uscalar\_t     flags     RS\_HIPRI or 0.  
12503       int             offset     Relative location of the stored value.

12504       The <stropts.h> header shall define the **striocctl** structure, which shall include at least the  
12505       following members:

12506       int    ic\_cmd       *ioctl()* command.  
12507       char   \*ic\_dp       Pointer to buffer.  
12508       int    ic\_len       Length of data.  
12509       int    ic\_timeout   Timeout for response.

12510       The <stropts.h> header shall define the **strrecvfd** structure, which shall include at least the  
12511       following members:

12512       int    fd        Received file descriptor.  
12513       gid\_t   gid       GID of sender.  
12514       uid\_t   uid       UID of sender.

12515       The <stropts.h> header shall define the **uid\_t** and **gid\_t** types through **typedef**, as described in  
12516       <sys/types.h>.

12517       The <stropts.h> header shall define the **t\_scalar\_t** and **t\_uscalar\_t** types, respectively, as signed  
12518       and unsigned opaque types of equal length of at least 32 bits.

12519       The <stropts.h> header shall define the **str\_list** structure, which shall include at least the  
12520       following members:

```

12521 struct str_mlist *sl_modlist STREAMS module names.
12522 int sl_nmods Number of STREAMS module names.
12523 The <stropts.h> header shall define the str_mlist structure, which shall include at least the
12524 following member:
12525 char l_name[FMNAMESZ+1] A STREAMS module name.
12526 The <stropts.h> header shall define at least the following symbolic constants for use as the
12527 request argument to ioctl():
12528 I_ATMARK Is the top message “marked”?
12529 I_CANPUT Is a band writable?
12530 I_CKBAND See if any messages exist in a band.
12531 I_FDINSERT Send implementation-defined information about another STREAM.
12532 I_FIND Look for a STREAMS module.
12533 I_FLUSH Flush a STREAM.
12534 I_FLUSHBAND Flush one band of a STREAM.
12535 I_GETBAND Get the band of the top message on a STREAM.
12536 I_GETCLTIME Get close time delay.
12537 I_GETSIG Retrieve current notification signals.
12538 I_GRDOPT Get the read mode.
12539 I_GWROPT Get the write mode.
12540 I_LINK Connect two STREAMS.
12541 I_LIST Get all the module names on a STREAM.
12542 I_LOOK Get the top module name.
12543 I_NREAD Size the top message.
12544 I_PEEK Peek at the top message on a STREAM.
12545 I_PLINK Persistently connect two STREAMS.
12546 I_POP Pop a STREAMS module.
12547 I_PUNLINK Dismantle a persistent STREAMS link.
12548 I_PUSH Push a STREAMS module.
12549 I_RECVFD Get a file descriptor sent via I_SENDFD.
12550 I_SENDFD Pass a file descriptor through a STREAMS pipe.
12551 I_SETCLTIME Set close time delay.
12552 I_SETSIG Ask for notification signals.
12553 I_SRDOPT Set the read mode.
12554 I_STR Send a STREAMS ioctl().

```

12555	I_SWROPT	Set the write mode.
12556	I_UNLINK	Disconnect two STREAMs.
12557	The <stropts.h> header shall define at least the following symbolic constant for use with	
12558	I_LOOK:	
12559	FMNAMESZ	The minimum size in bytes of the buffer referred to by the <i>arg</i> argument.
12560	The <stropts.h> header shall define at least the following symbolic constants for use with	
12561	I_FLUSH:	
12562	FLUSHR	Flush read queues.
12563	FLUSHRW	Flush read and write queues.
12564	FLUSHW	Flush write queues.
12565	The <stropts.h> header shall define at least the following symbolic constants for use with	
12566	I_SETSIG:	
12567	S_BANDURG	When used in conjunction with S_RDBAND, SIGURG is generated instead of SIGPOLL when a priority message reaches the front of the STREAM head read queue.
12568		
12569		
12570	S_ERROR	Notification of an error condition reaches the STREAM head.
12571	S_HANGUP	Notification of a hangup reaches the STREAM head.
12572	S_HIPRI	A high-priority message is present on a STREAM head read queue.
12573	S_INPUT	A message, other than a high-priority message, has arrived at the head of a STREAM head read queue.
12574		
12575	S_MSG	A STREAMS signal message that contains the SIGPOLL signal reaches the front of the STREAM head read queue.
12576		
12577	S_OUTPUT	The write queue for normal data (priority band 0) just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) normal data downstream.
12578		
12579		
12580	S_RDBAND	A message with a non-zero priority band has arrived at the head of a STREAM head read queue.
12581		
12582	S_RDNORM	A normal (priority band set to 0) message has arrived at the head of a STREAM head read queue.
12583		
12584	S_WRBAND	The write queue for a non-zero priority band just below the STREAM head is no longer full.
12585		
12586	S_WRNORM	Equivalent to S_OUTPUT.
12587	The <stropts.h> header shall define at least the following symbolic constant for use with	
12588	I_PEEK:	
12589	RS_HIPRI	Only look for high-priority messages.
12590	The <stropts.h> header shall define at least the following symbolic constants for use with	
12591	I_SRDOPT:	
12592	RMSGD	Message-discard mode.

12593	RMSGN	Message-non-discard mode.
12594	RNORM	Byte-STREAM mode, the default.
12595	RPROTDAT	Deliver the control part of a message as data when a process issues a <i>read()</i> .
12596	RPROTDIS	Discard the control part of a message, delivering any data part, when a process issues a <i>read()</i> .
12597		
12598	RPROTNORM	Fail <i>read()</i> with [EBADMSG] if a message containing a control part is at the front of the STREAM head read queue.
12599		
12600	The <stropts.h> header shall define at least the following symbolic constant for use with	
12601	L_SWOPT:	
12602	SNDZERO	Send a zero-length message downstream when a <i>write()</i> of 0 bytes occurs.
12603	The <stropts.h> header shall define at least the following symbolic constants for use with	
12604	L_ATMARK:	
12605	ANYMARK	Check if the message is marked.
12606	LASTMARK	Check if the message is the last one marked on the queue.
12607	The <stropts.h> header shall define at least the following symbolic constant for use with	
12608	L_UNLINK:	
12609	MUXID_ALL	Unlink all STREAMs linked to the STREAM associated with <i>files</i> .
12610	The <stropts.h> header shall define the following symbolic constants for <i>getmsg()</i> , <i>getpmsg()</i> ,	
12611	<i>putmsg()</i> , and <i>putpmsg()</i> :	
12612	MORECTL	More control information is left in message.
12613	MOREDATA	More data is left in message.
12614	MSG_ANY	Receive any message.
12615	MSG_BAND	Receive message from specified band.
12616	MSG_HIPRI	Send/receive high-priority message.
12617	The <stropts.h> header may make visible all of the symbols from <unistd.h>.	
12618	The <stropts.h> header may also define macros for message types using names that start with	
12619	M_.	
12620	The following shall be declared as functions and may also be defined as macros. Function	
12621	prototypes shall be provided.	
12622	int	fattach(int, const char *);
12623	int	fdetach(const char *);
12624	int	getmsg(int, struct strbuf *restrict, struct strbuf *restrict,
12625		int *restrict);
12626	int	getpmsg(int, struct strbuf *restrict, struct strbuf *restrict,
12627		int *restrict, int *restrict);
12628	int	ioctl(int, int, ...);
12629	int	isastream(int);
12630	int	putmsg(int, const struct strbuf *, const struct strbuf *, int);
12631	int	putpmsg(int, const struct strbuf *, const struct strbuf *, int,
12632		int);

12633 **APPLICATION USAGE**

12634 None.

12635 **RATIONALE**

12636 None.

12643 **CHANGE HISTORY**

12644 First released in Issue 4, Version 2.

12645 **Issue 5**

12646 The *flags* members of the **strpeek** and **strfdinsert** structures are changed from **type long** to  
12647 **t\_uscalar\_t**.

12648 **Issue 6**

12649 This header is marked as part of the XSI STREAMS Option Group.

12650 The **restrict** keyword is added to the prototypes for [getmsg\(\)](#) and [getpmsg\(\)](#).

12651 **Issue 7**

12652 SD5-XBD-ERN-87 is applied, correcting an error in the **strrecvfd** structure.

12653 The **<stropts.h>** header is marked obsolescent.

12654 This reference page is clarified with respect to macros and symbolic constants.

12655 **NAME**

12656 sys/ipc.h — XSI interprocess communication access structure

12657 **SYNOPSIS**12658 XSI `#include <sys/ipc.h>`12659 **DESCRIPTION**

12660 The **<sys/ipc.h>** header is used by three mechanisms for XSI interprocess communication (IPC):  
 12661 messages, semaphores, and shared memory. All use a common structure type, **ipc\_perm**, to pass  
 12662 information used in determining permission to perform an IPC operation.

12663 The **<sys/ipc.h>** header shall define the **ipc\_perm** structure, which shall include the following  
 12664 members:

12665	uid_t	uid	Owner's user ID.
12666	gid_t	gid	Owner's group ID.
12667	uid_t	cuid	Creator's user ID.
12668	gid_t	cgid	Creator's group ID.
12669	mode_t	mode	Read/write permission.

12670 The **<sys/ipc.h>** header shall define the **uid\_t**, **gid\_t**, **mode\_t**, and **key\_t** types as described in  
 12671 **<sys/types.h>**.

12672 The **<sys/ipc.h>** header shall define the following symbolic constants.

12673 Mode bits:

12674	IPC_CREAT	Create entry if key does not exist.
12675	IPC_EXCL	Fail if key exists.
12676	IPC_NOWAIT	Error if request must wait.

12677 Keys:

12678	IPC_PRIVATE	Private key.
-------	-------------	--------------

12679 Control commands:

12680	IPC_RMID	Remove identifier.
12681	IPC_SET	Set options.
12682	IPC_STAT	Get options.

12683 The following shall be declared as a function and may also be defined as a macro. A function  
 12684 prototype shall be provided.

12685 `key_t ftok(const char *, int);`

12695 **CHANGE HISTORY**

12696 First released in Issue 2. Derived from System V Release 2.0.

12697 **Issue 7**

12698 This reference page is clarified with respect to macros and symbolic constants.

12699 **NAME**

12700 sys/mman.h — memory management declarations

12701 **SYNOPSIS**

12702 #include &lt;sys/mman.h&gt;

12703 **DESCRIPTION**12704 The <sys/mman.h> header shall define the following symbolic constants for use as protection  
12705 options:

12706 PROT\_EXEC Page can be executed.

12707 PROT\_NONE Page cannot be accessed.

12708 PROT\_READ Page can be read.

12709 PROT\_WRITE Page can be written.

12710 The &lt;sys/mman.h&gt; header shall define the following symbolic constants for use as flag options:

12711 MAP\_FIXED Interpret *addr* exactly.

12712 MAP\_PRIVATE Changes are private.

12713 MAP\_SHARED Share changes.

12714 XSI|SIO The <sys/mman.h> header shall define the following symbolic constants for the *msync()*  
12715 function:

12716 MS\_ASYNC Perform asynchronous writes.

12717 MS\_INVALIDATE Invalidate mappings.

12718 MS\_SYNC Perform synchronous writes.

12719 ML The <sys/mman.h> header shall define the following symbolic constants for the *mlockall()*  
12720 function:

12721 MCL\_CURRENT Lock currently mapped pages.

12722 MCL\_FUTURE Lock pages that become mapped.

12723 The <sys/mman.h> header shall define the symbolic constant MAP\_FAILED which shall have  
12724 type **void \*** and shall be used to indicate a failure from the *mmap()* function .12725 ADV If the Advisory Information option is supported, the <sys/mman.h> header shall define  
12726 symbolic constants for the *advice* argument to the *posix\_madvise()* function as follows:

12727 POSIX\_MADV\_DONTNEED

12728 The application expects that it will not access the specified range in the near future.

12729 POSIX\_MADV\_NORMAL

12730 The application has no advice to give on its behavior with respect to the specified range. It  
12731 is the default characteristic if no advice is given for a range of memory.

12732 POSIX\_MADV\_RANDOM

12733 The application expects to access the specified range in a random order.

12734 POSIX\_MADV\_SEQUENTIAL

12735 The application expects to access the specified range sequentially from lower addresses to  
12736 higher addresses.

12737		POSIX_MADV_WILLNEED
12738		The application expects to access the specified range in the near future.
12739	TYM	The <sys/mman.h> header shall define the following symbolic constants for use as flags for the <i>posix_typed_mem_open()</i> function:
12740		
12741		POSIX_TYPED_MEM_ALLOCATE
12742		Allocate on <i>mmap()</i> .
12743		POSIX_TYPED_MEM_ALLOCATE_CONTIG
12744		Allocate contiguously on <i>mmap()</i> .
12745		POSIX_TYPED_MEM_MAP_ALLOCATABLE
12746		Map on <i>mmap()</i> , without affecting allocatability.
12747		The <sys/mman.h> header shall define the <b>mode_t</b> , <b>off_t</b> , and <b>size_t</b> types as described in
12748		<sys/types.h>.
12749	TYM	The <sys/mman.h> header shall define the <b>posix_typed_mem_info</b> structure, which shall
12750		include at least the following member:
12751		<b>size_t</b> <i>posix_tmi_length</i> Maximum length which may be allocated
12752		from a typed memory object.
12753		The following shall be declared as functions and may also be defined as macros. Function
12754		prototypes shall be provided.
12755	MLR	<b>int</b> <i>mlock</i> (const void *, <b>size_t</b> );
12756	ML	<b>int</b> <i>mlockall</i> ( <b>int</b> );
12757		<b>void</b> * <i>mmap</i> (void *, <b>size_t</b> , <b>int</b> , <b>int</b> , <b>int</b> , <b>off_t</b> );
12758		<b>int</b> <i>mprotect</i> (void *, <b>size_t</b> , <b>int</b> );
12759	XSI SIO	<b>int</b> <i>msync</i> (void *, <b>size_t</b> , <b>int</b> );
12760	MLR	<b>int</b> <i>munlock</i> (const void *, <b>size_t</b> );
12761	ML	<b>int</b> <i>munlockall</i> (void);
12762		<b>int</b> <i>munmap</i> (void *, <b>size_t</b> );
12763	ADV	<b>int</b> <i>posix_madvise</i> (void *, <b>size_t</b> , <b>int</b> );
12764	TYM	<b>int</b> <i>posix_mem_offset</i> (const void *restrict, <b>size_t</b> , <b>off_t</b> *restrict,
12765		<b>size_t</b> *restrict, <b>int</b> *restrict);
12766		<b>int</b> <i>posix_typed_mem_get_info</i> ( <b>int</b> , struct <i>posix_typed_mem_info</i> *);
12767		<b>int</b> <i>posix_typed_mem_open</i> (const char *, <b>int</b> , <b>int</b> );
12768	SHM	<b>int</b> <i>shm_open</i> (const char *, <b>int</b> , <b>mode_t</b> );
12769		<b>int</b> <i>shm_unlink</i> (const char *);

12770 **APPLICATION USAGE**

12771 None.

12772 **RATIONALE**

12773 None.

12774 **FUTURE DIRECTIONS**

12775 None.

12776 **SEE ALSO**12777 [`<sys/types.h>`](#)

12778 XSH [`mlock\(\)`](#), [`mlockall\(\)`](#), [`mmap\(\)`](#), [`mprotect\(\)`](#), [`msync\(\)`](#), [`munmap\(\)`](#), [`posix\_madvise\(\)`](#),  
12779 [`posix\_mem\_offset\(\)`](#), [`posix\_typed\_mem\_get\_info\(\)`](#), [`posix\_typed\_mem\_open\(\)`](#), [`shm\_open\(\)`](#),  
12780 [`shm\_unlink\(\)`](#)

12781 **CHANGE HISTORY**

12782 First released in Issue 4, Version 2.

12783 **Issue 5**

12784 Updated for alignment with the POSIX Realtime Extension.

12785 **Issue 6**

12786 The [`<sys/mman.h>`](#) header is marked as dependent on support for either the Memory Mapped  
12787 Files, Process Memory Locking, or Shared Memory Objects options.

12788 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 12789 • The TYM margin code is added to the list of margin codes for the [`<sys/mman.h>`](#) header  
12790 line, as well as for other lines.
- 12791 • The POSIX\_TYPED\_MEM\_ALLOCATE, POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG,  
12792 and POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flags are added.
- 12793 • The [`posix\_tmi\_length`](#) structure is added.
- 12794 • The [`posix\_mem\_offset\(\)`](#), [`posix\_typed\_mem\_get\_info\(\)`](#), and [`posix\_typed\_mem\_open\(\)`](#) functions  
12795 are added.

12796 The **restrict** keyword is added to the prototype for [`posix\_mem\_offset\(\)`](#).12797 IEEE PASC Interpretation 1003.1 #102 is applied, adding the prototype for [`posix\_madvise\(\)`](#).

12798 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/16 is applied, correcting margin code and  
12799 shading errors for the [`mlock\(\)`](#) and [`munlock\(\)`](#) functions.

12800 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code  
12801 for the [`mmap\(\)`](#) function from MF|SHM to MC3 (notation for MF|SHM|TYM).

12802 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code  
12803 for the [`munmap\(\)`](#) function from MF|SHM to MC3 (notation for MF|SHM|TYM).

12804 **Issue 7**

12805 SD5-XBD-ERN-5 is applied, rewriting the DESCRIPTION.

12806 Functionality relating to the Memory Protection and Memory Mapped Files options is moved to  
12807 the Base.

12808 This reference page is clarified with respect to macros and symbolic constants.

12809 **NAME**

12810 sys/msg.h — XSI message queue structures

12811 **SYNOPSIS**12812 XSI `#include <sys/msg.h>`12813 **DESCRIPTION**12814 The <sys/msg.h> header shall define the following data types through **typedef**:12815 **msgqnum\_t** Used for the number of messages in the message queue.12816 **msglen\_t** Used for the number of bytes allowed in a message queue.12817 These types shall be unsigned integer types that are able to store values at least as large as a type  
12818 **unsigned short**.12819 The <sys/msg.h> header shall define the following symbolic constant as a message operation  
12820 flag:12821 **MSG\_NOERROR** No error if big message.12822 The <sys/msg.h> header shall define the **msqid\_ds** structure, which shall include the following  
12823 members:

12824	<code>struct ipc_perm</code>	<code>msg_perm</code>	Operation permission structure.
12825	<code>msgqnum_t</code>	<code>msg_qnum</code>	Number of messages currently on queue.
12826	<code>msglen_t</code>	<code>msg_qbytes</code>	Maximum number of bytes allowed on queue.
12827	<code>pid_t</code>	<code>msg_lspid</code>	Process ID of last <i>msgsnd()</i> .
12828	<code>pid_t</code>	<code>msg_lrpid</code>	Process ID of last <i>msgrcv()</i> .
12829	<code>time_t</code>	<code>msg_stime</code>	Time of last <i>msgsnd()</i> .
12830	<code>time_t</code>	<code>msg_rtime</code>	Time of last <i>msgrcv()</i> .
12831	<code>time_t</code>	<code>msg_ctime</code>	Time of last change.

12832 The <sys/msg.h> header shall define the **pid\_t**, **size\_t**, **ssize\_t**, and **time\_t** types as described in  
12833 <sys/types.h>.12834 The following shall be declared as functions and may also be defined as macros. Function  
12835 prototypes shall be provided.

```

12836 int      msgctl(int, int, struct msqid_ds *);
12837 int      msgget(key_t, int);
12838 ssize_t  msgrcv(int, void *, size_t, long, int);
12839 int      msgsnd(int, const void *, size_t, int);

```

12840 In addition, the &lt;sys/msg.h&gt; header shall include the &lt;sys/ipc.h&gt; header.

12841 **APPLICATION USAGE**

12842 None.

12843 **RATIONALE**

12844 None.

12845 **FUTURE DIRECTIONS**

12846 None.

12850 **CHANGE HISTORY**

12851 First released in Issue 2. Derived from System V Release 2.0.

12852 **Issue 7**

12853 Austin Group Interpretation 1003.1-2001 #179 is applied.

12854 This reference page is clarified with respect to macros and symbolic constants.

## 12855 NAME

12856 sys/resource.h — definitions for XSI resource operations

## 12857 SYNOPSIS

12858 XSI `#include <sys/resource.h>`

## 12859 DESCRIPTION

12860 The <sys/resource.h> header shall define the following symbolic constants as possible values of  
12861 the *which* argument of *getpriority()* and *setpriority()*:

12862 PRIO\_PROCESS Identifies the *who* argument as a process ID.

12863 PRIO\_PGRP Identifies the *who* argument as a process group ID.

12864 PRIO\_USER Identifies the *who* argument as a user ID.

12865 The <sys/resource.h> header shall define the following type through **typedef**:

12866 **rlim\_t** Unsigned integer type used for limit values.

12867 The <sys/resource.h> header shall define the following symbolic constants, which shall have  
12868 values suitable for use in **#if** preprocessing directives:

12869 RLIM\_INFINITY A value of **rlim\_t** indicating no limit.

12870 RLIM\_SAVED\_MAX A value of type **rlim\_t** indicating an unrepresentable saved hard  
12871 limit.

12872 RLIM\_SAVED\_CUR A value of type **rlim\_t** indicating an unrepresentable saved soft limit.

12873 On implementations where all resource limits are representable in an object of type **rlim\_t**,  
12874 RLIM\_SAVED\_MAX and RLIM\_SAVED\_CUR need not be distinct from RLIM\_INFINITY.

12875 The <sys/resource.h> header shall define the following symbolic constants as possible values of  
12876 the *who* parameter of *getrusage()*:

12877 RUSAGE\_SELF Returns information about the current process.

12878 RUSAGE\_CHILDREN Returns information about children of the current process.

12879 The <sys/resource.h> header shall define the **rlimit** structure, which shall include at least the  
12880 following members:

12881 **rlim\_t** **rlim\_cur** The current (soft) limit.

12882 **rlim\_t** **rlim\_max** The hard limit.

12883 The <sys/resource.h> header shall define the **rusage** structure, which shall include at least the  
12884 following members:

12885 **struct timeval** **ru\_utime** User time used.

12886 **struct timeval** **ru\_stime** System time used.

12887 The <sys/resource.h> header shall define the **timeval** structure as described in <sys/time.h>.

12888 The <sys/resource.h> header shall define the following symbolic constants as possible values for  
12889 the *resource* argument of *getrlimit()* and *setrlimit()*:

12890 RLIMIT\_CORE Limit on size of **core** file.

12891 RLIMIT\_CPU Limit on CPU time per process.

12892	RLIMIT_DATA	Limit on data segment size.
12893	RLIMIT_FSIZE	Limit on file size.
12894	RLIMIT_NOFILE	Limit on number of open files.
12895	RLIMIT_STACK	Limit on stack size.
12896	RLIMIT_AS	Limit on address space size.
12897	The following shall be declared as functions and may also be defined as macros. Function	
12898	prototypes shall be provided.	
12899	<code>int getpriority(int, id_t);</code>	
12900	<code>int getrlimit(int, struct rlimit *);</code>	
12901	<code>int getrusage(int, struct rusage *);</code>	
12902	<code>int setpriority(int, id_t, int);</code>	
12903	<code>int setrlimit(int, const struct rlimit *);</code>	
12904	The <sys/resource.h> header shall define the <code>id_t</code> type through <b>typedef</b> , as described in	
12905	<sys/types.h>.	
12906	Inclusion of the <sys/resource.h> header may also make visible all symbols from <sys/time.h>.	
12907	<b>APPLICATION USAGE</b>	
12908	None.	
12909	<b>RATIONALE</b>	
12910	None.

12922 **NAME**

12923 sys/select.h — select types

12924 **SYNOPSIS**

12925 #include <sys/select.h>

12926 **DESCRIPTION**

12927 The <sys/select.h> header shall define the **timeval** structure, which shall include at least the  
12928 following members:

12929	time_t	tv_sec	Seconds.
12930	suseconds_t	tv_usec	Microseconds.

12931 The <sys/select.h> header shall define the **time\_t** and **suseconds\_t** types as described in  
12932 <sys/types.h>.

12933 The <sys/select.h> header shall define the **sigset\_t** type as described in <signal.h>.

12934 The <sys/select.h> header shall define the **timespec** structure as described in <time.h>.

12935 The <sys/select.h> header shall define the **fd\_set** type as a structure.

12936 The <sys/select.h> header shall define the following symbolic constant, which shall have a value  
12937 suitable for use in #if preprocessing directives:

12938 FD\_SETSIZE Maximum number of file descriptors in an **fd\_set** structure.

12939 The following shall be declared as functions, defined as macros, or both. If functions are  
12940 declared, function prototypes shall be provided.

```
12941 void FD_CLR(int, fd_set *);
12942 int FD_ISSET(int, fd_set *);
12943 void FD_SET(int, fd_set *);
12944 void FD_ZERO(fd_set *);
```

12945 If implemented as macros, these may evaluate their arguments more than once, so applications  
12946 should ensure that the arguments they supply are never expressions with side-effects.

12947 The following shall be declared as functions and may also be defined as macros. Function  
12948 prototypes shall be provided.

```
12949 int pselect(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
12950             const struct timespec *restrict, const sigset_t *restrict);
12951 int select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
12952            struct timeval *restrict);
```

12953 Inclusion of the <sys/select.h> header may make visible all symbols from the headers  
12954 <signal.h> and <time.h>.

12955 **APPLICATION USAGE**

12956 None.

12957 **RATIONALE**

12958 None.

12959 **FUTURE DIRECTIONS**

12960 None.

12961 **SEE ALSO**12962 [<signal.h>](#), [<sys/time.h>](#), [<sys/types.h>](#), [<time.h>](#)12963 XSH [pselect\(\)](#)12964 **CHANGE HISTORY**

12965 First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

12966 The requirement for the **fd\_set** structure to have a member *fds\_bits* has been removed as per The  
12967 Open Group Base Resolution bwg2001-005.12968 **Issue 7**

12969 SD5-XBD-ERN-6 is applied, reordering the DESCRIPTION.

12970 This reference page is clarified with respect to macros and symbolic constants.

12971 **NAME**

12972 sys/sem.h — XSI semaphore facility

12973 **SYNOPSIS**12974 XSI `#include <sys/sem.h>`12975 **DESCRIPTION**12976 The **<sys/sem.h>** header shall define the following symbolic constant for use as a semaphore  
12977 operation flag:

12978 SEM\_UNDO Set up adjust on exit entry.

12979 The **<sys/sem.h>** header shall define the following symbolic constants for use as commands for  
12980 the *semctl()* function:12981 GETNCNT Get *semmcnt*.12982 GETPID Get *sempid*.12983 GETVAL Get *semval*.12984 GETALL Get all cases of *semval*.12985 GETZCNT Get *semzcnt*.12986 SETVAL Set *semval*.12987 SETALL Set all cases of *semval*.12988 The **<sys/sem.h>** header shall define the **semid\_ds** structure, which shall include the following  
12989 members:

12990 struct ipc\_perm sem\_perm Operation permission structure.

12991 unsigned short sem\_nsems Number of semaphores in set.

12992 time\_t sem\_otime Last *semop()* time.12993 time\_t sem\_ctime Last time changed by *semctl()*.12994 The **<sys/sem.h>** header shall define the **pid\_t**, **size\_t**, and **time\_t** types as described in  
12995 **<sys/types.h>**.12996 A semaphore shall be represented by an anonymous structure, which shall include the following  
12997 members:

12998 unsigned short semval Semaphore value.

12999 pid\_t sempid Process ID of last operation.

13000 unsigned short semncnt Number of processes waiting for *semval*  
13001 to become greater than current value.13002 unsigned short semzcnt Number of processes waiting for *semval*  
13003 to become 0.13004 The **<sys/sem.h>** header shall define the **sembuf** structure, which shall include the following  
13005 members:

13006 unsigned short sem\_num Semaphore number.

13007 short sem\_op Semaphore operation.

13008 short sem\_flg Operation flags.

13009 The following shall be declared as functions and may also be defined as macros. Function  
13010 prototypes shall be provided.

13011 int semctl(int, int, int, ...);

13012           int     semget(key\_t, int, int);  
13013           int     semop(int, struct sembuf \*, size\_t);

13014           In addition, the <sys/sem.h> header shall include the <sys/ipc.h> header.

#### 13015 APPLICATION USAGE

13016           None.

#### 13017 RATIONALE

13018           None.

#### 13024 CHANGE HISTORY

13025           First released in Issue 2. Derived from System V Release 2.0.

#### 13026 Issue 7

13027           Austin Group Interpretation 1003.1-2001 #179 is applied.

13028           This reference page is clarified with respect to macros and symbolic constants.

## 13029 NAME

13030 sys/shm.h — XSI shared memory facility

## 13031 SYNOPSIS

13032 XSI `#include <sys/shm.h>`

## 13033 DESCRIPTION

13034 The <sys/shm.h> header shall define the following symbolic constants:

13035 SHM\_RDONLY Attach read-only (else read-write).

13036 SHM\_RND Round attach address to SHMLBA.

13037 SHMLBA Segment low boundary address multiple.

13038 The <sys/shm.h> header shall define the following data types through **typedef**:

13039 **shmatt\_t** Unsigned integer used for the number of current attaches that must be able to  
13040 store values at least as large as a type **unsigned short**.

13041 The <sys/shm.h> header shall define the **shmid\_ds** structure, which shall include the following  
13042 members:

13043	struct ipc_perm	shm_perm	Operation permission structure.
13044	size_t	shm_segsz	Size of segment in bytes.
13045	pid_t	shm_lpid	Process ID of last shared memory operation.
13046	pid_t	shm_cpid	Process ID of creator.
13047	shmatt_t	shm_nattch	Number of current attaches.
13048	time_t	shm_atime	Time of last <i>shmat</i> ( ).
13049	time_t	shm_dtime	Time of last <i>shmdt</i> ( ).
13050	time_t	shm_ctime	Time of last change by <i>shmctl</i> ( ).

13051 The <sys/shm.h> header shall define the **pid\_t**, **size\_t**, and **time\_t** types as described in  
13052 <sys/types.h>.

13053 The following shall be declared as functions and may also be defined as macros. Function  
13054 prototypes shall be provided.

```
13055 void *shmat(int, const void *, int);
13056 int shmctl(int, int, struct shmid_ds *);
13057 int shmdt(const void *);
13058 int shmget(key_t, size_t, int);
```

13059 In addition, the <sys/shm.h> header shall include the <sys/ipc.h> header.

13069 **CHANGE HISTORY**

13070 First released in Issue 2. Derived from System V Release 2.0.

13071 **Issue 5**

13072 The type of *shm\_segsz* is changed from **int** to **size\_t**.

13073 **Issue 7**

13074 Austin Group Interpretation 1003.1-2001 #179 is applied.

13075 This reference page is clarified with respect to macros and symbolic constants.

13076 **NAME**

13077 sys/socket.h — main sockets header

13078 **SYNOPSIS**

13079 #include &lt;sys/socket.h&gt;

13080 **DESCRIPTION**13081 The <sys/socket.h> header shall define the **socklen\_t** type, which is an integer type of width of  
13082 at least 32 bits; see APPLICATION USAGE.13083 The <sys/socket.h> header shall define the **sa\_family\_t** unsigned integer type.13084 The <sys/socket.h> header shall define the **sockaddr** structure, which shall include at least the  
13085 following members:13086 sa\_family\_t sa\_family Address family.  
13087 char sa\_data[] Socket address (variable-length data).13088 The **sockaddr** structure is used to define a socket address which is used in the *bind()*, *connect()*,  
13089 *getpeername()*, *getsockname()*, *recvfrom()*, and *sendto()* functions.13090 The <sys/socket.h> header shall define the **sockaddr\_storage** structure, which shall be:

- 13091
- Large enough to accommodate all supported protocol-specific address structures
  - Aligned at an appropriate boundary so that pointers to it can be cast as pointers to  
13092 protocol-specific address structures and used to access the fields of those structures  
13093 without alignment problems
- 13094

13095 The **sockaddr\_storage** structure shall include at least the following members:

13096 sa\_family\_t ss\_family

13097 When a pointer to a **sockaddr\_storage** structure is cast as a pointer to a **sockaddr** structure, the  
13098 *ss\_family* field of the **sockaddr\_storage** structure shall map onto the *sa\_family* field of the  
13099 **sockaddr** structure. When a pointer to a **sockaddr\_storage** structure is cast as a pointer to a  
13100 protocol-specific address structure, the *ss\_family* field shall map onto a field of that structure that  
13101 is of type **sa\_family\_t** and that identifies the protocol's address family.13102 The <sys/socket.h> header shall define the **msghdr** structure, which shall include at least the  
13103 following members:13104 void \*msg\_name Optional address.  
13105 socklen\_t msg\_namelen Size of address.  
13106 struct iovec \*msg\_iov Scatter/gather array.  
13107 int msg\_iovlen Members in *msg\_iov*.  
13108 void \*msg\_control Ancillary data; see below.  
13109 socklen\_t msg\_controllen Ancillary data buffer *len*.  
13110 int msg\_flags Flags on received message.13111 The **msghdr** structure is used to minimize the number of directly supplied parameters to the  
13112 *recvmsg()* and *sendmsg()* functions. This structure is used as a *value-result* parameter in the  
13113 *recvmsg()* function and *value* only for the *sendmsg()* function.13114 The <sys/socket.h> header shall define the **iovec** structure as described in <sys/uio.h>.13115 The <sys/socket.h> header shall define the **cmsg\_hdr** structure, which shall include at least the  
13116 following members:13117 socklen\_t cmsg\_len Data byte count, including the **cmsg\_hdr**.  
13118 int cmsg\_level Originating protocol.

13119           int            cmsg\_type    Protocol-specific type.

13120   The **cmsg\_hdr** structure is used for storage of ancillary data object information.

13121   Ancillary data consists of a sequence of pairs, each consisting of a **cmsg\_hdr** structure followed  
 13122   by a data array. The data array contains the ancillary data message, and the **cmsg\_hdr** structure  
 13123   contains descriptive information that allows an application to correctly parse the data.

13124   The values for *cmsg\_level* shall be legal values for the *level* argument to the *getsockopt()* and  
 13125   *setsockopt()* functions. The system documentation shall specify the *cmsg\_type* definitions for the  
 13126   supported protocols.

13127   Ancillary data is also possible at the socket level. The **<sys/socket.h>** header shall define the  
 13128   following symbolic constant for use as the *cmsg\_type* value when *cmsg\_level* is SOL\_SOCKET:

13129   SCM\_RIGHTS           Indicates that the data array contains the access rights to be sent or  
 13130                           received.

13131   The **<sys/socket.h>** header shall define the following macros to gain access to the data arrays in  
 13132   the ancillary data associated with a message header:

13133   CMMSG\_DATA(*cmsg*)  
 13134       If the argument is a pointer to a **cmsg\_hdr** structure, this macro shall return an unsigned  
 13135       character pointer to the data array associated with the **cmsg\_hdr** structure.

13136   CMMSG\_NXTHDR(*mhdr, cmsg*)  
 13137       If the first argument is a pointer to a **msghdr** structure and the second argument is a pointer  
 13138       to a **cmsg\_hdr** structure in the ancillary data pointed to by the *msg\_control* field of that  
 13139       **msghdr** structure, this macro shall return a pointer to the next **cmsg\_hdr** structure, or a null  
 13140       pointer if this structure is the last **cmsg\_hdr** in the ancillary data.

13141   CMMSG\_FIRSTHDR(*mhdr*)  
 13142       If the argument is a pointer to a **msghdr** structure, this macro shall return a pointer to the  
 13143       first **cmsg\_hdr** structure in the ancillary data associated with this **msghdr** structure, or a null  
 13144       pointer if there is no ancillary data associated with the **msghdr** structure.

13145   The **<sys/socket.h>** header shall define the **linger** structure, which shall include at least the  
 13146   following members:

13147   int   l\_onoff    Indicates whether linger option is enabled.  
 13148   int   l\_linger   Linger time, in seconds.

13149   The **<sys/socket.h>** header shall define the following symbolic constants with distinct values:

13150   SOCK\_DGRAM        Datagram socket.

13151   RS   SOCK\_RAW       Raw Protocol Interface.

13152   SOCK\_SEQPACKET   Sequenced-packet socket.

13153   SOCK\_STREAM       Byte-stream socket.

13154   The **<sys/socket.h>** header shall define the following symbolic constant for use as the *level*  
 13155   argument of *setsockopt()* and *getsockopt()*.

13156   SOL\_SOCKET        Options to be accessed at socket level, not protocol level.

13157   The **<sys/socket.h>** header shall define the following symbolic constants with distinct values for  
 13158   use as the *option\_name* argument in *getsockopt()* or *setsockopt()* calls (see XSH [Section 2.10.16](#), on  
 13159   page 528):

13160	SO_ACCEPTCONN	Socket is accepting connections.
13161	SO_BROADCAST	Transmission of broadcast messages is supported.
13162	SO_DEBUG	Debugging information is being recorded.
13163	SO_DONTROUTE	Bypass normal routing.
13164	SO_ERROR	Socket error status.
13165	SO_KEEPALIVE	Connections are kept alive with periodic messages.
13166	SO_LINGER	Socket lingers on close.
13167	SO_OOBLIN	Out-of-band data is transmitted in line.
13168	SO_RCVBUF	Receive buffer size.
13169	SO_RCVLOWAT	Receive “low water mark”.
13170	SO_RCVTIMEO	Receive timeout.
13171	SO_REUSEADDR	Reuse of local addresses is supported.
13172	SO_SNDBUF	Send buffer size.
13173	SO_SNDLOWAT	Send “low water mark”.
13174	SO_SNDTIMEO	Send timeout.
13175	SO_TYPE	Socket type.
13176	The <sys/socket.h> header shall define the following symbolic constant for use as the maximum	
13177	<i>backlog</i> queue length which may be specified by the <i>backlog</i> field of the <i>listen()</i> function:	
13178	SOMAXCONN	The maximum <i>backlog</i> queue length.
13179	The <sys/socket.h> header shall define the following symbolic constants with distinct values for	
13180	use as the valid values for the <i>msg_flags</i> field in the <b>msghdr</b> structure, or the <i>flags</i> parameter in	
13181	<i>recv()</i> , <i>recvfrom()</i> , <i>recvmsg()</i> , <i>send()</i> , <i>sendmsg()</i> , or <i>sendto()</i> calls:	
13182	MSG_CTRUNC	Control data truncated.
13183	MSG_DONTROUTE	Send without using routing tables.
13184	MSG_EOR	Terminates a record (if supported by the protocol).
13185	MSG_OOB	Out-of-band data.
13186	MSG_NOSIGNAL	No SIGPIPE generated when an attempt to send is made on a stream-
13187		oriented socket that is no longer connected.
13188	MSG_PEEK	Leave received data in queue.
13189	MSG_TRUNC	Normal data truncated.
13190	MSG_WAITALL	Attempt to fill the read buffer.
13191	The <sys/socket.h> header shall define the following symbolic constants with distinct values:	
13192	AF_INET	Internet domain sockets for use with IPv4 addresses.
13193	IP6 AF_INET6	Internet domain sockets for use with IPv6 addresses.
13194	AF_UNIX	UNIX domain sockets.

13195 AF\_UNSPEC Unspecified.

13196 The value of AF\_UNSPEC shall be 0. +

13197 The <sys/socket.h> header shall define the following symbolic constants with distinct values:

13198 SHUT\_RD Disables further receive operations.

13199 SHUT\_RDWR Disables further send and receive operations.

13200 SHUT\_WR Disables further send operations.

13201 The <sys/socket.h> header shall define the **size\_t** and **ssize\_t** types as described in

13202 <sys/types.h>.

13203 The following shall be declared as functions and may also be defined as macros. Function

13204 prototypes shall be provided.

```

13205 int accept(int, struct sockaddr *restrict, socklen_t *restrict);
13206 int bind(int, const struct sockaddr *, socklen_t);
13207 int connect(int, const struct sockaddr *, socklen_t);
13208 int getpeername(int, struct sockaddr *restrict, socklen_t *restrict);
13209 int getsockname(int, struct sockaddr *restrict, socklen_t *restrict);
13210 int getsockopt(int, int, int, void *restrict, socklen_t *restrict);
13211 int listen(int, int);
13212 ssize_t recv(int, void *, size_t, int);
13213 ssize_t recvfrom(int, void *restrict, size_t, int,
13214 struct sockaddr *restrict, socklen_t *restrict);
13215 ssize_t recvmsg(int, struct msghdr *, int);
13216 ssize_t send(int, const void *, size_t, int);
13217 ssize_t sendmsg(int, const struct msghdr *, int);
13218 ssize_t sendto(int, const void *, size_t, int, const struct sockaddr *,
13219 socklen_t);
13220 int setsockopt(int, int, int, const void *, socklen_t);
13221 int shutdown(int, int);
13222 int socketatmark(int);
13223 int socket(int, int, int);
13224 int socketpair(int, int, int, int [2]);

```

13225 Inclusion of <sys/socket.h> may also make visible all symbols from <sys/uio.h>.

## 13226 APPLICATION USAGE

13227 To forestall portability problems, it is recommended that applications not use values larger than

13228  $2^{31} - 1$  for the **socklen\_t** type.

13229 The **sockaddr\_storage** structure solves the problem of declaring storage for automatic variables

13230 which is both large enough and aligned enough for storing the socket address data structure of

13231 any family. For example, code with a file descriptor and without the context of the address

13232 family can pass a pointer to a variable of this type, where a pointer to a socket address structure

13233 is expected in calls such as *getpeername()*, and determine the address family by accessing the

13234 received content after the call.

13235 The example below illustrates a data structure which aligns on a 64-bit boundary. An

13236 implementation-defined field *\_ss\_align* following *\_ss\_pad1* is used to force a 64-bit alignment

13237 which covers proper alignment good enough for needs of at least **sockaddr\_in6** (IPv6) and

13238 **sockaddr\_in** (IPv4) address data structures. The size of padding field *\_ss\_pad1* depends on the

13239 chosen alignment boundary. The size of padding field *\_ss\_pad2* depends on the value of overall

13240 size chosen for the total size of the structure. This size and alignment are represented in the

above example by implementation-defined (not required) constants `_SS_MAXSIZE` (chosen value 128) and `_SS_ALIGNMENT` (with chosen value 8). Constants `_SS_PAD1SIZE` (derived value 6) and `_SS_PAD2SIZE` (derived value 112) are also for illustration and not required. The implementation-defined definitions and structure field names above start with an <underscore> to denote implementation private name space. Portable code is not expected to access or reference those fields or constants.

```

/*
 * Desired design of maximum size and alignment.
 */
#define _SS_MAXSIZE 128
/* Implementation-defined maximum size. */
#define _SS_ALIGNSIZE (sizeof(int64_t))
/* Implementation-defined desired alignment. */

/*
 * Definitions used for sockaddr_storage structure paddings design.
 */
#define _SS_PAD1SIZE (_SS_ALIGNSIZE - sizeof(sa_family_t))
#define _SS_PAD2SIZE (_SS_MAXSIZE - (sizeof(sa_family_t)+ \
                                   _SS_PAD1SIZE + _SS_ALIGNSIZE))
struct sockaddr_storage {
    sa_family_t  ss_family; /* Address family. */
/*
 * Following fields are implementation-defined.
 */
    char _ss_pad1[_SS_PAD1SIZE];
    /* 6-byte pad; this is to make implementation-defined
       pad up to alignment field that follows explicit in
       the data structure. */
    int64_t _ss_align; /* Field to force desired structure
                       storage alignment. */
    char _ss_pad2[_SS_PAD2SIZE];
    /* 112-byte pad to achieve desired size,
       _SS_MAXSIZE value minus size of ss_family
       __ss_pad1, __ss_align fields is 112. */
};

```

#### RATIONALE

None.

#### FUTURE DIRECTIONS

None.

#### SEE ALSO

XSH *accept()*, *bind()*, *connect()*, *getpeername()*, *getsockname()*, *getsockopt()*, *listen()*, *recv()*, *recvfrom()*, *recvmsg()*, *send()*, *sendmsg()*, *sendto()*, *setsockopt()*, *shutdown()*, *socketatmark()*, *socket()*, *socketpair()*

#### CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the prototypes for *accept()*, *getpeername()*, *getsockname()*, *getsockopt()*, and *recvfrom()*.

13289 **Issue 7**

13290 SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **ssize\_t** type.

13291 SD5-XBD-ERN-62 is applied.

13292 The MSG\_NOSIGNAL symbolic constant is added from The Open Group Technical Standard,  
13293 2006, Extended API Set Part 2.

13294 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
13295 for the **size\_t** type is added.

13296 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0067 [355] is applied.

13297 **NAME**13298 sys/stat.h — data returned by the `stat()` function13299 **SYNOPSIS**

13300 #include &lt;sys/stat.h&gt;

13301 **DESCRIPTION**13302 The <sys/stat.h> header shall define the structure of the data returned by the `fstat()`, `lstat()`, and  
13303 `stat()` functions.13304 The <sys/stat.h> header shall define the **stat** structure, which shall include at least the following  
13305 members:

13306	<code>dev_t st_dev</code>	Device ID of device containing file.
13307	<code>ino_t st_ino</code>	File serial number.
13308	<code>mode_t st_mode</code>	Mode of file (see below).
13309	<code>nlink_t st_nlink</code>	Number of hard links to the file.
13310	<code>uid_t st_uid</code>	User ID of file.
13311	<code>gid_t st_gid</code>	Group ID of file.
13312	XSI <code>dev_t st_rdev</code>	Device ID (if file is character or block special).
13313	<code>off_t st_size</code>	For regular files, the file size in bytes.
13314		For symbolic links, the length in bytes of the
13315		pathname contained in the symbolic link.
13316	SHM	For a shared memory object, the length in bytes.
13317	TYM	For a typed memory object, the length in bytes.
13318		For other file types, the use of this field is
13319		unspecified.
13320	<code>struct timespec st_atim</code>	Last data access timestamp.
13321	<code>struct timespec st_mtim</code>	Last data modification timestamp.
13322	<code>struct timespec st_ctim</code>	Last file status change timestamp.
13323	XSI <code>blksize_t st_blksize</code>	A file system-specific preferred I/O block size
13324		for this object. In some file system types, this
13325		may vary from file to file.
13326	<code>blkcnt_t st_blocks</code>	Number of blocks allocated for this object.

13327 The `st_ino` and `st_dev` fields taken together uniquely identify the file within the system.13328 XSI The <sys/stat.h> header shall define the **blkcnt\_t**, **blksize\_t**, **dev\_t**, **ino\_t**, **mode\_t**, **nlink\_t**,  
13329 **uid\_t**, **gid\_t**, **off\_t**, and **time\_t** types as described in <sys/types.h>.13330 The <sys/stat.h> header shall define the **timespec** structure as described in <time.h>. Times  
13331 shall be given in seconds since the Epoch.13332 Which structure members have meaningful values depends on the type of file. For further  
13333 information, see the descriptions of `fstat()`, `lstat()`, and `stat()` in the System Interfaces volume of  
13334 POSIX.1-2008.13335 For compatibility with earlier versions of this standard, the `st_atime` macro shall be defined with  
13336 the value `st_atim.tv_sec`. Similarly, `st_ctime` and `st_mtime` shall be defined as macros with the  
13337 values `st_ctim.tv_sec` and `st_mtim.tv_sec`, respectively.

The <sys/stat.h> header shall define the following symbolic constants for the file types encoded in type **mode\_t**. The values shall be suitable for use in **#if** preprocessing directives:

S_IFMT	Type of file.
S_IFBLK	Block special.
S_IFCHR	Character special.
S_IFIFO	FIFO special.
S_IFREG	Regular.
S_IFDIR	Directory.
S_IFLNK	Symbolic link.
S_IFSOCK	Socket.

The <sys/stat.h> header shall define the following symbolic constants for the file mode bits encoded in type **mode\_t**, with the indicated numeric values. These macros shall expand to an expression which has a type that allows them to be used, either singly or OR'ed together, as the third argument to *open()* without the need for a **mode\_t** cast. The values shall be suitable for use in **#if** preprocessing directives.

Name	Numeric Value	Description
S_IRWXU	0700	Read, write, execute/search by owner.
S_IRUSR	0400	Read permission, owner.
S_IWUSR	0200	Write permission, owner.
S_IXUSR	0100	Execute/search permission, owner.
S_IRWXG	070	Read, write, execute/search by group.
S_IRGRP	040	Read permission, group.
S_IWGRP	020	Write permission, group.
S_IXGRP	010	Execute/search permission, group.
S_IRWXO	07	Read, write, execute/search by others.
S_IROTH	04	Read permission, others.
S_IWOTH	02	Write permission, others.
S_IXOTH	01	Execute/search permission, others.
S_ISUID	04000	Set-user-ID on execution.
S_ISGID	02000	Set-group-ID on execution.
S_ISVTX	01000	On directories, restricted deletion flag.

The following macros shall be provided to test whether a file is of the specified type. The value *m* supplied to the macros is the value of *st\_mode* from a **stat** structure. The macro shall evaluate to a non-zero value if the test is true; 0 if the test is false.

S_ISBLK( <i>m</i> )	Test for a block special file.
S_ISCHR( <i>m</i> )	Test for a character special file.
S_ISDIR( <i>m</i> )	Test for a directory.
S_ISFIFO( <i>m</i> )	Test for a pipe or FIFO special file.
S_ISREG( <i>m</i> )	Test for a regular file.

13377		<code>S_ISLNK(<i>m</i>)</code>	Test for a symbolic link.
13378		<code>S_ISSOCK(<i>m</i>)</code>	Test for a socket.
13379		The implementation may implement message queues, semaphores, or shared memory objects as distinct file types. The following macros shall be provided to test whether a file is of the specified type. The value of the <i>buf</i> argument supplied to the macros is a pointer to a <b>stat</b> structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the <b>stat</b> structure referenced by <i>buf</i> . Otherwise, the macro shall evaluate to zero.	
13380			
13381			
13382			
13383			
13384			
13385		<code>S_TYPEISMQ(<i>buf</i>)</code>	Test for a message queue.
13386		<code>S_TYPEISSEM(<i>buf</i>)</code>	Test for a semaphore.
13387		<code>S_TYPEISSHM(<i>buf</i>)</code>	Test for a shared memory object.
13388	TYM	The implementation may implement typed memory objects as distinct file types, and the following macro shall test whether a file is of the specified type. The value of the <i>buf</i> argument supplied to the macros is a pointer to a <b>stat</b> structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the <b>stat</b> structure referenced by <i>buf</i> . Otherwise, the macro shall evaluate to zero.	
13389			
13390			
13391			
13392			
13393		<code>S_TYPEISTMO(<i>buf</i>)</code>	Test macro for a typed memory object.
13394		The <sys/stat.h> header shall define the following symbolic constants as distinct integer values outside of the range [0,999 999 999], for use with the <i>futimens()</i> and <i>utimensat()</i> functions:	
13395			
13396		<code>UTIME_NOW</code>	
13397		<code>UTIME_OMIT</code>	
13398		The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.	
13399			
13400		<code>int</code>	<code>chmod(const char *, mode_t);</code>
13401		<code>int</code>	<code>fchmod(int, mode_t);</code>
13402		<code>int</code>	<code>fchmodat(int, const char *, mode_t, int);</code>
13403		<code>int</code>	<code>fstat(int, struct stat *);</code>
13404		<code>int</code>	<code>fstatat(int, const char *restrict, struct stat *restrict, int);</code>
13405		<code>int</code>	<code>futimens(int, const struct timespec [2]);</code>
13406		<code>int</code>	<code>lstat(const char *restrict, struct stat *restrict);</code>
13407		<code>int</code>	<code>mkdir(const char *, mode_t);</code>
13408		<code>int</code>	<code>mkdirat(int, const char *, mode_t);</code>
13409		<code>int</code>	<code>mkfifo(const char *, mode_t);</code>
13410		<code>int</code>	<code>mkfifoat(int, const char *, mode_t);</code>
13411	XSI	<code>int</code>	<code>mknod(const char *, mode_t, dev_t);</code>
13412		<code>int</code>	<code>mknodat(int, const char *, mode_t, dev_t);</code>
13413		<code>int</code>	<code>stat(const char *restrict, struct stat *restrict);</code>
13414		<code>mode_t</code>	<code>umask(mode_t);</code>
13415		<code>int</code>	<code>utimensat(int, const char *, const struct timespec [2], int);</code>
13416		Inclusion of the <sys/stat.h> header may make visible all symbols from the <time.h> header. +	

## APPLICATION USAGE

Use of the macros is recommended for determining the type of a file.

## RATIONALE

A conforming C-language application must include **<sys/stat.h>** for functions that have arguments or return values of type **mode\_t**, so that symbolic values for that type can be used. An alternative would be to require that these constants are also defined by including **<sys/types.h>**.

The **S\_ISUID** and **S\_ISGID** bits may be cleared on any write, not just on *open()*, as some historical implementations do.

System calls that update the time entry fields in the **stat** structure must be documented by the implementors. POSIX-conforming systems should not update the time entry fields for functions listed in the System Interfaces volume of POSIX.1-2008 unless the standard requires that they do, except in the case of documented extensions to the standard.

Upon assignment, file timestamps are immediately converted to the resolution of the file system by truncation (i.e., the recorded time can be older than the actual time). For example, if the file system resolution is 1 microsecond, then a conforming *stat()* must always return an *st\_mtim.tv\_nsec* that is a multiple of 1000. Some older implementations returned higher-resolution timestamps while the *inode* information was cached, and then spontaneously truncated the *tv\_nsec* fields when they were stored to and retrieved from disk, but this behavior does not conform.

Note that *st\_dev* must be unique within a Local Area Network (LAN) in a “system” made up of multiple computers’ file systems connected by a LAN.

Networked implementations of a POSIX-conforming system must guarantee that all files visible within the file tree (including parts of the tree that may be remotely mounted from other machines on the network) on each individual processor are uniquely identified by the combination of the *st\_ino* and *st\_dev* fields.

The unit for the *st\_blocks* member of the **stat** structure is not defined within POSIX.1-2008. In some implementations it is 512 bytes. It may differ on a file system basis. There is no correlation between values of the *st\_blocks* and *st\_blksize*, and the *f\_bsize* (from **<sys/statvfs.h>**) structure members.

Traditionally, some implementations defined the multiplier for *st\_blocks* in **<sys/param.h>** as the symbol **DEV\_BSIZE**.

Some earlier versions of this standard did not specify values for the file mode bit macros. The expectation was that some implementors might choose to use a different encoding for these bits than the traditional one, and that new applications would use symbolic file modes instead of numeric. This version of the standard specifies the traditional encoding, in recognition that nearly 20 years after the first publication of this standard numeric file modes are still in widespread use by application developers, and that all conforming implementations still use the traditional encoding.

## FUTURE DIRECTIONS

No new **S\_IFMT** symbolic names for the file type values of **mode\_t** will be defined by POSIX.1-2008; if new file types are required, they will only be testable through *S\_ISxx()* or *S\_TYPEISxxx()* macros instead.

## CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

### Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

The type of *st\_blksize* is changed from **long** to **blksize\_t**; the type of *st\_blocks* is changed from **long** to **blkcnt\_t**.

### Issue 6

The S\_TYPEISMQ(), S\_TYPEISSEM(), and S\_TYPEISSHM() macros are unconditionally mandated.

The Open Group Corrigendum U035/4 is applied. In the DESCRIPTION, the types **blksize\_t** and **blkcnt\_t** have been described.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **dev\_t**, **ino\_t**, **mode\_t**, **nlink\_t**, **uid\_t**, **gid\_t**, **off\_t**, and **time\_t** types are mandated.

S\_IFSOCK and S\_ISSOCK are added for sockets.

The description of **stat** structure members is changed to reflect contents when file type is a symbolic link.

The test macro S\_TYPEISTMO is added for alignment with IEEE Std 1003.1j-2000.

The **restrict** keyword is added to the prototypes for *lstat()* and *stat()*.

The *lstat()* function is made mandatory.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/17 is applied, adding text regarding the *st\_blocks* member of the **stat** structure to the RATIONALE.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/25 is applied, adding to the DESCRIPTION that the **timespec** structure may be defined as described in the <time.h> header.

### Issue 7

SD5-XSH-ERN-161 is applied, updating the DESCRIPTION to clarify that the descriptions of the interfaces should be consulted in order to determine which structure members have meaningful values.

The *fchmodat()*, *fstatat()*, *mkdirat()*, *mkfifoat()*, *mknodat()*, and *utimensat()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The *futimens()* function is added.

This reference page is clarified with respect to macros and symbolic constants.

Changes are made related to support for finegrained timestamps and the **UTIME\_NOW** and **UTIME\_OMIT** symbolic constants are added.

POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0068 [207] is applied.

13498 **NAME**

13499 sys/statvfs.h — VFS File System information structure

13500 **SYNOPSIS**

13501 #include &lt;sys/statvfs.h&gt;

13502 **DESCRIPTION**13503 The <sys/statvfs.h> header shall define the **statvfs** structure, which shall include at least the  
13504 following members:

13505	unsigned long	f_bsize	File system block size.
13506	unsigned long	f_frsize	Fundamental file system block size.
13507	fsblkcnt_t	f_blocks	Total number of blocks on file system in units of <i>f_frsize</i> .
13508	fsblkcnt_t	f_bfree	Total number of free blocks.
13509	fsblkcnt_t	f_bavail	Number of free blocks available to non-privileged process.
13510			
13511	fsfilcnt_t	f_files	Total number of file serial numbers.
13512	fsfilcnt_t	f_ffree	Total number of free file serial numbers.
13513	fsfilcnt_t	f_favail	Number of file serial numbers available to non-privileged process.
13514			
13515	unsigned long	f_fsid	File system ID.
13516	unsigned long	f_flag	Bit mask of <i>f_flag</i> values.
13517	unsigned long	f_namemax	Maximum filename length.

13518 The <sys/statvfs.h> header shall define the **fsblkcnt\_t** and **fsfilcnt\_t** types as described in  
13519 <sys/types.h>.13520 The <sys/statvfs.h> header shall define the following symbolic constants for the *f\_flag* member:

13521 ST\_RDONLY Read-only file system.

13522 ST\_NOSUID Does not support the semantics of the ST\_ISUID and ST\_ISGID file mode bits.

13523 The following shall be declared as functions and may also be defined as macros. Function  
13524 prototypes shall be provided.

13525 int fstatvfs(int, struct statvfs \*);

13526 int statvfs(const char \*restrict, struct statvfs \*restrict);

13527 **APPLICATION USAGE**

13528 None.

13529 **RATIONALE**

13530 None.

13531 **FUTURE DIRECTIONS**

13532 None.

13533 **SEE ALSO**

13535 XSH *fstatvfs()*13536 **CHANGE HISTORY**

13537 First released in Issue 4, Version 2.

13538 **Issue 5**13539 The type of *f\_blocks*, *f\_bfree*, and *f\_bavail* is changed from **unsigned long** to **fsblkcnt\_t**; the type of  
13540 *f\_files*, *f\_ffree*, and *f\_favail* is changed from **unsigned long** to **fsfilcnt\_t**.

13541 **Issue 6**

13542 The Open Group Corrigendum U035/5 is applied. In the DESCRIPTION, the types **fsblkcnt\_t**  
13543 and **fsfilcnt\_t** have been described.

13544 The **restrict** keyword is added to the prototype for *statvfs()*.

13545 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/18 is applied, changing the description of  
13546 ST\_NOSUID from “Does not support *setuid()*/*setgid()* semantics” to “Does not support the  
13547 semantics of the ST\_ISUID and ST\_ISGID file mode bits”.

13548 **Issue 7**

13549 The <sys/statvfs.h> header is moved from the XSI option to the Base.

13550 This reference page is clarified with respect to macros and symbolic constants.

## 13551 NAME

13552 sys/time.h — time types

## 13553 SYNOPSIS

13554 XSI `#include <sys/time.h>`

## 13555 DESCRIPTION

13556 The **<sys/time.h>** header shall define the **timeval** structure, which shall include at least the  
 13557 following members:

13558	time_t	tv_sec	Seconds.
13559	suseconds_t	tv_usec	Microseconds.

13560 OB The **<sys/time.h>** header shall define the **itimerval** structure, which shall include at least the  
 13561 following members:

13562	struct timeval	it_interval	Timer interval.
13563	struct timeval	it_value	Current value.

13564 The **<sys/time.h>** header shall define the **time\_t** and **suseconds\_t** types as described in  
 13565 **<sys/types.h>**.

13566 The **<sys/time.h>** header shall define the **fd\_set** type as described in **<sys/select.h>**.

13567 OB The **<sys/time.h>** header shall define the following symbolic constants for the *which* argument of  
 13568 *getitimer()* and *setitimer()*:

13569	ITIMER_REAL	Decrements in real time.
13570	ITIMER_VIRTUAL	Decrements in process virtual time.
13571	ITIMER_PROF	Decrements both in process virtual time and when the system is running 13572 on behalf of the process.

13573 The **<sys/time.h>** header shall define the following as described in **<sys/select.h>**:

13574 *FD\_CLR()*  
 13575 *FD\_ISSET()*  
 13576 *FD\_SET()*  
 13577 *FD\_ZERO()*  
 13578 *FD\_SETSIZE*

13579 The following shall be declared as functions and may also be defined as macros. Function  
 13580 prototypes shall be provided.

13581 OB `int getitimer(int, struct itimerval *);`  
 13582 `int gettimeofday(struct timeval *restrict, void *restrict);`  
 13583 `int setitimer(int, const struct itimerval *restrict,`  
 13584 `struct itimerval *restrict);`  
 13585 `int select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,`  
 13586 `struct timeval *restrict);`  
 13587 `int utimes(const char *, const struct timeval [2]);`

13588 Inclusion of the **<sys/time.h>** header may make visible all symbols from the **<sys/select.h>**  
 13589 header.

13590 **APPLICATION USAGE**

13591 None.

13592 **RATIONALE**

13593 None.

13594 **FUTURE DIRECTIONS**

13595 None.

13599 **CHANGE HISTORY**

13600 First released in Issue 4, Version 2.

13601 **Issue 5**

13602 The type of *tv\_usec* is changed from **long** to **suseconds\_t**.

13603 **Issue 6**

13604 The **restrict** keyword is added to the prototypes for *gettimeofday()*, *select()*, and *setitimer()*.

13605 The note is added that inclusion of this header may also make symbols visible from  
13606 <sys/select.h>.

13607 The *utimes()* function is marked LEGACY.

13608 **Issue 7**

13609 This reference page is clarified with respect to macros and symbolic constants.

13610 **NAME**

13611 sys/times.h — file access and modification times structure

13612 **SYNOPSIS**

13613 #include &lt;sys/times.h&gt;

13614 **DESCRIPTION**13615 The <sys/times.h> header shall define the **tms** structure, which is returned by *times()* and shall  
13616 include at least the following members:

13617 clock\_t tms\_utime User CPU time.

13618 clock\_t tms\_stime System CPU time.

13619 clock\_t tms\_cutime User CPU time of terminated child processes.

13620 clock\_t tms\_cstime System CPU time of terminated child processes.

13621 The <sys/times.h> header shall define the **clock\_t** type as described in <sys/types.h>.13622 The following shall be declared as a function and may also be defined as a macro. A function  
13623 prototype shall be provided.

13624 clock\_t times(struct tms \*);

13625 **APPLICATION USAGE**

13626 None.

13627 **RATIONALE**

13635 First released in Issue 1. Derived from Issue 1 of the SVID.

13636 **NAME**

13637 sys/types.h — data types

13638 **SYNOPSIS**

13639 #include <sys/types.h>

13640 **DESCRIPTION**

13641 The <sys/types.h> header shall define at least the following types:

13642	<b>blkcnt_t</b>	Used for file block counts.
13643	<b>blksize_t</b>	Used for block sizes.
13644	<b>clock_t</b>	Used for system times in clock ticks or CLOCKS_PER_SEC; see <time.h>.
13645		
13646	<b>clockid_t</b>	Used for clock ID type in the clock and timer functions.
13647	<b>dev_t</b>	Used for device IDs.
13648	<b>fsblkcnt_t</b>	Used for file system block counts.
13649	<b>fsfilcnt_t</b>	Used for file system file counts.
13650	<b>gid_t</b>	Used for group IDs.
13651	<b>id_t</b>	Used as a general identifier; can be used to contain at least a <b>pid_t</b> ,
13652		<b>uid_t</b> , or <b>gid_t</b> .
13653	<b>ino_t</b>	Used for file serial numbers.
13654	XSI <b>key_t</b>	Used for XSI interprocess communication.
13655	<b>mode_t</b>	Used for some file attributes.
13656	<b>nlink_t</b>	Used for link counts.
13657	<b>off_t</b>	Used for file sizes.
13658	<b>pid_t</b>	Used for process IDs and process group IDs.
13659	<b>pthread_attr_t</b>	Used to identify a thread attribute object.
13660	<b>pthread_barrier_t</b>	Used to identify a barrier.
13661	<b>pthread_barrierattr_t</b>	Used to define a barrier attributes object.
13662	<b>pthread_cond_t</b>	Used for condition variables.
13663	<b>pthread_condattr_t</b>	Used to identify a condition attribute object.
13664	<b>pthread_key_t</b>	Used for thread-specific data keys.
13665	<b>pthread_mutex_t</b>	Used for mutexes.
13666	<b>pthread_mutexattr_t</b>	Used to identify a mutex attribute object.
13667	<b>pthread_once_t</b>	Used for dynamic package initialization.
13668	<b>pthread_rwlock_t</b>	Used for read-write locks.
13669	<b>pthread_rwlockattr_t</b>	Used for read-write lock attributes.
13670	<b>pthread_spinlock_t</b>	Used to identify a spin lock.

13671		<b>pthread_t</b>	Used to identify a thread.
13672		<b>size_t</b>	Used for sizes of objects.
13673		<b>ssize_t</b>	Used for a count of bytes or an error indication.
13674		<b>suseconds_t</b>	Used for time in microseconds. -
13675		<b>time_t</b>	Used for time in seconds.
13676		<b>timer_t</b>	Used for timer ID returned by <i>timer_create()</i> .
13677	OB TRC	<b>trace_attr_t</b>	Used to identify a trace stream attributes object
13678	OB TRC	<b>trace_event_id_t</b>	Used to identify a trace event type.
13679	OB TEF	<b>trace_event_set_t</b>	Used to identify a trace event type set.
13680	OB TRC	<b>trace_id_t</b>	Used to identify a trace stream.
13681		<b>uid_t</b>	Used for user IDs.
13682		All of the types shall be defined as arithmetic types of an appropriate length, with the following exceptions:	
13683			
13684		<b>pthread_attr_t</b>	
13685		<b>pthread_barrier_t</b>	
13686		<b>pthread_barrierattr_t</b>	
13687		<b>pthread_cond_t</b>	
13688		<b>pthread_condattr_t</b>	
13689		<b>pthread_key_t</b>	
13690		<b>pthread_mutex_t</b>	
13691		<b>pthread_mutexattr_t</b>	
13692		<b>pthread_once_t</b>	
13693		<b>pthread_rwlock_t</b>	
13694		<b>pthread_rwlockattr_t</b>	
13695		<b>pthread_spinlock_t</b>	
13696		<b>pthread_t</b>	
13697		<b>timer_t</b>	
13698	OB TRC	<b>trace_attr_t</b>	
13699		<b>trace_event_id_t</b>	
13700	OB TEF	<b>trace_event_set_t</b>	
13701	OB TRC	<b>trace_id_t</b>	
13702		Additionally:	
13703		• <b>mode_t</b> shall be an integer type.	
13704		• <b>dev_t</b> shall be an integer type.	
13705		• <b>nlink_t</b> , <b>uid_t</b> , <b>gid_t</b> , and <b>id_t</b> shall be integer types.	
13706		• <b>blkcnt_t</b> and <b>off_t</b> shall be signed integer types.	
13707		• <b>fsblkcnt_t</b> , <b>fsfilcnt_t</b> , and <b>ino_t</b> shall be defined as unsigned integer types.	
13708		• <b>size_t</b> shall be an unsigned integer type.	
13709		• <b>blksize_t</b> , <b>pid_t</b> , and <b>ssize_t</b> shall be signed integer types.	

13710 CX           • **clock\_t** shall be an integer or real-floating type. **time\_t** shall be an integer type.

13711           The type **ssize\_t** shall be capable of storing values at least in the range  $[-1, \{\text{SSIZE\_MAX}\}]$ .

13712 XSI           The type **suseconds\_t** shall be a signed integer type capable of storing values at least in the

13713           range  $[-1, 1\,000\,000]$ .

13714           The implementation shall support one or more programming environments in which the widths

13715           of **blksize\_t**, **pid\_t**, **size\_t**, **ssize\_t**, and **suseconds\_t** are no greater than the width of type **long**.

13716           The names of these programming environments can be obtained using the *confstr()* function or

13717           the *getconf* utility.

13718           There are no defined comparison or assignment operators for the following types:

13719           **pthread\_attr\_t**

13720           **pthread\_barrier\_t**

13721           **pthread\_barrierattr\_t**

13722           **pthread\_cond\_t**

13723           **pthread\_condattr\_t**

13724           **pthread\_mutex\_t**

13725           **pthread\_mutexattr\_t**

13726           **pthread\_rwlock\_t**

13727           **pthread\_rwlockattr\_t**

13728           **pthread\_spinlock\_t**

13729           **timer\_t**

13730 OB TRC       **trace\_attr\_t**

## 13741 CHANGE HISTORY

13742           First released in Issue 1. Derived from Issue 1 of the SVID.

### 13743 Issue 5

13744           The **clockid\_t** and **timer\_t** types are defined for alignment with the POSIX Realtime Extension.

13745           The types **blkcnt\_t**, **blksize\_t**, **fsblkcnt\_t**, **fsfilcnt\_t**, and **suseconds\_t** are added.

13746           Large File System extensions are added.

13747           Updated for alignment with the POSIX Threads Extension.

### 13748 Issue 6

13749           The **pthread\_barrier\_t**, **pthread\_barrierattr\_t**, and **pthread\_spinlock\_t** types are added for

13750           alignment with IEEE Std 1003.1j-2000.

13751           The margin code is changed from XSI to THR for the **pthread\_rwlock\_t** and

13752 **pthread\_rwlockattr\_t** types as Read-Write Locks have been absorbed into the POSIX Threads  
13753 option. The threads types are marked THR.

13754 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/26 is applied, adding **pthread\_t** to the list  
13755 of types that are not required to be arithmetic types, thus allowing **pthread\_t** to be defined as a  
13756 structure.

13757 **Issue 7**

13758 Austin Group Interpretation 1003.1-2001 #033 is applied, requiring **key\_t** to be an arithmetic  
13759 type.

13760 The Trace option types are marked obsolescent.

13761 The **clock\_t** and **id\_t** types are moved from the XSI option to the Base.

13762 The **pthread\_barrier\_t** and **pthread\_barrierattr\_t** types are moved from the Barriers option to  
13763 the Base.

13764 The **pthread\_spinlock\_t** type is moved from the Spin Locks option to the Base.

13765 Functionality relating to the Timers and Threads options is moved to the Base.

13766 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0069 [210], XBD/TC1-2008/0070 [28],  
13767 XBD/TC1-2008/0071 [376], XBD/TC1-2008/0072 [210], and XBD/TC1-2008/0073 [327] are  
13768 applied.

13769 **NAME**

13770 sys/uio.h — definitions for vector I/O operations

13771 **SYNOPSIS**13772 XSI `#include <sys/uio.h>`13773 **DESCRIPTION**13774 The <sys/uio.h> header shall define the **iovec** structure, which shall include at least the  
13775 following members:13776 `void *iov_base` Base address of a memory region for input or output.13777 `size_t iov_len` The size of the memory pointed to by *iov\_base*.13778 The <sys/uio.h> header uses the **iovec** structure for scatter/gather I/O.13779 The <sys/uio.h> header shall define the **ssize\_t** and **size\_t** types as described in <sys/types.h>.13780 The following shall be declared as functions and may also be defined as macros. Function  
13781 prototypes shall be provided.13782 `ssize_t readv(int, const struct iovec *, int);`13783 `ssize_t writev(int, const struct iovec *, int);`13784 **APPLICATION USAGE**13785 The implementation can put a limit on the number of scatter/gather elements which can be  
13786 processed in one call. The symbol {IOV\_MAX} defined in <limits.h> should always be used to  
13787 learn about the limits instead of assuming a fixed value.13788 **RATIONALE**13789 Traditionally, the maximum number of scatter/gather elements the system can process in one  
13790 call were described by the symbolic value {UIO\_MAXIOV}. In IEEE Std 1003.1-2001 this value is  
13791 replaced by the constant {IOV\_MAX} which can be found in <limits.h>.13792 **FUTURE DIRECTIONS**

13793 None.

13794 **SEE ALSO**

13795 &lt;limits.h&gt;, &lt;sys/types.h&gt;

13796 XSH *read()*, *readv()*, *write()*, *writev()*13797 **CHANGE HISTORY**

13798 First released in Issue 4, Version 2.

13799 **Issue 6**

13800 Text referring to scatter/gather I/O is added to the DESCRIPTION.

13801 **NAME**

13802 sys/un.h — definitions for UNIX domain sockets

13803 **SYNOPSIS**

13804 #include &lt;sys/un.h&gt;

13805 **DESCRIPTION**

13806 The <sys/un.h> header shall define the **sockaddr\_un** structure, which shall include at least the  
 13807 following members:

13808 sa\_family\_t sun\_family Address family.  
 13809 char sun\_path[] Socket pathname.

13810 The **sockaddr\_un** structure is used to store addresses for UNIX domain sockets. Pointers to this  
 13811 type shall be cast by applications to **struct sockaddr \*** for use with socket functions.

13812 The <sys/un.h> header shall define the **sa\_family\_t** type as described in <sys/socket.h>.

13813 **APPLICATION USAGE**

13814 The size of *sun\_path* has intentionally been left undefined. This is because different  
 13815 implementations use different sizes. For example, 4.3 BSD uses a size of 108, and 4.4 BSD uses a  
 13816 size of 104. Since most implementations originate from BSD versions, the size is typically in the  
 13817 range 92 to 108.

13818 Applications should not assume a particular length for *sun\_path* or assume that it can hold  
 13819 {\_POSIX\_PATH\_MAX} bytes (256).

13820 Although applications are required to initialize all members (including any non-standard ones) +  
 13821 of a **sockaddr\_in6** structure (see <netinet/in.h>, on page 305), the same is not required for the +  
 13822 **sockaddr\_un** structure, since historically many applications only initialized the standard +  
 13823 members. Despite this, applications are encouraged to initialize **sockaddr\_un** structures in a +  
 13824 manner similar to the required initialization of **sockaddr\_in6** structures.

13825 **RATIONALE**

13826 None.

13827 **FUTURE DIRECTIONS**

13828 None.

13829 **SEE ALSO**

13830 &lt;netinet/in.h&gt;, &lt;sys/socket.h&gt;

13831 XSH *bind()*, *socket()*, *socketpair()*13832 **CHANGE HISTORY**

13833 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

13834 **Issue 7**

13835 The value for {\_POSIX\_PATH\_MAX} is updated to 256.

13836 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0074 [355] is applied.

## 13837 NAME

13838 sys/utsname.h — system name structure

## 13839 SYNOPSIS

13840 #include <sys/utsname.h>

## 13841 DESCRIPTION

13842 The <sys/utsname.h> header shall define the structure **utsname** which shall include at least the  
13843 following members:

13844	char	sysname[ ]	Name of this implementation of the operating system.
13845	char	nodename[ ]	Name of this node within the communications
13846			network to which this node is attached, if any.
13847	char	release[ ]	Current release level of this implementation.
13848	char	version[ ]	Current version level of this release.
13849	char	machine[ ]	Name of the hardware type on which the system is running.

13850 The character arrays are of unspecified size, but the data stored in them shall be terminated by a  
13851 null byte.

13852 The following shall be declared as a function and may also be defined as a macro:

13853 int uname(struct utsname \*);

## 13854 APPLICATION USAGE

13855 None.

## 13856 RATIONALE

13857 None.

## 13858 FUTURE DIRECTIONS

13859 None.

## 13860 SEE ALSO

13861 XSH *uname()*

## 13862 CHANGE HISTORY

13863 First released in Issue 1. Derived from Issue 1 of the SVID.

## 13864 Issue 6

13865 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/27 is applied, changing the description of  
13866 *nodename* within the **utsname** structure from “an implementation-defined communications  
13867 network” to “the communications network to which this node is attached, if any”.

13868 **NAME**

13869 sys/wait.h — declarations for waiting

13870 **SYNOPSIS**

13871 #include &lt;sys/wait.h&gt;

13872 **DESCRIPTION**13873 The <sys/wait.h> header shall define the following symbolic constants for use with *waitpid()*:13874 XSI **WCONTINUED** Report status of continued child process.13875 **WNOHANG** Do not hang if no status is available; return immediately.13876 **WUNTRACED** Report status of stopped child process.

13877 The &lt;sys/wait.h&gt; header shall define the following macros for analysis of process status values:

13878 **WEXITSTATUS** Return exit status.13879 XSI **WIFCONTINUED** True if child has been continued.13880 **WIFEXITED** True if child exited normally.13881 **WIFSIGNALED** True if child exited due to uncaught signal.13882 **WIFSTOPPED** True if child is currently stopped.13883 **WSTOPSIG** Return signal number that caused process to stop.13884 **WTERMSIG** Return signal number that caused process to terminate.13885 The <sys/wait.h> header shall define the following symbolic constants as possible values for the  
13886 *options* argument to *waitid()*:13887 **WEXITED** Wait for processes that have exited.13888 **WNOWAIT** Keep the process whose status is returned in *infop* in a waitable state.13889 **WSTOPPED** Status is returned for any child that has stopped upon receipt of a signal.13890 XSI The **WCONTINUED** and **WNOHANG** constants, described above for *waitpid()*, can also be  
13891 used with *waitid()*.13892 The type **idtype\_t** shall be defined as an enumeration type whose possible values shall include  
13893 at least the following:13894 **P\_ALL**13895 **P\_PGID**13896 **P\_PID**13897 The <sys/wait.h> header shall define the **id\_t** and **pid\_t** types as described in <sys/types.h>.13898 The <sys/wait.h> header shall define the **siginfo\_t** type and the **sigval** union as described in |  
13899 <signal.h>.

13900 Inclusion of the &lt;sys/wait.h&gt; header may also make visible all symbols from &lt;signal.h&gt;.

13901 The following shall be declared as functions and may also be defined as macros. Function  
13902 prototypes shall be provided.13903 **pid\_t** wait(int \*);13904 **int** waitid(idtype\_t, id\_t, siginfo\_t \*, int);13905 **pid\_t** waitpid(pid\_t, int \*, int);

13906 **APPLICATION USAGE**

13907 None.

13908 **RATIONALE**

13909 None.

13910 **FUTURE DIRECTIONS**

13911 None.

13912 **SEE ALSO**

13913 [<signal.h>](#), [<sys/resource.h>](#), [<sys/types.h>](#)

13914 XSH *wait()*, *waitid()*

13915 **CHANGE HISTORY**

13916 First released in Issue 3.

13917 Included for alignment with the POSIX.1-1988 standard.

13918 **Issue 6**

13919 The *wait3()* function is removed.

13920 **Issue 7**

13921 The *waitid()* function and symbolic constants for its *options* argument are moved to the Base.

13922 The description of the WNOHANG constant is clarified.

13923 The requirement for [<sys/wait.h>](#) to define the **rusage** structure as described in [+<sys/resource.h>](#) is removed, and [<sys/wait.h>](#) is no longer allowed to make visible all symbols [+<sys/resource.h>](#).  
13924  
13925

13926 **NAME**

13927       syslog.h — definitions for system error logging

13928 **SYNOPSIS**

13929 XSI       #include &lt;syslog.h&gt;

13930 **DESCRIPTION**13931       The <syslog.h> header shall define the following symbolic constants, zero or more of which  
13932       may be OR'ed together to form the *logopt* option of *openlog()*:

13933       LOG\_PID               Log the process ID with each message.

13934       LOG\_CONS             Log to the system console on error.

13935       LOG\_NDELAY           Connect to syslog daemon immediately.

13936       LOG\_ODELAY           Delay open until *syslog()* is called.

13937       LOG\_NOWAIT           Do not wait for child processes.

13938       The <syslog.h> header shall define the following symbolic constants for use as the *facility*  
13939       argument to *openlog()*:

13940       LOG\_KERN             Reserved for message generated by the system.

13941       LOG\_USER             Message generated by a process.

13942       LOG\_MAIL             Reserved for message generated by mail system.

13943       LOG\_NEWS             Reserved for message generated by news system.

13944       LOG\_UUCP             Reserved for message generated by UUCP system.

13945       LOG\_DAEMON           Reserved for message generated by system daemon.

13946       LOG\_AUTH             Reserved for message generated by authorization daemon.

13947       LOG\_CRON             Reserved for message generated by clock daemon.

13948       LOG\_LPR              Reserved for message generated by printer system.

13949       LOG\_LOCAL0           Reserved for local use.

13950       LOG\_LOCAL1           Reserved for local use.

13951       LOG\_LOCAL2           Reserved for local use.

13952       LOG\_LOCAL3           Reserved for local use.

13953       LOG\_LOCAL4           Reserved for local use.

13954       LOG\_LOCAL5           Reserved for local use.

13955       LOG\_LOCAL6           Reserved for local use.

13956       LOG\_LOCAL7           Reserved for local use.

13957       The <syslog.h> header shall define the following macros for constructing the *maskpri* argument  
13958       to *setlogmask()*. The following macros expand to an expression of type **int** when the argument  
13959       *pri* is an expression of type **int**:13960       LOG\_MASK(*pri*)       A mask for priority *pri*.13961       The <syslog.h> header shall define the following symbolic constants for use as the *priority*  
13962       argument of *syslog()*:

13963	LOG_EMERG	A panic condition was reported to all processes.
13964	LOG_ALERT	A condition that should be corrected immediately.
13965	LOG_CRIT	A critical condition.
13966	LOG_ERR	An error message.
13967	LOG_WARNING	A warning message.
13968	LOG_NOTICE	A condition requiring special handling.
13969	LOG_INFO	A general information message.
13970	LOG_DEBUG	A message useful for debugging programs.
13971	The following shall be declared as functions and may also be defined as macros. Function	
13972	prototypes shall be provided.	
13973	void closelog(void);	
13974	void openlog(const char *, int, int);	
13975	int setlogmask(int);	
13976	void syslog(int, const char *, ...);	
13977	<b>APPLICATION USAGE</b>	
13978	None.	
13979	<b>RATIONALE</b>	
13980	None.	
13981	<b>FUTURE DIRECTIONS</b>

13991 **NAME**

13992 tar.h — extended tar definitions

13993 **SYNOPSIS**

13994 #include &lt;tar.h&gt;

13995 **DESCRIPTION**

13996 The &lt;tar.h&gt; header shall define the following symbolic constants with the indicated values.

13997 General definitions:

Name	Value	Description
TMAGIC	"ustar"	Used in the magic field in the <b>ustar</b> header block, including the trailing null byte.
TMAGLEN	6	Length in octets of the magic field.
TVERSION	"00"	Used in the version field in the <b>ustar</b> header block, excluding the trailing null byte.
TVERSLEN	2	Length in octets of the version field.

14005 *Typeflag* field definitions:

Name	Value	Description
REGTYPE	'0'	Regular file.
AREGTYPE	'\0'	Regular file.
LNKTYPE	'1'	Link.
SYMTYPE	'2'	Symbolic link.
CHRTYPE	'3'	Character special.
BLKTYPE	'4'	Block special.
DIRTYPE	'5'	Directory.
FIFOTYPE	'6'	FIFO special.
CONTTYPE	'7'	Reserved.

14016 *Mode* field bit definitions (octal):

Name	Value	Description
TSUID	04000	Set UID on execution.
TSGID	02000	Set GID on execution.
TSVTX	01000	On directories, restricted deletion flag.
TUREAD	00400	Read by owner.
TUWRITE	00200	Write by owner special.
TUEXEC	00100	Execute/search by owner.
TGREAD	00040	Read by group.
TGWRITE	00020	Write by group.
TGEXEC	00010	Execute/search by group.
TOREAD	00004	Read by other.
TOWRITE	00002	Write by other.
TOEXEC	00001	Execute/search by other.

14030 **APPLICATION USAGE**

14031 None.

14032 **RATIONALE**

14033 None.

14035 None.

14036 **SEE ALSO**

14037 XCU *pax*

14038 **CHANGE HISTORY**

14039 First released in Issue 3. Derived from the POSIX.1-1988 standard.

14040 **Issue 6**

14041 The SEE ALSO section is updated to refer to *pax*.

14042 **Issue 7**

14043 This reference page is clarified with respect to macros and symbolic constants.

14044 **NAME**

14045       termios.h — define values for termios

14046 **SYNOPSIS**

14047       #include &lt;termios.h&gt;

14048 **DESCRIPTION**

14049       The <termios.h> header shall contain the definitions used by the terminal I/O interfaces (see  
 14050       Chapter 11 (on page 199) for the structures and names defined).

14051 **The termios Structure**14052       The <termios.h> header shall define the following data types through **typedef**:14053       **cc\_t**               Used for terminal special characters.14054       **speed\_t**          Used for terminal baud rates.14055       **tcflag\_t**         Used for terminal modes.

14056       The above types shall be all unsigned integer types.

14057       The implementation shall support one or more programming environments in which the widths  
 14058       of **cc\_t**, **speed\_t**, and **tcflag\_t** are no greater than the width of type **long**. The names of these  
 14059       programming environments can be obtained using the *confstr()* function or the *getconf* utility.

14060       The <termios.h> header shall define the **termios** structure, which shall include at least the  
 14061       following members:

14062       **tcflag\_t**   **c\_iflag**       Input modes.  
 14063       **tcflag\_t**   **c\_oflag**       Output modes.  
 14064       **tcflag\_t**   **c\_cflag**       Control modes.  
 14065       **tcflag\_t**   **c\_lflag**       Local modes.  
 14066       **cc\_t**        **c\_cc[NCCS]**   Control characters.

14067       The &lt;termios.h&gt; header shall define the following symbolic constant:

14068       **NCCS**           Size of the array **c\_cc** for control characters.

14069       The <termios.h> header shall define the following symbolic constants for use as subscripts for  
 14070       the array **c\_cc**:

Subscript Usage		Description
Canonical Mode	Non-Canonical Mode	
VEOF	VINTR	EOF character.
VEOL		EOL character.
VERASE		ERASE character.
VINTR		INTR character.
VKILL		KILL character.
	VMIN	MIN value.
VQUIT	VQUIT	QUIT character.
VSTART	VSTART	START character.
VSTOP	VSTOP	STOP character.
VSUSP	VSUSP	SUSP character.
	VTIME	TIME value.

14084       The subscript values shall be suitable for use in **#if** preprocessing directives and shall be distinct,  
 14085       except that the VMIN and VTIME subscripts may have the same values as the VEOF and VEOL  
 14086       subscripts, respectively.

14087 **Input Modes**

14088 The <termios.h> header shall define the following symbolic constants for use as flags in the  
14089 *c\_iflag* field. The *c\_iflag* field describes the basic terminal input control.

14090	BRKINT	Signal interrupt on break.
14091	ICRNL	Map CR to NL on input.
14092	IGNBRK	Ignore break condition.
14093	IGNCR	Ignore CR.
14094	IGNPAR	Ignore characters with parity errors.
14095	INLCR	Map NL to CR on input.
14096	INPCK	Enable input parity check.
14097	ISTRIP	Strip character.
14098	IXANY	Enable any character to restart output.
14099	IXOFF	Enable start/stop input control.
14100	IXON	Enable start/stop output control.
14101	PARMRK	Mark parity errors.

14102 **Output Modes**

14103 The <termios.h> header shall define the following symbolic constants for use as flags in the  
14104 *c\_oflag* field. The *c\_oflag* field specifies the system treatment of output.

14105	OPOST	Post-process output.
14106	XSI ONLCR	Map NL to CR-NL on output.
14107	XSI OCRNL	Map CR to NL on output.
14108	XSI ONOCR	No CR output at column 0.
14109	XSI ONLRET	NL performs CR function.
14110	XSI OFDEL	Fill is DEL.
14111	XSI OFILL	Use fill characters for delay.
14112	XSI NLDLY	Select newline delays:
14113		NL0 Newline type 0.
14114		NL1 Newline type 1.
14115	XSI CRDLY	Select carriage-return delays:
14116		CR0 Carriage-return delay type 0.
14117		CR1 Carriage-return delay type 1.
14118		CR2 Carriage-return delay type 2.
14119		CR3 Carriage-return delay type 3.

14120	XSI	<b>TABDLY</b>	Select horizontal-tab delays:
14121		TAB0	Horizontal-tab delay type 0.
14122		TAB1	Horizontal-tab delay type 1.
14123		TAB2	Horizontal-tab delay type 2.
14124		TAB3	Expand tabs to spaces.
14125	XSI	<b>BSDLY</b>	Select backspace delays:
14126		BS0	Backspace-delay type 0.
14127		BS1	Backspace-delay type 1.
14128	XSI	<b>VTDLY</b>	Select vertical-tab delays:
14129		VT0	Vertical-tab delay type 0.
14130		VT1	Vertical-tab delay type 1.
14131	XSI	<b>FFDLY</b>	Select form-feed delays:
14132		FF0	Form-feed delay type 0.
14133		FF1	Form-feed delay type 1.

#### 14134 **Baud Rate Selection**

14135 The <termios.h> header shall define the following symbolic constants for use as values of  
 14136 objects of type **speed\_t**.

14137 The input and output baud rates are stored in the **termios** structure. These are the valid values  
 14138 for objects of type **speed\_t**. Not all baud rates need be supported by the underlying hardware.

14139	B0	Hang up
14140	B50	50 baud
14141	B75	75 baud
14142	B110	110 baud
14143	B134	134.5 baud
14144	B150	150 baud
14145	B200	200 baud
14146	B300	300 baud
14147	B600	600 baud
14148	B1200	1 200 baud
14149	B1800	1 800 baud
14150	B2400	2 400 baud

14151	B4800	4 800 baud
14152	B9600	9 600 baud
14153	B19200	19 200 baud
14154	B38400	38 400 baud

#### 14155 Control Modes

14156 The <termios.h> header shall define the following symbolic constants for use as flags in the  
 14157 *c\_cflag* field. The *c\_cflag* field describes the hardware control of the terminal; not all values  
 14158 specified are required to be supported by the underlying hardware.

14159	CSIZE	Character size:
14160		CS5 5 bits
14161		CS6 6 bits
14162		CS7 7 bits
14163		CS8 8 bits
14164	CSTOPB	Send two stop bits, else one.
14165	CREAD	Enable receiver.
14166	PARENB	Parity enable.
14167	PARODD	Odd parity, else even.
14168	HUPCL	Hang up on last close.
14169	CLOCAL	Ignore modem status lines.

14170 The implementation shall support the functionality associated with the symbols CS7, CS8,  
 14171 CSTOPB, PARODD, and PARENB.

#### 14172 Local Modes

14173 The <termios.h> header shall define the following symbolic constants for use as flags in the  
 14174 *c\_lflag* field. The *c\_lflag* field of the argument structure is used to control various terminal  
 14175 functions.

14176	ECHO	Enable echo.
14177	ECHOE	Echo erase character as error-correcting backspace.
14178	ECHOK	Echo KILL.
14179	ECHONL	Echo NL.
14180	ICANON	Canonical input (erase and kill processing).
14181	IEXTEN	Enable extended input character processing.
14182	ISIG	Enable signals.
14183	NOFLSH	Disable flush after interrupt or quit.
14184	TOSTOP	Send SIGTTOU for background output.

**Attribute Selection**

The <termios.h> header shall define the following symbolic constants for use with *tcsetattr()*:

TCSANOW      Change attributes immediately.  
 TCSADRAIN    Change attributes when output has drained.  
 TCSAFLUSH    Change attributes when output has drained; also flush pending input.

**Line Control**

The <termios.h> header shall define the following symbolic constants for use with *tcflush()*:

TCIFLUSH      Flush pending input.  
 TCIOFLUSH    Flush both pending input and untransmitted output.  
 TCOFLUSH     Flush untransmitted output.

The <termios.h> header shall define the following symbolic constants for use with *tcflow()*:

TCIOFF        Transmit a STOP character, intended to suspend input data.  
 TCION         Transmit a START character, intended to restart input data.  
 TCOOFF        Suspend output.  
 TCOON         Restart output.

The <termios.h> header shall define the **pid\_t** type as described in <sys/types.h>.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
speed_t cfgetispeed(const struct termios *);
speed_t cfgetospeed(const struct termios *);
int      cfsetispeed(struct termios *, speed_t);
int      cfsetospeed(struct termios *, speed_t);
int      tcdrain(int);
int      tcflow(int, int);
int      tcflush(int, int);
int      tcgetattr(int, struct termios *);
pid_t    tcgetsid(int);
int      tcsendbreak(int, int);
int      tcsetattr(int, int, const struct termios *);
```

**APPLICATION USAGE**

The following names are reserved for XSI-conformant systems to use as an extension to the above; therefore strictly conforming applications shall not use them:

CBAUD	EXTB	VDSUSP
DEFECHO	FLUSHO	VLNEXT
ECHOCTL	LOBLK	VREPRINT
ECHOKE	PENDIN	VSTATUS
ECHOPRT	SWTCH	VWERASE
EXTA	VDISCARD

14232 **CHANGE HISTORY**

14233 First released in Issue 3.

14234 Included for alignment with the ISO POSIX-1 standard.

14235 **Issue 6**

14236 The LEGACY symbols IUCLC, OLCUC, and XCASE are removed.

14237 FIPS 151-2 requirements for the symbols CS7, CS8, CSTOPB, PARODD, and PARENB are  
14238 reaffirmed.

14239 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/19 is applied, changing ECHOK to  
14240 ECHOK in the APPLICATION USAGE section.

14241 **Issue 7**

14242 Austin Group Interpretation 1003.1-2001 #144 is applied, moving functionality relating to the  
14243 IXANY symbol from the XSI option to the Base.

14244 SD5-XBD-ERN-35 is applied, adding the OFDEL output mode.

14245 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
14246 for the **pid\_t** type is added.

14247 **NAME**14248 `tgmath.h` — type-generic macros14249 **SYNOPSIS**14250 `#include <tgmath.h>`14251 **DESCRIPTION**

14252 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 14253 conflict between the requirements described here and the ISO C standard is unintentional. This  
 14254 volume of POSIX.1-2008 defers to the ISO C standard.

14255 The `<tgmath.h>` header shall include the headers `<math.h>` and `<complex.h>` and shall define  
 14256 several type-generic macros.

14257 Of the functions contained within the `<math.h>` and `<complex.h>` headers without an *f* (**float**)  
 14258 or *l* (**long double**) suffix, several have one or more parameters whose corresponding real type is  
 14259 XSI **double**. For each such function, except *modf()*, *j0()*, *j1()*, *jn()*, *y0()*, *y1()*, and *yn()*, there shall  
 14260 be a corresponding type-generic macro. The parameters whose corresponding real type is  
 14261 **double** in the function synopsis are generic parameters. Use of the macro invokes a function  
 14262 whose corresponding real type and type domain are determined by the arguments for the  
 14263 generic parameters.

14264 Use of the macro invokes a function whose generic parameters have the corresponding real type  
 14265 determined as follows:

- 14266 • First, if any argument for generic parameters has type **long double**, the type determined is  
 14267 **long double**.
- 14268 • Otherwise, if any argument for generic parameters has type **double** or is of integer type,  
 14269 the type determined is **double**.
- 14270 • Otherwise, the type determined is **float**.

14271 For each unsuffixed function in the `<math.h>` header for which there is a function in the  
 14272 `<complex.h>` header with the same name except for a *c* prefix, the corresponding type-generic  
 14273 macro (for both functions) has the same name as the function in the `<math.h>` header. The  
 14274 corresponding type-generic macro for *fabs()* and *cabs()* is *fabs()*.

14275	<math.h> Function	<complex.h> Function	Type-Generic Macro
14276	<i>acos()</i>	<i>cacos()</i>	<i>acos()</i>
14277	<i>asin()</i>	<i>casin()</i>	<i>asin()</i>
14278	<i>atan()</i>	<i>catan()</i>	<i>atan()</i>
14279	<i>acosh()</i>	<i>cacosh()</i>	<i>acosh()</i>
14280	<i>asinh()</i>	<i>casinh()</i>	<i>asinh()</i>
14281	<i>atanh()</i>	<i>catanh()</i>	<i>atanh()</i>
14282	<i>cos()</i>	<i>ccos()</i>	<i>cos()</i>
14283	<i>sin()</i>	<i>csin()</i>	<i>sin()</i>
14284	<i>tan()</i>	<i>ctan()</i>	<i>tan()</i>
14285	<i>cosh()</i>	<i>ccosh()</i>	<i>cosh()</i>
14286	<i>sinh()</i>	<i>csinh()</i>	<i>sinh()</i>
14287	<i>tanh()</i>	<i>ctanh()</i>	<i>tanh()</i>
14288	<i>exp()</i>	<i>cexp()</i>	<i>exp()</i>
14289	<i>log()</i>	<i>clog()</i>	<i>log()</i>
14290	<i>pow()</i>	<i>cpow()</i>	<i>pow()</i>
14291	<i>sqrt()</i>	<i>csqrt()</i>	<i>sqrt()</i>
14292	<i>fabs()</i>	<i>cabs()</i>	<i>fabs()</i>

If at least one argument for a generic parameter is complex, then use of the macro invokes a complex function; otherwise, use of the macro invokes a real function.

For each unsuffixed function in the **<math.h>** header without a *c*-prefixed counterpart in the **<complex.h>** header, except for *modf()*, *j0()*, *j1()*, *jn()*, *y0()*, *y1()*, and *yn()*, the corresponding type-generic macro has the same name as the function. These type-generic macros are:

<i>atan2()</i>	<i>fma()</i>	<i>llround()</i>	<i>remainder()</i>
<i>cbrt()</i>	<i>fmax()</i>	<i>log10()</i>	<i>remquo()</i>
<i>ceil()</i>	<i>fmin()</i>	<i>log1p()</i>	<i>rint()</i>
<i>copysign()</i>	<i>fmod()</i>	<i>log2()</i>	<i>round()</i>
<i>erf()</i>	<i>frexp()</i>	<i>logb()</i>	<i>scalbln()</i>
<i>erfc()</i>	<i>hypot()</i>	<i>lrint()</i>	<i>scalbn()</i>
<i>exp2()</i>	<i>ilogb()</i>	<i>lround()</i>	<i>tgamma()</i>
<i>expm1()</i>	<i>ldexp()</i>	<i>nearbyint()</i>	<i>trunc()</i>
<i>fdim()</i>	<i>lgamma()</i>	<i>nextafter()</i>	
<i>floor()</i>	<i>llrint()</i>	<i>nexttoward()</i>	

If all arguments for generic parameters are real, then use of the macro invokes a real function; otherwise, use of the macro results in undefined behavior.

For each unsuffixed function in the **<complex.h>** header that is not a *c*-prefixed counterpart to a function in the **<math.h>** header, the corresponding type-generic macro has the same name as the function. These type-generic macros are:

*carg()*  
*cimag()*  
*conj()*  
*cproj()*  
*creal()*

Use of the macro with any real or complex argument invokes a complex function.

## APPLICATION USAGE

With the declarations:

```
#include <tgmath.h>
int n;
float f;
double d;
long double ld;
float complex fc;
double complex dc;
long double complex ldc;
```

functions invoked by use of type-generic macros are shown in the following table:

Macro	Use Invokes
<i>exp(n)</i>	<i>exp(n)</i> , the function
<i>acosh(f)</i>	<i>acoshf(f)</i>
<i>sin(d)</i>	<i>sin(d)</i> , the function
<i>atan(ld)</i>	<i>atanl(ld)</i>
<i>log(fc)</i>	<i>clogf(fc)</i>
<i>sqrt(dc)</i>	<i>csqrt(dc)</i>

Macro	Use Invokes
<i>pow(ldc,f)</i>	<i>cpowl(ldc,f)</i>
<i>remainder(n,n)</i>	<i>remainder(n,n)</i> , the function
<i>nextafter(d,f)</i>	<i>nextafter(d,f)</i> , the function
<i>nexttoward(f,ld)</i>	<i>nexttowardf(f,ld)</i>
<i>copysign(n,ld)</i>	<i>copysignl(n,ld)</i>
<i>ceil(fc)</i>	Undefined behavior
<i>rint(dc)</i>	Undefined behavior
<i>fmax(ldc,ld)</i>	Undefined behavior
<i>carg(n)</i>	<i>carg(n)</i> , the function
<i>cproj(f)</i>	<i>cprojf(f)</i>
<i>creal(d)</i>	<i>creal(d)</i> , the function
<i>cimag(ld)</i>	<i>cimagl(ld)</i>
<i>cabs(fc)</i>	<i>cabsf(fc)</i>
<i>carg(dc)</i>	<i>carg(dc)</i> , the function
<i>cproj(ldc)</i>	<i>cprojl(ldc)</i>

**RATIONALE**

Type-generic macros allow calling a function whose type is determined by the argument type, as is the case for C operators such as '+' and '\*'. For example, with a type-generic *cos()* macro, the expression *cos((float)x)* will have type **float**. This feature enables writing more portably efficient code and alleviates need for awkward casting and suffixing in the process of porting or adjusting precision. Generic math functions are a widely appreciated feature of Fortran.

The only arguments that affect the type resolution are the arguments corresponding to the parameters that have type **double** in the synopsis. Hence the type of a type-generic call to *nexttoward()*, whose second parameter is **long double** in the synopsis, is determined solely by the type of the first argument.

The term “type-generic” was chosen over the proposed alternatives of intrinsic and overloading. The term is more specific than intrinsic, which already is widely used with a more general meaning, and reflects a closer match to Fortran’s generic functions than to C++ overloading.

The macros are placed in their own header in order not to silently break old programs that include the <math.h> header; for example, with:

```
printf ("%e", sin(x))
```

*modf(double, double \*)* is excluded because no way was seen to make it safe without complicating the type resolution.

The implementation might, as an extension, endow appropriate ones of the macros that POSIX.1-2008 specifies only for real arguments with the ability to invoke the complex functions.

POSIX.1-2008 does not prescribe any particular implementation mechanism for generic macros. It could be implemented simply with built-in macros. The generic macro for *sqrt()*, for example, could be implemented with:

```
#undef sqrt
#define sqrt(x) __BUILTIN_GENERIC_sqrt(x)
```

Generic macros are designed for a useful level of consistency with C++ overloaded math functions.

The great majority of existing C programs are expected to be unaffected when the <tgmath.h> header is included instead of the <math.h> or <complex.h> headers. Generic macros are similar to the ISO/IEC 9899:1999 standard library masking macros, though the semantic types of return

14383 values differ.

14384 The ability to overload on integer as well as floating types would have been useful for some  
14385 functions; for example, *copysign()*. Overloading with different numbers of arguments would  
14386 have allowed reusing names; for example, *remainder()* for *remquo()*. However, these facilities  
14387 would have complicated the specification; and their natural consistent use, such as for a floating  
14388 *abs()* or a two-argument *atan()*, would have introduced further inconsistencies with the  
14389 ISO/IEC 9899:1999 standard for insufficient benefit.

14390 The ISO C standard in no way limits the implementation's options for efficiency, including  
14391 inlining library functions.

#### 14397 CHANGE HISTORY

14398 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

#### 14399 Issue 7

14400 Austin Group Interpretation 1003.1-2001 #184 is applied, clarifying the functions for which a  
14401 corresponding type-generic macro exists with the same name as the function.

14402 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0075 [357,427] is applied.

## 14403 NAME

14404 time.h — time types

## 14405 SYNOPSIS

14406 #include &lt;time.h&gt;

## 14407 DESCRIPTION

14408 CX Some of the functionality described on this reference page extends the ISO C standard.  
 14409 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to  
 14410 enable the visibility of these symbols in this header.

14411 The <time.h> header shall define the **clock\_t**, **size\_t**, **time\_t**, types as described in  
 14412 <sys/types.h>.

14413 CX The <time.h> header shall define the **clockid\_t** and **timer\_t** types as described in <sys/types.h>.

14414 The <time.h> header shall define the **locale\_t** type as described in <locale.h>.

14415 CPT The <time.h> header shall define the **pid\_t** type as described in <sys/types.h>.

14416 CX The tag **sigevent** shall be declared as naming an incomplete structure type, the contents of which  
 14417 are described in the <signal.h> header.

14418 The <time.h> header shall declare the **tm** structure, which shall include at least the following  
 14419 members:

14420	int	tm_sec	Seconds [0,60].
14421	int	tm_min	Minutes [0,59].
14422	int	tm_hour	Hour [0,23].
14423	int	tm_mday	Day of month [1,31].
14424	int	tm_mon	Month of year [0,11].
14425	int	tm_year	Years since 1900.
14426	int	tm_wday	Day of week [0,6] (Sunday =0).
14427	int	tm_yday	Day of year [0,365].
14428	int	tm_isdst	Daylight Savings flag.

14429 The value of *tm\_isdst* shall be positive if Daylight Savings Time is in effect, 0 if Daylight Savings  
 14430 Time is not in effect, and negative if the information is not available.

14431 CX The <time.h> header shall declare the **timespec** structure, which shall include at least the  
 14432 following members:

14433	time_t	tv_sec	Seconds.
14434	long	tv_nsec	Nanoseconds.

14435 The <time.h> header shall also declare the **itimerspec** structure, which shall include at least the  
 14436 following members:

14437	struct timespec	it_interval	Timer period.
14438	struct timespec	it_value	Timer expiration.

14439 The <time.h> header shall define the following macros:

14440 NULL As described in <stddef.h>.

14441 CLOCKS\_PER\_SEC A number used to convert the value returned by the *clock()* function into  
 14442 XSI seconds. The value shall be an expression with type **clock\_t**. The value of  
 14443 CLOCKS\_PER\_SEC shall be 1 million on XSI-conformant systems.  
 14444 However, it may be variable on other systems, and it should not be

14445		assumed that <code>CLOCKS_PER_SEC</code> is a compile-time constant.
14446	CX	The <time.h> header shall define the following symbolic constants. The values shall have a type
14447		that is assignment-compatible with <code>clockid_t</code> .
14448	MON	<code>CLOCK_MONOTONIC</code>
14449		The identifier for the system-wide monotonic clock, which is defined as a
14450		clock measuring real time, whose value cannot be set via <code>clock_settime()</code>
14451		and which cannot have negative clock jumps. The maximum possible
14452		clock jump shall be implementation-defined.
14453	CPT	<code>CLOCK_PROCESS_CPUTIME_ID</code>
14454		The identifier of the CPU-time clock associated with the process making a
14455		<code>clock()</code> or <code>timer*()</code> function call.
14456	CX	<code>CLOCK_REALTIME</code> The identifier of the system-wide clock measuring real time.
14457	TCT	<code>CLOCK_THREAD_CPUTIME_ID</code>
14458		The identifier of the CPU-time clock associated with the thread making a
14459		<code>clock()</code> or <code>timer*()</code> function call.
14460	CX	The <time.h> header shall define the following symbolic constant:
14461		<code>TIMER_ABSTIME</code> Flag indicating time is absolute. For functions taking timer objects, this
14462		refers to the clock associated with the timer.
14463	XSI	The <time.h> header shall provide a declaration or definition for <code>getdate_err</code> . The <code>getdate_err</code>
14464		symbol shall expand to an expression of type <code>int</code> . It is unspecified whether <code>getdate_err</code> is a macro
14465		or an identifier declared with external linkage, and whether or not it is a modifiable lvalue. If a
14466		macro definition is suppressed in order to access an actual object, or a program defines an
14467		identifier with the name <code>getdate_err</code> , the behavior is undefined.
14468		The following shall be declared as functions and may also be defined as macros. Function
14469		prototypes shall be provided.
14470	OB	<code>char *asctime(const struct tm *);</code>
14471	OB CX	<code>char *asctime_r(const struct tm *restrict, char *restrict);</code>
14472		<code>clock_t clock(void);</code>
14473	CPT	<code>int clock_getcpuclockid(pid_t, clockid_t *);</code>
14474	CX	<code>int clock_getres(clockid_t, struct timespec *);</code>
14475		<code>int clock_gettime(clockid_t, struct timespec *);</code>
14476		<code>int clock_nanosleep(clockid_t, int, const struct timespec *,</code>
14477		<code>struct timespec *);</code>
14478		<code>int clock_settime(clockid_t, const struct timespec *);</code>
14479	OB	<code>char *ctime(const time_t *);</code>
14480	OB CX	<code>char *ctime_r(const time_t *, char *);</code>
14481		<code>double difftime(time_t, time_t);</code>
14482	XSI	<code>struct tm *getdate(const char *);</code>
14483		<code>struct tm *gmtime(const time_t *);</code>
14484	CX	<code>struct tm *gmtime_r(const time_t *restrict, struct tm *restrict);</code>
14485		<code>struct tm *localtime(const time_t *);</code>
14486	CX	<code>struct tm *localtime_r(const time_t *restrict, struct tm *restrict);</code>
14487		<code>time_t mktime(struct tm *);</code>
14488	CX	<code>int nanosleep(const struct timespec *, struct timespec *);</code>
14489		<code>size_t strftime(char *restrict, size_t, const char *restrict,</code>
14490		<code>const struct tm *restrict);</code>

```

14491 CX      size_t      strftime_l(char *restrict, size_t, const char *restrict,
14492              const struct tm *restrict, locale_t);
14493 XSI      char        *strptime(const char *restrict, const char *restrict,
14494              struct tm *restrict);
14495          time_t      time(time_t *);
14496 CX      int          timer_create(clockid_t, struct sigevent *restrict,
14497              timer_t *restrict);
14498          int          timer_delete(timer_t);
14499          int          timer_getoverrun(timer_t);
14500          int          timer_gettime(timer_t, struct itimerspec *);
14501          int          timer_settime(timer_t, int, const struct itimerspec *restrict,
14502              struct itimerspec *restrict);
14503          void         tzset(void);

```

14504 The <time.h> header shall declare the following as variables:

```

14505 XSI      extern int     daylight;
14506          extern long    timezone;
14507 CX      extern char     *tzname[];

```

14508 CX Inclusion of the <time.h> header may make visible all symbols from the <signal.h> header.

## 14509 APPLICATION USAGE

14510 The range [0,60] for *tm\_sec* allows for the occasional leap second.

14511 *tm\_year* is a signed value; therefore, years before 1900 may be represented.

14512 To obtain the number of clock ticks per second returned by the *times()* function, applications  
14513 should call *sysconf(\_SC\_CLK\_TCK)*.

## 14514 RATIONALE

14515 The range [0,60] seconds allows for positive or negative leap seconds. The formal definition of  
14516 UTC does not permit double leap seconds, so all mention of double leap seconds has been  
14517 removed, and the range shortened from the former [0,61] seconds seen in earlier versions of this  
14518 standard.

## 14519 FUTURE DIRECTIONS

14520 None.

## 14528 CHANGE HISTORY

14529 First released in Issue 1. Derived from Issue 1 of the SVID.

## 14530 Issue 5

14531 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
14532 Threads Extension.

## Issue 6

The Open Group Corrigendum U035/6 is applied. In the DESCRIPTION, the types **clockid\_t** and **timer\_t** have been described.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The POSIX timer-related functions are marked as part of the Timers option.

The symbolic name CLK\_TCK is removed. Application usage is added describing how its equivalent functionality can be obtained using *sysconf()*.

The *clock\_getcpuclockid()* function and manifest constants CLOCK\_PROCESS\_CPUTIME\_ID and CLOCK\_THREAD\_CPUTIME\_ID are added for alignment with IEEE Std 1003.1d-1999.

The manifest constant CLOCK\_MONOTONIC and the *clock\_nanosleep()* function are added for alignment with IEEE Std 1003.1j-2000.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The range for seconds is changed from [0,61] to [0,60].
- The **restrict** keyword is added to the prototypes for *asctime\_r()*, *gmtime\_r()*, *localtime\_r()*, *strftime()*, *strptime()*, *timer\_create()*, and *timer\_settime()*.

IEEE PASC Interpretation 1003.1 #84 is applied adding the statement that symbols from the <signal.h> header may be made visible when the <time.h> header is included.

Extensions beyond the ISO C standard are marked.

## Issue 7

Austin Group Interpretation 1003.1-2001 #111 is applied.

SD5-XBD-ERN-74 is applied.

The *strptime\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

Functionality relating to the Timers option is moved to the Base.

This reference page is clarified with respect to macros and symbolic constants, and declarations for the **locale\_t** and **pid\_t** types and the **sigevent** structure are added.

The description of the *getdate\_err* value is expanded.

POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0076 [212] and XBD/TC1-2008/0077 [212] are applied.

14562 **NAME**

14563       trace.h — tracing

14564 **SYNOPSIS**

14565 OB TRC   #include &lt;trace.h&gt;

14566 **DESCRIPTION**14567       The <trace.h> header shall define the **posix\_trace\_event\_info** structure, which shall include at  
14568       least the following members:

```

14569     trace_event_id_t   posix_event_id
14570     pid_t              posix_pid
14571     void               *posix_prog_address
14572     pthread_t          posix_thread_id
14573     struct timespec    posix_timestamp
14574     int                posix_truncation_status

```

14575       The <trace.h> header shall define the **posix\_trace\_status\_info** structure, which shall include at  
14576       least the following members:

```

14577     int                posix_stream_full_status
14578     int                posix_stream_overrun_status
14579     int                posix_stream_status
14580 OB TRL   int          posix_log_full_status
14581         int          posix_log_overrun_status
14582         int          posix_stream_flush_error
14583         int          posix_stream_flush_status

```

14584       The &lt;trace.h&gt; header shall define the following symbolic constants:

```

14585     POSIX_TRACE_ALL_EVENTS
14586 OB TRL   POSIX_TRACE_APPEND
14587 OB TRI   POSIX_TRACE_CLOSE_FOR_CHILD
14588 OB TEF   POSIX_TRACE_FILTER
14589 OB TRL   POSIX_TRACE_FLUSH
14590         POSIX_TRACE_FLUSH_START
14591         POSIX_TRACE_FLUSH_STOP
14592         POSIX_TRACE_FLUSHING
14593         POSIX_TRACE_FULL
14594         POSIX_TRACE_LOOP
14595         POSIX_TRACE_NO_OVERRUN
14596 OB TRL   POSIX_TRACE_NOT_FLUSHING
14597         POSIX_TRACE_NOT_FULL
14598 OB TRI   POSIX_TRACE_INHERITED
14599         POSIX_TRACE_NOT_TRUNCATED
14600         POSIX_TRACE_OVERFLOW
14601         POSIX_TRACE_OVERRUN
14602         POSIX_TRACE_RESUME
14603         POSIX_TRACE_RUNNING
14604         POSIX_TRACE_START
14605         POSIX_TRACE_STOP
14606         POSIX_TRACE_SUSPENDED
14607         POSIX_TRACE_SYSTEM_EVENTS
14608         POSIX_TRACE_TRUNCATED_READ

```

14609 POSIX\_TRACE\_TRUNCATED\_RECORD  
 14610 POSIX\_TRACE\_UNNAMED\_USER\_EVENT  
 14611 POSIX\_TRACE\_UNTIL\_FULL  
 14612 POSIX\_TRACE\_WOPID\_EVENTS

14613 OB TEF The <trace.h> header shall define the **size\_t**, **trace\_attr\_t**, **trace\_event\_id\_t**, **trace\_event\_set\_t**,  
 14614 and **trace\_id\_t** types as described in <sys/types.h>.

14615 The following shall be declared as functions and may also be defined as macros. Function  
 14616 prototypes shall be provided.

```

14617 int  posix_trace_attr_destroy(trace_attr_t *);
14618 int  posix_trace_attr_getclockres(const trace_attr_t *,
14619                                struct timespec *);

14735       First released in Issue 3.

14736 **Issue 7**

14737       The &lt;ulimit.h&gt; header is marked obsolescent.

**NAME**

unistd.h — standard symbolic constants and types

**SYNOPSIS**

```
#include <unistd.h>
```

**DESCRIPTION**

The <unistd.h> header defines miscellaneous symbolic constants and types, and declares miscellaneous functions. The actual values of the constants are unspecified except as shown. The contents of this header are shown below.

**Version Test Macros**

The <unistd.h> header shall define the following symbolic constants. The values shall be suitable for use in **#if** preprocessing directives.

**\_POSIX\_VERSION**

Integer value indicating version of this standard (C-language binding) to which the implementation conforms. For implementations conforming to POSIX.1-2008, the value shall be 200809L.

**\_POSIX2\_VERSION**

Integer value indicating version of the Shell and Utilities volume of POSIX.1 to which the implementation conforms. For implementations conforming to POSIX.1-2008, the value shall be 200809L. For profile implementations that define **\_POSIX\_SUBPROFILE** (see [Section 2.1.5.1](#)) in <unistd.h>, **\_POSIX2\_VERSION** may be left undefined or be defined with the value **-1** to indicate that the Shell and Utilities volume of POSIX.1 is not supported. In this case, a call to *sysconf(\_SC\_2\_VERSION)* shall return either 200809L or **-1** indicating that the Shell and Utilities volume of POSIX.1 is or is not, respectively, supported at runtime.

The <unistd.h> header shall define the following symbolic constant only if the implementation supports the XSI option; see [Section 2.1.4](#) (on page 19). If defined, its value shall be suitable for use in **#if** preprocessing directives.

**\_XOPEN\_VERSION**

Integer value indicating version of the X/Open Portability Guide to which the implementation conforms. The value shall be 700.

**Constants for Options and Option Groups**

The following symbolic constants, if defined in <unistd.h>, shall have a value of **-1**, **0**, or greater, unless otherwise specified below. For profile implementations that define **\_POSIX\_SUBPROFILE** (see [Section 2.1.5.1](#)) in <unistd.h>, constants described below as always having a value greater than zero need not be defined and, if defined, may have a value of **-1**, **0**, or greater. The values shall be suitable for use in **#if** preprocessing directives.

If a symbolic constant is not defined or is defined with the value **-1**, the option is not supported for compilation. If it is defined with a value greater than zero, the option shall always be supported when the application is executed. If it is defined with the value zero, the option shall be supported for compilation and might or might not be supported at runtime. See [Section 2.1.6](#) (on page 26) for further information about the conformance requirements of these three categories of support.

**\_POSIX\_ADVISORY\_INFO**

The implementation supports the Advisory Information option. If this symbol is defined in <unistd.h>, it shall be defined to be **-1**, **0**, or 200809L. The value of this symbol reported by *sysconf()* shall either be **-1** or 200809L.

14783		<b>_POSIX_ASYNCHRONOUS_IO</b>
14784		The implementation supports asynchronous input and output. This symbol shall always be
14785		set to the value 200809L.
14786		<b>_POSIX_BARRIERS</b>
14787		The implementation supports barriers. This symbol shall always be set to the value
14788		200809L.
14789		<b>_POSIX_CHOWN_RESTRICTED</b>
14790		The use of <i>chown()</i> and <i>fchown()</i> is restricted to a process with appropriate privileges, and
14791		to changing the group ID of a file only to the effective group ID of the process or to one of
14792		its supplementary group IDs. This symbol shall be defined with a value other than -1.
14793		<b>_POSIX_CLOCK_SELECTION</b>
14794		The implementation supports clock selection. This symbol shall always be set to the value
14795		200809L.
14796	CPT	<b>_POSIX_CPUTIME</b>
14797		The implementation supports the Process CPU-Time Clocks option. If this symbol is
14798		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14799		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14800	FSC	<b>_POSIX_FSYNC</b>
14801		The implementation supports the File Synchronization option. If this symbol is defined in
14802		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14803		<i>sysconf()</i> shall either be -1 or 200809L.
14804	IP6	<b>_POSIX_IPV6</b>
14805		The implementation supports the IPv6 option. If this symbol is defined in <unistd.h>, it
14806		shall be defined to be -1, 0, or 200809L. The value of this symbol reported by <i>sysconf()</i> shall
14807		either be -1 or 200809L.
14808		<b>_POSIX_JOB_CONTROL</b>
14809		The implementation supports job control. This symbol shall always be set to a value greater
14810		than zero.
14811		<b>_POSIX_MAPPED_FILES</b>
14812		The implementation supports memory mapped Files. This symbol shall always be set to the
14813		value 200809L.
14814	ML	<b>_POSIX_MEMLOCK</b>
14815		The implementation supports the Process Memory Locking option. If this symbol is defined
14816		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14817		by <i>sysconf()</i> shall either be -1 or 200809L.
14818	MLR	<b>_POSIX_MEMLOCK_RANGE</b>
14819		The implementation supports the Range Memory Locking option. If this symbol is defined
14820		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14821		by <i>sysconf()</i> shall either be -1 or 200809L.
14822		<b>_POSIX_MEMORY_PROTECTION</b>
14823		The implementation supports memory protection. This symbol shall always be set to the
14824		value 200809L.
14825	MSG	<b>_POSIX_MESSAGE_PASSING</b>
14826		The implementation supports the Message Passing option. If this symbol is defined in
14827		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14828		<i>sysconf()</i> shall either be -1 or 200809L.

14829	MON	<b>_POSIX_MONOTONIC_CLOCK</b>
14830		The implementation supports the Monotonic Clock option. If this symbol is defined in
14831		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14832		sysconf() shall either be -1 or 200809L.
14833		<b>_POSIX_NO_TRUNC</b>
14834		Pathname components longer than {NAME_MAX} generate an error. This symbol shall be
14835		defined with a value other than -1.
14836	PIO	<b>_POSIX_PRIORITIZED_IO</b>
14837		The implementation supports the Prioritized Input and Output option. If this symbol is
14838		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14839		reported by sysconf() shall either be -1 or 200809L.
14840	PS	<b>_POSIX_PRIORITY_SCHEDULING</b>
14841		The implementation supports the Process Scheduling option. If this symbol is defined in
14842		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14843		sysconf() shall either be -1 or 200809L.
14844	RS	<b>_POSIX_RAW_SOCKETS</b>
14845		The implementation supports the Raw Sockets option. If this symbol is defined in
14846		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14847		sysconf() shall either be -1 or 200809L.
14848		<b>_POSIX_READER_WRITER_LOCKS</b>
14849		The implementation supports read-write locks. This symbol shall always be set to the value
14850		200809L.
14851		<b>_POSIX_REALTIME_SIGNALS</b>
14852		The implementation supports realtime signals. This symbol shall always be set to the value
14853		200809L.
14854		<b>_POSIX_REGEX</b>
14855		The implementation supports the Regular Expression Handling option. This symbol shall
14856		always be set to a value greater than zero.
14857		<b>_POSIX_SAVED_IDS</b>
14858		Each process has a saved set-user-ID and a saved set-group-ID. This symbol shall always be
14859		set to a value greater than zero.
14860		<b>_POSIX_SEMAPHORES</b>
14861		The implementation supports semaphores. This symbol shall always be set to the value
14862		200809L.
14863	SHM	<b>_POSIX_SHARED_MEMORY_OBJECTS</b>
14864		The implementation supports the Shared Memory Objects option. If this symbol is defined
14865		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14866		by sysconf() shall either be -1 or 200809L.
14867		<b>_POSIX_SHELL</b>
14868		The implementation supports the POSIX shell. This symbol shall always be set to a value
14869		greater than zero.
14870	SPN	<b>_POSIX_SPAWN</b>
14871		The implementation supports the Spawn option. If this symbol is defined in <unistd.h>, it
14872		shall be defined to be -1, 0, or 200809L. The value of this symbol reported by sysconf() shall
14873		either be -1 or 200809L.

14874		<b>_POSIX_SPIN_LOCKS</b>
14875		The implementation supports spin locks. This symbol shall always be set to the value
14876		200809L.
14877	SS	<b>_POSIX_SPORADIC_SERVER</b>
14878		The implementation supports the Process Sporadic Server option. If this symbol is defined
14879		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14880		by <i>sysconf()</i> shall either be -1 or 200809L.
14881	SIO	<b>_POSIX_SYNCHRONIZED_IO</b>
14882		The implementation supports the Synchronized Input and Output option. If this symbol is
14883		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14884		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14885	TSA	<b>_POSIX_THREAD_ATTR_STACKADDR</b>
14886		The implementation supports the Thread Stack Address Attribute option. If this symbol is
14887		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14888		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14889	TSS	<b>_POSIX_THREAD_ATTR_STACKSIZE</b>
14890		The implementation supports the Thread Stack Size Attribute option. If this symbol is
14891		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14892		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14893	TCT	<b>_POSIX_THREAD_CPU_TIME</b>
14894		The implementation supports the Thread CPU-Time Clocks option. If this symbol is
14895		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14896		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14897	TPI	<b>_POSIX_THREAD_PRIO_INHERIT</b>
14898		The implementation supports the Non-Robust Mutex Priority Inheritance option. If this
14899		symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this
14900		symbol reported by <i>sysconf()</i> shall either be -1 or 200809L.
14901	TPP	<b>_POSIX_THREAD_PRIO_PROTECT</b>
14902		The implementation supports the Non-Robust Mutex Priority Protection option. If this
14903		symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this
14904		symbol reported by <i>sysconf()</i> shall either be -1 or 200809L.
14905	TPS	<b>_POSIX_THREAD_PRIORITY_SCHEDULING</b>
14906		The implementation supports the Thread Execution Scheduling option. If this symbol is
14907		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14908		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14909	TSH	<b>_POSIX_THREAD_PROCESS_SHARED</b>
14910		The implementation supports the Thread Process-Shared Synchronization option. If this
14911		symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this
14912		symbol reported by <i>sysconf()</i> shall either be -1 or 200809L.
14913	RPI	<b>_POSIX_THREAD_ROBUST_PRIO_INHERIT</b>
14914		The implementation supports the Robust Mutex Priority Inheritance option. If this symbol
14915		is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14916		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14917	RPP	<b>_POSIX_THREAD_ROBUST_PRIO_PROTECT</b>
14918		The implementation supports the Robust Mutex Priority Protection option. If this symbol is
14919		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol

14920		reported by <i>sysconf()</i> shall either be <code>-1</code> or <code>200809L</code> .
14921		<code>_POSIX_THREAD_SAFE_FUNCTIONS</code>
14922		The implementation supports thread-safe functions. This symbol shall always be set to the
14923		value <code>200809L</code> .
14924	TSP	<code>_POSIX_THREAD_SPORADIC_SERVER</code>
14925		The implementation supports the Thread Sporadic Server option. If this symbol is defined
14926		in <code>&lt;unistd.h&gt;</code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported
14927		by <i>sysconf()</i> shall either be <code>-1</code> or <code>200809L</code> .
14928		<code>_POSIX_THREADS</code>
14929		The implementation supports threads. This symbol shall always be set to the value
14930		<code>200809L</code> .
14931		<code>_POSIX_TIMEOUTS</code>
14932		The implementation supports timeouts. This symbol shall always be set to the value
14933		<code>200809L</code> .
14934		<code>_POSIX_TIMERS</code>
14935		The implementation supports timers. This symbol shall always be set to the value <code>200809L</code> .
14936	OB TRC	<code>_POSIX_TRACE</code>
14937		The implementation supports the Trace option. If this symbol is defined in <code>&lt;unistd.h&gt;</code> , it
14938		shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported by <i>sysconf()</i> shall
14939		either be <code>-1</code> or <code>200809L</code> .
14940	OB TEF	<code>_POSIX_TRACE_EVENT_FILTER</code>
14941		The implementation supports the Trace Event Filter option. If this symbol is defined in
14942		<code>&lt;unistd.h&gt;</code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported by
14943		<i>sysconf()</i> shall either be <code>-1</code> or <code>200809L</code> .
14944	OB TRI	<code>_POSIX_TRACE_INHERIT</code>
14945		The implementation supports the Trace Inherit option. If this symbol is defined in
14946		<code>&lt;unistd.h&gt;</code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported by
14947		<i>sysconf()</i> shall either be <code>-1</code> or <code>200809L</code> .
14948	OB TRL	<code>_POSIX_TRACE_LOG</code>
14949		The implementation supports the Trace Log option. If this symbol is defined in <code>&lt;unistd.h&gt;</code> ,
14950		it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported by <i>sysconf()</i>
14951		shall either be <code>-1</code> or <code>200809L</code> .
14952	TYM	<code>_POSIX_TYPED_MEMORY_OBJECTS</code>
14953		The implementation supports the Typed Memory Objects option. If this symbol is defined
14954		in <code>&lt;unistd.h&gt;</code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported
14955		by <i>sysconf()</i> shall either be <code>-1</code> or <code>200809L</code> .
14956	OB	<code>_POSIX_V6_ILP32_OFF32</code>
14957		The implementation provides a C-language compilation environment with 32-bit <b>int</b> , <b>long</b> ,
14958		<b>pointer</b> , and <b>off_t</b> types.
14959	OB	<code>_POSIX_V6_ILP32_OFFBIG</code>
14960		The implementation provides a C-language compilation environment with 32-bit <b>int</b> , <b>long</b> ,
14961		and <b>pointer</b> types and an <b>off_t</b> type using at least 64 bits.
14962	OB	<code>_POSIX_V6_LP64_OFF64</code>
14963		The implementation provides a C-language compilation environment with 32-bit <b>int</b> and
14964		64-bit <b>long</b> , <b>pointer</b> , and <b>off_t</b> types.

14965	OB	<b>_POSIX_V6_LPBIG_OFFBIG</b>
14966		The implementation provides a C-language compilation environment with an <b>int</b> type
14967		using at least 32 bits and <b>long</b> , <b>pointer</b> , and <b>off_t</b> types using at least 64 bits.
14968		<b>_POSIX_V7_ILP32_OFF32</b>
14969		The implementation provides a C-language compilation environment with 32-bit <b>int</b> , <b>long</b> ,
14970		<b>pointer</b> , and <b>off_t</b> types.
14971		<b>_POSIX_V7_ILP32_OFFBIG</b>
14972		The implementation provides a C-language compilation environment with 32-bit <b>int</b> , <b>long</b> ,
14973		and <b>pointer</b> types and an <b>off_t</b> type using at least 64 bits.
14974		<b>_POSIX_V7_LP64_OFF64</b>
14975		The implementation provides a C-language compilation environment with 32-bit <b>int</b> and
14976		64-bit <b>long</b> , <b>pointer</b> , and <b>off_t</b> types.
14977		<b>_POSIX_V7_LPBIG_OFFBIG</b>
14978		The implementation provides a C-language compilation environment with an <b>int</b> type
14979		using at least 32 bits and <b>long</b> , <b>pointer</b> , and <b>off_t</b> types using at least 64 bits.
14980		<b>_POSIX2_C_BIND</b>
14981		The implementation supports the C-Language Binding option. This symbol shall always
14982		have the value 200809L.
14983	CD	<b>_POSIX2_C_DEV</b>
14984		The implementation supports the C-Language Development Utilities option. If this symbol
14985		is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14986		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14987		<b>_POSIX2_CHAR_TERM</b>
14988		The implementation supports the Terminal Characteristics option. The value of this symbol
14989		reported by <i>sysconf()</i> shall either be -1 or a value greater than zero.
14990	FD	<b>_POSIX2_FORT_DEV</b>
14991		The implementation supports the FORTRAN Development Utilities option. If this symbol
14992		is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14993		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14994	FR	<b>_POSIX2_FORT_RUN</b>
14995		The implementation supports the FORTRAN Runtime Utilities option. If this symbol is
14996		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14997		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14998		<b>_POSIX2_LOCALEDEF</b>
14999		The implementation supports the creation of locales by the <i>localedef</i> utility. If this symbol is
15000		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
15001		reported by <i>sysconf()</i> shall either be -1 or 200809L.
15002	OB BE	<b>_POSIX2_PBS</b>
15003		The implementation supports the Batch Environment Services and Utilities option. If this
15004		symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this
15005		symbol reported by <i>sysconf()</i> shall either be -1 or 200809L.
15006	OB BE	<b>_POSIX2_PBS_ACCOUNTING</b>
15007		The implementation supports the Batch Accounting option. If this symbol is defined in
15008		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
15009		<i>sysconf()</i> shall either be -1 or 200809L.

15010	OB BE	<b>_POSIX2_PBS_CHECKPOINT</b>
15011		The implementation supports the Batch Checkpoint/Restart option. If this symbol is
15012		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
15013		reported by <i>sysconf()</i> shall either be -1 or 200809L.
15014	OB BE	<b>_POSIX2_PBS_LOCATE</b>
15015		The implementation supports the Locate Batch Job Request option. If this symbol is defined
15016		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
15017		by <i>sysconf()</i> shall either be -1 or 200809L.
15018	OB BE	<b>_POSIX2_PBS_MESSAGE</b>
15019		The implementation supports the Batch Job Message Request option. If this symbol is
15020		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
15021		reported by <i>sysconf()</i> shall either be -1 or 200809L.
15022	OB BE	<b>_POSIX2_PBS_TRACK</b>
15023		The implementation supports the Track Batch Job Request option. If this symbol is defined
15024		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
15025		by <i>sysconf()</i> shall either be -1 or 200809L.
15026	SD	<b>_POSIX2_SW_DEV</b>
15027		The implementation supports the Software Development Utilities option. If this symbol is
15028		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
15029		reported by <i>sysconf()</i> shall either be -1 or 200809L.
15030	UP	<b>_POSIX2_UPE</b>
15031		The implementation supports the User Portability Utilities option. If this symbol is defined
15032		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
15033		by <i>sysconf()</i> shall either be -1 or 200809L.
15034	XSI	<b>_XOPEN_CRYPT</b>
15035		The implementation supports the X/Open Encryption Option Group.
15036		<b>_XOPEN_ENH_I18N</b>
15037		The implementation supports the Issue 4, Version 2 Enhanced Internationalization Option
15038		Group. This symbol shall always be set to a value other than -1.
15039		<b>_XOPEN_REALTIME</b>
15040		The implementation supports the X/Open Realtime Option Group.
15041		<b>_XOPEN_REALTIME_THREADS</b>
15042		The implementation supports the X/Open Realtime Threads Option Group.
15043		<b>_XOPEN_SHM</b>
15044		The implementation supports the Issue 4, Version 2 Shared Memory Option Group. This
15045		symbol shall always be set to a value other than -1.
15046	OB XSR	<b>_XOPEN_STREAMS</b>
15047		The implementation supports the XSI STREAMS Option Group.
15048	XSI	<b>_XOPEN_UNIX</b>
15049		The implementation supports the XSI option.
15050	UU	<b>_XOPEN_UUCP</b>
15051		The implementation supports the UUCP Utilities option. If this symbol is defined in
15052		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
15053		<i>sysconf()</i> shall be either -1 or 200809L.

**Execution-Time Symbolic Constants**

If any of the following symbolic constants are not defined in the <unistd.h> header, the value shall vary depending on the file to which it is applied. If defined, they shall have values suitable for use in **#if** preprocessing directives.

If any of the following symbolic constants are defined to have value `-1` in the <unistd.h> header, the implementation shall not provide the option on any file; if any are defined to have a value other than `-1` in the <unistd.h> header, the implementation shall provide the option on all applicable files.

All of the following values, whether defined as symbolic constants in <unistd.h> or not, may be queried with respect to a specific file using the *pathconf()* or *fpathconf()* functions:

`_POSIX_ASYNC_IO`

Asynchronous input or output operations may be performed for the associated file.

`_POSIX_PRIO_IO`

Prioritized input or output operations may be performed for the associated file.

`_POSIX_SYNC_IO`

Synchronized input or output operations may be performed for the associated file.

If the following symbolic constants are defined in the <unistd.h> header, they apply to files and all paths in all file systems on the implementation:

`_POSIX_TIMESTAMP_RESOLUTION`

The resolution in nanoseconds for all file timestamps.

`_POSIX2_SYMLINKS`

Symbolic links can be created.

**Constants for Functions**

The <unistd.h> header shall define `NULL` as described in <stddef.h>.

The <unistd.h> header shall define the following symbolic constants for use with the *access()* function. The values shall be suitable for use in **#if** preprocessing directives.

`F_OK`                Test for existence of file.

`R_OK`                Test for read permission.

`W_OK`                Test for write permission.

`X_OK`                Test for execute (search) permission.

The constants `F_OK`, `R_OK`, `W_OK`, and `X_OK` and the expressions `R_OK | W_OK`, `R_OK | X_OK`, and `R_OK | W_OK | X_OK` shall all have distinct values.

The <unistd.h> header shall define the following symbolic constants for the *confstr()* function:

`_CS_PATH`

This is the value for the *PATH* environment variable that finds all of the standard utilities that are provided in a manner accessible via the *exec* family of functions.

`_CS_POSIX_V7_ILP32_OFF32_CFLAGS`

If *sysconf(\_SC\_V7\_ILP32\_OFF32)* returns `-1`, the meaning of this value is unspecified. Otherwise, this value is the set of initial options to be given to the *c99* utility to build an application using a programming model with 32-bit **int**, **long**, **pointer**, and **off\_t** types.

15094 `_CS_POSIX_V7_ILP32_OFF32_LDFLAGS`  
 15095 If `sysconf(_SC_V7_ILP32_OFF32)` returns `-1`, the meaning of this value is unspecified.  
 15096 Otherwise, this value is the set of final options to be given to the `c99` utility to build an  
 15097 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off\_t** types.

15098 `_CS_POSIX_V7_ILP32_OFF32_LIBS`  
 15099 If `sysconf(_SC_V7_ILP32_OFF32)` returns `-1`, the meaning of this value is unspecified.  
 15100 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an  
 15101 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off\_t** types.

15102 `_CS_POSIX_V7_ILP32_OFFBIG_CFLAGS`  
 15103 If `sysconf(_SC_V7_ILP32_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 15104 Otherwise, this value is the set of initial options to be given to the `c99` utility to build an  
 15105 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an  
 15106 **off\_t** type using at least 64 bits.

15107 `_CS_POSIX_V7_ILP32_OFFBIG_LDFLAGS`  
 15108 If `sysconf(_SC_V7_ILP32_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 15109 Otherwise, this value is the set of final options to be given to the `c99` utility to build an  
 15110 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an  
 15111 **off\_t** type using at least 64 bits.

15112 `_CS_POSIX_V7_ILP32_OFFBIG_LIBS`  
 15113 If `sysconf(_SC_V7_ILP32_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 15114 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an  
 15115 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an  
 15116 **off\_t** type using at least 64 bits.

15117 `_CS_POSIX_V7_LP64_OFF64_CFLAGS`  
 15118 If `sysconf(_SC_V7_LP64_OFF64)` returns `-1`, the meaning of this value is unspecified.  
 15119 Otherwise, this value is the set of initial options to be given to the `c99` utility to build an  
 15120 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off\_t**  
 15121 types.

15122 `_CS_POSIX_V7_LP64_OFF64_LDFLAGS`  
 15123 If `sysconf(_SC_V7_LP64_OFF64)` returns `-1`, the meaning of this value is unspecified.  
 15124 Otherwise, this value is the set of final options to be given to the `c99` utility to build an  
 15125 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off\_t**  
 15126 types.

15127 `_CS_POSIX_V7_LP64_OFF64_LIBS`  
 15128 If `sysconf(_SC_V7_LP64_OFF64)` returns `-1`, the meaning of this value is unspecified.  
 15129 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an  
 15130 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off\_t**  
 15131 types.

15132 `_CS_POSIX_V7_LPBIG_OFFBIG_CFLAGS`  
 15133 If `sysconf(_SC_V7_LPBIG_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 15134 Otherwise, this value is the set of initial options to be given to the `c99` utility to build an  
 15135 application using a programming model with an **int** type using at least 32 bits and **long**,  
 15136 **pointer**, and **off\_t** types using at least 64 bits.

15137 `_CS_POSIX_V7_LPBIG_OFFBIG_LDFLAGS`  
 15138 If `sysconf(_SC_V7_LPBIG_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 15139 Otherwise, this value is the set of final options to be given to the `c99` utility to build an  
 15140 application using a programming model with an **int** type using at least 32 bits and **long**,

15141 **pointer**, and **off\_t** types using at least 64 bits.

15142 **\_CS\_POSIX\_V7\_LPBIG\_OFFBIG\_LIBS**

15143 If *sysconf*(*\_SC\_V7\_LPBIG\_OFFBIG*) returns -1, the meaning of this value is unspecified.

15144 Otherwise, this value is the set of libraries to be given to the *c99* utility to build an

15145 application using a programming model with an **int** type using at least 32 bits and **long**,

15146 **pointer**, and **off\_t** types using at least 64 bits.

15147 **\_CS\_POSIX\_V7\_THREADS\_CFLAGS**

15148 If *sysconf*(*\_SC\_POSIX\_THREADS*) returns -1, the meaning of this value is unspecified.

15149 Otherwise, this value is the set of initial options to be given to the *c99* utility to build a

15150 multi-threaded application. These flags are in addition to those associated with any of the

15151 other *\_CS\_POSIX\_V7\_\*\_CFLAGS* values used to specify particular type size programming

15152 environments.

15153 **\_CS\_POSIX\_V7\_THREADS\_LDFLAGS**

15154 If *sysconf*(*\_SC\_POSIX\_THREADS*) returns -1, the meaning of this value is unspecified.

15155 Otherwise, this value is the set of final options to be given to the *c99* utility to build a multi-

15156 threaded application. These flags are in addition to those associated with any of the other

15157 *\_CS\_POSIX\_V7\_\*\_LDFLAGS* values used to specify particular type size programming

15158 environments.

15159 **\_CS\_POSIX\_V7\_WIDTH\_RESTRICTED\_ENVS**

15160 This value is a <newline>-separated list of names of programming environments supported

15161 by the implementation in which the widths of the **blksize\_t**, **cc\_t**, **mode\_t**, **nfds\_t**, **pid\_t**,

15162 **ptrdiff\_t**, **size\_t**, **speed\_t**, **ssize\_t**, **suseconds\_t**, **tcflag\_t**, **wchar\_t**, and **wint\_t** types are no

15163 greater than the width of type **long**. The format of each name shall be suitable for use with

15164 the *getconf* -v option.

15165 **\_CS\_V7\_ENV**

15166 This is the value that provides the environment variable information (other than that

15167 provided by *\_CS\_PATH*) that is required by the implementation to create a conforming

15168 environment, as described in the implementation's conformance documentation.

15169 OB The following symbolic constants are reserved for compatibility with Issue 6:

15170 **\_CS\_POSIX\_V6\_ILP32\_OFF32\_CFLAGS**

15171 **\_CS\_POSIX\_V6\_ILP32\_OFF32\_LDFLAGS**

15172 **\_CS\_POSIX\_V6\_ILP32\_OFF32\_LIBS**

15173 **\_CS\_POSIX\_V6\_ILP32\_OFFBIG\_CFLAGS**

15174 **\_CS\_POSIX\_V6\_ILP32\_OFFBIG\_LDFLAGS**

15175 **\_CS\_POSIX\_V6\_ILP32\_OFFBIG\_LIBS**

15176 **\_CS\_POSIX\_V6\_LP64\_OFF64\_CFLAGS**

15177 **\_CS\_POSIX\_V6\_LP64\_OFF64\_LDFLAGS**

15178 **\_CS\_POSIX\_V6\_LP64\_OFF64\_LIBS**

15179 **\_CS\_POSIX\_V6\_LPBIG\_OFFBIG\_CFLAGS**

15180 **\_CS\_POSIX\_V6\_LPBIG\_OFFBIG\_LDFLAGS**

15181 **\_CS\_POSIX\_V6\_LPBIG\_OFFBIG\_LIBS**

15182 **\_CS\_POSIX\_V6\_WIDTH\_RESTRICTED\_ENVS**

15183 **\_CS\_V6\_ENV**

15184 The <unistd.h> header shall define *SEEK\_CUR*, *SEEK\_END*, and *SEEK\_SET* as described in

15185 <stdio.h>.

15186 XSI The <unistd.h> header shall define the following symbolic constants as possible values for the  
15187 *function* argument to the *lockf()* function:

15188	F_LOCK	Lock a section for exclusive use.
15189	F_TEST	Test section for locks by other processes.
15190	F_TLOCK	Test and lock a section for exclusive use.
15191	F_ULOCK	Unlock locked sections.

15192 The <unistd.h> header shall define the following symbolic constants for *pathconf()*:

15193	_PC_2_SYMLINKS
15194	_PC_ALLOC_SIZE_MIN
15195	_PC_ASYNC_IO
15196	_PC_CHOWN_RESTRICTED
15197	_PC_FILESIZEBITS
15198	_PC_LINK_MAX
15199	_PC_MAX_CANON
15200	_PC_MAX_INPUT
15201	_PC_NAME_MAX
15202	_PC_NO_TRUNC
15203	_PC_PATH_MAX
15204	_PC_PIPE_BUF
15205	_PC_PRIO_IO
15206	_PC_REC_INCR_XFER_SIZE
15207	_PC_REC_MAX_XFER_SIZE
15208	_PC_REC_MIN_XFER_SIZE
15209	_PC_REC_XFER_ALIGN
15210	_PC_SYMLINK_MAX
15211	_PC_SYNC_IO
15212	_PC_TIMESTAMP_RESOLUTION
15213	_PC_VDISABLE

15214 The <unistd.h> header shall define the following symbolic constants for *sysconf()*:

15215	_SC_2_C_BIND
15216	_SC_2_C_DEV
15217	_SC_2_CHAR_TERM
15218	_SC_2_FORT_DEV
15219	_SC_2_FORT_RUN
15220	_SC_2_LOCALEDEF
15221	_SC_2_PBS
15222	_SC_2_PBS_ACCOUNTING
15223	_SC_2_PBS_CHECKPOINT
15224	_SC_2_PBS_LOCATE
15225	_SC_2_PBS_MESSAGE
15226	_SC_2_PBS_TRACK
15227	_SC_2_SW_DEV
15228	_SC_2_UPE
15229	_SC_2_VERSION
15230	_SC_ADVISORY_INFO
15231	_SC_AIO_LISTIO_MAX
15232	_SC_AIO_MAX

15337        \_SC\_XOPEN\_UNIX  
 15338        \_SC\_XOPEN\_UUCP  
 15339        \_SC\_XOPEN\_VERSION

15340        The two constants `_SC_PAGESIZE` and `_SC_PAGE_SIZE` may be defined to have the same value.

15341        The <unistd.h> header shall define the following symbolic constants for file streams:

15342        STDERR\_FILENO     File number of *stderr*; 2.  
 15343        STDIN\_FILENO      File number of *stdin*; 0.  
 15344        STDOUT\_FILENO     File number of *stdout*; 1.

15345        The <unistd.h> header shall define the following symbolic constant for terminal special  
 15346        character handling:

15347        \_POSIX\_VDISABLE   This symbol shall be defined to be the value of a character that shall  
 15348                            disable terminal special character handling as described in [Section 11.2.6](#)  
 15349                            (on page 212). This symbol shall always be set to a value other than -1.

## 15350        Type Definitions

15351        The <unistd.h> header shall define the `size_t`, `ssize_t`, `uid_t`, `gid_t`, `off_t`, and `pid_t` types as  
 15352        described in <sys/types.h>.

15353        The <unistd.h> header shall define the `intptr_t` type as described in <stdint.h>.

## 15354        Declarations

15355        The following shall be declared as functions and may also be defined as macros. Function  
 15356        prototypes shall be provided.

15357        int                access(const char \*, int);  
 15358        unsigned          alarm(unsigned);  
 15359        int                chdir(const char \*);  
 15360        int                chown(const char \*, uid\_t, gid\_t);  
 15361        int                close(int);  
 15362        size\_t            confstr(int, char \*, size\_t);  
 15363        XSI char           \*crypt(const char \*, const char \*);  
 15364        int                dup(int);  
 15365        int                dup2(int, int);  
 15366        void              \_exit(int);  
 15367        XSI void          encrypt(char [64], int);  
 15368        int                execl(const char \*, const char \*, ...);  
 15369        int                execle(const char \*, const char \*, ...);  
 15370        int                execlp(const char \*, const char \*, ...);  
 15371        int                execv(const char \*, char \*const []);  
 15372        int                execve(const char \*, char \*const [], char \*const []);  
 15373        int                execvp(const char \*, char \*const []);  
 15374        int                faccessat(int, const char \*, int, int);  
 15375        int                fchdir(int);  
 15376        int                fchown(int, uid\_t, gid\_t);  
 15377        int                fchownat(int, const char \*, uid\_t, gid\_t, int);  
 15378        SIO int           fdatasync(int);  
 15379        int                fexecve(int, char \*const [], char \*const []);  
 15380        pid\_t             fork(void);

```

15381      long      fpathconf(int, int);

15395      pid_t     getpgrp(void);
15396      pid_t     getpid(void);
15397      pid_t     getppid(void);
15398      pid_t     getsid(pid_t);
15399      uid_t     getuid(void);
15400      int      isatty(int);
15401      int      lchown(const char *, uid_t, gid_t);
15402      int      link(const char *, const char *);
15403      int      linkat(int, const char *, int, const char *, int);
15404 XSI      int      lockf(int, int, off_t);
15405      off_t     lseek(int, off_t, int);
15406 XSI      int      nice(int);
15407      long      pathconf(const char *, int);
15408      int      pause(void);
15409      int      pipe(int [2]);
15410      ssize_t   pread(int, void *, size_t, off_t);
15411      ssize_t   pwrite(int, const void *, size_t, off_t);
15412      ssize_t   read(int, void *, size_t);
15413      ssize_t   readlink(const char *restrict, char *restrict, size_t);
15414      ssize_t   readlinkat(int, const char *restrict, char *restrict, size_t);
15415      int      rmdir(const char *);
15416      int      setegid(gid_t);
15417      int      seteuid(uid_t);
15418      int      setgid(gid_t);
15419      int      setpgid(pid_t, pid_t);
15420 OB XSI      pid_t   setpgrp(void);
15421 XSI      int      setregid(gid_t, gid_t);
15422      int      setreuid(uid_t, uid_t);
15423      pid_t     setsid(void);
15424      int      setuid(uid_t);
15425      unsigned  sleep(unsigned);
15426 XSI      void     swab(const void *restrict, void *restrict, ssize_t);
15427      int      symlink(const char *, const char *);
15428      int      symlinkat(const char *, int, const char *);
15429 XSI      void     sync(void);
15430      long      sysconf(int);
15431      pid_t     tcgetpgrp(int);
15432      int      tcsetpgrp(int, pid_t);

```

```

15433     int            truncate(const char *, off_t);
15434     char          *ttyname(int);
15435     int           ttyname_r(int, char *, size_t);
15436     int           unlink(const char *);
15437     int           unlinkat(int, const char *, int);
15438     ssize_t       write(int, const void *, size_t);

```

15439 OB Implementations may also include the `pthread_atfork()` prototype as defined in `<pthread.h>`.  
 15440 Implementations may also include the `ctermid()` prototype as defined in `<stdio.h>`.

15441 The `<unistd.h>` header shall declare the following external variables:

```

15442     extern char    *optarg;
15443     extern int     opterr, optind, optopt;

```

15444 Inclusion of the `<unistd.h>` header may make visible all symbols from the headers `<stddef.h>`, +  
 15445 `<stdint.h>`, and `<stdio.h>`.

## 15446 APPLICATION USAGE

15447 POSIX.1-2008 only describes the behavior of systems that claim conformance to it. However,  
 15448 application developers who want to write applications that adapt to other versions of this  
 15449 standard (or to systems that do not conform to any POSIX standard) may find it useful to code  
 15450 them so as to conditionally compile different code depending on the value of  
 15451 `_POSIX_VERSION`, for example:

```

15452     #if _POSIX_VERSION >= 200112L
15453     /* Use the newer function that copes with large files. */
15454     off_t pos=ftello(fp);
15455     #else
15456     /* Either this is an old version of POSIX, or _POSIX_VERSION is
15457        not even defined, so use the traditional function. */
15458     long pos=ftell(fp);
15459     #endif

```

15460 Earlier versions of POSIX.1-2008 and of the Single UNIX Specification can be identified by the  
 15461 following macros:

15462 POSIX.1-1988 standard  
 15463 `_POSIX_VERSION == 198808L`

15464 POSIX.1-1990 standard  
 15465 `_POSIX_VERSION == 199009L`

15466 ISO POSIX-1: 1996 standard  
 15467 `_POSIX_VERSION == 199506L`

15468 Single UNIX Specification, Version 1  
 15469 `_XOPEN_UNIX` and `_XOPEN_VERSION == 4`

15470 Single UNIX Specification, Version 2  
 15471 `_XOPEN_UNIX` and `_XOPEN_VERSION == 500`

15472 ISO POSIX-1: 2001 and Single UNIX Specification, Version 3  
 15473 `_POSIX_VERSION == 200112L`, plus (if the XSI option is supported) `_XOPEN_UNIX` and  
 15474 `_XOPEN_VERSION == 600`

15475 POSIX.1-2008 does not make any attempt to define application binary interaction with the  
 15476 underlying operating system. However, application developers may find it useful to query  
 15477 `_SC_VERSION` at runtime via `sysconf()` to determine whether the current version of the

operating system supports the necessary functionality as in the following program fragment:

```
if (sysconf(_SC_VERSION) < 200809L) {
    fprintf(stderr, "POSIX.1-2008 system required, terminating \n");
    exit(1);
}
```

New applications should not use `_XOPEN_SHM` or `_XOPEN_ENH_I18N`.

## RATIONALE

As POSIX.1-2008 evolved, certain options became sufficiently standardized that it was concluded that simply requiring one of the option choices was simpler than retaining the option. However, for backwards-compatibility, the option flags (with required constant values) are retained.

### Version Test Macros

The standard developers considered altering the definition of `_POSIX_VERSION` and removing `_SC_VERSION` from the specification of `sysconf()` since the utility to an application was deemed by some to be minimal, and since the implementation of the functionality is potentially problematic. However, they recognized that support for existing application binaries is a concern to manufacturers, application developers, and the users of implementations conforming to POSIX.1-2008.

While the example using `_SC_VERSION` in the APPLICATION USAGE section does not provide the greatest degree of imaginable utility to the application developer or user, it is arguably better than a **core** file or some other equally obscure result. (It is also possible for implementations to encode and recognize application binaries compiled in various POSIX.1-conforming environments, and modify the semantics of the underlying system to conform to the expectations of the application.) For the reasons outlined in the preceding paragraphs and in the APPLICATION USAGE section, the standard developers elected to retain the `_POSIX_VERSION` and `_SC_VERSION` functionality.

### Compile-Time Symbolic Constants for System-Wide Options

POSIX.1-2008 includes support in certain areas for the newly adopted policy governing options and stubs.

This policy provides flexibility for implementations in how they support options. It also specifies how conforming applications can adapt to different implementations that support different sets of options. It allows the following:

1. If an implementation has no interest in supporting an option, it does not have to provide anything associated with that option beyond the announcement that it does not support it.
2. An implementation can support a partial or incompatible version of an option (as a non-standard extension) as long as it does not claim to support the option.
3. An application can determine whether the option is supported. A strictly conforming application must check this announcement mechanism before first using anything associated with the option.

There is an important implication of this policy. POSIX.1-2008 cannot dictate the behavior of interfaces associated with an option when the implementation does not claim to support the option. In particular, it cannot require that a function associated with an unsupported option will fail if it does not perform as specified. However, this policy does not prevent a standard

from requiring certain functions to always be present, but that they shall always fail on some implementations. The `setpgid()` function in the POSIX.1-1990 standard, for example, is considered appropriate.

The POSIX standards include various options, and the C-language binding support for an option implies that the implementation must supply data types and function interfaces. An application must be able to discover whether the implementation supports each option.

Any application must consider the following three cases for each option:

1. Option never supported.

The implementation advertises at compile time that the option will never be supported. In this case, it is not necessary for the implementation to supply any of the data types or function interfaces that are provided only as part of the option. The implementation might provide data types and functions that are similar to those defined by POSIX.1-2008, but there is no guarantee for any particular behavior.

2. Option always supported.

The implementation advertises at compile time that the option will always be supported. In this case, all data types and function interfaces shall be available and shall operate as specified.

3. Option might or might not be supported.

Some implementations might not provide a mechanism to specify support of options at compile time. In addition, the implementation might be unable or unwilling to specify support or non-support at compile time. In either case, any application that might use the option at runtime must be able to compile and execute. The implementation must provide, at compile time, all data types and function interfaces that are necessary to allow this. In this situation, there must be a mechanism that allows the application to query, at runtime, whether the option is supported. If the application attempts to use the option when it is not supported, the result is unspecified unless explicitly specified otherwise in POSIX.1-2008.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

## Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

The symbolic constants `_XOPEN_REALTIME` and `_XOPEN_REALTIME_THREADS` are added.

\_POSIX2\_C\_BIND, \_XOPEN\_ENH\_I18N, and \_XOPEN\_SHM must now be set to a value other than -1 by a conforming implementation.

Large File System extensions are added.

The type of the argument to *sbrk()* is changed from **int** to **intptr\_t**.

\_XBS\_ constants are added to the list of constants for Options and Option Groups, to the list of constants for the *confstr()* function, and to the list of constants to the *sysconf()* function. These are all marked EX.

## Issue 6

\_POSIX2\_C\_VERSION is removed.

The Open Group Corrigendum U026/4 is applied, adding the prototype for *fdatasync()*.

The Open Group Corrigendum U026/1 is applied, adding the symbols \_SC\_XOPEN\_LEGACY, \_SC\_XOPEN\_REALTIME, and \_SC\_XOPEN\_REALTIME\_THREADS.

The symbols \_XOPEN\_STREAMS and \_SC\_XOPEN\_STREAMS are added to support the XSI STREAMS Option Group.

Text in the DESCRIPTION relating to conformance requirements is moved elsewhere in IEEE Std 1003.1-2001.

The LEGACY symbol \_SC\_PASS\_MAX is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The \_CS\_POSIX\_\* and \_CS\_XBS5\_\* constants are added for the *confstr()* function.
- The \_SC\_XBS5\_\* constants are added for the *sysconf()* function.
- The symbolic constants F\_ULOCK, F\_LOCK, F\_TLOCK, and F\_TEST are added.
- The **uid\_t**, **gid\_t**, **off\_t**, **pid\_t**, and **useconds\_t** types are mandated.

The *gethostname()* prototype is added for sockets.

A new section is added for System-Wide Options.

Function prototypes for *setegid()* and *seteuid()* are added.

Option symbolic constants are added for \_POSIX\_ADVISORY\_INFO, \_POSIX\_CPUTIME, \_POSIX\_SPAWN, \_POSIX\_SPORADIC\_SERVER, \_POSIX\_THREAD\_CPUTIME, \_POSIX\_THREAD\_SPORADIC\_SERVER, and \_POSIX\_TIMEOUTS, and *pathconf()* variables are added for \_PC\_ALLOC\_SIZE\_MIN, \_PC\_REC\_INCR\_XFER\_SIZE, \_PC\_REC\_MAX\_XFER\_SIZE, \_PC\_REC\_MIN\_XFER\_SIZE, and \_PC\_REC\_XFER\_ALIGN for alignment with IEEE Std 1003.1d-1999.

The following are added for alignment with IEEE Std 1003.1j-2000:

- Option symbolic constants \_POSIX\_BARRIERS, \_POSIX\_CLOCK\_SELECTION, \_POSIX\_MONOTONIC\_CLOCK, \_POSIX\_READER\_WRITER\_LOCKS, \_POSIX\_SPIN\_LOCKS, and \_POSIX\_TYPED\_MEMORY\_OBJECTS
- *sysconf()* variables \_SC\_BARRIERS, \_SC\_CLOCK\_SELECTION, \_SC\_MONOTONIC\_CLOCK, \_SC\_READER\_WRITER\_LOCKS, \_SC\_SPIN\_LOCKS, and \_SC\_TYPED\_MEMORY\_OBJECTS

The \_SC\_XBS5 macros associated with the ISO/IEC 9899:1990 standard are marked LEGACY, and new equivalent \_SC\_V6 macros associated with the ISO/IEC 9899:1999 standard are

introduced.

The `getwd()` function is marked LEGACY.

The **restrict** keyword is added to the prototypes for `readlink()` and `swab()`.

Constants for options are now harmonized, so when supported they take the year of approval of IEEE Std 1003.1-2001 as the value.

The following are added for alignment with IEEE Std 1003.1q-2000:

- Optional symbolic constants `_POSIX_TRACE`, `_POSIX_TRACE_EVENT_FILTER`, `_POSIX_TRACE_LOG`, and `_POSIX_TRACE_INHERIT`
- The `sysconf()` symbolic constants `_SC_TRACE`, `_SC_TRACE_EVENT_FILTER`, `_SC_TRACE_LOG`, and `_SC_TRACE_INHERIT`

The `brk()` and `sbrk()` LEGACY functions are removed.

The Open Group Base Resolution bwg2001-006 is applied, which reworks the XSI versioning information.

The Open Group Base Resolution bwg2001-008 is applied, changing the `namelen` parameter for `gethostname()` from `socklen_t` to `size_t`.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/2 is applied, changing “Thread Stack Address Size” to “Thread Stack Size Attribute”.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/20 is applied, adding the `_POSIX_IPV6`, `_SC_V6`, and `_SC_RAW_SOCKETS` symbols.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/21 is applied, correcting the description in “Constants for Functions” for the `_CS_POSIX_V6_LP64_OFF64_CFLAGS`, `_CS_POSIX_V6_LP64_OFF64_LDFLAGS`, and `_CS_POSIX_V6_LP64_OFF64_LIBS` symbols.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/22 is applied, removing the shading for the `_PC*` and `_SC*` constants, since these are mandatory on all implementations.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/23 is applied, adding the `_PC_SYMLINK_MAX` and `_SC_SYMLINK_MAX` constants.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/24 is applied, correcting the shading and margin code for the `fsync()` function.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/25 is applied, adding the following text to the APPLICATION USAGE section: “New applications should not use `_XOPEN_SHM` or `_XOPEN_ENH_I18N`.”.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/29 is applied, clarifying the requirements for when constants for Options and Option Groups can be defined or undefined.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/30 is applied, changing the `_V6_ILP32_OFF32`, `_V6_ILP32_OFFBIG`, `_V6_LP64_OFF64`, and `_V6_LP64_OFFBIG` symbols to `_POSIX_V6_ILP32_OFF32`, `_POSIX_V6_ILP32_OFFBIG`, `_POSIX_V6_LP64_OFF64`, and `_POSIX_V6_LP64_OFFBIG`, respectively. This is for consistency with the `sysconf()` and `c99` reference pages.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/31 is applied, adding that the format of names of programming environments can be obtained using the `getconf -v` option.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/32 is applied, deleting the `_SC_FILE_LOCKING`, `_SC_2_C_VERSION`, and `_SC_XOPEN_XCU_VERSION` constants.

15650 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/33 is applied, adding  
 15651 `_SC_SS_REPL_MAX`, `_SC_TRACE_EVENT_NAME_MAX`, `_SC_TRACE_NAME_MAX`,  
 15652 `_SC_TRACE_SYS_MAX`, and `_SC_TRACE_USER_EVENT_MAX` to the list of symbolic constants  
 15653 for `sysconf()`.

15654 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/34 is applied, updating the prototype for  
 15655 the `symlink()` function to match that in the System Interfaces volume of IEEE Std 1003.1-2001.

15656 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/35 is applied, adding `_PC_2_SYMLINKS`  
 15657 to the symbolic constants list for `pathconf()`. This corresponds to the definition of  
 15658 `POSIX2_SYMLINKS` in the Shell and Utilities volume of IEEE Std 1003.1-2001.

15659 **Issue 7**

15660 Austin Group Interpretations 1003.1-2001 #026 and #047 are applied.

15661 Austin Group Interpretation 1003.1-2001 #166 is applied to permit an additional compiler flag to  
 15662 enable threads.

15663 Austin Group Interpretation 1003.1-2001 #178 is applied, clarifying the values allowed for  
 15664 `_POSIX2_CHAR_TERM`.

15665 SD5-XBD-ERN-41 is applied, adding the `_POSIX2_SYMLINKS` constant.

15666 SD5-XBD-ERN-76 and SD5-XBD-ERN-77 are applied.

15667 Symbols to support the UUCP Utilities option are added.

15668 The variables for the supported programming environments are updated to be V7.

15669 The LEGACY and obsolescent symbols are removed.

15670 The `faccessat()`, `fchownat()`, `fexecve()`, `linkat()`, `readlinkat()`, `symlinkat()`, and `unlinkat()` functions  
 15671 are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

15672 The `_POSIX_TRACE*` constants from the Trace option are marked obsolescent.

15673 The `_POSIX2_PBS*` constants from the Batch Environment Services and Utilities option are  
 15674 marked obsolescent.

15675 Functionality relating to the Asynchronous Input and Output, Barriers, Clock Selection, Memory  
 15676 Mapped Files, Memory Protection, Realtime Signals Extension, Semaphores, Spin Locks,  
 15677 Threads, Timeouts, and Timers options is moved to the Base.

15678 Functionality relating to the Thread Priority Protection and Thread Priority Inheritance options  
 15679 is changed to be Non-Robust Mutex or Robust Mutex Priority Protection and Non-Robust Mutex  
 15680 or Robust Mutex Priority Inheritance, respectively.

15681 This reference page is clarified with respect to macros and symbolic constants.

15682 Changes are made related to support for finegrained timestamps and the  
 15683 `_POSIX_TIMESTAMP_RESOLUTION` constant is added.

15684 The `_SC_THREAD_ROBUST_PRIO_INHERIT` and `_SC_THREAD_ROBUST_PRIO_PROTECT`  
 15685 symbolic constants are added.

15686 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0078 [311], XBD/TC1-2008/0079 [209],  
 15687 and XBD/TC1-2008/0080 [360] are applied.

15688 **NAME**

15689 utime.h — access and modification times structure

15690 **SYNOPSIS**15691 OB `#include <utime.h>`15692 **DESCRIPTION**15693 The <utime.h> header shall declare the **utimbuf** structure, which shall include the following  
15694 members:15695 `time_t` `actime` Access time.  
15696 `time_t` `modtime` Modification time.

15697 The times shall be measured in seconds since the Epoch.

15698 The <utime.h> header shall define the **time\_t** type as described in <sys/types.h>.15699 The following shall be declared as a function and may also be defined as a macro. A function  
15700 prototype shall be provided.15701 `int utime(const char *, const struct utimbuf *);`15702 **APPLICATION USAGE**15703 The *utime()* function only allows setting file timestamps to the nearest second. Applications  
15704 should use the *utimensat()* function instead. See <sys/stat.h>.15705 **RATIONALE**

15706 None.

15707 **FUTURE DIRECTIONS**

15708 The &lt;utime.h&gt; header may be removed in a future version.

15709 **SEE ALSO**15710 [<sys/stat.h>](#), [<sys/types.h>](#)15711 XSH *futimens()*, *utime()*15712 **CHANGE HISTORY**

15713 First released in Issue 3.

15714 **Issue 6**15715 The following new requirements on POSIX implementations derive from alignment with the  
15716 Single UNIX Specification:

- 15717
- The **time\_t** type is defined.

15718 **Issue 7**

15719 The &lt;utime.h&gt; header is marked obsolescent.

15720 **NAME**

15721 utmpx.h — user accounting database definitions

15722 **SYNOPSIS**15723 XSI `#include <utmpx.h>`15724 **DESCRIPTION**15725 The <utmpx.h> header shall define the **utmpx** structure that shall include at least the following  
15726 members:

15727	char	ut_user[]	User login name.
15728	char	ut_id[]	Unspecified initialization process identifier.
15729	char	ut_line[]	Device name.
15730	pid_t	ut_pid	Process ID.
15731	short	ut_type	Type of entry.
15732	struct timeval	ut_tv	Time entry was made.

15733 The <utmpx.h> header shall define the **pid\_t** type through **typedef**, as described in  
15734 <sys/types.h>.15735 The <utmpx.h> header shall define the **timeval** structure as described in <sys/time.h>.

15736 Inclusion of the &lt;utmpx.h&gt; header may also make visible all symbols from &lt;sys/time.h&gt;.

15737 The <utmpx.h> header shall define the following symbolic constants as possible values for the  
15738 *ut\_type* member of the **utmpx** structure:

15739	EMPTY	No valid user accounting information.
15740	BOOT_TIME	Identifies time of system boot.
15741	OLD_TIME	Identifies time when system clock changed.
15742	NEW_TIME	Identifies time after system clock changed.
15743	USER_PROCESS	Identifies a process.
15744	INIT_PROCESS	Identifies a process spawned by the init process.
15745	LOGIN_PROCESS	Identifies the session leader of a logged-in user.
15746	DEAD_PROCESS	Identifies a session leader who has exited.

15747 The following shall be declared as functions and may also be defined as macros. Function  
15748 prototypes shall be provided.

```

15749 void          endutxent(void);
15750 struct utmpx *getutxent(void);
15751 struct utmpx *getutxid(const struct utmpx *);
15752 struct utmpx *getutxline(const struct utmpx *);
15753 struct utmpx *pututxline(const struct utmpx *);
15754 void          setutxent(void);

```

**15755 APPLICATION USAGE**

**15764 CHANGE HISTORY**

15765       First released in Issue 4, Version 2.

## 15766 NAME

15767       wchar.h — wide-character handling

## 15768 SYNOPSIS

15769       #include &lt;wchar.h&gt;

## 15770 DESCRIPTION

15771 CX       Some of the functionality described on this reference page extends the ISO C standard.  
 15772       Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to  
 15773       enable the visibility of these symbols in this header.

15774       The &lt;wchar.h&gt; header shall define the following types:

15775 CX       **FILE**           As described in <stdio.h>.15776 CX       **locale\_t**       As described in <locale.h>.

15777       **mbstate\_t**       An object type other than an array type that can hold the conversion state  
 15778       information necessary to convert between sequences of (possibly multi-byte)  
 15779 CX       characters and wide characters. If a codeset is being used such that an  
 15780       **mbstate\_t** needs to preserve more than two levels of reserved state, the results  
 15781       are unspecified.

15782       **size\_t**           As described in <stddef.h>.15783 CX       **va\_list**       As described in <stdarg.h>.15784       **wchar\_t**       As described in <stddef.h>.

15785 OB XSI   **wctype\_t**       A scalar type of a data object that can hold values which represent locale-  
 15786       specific character classification.

15787       **wint\_t**       An integer type capable of storing any valid value of **wchar\_t** or WEOF.

15788       The tag **tm** shall be declared as naming an incomplete structure type, the contents of which are  
 15789       described in the <time.h> header.

15790       The implementation shall support one or more programming environments in which the width  
 15791       of **wint\_t** is no greater than the width of type **long**. The names of these programming  
 15792       environments can be obtained using the *confstr()* function or the *getconf* utility.

15793       The &lt;wchar.h&gt; header shall define the following macros:

15794       **WCHAR\_MAX**   As described in <stdint.h>.15795       **WCHAR\_MIN**   As described in <stdint.h>.

15796       **WEOF**           Constant expression of type **wint\_t** that is returned by several WP functions to  
 15797       indicate end-of-file.

15798       **NULL**           As described in <stddef.h>.

15799 CX       Inclusion of the <wchar.h> header may make visible all symbols from the headers <ctype.h>,  
 15800       <string.h>, <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, and <time.h>.

15801       The following shall be declared as functions and may also be defined as macros. Function  
 15802       prototypes shall be provided for use with ISO C standard compilers. Arguments to functions in  
 15803       this list can point to arrays containing **wchar\_t** values that do not correspond to members of the  
 15804       character set of the current locale. Such values shall be processed according to the specified  
 15805       semantics, unless otherwise stated.

15806       **wint\_t**        btowc(int);15807       **wint\_t**        fgetwc(FILE \*);

```

15808     wchar_t      *fgetws(wchar_t *restrict, int, FILE *restrict);
15809     wint_t      fputwc(wchar_t, FILE *);
15810     int         fputws(const wchar_t *restrict, FILE *restrict);
15811     int         fwide(FILE *, int);
15812     int         fwprintf(FILE *restrict, const wchar_t *restrict, ...);
15813     int         fwscanf(FILE *restrict, const wchar_t *restrict, ...);
15814     wint_t      getwc(FILE *);
15815     wint_t      getwchar(void);
15816     OB XSI     int     iswalnum(wint_t);
15817               int     iswalpha(wint_t);
15818               int     iswcntrl(wint_t);
15819               int     iswctype(wint_t, wctype_t);
15820               int     iswdigit(wint_t);
15821               int     iswgraph(wint_t);
15822               int     iswlower(wint_t);
15823               int     iswprint(wint_t);
15824               int     iswpunct(wint_t);
15825               int     iswspace(wint_t);
15826               int     iswupper(wint_t);
15827               int     iswxdigit(wint_t);
15828     size_t      mbrlen(const char *restrict, size_t, mbstate_t *restrict);
15829     size_t      mbrtowc(wchar_t *restrict, const char *restrict, size_t,
15830                        mbstate_t *restrict);
15831     int         mbsinit(const mbstate_t *);
15832     CX         size_t  mbsnrtowcs(wchar_t *restrict, const char **restrict,
15833                        size_t, size_t, mbstate_t *restrict);
15834     size_t      mbsrtowcs(wchar_t *restrict, const char **restrict, size_t,
15835                        mbstate_t *restrict);
15836     CX         FILE    *open_wmemstream(wchar_t **, size_t *);
15837     wint_t      putwc(wchar_t, FILE *);
15838     wint_t      putwchar(wchar_t);
15839     int         swprintf(wchar_t *restrict, size_t,
15840                        const wchar_t *restrict, ...);
15841     int         swscanf(const wchar_t *restrict,
15842                        const wchar_t *restrict, ...);
15843     OB XSI     wint_t  tolower(wint_t);
15844               wint_t  toupper(wint_t);
15845     wint_t      ungetwc(wint_t, FILE *);
15846     int         vfwprintf(FILE *restrict, const wchar_t *restrict, va_list);
15847     int         vfwscanf(FILE *restrict, const wchar_t *restrict, va_list);
15848     int         vswprintf(wchar_t *restrict, size_t,
15849                        const wchar_t *restrict, va_list);
15850     int         vswscanf(const wchar_t *restrict, const wchar_t *restrict,

15907 int          wprintf(const wchar_t *restrict, ...);
15908 int          wscanf(const wchar_t *restrict, ...);

```

**APPLICATION USAGE**

The `iswblank()` function was a late addition to the ISO C standard and was introduced at the same time as the ISO C standard introduced **<wctype.h>**, which contains all of the `isw*()` functions. The Open Group Base Specifications had previously aligned with the MSE working draft and had introduced the rest of the `isw*()` functions into **<wchar.h>**. For backwards-compatibility, the original set of `isw*()` functions, without `iswblank()`, are permitted (as part of the XSI option) in **<wchar.h>**. For maximum portability, applications should include **<wctype.h>** in order to obtain declarations for the `isw*()` functions. This compatibility has been made obsolescent.

**RATIONALE**

In the ISO C standard, the symbols referenced as XSI extensions are in **<wctype.h>**. Their presence here is thus an extension.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

**<ctype.h>**, **<locale.h>**, **<stdarg.h>**, **<stddef.h>**, **<stdint.h>**, **<stdio.h>**, **<stdlib.h>**, **<string.h>**, **<time.h>**, **<wctype.h>**

XCU `getconf`

**CHANGE HISTORY**

First released in Issue 4.

**Issue 5**

Aligned with the ISO/IEC 9899:1990/Amendment 1:1995 (E).

**Issue 6**

The Open Group Corrigendum U021/10 is applied. The prototypes for `wcswidth()` and `wcwidth()` are marked as extensions.

The Open Group Corrigendum U028/5 is applied, correcting the prototype for the `mbsinit()` function.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- Various function prototypes are updated to add the **restrict** keyword.
- The functions `vfwscanf()`, `vwscanf()`, `wcstof()`, `wcstold()`, `wcstoll()`, and `wcstoull()` are added.

The type **wctype\_t**, the `isw*()`, `to*()`, and `wctype()` functions are marked as XSI extensions.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/26 is applied, adding the APPLICATION USAGE section.

15952 **Issue 7**

15953 The *mbsnrtowcs()*, *open\_wmemstream()*, *wcpcpy()*, *wcpncpy()*, *wscasecmp()*, *wcsdup()*,  
15954 *wcsncasecmp()*, *wcsnlen()*, and *wcsnrtombs()* functions are added from The Open Group  
15955 Technical Standard, 2006, Extended API Set Part 1.

15956 The *wscasecmp\_l()*, *wcsncasecmp\_l()*, *wscoll\_l()*, and *wcsxfrm\_l()* functions are added from The  
15957 Open Group Technical Standard, 2006, Extended API Set Part 4.

15958 The **wctype\_t** type, and the *isw\*()*, *towlower()*, and *towupper()* functions are marked obsolescent  
15959 in <wchar.h> since the ISO C standard requires the declarations to be in <wctype.h>.

15960 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
15961 for the **locale\_t** type is added.

15962 POSIX.1-2008, Technical Corrigendum 1, XBD/TC1-2008/0081 [380] is applied.

## 15963 NAME

15964 wctype.h — wide-character classification and mapping utilities

## 15965 SYNOPSIS

15966 #include &lt;wctype.h&gt;

## 15967 DESCRIPTION

15968 CX Some of the functionality described on this reference page extends the ISO C standard.  
 15969 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 472) to  
 15970 enable the visibility of these symbols in this header.

15971 The &lt;wctype.h&gt; header shall define the following types:

15972 **wint\_t** As described in <wchar.h>.

15973 **wctrans\_t** A scalar type that can hold values which represent locale-specific character  
 15974 mappings.

15975 **wctype\_t** As described in <wchar.h>.15976 CX The <wctype.h> header shall define the **locale\_t** type as described in <locale.h>.

15977 The &lt;wctype.h&gt; header shall define the following macro:

15978 **WEOF** As described in <wchar.h>.

15979 For all functions described in this header that accept an argument of type **wint\_t**, the value is  
 15980 representable as a **wchar\_t** or equals the value of WEOF. If this argument has any other value,  
 15981 the behavior is undefined.

15982 The behavior of these functions shall be affected by the *LC\_CTYPE* category of the current locale.

15983 CX Inclusion of the <wctype.h> header may make visible all symbols from the headers <ctype.h>,  
 15984 <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, <string.h>, <time.h>, and <wchar.h>.

15985 The following shall be declared as functions and may also be defined as macros. Function  
 15986 prototypes shall be provided for use with ISO C standard compilers.

```

15987 int      iswalnum(wint_t);
15988 CX int    iswalnum_l(wint_t, locale_t);
15989 int      iswalpha(wint_t);
15990 CX int    iswalpha_l(wint_t, locale_t);
15991 int      iswblank(wint_t);
15992 CX int    iswblank_l(wint_t, locale_t);
15993 int      iswcntrl(wint_t);
15994 CX int    iswcntrl_l(wint_t, locale_t);
15995 int      iswctype(wint_t, wctype_t);
15996 CX int    iswctype_l(wint_t, wctype_t, locale_t);
15997 int      iswdigit(wint_t);
15998 CX int    iswdigit_l(wint_t, locale_t);
15999 int      iswgraph(wint_t);
16000 CX int    iswgraph_l(wint_t, locale_t);
16001 int      iswlower(wint_t);
16002 CX int    iswlower_l(wint_t, locale_t);
16003 int      iswprint(wint_t);
16004 CX int    iswprint_l(wint_t, locale_t);
16005 int      iswpunct(wint_t);
16006 CX int    iswpunct_l(wint_t, locale_t);
16007 int      iswspace(wint_t);
  
```

```

16008 CX      int      iswspace_l(wint_t, locale_t);
16009          int      iswupper(wint_t);
16010 CX      int      iswupper_l(wint_t, locale_t);
16011          int      iswxdigit(wint_t);
16012 CX      int      iswxdigit_l(wint_t, locale_t);
16013          wint_t    towctrans(wint_t, wctrans_t);
16014 CX      wint_t    towctrans_l(wint_t, wctrans_t, locale_t);
16015          wint_t    towlower(wint_t);
16016 CX      wint_t    towlower_l(wint_t, locale_t);
16017          wint_t    towupper(wint_t);
16018 CX      wint_t    towupper_l(wint_t, locale_t);
16019          wctrans_t wctrans(const char *);
16020 CX      wctrans_t wctrans_l(const char *, locale_t);
16021          wctype_t  wctype(const char *);
16022 CX      wctype_t  wctype_l(const char *, locale_t);

```

## 16035 CHANGE HISTORY

16036 First released in Issue 5. Derived from the ISO/IEC 9899:1990/Amendment 1:1995 (E).

### 16037 Issue 6

16038 The *iswblank()* function is added for alignment with the ISO/IEC 9899:1999 standard.

### 16039 Issue 7

16040 SD5-XBD-ERN-6 is applied.

16041 The *\*\_l()* functions are added from The Open Group Technical Standard, 2006, Extended API Set  
 16042 Part 4.

16043 This reference page is clarified with respect to macros and symbolic constants.

## 16044 NAME

16045 wordexp.h — word-expansion types

## 16046 SYNOPSIS

16047 #include &lt;wordexp.h&gt;

## 16048 DESCRIPTION

16049 The <wordexp.h> header shall define the structures and symbolic constants used by the  
16050 *wordexp()* and *wordfree()* functions.16051 The <wordexp.h> header shall define the **wordexp\_t** structure type, which shall include at least  
16052 the following members:

16053 `size_t we_wordc` Count of words matched by *words*.  
 16054 `char **we_wordv` Pointer to list of expanded words.  
 16055 `size_t we_offs` Slots to reserve at the beginning of *we\_wordv*.

16056 The <wordexp.h> header shall define the following symbolic constants for use as flags for the  
16057 *wordexp()* function:

16058 **WRDE\_APPEND** Append words to those previously generated.  
 16059 **WRDE\_DOOFFS** Number of null pointers to prepend to *we\_wordv*.  
 16060 **WRDE\_NOCMD** Fail if command substitution is requested.  
 16061 **WRDE\_REUSE** The *pwordexp* argument was passed to a previous successful call to  
 16062 *wordexp()*, and has not been passed to *wordfree()*. The result is the same  
 16063 as if the application had called *wordfree()* and then called *wordexp()*  
 16064 without **WRDE\_REUSE**.

16065 **WRDE\_SHOWERR** Do not redirect *stderr* to **/dev/null**.16066 **WRDE\_UNDEF** Report error on an attempt to expand an undefined shell variable.

16067 The &lt;wordexp.h&gt; header shall define the following symbolic constants as error return values:

16068 **WRDE\_BADCHAR** One of the unquoted characters—<newline>, ' | ', '&', ' ; ', '<', '>',  
 16069 ' ( ', ' ) ', ' { ', ' } '—appears in *words* in an inappropriate context.  
 16070 **WRDE\_BADVAL** Reference to undefined shell variable when **WRDE\_UNDEF** is set in *flags*.  
 16071 **WRDE\_CMDSUB** Command substitution requested when **WRDE\_NOCMD** was set in *flags*.  
 16072 **WRDE\_NOSPACE** Attempt to allocate memory failed.  
 16073 **WRDE\_SYNTAX** Shell syntax error, such as unbalanced parentheses or unterminated  
 16074 string.

16075 The <wordexp.h> header shall define the **size\_t** type as described in <stddef.h>.16076 The following shall be declared as functions and may also be defined as macros. Function  
16077 prototypes shall be provided.

16078 `int wordexp(const char *restrict, wordexp_t *restrict, int);`  
 16079 `void wordfree(wordexp_t *);`

16080 **APPLICATION USAGE**

**Vol. 2:**

16099

**System Interfaces, Issue 7**

16100

*The Open Group*

16101

*The Institute of Electrical and Electronics Engineers, Inc.*

# Introduction

The System Interfaces volume of POSIX.1-2008 describes the interfaces offered to application programs by POSIX-conformant systems.

## 1.1 Relationship to Other Formal Standards

Great care has been taken to ensure that this volume of POSIX.1-2008 is fully aligned with the following standards:

ISO C (1999)

ISO/IEC 9899:1999, Programming Languages — C, including ISO/IEC 9899:1999/Cor.1:2001(E), ISO/IEC 9899:1999/Cor.2:2004(E), and ISO/IEC 9899:1999/Cor.3.

Parts of the ISO/IEC 9899:1999 standard (hereinafter referred to as the ISO C standard) are referenced to describe requirements also mandated by this volume of POSIX.1-2008. Some functions and headers included within this volume of POSIX.1-2008 have a version in the ISO C standard; in this case CX markings are added as appropriate to show where the ISO C standard has been extended (see [Section 1.7.1](#), on page 7). Any conflict between this volume of POSIX.1-2008 and the ISO C standard is unintentional.

This volume of POSIX.1-2008 also allows, but does not require, mathematics functions to support IEEE Std 754-1985 and IEEE Std 854-1987.

## 1.2 Format of Entries

The entries in [Chapter 3](#) are based on a common format as follows. The only sections relating to conformance are the SYNOPSIS, DESCRIPTION, RETURN VALUE, and ERRORS sections.

### NAME

This section gives the name or names of the entry and briefly states its purpose.

### SYNOPSIS

This section summarizes the use of the entry being described. If it is necessary to include a header to use this function, the names of such headers are shown, for example:

```
#include <stdio.h>
```

### DESCRIPTION

This section describes the functionality of the function or header.

### RETURN VALUE

This section indicates the possible return values, if any.

If the implementation can detect errors, “successful completion” means that no error

16136 has been detected during execution of the function. If the implementation does detect  
16137 an error, the error is indicated.

16138 For functions where no errors are defined, “successful completion” means that if the  
16139 implementation checks for errors, no error has been detected. If the implementation can  
16140 detect errors, and an error is detected, the indicated return value is returned and *errno*  
16141 may be set.

## 16142 **ERRORS**

16143 This section gives the symbolic names of the error values returned by a function or  
16144 stored into a variable accessed through the symbol *errno* if an error occurs.

16145 “No errors are defined” means that error values returned by a function or stored into a  
16146 variable accessed through the symbol *errno*, if any, depend on the implementation.

## 16147 **EXAMPLES**

16148 This section is informative.

16149 This section gives examples of usage, where appropriate. In the event of conflict  
16150 between an example and a normative part of this volume of POSIX.1-2008, the  
16151 normative material is to be taken as correct.

## 16152 **APPLICATION USAGE**

16153 This section is informative.

16154 This section gives warnings and advice to application developers about the entry. In the  
16155 event of conflict between warnings and advice and a normative part of this volume of  
16156 POSIX.1-2008, the normative material is to be taken as correct.

## 16157 **RATIONALE**

16158 This section is informative.

16159 This section contains historical information concerning the contents of this volume of  
16160 POSIX.1-2008 and why features were included or discarded by the standard  
16161 developers.

## 16162 **FUTURE DIRECTIONS**

16163 This section is informative.

16164 This section provides comments which should be used as a guide to current thinking;  
16165 there is not necessarily a commitment to adopt these future directions.

## 16166 **SEE ALSO**

16167 This section is informative.

16168 This section gives references to related information.

## 16169 **CHANGE HISTORY**

16170 This section is informative.

16171 This section shows the derivation of the entry and any significant changes that have  
16172 been made to it.

Chapter 2

16174

# General Information

16175

This chapter covers information that is relevant to all the functions specified in [Chapter 3](#) and XBD [Chapter 13](#) (on page 219).

16176

16177

## 2.1 Use and Implementation of Interfaces

16178

### 2.1.1 Use and Implementation of Functions

16179

Each of the following statements shall apply to all functions unless explicitly stated otherwise in the detailed descriptions that follow:

16180

16181

1. If an argument to a function has an invalid value (such as a value outside the domain of the function, or a pointer outside the address space of the program, or a null pointer), the behavior is undefined.

16182

16183

16184

2. Any function declared in a header may also be implemented as a macro defined in the header, so a function should not be declared explicitly if its header is included. Any macro definition of a function can be suppressed locally by enclosing the name of the function in parentheses, because the name is then not followed by the <left-parenthesis> that indicates expansion of a macro function name. For the same syntactic reason, it is permitted to take the address of a function even if it is also defined as a macro. The use of the C-language **#undef** construct to remove any such macro definition shall also ensure that an actual function is referred to.

16185

16186

16187

16188

16189

16190

16191

16192

3. Any invocation of a function that is implemented as a macro shall expand to code that evaluates each of its arguments exactly once, fully protected by parentheses where necessary, so it is generally safe to use arbitrary expressions as arguments.

16193

16194

16195

4. Provided that a function can be declared without reference to any type defined in a header, it is also permissible to declare the function explicitly and use it without including its associated header.

16196

16197

16198

5. If a function that accepts a variable number of arguments is not declared (explicitly or by including its associated header), the behavior is undefined.

16199

## 2.1.2 Use and Implementation of Macros

Each of the following statements shall apply to all macros unless explicitly stated otherwise:

1. Any definition of an object-like macro in a header shall expand to code that is fully protected by parentheses where necessary, so that it groups in an arbitrary expression as if it were a single identifier.
2. All object-like macros listed as expanding to integer constant expressions shall additionally be suitable for use in **#if** preprocessing directives.
3. Any definition of a function-like macro in a header shall expand to code that evaluates each of its arguments exactly once, fully protected by parentheses where necessary, so that it is generally safe to use arbitrary expressions as arguments.
4. Any definition of a function-like macro in a header can be invoked in an expression anywhere a function with a compatible return type could be called.

## 2.2 The Compilation Environment

### 2.2.1 POSIX.1 Symbols

Certain symbols in this volume of POSIX.1-2008 are defined in headers (see XBD [Chapter 13](#), on page 219). Some of those headers could also define symbols other than those defined by POSIX.1-2008, potentially conflicting with symbols used by the application. Also, POSIX.1-2008 defines symbols that are not permitted by other standards to appear in those headers without some control on the visibility of those symbols.

Symbols called “feature test macros” are used to control the visibility of symbols that might be included in a header. Implementations, future versions of this standard, and other standards may define additional feature test macros.

In the compilation of an application that **#defines** a feature test macro specified by POSIX.1-2008, no header defined by POSIX.1-2008 shall be included prior to the definition of the feature test macro. This restriction also applies to any implementation-provided header in which these feature test macros are used. If the definition of the macro does not precede the **#include**, the result is undefined.

Feature test macros shall begin with the <underscore> character (‘\_’).

#### 2.2.1.1 The `_POSIX_C_SOURCE` Feature Test Macro

A POSIX-conforming application shall ensure that the feature test macro `_POSIX_C_SOURCE` is defined before inclusion of any header.

When an application includes a header described by POSIX.1-2008, and when this feature test macro is defined to have the value 200809L:

1. All symbols required by POSIX.1-2008 to appear when the header is included shall be made visible.

2. Symbols that are explicitly permitted, but not required, by POSIX.1-2008 to appear in that header (including those in reserved name spaces) may be made visible.

3. Additional symbols not required or explicitly permitted by POSIX.1-2008 to be in that header shall not be made visible, except when enabled by another feature test macro.

Identifiers in POSIX.1-2008 may only be undefined using the **#undef** directive as described in [Section 2.1](#) (on page 471) or [Section 2.2.2](#). These **#undef** directives shall follow all **#include** directives of any header in POSIX.1-2008.

**Note:** The POSIX.1-1990 standard specified a macro called `_POSIX_SOURCE`. This has been superseded by `_POSIX_C_SOURCE`.

#### 2.2.1.2 The `_XOPEN_SOURCE` Feature Test Macro

XSI An XSI-conforming application shall ensure that the feature test macro `_XOPEN_SOURCE` is defined with the value 700 before inclusion of any header. This is needed to enable the functionality described in [Section 2.2.1.1](#) (on page 472) and to ensure that the XSI option is enabled.

Since this volume of POSIX.1-2008 is aligned with the ISO C standard, and since all functionality enabled by `_POSIX_C_SOURCE` set equal to 200809L is enabled by `_XOPEN_SOURCE` set equal to 700, there should be no need to define `_POSIX_C_SOURCE` if `_XOPEN_SOURCE` is so defined. Therefore, if `_XOPEN_SOURCE` is set equal to 700 and `_POSIX_C_SOURCE` is set equal to 200809L, the behavior is the same as if only `_XOPEN_SOURCE` is defined and set equal to 700. However, should `_POSIX_C_SOURCE` be set to a value greater than 200809L, the behavior is unspecified.

If `_XOPEN_SOURCE` is defined with the value 700 and `_POSIX_C_SOURCE` is undefined before inclusion of any header, then the header may define the `_POSIX_C_SOURCE` macro with the value 200809L.

### 2.2.2 The Name Space

XSI All identifiers in this volume of POSIX.1-2008, except *environ*, are defined in at least one of the headers, as shown in XBD [Chapter 13](#) (on page 219). When `_XOPEN_SOURCE` or `_POSIX_C_SOURCE` is defined, each header defines or declares some identifiers, potentially conflicting with identifiers used by the application. The set of identifiers visible to the application consists of precisely those identifiers from the header pages of the included headers, as well as additional identifiers reserved for the implementation. In addition, some headers may make visible identifiers from other headers as indicated on the relevant header pages.

Implementations may also add members to a structure or union without controlling the visibility of those members with a feature test macro, as long as a user-defined macro with the same name cannot interfere with the correct interpretation of the program. The identifiers reserved for use by the implementation are described below:

1. Each identifier with external linkage described in the header section is reserved for use as an identifier with external linkage if the header is included.
2. Each macro described in the header section is reserved for any use if the header is included.
3. Each identifier with file scope described in the header section is reserved for use as an identifier with file scope in the same name space if the header is included.

The prefixes `posix_`, `POSIX_`, and `_POSIX_` are reserved for use by POSIX.1-2008 and other

16278 POSIX standards. Implementations may add symbols to the headers shown in the following  
16279 table, provided the identifiers for those symbols either:

- 16280 1. Begin with the corresponding reserved prefixes in the table, or
- 16281 2. Have one of the corresponding complete names in the table, or
- 16282 3. End in the string indicated as a reserved suffix in the table and do not use the reserved  
16283 prefixes `posix_`, `POSIX_`, or `_POSIX_`, as long as the reserved suffix is in that part of the  
16284 name considered significant by the implementation.

16285 Symbols that use the reserved prefix `_POSIX_` may be made visible by implementations in any  
16286 header defined by POSIX.1-2008.

		Header	Prefix	Suffix	Complete Name
16287		<aio.h>	aio_, lio_, AIO_, LIO_		
16288		<arpa/inet.h>	inet_		
16289		<ctype.h>	to[a-z], is[a-z]		
16290		<dlfcn.h>	RTLD_		
16291		<dirent.h>	d_		
16292		<fcntl.h>	l_		
16293		<fmtmsg.h>	MM_		
16294	XSI	<fnmatch.h>	FNM_		
16295		<ftw.h>	FTW		
16296	XSI	<glob.h>	gl_, GLOB_		
16297		<grp.h>	gr_		
16298		<limits.h>		_MAX, _MIN	
16299		<math.h>	M_		
16300	XSI	<mqueue.h>	mq_, MQ_		
16301	MSG	<ndbm.h>	dbm_, DBM_		
16302	XSI	<netdb.h>	ai_, h_, n_, p_, s_		
16303		<net/if.h>	if_, IF_		
16304		<netinet/in.h>	in_, ip_, s_, sin_, INADDR_, IPPROTO_		
16305			in6_, s6_, sin6_, IPV6_		
16306	IP6	<netinet/tcp.h>	TCP_		
16307		<nl_types.h>	NL_		
16308		<poll.h>	pd_, ph_, ps_, POLL		
16309		<pthread.h>	pthread_, PTHREAD_		
16310		<pwd.h>	pw_		
16311		<regex.h>	re_, rm_, REG_		
16312		<sched.h>	sched_, SCHED_		
16313		<semaphore.h>	sem_, SEM_		
16314		<signal.h>	sa_, si_, sigev_, sival_, uc_, BUS_, CLD_, FPE_, ILL_, SA_, SEGV_, SI_, SIGEV_, ss_, sv_, SS_, TRAP_, POLL_		
16315	CX	<stropts.h>	bi_, ic_, l_, sl_, str_, FLUSH[A-Z], I_, S_, SND[A-Z]		
16316	XSI	<stdint.h>			
16317		<stdlib.h>	str[a-z]		
16318		<string.h>	str[a-z], mem[a-z], wcs[a-z]		
16319	XSI	<sys/ipc.h>	ipc_, IPC_		key, pad, seq
16320		<sys/mman.h>	shm_, MAP_, MCL_, MS_, PROT_		
16321	XSI	<sys/msg.h>	msg, MSG_[A-Z]		msg
16322	XSI	<sys/resource.h>	rlim_, ru_, PRIO_, RLIMIT_, RUSAGE_		
16323		<sys/select.h>	fd_, fds_, FD_		

		Header	Prefix	Suffix	Complete Name
16331					
16332					
16333	XSI	<sys/sem.h>	sem, SEM_		sem
16334	XSI	<sys/shm.h>	shm, SHM[A-Z], SHM_[A-Z]		
16335		<sys/socket.h>	cmsg_, if_, ifc_, ifra_, ifru_, infu_, l_, msg_, sa_, ss_, AF_, MSG_, PF_, SCM_, SHUT_, SO		
16336					
16337	XSI				
16338					
16339		<sys/stat.h>	st_		
16340		<sys/statvfs.h>	f_, ST_		
16341	XSI	<sys/time.h>	it_, tv_, ITIMER_		
16342		<sys/times.h>	tms_		
16343	XSI	<sys/uio.h>	iov_		UIO_MAXIOV
16344		<sys/un.h>	sun_		
16345		<sys/utsname.h>	uts_		
16346		<sys/wait.h>	P_, W[A-Z]		
16347	XSI	<syslog.h>	LOG_		
16348		<termios.h>	c_, B[0-9], TC		
16349	CX	<time.h>	tm_ clock_, it_, timer_, tv_, CLOCK_, TIMER_		
16350					
16351					
16352	XSI	<ulimit.h>	UL_		
16353	OB	<utime.h>	utim_		
16354	XSI	<utmpx.h>	ut_	_LVL, _PROCESS, _TIME	
16355					
16356		<wchar.h>	wcs[a-z]		
16357		<wctype.h>	is[a-z], to[a-z]		
16358		<wordexp.h>	we_, WRDE_		
16359	CX	ANY header		_t	

**Note:** The notation [0–9] indicates any digit. The notation [A–Z] indicates any uppercase letter in the portable character set. The notation [a–z] indicates any lowercase letter in the portable character set. Commas and spaces in the lists of prefixes and complete names in the above table are not part of any prefix or complete name. +

Implementations may also add symbols to the **<complex.h>** header with the following complete names or the same names suffixed with 'f' or 'l': +

16366	cerf	+	cerfc	+	cexp2	+	++
16367	cexpm1	+	clog10	+	clog1p	+	++
16368	clog2	+	clgamma	+	ctgamma	+	++

If any header in the following table is included, macros with the prefixes shown may be defined. After the last inclusion of a given header, an application may use identifiers with the corresponding prefixes for its own purpose, provided their use is preceded by a **#undef** of the corresponding macro.

Header	Prefix
<b>&lt;errno.h&gt;</b>	E[0-9], E[A-Z]
<b>&lt;fcntl.h&gt;</b>	F_, O_
<b>&lt;fenv.h&gt;</b>	FE_[A-Z]
<b>&lt;inttypes.h&gt;</b>	PRI[Xa-z], SCN[Xa-z]
<b>&lt;locale.h&gt;</b>	LC_[A-Z]
<b>&lt;math.h&gt;</b>	FP_[A-Z]
<b>&lt;netinet/in.h&gt;</b>	IMPLINK_, IN_, IP_, IPPORT_, SOCK_,
	IN6_
<b>&lt;signal.h&gt;</b>	SIG_, SIG[A-Z],
	SV_
<b>&lt;stdio.h&gt;</b>	SEEK_
<b>&lt;stropts.h&gt;</b>	M_, MUXID_R[A-Z], STR
<b>&lt;sys/resource.h&gt;</b>	RLIM_
<b>&lt;sys/socket.h&gt;</b>	CMSG_
<b>&lt;sys/stat.h&gt;</b>	S_
<b>&lt;sys/uio.h&gt;</b>	IOV_
<b>&lt;termios.h&gt;</b>	I, O, V (See below.)
<b>&lt;unistd.h&gt;</b>	SEEK_

The following are used to reserve complete names for the **<stdint.h>** header:

INT[0-9A-Za-z-]\*\_MIN  
 INT[0-9A-Za-z-]\*\_MAX  
 INT[0-9A-Za-z-]\*\_C  
 UINT[0-9A-Za-z-]\*\_MIN  
 UINT[0-9A-Za-z-]\*\_MAX  
 UINT[0-9A-Za-z-]\*\_C

**Note:** The notation [0-9] indicates any digit. The notation [A-Z] indicates any uppercase letter in the portable character set. The notation [Xa-z] indicates the character 'x' or any lowercase letter in the portable character set. The notation [0-9A-Za-z-]\* indicates zero or more occurrences of any of the following: a digit, an uppercase or lowercase letter in the portable character set, or an underscore.

The following reserved names are used as exact matches for **<termios.h>**:

CBAUD	EXTB	VDSUSP
DEFECHO	FLUSHO	VLNEXT
ECHOCTL	LOBLK	VREPRINT
ECHOKE	PENDIN	VSTATUS
ECHOPRT	SWTCH	VWERASE
EXTA	VDISCARD	

- 16411 The following identifiers are reserved regardless of the inclusion of headers:
- 16412 1. With the exception of identifiers beginning with the prefix `_POSIX_`, all identifiers that
- 16413 begin with an `<underscore>` and either an uppercase letter or another `<underscore>` are
- 16414 always reserved for any use by the implementation.
- 16415 2. All identifiers that begin with an `<underscore>` are always reserved for use as identifiers
- 16416 with file scope in both the ordinary identifier and tag name spaces.
- 16417 3. All identifiers in the table below are reserved for use as identifiers with external linkage.
- 16418 Some of these identifiers do not appear in this volume of POSIX.1-2008, but are reserved for
- 16419 future use by the ISO C standard.
- 16420 4. All functions and external identifiers defined in XBD [Chapter 13](#) (on page 219) are reserved
- 16421 for use as identifiers with external linkage.
- 16422 5. All the identifiers defined in this volume of POSIX.1-2008 that have external linkage are
- 16423 always reserved for use as identifiers with external linkage.
- 16424 **Note:** The notation `[a-z]` indicates any lowercase letter in the portable character set. The notation `' * '`
- 16425 indicates any combination of digits, letters in the portable character set, or `<underscore>`.
- 16426 No other identifiers are reserved.

**Note:** The notation [a-z] indicates any lowercase letter in the portable character set. The notation ' \* ' indicates any sequence of zero or more characters that are valid in identifiers with external linkage.

Applications shall not declare or define identifiers with the same name as an identifier reserved in the same context. Since macro names are replaced whenever found, independent of scope and name space, macro names matching any of the reserved identifier names shall not be defined by an application if any associated header is included.

Except that the effect of each inclusion of **<assert.h>** depends on the definition of **NDEBUG**, headers may be included in any order, and each may be included more than once in a given scope, with no difference in effect from that of being included only once.

If used, the application shall ensure that a header is included outside of any external declaration or definition, and it shall be first included before the first reference to any type or macro it defines, or to any function or object it declares. However, if an identifier is declared or defined in more than one header, the second and subsequent associated headers may be included after the initial reference to the identifier. Prior to the inclusion of a header, the application shall not define any macros with names lexically identical to symbols defined by that header.

## 2.3 Error Numbers

Most functions can provide an error number. The means by which each function provides its error numbers is specified in its description.

Some functions provide the error number in a variable accessed through the symbol *errno*, defined by including the `<errno.h>` header. The value of *errno* should only be examined when it is indicated to be valid by a function's return value. No function in this volume of POSIX.1-2008 shall set *errno* to zero. For each thread of a process, the value of *errno* shall not be affected by function calls or assignments to *errno* by other threads.

Some functions return an error number directly as the function value. These functions return a value of zero to indicate success.

If more than one error occurs in processing a function call, any one of the possible errors may be returned, as the order of detection is undefined.

Implementations may support additional errors not included in this list, may generate errors included in this list under circumstances other than those described here, or may contain extensions or limitations that prevent some errors from occurring.

The ERRORS section on each reference page specifies which error conditions shall be detected by all implementations ("shall fail") and which may be optionally detected by an implementation ("may fail"). If no error condition is detected, the action requested shall be successful. If an error condition is detected, the action requested may have been partially performed, unless otherwise stated.

Implementations may generate error numbers listed here under circumstances other than those described, if and only if all those error conditions can always be treated identically to the error conditions as described in this volume of POSIX.1-2008. Implementations shall not generate a different error number from one required by this volume of POSIX.1-2008 for an error condition described in this volume of POSIX.1-2008, but may generate additional errors unless explicitly disallowed for a particular function.

Each implementation shall document, in the conformance document, situations in which each of the optional conditions defined in POSIX.1-2008 is detected. The conformance document may also contain statements that one or more of the optional error conditions are not detected.

Certain threads-related functions are not allowed to return an error code of [EINTR]. Where this applies it is stated in the ERRORS section on the individual function pages.

The following macro names identify the possible error numbers, in the context of the functions specifically defined in this volume of POSIX.1-2008; these general descriptions are more precisely defined in the ERRORS sections of the functions that return them. Only these macro names should be used in programs, since the actual value of the error number is unspecified. All values listed in this section shall be unique, except as noted below. The values for all these macros shall be found in the `<errno.h>` header defined in the Base Definitions volume of POSIX.1-2008. The actual values are unspecified by this volume of POSIX.1-2008.

[E2BIG]

Argument list too long. The sum of the number of bytes used by the new process image's argument list and environment list is greater than the system-imposed limit of {ARG\_MAX} bytes.

or:

Lack of space in an output buffer.

or:

16572		Argument is greater than the system-imposed maximum.
16573		[EACCES]
16574		Permission denied. An attempt was made to access a file in a way forbidden by its file
16575		access permissions.
16576		[EADDRINUSE]
16577		Address in use. The specified address is in use.
16578		[EADDRNOTAVAIL]
16579		Address not available. The specified address is not available from the local system.
16580		[EAFNOSUPPORT]
16581		Address family not supported. The implementation does not support the specified address
16582		family, or the specified address is not a valid address for the address family of the specified
16583		socket.
16584		[EAGAIN]
16585		Resource temporarily unavailable. This is a temporary condition and later calls to the same
16586		routine may complete normally.
16587		[EALREADY]
16588		Connection already in progress. A connection request is already in progress for the specified
16589		socket.
16590		[EBADF]
16591		Bad file descriptor. A file descriptor argument is out of range, refers to no open file, or a
16592		read (write) request is made to a file that is only open for writing (reading).
16593		[EBADMSG]
16594	OB XSR	Bad message. During a <i>read()</i> , <i>getmsg()</i> , <i>getpmsg()</i> , or <i>ioctl()</i> I_RECVFD request to a
16595		STREAMS device, a message arrived at the head of the STREAM that is inappropriate for
16596		the function receiving the message.
16597		<i>read()</i> Message waiting to be read on a STREAM is not a data message.
16598		<i>getmsg()</i> or <i>getpmsg()</i>
16599		A file descriptor was received instead of a control message.
16600		<i>ioctl()</i> Control or data information was received instead of a file descriptor when
16601		I_RECVFD was specified.
16602		or:
16603		Bad Message. The implementation has detected a corrupted message.
16604		[EBUSY]
16605		Resource busy. An attempt was made to make use of a system resource that is not currently
16606		available, as it is being used by another process in a manner that would have conflicted
16607		with the request being made by this process.
16608		[ECANCELED]
16609		Operation canceled. The associated asynchronous operation was canceled before
16610		completion.
16611		[ECHILD]
16612		No child process. A <i>wait()</i> , <i>waitid()</i> , or <i>waitpid()</i> function was executed by a process that
16613		had no existing or unwaited-for child process.

16614	[ECONNABORTED]
16615	Connection aborted. The connection has been aborted.
16616	[ECONNREFUSED]
16617	Connection refused. An attempt to connect to a socket was refused because there was no
16618	process listening or because the queue of connection requests was full and the underlying
16619	protocol does not support retransmissions.
16620	[ECONNRESET]
16621	Connection reset. The connection was forcibly closed by the peer.
16622	[EDEADLK]
16623	Resource deadlock would occur. An attempt was made to lock a system resource that would
16624	have resulted in a deadlock situation.
16625	[EDESTADDRREQ]
16626	Destination address required. No bind address was established.
16627	[EDOM]
16628	Domain error. An input argument is outside the defined domain of the mathematical
16629	function (defined in the ISO C standard).
16630	[EDQUOT]
16631	Reserved.
16632	[EEXIST]
16633	File exists. An existing file was mentioned in an inappropriate context; for example, as a
16634	new link name in the <i>link()</i> function.
16635	[EFAULT]
16636	Bad address. The system detected an invalid address in attempting to use an argument of a
16637	call. The reliable detection of this error cannot be guaranteed, and when not detected may
16638	result in the generation of a signal, indicating an address violation, which is sent to the
16639	process.
16640	[EFBIG]
16641	File too large. The size of a file would exceed the maximum file size of an implementation
16642	or offset maximum established in the corresponding file description.
16643	[EHOSTUNREACH]
16644	Host is unreachable. The destination host cannot be reached (probably because the host is
16645	down or a remote router cannot reach it).
16646	[EIDRM]
16647	Identifier removed. Returned during XSI interprocess communication if an identifier has
16648	been removed from the system.
16649	[EILSEQ]
16650	Illegal byte sequence. A wide-character code has been detected that does not correspond to
16651	a valid character, or a byte sequence does not form a valid wide-character code (defined in
16652	the ISO C standard).
16653	[EINPROGRESS]
16654	Operation in progress. This code is used to indicate that an asynchronous operation has not
16655	yet completed.
16656	or:
16657	O_NONBLOCK is set for the socket file descriptor and the connection cannot be
16658	immediately established.

16659	[EINTR]
16660	Interrupted function call. An asynchronous signal was caught by the process during the
16661	execution of an interruptible function. If the signal handler performs a normal return, the
16662	interrupted function call may return this condition (see the Base Definitions volume of
16663	POSIX.1-2008, <signal.h>).
16664	[EINVAL]
16665	Invalid argument. Some invalid argument was supplied; for example, specifying an
16666	undefined signal in a <i>signal()</i> function or a <i>kill()</i> function.
16667	[EIO]
16668	Input/output error. Some physical input or output error has occurred. This error may be
16669	reported on a subsequent operation on the same file descriptor. Any other error-causing
16670	operation on the same file descriptor may cause the [EIO] error indication to be lost.
16671	[EISCONN]
16672	Socket is connected. The specified socket is already connected.
16673	[EISDIR]
16674	Is a directory. An attempt was made to open a directory with write mode specified.
16675	[ELOOP]
16676	Symbolic link loop. A loop exists in symbolic links encountered during pathname
16677	resolution. This error may also be returned if more than {SYMLOOP_MAX} symbolic links
16678	are encountered during pathname resolution.
16679	[EMFILE]
16680	File descriptor value too large or too many open streams. An attempt was made to open a
16681	XSI file descriptor with a value greater than or equal to {OPEN_MAX}, or greater than or equal
16682	to the soft limit RLIMIT_NOFILE for the process (if smaller than {OPEN_MAX}); or an
16683	attempt was made to open more than the maximum number of streams allowed in the
16684	process.
16685	[EMLINK]
16686	Too many links. An attempt was made to have the link count of a single file exceed
16687	{LINK_MAX}.
16688	[EMSGSIZE]
16689	Message too large. A message sent on a transport provider was larger than an internal
16690	message buffer or some other network limit.
16691	or:
16692	Inappropriate message buffer length.
16693	[EMULTIHOP]
16694	Reserved.
16695	[ENAMETOOLONG]
16696	Filename too long. The length of a pathname exceeds {PATH_MAX} and the
16697	implementation considers this to be an error, or a pathname component is longer than
16698	{NAME_MAX}. This error may also occur when pathname substitution, as a result of
16699	encountering a symbolic link during pathname resolution, results in a pathname string the
16700	size of which exceeds {PATH_MAX}.
16701	[ENETDOWN]
16702	Network is down. The local network interface used to reach the destination is down.

16703		[ENETRESET]
16704		The connection was aborted by the network.
16705		[ENETUNREACH]
16706		Network unreachable. No route to the network is present.
16707		[ENFILE]
16708		Too many files open in system. Too many files are currently open in the system. The system
16709		has reached its predefined limit for simultaneously open files and temporarily cannot
16710		accept requests to open another one.
16711		[ENOBUFFS]
16712		No buffer space available. Insufficient buffer resources were available in the system to
16713		perform the socket operation.
16714	OB XSR	[ENODATA]
16715		No message available. No message is available on the STREAM head read queue.
16716		[ENODEV]
16717		No such device. An attempt was made to apply an inappropriate function to a device; for
16718		example, trying to read a write-only device such as a printer.
16719		[ENOENT]
16720		No such file or directory. A component of a specified pathname does not exist, or the
16721		pathname is an empty string.
16722		[ENOEXEC]
16723		Executable file format error. A request is made to execute a file that, although it has
16724		appropriate privileges, is not in the format required by the implementation for executable
16725		files.
16726		[ENOLCK]
16727		No locks available. A system-imposed limit on the number of simultaneous file and record
16728		locks has been reached and no more are currently available.
16729		[ENOLINK]
16730		Reserved.
16731		[ENOMEM]
16732		Not enough space. The new process image requires more memory than is allowed by the
16733		hardware or system-imposed memory management constraints.
16734		[ENOMSG]
16735		No message of the desired type. The message queue does not contain a message of the
16736		required type during XSI interprocess communication.
16737		[ENOPROTOPT]
16738		Protocol not available. The protocol option specified to <i>setsockopt()</i> is not supported by the
16739		implementation.
16740		[ENOSPC]
16741		No space left on a device. During the <i>write()</i> function on a regular file or when extending a
16742		directory, there is no free space left on the device.
16743	OB XSR	[ENOSR]
16744		No STREAM resources. Insufficient STREAMS memory resources are available to perform a
16745		STREAMS-related function. This is a temporary condition; it may be recovered from if other
16746		processes release resources.

16747	OB XSR	[ENOSTR]
16748		Not a STREAM. A STREAM function was attempted on a file descriptor that was not
16749		associated with a STREAMS device.
16750		[ENOSYS]
16751		Functionality not supported. An attempt was made to use optional functionality that is not
16752		supported in this implementation.
16753		[ENOTCONN]
16754		Socket not connected. The socket is not connected.
16755		[ENOTDIR]
16756		Not a directory. A component of the specified pathname exists, but it is not a directory,
16757		when a directory was expected; or an attempt was made to create a non-directory file, and
16758		the specified pathname contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or
16759		more trailing <code>&lt;slash&gt;</code> characters.
16760		[ENOTEMPTY]
16761		Directory not empty. A directory other than an empty directory was supplied when an
16762		empty directory was expected.
16763		[ENOTRECOVERABLE]
16764		State not recoverable. The state protected by a robust mutex is not recoverable.
16765		[ENOTSOCK]
16766		Not a socket. The file descriptor does not refer to a socket.
16767		[ENOTSUP]
16768		Not supported. The implementation does not support the requested feature or value.
16769		[ENOTTY]
16770		Inappropriate I/O control operation. A control function has been attempted for a file or
16771		special file for which the operation is inappropriate.
16772		[ENXIO]
16773		No such device or address. Input or output on a special file refers to a device that does not
16774		exist, or makes a request beyond the capabilities of the device. It may also occur when, for
16775		example, a tape drive is not on-line.
16776		[EOPNOTSUPP]
16777		Operation not supported on socket. The type of socket (address family or protocol) does not
16778		support the requested operation. A conforming implementation may assign the same values
16779		for [EOPNOTSUPP] and [ENOTSUP].
16780		[EOVERFLOW]
16781		Value too large to be stored in data type. An operation was attempted which would
16782		generate a value that is outside the range of values that can be represented in the relevant
16783		data type or that are allowed for a given data item.
16784		[EOWNERDEAD]
16785		Previous owner died. The owner of a robust mutex terminated while holding the mutex
16786		lock.
16787		[EPERM]
16788		Operation not permitted. An attempt was made to perform an operation limited to
16789		processes with appropriate privileges or to the owner of a file or other resource.
16790		[EPIPE]
16791		Broken pipe. A write was attempted on a socket, pipe, or FIFO for which there is no process
16792		to read the data.

16793	[EPROTO]
16794	Protocol error. Some protocol error occurred. This error is device-specific, but is generally
16795	not related to a hardware failure.
16796	[EPROTONOSUPPORT]
16797	Protocol not supported. The protocol is not supported by the address family, or the protocol
16798	is not supported by the implementation.
16799	[EPROTOTYPE]
16800	Protocol wrong type for socket. The socket type is not supported by the protocol.
16801	[ERANGE]
16802	Result too large or too small. The result of the function is too large (overflow) or too small
16803	(underflow) to be represented in the available space (defined in the ISO C standard).
16804	[EROFS]
16805	Read-only file system. An attempt was made to modify a file or directory on a file system
16806	that is read-only.
16807	[ESPIPE]
16808	Invalid seek. An attempt was made to access the file offset associated with a pipe or FIFO.
16809	[ESRCH]
16810	No such process. No process can be found corresponding to that specified by the given
16811	process ID.
16812	[ESTALE]
16813	Reserved.
16814	OB XSR [ETIME]
16815	STREAM <i>ioctl()</i> timeout. The timer set for a STREAMS <i>ioctl()</i> call has expired. The cause of
16816	this error is device-specific and could indicate either a hardware or software failure, or a
16817	timeout value that is too short for the specific operation. The status of the <i>ioctl()</i> operation is
16818	unspecified.
16819	[ETIMEDOUT]
16820	Connection timed out. The connection to a remote machine has timed out. If the connection
16821	timed out during execution of the function that reported this error (as opposed to timing
16822	out prior to the function being called), it is unspecified whether the function has completed
16823	some or all of the documented behavior associated with a successful completion of the
16824	function.
16825	or:
16826	Operation timed out. The time limit associated with the operation was exceeded before the
16827	operation completed.
16828	[ETXTBSY]
16829	Text file busy. An attempt was made to execute a pure-procedure program that is currently
16830	open for writing, or an attempt has been made to open for writing a pure-procedure
16831	program that is being executed.
16832	[EWOULDBLOCK]
16833	Operation would block. An operation on a socket marked as non-blocking has encountered
16834	a situation such as no data available that otherwise would have caused the function to
16835	suspend execution.
16836	A conforming implementation may assign the same values for [EWOULDBLOCK] and
16837	[EAGAIN].

[EXDEV]

Improper link. A link to a file on another file system was attempted.

### 2.3.1 Additional Error Numbers

Additional implementation-defined error numbers may be defined in `<errno.h>`.

## 2.4 Signal Concepts

### 2.4.1 Signal Generation and Delivery

A signal is said to be “generated” for (or sent to) a process or thread when the event that causes the signal first occurs. Examples of such events include detection of hardware faults, timer expiration, signals generated via the **sigevent** structure and terminal activity, as well as invocations of the `kill()` and `sigqueue()` functions. In some circumstances, the same event generates signals for multiple processes.

At the time of generation, a determination shall be made whether the signal has been generated for the process or for a specific thread within the process. Signals which are generated by some action attributable to a particular thread, such as a hardware fault, shall be generated for the thread that caused the signal to be generated. Signals that are generated in association with a process ID or process group ID or an asynchronous event, such as terminal activity, shall be generated for the process.

Each process has an action to be taken in response to each signal defined by the system (see [Section 2.4.3](#)). A signal is said to be “delivered” to a process when the appropriate action for the process and signal is taken. A signal is said to be “accepted” by a process when the signal is selected and returned by one of the `sigwait()` functions.

During the time between the generation of a signal and its delivery or acceptance, the signal is said to be “pending”. Ordinarily, this interval cannot be detected by an application. However, a signal can be “blocked” from delivery to a thread. If the action associated with a blocked signal is anything other than to ignore the signal, and if that signal is generated for the thread, the signal shall remain pending until it is unblocked, it is accepted when it is selected and returned by a call to the `sigwait()` function, or the action associated with it is set to ignore the signal. Signals generated for the process shall be delivered to exactly one of those threads within the process which is in a call to a `sigwait()` function selecting that signal or has not blocked delivery of the signal. If there are no threads in a call to a `sigwait()` function selecting that signal, and if all threads within the process block delivery of the signal, the signal shall remain pending on the process until a thread calls a `sigwait()` function selecting that signal, a thread unblocks delivery of the signal, or the action associated with the signal is set to ignore the signal. If the action associated with a blocked signal is to ignore the signal and if that signal is generated for the process, it is unspecified whether the signal is discarded immediately upon generation or remains pending.

Each thread has a “signal mask” that defines the set of signals currently blocked from delivery to it. The signal mask for a thread shall be initialized from that of its parent or creating thread, or from the corresponding thread in the parent process if the thread was created as the result of a call to `fork()`. The `pthread_sigmask()`, `sigaction()`, `sigprocmask()`, and `sigsuspend()` functions control the manipulation of the signal mask.

The determination of which action is taken in response to a signal is made at the time the signal is delivered, allowing for any changes since the time of generation. This determination is independent of the means by which the signal was originally generated. If a subsequent occurrence of a pending signal is generated, it is implementation-defined as to whether the signal is delivered or accepted more than once in circumstances other than those in which queuing is required. The order in which multiple, simultaneously pending signals outside the range SIGRTMIN to SIGRTMAX are delivered to or accepted by a process is unspecified.

When any stop signal (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is generated for a process or thread, all pending SIGCONT signals for that process or any of the threads within that process shall be discarded. Conversely, when SIGCONT is generated for a process or thread, all pending stop signals for that process or any of the threads within that process shall be discarded. When SIGCONT is generated for a process that is stopped, the process shall be continued, even if the SIGCONT signal is ignored by the process or is blocked by all threads within the process and there are no threads in a call to a *sigwait()* function selecting SIGCONT. If SIGCONT is blocked by all threads within the process, there are no threads in a call to a *sigwait()* function selecting SIGCONT, and SIGCONT is not ignored by the process, the SIGCONT signal shall remain pending on the process until it is either unblocked by a thread or a thread calls a *sigwait()* function selecting SIGCONT, or a stop signal is generated for the process or any of the threads within the process.

An implementation shall document any condition not specified by this volume of POSIX.1-2008 under which the implementation generates signals.

## 2.4.2 Realtime Signal Generation and Delivery

This section describes functionality to support realtime signal generation and delivery.

Some signal-generating functions, such as high-resolution timer expiration, asynchronous I/O completion, interprocess message arrival, and the *sigqueue()* function, support the specification of an application-defined value, either explicitly as a parameter to the function or in a **sigevent** structure parameter. The **sigevent** structure is defined in **<signal.h>** and contains at least the following members:

Member Type	Member Name	Description
<b>int</b>	<i>sigev_notify</i>	Notification type.
<b>int</b>	<i>sigev_signo</i>	Signal number.
<b>union signal</b>	<i>sigev_value</i>	Signal value.
<b>void(*) (union signal)</b>	<i>sigev_notify_function</i>	Notification function.
<b>(pthread_attr_t*)</b>	<i>sigev_notify_attributes</i>	Notification attributes.

The *sigev\_notify* member specifies the notification mechanism to use when an asynchronous event occurs. This volume of POSIX.1-2008 defines the following values for the *sigev\_notify* member:

**SIGEV\_NONE** No asynchronous notification shall be delivered when the event of interest occurs.

**SIGEV\_SIGNAL** The signal specified in *sigev\_signo* shall be generated for the process when the event of interest occurs. If the implementation supports the Realtime Signals Extension option and if the SA\_SIGINFO flag is set for that signal number, then the signal shall be queued to the process and the value specified in *sigev\_value* shall be the *si\_value* component of the generated signal. If SA\_SIGINFO is not set for that signal number, it is unspecified whether the signal is queued and what value, if any, is sent.

SIGEV\_THREAD A notification function shall be called to perform notification.

An implementation may define additional notification mechanisms.

The *sigeval\_sigeno* member specifies the signal to be generated. The *sigeval\_value* member is the application-defined value to be passed to the signal-catching function at the time of the signal delivery or to be returned at signal acceptance as the *si\_value* member of the **siginfo\_t** structure.

The **sigval** union is defined in **<signal.h>** and contains at least the following members:

Member Type	Member Name	Description
<b>int</b>	<i>sival_int</i>	Integer signal value.
<b>void*</b>	<i>sival_ptr</i>	Pointer signal value.

The *sival\_int* member shall be used when the application-defined value is of type **int**; the *sival\_ptr* member shall be used when the application-defined value is a pointer.

When a signal is generated by the *sigqueue()* function or any signal-generating function that supports the specification of an application-defined value, the signal shall be marked pending and, if the SA\_SIGINFO flag is set for that signal, the signal shall be queued to the process along with the application-specified signal value. Multiple occurrences of signals so generated are queued in FIFO order. It is unspecified whether signals so generated are queued when the SA\_SIGINFO flag is not set for that signal.

Signals generated by the *kill()* function or other events that cause signals to occur, such as detection of hardware faults, *alarm()* timer expiration, or terminal activity, and for which the implementation does not support queuing, shall have no effect on signals already queued for the same signal number.

When multiple unblocked signals, all in the range SIGRTMIN to SIGRTMAX, are pending, the behavior shall be as if the implementation delivers the pending unblocked signal with the lowest signal number within that range. No other ordering of signal delivery is specified.

If, when a pending signal is delivered, there are additional signals queued to that signal number, the signal shall remain pending. Otherwise, the pending indication shall be reset.

Multi-threaded programs can use an alternate event notification mechanism. When a notification is processed, and the *sigeval\_notify* member of the **sigevent** structure has the value SIGEV\_THREAD, the function *sigeval\_notify\_function* is called with parameter *sigeval\_value*.

The function shall be executed in an environment as if it were the *start\_routine* for a newly created thread with thread attributes specified by *sigeval\_notify\_attributes*. If *sigeval\_notify\_attributes* is NULL, the behavior shall be as if the thread were created with the *detachstate* attribute set to PTHREAD\_CREATE\_DETACHED. Supplying an attributes structure with a *detachstate* attribute of PTHREAD\_CREATE\_JOINABLE results in undefined behavior. The signal mask of this thread is implementation-defined.

### 2.4.3 Signal Actions

There are three types of action that can be associated with a signal: SIG\_DFL, SIG\_IGN, or a pointer to a function. Initially, all signals shall be set to SIG\_DFL or SIG\_IGN prior to entry of the *main()* routine (see the *exec* functions). The actions prescribed by these values are as follows.

**SIG\_DFL**

Signal-specific default action.

The default actions for the signals defined in this volume of POSIX.1-2008 are specified under **<signal.h>**. The default actions for the realtime signals in the range SIGRTMIN to SIGRTMAX shall be to terminate the process abnormally.

If the default action is to terminate the process abnormally, the process is terminated as if by a call to `_exit()`, except that the status made available to `wait()`, `waitid()`, and `waitpid()` indicates abnormal termination by the signal. If the default action is to terminate the process abnormally with additional actions, implementation-defined abnormal termination actions, such as creation of a core file, may also occur.

If the default action is to stop the process, the execution of that process is temporarily suspended. When a process stops, a SIGCHLD signal shall be generated for its parent process, unless the parent process has set the SA\_NOCLDSTOP flag. While a process is stopped, any additional signals that are sent to the process shall not be delivered until the process is continued, except SIGKILL which always terminates the receiving process. A process that is a member of an orphaned process group shall not be allowed to stop in response to the SIGTSTP, SIGTTIN, or SIGTTOU signals. In cases where delivery of one of these signals would stop such a process, the signal shall be discarded.

If the default action is to ignore the signal, delivery of the signal shall have no effect on the process.

Setting a signal action to SIG\_DFL for a signal that is pending, and whose default action is to ignore the signal (for example, SIGCHLD), shall cause the pending signal to be discarded, whether or not it is blocked. Any queued values pending shall be discarded and the resources used to queue them shall be released and returned to the system for other use.

The default action for SIGCONT is to resume execution at the point where the process was stopped, after first handling any pending unblocked signals.

When a stopped process is continued, a SIGCHLD signal may be generated for its parent process, unless the parent process has set the SA\_NOCLDSTOP flag.

**SIG\_IGN**

Ignore signal.

Delivery of the signal shall have no effect on the process. The behavior of a process is undefined after it ignores a SIGFPE, SIGILL, SIGSEGV, or SIGBUS signal that was not generated by `kill()`, `sigqueue()`, or `raise()`.

The system shall not allow the action for the signals SIGKILL or SIGSTOP to be set to SIG\_IGN.

Setting a signal action to SIG\_IGN for a signal that is pending shall cause the pending signal to be discarded, whether or not it is blocked.

If a process sets the action for the SIGCHLD signal to SIG\_IGN, the behavior is unspecified, except as specified under “Consequences of Process Termination” in the description of the `_Exit()` function (see XSH `_Exit()`, on page 553).

Any queued values pending shall be discarded and the resources used to queue them shall be released and made available to queue other signals.

**Pointer to a Function**

Catch signal.

On delivery of the signal, the receiving process is to execute the signal-catching function at the specified address. After returning from the signal-catching function, the receiving process shall resume execution at the point at which it was interrupted.

If the SA\_SIGINFO flag for the signal is cleared, the signal-catching function shall be entered as a C-language function call as follows:

```
void func(int signo);
```

If the SA\_SIGINFO flag for the signal is set, the signal-catching function shall be entered as a C-language function call as follows:

```
void func(int signo, siginfo_t *info, void *context);
```

where *func* is the specified signal-catching function, *signo* is the signal number of the signal being delivered, and *info* is a pointer to a **siginfo\_t** structure defined in **<signal.h>** containing at least the following members:

Member Type	Member Name	Description
<b>int</b>	<i>si_signo</i>	Signal number.
<b>int</b>	<i>si_code</i>	Cause of the signal.
<b>pid_t</b>	<i>si_pid</i>	Sending process ID.
<b>uid_t</b>	<i>si_uid</i>	Real user ID of sending process.
<b>void *</b>	<i>si_addr</i>	Address of faulting instruction.
<b>int</b>	<i>si_status</i>	Exit value or signal.
<b>union signal</b>	<i>si_value</i>	Signal value.

The *si\_signo* member shall contain the signal number. This shall be the same as the *signo* parameter. The *si\_code* member shall contain a code identifying the cause of the signal. The following non-signal-specific values are defined for *si\_code*:

**SI\_USER**      The signal was sent by the *kill()* function. The implementation may set *si\_code* to **SI\_USER** if the signal was sent by the *raise()* or *abort()* functions or any similar functions provided as implementation extensions.

**SI\_QUEUE**      The signal was sent by the *sigqueue()* function.

**SI\_TIMER**      The signal was generated by the expiration of a timer set by *timer\_settime()*.

**SI\_ASYNCIO**    The signal was generated by the completion of an asynchronous I/O request.

**MSG**      **SI\_MSGQ**      The signal was generated by the arrival of a message on an empty message queue.

Signal-specific values for *si\_code* are also defined, as described in XBD **<signal.h>**.

If the signal was not generated by one of the functions or events listed above, *si\_code* shall be set either to one of the signal-specific values described in XBD **<signal.h>**, or to an implementation-defined value that is not equal to any of the values defined above.

**XSI**      If *si\_code* is **SI\_USER** or **SI\_QUEUE**, or any value less than or equal to 0, then the signal was generated by a process and *si\_pid* and *si\_uid* shall be set to the process ID and the real user ID of the sender, respectively.

In addition, *si\_addr*, *si\_pid*, *si\_status*, and *si\_uid* shall be set for certain signal-specific values of *si\_code*, as described in XBD **<signal.h>**.

If *si\_code* is one of **SI\_QUEUE**, **SI\_TIMER**, **SI\_ASYNCIO**, or **SI\_MSGQ**, then *si\_value* shall

17048 contain the application-specified signal value. Otherwise, the contents of *si\_value* are undefined.

17049 The behavior of a process is undefined after it returns normally from a signal-catching function  
 17050 for a SIGBUS, SIGFPE, SIGILL, or SIGSEGV signal that was not generated by *kill()*, *sigqueue()*,  
 17051 or *raise()*.

17052 The system shall not allow a process to catch the signals SIGKILL and SIGSTOP.

17053 If a process establishes a signal-catching function for the SIGCHLD signal while it has a  
 17054 terminated child process for which it has not waited, it is unspecified whether a SIGCHLD  
 17055 signal is generated to indicate that child process.

17056 If the process is multi-threaded, or if the process is single-threaded and a signal handler is  
 17057 executed other than as the result of:

- 17058 • The process calling *abort()*, *raise()*, *kill()*, *pthread\_kill()*, or *sigqueue()* to generate a signal  
 17059 that is not blocked
- 17060 • A pending signal being unblocked and being delivered before the call that unblocked it  
 17061 returns

17062 the behavior is undefined if the signal handler refers to any object other than *errno* with static  
 17063 storage duration other than by assigning a value to an object declared as **volatile sig\_atomic\_t**,  
 17064 or if the signal handler calls any function defined in this standard other than one of the functions  
 17065 listed in the following table.

17066 The following table defines a set of functions that shall be async-signal-safe. Therefore, |  
 17067 applications can call them, without restriction, from signal-catching functions. Note that, |  
 17068 although there is no restriction on the calls themselves, for certain functions there are restrictions |  
 17069 on subsequent behavior after the function is called from a signal-catching function (see XSH |  
 17070 *longjmp()*, on page 1275).

17120	<code>getpid()</code>	<code>send()</code>	<code>tcgetattr()</code>	

All functions not in the above table may be unsafe with respect to signals. Implementations may make other interfaces async-signal-safe. In the presence of signals, all functions defined by this

volume of POSIX.1-2008 shall behave as defined when called from or interrupted by a signal-catching function, with the exception that when a signal interrupts an unsafe function or equivalent (such as the processing equivalent to *exit()* performed after a return from the initial call to *main()*) and the signal-catching function calls an unsafe function, the behavior is undefined. Additional exceptions are specified in the descriptions of individual functions such as *longjmp()*.

Operations which obtain the value of *errno* and operations which assign a value to *errno* shall be async-signal-safe, provided that the signal-catching function saves the value of *errno* upon entry and restores it before it returns.

When a signal is delivered to a thread, if the action of that signal specifies termination, stop, or continue, the entire process shall be terminated, stopped, or continued, respectively.

#### 2.4.4 Signal Effects on Other Functions

Signals affect the behavior of certain functions defined by this volume of POSIX.1-2008 if delivered to a process while it is executing such a function. If the action of the signal is to terminate the process, the process shall be terminated and the function shall not return. If the action of the signal is to stop the process, the process shall stop until continued or terminated. Generation of a SIGCONT signal for the process shall cause the process to be continued, and the original function shall continue at the point the process was stopped. If the action of the signal is to invoke a signal-catching function, the signal-catching function shall be invoked; in this case the original function is said to be “interrupted” by the signal. If the signal-catching function executes a **return** statement, the behavior of the interrupted function shall be as described individually for that function, except as noted for unsafe functions. After returning from a signal-catching function, the value of *errno* is unspecified if the signal-catching function or any function it called assigned a value to *errno* and the signal-catching function did not save and restore the original value of *errno*. Signals that are ignored shall not affect the behavior of any function; signals that are blocked shall not affect the behavior of any function until they are unblocked and then delivered, except as specified for the *sigpending()* and *sigwait()* functions.

### 2.5 Standard I/O Streams

A stream is associated with an external file (which may be a physical device) or memory buffer by “opening” a file or buffer. This may involve “creating” a new file. Creating an existing file causes its former contents to be discarded if necessary. If a file can support positioning requests (such as a disk file, as opposed to a terminal), then a “file position indicator” associated with the stream is positioned at the start (byte number 0) of the file, unless the file is opened with append mode, in which case it is implementation-defined whether the file position indicator is initially positioned at the beginning or end of the file. The file position indicator is maintained by subsequent reads, writes, and positioning requests, to facilitate an orderly progression through the file.

The wide-character input functions shall read characters from the stream and convert them to wide characters as if they were read by successive calls to the *fgetwc()* function. Each conversion shall occur as if by a call to the *mbrtowc()* function, with the conversion state described by the stream’s own **mbstate\_t** object (see Section 2.5.2, on page 498). The byte input functions shall read characters from the stream as if by successive calls to the *fgetc()* function.

The wide-character output functions shall convert wide characters to characters and write them to the stream as if they were written by successive calls to the *fputwc()* function. Each conversion

shall occur as if by a call to the *wcrtomb()* function, with the conversion state described by the stream's own **mbstate\_t** object (see [Section 2.5.2](#), on page 498). The byte output functions shall write characters to the stream as if by successive calls to the *fputc()* function.

The *perror()*, *psiginfo()*, and *psignal()* functions shall behave as described above for the byte output functions if the stream is already byte-oriented, and shall behave as described above for the wide-character output functions if the stream is already wide-oriented. If the stream has no orientation, they shall behave as described for the byte output functions except that they shall not change the orientation of the stream.

Functions other than *perror()*, *psiginfo()*, and *psignal()* that write to streams but are neither wide-character output nor byte output functions (*getopt()* and *wordexp()*), shall behave as described above for the byte output functions, except that if the stream has no orientation, it is unspecified whether they set the stream to byte orientation or leave it with no orientation.

When a stream is “unbuffered”, bytes are intended to appear from the source or at the destination as soon as possible; otherwise, bytes may be accumulated and transmitted as a block. When a stream is “fully buffered”, bytes are intended to be transmitted as a block when a buffer is filled. When a stream is “line buffered”, bytes are intended to be transmitted as a block when a <newline> byte is encountered. Furthermore, bytes are intended to be transmitted as a block when a buffer is filled, when input is requested on an unbuffered stream, or when input is requested on a line-buffered stream that requires the transmission of bytes. Support for these characteristics is implementation-defined, and may be affected via *setbuf()* and *setvbuf()*.

A file may be disassociated from a controlling stream by “closing” the file. Output streams are flushed (any unwritten buffer contents are transmitted) before the stream is disassociated from the file. The value of a pointer to a **FILE** object is unspecified after the associated file is closed (including the standard streams).

A file may be subsequently reopened, by the same or another program execution, and its contents reclaimed or modified (if it can be repositioned at its start). If the *main()* function returns to its original caller, or if the *exit()* function is called, all open files are closed (hence all output streams are flushed) before program termination. Other paths to program termination, such as calling *abort()*, need not close all files properly.

The address of the **FILE** object used to control a stream may be significant; a copy of a **FILE** object need not necessarily serve in place of the original.

At program start-up, three streams are predefined and need not be opened explicitly: *standard input* (for reading conventional input), *standard output* (for writing conventional output), and *standard error* (for writing diagnostic output). When opened, the standard error stream is not fully buffered; the standard input and standard output streams are fully buffered if and only if the stream can be determined not to refer to an interactive device.

CX A stream associated with a memory buffer shall have the same operations for text files that a stream associated with an external file would have. In addition, the stream orientation shall be determined in exactly the same fashion.

Input and output operations on a stream associated with a memory buffer by a call to *fmemopen()* shall be constrained by the implementation to take place within the bounds of the memory buffer. In the case of a stream opened by *open\_memstream()* or *open\_wmemstream()*, the memory area shall grow dynamically to accommodate write operations as necessary. For output, data is moved from the buffer provided by *setvbuf()* to the memory stream during a flush or close operation.

## 2.5.1 Interaction of File Descriptors and Standard I/O Streams

CX This section describes the interaction of file descriptors and standard I/O streams. The functionality described in this section is an extension to the ISO C standard (and the rest of this section is not further CX shaded).

An open file description may be accessed through a file descriptor, which is created using functions such as *open()* or *pipe()*, or through a stream, which is created using functions such as *fopen()* or *popen()*. Either a file descriptor or a stream is called a “handle” on the open file description to which it refers; an open file description may have several handles.

Handles can be created or destroyed by explicit user action, without affecting the underlying open file description. Some of the ways to create them include *fcntl()*, *dup()*, *fdopen()*, *fileno()*, and *fork()*. They can be destroyed by at least *fclose()*, *close()*, and the *exec* functions.

A file descriptor that is never used in an operation that could affect the file offset (for example, *read()*, *write()*, or *lseek()*) is not considered a handle for this discussion, but could give rise to one (for example, as a consequence of *fdopen()*, *dup()*, or *fork()*). This exception does not include the file descriptor underlying a stream, whether created with *fopen()* or *fdopen()*, so long as it is not used directly by the application to affect the file offset. The *read()* and *write()* functions implicitly affect the file offset; *lseek()* explicitly affects it.

The result of function calls involving any one handle (the “active handle”) is defined elsewhere in this volume of POSIX.1-2008, but if two or more handles are used, and any one of them is a stream, the application shall ensure that their actions are coordinated as described below. If this is not done, the result is undefined.

A handle which is a stream is considered to be closed when either an *fclose()*, or *freopen()* with non-full filename, is executed on it (for *freopen()* with a null filename, it is implementation-defined whether a new handle is created or the existing one reused), or when the process owning that stream terminates with *exit()*, *abort()*, or due to a signal. A file descriptor is closed by *close()*, *\_exit()*, or the *exec* functions when *FD\_CLOEXEC* is set on that file descriptor.

For a handle to become the active handle, the application shall ensure that the actions below are performed between the last use of the handle (the current active handle) and the first use of the second handle (the future active handle). The second handle then becomes the active handle. All activity by the application affecting the file offset on the first handle shall be suspended until it again becomes the active file handle. (If a stream function has as an underlying function one that affects the file offset, the stream function shall be considered to affect the file offset.)

The handles need not be in the same process for these rules to apply.

Note that after a *fork()*, two handles exist where one existed before. The application shall ensure that, if both handles can ever be accessed, they are both in a state where the other could become the active handle first. The application shall prepare for a *fork()* exactly as if it were a change of active handle. (If the only action performed by one of the processes is one of the *exec* functions or *\_exit()* (not *exit()*), the handle is never accessed in that process.)

For the first handle, the first applicable condition below applies. After the actions required below are taken, if the handle is still open, the application can close it.

- If it is a file descriptor, no action is required.
- If the only further action to be performed on any handle to this open file descriptor is to close it, no action need be taken.
- If it is a stream which is unbuffered, no action need be taken.

- If it is a stream which is line buffered, and the last byte written to the stream was a <newline> (that is, as if a:

`putc( '\n' )`

was the most recent operation on that stream), no action need be taken.

- If it is a stream which is open for writing or appending (but not also open for reading), the application shall either perform an *fflush()*, or the stream shall be closed.
- If the stream is open for reading and it is at the end of the file (*feof()* is true), no action need be taken.
- If the stream is open with a mode that allows reading and the underlying open file description refers to a device that is capable of seeking, the application shall either perform an *fflush()*, or the stream shall be closed.

For the second handle:

- If any previous active handle has been used by a function that explicitly changed the file offset, except as required above for the first handle, the application shall perform an *lseek()* or *fseek()* (as appropriate to the type of handle) to an appropriate location.

If the active handle ceases to be accessible before the requirements on the first handle, above, have been met, the state of the open file description becomes undefined. This might occur during functions such as a *fork()* or *\_exit()*.

The *exec* functions make inaccessible all streams that are open at the time they are called, independent of which streams or file descriptors may be available to the new process image.

When these rules are followed, regardless of the sequence of handles used, implementations shall ensure that an application, even one consisting of several processes, shall yield correct results: no data shall be lost or duplicated when writing, and all data shall be written in order, except as requested by seeks. It is implementation-defined whether, and under what conditions, all input is seen exactly once.

Each function that operates on a stream is said to have zero or more “underlying functions”. This means that the stream function shares certain traits with the underlying functions, but does not require that there be any relation between the implementations of the stream function and its underlying functions.

## 2.5.2 Stream Orientation and Encoding Rules

For conformance to the ISO/IEC 9899:1999 standard, the definition of a stream includes an “orientation”. After a stream is associated with an external file, but before any operations are performed on it, the stream is without orientation. Once a wide-character input/output function has been applied to a stream without orientation, the stream shall become “wide-oriented”. Similarly, once a byte input/output function has been applied to a stream without orientation, the stream shall become “byte-oriented”. Only a call to the *freopen()* function or the *fwide()* function can otherwise alter the orientation of a stream.

A successful call to *freopen()* shall remove any orientation. The three predefined streams *standard input*, *standard output*, and *standard error* shall be unoriented at program start-up.

Byte input/output functions cannot be applied to a wide-oriented stream, and wide-character input/output functions cannot be applied to a byte-oriented stream. The remaining stream operations shall not affect and shall not be affected by a stream’s orientation, except for the following additional restriction:

- For wide-oriented streams, after a successful call to a file-positioning function that leaves the file position indicator prior to the end-of-file, a wide-character output function can overwrite a partial character; any file contents beyond the byte(s) written are henceforth undefined.

Each wide-oriented stream has an associated **mbstate\_t** object that stores the current parse state of the stream. A successful call to *fgetpos()* shall store a representation of the value of this **mbstate\_t** object as part of the value of the **fpos\_t** object. A later successful call to *fsetpos()* using the same stored **fpos\_t** value shall restore the value of the associated **mbstate\_t** object as well as the position within the controlled stream.

Implementations that support multiple encoding rules associate an encoding rule with the stream. The encoding rule shall be determined by the setting of the *LC\_CTYPE* category in the current locale at the time when the stream becomes wide-oriented. As with the stream's orientation, the encoding rule associated with a stream cannot be changed once it has been set, except by a successful call to *freopen()* which clears the encoding rule and resets the orientation to unoriented.

Although wide-oriented streams are conceptually sequences of wide characters, the external file associated with a wide-oriented stream is a sequence of (possibly multi-byte) characters generalized as follows:

- Multi-byte encodings within files may contain embedded null bytes (unlike multi-byte encodings valid for use internal to the program).
- A file need not begin nor end in the initial shift state.

Moreover, the encodings used for characters may differ among files. Both the nature and choice of such encodings are implementation-defined.

The wide-character input functions read characters from the stream and convert them to wide characters as if they were read by successive calls to the *fgetwc()* function. Each conversion shall occur as if by a call to the *mbrtowc()* function, with the conversion state described by the stream's own **mbstate\_t** object, except the encoding rule associated with the stream is used instead of the encoding rule implied by the *LC\_CTYPE* category of the current locale.

The wide-character output functions convert wide characters to (possibly multi-byte) characters and write them to the stream as if they were written by successive calls to the *fputwc()* function. Each conversion shall occur as if by a call to the *wcrtomb()* function, with the conversion state described by the stream's own **mbstate\_t** object, except the encoding rule associated with the stream is used instead of the encoding rule implied by the *LC\_CTYPE* category of the current locale.

An "encoding error" shall occur if the character sequence presented to the underlying *mbrtowc()* function does not form a valid (generalized) character, or if the code value passed to the underlying *wcrtomb()* function does not correspond to a valid (generalized) character. The wide-character input/output functions and the byte input/output functions store the value of the macro `[EILSEQ]` in *errno* if and only if an encoding error occurs.

## 2.6 STREAMS

OB XSR STREAMS functionality is provided on implementations supporting the XSI STREAMS Option Group. The functionality described in this section is dependent on support of the XSI STREAMS option (and the rest of this section is not further shaded for this option).

STREAMS provides a uniform mechanism for implementing networking services and other character-based I/O. The STREAMS function provides direct access to protocol modules. STREAMS modules are unspecified objects. Access to STREAMS modules is provided by interfaces in POSIX.1-2008. Creation of STREAMS modules is outside the scope of POSIX.1-2008.

A STREAM is typically a full-duplex connection between a process and an open device or pseudo-device. However, since pipes may be STREAMS-based, a STREAM can be a full-duplex connection between two processes. The STREAM itself exists entirely within the implementation and provides a general character I/O function for processes. It optionally includes one or more intermediate processing modules that are interposed between the process end of the STREAM (STREAM head) and a device driver at the end of the STREAM (STREAM end).

STREAMS I/O is based on messages. There are three types of message:

- *Data messages* containing actual data for input or output
- *Control data* containing instructions for the STREAMS modules and underlying implementation
- Other messages, which include file descriptors

The interface between the STREAM and the rest of the implementation is provided by a set of functions at the STREAM head. When a process calls *write()*, *writew()*, *putmsg()*, *putpmsg()*, or *ioctl()*, messages are sent down the STREAM, and *read()*, *readv()*, *getmsg()*, or *getpmsg()* accepts data from the STREAM and passes it to a process. Data intended for the device at the downstream end of the STREAM is packaged into messages and sent downstream, while data and signals from the device are composed into messages by the device driver and sent upstream to the STREAM head.

When a STREAMS-based device is opened, a STREAM shall be created that contains the STREAM head and the STREAM end (driver). If pipes are STREAMS-based in an implementation, when a pipe is created, two STREAMS shall be created, each containing a STREAM head. Other modules are added to the STREAM using *ioctl()*. New modules are “pushed” onto the STREAM one at a time in last-in, first-out (LIFO) style, as though the STREAM was a push-down stack.

### Priority

Message types are classified according to their queuing priority and may be *normal* (non-priority), *priority*, or *high-priority* messages. A message belongs to a particular priority band that determines its ordering when placed on a queue. Normal messages have a priority band of 0 and shall always be placed at the end of the queue following all other messages in the queue. High-priority messages are always placed at the head of a queue, but shall be discarded if there is already a high-priority message in the queue. Their priority band shall be ignored; they are high-priority by virtue of their type. Priority messages have a priority band greater than 0. Priority messages are always placed after any messages of the same or higher priority. High-priority and priority messages are used to send control and data information outside the normal flow of control. By convention, high-priority messages shall not be affected by flow control. Normal and priority messages have separate flow controls.

## Message Parts

A process may access STREAMS messages that contain a data part, control part, or both. The data part is that information which is transmitted over the communication medium and the control information is used by the local STREAMS modules. The other types of messages are used between modules and are not accessible to processes. Messages containing only a data part are accessible via *putmsg()*, *putpmsg()*, *getmsg()*, *getpmsg()*, *read()*, *readv()*, *write()*, or *writv()*. Messages containing a control part with or without a data part are accessible via calls to *putmsg()*, *putpmsg()*, *getmsg()*, or *getpmsg()*.

### 2.6.1 Accessing STREAMS

A process accesses STREAMS-based files using the standard functions *close()*, *ioctl()*, *getmsg()*, *getpmsg()*, *open()*, *pipe()*, *poll()*, *putmsg()*, *putpmsg()*, *read()*, or *write()*. Refer to the applicable function definitions for general properties and errors.

Calls to *ioctl()* shall perform control functions on the STREAM associated with the file descriptor *fildev*. The control functions may be performed by the STREAM head, a STREAMS module, or the STREAMS driver for the STREAM.

STREAMS modules and drivers can detect errors, sending an error message to the STREAM head, thus causing subsequent functions to fail and set *errno* to the value specified in the message. In addition, STREAMS modules and drivers can elect to fail a particular *ioctl()* request alone by sending a negative acknowledgement message to the STREAM head. This shall cause just the pending *ioctl()* request to fail and set *errno* to the value specified in the message.

## 2.7 XSI Interprocess Communication

XSI This section describes extensions to support interprocess communication. The functionality described in this section shall be provided on implementations that support the XSI option (and the rest of this section is not further shaded).

The following message passing, semaphore, and shared memory services form an XSI interprocess communication facility. Certain aspects of their operation are common, and are defined as follows.

IPC Functions		
<i>msgctl()</i>	<i>semctl()</i>	<i>shmat()</i>
<i>msgget()</i>	<i>semget()</i>	<i>shmctl()</i>
<i>msgrcv()</i>	<i>semop()</i>	<i>shmdt()</i>
<i>msgsnd()</i>		<i>shmget()</i>

Another interprocess communication facility is provided by functions in the Realtime Option Group; see [Section 2.8](#) (on page 503).

## 2.7.1 IPC General Description

Each individual shared memory segment, message queue, and semaphore set shall be identified by a unique positive integer, called, respectively, a shared memory identifier, *shmid*, a semaphore identifier, *semid*, and a message queue identifier, *msqid*. The identifiers shall be returned by calls to *shmget()*, *semget()*, and *msgget()*, respectively.

Associated with each identifier is a data structure which contains data related to the operations which may be or may have been performed; see the Base Definitions volume of POSIX.1-2008, **<sys/shm.h>**, **<sys/sem.h>**, and **<sys/msg.h>** for their descriptions.

Each of the data structures contains both ownership information and an **ipc\_perm** structure (see the Base Definitions volume of POSIX.1-2008, **<sys/ipc.h>**) which are used in conjunction to determine whether or not read/write (read/alter for semaphores) permissions should be granted to processes using the IPC facilities. The *mode* member of the **ipc\_perm** structure acts as a bit field which determines the permissions.

The values of the bits are given below in octal notation.

Bit	Meaning
0400	Read by user.
0200	Write by user.
0040	Read by group.
0020	Write by group.
0004	Read by others.
0002	Write by others.

The name of the **ipc\_perm** structure is *shm\_perm*, *sem\_perm*, or *msg\_perm*, depending on which service is being used. In each case, read and write/alter permissions shall be granted to a process if one or more of the following are true ("xxx" is replaced by *shm*, *sem*, or *msg*, as appropriate):

- The process has appropriate privileges.
- The effective user ID of the process matches *xxx\_perm.cuid* or *xxx\_perm.uid* in the data structure associated with the IPC identifier, and the appropriate bit of the *user* field in *xxx\_perm.mode* is set.
- The effective user ID of the process does not match *xxx\_perm.cuid* or *xxx\_perm.uid* but the effective group ID of the process matches *xxx\_perm.cgid* or *xxx\_perm.gid* in the data structure associated with the IPC identifier, and the appropriate bit of the *group* field in *xxx\_perm.mode* is set.
- The effective user ID of the process does not match *xxx\_perm.cuid* or *xxx\_perm.uid* and the effective group ID of the process does not match *xxx\_perm.cgid* or *xxx\_perm.gid* in the data structure associated with the IPC identifier, but the appropriate bit of the *other* field in *xxx\_perm.mode* is set.

Otherwise, the permission shall be denied.

In addition to the **ipc\_perm** structure, each associated data structure includes several **time\_t** fields for recording timestamps of particular operations. When an operation is described as setting a timestamp to the current time, that particular timestamp member of the associated data structure shall be set to the largest **time\_t** value which is not greater than the current time.

## 2.8 Realtime

This section defines functions to support the source portability of applications with realtime requirements. The presence of some of these functions is dependent on support for implementation options described in the text.

The specific functional areas included in this section and their scope include the following. Full definitions of these terms can be found in XBD [Chapter 3](#) (on page 33).

- Semaphores
- Process Memory Locking
- Memory Mapped Files and Shared Memory Objects
- Priority Scheduling
- Realtime Signal Extension
- Timers
- Interprocess Communication
- Synchronized Input and Output
- Asynchronous Input and Output

All the realtime functions defined in this volume of POSIX.1-2008 are portable, although some of the numeric parameters used by an implementation may have hardware dependencies.

### 2.8.1 Realtime Signals

See [Section 2.4.2](#) (on page 489).

### 2.8.2 Asynchronous I/O

An asynchronous I/O control block structure **aio** is used in many asynchronous I/O functions. It is defined in the Base Definitions volume of POSIX.1-2008, **<aio.h>** and has at least the following members:

Member Type	Member Name	Description
<b>int</b>	<i>aio_fildes</i>	File descriptor.
<b>off_t</b>	<i>aio_offset</i>	File offset.
<b>volatile void*</b>	<i>aio_buf</i>	Location of buffer.
<b>size_t</b>	<i>aio_nbytes</i>	Length of transfer.
<b>int</b>	<i>aio_reqprio</i>	Request priority offset.
<b>struct sigevent</b>	<i>aio_sigevent</i>	Signal number and value.
<b>int</b>	<i>aio_lio_opcode</i>	Operation to be performed.

The *aio\_fildes* element is the file descriptor on which the asynchronous operation is performed.

If **O\_APPEND** is not set for the file descriptor *aio\_fildes* and if *aio\_fildes* is associated with a device that is capable of seeking, then the requested operation takes place at the absolute position in the file as given by *aio\_offset*, as if *lseek()* were called immediately prior to the operation with an *offset* argument equal to *aio\_offset* and a *whence* argument equal to **SEEK\_SET**. If **O\_APPEND** is set for the file descriptor, or if *aio\_fildes* is associated with a device that is incapable of seeking, write operations append to the file in the same order as the calls were made, with the following exception: under implementation-defined circumstances, such as

operation on a multi-processor or when requests of differing priorities are submitted at the same time, the ordering restriction may be relaxed. Since there is no way for a strictly conforming application to determine whether this relaxation applies, all strictly conforming applications which rely on ordering of output shall be written in such a way that they will operate correctly if the relaxation applies. After a successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file is unspecified. The *aio\_nbytes* and *aio\_buf* elements are the same as the *nbyte* and *buf* arguments defined by *read()* and *write()*, respectively.

If `_POSIX_PRIORITIZED_IO` and `_POSIX_PRIORITY_SCHEDULING` are defined, then asynchronous I/O is queued in priority order, with the priority of each asynchronous operation based on the current scheduling priority of the calling process. The *aio\_reqprio* member can be used to lower (but not raise) the asynchronous I/O operation priority and is within the range zero through `{AIO_PRIO_DELTA_MAX}`, inclusive. Unless both `_POSIX_PRIORITIZED_IO` and `_POSIX_PRIORITY_SCHEDULING` are defined, the order of processing asynchronous I/O requests is unspecified. When both `_POSIX_PRIORITIZED_IO` and `_POSIX_PRIORITY_SCHEDULING` are defined, the order of processing of requests submitted by processes whose schedulers are not `SCHED_FIFO`, `SCHED_RR`, or `SCHED_SPORADIC` is unspecified. The priority of an asynchronous request is computed as (process scheduling priority) minus *aio\_reqprio*. The priority assigned to each asynchronous I/O request is an indication of the desired order of execution of the request relative to other asynchronous I/O requests for this file. If `_POSIX_PRIORITIZED_IO` is defined, requests issued with the same priority to a character special file are processed by the underlying device in FIFO order; the order of processing of requests of the same priority issued to files that are not character special files is unspecified. Numerically higher priority values indicate requests of higher priority. The value of *aio\_reqprio* has no effect on process scheduling priority. When prioritized asynchronous I/O requests to the same file are blocked waiting for a resource required for that I/O operation, the higher-priority I/O requests shall be granted the resource before lower-priority I/O requests are granted the resource. The relative priority of asynchronous I/O and synchronous I/O is implementation-defined. If `_POSIX_PRIORITIZED_IO` is defined, the implementation shall define for which files I/O prioritization is supported.

The *aio\_sigevent* determines how the calling process shall be notified upon I/O completion, as specified in [Section 2.4.1](#) (on page 488). If *aio\_sigevent.sigev\_notify* is `SIGEV_NONE`, then no signal shall be posted upon I/O completion, but the error status for the operation and the return status for the operation shall be set appropriately.

The *aio\_lio\_opcode* field is used only by the *lio\_listio()* call. The *lio\_listio()* call allows multiple asynchronous I/O operations to be submitted at a single time. The function takes as an argument an array of pointers to **aiocb** structures. Each **aiocb** structure indicates the operation to be performed (read or write) via the *aio\_lio\_opcode* field.

The address of the **aiocb** structure is used as a handle for retrieving the error status and return status of the asynchronous operation while it is in progress.

The **aiocb** structure and the data buffers associated with the asynchronous I/O operation are being used by the system for asynchronous I/O while, and only while, the error status of the asynchronous operation is equal to `[EINPROGRESS]`. Applications shall not modify the **aiocb** structure while the structure is being used by the system for asynchronous I/O.

The return status of the asynchronous operation is the number of bytes transferred by the I/O operation. If the error status is set to indicate an error completion, then the return status is set to the return value that the corresponding *read()*, *write()*, or *fsync()* call would have returned. When the error status is not equal to `[EINPROGRESS]`, the return status shall reflect the return status of the corresponding synchronous operation.

## 17546 2.8.3 Memory Management

### 17547 2.8.3.1 Memory Locking

17548 MLR Range memory locking operations are defined in terms of pages. Implementations may restrict  
17549 the size and alignment of range lockings to be on page-size boundaries. The page size, in bytes,  
17550 is the value of the configurable system variable {PAGESIZE}. If an implementation has no  
17551 restrictions on size or alignment, it may specify a 1-byte page size.

17552 ML|MLR Memory locking guarantees the residence of portions of the address space. It is implementation-  
17553 defined whether locking memory guarantees fixed translation between virtual addresses (as  
17554 seen by the process) and physical addresses. Per-process memory locks are not inherited across a  
17555 *fork()*, and all memory locks owned by a process are unlocked upon *exec* or process termination.  
17556 Unmapping of an address range removes any memory locks established on that address range  
17557 by this process.

### 17558 2.8.3.2 Memory Mapped Files

17559 Range memory mapping operations are defined in terms of pages. Implementations may  
17560 restrict the size and alignment of range mappings to be on page-size boundaries. The page size,  
17561 in bytes, is the value of the configurable system variable {PAGESIZE}. If an implementation has  
17562 no restrictions on size or alignment, it may specify a 1-byte page size.

17563 Memory mapped files provide a mechanism that allows a process to access files by directly  
17564 incorporating file data into its address space. Once a file is mapped into a process address space,  
17565 the data can be manipulated as memory. If more than one process maps a file, its contents are  
17566 shared among them. If the mappings allow shared write access, then data written into the  
17567 memory object through the address space of one process appears in the address spaces of all  
17568 processes that similarly map the same portion of the memory object.

17569 SHM Shared memory objects are named regions of storage that may be independent of the file system  
17570 and can be mapped into the address space of one or more processes to allow them to share the  
17571 associated memory.

17572 SHM An *unlink()* of a file or *shm\_unlink()* of a shared memory object, while causing the removal of  
17573 the name, does not unmap any mappings established for the object. Once the name has been  
17574 removed, the contents of the memory object are preserved as long as it is referenced. The  
17575 memory object remains referenced as long as a process has the memory object open or has some  
17576 area of the memory object mapped.

### 17577 2.8.3.3 Memory Protection

17578 When an object is mapped, various application accesses to the mapped region may result in  
17579 signals. In this context, SIGBUS is used to indicate an error using the mapped object, and  
17580 SIGSEGV is used to indicate a protection violation or misuse of an address:

- 17581 • A mapping may be restricted to disallow some types of access.
- 17582 • Write attempts to memory that was mapped without write access, or any access to  
17583 memory mapped PROT\_NONE, shall result in a SIGSEGV signal.
- 17584 • References to unmapped addresses shall result in a SIGSEGV signal.

- 17585 • Reference to whole pages within the mapping, but beyond the current length of the object,
- 17586 shall result in a SIGBUS signal.
- 17587 • The size of the object is unaffected by access beyond the end of the object (even if a
- 17588 SIGBUS is not generated).

#### 17589 2.8.3.4 Typed Memory Objects

17590 TYM The functionality described in this section shall be provided on implementations that support  
 17591 the Typed Memory Objects option (and the rest of this section is not further shaded for this  
 17592 option).

17593 Implementations may support the Typed Memory Objects option independently of support for  
 17594 memory mapped files or shared memory objects. Typed memory objects are implementation-  
 17595 configurable named storage pools accessible from one or more processors in a system, each via  
 17596 one or more ports, such as backplane buses, LANs, I/O channels, and so on. Each valid  
 17597 combination of a storage pool and a port is identified through a name that is defined at system  
 17598 configuration time, in an implementation-defined manner; the name may be independent of the  
 17599 file system. Using this name, a typed memory object can be opened and mapped into process  
 17600 address space. For a given storage pool and port, it is necessary to support both dynamic  
 17601 allocation from the pool as well as mapping at an application-supplied offset within the pool;  
 17602 when dynamic allocation has been performed, subsequent deallocation must be supported.  
 17603 Lastly, accessing typed memory objects from different ports requires a method for obtaining the  
 17604 offset and length of contiguous storage of a region of typed memory (dynamically allocated or  
 17605 not); this allows typed memory to be shared among processes and/or processors while being  
 17606 accessed from the desired port.

### 17607 2.8.4 Process Scheduling

17608 PS The functionality described in this section shall be provided on implementations that support  
 17609 the Process Scheduling option (and the rest of this section is not further shaded for this option).

#### 17610 Scheduling Policies

17611 The scheduling semantics described in this volume of POSIX.1-2008 are defined in terms of a  
 17612 conceptual model that contains a set of thread lists. No implementation structures are  
 17613 necessarily implied by the use of this conceptual model. It is assumed that no time elapses  
 17614 during operations described using this model, and therefore no simultaneous operations are  
 17615 possible. This model discusses only processor scheduling for runnable threads, but it should be  
 17616 noted that greatly enhanced predictability of realtime applications results if the sequencing of  
 17617 other resources takes processor scheduling policy into account.

17618 There is, conceptually, one thread list for each priority. A runnable thread will be on the thread  
 17619 list for that thread's priority. Multiple scheduling policies shall be provided. Each non-empty  
 17620 thread list is ordered, contains a head as one end of its order, and a tail as the other. The purpose  
 17621 of a scheduling policy is to define the allowable operations on this set of lists (for example,  
 17622 moving threads between and within lists).

17623 The POSIX model treats a "process" as an aggregation of system resources, including one or  
 17624 more threads that may be scheduled by the operating system on the processor(s) it controls.  
 17625 Although a process has its own set of scheduling attributes, these have an indirect effect (if any)  
 17626 on the scheduling behavior of individual threads as described below.

17627 Each thread shall be controlled by an associated scheduling policy and priority. These  
 17628 parameters may be specified by explicit application execution of the `pthread_setschedparam()`

function. Additionally, the scheduling parameters of a thread (but not its scheduling policy) may be changed by application execution of the `pthread_setschedprio()` function.

Each process shall be controlled by an associated scheduling policy and priority. These parameters may be specified by explicit application execution of the `sched_setscheduler()` or `sched_setparam()` functions.

The effect of the process scheduling attributes on individual threads in the process is dependent on the scheduling contention scope of the threads (see [Section 2.9.4](#), on page 515):

- For threads with system scheduling contention scope, the process scheduling attributes shall have no effect on the scheduling attributes or behavior either of the thread or an underlying kernel scheduling entity dedicated to that thread.
- For threads with process scheduling contention scope, the process scheduling attributes shall have no effect on the scheduling attributes of the thread. However, any underlying kernel scheduling entity used by these threads shall at all times behave as specified by the scheduling attributes of the containing process, and this behavior may affect the scheduling behavior of the process contention scope threads. For example, a process contention scope thread with scheduling policy `SCHED_FIFO` and the system maximum priority  $H$  (the value returned by `sched_get_priority_max(SCHED_FIFO)`) in a process with scheduling policy `SCHED_RR` and system minimum priority  $L$  (the value returned by `sched_get_priority_min(SCHED_RR)`) shall be subject to timeslicing and to preemption by any thread with an effective priority higher than  $L$ .

Associated with each policy is a priority range. Each policy definition shall specify the minimum priority range for that policy. The priority ranges for each policy may but need not overlap the priority ranges of other policies.

A conforming implementation shall select the thread that is defined as being at the head of the highest priority non-empty thread list to become a running thread, regardless of its associated policy. This thread is then removed from its thread list.

Four scheduling policies are specifically required. Other implementation-defined scheduling policies may be defined. The following symbols are defined in the Base Definitions volume of POSIX.1-2008, `<sched.h>`:

`SCHED_FIFO` First in, first out (FIFO) scheduling policy.

`SCHED_RR` Round robin scheduling policy.

`SCHED_SPORADIC` Sporadic server scheduling policy.

`SCHED_OTHER` Another scheduling policy.

The values of these symbols shall be distinct.

## **SCHED\_FIFO**

Conforming implementations shall include a scheduling policy called the FIFO scheduling policy.

Threads scheduled under this policy are chosen from a thread list that is ordered by the time its threads have been on the list without being executed; generally, the head of the list is the thread that has been on the list the longest time, and the tail is the thread that has been on the list the shortest time.

Under the `SCHED_FIFO` policy, the modification of the definitional thread lists is as follows:

1. When a running thread becomes a preempted thread, it becomes the head of the thread list for its priority.
2. When a blocked thread becomes a runnable thread, it becomes the tail of the thread list for its priority.
3. When a running thread calls the *sched\_setscheduler()* function, the process specified in the function call is modified to the specified policy and the priority specified by the *param* argument.
4. When a running thread calls the *sched\_setparam()* function, the priority of the process specified in the function call is modified to the priority specified by the *param* argument.
5. When a running thread calls the *pthread\_setschedparam()* function, the thread specified in the function call is modified to the specified policy and the priority specified by the *param* argument.
6. When a running thread calls the *pthread\_setschedprio()* function, the thread specified in the function call is modified to the priority specified by the *prio* argument.
7. If a thread whose policy or priority has been modified other than by *pthread\_setschedprio()* is a running thread or is runnable, it then becomes the tail of the thread list for its new priority.
8. If a thread whose priority has been modified by *pthread\_setschedprio()* is a running thread or is runnable, the effect on its position in the thread list depends on the direction of the modification, as follows:
  - a. If the priority is raised, the thread becomes the tail of the thread list.
  - b. If the priority is unchanged, the thread does not change position in the thread list.
  - c. If the priority is lowered, the thread becomes the head of the thread list.
9. When a running thread issues the *sched\_yield()* function, the thread becomes the tail of the thread list for its priority.
10. At no other time is the position of a thread with this scheduling policy within the thread lists affected.

For this policy, valid priorities shall be within the range returned by the *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions when SCHED\_FIFO is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 priorities for this policy.

## SCHED\_RR

Conforming implementations shall include a scheduling policy called the “round robin” scheduling policy. This policy shall be identical to the SCHED\_FIFO policy with the additional condition that when the implementation detects that a running thread has been executing as a running thread for a time period of the length returned by the *sched\_rr\_get\_interval()* function or longer, the thread shall become the tail of its thread list and the head of that thread list shall be removed and made a running thread.

The effect of this policy is to ensure that if there are multiple SCHED\_RR threads at the same priority, one of them does not monopolize the processor. An application should not rely only on the use of SCHED\_RR to ensure application progress among multiple threads if the application includes threads using the SCHED\_FIFO policy at the same or higher priority levels or SCHED\_RR threads at a higher priority level.

A thread under this policy that is preempted and subsequently resumes execution as a running

thread completes the unexpired portion of its round robin interval time period.

For this policy, valid priorities shall be within the range returned by the *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions when *SCHED\_RR* is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 priorities for this policy.

## SCHED\_SPORADIC

The functionality described in this section shall be provided on implementations that support the Process Sporadic Server or Thread Sporadic Server options (and the rest of this section is not further shaded for these options).

If *\_POSIX\_SPORADIC\_SERVER* or *\_POSIX\_THREAD\_SPORADIC\_SERVER* is defined, the implementation shall include a scheduling policy identified by the value *SCHED\_SPORADIC*.

The sporadic server policy is based primarily on two time parameters: the replenishment period and the available execution capacity. The replenishment period is given by the *sched\_ss\_repl\_period* member of the **sched\_param** structure. The available execution capacity is initialized to the value given by the *sched\_ss\_init\_budget* member of the same parameter. The sporadic server policy is identical to the *SCHED\_FIFO* policy with some additional conditions that cause the thread's assigned priority to be switched between the values specified by the *sched\_priority* and *sched\_ss\_low\_priority* members of the **sched\_param** structure.

The priority assigned to a thread using the sporadic server scheduling policy is determined in the following manner: if the available execution capacity is greater than zero and the number of pending replenishment operations is strictly less than *sched\_ss\_max\_repl*, the thread is assigned the priority specified by *sched\_priority*; otherwise, the assigned priority shall be *sched\_ss\_low\_priority*. If the value of *sched\_priority* is less than or equal to the value of *sched\_ss\_low\_priority*, the results are undefined. When active, the thread shall belong to the thread list corresponding to its assigned priority level, according to the mentioned priority assignment. The modification of the available execution capacity and, consequently of the assigned priority, is done as follows:

1. When the thread at the head of the *sched\_priority* list becomes a running thread, its execution time shall be limited to at most its available execution capacity, plus the resolution of the execution time clock used for this scheduling policy. This resolution shall be implementation-defined.
2. Each time the thread is inserted at the tail of the list associated with *sched\_priority*—because as a blocked thread it became runnable with priority *sched\_priority* or because a replenishment operation was performed—the time at which this operation is done is posted as the *activation\_time*.
3. When the running thread with assigned priority equal to *sched\_priority* becomes a preempted thread, it becomes the head of the thread list for its priority, and the execution time consumed is subtracted from the available execution capacity. If the available execution capacity would become negative by this operation, it shall be set to zero.
4. When the running thread with assigned priority equal to *sched\_priority* becomes a blocked thread, the execution time consumed is subtracted from the available execution capacity, and a replenishment operation is scheduled, as described in 6 and 7. If the available execution capacity would become negative by this operation, it shall be set to zero.
5. When the running thread with assigned priority equal to *sched\_priority* reaches the limit imposed on its execution time, it becomes the tail of the thread list for *sched\_ss\_low\_priority*, the execution time consumed is subtracted from the available execution capacity (which becomes zero), and a replenishment operation is scheduled, as

described in 6 and 7.

6. Each time a replenishment operation is scheduled, the amount of execution capacity to be replenished, *replenish\_amount*, is set equal to the execution time consumed by the thread since the *activation\_time*. The replenishment is scheduled to occur at *activation\_time* plus *sched\_ss\_repl\_period*. If the scheduled time obtained is before the current time, the replenishment operation is carried out immediately. Several replenishment operations may be pending at the same time, each of which will be serviced at its respective scheduled time. With the above rules, the number of replenishment operations simultaneously pending for a given thread that is scheduled under the sporadic server policy shall not be greater than *sched\_ss\_max\_repl*.
7. A replenishment operation consists of adding the corresponding *replenish\_amount* to the available execution capacity at the scheduled time. If, as a consequence of this operation, the execution capacity would become larger than *sched\_ss\_initial\_budget*, it shall be rounded down to a value equal to *sched\_ss\_initial\_budget*. Additionally, if the thread was runnable or running, and had assigned priority equal to *sched\_ss\_low\_priority*, then it becomes the tail of the thread list for *sched\_priority*.

Execution time is defined in XBD [Section 3.118](#) (on page 52).

For this policy, changing the value of a CPU-time clock via *clock\_settime()* shall have no effect on its behavior.

For this policy, valid priorities shall be within the range returned by the *sched\_get\_priority\_min()* and *sched\_get\_priority\_max()* functions when SCHED\_SPORADIC is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 distinct priorities for this policy.

If the scheduling policy of the target process is either SCHED\_FIFO or SCHED\_RR, the *sched\_ss\_low\_priority*, *sched\_ss\_repl\_period*, and *sched\_ss\_init* budget members of the *param* argument shall have no effect on the scheduling behavior. If the scheduling policy of this process is not SCHED\_FIFO, SCHED\_RR, or SCHED\_SPORADIC, the effects of these members are implementation-defined; this case includes the SCHED\_OTHER policy.

## SCHED\_OTHER

Conforming implementations shall include one scheduling policy identified as SCHED\_OTHER (which may execute identically with either the FIFO or round robin scheduling policy). The effect of scheduling threads with the SCHED\_OTHER policy in a system in which other threads are executing under SCHED\_FIFO, SCHED\_RR, or SCHED\_SPORADIC is implementation-defined.

This policy is defined to allow strictly conforming applications to be able to indicate in a portable manner that they no longer need a realtime scheduling policy.

For threads executing under this policy, the implementation shall use only priorities within the range returned by the *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions when SCHED\_OTHER is provided as the parameter.

## 2.8.5 Clocks and Timers

The `<time.h>` header defines the types and manifest constants used by the timing facility.

### Time Value Specification Structures

Many of the timing facility functions accept or return time value specifications. A time value structure **timespec** specifies a single time value and includes at least the following members:

Member Type	Member Name	Description
<b>time_t</b>	<i>tv_sec</i>	Seconds.
<b>long</b>	<i>tv_nsec</i>	Nanoseconds.

The *tv\_nsec* member is only valid if greater than or equal to zero, and less than the number of nanoseconds in a second (1 000 million). The time interval described by this structure is  $(tv\_sec * 10^9 + tv\_nsec)$  nanoseconds.

A time value structure **itimerspec** specifies an initial timer value and a repetition interval for use by the per-process timer functions. This structure includes at least the following members:

Member Type	Member Name	Description
<b>struct timespec</b>	<i>it_interval</i>	Timer period.
<b>struct timespec</b>	<i>it_value</i>	Timer expiration.

If the value described by *it\_value* is non-zero, it indicates the time to or time of the next timer expiration (for relative and absolute timer values, respectively). If the value described by *it\_value* is zero, the timer shall be disarmed.

If the value described by *it\_interval* is non-zero, it specifies an interval which shall be used in reloading the timer when it expires; that is, a periodic timer is specified. If the value described by *it\_interval* is zero, the timer is disarmed after its next expiration; that is, a one-shot timer is specified.

### Timer Event Notification Control Block

Per-process timers may be created that notify the process of timer expirations by queuing a realtime extended signal. The **sigevent** structure, defined in the Base Definitions volume of POSIX.1-2008, `<signal.h>`, is used in creating such a timer. The **sigevent** structure contains the signal number and an application-specific data value which shall be used when notifying the calling process of timer expiration events.

### Manifest Constants

The following constants are defined in the Base Definitions volume of POSIX.1-2008, `<time.h>`:

<b>CLOCK_REALTIME</b>	The identifier for the system-wide realtime clock.
<b>TIMER_ABSTIME</b>	Flag indicating time is absolute with respect to the clock associated with a timer.
<b>CLOCK_MONOTONIC</b>	The identifier for the system-wide monotonic clock, which is defined as a clock whose value cannot be set via <i>clock_settime()</i> and which cannot have backward clock jumps. The maximum possible clock jump is implementation-defined.
The maximum allowable resolution for <b>CLOCK_REALTIME</b> and <b>CLOCK_MONOTONIC</b> clocks and all time services based on these clocks is represented by <code>{_POSIX_CLOCKRES_MIN}</code> and shall be defined as 20 ms (1/50 of a second). Implementations may support smaller values of	

17842 resolution for these clocks to provide finer granularity time bases. The actual resolution  
 17843 supported by an implementation for a specific clock is obtained using the *clock\_getres()* function.  
 17844 If the actual resolution supported for a time service based on one of these clocks differs from the  
 17845 resolution supported for that clock, the implementation shall document this difference.

17846 MON The minimum allowable maximum value for `CLOCK_REALTIME` and `CLOCK_MONOTONIC`  
 17847 clocks and all absolute time services based on them is the same as that defined by the ISO C  
 17848 standard for the `time_t` type. If the maximum value supported by a time service based on one of  
 17849 these clocks differs from the maximum value supported by that clock, the implementation shall  
 17850 document this difference.

## 17851 Execution Time Monitoring

17852 CPT If `_POSIX_CPUTIME` is defined, process CPU-time clocks shall be supported in addition to the  
 17853 clocks described in [Manifest Constants](#) (on page 511).

17854 TCT If `_POSIX_THREAD_CPUTIME` is defined, thread CPU-time clocks shall be supported.

17855 CPT|TCT CPU-time clocks measure execution or CPU time, which is defined in XBD [Section 3.118](#) (on  
 17856 page 52). The mechanism used to measure execution time is described in XBD [Section 4.11](#) (on  
 17857 page 110).

17858 CPT If `_POSIX_CPUTIME` is defined, the following constant of the type `clockid_t` is defined in  
 17859 `<time.h>`:

17860 `CLOCK_PROCESS_CPUTIME_ID`

17861 When this value of the type `clockid_t` is used in a *clock()* or *timer\*()* function call, it is  
 17862 interpreted as the identifier of the CPU-time clock associated with the process making the  
 17863 function call.

17864 TCT If `_POSIX_THREAD_CPUTIME` is defined, the following constant of the type `clockid_t` is  
 17865 defined in `<time.h>`:

17866 `CLOCK_THREAD_CPUTIME_ID`

17867 When this value of the type `clockid_t` is used in a *clock()* or *timer\*()* function call, it is  
 17868 interpreted as the identifier of the CPU-time clock associated with the thread making the  
 17869 function call.

## 17870 2.9 Threads

17871 This section defines functionality to support multiple flows of control, called “threads”, within a  
 17872 process. For the definition of threads, see XBD [Section 3.404](#) (on page 99).

17873 The specific functional areas covered by threads and their scope include:

- 17874 • Thread management: the creation, control, and termination of multiple flows of control in  
 17875 the same process under the assumption of a common shared address space
- 17876 • Synchronization primitives optimized for tightly coupled operation of multiple control  
 17877 flows in a common, shared address space

## 2.9.1 Thread-Safety

All functions defined by this volume of POSIX.1-2008 shall be thread-safe, except that the following functions<sup>7</sup> need not be thread-safe.

<i>asctime()</i>	<i>ftw()</i>	<i>getutxent()</i>	<i>putenv()</i>
<i>basename()</i>	<i>getdate()</i>	<i>getutxid()</i>	<i>pututxline()</i>
<i>catgets()</i>	<i>getenv()</i>	<i>getutxline()</i>	<i>rand()</i>
<i>crypt()</i>	<i>getgrent()</i>	<i>gmtime()</i>	<i>readdir()</i>
<i>ctime()</i>	<i>getgrgid()</i>	<i>hcreate()</i>	<i>setenv()</i>
<i>dbm_clearerr()</i>	<i>getgrnam()</i>	<i>hdestroy()</i>	<i>setgrent()</i>
<i>dbm_close()</i>	<i>gethostent()</i>	<i>hsearch()</i>	<i>setkey()</i>
<i>dbm_delete()</i>	<i>getlogin()</i>	<i>inet_ntoa()</i>	<i>setlocale()</i>
<i>dbm_error()</i>	<i>getnetbyaddr()</i>	<i>l64a()</i>	<i>setpwent()</i>
<i>dbm_fetch()</i>	<i>getnetbyname()</i>	<i>lgamma()</i>	<i>setutxent()</i>
<i>dbm_firstkey()</i>	<i>getnetent()</i>	<i>lgammaf()</i>	<i>strerror()</i>
<i>dbm_nextkey()</i>	<i>getopt()</i>	<i>lgammal()</i>	<i>strsignal()</i>
<i>dbm_open()</i>	<i>getprotobyname()</i>	<i>localeconv()</i>	<i>strtok()</i>
<i>dbm_store()</i>	<i>getprotobyname()</i>	<i>localtime()</i>	<i>system()</i>
<i>dirname()</i>	<i>getprotoent()</i>	<i>lrand48()</i>	<i>ttyname()</i>
<i>derror()</i>	<i>getpwent()</i>	<i>mblen()</i>	<i>unsetenv()</i>
<i>drand48()</i>	<i>getpwnam()</i>	<i>mbtowc()</i>	<i>wctomb()</i>
<i>encrypt()</i>	<i>getpwuid()</i>	<i>mrnd48()</i>	
<i>endgrent()</i>	<i>getservbyname()</i>	<i>nftw()</i>	
<i>endpwent()</i>	<i>getservbyport()</i>	<i>nl_langinfo()</i>	
<i>endutxent()</i>	<i>getservent()</i>	<i>ptsname()</i>	

The *ctermid()* and *tmpnam()* functions need not be thread-safe if passed a NULL argument. The *mbrlen()*, *mbrtowc()*, *mbsnrtowcs()*, *mbsrtowcs()*, *wcrtomb()*, *wcsnrtombs()*, and *wcsrtombs()* functions need not be thread-safe if passed a NULL *ps* argument. The *getc\_unlocked()*, *getchar\_unlocked()*, *putc\_unlocked()*, and *putchar\_unlocked()* functions need not be thread-safe unless the invoking thread owns the (FILE \*) object accessed by the call, as is the case after a successful call to the *flockfile()* or *ftrylockfile()* functions.

Implementations shall provide internal synchronization as necessary in order to satisfy this requirement.

Since multi-threaded applications are not allowed to use the *environ* variable to access or modify any environment variable while any other thread is concurrently modifying any environment variable, any function dependent on any environment variable is not thread-safe if another thread is modifying the environment; see XSH *exec* (on page 781).

## 2.9.2 Thread IDs

Although implementations may have thread IDs that are unique in a system, applications should only assume that thread IDs are usable and unique within a single process. The effect of calling any of the functions defined in this volume of POSIX.1-2008 and passing as an argument the thread ID of a thread from another process is unspecified. The lifetime of a thread ID ends after the thread terminates if it was created with the *detachstate* attribute set to *PTHREAD\_CREATE\_DETACHED* or if *pthread\_detach()* or *pthread\_join()* has been called for that thread. A conforming implementation is free to reuse a thread ID after its lifetime has ended. If an application attempts to use a thread ID whose lifetime has ended, the behavior is undefined.

7. The functions in the table are not shaded to denote applicable options. Individual reference pages should be consulted.

17924 If a thread is detached, its thread ID is invalid for use as an argument in a call to *pthread\_detach()*  
 17925 or *pthread\_join()*.

### 17926 2.9.3 Thread Mutexes

17927 A thread that has blocked shall not prevent any unblocked thread that is eligible to use the same  
 17928 processing resources from eventually making forward progress in its execution. Eligibility for  
 17929 processing resources is determined by the scheduling policy.

17930 A thread shall become the owner of a mutex, *m*, when one of the following occurs:

- 17931 • It calls *pthread\_mutex\_lock()* with *m* as the *mutex* argument and the call returns zero or  
 17932 [EOWNERDEAD].
- 17933 • It calls *pthread\_mutex\_trylock()* with *m* as the *mutex* argument and the call returns zero or  
 17934 [EOWNERDEAD].
- 17935 • It calls *pthread\_mutex\_timedlock()* with *m* as the *mutex* argument and the call returns zero or  
 17936 [EOWNERDEAD].
- 17937 • It calls *pthread\_mutex\_setprioceiling()* with *m* as the *mutex* argument and the call returns  
 17938 [EOWNERDEAD].
- 17939 • It calls *pthread\_cond\_wait()* with *m* as the *mutex* argument and the call returns zero or  
 17940 certain error numbers (see *pthread\_cond\_timedwait()*).
- 17941 • It calls *pthread\_cond\_timedwait()* with *m* as the *mutex* argument and the call returns zero or  
 17942 certain error numbers (see *pthread\_cond\_timedwait()*).

17943 The thread shall remain the owner of *m* until one of the following occurs:

- 17944 • It executes *pthread\_mutex\_unlock()* with *m* as the *mutex* argument
- 17945 • It blocks in a call to *pthread\_cond\_wait()* with *m* as the *mutex* argument.
- 17946 • It blocks in a call to *pthread\_cond\_timedwait()* with *m* as the *mutex* argument.

17947 The implementation shall behave as if at all times there is at most one owner of any mutex.

17948 A thread that becomes the owner of a mutex is said to have “acquired” the mutex and the mutex  
 17949 is said to have become “locked”; when a thread gives up ownership of a mutex it is said to have  
 17950 “released” the mutex and the mutex is said to have become “unlocked”.

17951 A problem can occur if a process terminates while one of its threads holds a mutex lock.  
 17952 Depending on the mutex type, it might be possible for another thread to unlock the mutex and  
 17953 recover the state of the mutex. However, it is difficult to perform this recovery reliably.

17954 Robust mutexes provide a means to enable the implementation to notify other threads in the  
 17955 event of a process terminating while one of its threads holds a mutex lock. The next thread that  
 17956 acquires the mutex is notified about the termination by the return value [EOWNERDEAD] from  
 17957 the locking function. The notified thread can then attempt to recover the state protected by the  
 17958 mutex, and if successful mark the state protected by the mutex as consistent by a call to  
 17959 *pthread\_mutex\_consistent()*. If the notified thread is unable to recover the state, it can declare the  
 17960 state as not recoverable by a call to *pthread\_mutex\_unlock()* without a prior call to  
 17961 *pthread\_mutex\_consistent()*.

17962 Whether or not the state protected by a mutex can be recovered is dependent solely on the  
 17963 application using robust mutexes. The robust mutex support provided in the implementation  
 17964 provides notification only that a mutex owner has terminated while holding a lock, or that the  
 17965 state of the mutex is not recoverable.

## 2.9.4 Thread Scheduling

TPS The functionality described in this section shall be provided on implementations that support the Thread Execution Scheduling option (and the rest of this section is not further shaded for this option).

### Thread Scheduling Attributes

In support of the scheduling function, threads have attributes which are accessed through the **pthread\_attr\_t** thread creation attributes object.

The *contentionscope* attribute defines the scheduling contention scope of the thread to be either PTHREAD\_SCOPE\_PROCESS or PTHREAD\_SCOPE\_SYSTEM.

The *inheritsched* attribute specifies whether a newly created thread is to inherit the scheduling attributes of the creating thread or to have its scheduling values set according to the other scheduling attributes in the **pthread\_attr\_t** object.

The *schedpolicy* attribute defines the scheduling policy for the thread. The *schedparam* attribute defines the scheduling parameters for the thread. The interaction of threads having different policies within a process is described as part of the definition of those policies.

If the Thread Execution Scheduling option is defined, and the *schedpolicy* attribute specifies one of the priority-based policies defined under this option, the *schedparam* attribute contains the scheduling priority of the thread. A conforming implementation ensures that the priority value in *schedparam* is in the range associated with the scheduling policy when the thread attributes object is used to create a thread, or when the scheduling attributes of a thread are dynamically modified. The meaning of the priority value in *schedparam* is the same as that of *priority*.

TSP If **\_POSIX\_THREAD\_SPORADIC\_SERVER** is defined, the *schedparam* attribute supports four new members that are used for the sporadic server scheduling policy. These members are *sched\_ss\_low\_priority*, *sched\_ss\_repl\_period*, *sched\_ss\_init\_budget*, and *sched\_ss\_max\_repl*. The meaning of these attributes is the same as in the definitions that appear under [Section 2.8.4](#) (on page 506).

When a process is created, its single thread has a scheduling policy and associated attributes equal to the policy and attributes of the process. The default scheduling contention scope value is implementation-defined. The default values of other scheduling attributes are implementation-defined.

### Thread Scheduling Contention Scope

The scheduling contention scope of a thread defines the set of threads with which the thread competes for use of the processing resources. The scheduling operation selects at most one thread to execute on each processor at any point in time and the thread's scheduling attributes (for example, *priority*), whether under process scheduling contention scope or system scheduling contention scope, are the parameters used to determine the scheduling decision.

The scheduling contention scope, in the context of scheduling a mixed scope environment, affects threads as follows:

- A thread created with PTHREAD\_SCOPE\_SYSTEM scheduling contention scope contends for resources with all other threads in the same scheduling allocation domain relative to their system scheduling attributes. The system scheduling attributes of a thread created with PTHREAD\_SCOPE\_SYSTEM scheduling contention scope are the scheduling attributes with which the thread was created. The system scheduling attributes of a thread created with PTHREAD\_SCOPE\_PROCESS scheduling contention scope are the implementation-defined mapping into system attribute space of the scheduling attributes

- 18011 with which the thread was created.
- 18012 • Threads created with PTHREAD\_SCOPE\_PROCESS scheduling contention scope contend
  - 18013 directly with other threads within their process that were created with
  - 18014 PTHREAD\_SCOPE\_PROCESS scheduling contention scope. The contention is resolved
  - 18015 based on the threads' scheduling attributes and policies. It is unspecified how such threads
  - 18016 are scheduled relative to threads in other processes or threads with
  - 18017 PTHREAD\_SCOPE\_SYSTEM scheduling contention scope.
  - 18018 • Conforming implementations shall support the PTHREAD\_SCOPE\_PROCESS scheduling
  - 18019 contention scope, the PTHREAD\_SCOPE\_SYSTEM scheduling contention scope, or both.

## 18020 Scheduling Allocation Domain

18021 Implementations shall support scheduling allocation domains containing one or more

18022 processors. It should be noted that the presence of multiple processors does not automatically

18023 indicate a scheduling allocation domain size greater than one. Conforming implementations on

18024 multi-processors may map all or any subset of the CPUs to one or multiple scheduling allocation

18025 domains, and could define these scheduling allocation domains on a per-thread, per-process, or

18026 per-system basis, depending on the types of applications intended to be supported by the

18027 implementation. The scheduling allocation domain is independent of scheduling contention

18028 scope, as the scheduling contention scope merely defines the set of threads with which a thread

18029 contends for processor resources, while scheduling allocation domain defines the set of

18030 processors for which it contends. The semantics of how this contention is resolved among

18031 threads for processors is determined by the scheduling policies of the threads.

18032 The choice of scheduling allocation domain size and the level of application control over

18033 scheduling allocation domains is implementation-defined. Conforming implementations may

18034 change the size of scheduling allocation domains and the binding of threads to scheduling

18035 allocation domains at any time.

18036 For application threads with scheduling allocation domains of size equal to one, the scheduling

18037 rules defined for SCHED\_FIFO and SCHED\_RR shall be used; see [Scheduling Policies](#) (on page

18038 506). All threads with system scheduling contention scope, regardless of the processes in which

18039 they reside, compete for the processor according to their priorities. Threads with process

18040 scheduling contention scope compete only with other threads with process scheduling

18041 contention scope within their process.

18042 For application threads with scheduling allocation domains of size greater than one, the rules

18043 TSP defined for SCHED\_FIFO, SCHED\_RR, and SCHED\_SPORADIC shall be used in an

18044 implementation-defined manner. Each thread with system scheduling contention scope

18045 competes for the processors in its scheduling allocation domain in an implementation-defined

18046 manner according to its priority. Threads with process scheduling contention scope are

18047 scheduled relative to other threads within the same scheduling contention scope in the process.

18048 TSP If \_POSIX\_THREAD\_SPORADIC\_SERVER is defined, the rules defined for SCHED\_SPORADIC

18049 in [Scheduling Policies](#) (on page 506) shall be used in an implementation-defined manner for

18050 application threads whose scheduling allocation domain size is greater than one.

## Scheduling Documentation

If `_POSIX_PRIORITY_SCHEDULING` is defined, then any scheduling policies beyond `SCHED_OTHER`, `SCHED_FIFO`, `SCHED_RR`, and `SCHED_SPORADIC`, as well as the effects of the scheduling policies indicated by these other values, and the attributes required in order to support such a policy, are implementation-defined. Furthermore, the implementation shall document the effect of all processor scheduling allocation domain values supported for these policies.

## 2.9.5 Thread Cancellation

The thread cancellation mechanism allows a thread to terminate the execution of any other thread in the process in a controlled manner. The target thread (that is, the one that is being canceled) is allowed to hold cancellation requests pending in a number of ways and to perform application-specific cleanup processing when the notice of cancellation is acted upon.

Cancellation is controlled by the cancellation control functions. Each thread maintains its own cancelability state. Cancellation may only occur at cancellation points or when the thread is asynchronously cancelable.

The thread cancellation mechanism described in this section depends upon programs having set *deferred* cancelability state, which is specified as the default. Applications shall also carefully follow static lexical scoping rules in their execution behavior. For example, use of `setjmp()`, `return`, `goto`, and so on, to leave user-defined cancellation scopes without doing the necessary scope pop operation results in undefined behavior.

Use of asynchronous cancelability while holding resources which potentially need to be released may result in resource loss. Similarly, cancellation scopes may only be safely manipulated (pushed and popped) when the thread is in the *deferred* or *disabled* cancelability states.

### 2.9.5.1 Cancelability States

The cancelability state of a thread determines the action taken upon receipt of a cancellation request. The thread may control cancellation in a number of ways.

Each thread maintains its own cancelability state, which may be encoded in two bits:

1. Cancelability-Enable: When cancelability is `PTHREAD_CANCEL_DISABLE` (as defined in the Base Definitions volume of POSIX.1-2008, `<pthread.h>`), cancellation requests against the target thread are held pending. By default, cancelability is set to `PTHREAD_CANCEL_ENABLE` (as defined in `<pthread.h>`).
2. Cancelability Type: When cancelability is enabled and the cancelability type is `PTHREAD_CANCEL_ASYNCHRONOUS` (as defined in `<pthread.h>`), new or pending cancellation requests may be acted upon at any time. When cancelability is enabled and the cancelability type is `PTHREAD_CANCEL_DEFERRED` (as defined in `<pthread.h>`), cancellation requests are held pending until a cancellation point (see below) is reached. If cancelability is disabled, the setting of the cancelability type has no immediate effect as all cancellation requests are held pending; however, once cancelability is enabled again the new type is in effect. The cancelability type is `PTHREAD_CANCEL_DEFERRED` in all newly created threads including the thread in which `main()` was first invoked.

## 18091 2.9.5.2 Cancellation Points

18092 Cancellation points shall occur when a thread is executing the following functions:

18093	<i>accept()</i>	<i>nanosleep()</i>	<i>select()</i>
18094	<i>aio_suspend()</i>	<i>open()</i>	<i>sem_timedwait()</i>
18095	<i>clock_nanosleep()</i>	<i>openat()</i>	<i>sem_wait()</i>
18096	<i>close()</i>	<i>pause()</i>	<i>send()</i>
18097	<i>connect()</i>	<i>poll()</i>	<i>sendmsg()</i>
18098	<i>creat()</i>	<i>pread()</i>	<i>sendto()</i>
18099	<i>fcntl()</i> †	<i>pselect()</i>	<i>sigsuspend()</i>
18100	<i>fdatasync()</i>	<i>pthread_cond_timedwait()</i>	<i>sigtimedwait()</i>
18101	<i>fsync()</i>	<i>pthread_cond_wait()</i>	<i>sigwait()</i>
18102	<i>getmsg()</i>	<i>pthread_join()</i>	<i>sigwaitinfo()</i>
18103	<i>getpmsg()</i>	<i>pthread_testcancel()</i>	<i>sleep()</i>
18104	<i>lockf()</i> ††	<i>putmsg()</i>	<i>tcdrain()</i>
18105	<i>mq_receive()</i>	<i>putpmsg()</i>	<i>wait()</i>
18106	<i>mq_send()</i>	<i>pwrite()</i>	<i>waitid()</i>
18107	<i>mq_timedreceive()</i>	<i>read()</i>	<i>waitpid()</i>
18108	<i>mq_timedsend()</i>	<i>readv()</i>	<i>write()</i>
18109	<i>msgrcv()</i>	<i>recv()</i>	<i>writev()</i>
18110	<i>msgsnd()</i>	<i>recvfrom()</i>	
18111	<i>msync()</i>	<i>recvmsg()</i>	

---

18112 † When the *cmd* argument is F\_SETLK.

18113 †† When the *function* argument is F\_LOCK.

18114 A cancellation point may also occur when a thread is executing the following functions:

18115	<i>access()</i>	<i>fstatat()</i>	<i>mkstemp()</i>
18116	<i>asctime_r()</i>	<i>ftell()</i>	<i>mktime()</i>
18117	<i>catclose()</i>	<i>ftello()</i>	<i>opendir()</i>
18118	<i>catopen()</i>	<i>futimens()</i>	<i>openlog()</i>
18119	<i>chmod()</i>	<i>fwprintf()</i>	<i>pathconf()</i>
18120	<i>chown()</i>	<i>fwrite()</i>	<i>perror()</i>
18121	<i>closedir()</i>	<i>fwscanf()</i>	<i>popen()</i>
18122	<i>closelog()</i>	<i>getaddrinfo()</i>	<i>posix_fadvise()</i>
18123	<i>ctermid()</i>	<i>getc()</i>	<i>posix_fallocate()</i>
18124	<i>ctime_r()</i>	<i>getc_unlocked()</i>	<i>posix_madvise()</i>
18125	<i>dlclose()</i>	<i>getchar()</i>	<i>posix_openpt()</i>
18126	<i>dlopen()</i>	<i>getchar_unlocked()</i>	<i>posix_spawn()</i>
18127	<i>dprintf()</i>	<i>getcwd()</i>	<i>posix_spawnnp()</i>
18128	<i>endhostent()</i>	<i>getdelim()</i>	<i>posix_trace_clear()</i>
18129	<i>endnetent()</i>	<i>getgrgid_r()</i>	<i>posix_trace_close()</i>
18130	<i>endprotoent()</i>	<i>getgrnam_r()</i>	<i>posix_trace_create()</i>
18131	<i>endservent()</i>	<i>gethostid()</i>	<i>posix_trace_create_withlog()</i>
18132	<i>faccessat()</i>	<i>gethostname()</i>	<i>posix_trace_eventtypelist_getnext_id()</i>
18133	<i>fchmod()</i>	<i>getline()</i>	<i>posix_trace_eventtypelist_rewind()</i>
18134	<i>fchmodat()</i>	<i>getlogin_r()</i>	<i>posix_trace_flush()</i>
18135	<i>fchown()</i>	<i>getnameinfo()</i>	<i>posix_trace_get_attr()</i>
18136	<i>fchownat()</i>	<i>getpwnam_r()</i>	<i>posix_trace_get_filter()</i>
18137	<i>fclose()</i>	<i>getpwuid_r()</i>	<i>posix_trace_get_status()</i>
18138	<i>fcntl()</i> †	<i>gets()</i>	<i>posix_trace_getnext_event()</i>
18139	<i>fflush()</i>	<i>getwc()</i>	<i>posix_trace_open()</i>
18140	<i>fgetc()</i>	<i>getwchar()</i>	<i>posix_trace_rewind()</i>
18141	<i>fgetpos()</i>	<i>glob()</i>	<i>posix_trace_set_filter()</i>
18142	<i>fgets()</i>	<i>iconv_close()</i>	<i>posix_trace_shutdown()</i>
18143	<i>fgetwc()</i>	<i>iconv_open()</i>	<i>posix_trace_timedgetnext_event()</i>
18144	<i>fgetws()</i>	<i>ioctl()</i>	<i>posix_typed_mem_open()</i>
18145	<i>fntmsg()</i>	<i>link()</i>	<i>printf()</i>
18146	<i>fopen()</i>	<i>linkat()</i>	<i>psiginfo()</i>

In addition, a cancellation point may occur when a thread is executing any function that this standard does not require to be thread-safe but the implementation documents as being thread-safe. If a thread is cancelled while executing a non-thread-safe function, the behavior is undefined.

An implementation shall not introduce cancellation points into any other functions specified in this volume of POSIX.1-2008.

The side-effects of acting upon a cancellation request while suspended during a call of a function are the same as the side-effects that may be seen in a single-threaded program when a call to a function is interrupted by a signal and the given function returns [EINTR]. Any such side-effects occur before any cancellation cleanup handlers are called. For functions that are explicitly required not to return when interrupted (for example, `pclose()`), if a thread is canceled while executing the function, the behavior is undefined.

Whenever a thread has cancelability enabled and a cancellation request has been made with that thread as the target, and the thread then calls any function that is a cancellation point (such as `pthread_testcancel()` or `read()`), the cancellation request shall be acted upon before the function returns. If a thread has cancelability enabled and a cancellation request is made with the thread as a target while the thread is suspended at a cancellation point, the thread shall be awakened and the cancellation request shall be acted upon. It is unspecified whether the cancellation request is acted upon or whether the cancellation request remains pending and the thread resumes normal execution if:

- The thread is suspended at a cancellation point and the event for which it is waiting occurs
- A specified timeout expired

before the cancellation request is acted upon.

### 2.9.5.3 Thread Cancellation Cleanup Handlers

Each thread maintains a list of cancellation cleanup handlers. The programmer uses the `pthread_cleanup_push()` and `pthread_cleanup_pop()` functions to place routines on and remove routines from this list.

When a cancellation request is acted upon, or when a thread calls `pthread_exit()`, the thread first disables cancellation by setting its cancelability state to `PTHREAD_CANCEL_DISABLE` and its

---

† For any value of the *cmd* argument.

cancelability type to `PTHREAD_CANCEL_DEFERRED`. The cancelability state shall remain set to `PTHREAD_CANCEL_DISABLE` until the thread has terminated. The behavior is undefined if a cancellation cleanup handler or thread-specific data destructor routine changes the cancelability state to `PTHREAD_CANCEL_ENABLE`.

The routines in the thread's list of cancellation cleanup handlers are invoked one by one in LIFO sequence; that is, the last routine pushed onto the list (Last In) is the first to be invoked (First Out). When the cancellation cleanup handler for a scope is invoked, the storage for that scope remains valid. If the last cancellation cleanup handler returns, thread-specific data destructors (if any) associated with thread-specific data keys for which the thread has non-NULL values will be run, in unspecified order, as described for *pthread\_key\_create()*.

After all cancellation cleanup handlers and thread-specific data destructors have returned, thread execution is terminated. If the thread has terminated because of a call to *pthread\_exit()*, the *value\_ptr* argument is made available to any threads joining with the target. If the thread has terminated by acting on a cancellation request, a status of `PTHREAD_CANCELED` is made available to any threads joining with the target. The symbolic constant `PTHREAD_CANCELED` expands to a constant expression of type (**void** \*) whose value matches no pointer to an object in memory nor the value `NULL`.

A side-effect of acting upon a cancellation request while in a condition variable wait is that the mutex is re-acquired before calling the first cancellation cleanup handler. In addition, the thread is no longer considered to be waiting for the condition and the thread shall not have consumed any pending condition signals on the condition.

A cancellation cleanup handler cannot exit via *longjmp()* or *siglongjmp()*.

#### 2.9.5.4 Async-Cancel Safety

The *pthread\_cancel()*, *pthread\_setcancelstate()*, and *pthread\_setcanceltype()* functions are defined to be async-cancel safe.

No other functions in this volume of POSIX.1-2008 are required to be async-cancel-safe.

If a thread has asynchronous cancellation enabled and is cancelled during execution of a function that is not async-cancel-safe, the behavior is undefined. +

If a thread has deferred cancellation enabled, a signal-catching function is called in that thread during execution of a function that is not async-cancel-safe, and the signal-catching function calls any function that is a cancellation point while a cancellation is pending for the thread, the behavior is undefined. +

### 2.9.6 Thread Read-Write Locks

Multiple readers, single writer (read-write) locks allow many threads to have simultaneous read-only access to data while allowing only one thread to have exclusive write access at any given time. They are typically used to protect data that is read more frequently than it is changed.

One or more readers acquire read access to the resource by performing a read lock operation on the associated read-write lock. A writer acquires exclusive write access by performing a write lock operation. Basically, all readers exclude any writers and a writer excludes all readers and any other writers.

A thread that has blocked on a read-write lock (for example, has not yet returned from a *pthread\_rwlock\_rdlock()* or *pthread\_rwlock\_wrlock()* call) shall not prevent any unblocked thread

that is eligible to use the same processing resources from eventually making forward progress in its execution. Eligibility for processing resources shall be determined by the scheduling policy.

Read-write locks can be used to synchronize threads in the current process and other processes if they are allocated in memory that is writable and shared among the cooperating processes and have been initialized for this behavior.

### 2.9.7 Thread Interactions with Regular File Operations

All of the following functions shall be atomic with respect to each other in the effects specified in POSIX.1-2008 when they operate on regular files or symbolic links:

<i>chmod()</i>	<i>fchownat()</i>	<i>lseek()</i>	<i>readv()</i>	<i>unlink()</i>
<i>chown()</i>	<i>fcntl()</i>	<i>lstat()</i>	<i>pwrite()</i>	<i>unlinkat()</i>
<i>close()</i>	<i>fstat()</i>	<i>open()</i>	<i>rename()</i>	<i>utime()</i>
<i>creat()</i>	<i>fstatat()</i>	<i>openat()</i>	<i>renameat()</i>	<i>utimensat()</i>
<i>dup2()</i>	<i>ftruncate()</i>	<i>pread()</i>	<i>stat()</i>	<i>utimes()</i>
<i>fchmod()</i>	<i>lchown()</i>	<i>read()</i>	<i>symlink()</i>	<i>write()</i>
<i>fchmodat()</i>	<i>link()</i>	<i>readlink()</i>	<i>symlinkat()</i>	<i>writew()</i>
<i>fchown()</i>	<i>linkat()</i>	<i>readlinkat()</i>	<i>truncate()</i>	

If two threads each call one of these functions, each call shall either see all of the specified effects of the other call, or none of them. The requirement on the *close()* function shall also apply whenever a file descriptor is successfully closed, however caused (for example, as a consequence of calling *close()*, calling *dup2()*, or of process termination).

### 2.9.8 Use of Application-Managed Thread Stacks

An “application-managed thread stack” is a region of memory allocated by the application—for example, memory returned by the *malloc()* or *mmap()* functions—and designated as a stack through the act of passing the address and size of the stack, respectively, as the *stackaddr* and *stacksize* arguments to *pthread\_attr\_setstack()*. Application-managed stacks allow the application to precisely control the placement and size of a stack.

The application grants to the implementation permanent ownership of and control over the application-managed stack when the attributes object in which the *stack* or *stackaddr* attribute has been set is used, either by presenting that attribute’s object as the *attr* argument in a call to *pthread\_create()* that completes successfully, or by storing a pointer to the attributes object in the *sigev\_notify\_attributes* member of a **struct sigevent** and passing that **struct sigevent** to a function accepting such argument that completes successfully. The application may thereafter utilize the memory within the stack only within the normal context of stack usage within or properly synchronized with a thread that has been scheduled by the implementation with stack pointer value(s) that are within the range of that stack. In particular, the region of memory cannot be freed, nor can it be later specified as the stack for another thread.

When specifying an attributes object with an application-managed stack through the *sigev\_notify\_attributes* member of a **struct sigevent**, the results are undefined if the requested signal is generated multiple times (as for a repeating timer).

Until an attributes object in which the *stack* or *stackaddr* attribute has been set is used, the application retains ownership of and control over the memory allocated to the stack. It may free or reuse the memory as long as it either deletes the attributes object, or before using the attributes object replaces the stack by making an additional call to *pthread\_attr\_setstack()*, that was used originally to designate the stack. There is no mechanism to retract the reference to an

18292 application-managed stack by an existing attributes object.

18293 Once an attributes object with an application-managed stack has been used, that attributes object  
 18294 cannot be used again by a subsequent call to *pthread\_create()* or any function accepting a **struct**  
 18295 **sigevent** with *sigev\_notify\_attributes* containing a pointer to the attributes object, without  
 18296 designating an unused application-managed stack by making an additional call to  
 18297 *pthread\_attr\_setstack()*.

## 18298 2.9.9 Synchronization Object Copies and Alternative Mappings

18299 TSH For barriers, condition variables, mutexes, and read-write locks, if the process-shared attribute +  
 18300 is set to `PTHREAD_PROCESS_PRIVATE`, only the synchronization object at the address used to +  
 18301 initialize it can be used for performing synchronization. The effect of referring to another +  
 18302 TSH mapping of the same object when locking, unlocking, or destroying the object is undefined. If +  
 18303 the process-shared attribute is set to `PTHREAD_PROCESS_SHARED`, only the synchronization +  
 18304 object itself can be used for performing synchronization; however, it need not be referenced at +  
 18305 the address used to initialize it (that is, another mapping of the same object can be used). The +  
 18306 effect of referring to a copy of the object when locking, unlocking, or destroying it is undefined. +  
 18307 For spin locks, the above requirements shall apply as if spin locks have a process-shared +  
 18308 attribute that is set from the *pshared* argument to *pthread\_spin\_init()*. For semaphores, the above +  
 18309 requirements shall apply as if semaphores have a process-shared attribute that is set to +  
 18310 `PTHREAD_PROCESS_PRIVATE` if the *pshared* argument to *sem\_init()* is zero and set to +  
 18311 `PTHREAD_PROCESS_SHARED` if *pshared* is non-zero.

## 18312 2.10 Sockets

18313 A socket is an endpoint for communication using the facilities described in this section. A socket  
 18314 is created with a specific socket type, described in [Section 2.10.6](#) (on page 524), and is associated  
 18315 with a specific protocol, detailed in [Section 2.10.3](#) (on page 524). A socket is accessed via a file  
 18316 descriptor obtained when the socket is created.

### 18317 2.10.1 Address Families

18318 All network protocols are associated with a specific address family. An address family provides  
 18319 basic services to the protocol implementation to allow it to function within a specific network  
 18320 environment. These services may include packet fragmentation and reassembly, routing,  
 18321 addressing, and basic transport. An address family is normally comprised of a number of  
 18322 protocols, one per socket type. Each protocol is characterized by an abstract socket type. It is not  
 18323 required that an address family support all socket types. An address family may contain  
 18324 multiple protocols supporting the same socket abstraction.

18325 [Section 2.10.17](#) (on page 531), [Section 2.10.19](#) (on page 532), and [Section 2.10.20](#) (on page 532),  
 18326 respectively, describe the use of sockets for local UNIX connections, for Internet protocols based  
 18327 on IPv4, and for Internet protocols based on IPv6.

## 18328 2.10.2 Addressing

18329 An address family defines the format of a socket address. All network addresses are described  
 18330 using a general structure, called a **sockaddr**, as defined in the Base Definitions volume of  
 18331 POSIX.1-2008, **<sys/socket.h>**. However, each address family imposes finer and more specific  
 18332 structure, generally defining a structure with fields specific to the address family. The field  
 18333 *sa\_family* in the **sockaddr** structure contains the address family identifier, specifying the format  
 18334 of the *sa\_data* area. The size of the *sa\_data* area is unspecified.

## 18335 2.10.3 Protocols

18336 A protocol supports one of the socket abstractions detailed in [Section 2.10.6](#). Selecting a protocol  
 18337 involves specifying the address family, socket type, and protocol number to the *socket()* function.  
 18338 Certain semantics of the basic socket abstractions are protocol-specific. All protocols are  
 18339 expected to support the basic model for their particular socket type, but may, in addition,  
 18340 provide non-standard facilities or extensions to a mechanism.

## 18341 2.10.4 Routing

18342 Sockets provides packet routing facilities. A routing information database is maintained, which  
 18343 is used in selecting the appropriate network interface when transmitting packets.

## 18344 2.10.5 Interfaces

18345 Each network interface in a system corresponds to a path through which messages can be sent  
 18346 and received. A network interface usually has a hardware device associated with it, though  
 18347 certain interfaces such as the loopback interface, do not.

## 18348 2.10.6 Socket Types

18349 A socket is created with a specific type, which defines the communication semantics and which  
 18350 allows the selection of an appropriate communication protocol. Four types are defined:  
 18351 RS SOCK\_DGRAM, **SOCK\_RAW**, SOCK\_SEQPACKET, and SOCK\_STREAM. Implementations  
 18352 may specify additional socket types.

18353 The SOCK\_STREAM socket type provides reliable, sequenced, full-duplex octet streams  
 18354 between the socket and a peer to which the socket is connected. A socket of type  
 18355 SOCK\_STREAM must be in a connected state before any data may be sent or received. Record  
 18356 boundaries are not maintained; data sent on a stream socket using output operations of one size  
 18357 may be received using input operations of smaller or larger sizes without loss of data. Data may  
 18358 be buffered; successful return from an output function does not imply that the data has been  
 18359 delivered to the peer or even transmitted from the local system. If data cannot be successfully  
 18360 transmitted within a given time then the connection is considered broken, and subsequent  
 18361 operations shall fail. A SIGPIPE signal is raised if a thread attempts to send data on a broken  
 18362 stream (one that is no longer connected), except that the signal is suppressed if the  
 18363 MSG\_NOSIGNAL flag is used in calls to *send()*, *sendto()*, and *sendmsg()*. Support for an out-of-  
 18364 band data transmission facility is protocol-specific.

18365 The SOCK\_SEQPACKET socket type is similar to the SOCK\_STREAM type, and is also  
 18366 connection-oriented. The only difference between these types is that record boundaries are  
 18367 maintained using the SOCK\_SEQPACKET type. A record can be sent using one or more output

operations and received using one or more input operations, but a single operation never transfers parts of more than one record. Record boundaries are visible to the receiver via the MSG\_EOR flag in the received message flags returned by the *recvmsg()* function. It is protocol-specific whether a maximum record size is imposed.

The SOCK\_DGRAM socket type supports connectionless data transfer which is not necessarily acknowledged or reliable. Datagrams may be sent to the address specified (possibly multicast or broadcast) in each output operation, and incoming datagrams may be received from multiple sources. The source address of each datagram is available when receiving the datagram. An application may also pre-specify a peer address, in which case calls to output functions that do not specify a peer address shall send to the pre-specified peer. If a peer has been specified, only datagrams from that peer shall be received. A datagram must be sent in a single output operation, and must be received in a single input operation. The maximum size of a datagram is protocol-specific; with some protocols, the limit is implementation-defined. Output datagrams may be buffered within the system; thus, a successful return from an output function does not guarantee that a datagram is actually sent or received. However, implementations should attempt to detect any errors possible before the return of an output function, reporting any error by an unsuccessful return value.

The SOCK\_RAW socket type is similar to the SOCK\_DGRAM type. It differs in that it is normally used with communication providers that underlie those used for the other socket types. For this reason, the creation of a socket with type SOCK\_RAW shall require appropriate privileges. The format of datagrams sent and received with this socket type generally include specific protocol headers, and the formats are protocol-specific and implementation-defined.

## 2.10.7 Socket I/O Mode

The I/O mode of a socket is described by the O\_NONBLOCK file status flag which pertains to the open file description for the socket. This flag is initially off when a socket is created, but may be set and cleared by the use of the F\_SETFL command of the *fcntl()* function.

When the O\_NONBLOCK flag is set, certain functions that would normally block until they are complete shall return immediately.

The *bind()* function initiates an address assignment and shall return without blocking when O\_NONBLOCK is set; if the socket address cannot be assigned immediately, *bind()* shall return the [EINPROGRESS] error to indicate that the assignment was initiated successfully, but that it has not yet completed.

The *connect()* function initiates a connection and shall return without blocking when O\_NONBLOCK is set; it shall return the error [EINPROGRESS] to indicate that the connection was initiated successfully, but that it has not yet completed.

Data transfer operations (the *read()*, *write()*, *send()*, and *recv()* functions) shall complete immediately, transfer only as much as is available, and then return without blocking, or return an error indicating that no transfer could be made without blocking.

## 2.10.8 Socket Owner

The owner of a socket is unset when a socket is created. The owner may be set to a process ID or process group ID using the `F_SETOWN` command of the `fcntl()` function.

## 2.10.9 Socket Queue Limits

The transmit and receive queue sizes for a socket are set when the socket is created. The default sizes used are both protocol-specific and implementation-defined. The sizes may be changed using the `setsockopt()` function.

## 2.10.10 Pending Error

Errors may occur asynchronously, and be reported to the socket in response to input from the network protocol. The socket stores the pending error to be reported to a user of the socket at the next opportunity. The error is returned in response to a subsequent `send()`, `recv()`, or `getsockopt()` operation on the socket, and the pending error is then cleared.

## 2.10.11 Socket Receive Queue

A socket has a receive queue that buffers data when it is received by the system until it is removed by a receive call. Depending on the type of the socket and the communication provider, the receive queue may also contain ancillary data such as the addressing and other protocol data associated with the normal data in the queue, and may contain out-of-band or expedited data. The limit on the queue size includes any normal, out-of-band data, datagram source addresses, and ancillary data in the queue. The description in this section applies to all sockets, even though some elements cannot be present in some instances.

The contents of a receive buffer are logically structured as a series of data segments with associated ancillary data and other information. A data segment may contain normal data or out-of-band data, but never both. A data segment may complete a record if the protocol supports records (always true for types `SOCK_SEQPACKET` and `SOCK_DGRAM`). A record may be stored as more than one segment; the complete record might never be present in the receive buffer at one time, as a portion might already have been returned to the application, and another portion might not yet have been received from the communications provider. A data segment may contain ancillary protocol data, which is logically associated with the segment. Ancillary data is received as if it were queued along with the first normal data octet in the segment (if any). A segment may contain ancillary data only, with no normal or out-of-band data. For the purposes of this section, a datagram is considered to be a data segment that terminates a record, and that includes a source address as a special type of ancillary data. Data segments are placed into the queue as data is delivered to the socket by the protocol. Normal data segments are placed at the end of the queue as they are delivered. If a new segment contains the same type of data as the preceding segment and includes no ancillary data, and if the preceding segment does not terminate a record, the segments are logically merged into a single segment.

The receive queue is logically terminated if an end-of-file indication has been received or a connection has been terminated. A segment shall be considered to be terminated if another segment follows it in the queue, if the segment completes a record, or if an end-of-file or other connection termination has been reported. The last segment in the receive queue shall also be considered to be terminated while the socket has a pending error to be reported.

18448 A receive operation shall never return data or ancillary data from more than one segment.

## 18449 2.10.12 Socket Out-of-Band Data State

18450 The handling of received out-of-band data is protocol-specific. Out-of-band data may be placed  
 18451 in the socket receive queue, either at the end of the queue or before all normal data in the queue.  
 18452 In this case, out-of-band data is returned to an application program by a normal receive call.  
 18453 Out-of-band data may also be queued separately rather than being placed in the socket receive  
 18454 queue, in which case it shall be returned only in response to a receive call that requests out-of-  
 18455 band data. It is protocol-specific whether an out-of-band data mark is placed in the receive  
 18456 queue to demarcate data preceding the out-of-band data and following the out-of-band data. An  
 18457 out-of-band data mark is logically an empty data segment that cannot be merged with other  
 18458 segments in the queue. An out-of-band data mark is never returned in response to an input  
 18459 operation. The *socketmark()* function can be used to test whether an out-of-band data mark is the  
 18460 first element in the queue. If an out-of-band data mark is the first element in the queue when an  
 18461 input function is called without the MSG\_PEEK option, the mark is removed from the queue  
 18462 and the following data (if any) is processed as if the mark had not been present.

## 18463 2.10.13 Connection Indication Queue

18464 Sockets that are used to accept incoming connections maintain a queue of outstanding  
 18465 connection indications. This queue is a list of connections that are awaiting acceptance by the  
 18466 application; see *listen()*.

## 18467 2.10.14 Signals

18468 One category of event at the socket interface is the generation of signals. These signals report  
 18469 protocol events or process errors relating to the state of the socket. The generation or delivery of  
 18470 a signal does not change the state of the socket, although the generation of the signal may have  
 18471 been caused by a state change.

18472 The SIGPIPE signal shall be sent to a thread that attempts to send data on a socket that is no  
 18473 longer able to send (one that is no longer connected), except that the signal is suppressed if the  
 18474 MSG\_NOSIGNAL flag is used in calls to *send()*, *sendto()*, and *sendmsg()*. Regardless of whether  
 18475 the generation of the signal is suppressed, the send operation shall fail with the [EPIPE] error.

18476 If a socket has an owner, the SIGURG signal is sent to the owner of the socket when it is notified  
 18477 of expedited or out-of-band data. The socket state at this time is protocol-dependent, and the  
 18478 status of the socket is specified in [Section 2.10.17](#) (on page 531), [Section 2.10.19](#) (on page 532),  
 18479 and [Section 2.10.20](#) (on page 532). Depending on the protocol, the expedited data may or may  
 18480 not have arrived at the time of signal generation.

## 18481 2.10.15 Asynchronous Errors

18482 If any of the following conditions occur asynchronously for a socket, the corresponding value  
 18483 listed below shall become the pending error for the socket:

18484 [ECONNABORTED]

18485 The connection was aborted locally.

**[ECONNREFUSED]**

For a connection-mode socket attempting a non-blocking connection, the attempt to connect was forcefully rejected. For a connectionless-mode socket, an attempt to deliver a datagram was forcefully rejected.

**[ECONNRESET]**

The peer has aborted the connection.

**[EHOSTDOWN]**

The destination host has been determined to be down or disconnected.

**[EHOSTUNREACH]**

The destination host is not reachable.

**[EMSGSIZE]**

For a connectionless-mode socket, the size of a previously sent datagram prevented delivery.

**[ENETDOWN]**

The local network connection is not operational.

**[ENETRESET]**

The connection was aborted by the network.

**[ENETUNREACH]**

The destination network is not reachable.

**2.10.16 Use of Options**

There are a number of socket options which either specialize the behavior of a socket or provide useful information. These options may be set at different protocol levels and are always present at the uppermost “socket” level.

Socket options are manipulated by two functions, *getsockopt()* and *setsockopt()*. These functions allow an application program to customize the behavior and characteristics of a socket to provide the desired effect.

All of the options have default values. The type and meaning of these values is defined by the protocol level to which they apply. Instead of using the default values, an application program may choose to customize one or more of the options. However, in the bulk of cases, the default values are sufficient for the application.

Some of the options are used to enable or disable certain behavior within the protocol modules (for example, turn on debugging) while others may be used to set protocol-specific information (for example, IP time-to-live on all the application’s outgoing packets). As each of the options is introduced, its effect on the underlying protocol modules is described.

Table 2-1 shows the value for the socket level.

**Table 2-1** Value of Level for Socket Options

Name	Description
SOL_SOCKET	Options are intended for the sockets level.

Table 2-2 (on page 529) lists those options present at the socket level; that is, when the *level* parameter of the *getsockopt()* or *setsockopt()* function is SOL\_SOCKET, the types of the option value parameters associated with each option, and a brief synopsis of the meaning of the option

value parameter. Unless otherwise noted, each may be examined with *getsockopt()* and set with *setsockopt()* on all types of socket. Options at other protocol levels vary in format and name.

Table 2-2 Socket-Level Options

Option	Parameter Type	Parameter Meaning
SO_ACCEPTCONN	int	Non-zero indicates that socket listening is enabled ( <i>getsockopt()</i> only).
SO_BROADCAST	int	Non-zero requests permission to transmit broadcast datagrams (SOCK_DGRAM sockets only).
SO_DEBUG	int	Non-zero requests debugging in underlying protocol modules.
SO_DONTROUTE	int	Non-zero requests bypass of normal routing; route based on destination address only.
SO_ERROR	int	Requests and clears pending error information on the socket ( <i>getsockopt()</i> only).
SO_KEEPALIVE	int	Non-zero requests periodic transmission of keepalive messages (protocol-specific).
SO_LINGER	struct linger	Specify actions to be taken for queued, unsent data on <i>close()</i> : linger on/off and linger time in seconds.
SO_OOINLINE	int	Non-zero requests that out-of-band data be placed into normal data input queue as received.
SO_RCVBUF	int	Size of receive buffer (in bytes).
SO_RCVLOWAT	int	Minimum amount of data to return to application for input operations (in bytes).
SO_RCVTIMEO	struct timeval	Timeout value for a socket receive operation.
SO_REUSEADDR	int	Non-zero requests reuse of local addresses in <i>bind()</i> (protocol-specific).
SO_SNDBUF	int	Size of send buffer (in bytes).
SO_SNDLOWAT	int	Minimum amount of data to send for output operations (in bytes).
SO_SNDTIMEO	struct timeval	Timeout value for a socket send operation.
SO_TYPE	int	Identify socket type ( <i>getsockopt()</i> only).

The SO\_ACCEPTCONN option is used only on *getsockopt()*. When this option is specified, *getsockopt()* shall report whether socket listening is enabled for the socket. A value of zero shall indicate that socket listening is disabled; non-zero that it is enabled. SO\_ACCEPTCONN has no default value.

The SO\_BROADCAST option requests permission to send broadcast datagrams on the socket. Support for SO\_BROADCAST is protocol-specific. The default for SO\_BROADCAST is that the ability to send broadcast datagrams on a socket is disabled.

The SO\_DEBUG option enables debugging in the underlying protocol modules. This can be useful for tracing the behavior of the underlying protocol modules during normal system operation. The semantics of the debug reports are implementation-defined. The default value for SO\_DEBUG is for debugging to be turned off.

The SO\_DONTROUTE option requests that outgoing messages bypass the standard routing facilities. The destination must be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. It is protocol-specific whether this option has any effect and how the outgoing network interface is chosen. Support

for this option with each protocol is implementation-defined.

The `SO_ERROR` option is used only on `getsockopt()`. When this option is specified, `getsockopt()` shall return any pending error on the socket and clear the error status. It shall return a value of 0 if there is no pending error. `SO_ERROR` may be used to check for asynchronous errors on connected connectionless-mode sockets or for other types of asynchronous errors. `SO_ERROR` has no default value.

The `SO_KEEPALIVE` option enables the periodic transmission of messages on a connected socket. The behavior of this option is protocol-specific. On a connection-mode socket for which a connection has been established, if `SO_KEEPALIVE` is enabled and the connected socket fails to respond to the keep-alive messages, the connection shall be broken. The default value for `SO_KEEPALIVE` is zero, specifying that this capability is turned off.

The `SO_LINGER` option controls the action of the interface when unsent messages are queued on a socket and a `close()` is performed. The details of this option are protocol-specific. If `SO_LINGER` is enabled, the system shall block the calling thread during `close()` until it can transmit the data or until the end of the interval indicated by the `l_linger` member, whichever comes first. If `SO_LINGER` is not specified, and `close()` is issued, the system handles the call in a way that allows the calling thread to continue as quickly as possible. The default value for `SO_LINGER` is zero, or off, for the `l_onoff` element of the option value and zero seconds for the linger time specified by the `l_linger` element.

The `SO_OOBINLINE` option is valid only on protocols that support out-of-band data. The `SO_OOBINLINE` option requests that out-of-band data be placed in the normal data input queue as received; it is then accessible using the `read()` or `recv()` functions without the `MSG_OOB` flag set. The default for `SO_OOBINLINE` is off; that is, for out-of-band data not to be placed in the normal data input queue.

The `SO_RCVBUF` option requests that the buffer space allocated for receive operations on this socket be set to the value, in bytes, of the option value. Applications may wish to increase buffer size for high volume connections, or may decrease buffer size to limit the possible backlog of incoming data. The default value for the `SO_RCVBUF` option value is implementation-defined, and may vary by protocol.

The `SO_RCVLOWAT` option sets the minimum number of bytes to process for socket input operations. In general, receive calls block until any (non-zero) amount of data is received, then return the smaller of the amount available or the amount requested. The default value for `SO_RCVLOWAT` is 1, and does not affect the general case. If `SO_RCVLOWAT` is set to a larger value, blocking receive calls normally wait until they have received the smaller of the low water mark value or the requested amount. Receive calls may still return less than the low water mark if an error occurs, a signal is caught, or the type of data next in the receive queue is different from that returned (for example, out-of-band data). As mentioned previously, the default value for `SO_RCVLOWAT` is 1 byte. It is implementation-defined whether the `SO_RCVLOWAT` option can be set.

The `SO_RCVTIMEO` option is an option to set a timeout value for input operations. It accepts a **timeval** structure with the number of seconds and microseconds specifying the limit on how long to wait for an input operation to complete. If a receive operation has blocked for this much time without receiving additional data, it shall return with a partial count or `errno` shall be set to `[EAGAIN]` or `[EWOULDBLOCK]` if no data were received. The default for this option is the value zero, which indicates that a receive operation will not time out. It is implementation-defined whether the `SO_RCVTIMEO` option can be set.

The `SO_REUSEADDR` option indicates that the rules used in validating addresses supplied in a `bind()` should allow reuse of local addresses. Operation of this option is protocol-specific. The default value for `SO_REUSEADDR` is off; that is, reuse of local addresses is not permitted.

The `SO_SNDBUF` option requests that the buffer space allocated for send operations on this socket be set to the value, in bytes, of the option value. The default value for the `SO_SNDBUF` option value is implementation-defined, and may vary by protocol.

The `SO_SNDLOWAT` option sets the minimum number of bytes to process for socket output operations. Most output operations process all of the data supplied by the call, delivering data to the protocol for transmission and blocking as necessary for flow control. Non-blocking output operations process as much data as permitted subject to flow control without blocking, but process no data if flow control does not allow the smaller of the send low water mark value or the entire request to be processed. A `select()` operation testing the ability to write to a socket shall return true only if the send low water mark could be processed. The default value for `SO_SNDLOWAT` is implementation-defined and protocol-specific. It is implementation-defined whether the `SO_SNDLOWAT` option can be set.

The `SO_SNDTIMEO` option is an option to set a timeout value for the amount of time that an output function shall block because flow control prevents data from being sent. As noted in [Table 2-2](#) (on page 529), the option value is a **timeval** structure with the number of seconds and microseconds specifying the limit on how long to wait for an output operation to complete. If a send operation has blocked for this much time, it shall return with a partial count or *errno* set to `[EAGAIN]` or `[EWOULDBLOCK]` if no data were sent. The default for this option is the value zero, which indicates that a send operation will not time out. It is implementation-defined whether the `SO_SNDTIMEO` option can be set.

The `SO_TYPE` option is used only on `getsockopt()`. When this option is specified, `getsockopt()` shall return the type of the socket (for example, `SOCK_STREAM`). This option is useful to servers that inherit sockets on start-up. `SO_TYPE` has no default value.

## 2.10.17 Use of Sockets for Local UNIX Connections

Support for UNIX domain sockets is mandatory.

UNIX domain sockets provide process-to-process communication in a single system.

### 2.10.17.1 Headers

The symbolic constant `AF_UNIX` defined in the `<sys/socket.h>` header is used to identify the UNIX domain address family. The `<sys/un.h>` header contains other definitions used in connection with UNIX domain sockets. See [XBD Chapter 13](#) (on page 219).

The **sockaddr\_storage** structure defined in `<sys/socket.h>` shall be large enough to accommodate a **sockaddr\_un** structure (see the `<sys/un.h>` header defined in [XBD Chapter 13](#), on page 219) and shall be aligned at an appropriate boundary so that pointers to it can be cast as pointers to **sockaddr\_un** structures and used to access the fields of those structures without alignment problems. When a **sockaddr\_storage** structure is cast as a **sockaddr\_un** structure, the *ss\_family* field maps onto the *sun\_family* field.

18660 **2.10.18 Use of Sockets over Internet Protocols**

18661 When a socket is created in the Internet family with a protocol value of zero, the implementation  
18662 shall use the protocol listed below for the type of socket created.

18663 SOCK\_STREAM IPPROTO\_TCP.

18664 SOCK\_DGRAM IPPROTO\_UDP.

18665 RS SOCK\_RAW IPPROTO\_RAW.

18666 SOCK\_SEQPACKET Unspecified.

18667 RS A raw interface to IP is available by creating an Internet socket of type SOCK\_RAW. The default  
18668 protocol for type SOCK\_RAW shall be identified in the IP header with the value  
18669 IPPROTO\_RAW. Applications should not use the default protocol when creating a socket with  
18670 type SOCK\_RAW, but should identify a specific protocol by value. The ICMP control protocol is  
18671 accessible from a raw socket by specifying a value of IPPROTO\_ICMP for protocol.

18672 **2.10.19 Use of Sockets over Internet Protocols Based on IPv4**

18673 Support for sockets over Internet protocols based on IPv4 is mandatory.

18674 **2.10.19.1 Headers**

18675 The symbolic constant AF\_INET defined in the `<sys/socket.h>` header is used to identify the  
18676 IPv4 Internet address family. The `<netinet/in.h>` header contains other definitions used in  
18677 connection with IPv4 Internet sockets. See XBD [Chapter 13](#) (on page 219).

18678 The `sockaddr_storage` structure defined in `<sys/socket.h>` shall be large enough to  
18679 accommodate a `sockaddr_in` structure (see the `<netinet/in.h>` header defined in XBD [Chapter](#)  
18680 [13](#), on page 219) and shall be aligned at an appropriate boundary so that pointers to it can be  
18681 cast as pointers to `sockaddr_in` structures and used to access the fields of those structures  
18682 without alignment problems. When a `sockaddr_storage` structure is cast as a `sockaddr_in`  
18683 structure, the `ss_family` field maps onto the `sin_family` field.

18684 **2.10.20 Use of Sockets over Internet Protocols Based on IPv6**

18685 IP6 This section describes extensions to support sockets over Internet protocols based on IPv6. The  
18686 functionality described in this section shall be provided on implementations that support the  
18687 IPV6 option (and the rest of this section is not further shaded for this option).

18688 To enable smooth transition from IPv4 to IPv6, the features defined in this section may, in certain  
18689 circumstances, also be used in connection with IPv4; see [Section 2.10.20.2](#) (on page 533).

18690 **2.10.20.1 Addressing**

18691 IPv6 overcomes the addressing limitations of earlier versions by using 128-bit addresses instead  
18692 of 32-bit addresses. The IPv6 address architecture is described in RFC 2373.

18693 There are three kinds of IPv6 address:

18694 Unicast

18695 Identifies a single interface.

18696 A unicast address can be global, link-local (designed for use on a single link), or site-local

(designed for systems not connected to the Internet). Link-local and site-local addresses need not be globally unique.

#### Anycast

Identifies a set of interfaces such that a packet sent to the address can be delivered to any member of the set.

An anycast address is similar to a unicast address; the nodes to which an anycast address is assigned must be explicitly configured to know that it is an anycast address.

#### Multicast

Identifies a set of interfaces such that a packet sent to the address should be delivered to every member of the set.

An application can send multicast datagrams by simply specifying an IPv6 multicast address in the *address* argument of *sendto()*. To receive multicast datagrams, an application must join the multicast group (using *setsockopt()* with `IPV6_JOIN_GROUP`) and must bind to the socket the UDP port on which datagrams will be received. Some applications should also bind the multicast group address to the socket, to prevent other datagrams destined to that port from being delivered to the socket.

A multicast address can be global, node-local, link-local, site-local, or organization-local.

The following special IPv6 addresses are defined:

#### Unspecified

An address that is not assigned to any interface and is used to indicate the absence of an address.

#### Loopback

A unicast address that is not assigned to any interface and can be used by a node to send packets to itself.

Two sets of IPv6 addresses are defined to correspond to IPv4 addresses:

#### IPv4-compatible addresses

These are assigned to nodes that support IPv6 and can be used when traffic is “tunneled” through IPv4.

#### IPv4-mapped addresses

These are used to represent IPv4 addresses in IPv6 address format; see [Section 2.10.20.2](#).

Note that the unspecified address and the loopback address must not be treated as IPv4-compatible addresses.

### 2.10.20.2 Compatibility with IPv4

The API provides the ability for IPv6 applications to interoperate with applications using IPv4, by using IPv4-mapped IPv6 addresses. These addresses can be generated automatically by the *getaddrinfo()* function when the specified host has only IPv4 addresses.

Applications can use `AF_INET6` sockets to open TCP connections to IPv4 nodes, or send UDP packets to IPv4 nodes, by simply encoding the destination’s IPv4 address as an IPv4-mapped IPv6 address, and passing that address, within a `sockaddr_in6` structure, in the *connect()*, *sendto()*, or *sendmsg()* function. When applications use `AF_INET6` sockets to accept TCP connections from IPv4 nodes, or receive UDP packets from IPv4 nodes, the system shall return the peer’s address to the application in the *accept()*, *recvfrom()*, *recvmsg()*, or *getpeername()* function using a `sockaddr_in6` structure encoded this way. If a node has an IPv4 address, then the implementation shall allow applications to communicate using that address via an

AF\_INET6 socket. In such a case, the address will be represented at the API by the corresponding IPv4-mapped IPv6 address. Also, the implementation may allow an AF\_INET6 socket bound to **in6addr\_any** to receive inbound connections and packets destined to one of the node's IPv4 addresses.

An application can use AF\_INET6 sockets to bind to a node's IPv4 address by specifying the address as an IPv4-mapped IPv6 address in a **sockaddr\_in6** structure in the *bind()* function. For an AF\_INET6 socket bound to a node's IPv4 address, the system shall return the address in the *getsockname()* function as an IPv4-mapped IPv6 address in a **sockaddr\_in6** structure.

#### 2.10.20.3 Interface Identification

Each local interface is assigned a unique positive integer as a numeric index. Indexes start at 1; zero is not used. There may be gaps so that there is no current interface for a particular positive index. Each interface also has a unique implementation-defined name.

#### 2.10.20.4 Options

The following options apply at the IPPROTO\_IPV6 level:

##### IPV6\_JOIN\_GROUP

When set via *setsockopt()*, it joins the application to a multicast group on an interface (identified by its index) and addressed by a given multicast address, enabling packets sent to that address to be read via the socket. If the interface index is specified as zero, the system selects the interface (for example, by looking up the address in a routing table and using the resulting interface).

An attempt to read this option using *getsockopt()* shall result in an [EOPNOTSUPP] error.

The parameter type of this option is a pointer to an **ipv6\_mreq** structure.

##### IPV6\_LEAVE\_GROUP

When set via *setsockopt()*, it removes the application from the multicast group on an interface (identified by its index) and addressed by a given multicast address.

An attempt to read this option using *getsockopt()* shall result in an [EOPNOTSUPP] error.

The parameter type of this option is a pointer to an **ipv6\_mreq** structure.

##### IPV6\_MULTICAST\_HOPS

The value of this option is the hop limit for outgoing multicast IPv6 packets sent via the socket. Its possible values are the same as those of IPV6\_UNICAST\_HOPS. If the IPV6\_MULTICAST\_HOPS option is not set, a value of 1 is assumed. This option can be set via *setsockopt()* and read via *getsockopt()*.

The parameter type of this option is a pointer to an **int**. (Default value: 1)

##### IPV6\_MULTICAST\_IF

The index of the interface to be used for outgoing multicast packets. It can be set via *setsockopt()* and read via *getsockopt()*. If the interface index is specified as zero, the system selects the interface (for example, by looking up the address in a routing table and using the resulting interface).

The parameter type of this option is a pointer to an **unsigned int**. (Default value: 0)

##### IPV6\_MULTICAST\_LOOP

This option controls whether outgoing multicast packets should be delivered back to the local application when the sending interface is itself a member of the destination multicast

18783 group. If it is set to 1 they are delivered. If it is set to 0 they are not. Other values result in an  
 18784 [EINVAL] error. This option can be set via *setsockopt()* and read via *getsockopt()*.

18785 The parameter type of this option is a pointer to an **unsigned int** which is used as a Boolean  
 18786 value. (Default value: 1)

18787 IPV6\_UNICAST\_HOPS

18788 The value of this option is the hop limit for outgoing unicast IPv6 packets sent via the  
 18789 socket. If the option is not set, or is set to -1, the system selects a default value. Attempts to  
 18790 set a value less than -1 or greater than 255 shall result in an [EINVAL] error. This option can  
 18791 be set via *setsockopt()* and read via *getsockopt()*.

18792 The parameter type of this option is a pointer to an **int**. (Default value: Unspecified)

18793 IPV6\_V6ONLY

18794 This socket option restricts AF\_INET6 sockets to IPv6 communications only. AF\_INET6  
 18795 sockets may be used for both IPv4 and IPv6 communications. Some applications may want  
 18796 to restrict their use of an AF\_INET6 socket to IPv6 communications only. For these  
 18797 applications, the IPV6\_V6ONLY socket option is defined. When this option is turned on, the  
 18798 socket can be used to send and receive IPv6 packets only. This is an IPPROTO\_IPv6-level  
 18799 option.

18800 The parameter type of this option is a pointer to an **int** which is used as a Boolean value.  
 18801 (Default value: 0)

18802 An [EOPNOTSUPP] error shall result if IPV6\_JOIN\_GROUP or IPV6\_LEAVE\_GROUP is used  
 18803 with *getsockopt()*.

#### 18804 2.10.20.5 Headers

18805 The symbolic constant AF\_INET6 is defined in the `<sys/socket.h>` header to identify the IPv6  
 18806 Internet address family. See XBD [Chapter 13](#) (on page 219).

18807 The **sockaddr\_storage** structure defined in `<sys/socket.h>` shall be large enough to  
 18808 accommodate a **sockaddr\_in6** structure (see the `<netinet/in.h>` header defined in XBD [Chapter](#)  
 18809 [13](#), on page 219) and shall be aligned at an appropriate boundary so that pointers to it can be  
 18810 cast as pointers to **sockaddr\_in6** structures and used to access the fields of those structures  
 18811 without alignment problems. When a **sockaddr\_storage** structure is cast as a **sockaddr\_in6**  
 18812 structure, the *ss\_family* field maps onto the *sin6\_family* field.

18813 The `<netinet/in.h>`, `<arpa/inet.h>`, and `<netdb.h>` headers contain other definitions used in  
 18814 connection with IPv6 Internet sockets; see XBD [Chapter 13](#) (on page 219).

## 2.11 Tracing

OB TRC

This section describes extensions to support tracing of user applications. The functionality described in this section is dependent on support of the Trace option (and the rest of this section is not further shaded for this option).

The tracing facilities defined in POSIX.1-2008 allow a process to select a set of trace event types, to activate a trace stream of the selected trace events as they occur in the flow of execution, and to retrieve the recorded trace events.

The tracing operation relies on three logically different components: the traced process, the controller process, and the analyzer process. During the execution of the traced process, when a trace point is reached, a trace event is recorded into the trace streams created for that process in which the associated trace event type identifier is not being filtered out. The controller process controls the operation of recording the trace events into the trace stream. It shall be able to:

- Initialize the attributes of a trace stream
- Create the trace stream (for a specified traced process) using those attributes
- Start and stop tracing for the trace stream
- Filter the type of trace events to be recorded, if the Trace Event Filter option is supported
- Shut a trace stream down

These operations can be done for an active trace stream. The analyzer process retrieves the traced events either at runtime, when the trace stream has not yet been shut down, but is still recording trace events; or after opening a trace log that had been previously recorded and shut down. These three logically different operations can be performed by the same process, or can be distributed into different processes.

A trace stream identifier can be created by a call to `posix_trace_create()`, `posix_trace_create_withlog()`, or `posix_trace_open()`. The `posix_trace_create()` and `posix_trace_create_withlog()` functions should be used by a controller process. The `posix_trace_open()` should be used by an analyzer process.

The tracing functions can serve different purposes. One purpose is debugging the possibly pre-instrumented code, while another is post-mortem fault analysis. These two potential uses differ in that the first requires pre-filtering capabilities to avoid overwhelming the trace stream and permits focusing on expected information; while the second needs comprehensive trace capabilities in order to be able to record all types of information.

The events to be traced belong to two classes:

1. User trace events (generated by the application instrumentation)
2. System trace events (generated by the operating system)

The trace interface defines several system trace event types associated with control of and operation of the trace stream. This small set of system trace events includes the minimum required to interpret correctly the trace event information present in the stream. Other desirable system trace events for some particular application profile may be implemented and are encouraged; for example, process and thread scheduling, signal occurrence, and so on.

Each traced process shall have a mapping of the trace event names to trace event type identifiers that have been defined for that process. Each active trace stream shall have a mapping that incorporates all the trace event type identifiers predefined by the trace system plus all the mappings of trace event names to trace event type identifiers of the processes that are being traced into that trace stream. These mappings are defined from the instrumented application by calling the `posix_trace_eventid_open()` function and from the controller process by calling the

18860 *posix\_trace\_trid\_eventid\_open()* function. For a pre-recorded trace stream, the list of trace event  
18861 types is obtained from the pre-recorded trace log.

18862 The last data modification and file status change timestamps of a file associated with an active  
18863 trace stream shall be marked for update every time any of the tracing operations modifies that  
18864 file.

18865 The last data access timestamp of a file associated with a trace stream shall be marked for  
18866 update every time any of the tracing operations causes data to be read from that file.

18867 Results are undefined if the application performs any operation on a file descriptor associated  
18868 with an active or pre-recorded trace stream until *posix\_trace\_shutdown()* or *posix\_trace\_close()* is  
18869 called for that trace stream. Results are also undefined if the analyzer process and the traced  
18870 process do not share the same programming environment (see *c99*, Programming Environments  
18871 in the Shell and Utilities volume of POSIX.1-2008).

18872 The main purpose of this option is to define a complete set of functions and concepts that allow  
18873 a conforming application to be traced from creation to termination, whatever its realtime  
18874 constraints and properties.

## 2.11.1 Tracing Data Definitions

### 2.11.1.1 Structures

The **<trace.h>** header shall define the *posix\_trace\_status\_info* and *posix\_trace\_event\_info* structures described below. Implementations may add extensions to these structures.

#### **posix\_trace\_status\_info** Structure

To facilitate control of a trace stream, information about the current state of an active trace stream can be obtained dynamically. This structure is returned by a call to the *posix\_trace\_get\_status()* function.

The **posix\_trace\_status\_info** structure defined in **<trace.h>** shall contain at least the following members:

Member Type	Member Name	Description
<b>int</b>	<i>posix_stream_status</i>	The operating mode of the trace stream.
<b>int</b>	<i>posix_stream_full_status</i>	The full status of the trace stream.
<b>int</b>	<i>posix_stream_overrun_status</i>	Indicates whether trace events were lost in the trace stream.

If the Trace Log option is supported in addition to the Trace option, the **posix\_trace\_status\_info** structure defined in **<trace.h>** shall contain at least the following additional members:

Member Type	Member Name	Description
<b>int</b>	<i>posix_stream_flush_status</i>	Indicates whether a flush is in progress.
<b>int</b>	<i>posix_stream_flush_error</i>	Indicates whether any error occurred during the last flush operation.
<b>int</b>	<i>posix_log_overrun_status</i>	Indicates whether trace events were lost in the trace log.
<b>int</b>	<i>posix_log_full_status</i>	The full status of the trace log.

The *posix\_stream\_status* member indicates the operating mode of the trace stream and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

#### POSIX\_TRACE\_RUNNING

Tracing is in progress; that is, the trace stream is accepting trace events.

#### POSIX\_TRACE\_SUSPENDED

The trace stream is not accepting trace events. The tracing operation has not yet started or has stopped, either following a *posix\_trace\_stop()* function call or because the trace resources are exhausted.

The *posix\_stream\_full\_status* member indicates the full status of the trace stream, and it shall have one of the following values defined by manifest constants in the **<trace.h>** header:

#### POSIX\_TRACE\_FULL

The space in the trace stream for trace events is exhausted.

#### POSIX\_TRACE\_NOT\_FULL

There is still space available in the trace stream.

The combination of the *posix\_stream\_status* and *posix\_stream\_full\_status* members also indicates the actual status of the stream. The status shall be interpreted as follows:

18915 POSIX\_TRACE\_RUNNING and POSIX\_TRACE\_NOT\_FULL

18916 This status combination indicates that tracing is in progress, and there is space available for  
18917 recording more trace events.

18918 POSIX\_TRACE\_RUNNING and POSIX\_TRACE\_FULL

18919 This status combination indicates that tracing is in progress and that the trace stream is full  
18920 of trace events. This status combination cannot occur unless the *stream-full-policy* is set to  
18921 POSIX\_TRACE\_LOOP. The trace stream contains trace events recorded during a moving  
18922 time window of prior trace events, and some older trace events may have been overwritten  
18923 and thus lost.

18924 POSIX\_TRACE\_SUSPENDED and POSIX\_TRACE\_NOT\_FULL

18925 This status combination indicates that tracing has not yet been started, has been stopped by  
18926 the *posix\_trace\_stop()* function, or has been cleared by the *posix\_trace\_clear()* function.

18927 POSIX\_TRACE\_SUSPENDED and POSIX\_TRACE\_FULL

18928 This status combination indicates that tracing has been stopped by the implementation  
18929 because the *stream-full-policy* attribute was POSIX\_TRACE\_UNTIL\_FULL and trace  
18930 resources were exhausted, or that the trace stream was stopped by the function  
18931 *posix\_trace\_stop()* at a time when trace resources were exhausted.

18932 The *posix\_stream\_overrun\_status* member indicates whether trace events were lost in the trace  
18933 stream, and shall have one of the following values defined by manifest constants in the  
18934 **<trace.h>** header:

18935 POSIX\_TRACE\_OVERRUN

18936 At least one trace event was lost and thus was not recorded in the trace stream.

18937 POSIX\_TRACE\_NO\_OVERRUN

18938 No trace events were lost.

18939 When the corresponding trace stream is created, the *posix\_stream\_overrun\_status* member shall be  
18940 set to POSIX\_TRACE\_NO\_OVERRUN.

18941 Whenever an overrun occurs, the *posix\_stream\_overrun\_status* member shall be set to  
18942 POSIX\_TRACE\_OVERRUN.

18943 An overrun occurs when:

- 18944 • The policy is POSIX\_TRACE\_LOOP and a recorded trace event is overwritten.
- 18945 • The policy is POSIX\_TRACE\_UNTIL\_FULL and the trace stream is full when a trace event  
18946 is generated.
- 18947 • If the Trace Log option is supported, the policy is POSIX\_TRACE\_FLUSH and at least one  
18948 trace event is lost while flushing the trace stream to the trace log.

18949 The *posix\_stream\_overrun\_status* member is reset to zero after its value is read.

18950 If the Trace Log option is supported in addition to the Trace option, the *posix\_stream\_flush\_status*,  
18951 *posix\_stream\_flush\_error*, *posix\_log\_overrun\_status*, and *posix\_log\_full\_status* members are defined  
18952 as follows; otherwise, they are undefined.

18953 The *posix\_stream\_flush\_status* member indicates whether a flush operation is being performed  
18954 and shall have one of the following values defined by manifest constants in the header  
18955 **<trace.h>**:

18956 POSIX\_TRACE\_FLUSHING

18957 The trace stream is currently being flushed to the trace log.

## POSIX\_TRACE\_NOT\_FLUSHING

No flush operation is in progress.

The *posix\_stream\_flush\_status* member shall be set to POSIX\_TRACE\_FLUSHING if a flush operation is in progress either due to a call to the *posix\_trace\_flush()* function (explicit or caused by a trace stream shutdown operation) or because the trace stream has become full with the *stream-full-policy* attribute set to POSIX\_TRACE\_FLUSH. The *posix\_stream\_flush\_status* member shall be set to POSIX\_TRACE\_NOT\_FLUSHING if no flush operation is in progress.

The *posix\_stream\_flush\_error* member shall be set to zero if no error occurred during flushing. If an error occurred during a previous flushing operation, the *posix\_stream\_flush\_error* member shall be set to the value of the first error that occurred. If more than one error occurs while flushing, error values after the first shall be discarded. The *posix\_stream\_flush\_error* member is reset to zero after its value is read.

The *posix\_log\_overnrun\_status* member indicates whether trace events were lost in the trace log, and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

## POSIX\_TRACE\_OVERRUN

At least one trace event was lost.

## POSIX\_TRACE\_NO\_OVERRUN

No trace events were lost.

When the corresponding trace stream is created, the *posix\_log\_overnrun\_status* member shall be set to POSIX\_TRACE\_NO\_OVERRUN. Whenever an overrun occurs, this status shall be set to POSIX\_TRACE\_OVERRUN. The *posix\_log\_overnrun\_status* member is reset to zero after its value is read.

The *posix\_log\_full\_status* member indicates the full status of the trace log, and it shall have one of the following values defined by manifest constants in the **<trace.h>** header:

## POSIX\_TRACE\_FULL

The space in the trace log is exhausted.

## POSIX\_TRACE\_NOT\_FULL

There is still space available in the trace log.

The *posix\_log\_full\_status* member is only meaningful if the *log-full-policy* attribute is either POSIX\_TRACE\_UNTIL\_FULL or POSIX\_TRACE\_LOOP.

For an active trace stream without log, that is created by the *posix\_trace\_create()* function, the *posix\_log\_overnrun\_status* member shall be set to POSIX\_TRACE\_NO\_OVERRUN and the *posix\_log\_full\_status* member shall be set to POSIX\_TRACE\_NOT\_FULL.

## posix\_trace\_event\_info Structure

The trace event structure **posix\_trace\_event\_info** contains the information for one recorded trace event. This structure is returned by the set of functions *posix\_trace\_getnext\_event()*, *posix\_trace\_timedgetnext\_event()*, and *posix\_trace\_trygetnext\_event()*.

The **posix\_trace\_event\_info** structure defined in **<trace.h>** shall contain at least the following members:

Member Type	Member Name	Description
<b>trace_event_id_t</b>	<i>posix_event_id</i>	Trace event type identification.
<b>pid_t</b>	<i>posix_pid</i>	Process ID of the process that generated the trace event.
<b>void *</b>	<i>posix_prog_address</i>	Address at which the trace point was invoked.
<b>int</b>	<i>posix_truncation_status</i>	Status about the truncation of the data associated with this trace event.
<b>struct timespec</b>	<i>posix_timestamp</i>	Time at which the trace event was generated.

In addition, the **posix\_trace\_event\_info** structure defined in **<trace.h>** shall contain the following additional member:

Member Type	Member Name	Description
<b>pthread_t</b>	<i>posix_thread_id</i>	Thread ID of the thread that generated the trace event.

The *posix\_event\_id* member represents the identification of the trace event type and its value is not directly defined by the user. This identification is returned by a call to one of the following functions: *posix\_trace\_trid\_eventid\_open()*, *posix\_trace\_eventtypelist\_getnext\_id()*, or *posix\_trace\_eventid\_open()*. The name of the trace event type can be obtained by calling *posix\_trace\_eventid\_get\_name()*.

The *posix\_pid* is the process identifier of the traced process which generated the trace event. If the *posix\_event\_id* member is one of the implementation-defined system trace events and that trace event is not associated with any process, the *posix\_pid* member shall be set to zero.

For a user trace event, the *posix\_prog\_address* member is the process mapped address of the point at which the associated call to the *posix\_trace\_event()* function was made. For a system trace event, if the trace event is caused by a system service explicitly called by the application, the *posix\_prog\_address* member shall be the address of the process at the point where the call to that system service was made.

The *posix\_truncation\_status* member defines whether the data associated with a trace event has been truncated at the time the trace event was generated, or at the time the trace event was read from the trace stream, or (if the Trace Log option is supported) from the trace log (see the *event* argument from the *posix\_trace\_getnext\_event()* function). The *posix\_truncation\_status* member shall have one of the following values defined by manifest constants in the **<trace.h>** header:

**POSIX\_TRACE\_NOT\_TRUNCATED**

All the traced data is available.

**POSIX\_TRACE\_TRUNCATED\_RECORD**

Data was truncated at the time the trace event was generated.

**POSIX\_TRACE\_TRUNCATED\_READ**

Data was truncated at the time the trace event was read from a trace stream or a trace log because the reader's buffer was too small. This truncation status overrides the **POSIX\_TRACE\_TRUNCATED\_RECORD** status.

The *posix\_timestamp* member shall be the time at which the trace event was generated. The clock used is implementation-defined, but the resolution of this clock can be retrieved by a call to the *posix\_trace\_attr\_getclockres()* function.

The *posix\_thread\_id* member is the identifier of the thread that generated the trace event. If the *posix\_event\_id* member is one of the implementation-defined system trace events and that trace

event is not associated with any thread, the *posix\_thread\_id* member shall be set to zero.

#### 2.11.1.2 Trace Stream Attributes

Trace streams have attributes that compose the **posix\_trace\_attr\_t** trace stream attributes object. This object shall contain at least the following attributes:

- The *generation-version* attribute identifies the origin and version of the trace system.
- The *trace-name* attribute is a character string defined by the trace controller, and that identifies the trace stream.
- The *creation-time* attribute represents the time of the creation of the trace stream.
- The *clock-resolution* attribute defines the clock resolution of the clock used to generate timestamps.
- The *stream-min-size* attribute defines the minimum size in bytes of the trace stream strictly reserved for the trace events.
- The *stream-full-policy* attribute defines the policy followed when the trace stream is full; its value is `POSIX_TRACE_LOOP`, `POSIX_TRACE_UNTIL_FULL`, or `POSIX_TRACE_FLUSH`.
- The *max-data-size* attribute defines the maximum record size in bytes of a trace event.

In addition, if the Trace option and the Trace Inherit option are both supported, the **posix\_trace\_attr\_t** trace stream creation attributes object shall contain at least the following attributes:

- The *inheritance* attribute specifies whether a newly created trace stream will inherit tracing in its parent's process trace stream. It is either `POSIX_TRACE_INHERITED` or `POSIX_TRACE_CLOSE_FOR_CHILD`.

In addition, if the Trace option and the Trace Log option are both supported, the **posix\_trace\_attr\_t** trace stream creation attributes object shall contain at least the following attribute:

- If the file type corresponding to the trace log supports the `POSIX_TRACE_LOOP` or the `POSIX_TRACE_UNTIL_FULL` policies, the *log-max-size* attribute defines the maximum size in bytes of the trace log associated with an active trace stream. Other stream data—for example, trace attribute values—shall not be included in this size.
- The *log-full-policy* attribute defines the policy of a trace log associated with an active trace stream to be `POSIX_TRACE_LOOP`, `POSIX_TRACE_UNTIL_FULL`, or `POSIX_TRACE_APPEND`.

## 2.11.2 Trace Event Type Definitions

### 2.11.2.1 System Trace Event Type Definitions

The following system trace event types, defined in the **<trace.h>** header, track the invocation of the trace operations:

- `POSIX_TRACE_START` shall be associated with a trace start operation.

- POSIX\_TRACE\_STOP shall be associated with a trace stop operation.
- If the Trace Event Filter option is supported, POSIX\_TRACE\_FILTER shall be associated with a trace event type filter change operation.

The following system trace event types, defined in the **<trace.h>** header, report operational trace events:

- POSIX\_TRACE\_OVERFLOW shall mark the beginning of a trace overflow condition.
- POSIX\_TRACE\_RESUME shall mark the end of a trace overflow condition.
- If the Trace Log option is supported, POSIX\_TRACE\_FLUSH\_START shall mark the beginning of a flush operation.
- If the Trace Log option is supported, POSIX\_TRACE\_FLUSH\_STOP shall mark the end of a flush operation.
- If an implementation-defined trace error condition is reported, it shall be marked POSIX\_TRACE\_ERROR.

The interpretation of a trace stream or a trace log by a trace analyzer process relies on the information recorded for each trace event, and also on system trace events that indicate the invocation of trace control operations and trace system operational trace events.

The POSIX\_TRACE\_START and POSIX\_TRACE\_STOP trace events specify the time windows during which the trace stream is running.

- The POSIX\_TRACE\_STOP trace event with an associated data that is equal to zero indicates a call of the function *posix\_trace\_stop()*.
- The POSIX\_TRACE\_STOP trace event with an associated data that is different from zero indicates an automatic stop of the trace stream (see the definition of the *posix\_trace\_attr\_getstreamfullpolicy()* function in *posix\_trace\_attr\_getinherited()*).

The POSIX\_TRACE\_FILTER trace event indicates that a trace event type filter value changed while the trace stream was running.

The POSIX\_TRACE\_ERROR serves to inform the analyzer process that an implementation-defined internal error of the trace system occurred.

The POSIX\_TRACE\_OVERFLOW trace event shall be reported with a timestamp equal to the timestamp of the first trace event overwritten. This is an indication that some generated trace events have been lost.

The POSIX\_TRACE\_RESUME trace event shall be reported with a timestamp equal to the timestamp of the first valid trace event reported after the overflow condition ends and shall be reported before this first valid trace event. This is an indication that the trace system is reliably recording trace events after an overflow condition.

Each of these trace event types shall be defined by a constant trace event name and a **trace\_event\_id\_t** constant; trace event data is associated with some of these trace events.

If the Trace option is supported and the Trace Event Filter option and the Trace Log option are not supported, the following predefined system trace events in [Table 2-3](#) (on page 544) shall be defined:

19119

**Table 2-3** Trace Option: System Trace Events

19120

19121

19122

19123

19124

19125

19126

19127

19128

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error <b>int</b>
posix_trace_start	POSIX_TRACE_START	None.
posix_trace_stop	POSIX_TRACE_STOP	auto <b>int</b>
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.

19129

19130

19131

If the Trace option and the Trace Event Filter option are both supported, and if the Trace Log option is not supported, the following predefined system trace events in [Table 2-4](#) shall be defined:

19132

**Table 2-4** Trace and Trace Event Filter Options: System Trace Events

19133

19134

19135

19136

19137

19138

19141

19142

19143

19144

19145

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error <b>int</b>
posix_trace_start	POSIX_TRACE_START	event_filter <b>trace_event_set_t</b>
posix_trace_stop	POSIX_TRACE_STOP	auto <b>int</b>
posix_trace_filter	POSIX_TRACE_FILTER	old_event_filter new_event_filter <b>trace_event_set_t</b>
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.

19146

19147

19148

If the Trace option and the Trace Log option are both supported, and if the Trace Event Filter option is not supported, the following predefined system trace events in [Table 2-5](#) (on page 545) shall be defined:

**Table 2-5** Trace and Trace Log Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error <b>int</b>
posix_trace_start	POSIX_TRACE_START	None.
posix_trace_stop	POSIX_TRACE_STOP	auto <b>int</b>
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

If the Trace option, the Trace Event Filter option, and the Trace Log option are all supported, the following predefined system trace events in [Table 2-6](#) shall be defined:

**Table 2-6** Trace, Trace Log, and Trace Event Filter Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error <b>int</b>
posix_trace_start	POSIX_TRACE_START	event_filter <b>trace_event_set_t</b>
posix_trace_stop	POSIX_TRACE_STOP	auto <b>int</b>
posix_trace_filter	POSIX_TRACE_FILTER	old_event_filter new_event_filter <b>trace_event_set_t</b>
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

#### 2.11.2.2 User Trace Event Type Definitions

The user trace event POSIX\_TRACE\_UNNAMED\_USEREVENT is defined in the **<trace.h>** header. If the limit of per-process user trace event names represented by {TRACE\_USER\_EVENT\_MAX} has already been reached, this predefined user event shall be returned when the application tries to register more events than allowed. The data associated with this trace event is application-defined.

The following predefined user trace event in [Table 2-7](#) (on page 546) shall be defined:

19186

**Table 2-7** Trace Option: User Trace Event

19187

19188

Event Name	Constant
posix_trace_unnamed_userevent	POSIX_TRACE_UNNAMED_USEREVENT

19189

**2.11.3 Trace Functions**

19190

19191

19192

19193

19194

19195

The trace interface is built and structured to improve portability through use of trace data of opaque type. The object-oriented approach for the manipulation of trace attributes and trace event type identifiers requires definition of many constructor and selector functions which operate on these opaque types. Also, the trace interface must support several different tracing roles. To facilitate reading the trace interface, the trace functions are grouped into small functional sets supporting the three different roles:

19196

19197

- A trace controller process requires functions to set up and customize all the resources needed to run a trace stream, including:

19198

- Attribute initialization and destruction (*posix\_trace\_attr\_init()*)

19199

- Identification information manipulation (*posix\_trace\_attr\_getgenversion()*)

19200

- Trace system behavior modification (*posix\_trace\_attr\_getinherited()*)

19201

- Trace stream and trace log size set (*posix\_trace\_attr\_getmaxusereventsize()*)

19202

- Trace stream creation, flush, and shutdown (*posix\_trace\_create()*)

19203

- Trace stream and trace log clear (*posix\_trace\_clear()*)

19204

- Trace event type identifier manipulation (*posix\_trace\_trid\_eventid\_open()*)

19205

- Trace event type identifier list exploration (*posix\_trace\_eventtypelist\_getnext\_id()*)

19206

- Trace event type set manipulation (*posix\_trace\_eventset\_empty()*)

19207

- Trace event type filter set (*posix\_trace\_set\_filter()*)

19208

- Trace stream start and stop (*posix\_trace\_start()*)

19209

- Trace stream information and status read (*posix\_trace\_get\_attr()*)

19210

- A traced process requires functions to instrument trace points:

19211

- Trace event type identifiers definition and trace points insertion (*posix\_trace\_event()*)

19212

19213

- A trace analyzer process requires functions to retrieve information from a trace stream and trace log:

19214

- Identification information read (*posix\_trace\_attr\_getgenversion()*)

19215

- Trace system behavior information read (*posix\_trace\_attr\_getinherited()*)

19216

- Trace stream and trace log size get (*posix\_trace\_attr\_getmaxusereventsize()*)

19217

- Trace event type identifier manipulation (*posix\_trace\_trid\_eventid\_open()*)

19218

- Trace event type identifier list exploration (*posix\_trace\_eventtypelist\_getnext\_id()*)

19219

- Trace log open, rewind, and close (*posix\_trace\_open()*)

- 19220 — Trace stream information and status read (*posix\_trace\_get\_attr()*)
- 19221 — Trace event read (*posix\_trace\_getnext\_event()*)

## 19222 2.12 Data Types

### 19223 2.12.1 Defined Types

19224 All of the data types used by various functions are defined by the implementation. The  
 19225 following table describes some of these types. Other types referenced in the description of a  
 19226 function, not mentioned here, can be found in the appropriate header for that function.

19227	Defined Type	Description
19228	<b>cc_t</b>	Type used for terminal special characters.
19229	<b>clock_t</b>	Integer or real-floating type used for processor times, as defined in the ISO C standard.
19230		
19231	<b>clockid_t</b>	Used for clock ID type in some timer functions.
19232	<b>dev_t</b>	Integer type used for device numbers.
19233	<b>DIR</b>	Type representing a directory stream.
19234	<b>div_t</b>	Structure type returned by the <i>div()</i> function.
19235	<b>FILE</b>	Structure containing information about a file.
19236	<b>glob_t</b>	Structure type used in pathname pattern matching.
19237	<b>fpos_t</b>	Type containing all information needed to specify uniquely every position within a file.
19238		
19239	<b>gid_t</b>	Integer type used for group IDs.
19240	<b>iconv_t</b>	Type used for conversion descriptors.
19241	<b>id_t</b>	Integer type used as a general identifier; can be used to contain at least the largest of a <b>pid_t</b> , <b>uid_t</b> , or <b>gid_t</b> .
19242		
19243	<b>ino_t</b>	Unsigned integer type used for file serial numbers.
19244	<b>key_t</b>	Arithmetic type used for XSI interprocess communication.
19245	<b>ldiv_t</b>	Structure type returned by the <i>ldiv()</i> function.
19246	<b>mode_t</b>	Integer type used for file attributes.
19247	<b>mqd_t</b>	Used for message queue descriptors.
19248	<b>nfds_t</b>	Integer type used for the number of file descriptors.
19249	<b>nlink_t</b>	Integer type used for link counts.
19250	<b>off_t</b>	Signed integer type used for file sizes.
19251	<b>pid_t</b>	Signed integer type used for process and process group IDs.
19252	<b>pthread_attr_t</b>	Used to identify a thread attribute object.
19253	<b>pthread_cond_t</b>	Used for condition variables.
19254	<b>pthread_condattr_t</b>	Used to identify a condition attribute object.
19255	<b>pthread_key_t</b>	Used for thread-specific data keys.
19256	<b>pthread_mutex_t</b>	Used for mutexes.
19257	<b>pthread_mutexattr_t</b>	Used to identify a mutex attribute object.
19258	<b>pthread_once_t</b>	Used for dynamic package initialization.
19259	<b>pthread_rwlock_t</b>	Used for read-write locks.
19260	<b>pthread_rwlockattr_t</b>	Used for read-write lock attributes.
19261	<b>pthread_t</b>	Used to identify a thread.

Defined Type	Description
<b>ptrdiff_t</b>	Signed integer type of the result of subtracting two pointers.
<b>regex_t</b>	Structure type used in regular expression matching.
<b>regmatch_t</b>	Structure type used in regular expression matching.
<b>rlim_t</b>	Unsigned integer type used for limit values, to which objects of type <b>int</b> and <b>off_t</b> can be cast without loss of value.
<b>sem_t</b>	Type used in performing semaphore operations.
<b>sig_atomic_t</b>	Possibly volatile-qualified integer type of an object that can be accessed as an atomic entity, even in the presence of asynchronous interrupts.
<b>sigset_t</b>	Integer or structure type of an object used to represent sets of signals.
<b>size_t</b>	Unsigned integer type used for size of objects.
<b>speed_t</b>	Type used for terminal baud rates.
<b>ssize_t</b>	Signed integer type used for a count of bytes or an error indication.
<b>suseconds_t</b>	Signed integer type used for time in microseconds.
<b>tcflag_t</b>	Type used for terminal modes.
<b>time_t</b>	Integer type used for time in seconds, as defined in the ISO C standard.
<b>timer_t</b>	Used for timer ID returned by the <i>timer_create()</i> function.
<b>uid_t</b>	Integer type used for user IDs.
<b>va_list</b>	Type used for traversing variable argument lists.
<b>wchar_t</b>	Integer type whose range of values can represent distinct codes for all members of the largest extended character set specified by the supported locales.
<b>wctype_t</b>	Scalar type which represents a character class descriptor.
<b>wint_t</b>	Integer type capable of storing any valid value of <b>wchar_t</b> or WEOF.
<b>wordexp_t</b>	Structure type used in word expansion.

## 2.12.2 The char Type

The type **char** is defined as a single byte; see XBD [Chapter 3](#) (on page 33) (Byte and Character).

## 2.13 Status Information

Status information is data associated with a process detailing a change in the state of the process. It shall consist of:

- The state the process transitioned into (*stopped*, *continued*, or *terminated*)
  - The information necessary to populate the **siginfo\_t** structure provided by *waitid()*
  - If the new state is *terminated*:
    - The low-order 8 bits of the status argument that the process passed to *\_Exit()*, *\_exit()*, or *exit()*, or the low-order 8 bits of the value the process returned from *main()*
- Note that these 8 bits are part of the complete value that is used to set the *si\_status* member of the **siginfo\_t** structure provided by *waitid()*

19304	— Whether the process terminated due to the receipt of a signal that was not caught	+
19305	and, if so, the number of the signal that caused the termination of the process	+
19306	• If the new state is <i>stopped</i> :	+
19307	— The number of the signal that caused the process to stop	+
19308	A process might not have any status information (such as immediately after a process has	+
19309	started).	+
19310	Status information for a process shall be generated (made available to the parent process) when	+
19311	the process stops, continues, or terminates except in the following case:	+
19312	• If the parent process sets the action for the SIGCHLD signal to SIG_IGN, or if the parent	+
19313	sets the SA_NOCLDWAIT flag for the SIGCHLD signal action, process termination shall	+
19314	not generate new status information but shall cause any existing status information for the	+
19315	process to be discarded.	+
19316	If new status information is generated, and the process already had status information, the	+
19317	existing status information shall be discarded and replaced with the new status information.	+
19318	Only the process' parent process can obtain the process' status information. The parent obtains a	+
19319	child's status information by calling <i>wait()</i> , <i>waitid()</i> , or <i>waitpid()</i> . Except when <i>waitid()</i> is called	+
19320	with the WNOWAIT flag set in the <i>options</i> argument, the status information obtained by a <i>wait()</i>	+
19321	function shall be consumed (discarded) by that <i>wait()</i> function; no two calls to <i>wait()</i> , <i>waitid()</i>	+
19322	(without WNOWAIT), or <i>waitpid()</i> shall obtain the same status information.	+
19323	When status information becomes available to the parent process and more than one thread in	+
19324	the parent process is waiting for the status information (blocked in a call to <i>wait()</i> , <i>waitid()</i> , or	+
19325	<i>waitpid()</i> with arguments that would match the status information):	+
19326	• If none of the matching threads is in a call to <i>waitid()</i> with the WNOWAIT flag set in the	+
19327	<i>options</i> argument, the thread that obtains the status information is unspecified.	+
19328	• Otherwise (at least one of the matching threads is in a call to <i>waitid()</i> with the WNOWAIT	+
19329	flag set), the matching thread or threads that obtain the status information is unspecified	+
19330	except that at least one of the matching threads shall obtain the status information and at	+
19331	most one of the matching threads that are not calling <i>waitid()</i> with the WNOWAIT flag set	+
19332	shall obtain it.	+

## 19333 2.14 File Descriptor Allocation +

19334	All functions that open one or more file descriptors shall, unless specified otherwise, atomically	+
19335	allocate the lowest numbered available (that is, not already open in the calling process) file	+
19336	descriptor at the time of each allocation. Where a single function allocates two file descriptors	+
19337	(for example, <i>pipe()</i> or <i>socketpair()</i> ), the allocations may be independent and therefore	+
19338	applications should not expect them to have adjacent values or depend on which has the higher	+
19339	value.	+

*Chapter 3*

19342

# *System Interfaces*

19343

This chapter describes the functions, macros, and external variables to support applications portability at the C-language source level.

19344

19345 **NAME**

19346 FD\_CLR — macros for synchronous I/O multiplexing

19347 **SYNOPSIS**

```
19348     #include <sys/select.h>
19349     void FD_CLR(int fd, fd_set *fdset);
19350     int FD_ISSET(int fd, fd_set *fdset);
19351     void FD_SET(int fd, fd_set *fdset);
19352     void FD_ZERO(fd_set *fdset);
```

19353 **DESCRIPTION**19354 Refer to *pselect()*.

19355 **NAME**19356        `_Exit`, `_exit` — terminate a process19357 **SYNOPSIS**19358        `#include <stdlib.h>`19359        `void _Exit(int status);`19360        `#include <unistd.h>`19361        `void _exit(int status);`19362 **DESCRIPTION**

19363 CX       For `_Exit()`: The functionality described on this reference page is aligned with the ISO C  
 19364 standard. Any conflict between the requirements described here and the ISO C standard is  
 19365 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

19366 CX       The value of *status* may be 0, `EXIT_SUCCESS`, `EXIT_FAILURE`, or any other value, though only  
 19367 the least significant 8 bits (that is, *status* & 0377) shall be available to a waiting parent process.

19368 CX       The `_Exit()` and `_exit()` functions shall be functionally equivalent.

19369 CX       The `_Exit()` and `_exit()` functions shall not call functions registered with `atexit()` nor any  
 19370 CX registered signal handlers. Open streams shall not be flushed. Whether open streams are  
 19371 closed (without flushing) is implementation-defined. Finally, the calling process shall be  
 19372 terminated with the consequences described below.

19373 **Consequences of Process Termination**

19374 CX       Process termination caused by any reason shall have the following consequences:

19375 **Note:**       These consequences are all extensions to the ISO C standard and are not further CX shaded.  
 19376               However, functionality relating to the XSI option is shaded.

- 19377 • All of the file descriptors, directory streams, conversion descriptors, and message catalog  
 19378 descriptors open in the calling process shall be closed.

- 19379 XSI • If the parent process of the calling process is executing a `wait()`, `waitid()`, or `waitpid()`, and  
 19380 has neither set its `SA_NOCLDWAIT` flag nor set `SIGCHLD` to `SIG_IGN`, it shall be notified  
 19381 of termination of the calling process and the low-order eight bits (that is, bits 0377) of *status*  
 19382 shall be made available to it. If the parent is not waiting, the child's status shall be made  
 19383 available to it when the parent subsequently executes `wait()`, `waitid()`, or `waitpid()`.

19384       The semantics of the `waitid()` function shall be equivalent to `wait()`.

- 19385 XSI • If the parent process of the calling process is not executing a `wait()`, `waitid()`, or `waitpid()`,  
 19386 and has neither set its `SA_NOCLDWAIT` flag nor set `SIGCHLD` to `SIG_IGN`, the calling  
 19387 process shall be transformed into a *zombie process*. A *zombie process* is an inactive process  
 19388 and it shall be deleted at some later time when its parent process executes `wait()`, `waitid()`,  
 19389 or `waitpid()`.

19390 XSI       The semantics of the `waitid()` function shall be equivalent to `wait()`.

- 19391 • Termination of a process does not directly terminate its children. The sending of a `SIGHUP`  
 19392 signal as described below indirectly terminates children in some circumstances.

- 19393 • Either:

19394       If the implementation supports the `SIGCHLD` signal, a `SIGCHLD` shall be sent to the  
 19395 parent process.

19396       Or:

- 19397 XSI If the parent process has set its SA\_NOCLDWAIT flag, or set SIGCHLD to SIG\_IGN, the  
19398 status shall be discarded, and the lifetime of the calling process shall end immediately. If  
19399 SA\_NOCLDWAIT is set, it is implementation-defined whether a SIGCHLD signal is sent to  
19400 the parent process.
- 19401 • The parent process ID of all of the existing child processes and zombie processes of the  
19402 calling process shall be set to the process ID of an implementation-defined system process.  
19403 That is, these processes shall be inherited by a special system process.
- 19404 XSI • Each attached shared-memory segment is detached and the value of *shm\_nattch* (see  
19405 *shmget()*) in the data structure associated with its shared memory ID shall be decremented  
19406 by 1.
- 19407 XSI • For each semaphore for which the calling process has set a *semadj* value (see *semop()*), that  
19408 value shall be added to the *semval* of the specified semaphore.
- 19409 • If the process is a controlling process, the SIGHUP signal shall be sent to each process in  
19410 the foreground process group of the controlling terminal belonging to the calling process.
- 19411 • If the process is a controlling process, the controlling terminal associated with the session  
19412 shall be disassociated from the session, allowing it to be acquired by a new controlling  
19413 process.
- 19414 • If the exit of the process causes a process group to become orphaned, and if any member of  
19415 the newly-orphaned process group is stopped, then a SIGHUP signal followed by a  
19416 SIGCONT signal shall be sent to each process in the newly-orphaned process group.
- 19417 • All open named semaphores in the calling process shall be closed as if by appropriate calls  
19418 to *sem\_close()*.
- 19419 ML • Any memory locks established by the process via calls to *mlockall()* or *mlock()* shall be  
19420 removed. If locked pages in the address space of the calling process are also mapped into  
19421 the address spaces of other processes and are locked by those processes, the locks  
19422 established by the other processes shall be unaffected by the call by this process to *\_Exit()*  
19423 or *\_exit()*.
- 19424 • Memory mappings that were created in the process shall be unmapped before the process  
19425 is destroyed.
- 19426 TYM • Any blocks of typed memory that were mapped in the calling process shall be unmapped,  
19427 as if *munmap()* was implicitly called to unmap them.
- 19428 MSG • All open message queue descriptors in the calling process shall be closed as if by  
19429 appropriate calls to *mq\_close()*.
- 19430 • Any outstanding cancelable asynchronous I/O operations may be canceled. Those  
19431 asynchronous I/O operations that are not canceled shall complete as if the *\_Exit()* or  
19432 *\_exit()* operation had not yet occurred, but any associated signal notifications shall be  
19433 suppressed. The *\_Exit()* or *\_exit()* operation may block awaiting such I/O completion.  
19434 Whether any I/O is canceled, and which I/O may be canceled upon *\_Exit()* or *\_exit()*, is  
19435 implementation-defined.
- 19436 • Threads terminated by a call to *\_Exit()* or *\_exit()* shall not invoke their cancellation  
19437 cleanup handlers or per-thread data destructors.
- 19438 OB TRC • If the calling process is a trace controller process, any trace streams that were created by  
19439 the calling process shall be shut down as described by the *posix\_trace\_shutdown()* function,  
19440 and mapping of trace event names to trace event type identifiers of any process built for  
19441 these trace streams may be deallocated.

**RETURN VALUE**

These functions do not return.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

Normally applications should use *exit()* rather than *\_Exit()* or *\_exit()*.

**RATIONALE****Process Termination**

Early proposals drew a distinction between normal and abnormal process termination. Abnormal termination was caused only by certain signals and resulted in implementation-defined “actions”, as discussed below. Subsequent proposals distinguished three types of termination: *normal termination* (as in the current specification), *simple abnormal termination*, and *abnormal termination with actions*. Again the distinction between the two types of abnormal termination was that they were caused by different signals and that implementation-defined actions would result in the latter case. Given that these actions were completely implementation-defined, the early proposals were only saying when the actions could occur and how their occurrence could be detected, but not what they were. This was of little or no use to conforming applications, and thus the distinction is not made in this volume of POSIX.1-2008.

The implementation-defined actions usually include, in most historical implementations, the creation of a file named **core** in the current working directory of the process. This file contains an image of the memory of the process, together with descriptive information about the process, perhaps sufficient to reconstruct the state of the process at the receipt of the signal.

There is a potential security problem in creating a **core** file if the process was set-user-ID and the current user is not the owner of the program, if the process was set-group-ID and none of the user’s groups match the group of the program, or if the user does not have permission to write in the current directory. In this situation, an implementation either should not create a **core** file or should make it unreadable by the user.

Despite the silence of this volume of POSIX.1-2008 on this feature, applications are advised not to create files named **core** because of potential conflicts in many implementations. Some implementations use a name other than **core** for the file; for example, by appending the process ID to the filename.

**Terminating a Process**

It is important that the consequences of process termination as described occur regardless of whether the process called *\_exit()* (perhaps indirectly through *exit()*) or instead was terminated due to a signal or for some other reason. Note that in the specific case of *exit()* this means that the *status* argument to *exit()* is treated in the same way as the *status* argument to *\_exit()*.

A language other than C may have other termination primitives than the C-language *exit()* function, and programs written in such a language should use its native termination primitives, but those should have as part of their function the behavior of *\_exit()* as described. Implementations in languages other than C are outside the scope of this version of this volume of POSIX.1-2008, however.

As required by the ISO C standard, using **return** from *main()* has the same behavior (other than

with respect to language scope issues) as calling *exit()* with the returned value. Reaching the end of the *main()* function has the same behavior as calling *exit(0)*.

A value of zero (or *EXIT\_SUCCESS*, which is required to be zero) for the argument *status* conventionally indicates successful termination. This corresponds to the specification for *exit()* in the ISO C standard. The convention is followed by utilities such as *make* and various shells, which interpret a zero status from a child process as success. For this reason, applications should not call *exit(0)* or *\_exit(0)* when they terminate unsuccessfully; for example, in signal-catching functions.

Historically, the implementation-defined process that inherits children whose parents have terminated without waiting on them is called *init* and has a process ID of 1.

The sending of a *SIGHUP* to the foreground process group when a controlling process terminates corresponds to somewhat different historical implementations. In System V, the kernel sends a *SIGHUP* on termination of (essentially) a controlling process. In 4.2 BSD, the kernel does not send *SIGHUP* in a case like this, but the termination of a controlling process is usually noticed by a system daemon, which arranges to send a *SIGHUP* to the foreground process group with the *vhangup()* function. However, in 4.2 BSD, due to the behavior of the shells that support job control, the controlling process is usually a shell with no other processes in its process group. Thus, a change to make *\_exit()* behave this way in such systems should not cause problems with existing applications.

The termination of a process may cause a process group to become orphaned in either of two ways. The connection of a process group to its parent(s) outside of the group depends on both the parents and their children. Thus, a process group may be orphaned by the termination of the last connecting parent process outside of the group or by the termination of the last direct descendant of the parent process(es). In either case, if the termination of a process causes a process group to become orphaned, processes within the group are disconnected from their job control shell, which no longer has any information on the existence of the process group. Stopped processes within the group would languish forever. In order to avoid this problem, newly orphaned process groups that contain stopped processes are sent a *SIGHUP* signal and a *SIGCONT* signal to indicate that they have been disconnected from their session. The *SIGHUP* signal causes the process group members to terminate unless they are catching or ignoring *SIGHUP*. Under most circumstances, all of the members of the process group are stopped if any of them are stopped.

The action of sending a *SIGHUP* and a *SIGCONT* signal to members of a newly orphaned process group is similar to the action of 4.2 BSD, which sends *SIGHUP* and *SIGCONT* to each stopped child of an exiting process. If such children exit in response to the *SIGHUP*, any additional descendants receive similar treatment at that time. In this volume of POSIX.1-2008, the signals are sent to the entire process group at the same time. Also, in this volume of POSIX.1-2008, but not in 4.2 BSD, stopped processes may be orphaned, but may be members of a process group that is not orphaned; therefore, the action taken at *\_exit()* must consider processes other than child processes.

It is possible for a process group to be orphaned by a call to *setpgid()* or *setsid()*, as well as by process termination. This volume of POSIX.1-2008 does not require sending *SIGHUP* and *SIGCONT* in those cases, because, unlike process termination, those cases are not caused accidentally by applications that are unaware of job control. An implementation can choose to send *SIGHUP* and *SIGCONT* in those cases as an extension; such an extension must be documented as required in **<signal.h>**.

The ISO/IEC 9899:1999 standard adds the *\_Exit()* function that results in immediate program termination without triggering signals or *atexit()*-registered functions. In POSIX.1-2008, this is

19534 equivalent to the `_exit()` function.

#### 19535 FUTURE DIRECTIONS

19536 None.

#### 19537 SEE ALSO

19538 *atexit()*, *exit()*, *mlock()*, *mlockall()*, *mq\_close()*, *munmap()*, *posix\_trace\_create()*, *sem\_close()*,  
19539 *semop()*, *setpgid()*, *setsid()*, *shmget()*, *wait()*, *waitid()*

19540 XBD `<stdlib.h>`, `<unistd.h>`

#### 19541 CHANGE HISTORY

19542 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 19543 Issue 5

19544 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
19545 Threads Extension.

19546 Interactions with the SA\_NOCLDWAIT flag and SIGCHLD signal are further clarified.

19547 The values of *status* from *exit()* are better described.

#### 19548 Issue 6

19549 Extensions beyond the ISO C standard are marked.

19550 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics  
19551 for typed memory.

19552 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 19553 • The `_Exit()` function is included.
- 19554 • The DESCRIPTION is updated.

19555 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

19556 References to the *wait3()* function are removed.

19557 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/16 is applied, correcting grammar in the  
19558 DESCRIPTION.

#### 19559 Issue 7

19560 Austin Group Interpretation 1003.1-2001 #031 is applied, separating these functions from the  
19561 *exit()* function.

19562 Austin Group Interpretation 1003.1-2001 #085 is applied, clarifying the text regarding flushing of  
19563 streams and closing of temporary files.

19564 Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, and  
19565 Semaphores options is moved to the Base.

19566 **NAME**

19567        \_longjmp, \_setjmp — non-local goto

19568 **SYNOPSIS**

```
19569 OB XSI  #include <setjmp.h>
19570          void _longjmp(jmp_buf env, int val);
19571          int _setjmp(jmp_buf env);
```

19572 **DESCRIPTION**

19573        The *\_longjmp()* and *\_setjmp()* functions shall be equivalent to *longjmp()* and *setjmp()*,  
19574        respectively, with the additional restriction that *\_longjmp()* and *\_setjmp()* shall not manipulate  
19575        the signal mask.

19576        If *\_longjmp()* is called even though *env* was never initialized by a call to *\_setjmp()*, or when the  
19577        last such call was in a function that has since returned, the results are undefined.

19578 **RETURN VALUE**19579        Refer to *longjmp()* and *setjmp()*.19580 **ERRORS**

19581        No errors are defined.

19582 **EXAMPLES**

19583        None.

19584 **APPLICATION USAGE**

19585        If *\_longjmp()* is executed and the environment in which *\_setjmp()* was executed no longer exists,  
19586        errors can occur. The conditions under which the environment of the *\_setjmp()* no longer exists  
19587        include exiting the function that contains the *\_setjmp()* call, and exiting an inner block with  
19588        temporary storage. This condition might not be detectable, in which case the *\_longjmp()* occurs  
19589        and, if the environment no longer exists, the contents of the temporary storage of an inner block  
19590        are unpredictable. This condition might also cause unexpected process termination. If the  
19591        function has returned, the results are undefined.

19592        Passing *longjmp()* a pointer to a buffer not created by *setjmp()*, passing *\_longjmp()* a pointer to a  
19593        buffer not created by *\_setjmp()*, passing *siglongjmp()* a pointer to a buffer not created by  
19594        *sigsetjmp()*, or passing any of these three functions a buffer that has been modified by the user  
19595        can cause all the problems listed above, and more.

19596        The *\_longjmp()* and *\_setjmp()* functions are included to support programs written to historical  
19597        system interfaces. New applications should use *siglongjmp()* and *sigsetjmp()* respectively.

19598 **RATIONALE**

19599        None.

19600 **FUTURE DIRECTIONS**19601        The *\_longjmp()* and *\_setjmp()* functions may be removed in a future version.19602 **SEE ALSO**19603        *longjmp()*, *setjmp()*, *siglongjmp()*, *sigsetjmp()*19604        XBD *<setjmp.h>*19605 **CHANGE HISTORY**

19606        First released in Issue 4, Version 2.

19607 **Issue 5**

19608 Moved from X/OPEN UNIX extension to BASE.

19609 **Issue 7**19610 The *\_longjmp()* and *\_setjmp()* functions are marked obsolescent.

**19611 NAME**

19612        \_toupper — transliterate uppercase characters to lowercase

**19613 SYNOPSIS**

```
19614 OB XSI #include <ctype.h>  
19615 int _tolower(int c);
```

**19616 DESCRIPTION**

19617        The *\_tolower()* macro shall be equivalent to *tolower(c)* except that the application shall ensure  
19618        that the argument *c* is an uppercase letter.

**19619 RETURN VALUE**

19620        Upon successful completion, *\_tolower()* shall return the lowercase letter corresponding to the  
19621        argument passed.

**19622 ERRORS**

19623        No errors are defined.

**19624 EXAMPLES**

19625        None.

**19626 APPLICATION USAGE**

19627        Applications should use the *tolower()* function instead of the obsolescent *\_tolower()* function.

**19628 RATIONALE**

19629        None.

**19630 FUTURE DIRECTIONS**

19631        The *\_tolower()* function may be removed in a future version.

**19632 SEE ALSO**

19633        *tolower()*, *isupper()*

19634        XBD Chapter 7 (on page 135), *<ctype.h>*

**19635 CHANGE HISTORY**

19636        First released in Issue 1. Derived from Issue 1 of the SVID.

**19637 Issue 6**

19638        The normative text is updated to avoid use of the term “must” for application requirements.

**19639 Issue 7**

19640        The *\_tolower()* function is marked obsolescent.

**19641 NAME**

19642        \_toupper — transliterate lowercase characters to uppercase

**19643 SYNOPSIS**

```
19644 OB XSI  #include <ctype.h>
19645          int _toupper(int c);
```

**19646 DESCRIPTION**

19647        The *\_toupper()* macro shall be equivalent to *toupper()* except that the application shall ensure  
19648        that the argument *c* is a lowercase letter.

**19649 RETURN VALUE**

19650        Upon successful completion, *\_toupper()* shall return the uppercase letter corresponding to the  
19651        argument passed.

**19652 ERRORS**

19653        No errors are defined.

**19654 EXAMPLES**

19655        None.

**19656 APPLICATION USAGE**

19657        Applications should use the *toupper()* function instead of the obsolescent *\_toupper()* function.

**19658 RATIONALE**

19659        None.

**19660 FUTURE DIRECTIONS**

19661        The *\_toupper()* function may be removed in a future version.

**19662 SEE ALSO**

19663        *islower()*, *toupper()*

19664        XBD Chapter 7 (on page 135), *<ctype.h>*

**19665 CHANGE HISTORY**

19666        First released in Issue 1. Derived from Issue 1 of the SVID.

**19667 Issue 6**

19668        The normative text is updated to avoid use of the term “must” for application requirements.

**19669 Issue 7**

19670        The *\_toupper()* function is marked obsolescent.

19671 **NAME**

19672 a64l, l64a — convert between a 32-bit integer and a radix-64 ASCII string

19673 **SYNOPSIS**

```
19674 XSI      #include <stdlib.h>
19675          long a64l(const char *s);
19676          char *l64a(long value);
```

19677 **DESCRIPTION**

19678 These functions maintain numbers stored in radix-64 ASCII characters. This is a notation by  
 19679 which 32-bit integers can be represented by up to six characters; each character represents a digit  
 19680 in radix-64 notation. If the type **long** contains more than 32 bits, only the low-order 32 bits shall  
 19681 be used for these operations.

19682 The characters used to represent digits are ' .' (dot) for 0, ' / ' for 1, ' 0 ' through ' 9 ' for [2,11],  
 19683 ' A ' through ' Z ' for [12,37], and ' a ' through ' z ' for [38,63].

19684 The *a64l()* function shall take a pointer to a radix-64 representation, in which the first digit is the  
 19685 least significant, and return the corresponding **long** value. If the string pointed to by *s* contains  
 19686 more than six characters, *a64l()* shall use the first six. If the first six characters of the string  
 19687 contain a null terminator, *a64l()* shall use only characters preceding the null terminator. The  
 19688 *a64l()* function shall scan the character string from left to right with the least significant digit on  
 19689 the left, decoding each character as a 6-bit radix-64 number. If the type **long** contains more than  
 19690 32 bits, the resulting value is sign-extended. The behavior of *a64l()* is unspecified if *s* is a null  
 19691 pointer or the string pointed to by *s* was not generated by a previous call to *l64a()*.

19692 The *l64a()* function shall take a **long** argument and return a pointer to the corresponding  
 19693 radix-64 representation. The behavior of *l64a()* is unspecified if *value* is negative.

19694 The value returned by *l64a()* may be a pointer into a static buffer. Subsequent calls to *l64a()* may  
 19695 overwrite the buffer.

19696 The *l64a()* function need not be thread-safe.

19697 **RETURN VALUE**

19698 Upon successful completion, *a64l()* shall return the **long** value resulting from conversion of the  
 19699 input string. If a string pointed to by *s* is an empty string, *a64l()* shall return 0L.

19700 The *l64a()* function shall return a pointer to the radix-64 representation. If *value* is 0L, *l64a()* shall  
 19701 return a pointer to an empty string.

19702 **ERRORS**

19703 No errors are defined.

19704 **EXAMPLES**

19705 None.

19706 **APPLICATION USAGE**

19707 If the type **long** contains more than 32 bits, the result of *a64l(l64a(x))* is *x* in the low-order 32 bits.

19708 **RATIONALE**

19709 This is not the same encoding as used by either encoding variant of the *uuencode* utility.

19710 **FUTURE DIRECTIONS**

19711 None.

19712 **SEE ALSO**19713 *strtoul()*

19714 XBD &lt;stdlib.h&gt;

19715 XCU *uuencode*19716 **CHANGE HISTORY**

19717 First released in Issue 4, Version 2.

19718 **Issue 5**

19719 Moved from X/OPEN UNIX extension to BASE.

19720 Normative text previously in the APPLICATION USAGE section is moved to the  
19721 DESCRIPTION.19722 A note indicating that the *l64a()* function need not be reentrant is added to the DESCRIPTION.19723 **Issue 7**

19724 Austin Group Interpretation 1003.1-2001 #156 is applied.

19725 **NAME**

19726 abort — generate an abnormal process abort

19727 **SYNOPSIS**

19728 #include &lt;stdlib.h&gt;

19729 void abort(void);

19730 **DESCRIPTION**

19731 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
19732 conflict between the requirements described here and the ISO C standard is unintentional. This  
19733 volume of POSIX.1-2008 defers to the ISO C standard.

19734 The *abort()* function shall cause abnormal process termination to occur, unless the signal  
19735 SIGABRT is being caught and the signal handler does not return.

19736 CX The abnormal termination processing shall include the default actions defined for SIGABRT and  
19737 may include an attempt to effect *fclose()* on all open streams.

19738 The SIGABRT signal shall be sent to the calling process as if by means of *raise()* with the  
19739 argument SIGABRT.

19740 CX The status made available to *wait()*, *waitid()*, or *waitpid()* by *abort()* shall be that of a process  
19741 terminated by the SIGABRT signal. The *abort()* function shall override blocking or ignoring the  
19742 SIGABRT signal.

19743 **RETURN VALUE**19744 The *abort()* function shall not return.19745 **ERRORS**

19746 No errors are defined.

19747 **EXAMPLES**

19748 None.

19749 **APPLICATION USAGE**

19750 Catching the signal is intended to provide the application developer with a portable means to  
19751 abort processing, free from possible interference from any implementation-supplied functions.

19752 **RATIONALE**

19753 The ISO/IEC 9899:1999 standard requires the *abort()* function to be async-signal-safe. Since  
19754 POSIX.1-2008 defers to the ISO C standard, this required a change to the DESCRIPTION from  
19755 “shall include the effect of *fclose()*” to “may include an attempt to effect *fclose()*.”

19756 The revised wording permits some backwards-compatibility and avoids a potential deadlock  
19757 situation.

19758 The Open Group Base Resolution bwg2002-003 is applied, removing the following XSI shaded  
19759 paragraph from the DESCRIPTION:

19760 “On XSI-conformant systems, in addition the abnormal termination processing shall include the  
19761 effect of *fclose()* on message catalog descriptors.”

19762 There were several reasons to remove this paragraph:

- 19763 • No special processing of open message catalogs needs to be performed prior to abnormal  
19764 process termination.
- 19765 • The main reason to specifically mention that *abort()* includes the effect of *fclose()* on open  
19766 streams is to flush output queued on the stream. Message catalogs in this context are read-  
19767 only and, therefore, do not need to be flushed.

- The effect of *fclose()* on a message catalog descriptor is unspecified. Message catalog descriptors are allowed, but not required to be implemented using a file descriptor, but there is no mention in POSIX.1-2008 of a message catalog descriptor using a standard I/O stream FILE object as would be expected by *fclose()*.

#### 19772 FUTURE DIRECTIONS

19773 None.

#### 19777 CHANGE HISTORY

19778 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 19779 Issue 6

19780 Extensions beyond the ISO C standard are marked.

19781 Changes are made to the DESCRIPTION for alignment with the ISO/IEC 9899:1999 standard.

19782 The Open Group Base Resolution bwg2002-003 is applied.

19783 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/10 is applied, changing the  
19784 DESCRIPTION of abnormal termination processing and adding to the RATIONALE section.

19785 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/9 is applied, changing “implementation-  
19786 defined functions” to “implementation-supplied functions” in the APPLICATION USAGE  
19787 section.

19788 **NAME**

19789       abs — return an integer absolute value

19790 **SYNOPSIS**

19791       #include &lt;stdlib.h&gt;

19792       int abs(int i);

19793 **DESCRIPTION**

19794 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
19795       conflict between the requirements described here and the ISO C standard is unintentional. This  
19796       volume of POSIX.1-2008 defers to the ISO C standard.

19797       The *abs()* function shall compute the absolute value of its integer operand, *i*. If the result cannot  
19798       be represented, the behavior is undefined.

19799 **RETURN VALUE**19800       The *abs()* function shall return the absolute value of its integer operand.19801 **ERRORS**

19802       No errors are defined.

19803 **EXAMPLES**

19804       None.

19805 **APPLICATION USAGE**

19806       In two's-complement representation, the absolute value of the negative integer with largest  
19807       magnitude {INT\_MIN} might not be representable.

19808 **RATIONALE**

19809       None.

19810 **FUTURE DIRECTIONS**

19811       None.

19812 **SEE ALSO**19813       *fabs()*, *labs()*

19814       XBD &lt;stdlib.h&gt;

19815 **CHANGE HISTORY**

19816       First released in Issue 1. Derived from Issue 1 of the SVID.

19817 **Issue 6**

19818       Extensions beyond the ISO C standard are marked.

**NAME**

accept — accept a new connection on a socket

**SYNOPSIS**

```
#include <sys/socket.h>

int accept(int socket, struct sockaddr *restrict address,
           socklen_t *restrict address_len);
```

**DESCRIPTION**

The *accept()* function shall extract the first connection on the queue of pending connections, create a new socket with the same socket type protocol and address family as the specified socket, and allocate a new file descriptor for that socket. The file descriptor shall be allocated as described in [Section 2.14](#) (on page 549).

The *accept()* function takes the following arguments:

<i>socket</i>	Specifies a socket that was created with <i>socket()</i> , has been bound to an address with <i>bind()</i> , and has issued a successful call to <i>listen()</i> .
<i>address</i>	Either a null pointer, or a pointer to a <b>sockaddr</b> structure where the address of the connecting socket shall be returned.
<i>address_len</i>	Either a null pointer, if <i>address</i> is a null pointer, or a pointer to a <b>socklen_t</b> object which on input specifies the length of the supplied <b>sockaddr</b> structure, and on output specifies the length of the stored address.

If *address* is not a null pointer, the address of the peer for the accepted connection shall be stored in the **sockaddr** structure pointed to by *address*, and the length of this address shall be stored in the object pointed to by *address\_len*.

If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated.

If the protocol permits connections by unbound clients, and the peer is not bound, then the value stored in the object pointed to by *address* is unspecified.

If the listen queue is empty of connection requests and **O\_NONBLOCK** is not set on the file descriptor for the socket, *accept()* shall block until a connection is present. If the *listen()* queue is empty of connection requests and **O\_NONBLOCK** is set on the file descriptor for the socket, *accept()* shall fail and set *errno* to **[EAGAIN]** or **[EWOULDBLOCK]**.

The accepted socket cannot itself accept more connections. The original socket remains open and can accept more connections.

**RETURN VALUE**

Upon successful completion, *accept()* shall return the non-negative file descriptor of the accepted socket. Otherwise, **-1** shall be returned, *errno* shall be set to indicate the error, and any object pointed to by *address\_len* shall remain unchanged.

**ERRORS**

The *accept()* function shall fail if:

**[EAGAIN]** or **[EWOULDBLOCK]**

**O\_NONBLOCK** is set for the socket file descriptor and no connections are present to be accepted.

**[EBADF]** The *socket* argument is not a valid file descriptor.

19861		[ECONNABORTED]	
19862			A connection has been aborted.
19863		[EINTR]	The <i>accept()</i> function was interrupted by a signal that was caught before a
19864			valid connection arrived.
19865		[EINVAL]	The <i>socket</i> is not accepting connections.
19866		[EMFILE]	All file descriptors available to the process are currently open.
19867		[ENFILE]	The maximum number of file descriptors in the system are already open.
19868		[ENOBUFS]	No buffer space is available.
19869		[ENOMEM]	There was insufficient memory available to complete the operation.
19870		[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
19871		[EOPNOTSUPP]	The socket type of the specified socket does not support accepting
19872			connections.
19873		The <i>accept()</i> function may fail if:	
19874	OB XSR	[EPROTO]	A protocol error has occurred; for example, the STREAMS protocol stack has
19875			not been initialized.

## 19876 EXAMPLES

19877 None.

## 19878 APPLICATION USAGE

19879 When a connection is available, *select()* indicates that the file descriptor for the socket is ready  
19880 for reading.

## 19881 RATIONALE

19882 None.

## 19883 FUTURE DIRECTIONS

19884 None.

## 19885 SEE ALSO

19886 [Section 2.14](#) (on page 549), *bind()*, *connect()*, *listen()*, *socket()*

19887 XBD [<sys/socket.h>](#)

## 19888 CHANGE HISTORY

19889 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19890 The **restrict** keyword is added to the *accept()* prototype for alignment with the  
19891 ISO/IEC 9899:1999 standard.

## 19892 Issue 7

19893 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

19894 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [ENOBUFS]  
19895 and [ENOMEM] errors to become “shall fail” errors.

19896 Functionality relating to XSI STREAMS is marked obsolescent.

19897 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0018 [464] is applied.

19898 **NAME**

19899       access, faccessat — determine accessibility of a file descriptor |

19900 **SYNOPSIS**

19901       #include &lt;unistd.h&gt;

19902       int access(const char \*path, int amode);

19903 OH     #include &lt;fcntl.h&gt; +

19904 +

19905       int faccessat(int fd, const char \*path, int amode, int flag);

19906 **DESCRIPTION**

19907       The *access()* function shall check the file named by the pathname pointed to by the *path*  
 19908       argument for accessibility according to the bit pattern contained in *amode*. The checks for  
 19909       accessibility (including directory permissions checked during pathname resolution) shall be  
 19910       performed using the real user ID in place of the effective user ID and the real group ID in place  
 19911       of the effective group ID.

19912       The value of *amode* is either the bitwise-inclusive OR of the access permissions to be checked  
 19913       (R\_OK, W\_OK, X\_OK) or the existence test (F\_OK).

19914       If any access permissions are checked, each shall be checked individually, as described in XBD  
 19915       Section 4.5 (on page 108), except that where that description refers to execute permission for a  
 19916       process with appropriate privileges, an implementation may indicate success for X\_OK even if  
 19917       execute permission is not granted to any user.

19918       The *faccessat()* function, when called with a *flag* value of zero, shall be equivalent to the *access()*  
 19919       function, except in the case where *path* specifies a relative path. In this case the file whose  
 19920       accessibility is to be determined shall be located relative to the directory associated with the file  
 19921       descriptor *fd* instead of the current working directory. If the access mode of the open file  
 19922       description associated with the file descriptor is not O\_SEARCH, the function shall check  
 19923       whether directory searches are permitted using the current permissions of the directory  
 19924       underlying the file descriptor. If the access mode is O\_SEARCH, the function shall not perform  
 19925       the check.

19926       If *faccessat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 19927       directory shall be used and, if *flag* is zero, the behavior shall be identical to a call to *access()*.

19928       Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 19929       in <fcntl.h>:

19930	AT_EACCESS	The checks for accessibility (including directory permissions checked during	
19931		pathname resolution) shall be performed using the effective user ID and	
19932		group ID instead of the real user ID and group ID as required in a call to	
19933		<i>access()</i> .	

19934 **RETURN VALUE**

19935       Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 19936       return -1 and set *errno* to indicate the error.

19937 **ERRORS**

19938       These functions shall fail if:

19939	[EACCES]	Permission bits of the file mode do not permit the requested access, or search	
19940		permission is denied on a component of the path prefix.	

19941	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i>
19942		argument.
19943	[ENAMETOOLONG]	
19944		The length of a component of a pathname is longer than {NAME_MAX}.
19945	[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
19946	[ENOTDIR]	A component of the path prefix names an existing file that is neither a
19947		directory nor a symbolic link to a directory, or the <i>path</i> argument contains at
19948		least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code>
19949		characters and the last pathname component names an existing file that is
19950		neither a directory nor a symbolic link to a directory.
19951	[EROFS]	Write access is requested for a file on a read-only file system.
19952	The <i>faccessat</i> ( ) function shall fail if:	
19953	[EACCES]	The access mode of the open file description associated with <i>fd</i> is not
19954		O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit
19955		directory searches.
19956	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is
19957		neither AT_FDCWD nor a valid file descriptor open for reading or searching.
19958	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated
19959		with a non-directory file.
19960	These functions may fail if:	
19961	[EINVAL]	The value of the <i>amode</i> argument is invalid.
19962	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during
19963		resolution of the <i>path</i> argument.
19964	[ENAMETOOLONG]	
19965		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
19966		symbolic link produced an intermediate result with a length that exceeds
19967		{PATH_MAX}.
19968	[ETXTBSY]	Write access is requested for a pure procedure (shared text) file that is being
19969		executed.
19970	The <i>faccessat</i> ( ) function may fail if:	
19971	[EINVAL]	The value of the <i>flag</i> argument is not valid.

## EXAMPLES

### Testing for the Existence of a File

The following example tests whether a file named **myfile** exists in the **/tmp** directory.

```
#include <unistd.h>
...
int result;
const char *pathname = "/tmp/myfile";
result = access (pathname, F_OK);
```

## APPLICATION USAGE

Use of these functions is discouraged since by the time the returned information is acted upon, it is out-of-date. (That is, acting upon the information always leads to a time-of-check-to-time-of-use race condition.) An application should instead attempt the action itself and handle the [EACCES] error that occurs if the file is not accessible (with a change of effective user and group IDs beforehand, and perhaps a change back afterwards, in the case where *access()* or *faccessat()* without AT\_EACCESS would have been used.)

Historically, one of the uses of *access()* was in set-user-ID root programs to check whether the user running the program had access to a file. This relied on “super-user” privileges which were granted based on the effective user ID being zero, so that when *access()* used the real user ID to check accessibility those privileges were not taken into account. On newer systems where privileges can be assigned which have no association with user or group IDs, if a program with such privileges calls *access()*, the change of IDs has no effect on the privileges and therefore they are taken into account in the accessibility checks. Thus, *access()* (and *faccessat()* with flag zero) cannot be used for this historical purpose in such programs. Likewise, if a system provides any additional or alternate file access control mechanisms that are not user ID-based, they will still be taken into account.

If a relative pathname is used, no account is taken of whether the current directory (or the directory associated with the file descriptor *fd*) is accessible via any absolute pathname. Applications using *access()*, or *faccessat()* without AT\_EACCESS, may consequently act as if the file would be accessible to a user with the real user ID and group ID of the process when such a user would not in practice be able to access the file because access would be denied at some point above the current directory (or the directory associated with the file descriptor *fd*) in the file hierarchy.

If *access()* or *faccessat()* is used with W\_OK to check for write access to a directory which has the S\_ISVTX bit set, a return value indicating the directory is writable can be misleading since some operations on files in the directory would not be permitted based on the ownership of those files (see XBD Section 4.3, on page 108).

Additional values of *amode* other than the set defined in the description may be valid; for example, if a system has extended access controls.

The use of the AT\_EACCESS value for *flag* enables functionality not available in *access()*.

## RATIONALE

In early proposals, some inadequacies in the *access()* function led to the creation of an *eaccess()* function because:

1. Historical implementations of *access()* do not test file access correctly when the process' real user ID is superuser. In particular, they always return zero when testing execute permissions without regard to whether the file is executable.
2. The superuser has complete access to all files on a system. As a consequence, programs started by the superuser and switched to the effective user ID with lesser privileges cannot use *access()* to test their file access permissions.

However, the historical model of *eaccess()* does not resolve problem (1), so this volume of POSIX.1-2008 now allows *access()* to behave in the desired way because several implementations have corrected the problem. It was also argued that problem (2) is more easily solved by using *open()*, *chdir()*, or one of the *exec* functions as appropriate and responding to the error, rather than creating a new function that would not be as reliable. Therefore, *eaccess()* is not included in this volume of POSIX.1-2008.

The sentence concerning appropriate privileges and execute permission bits reflects the two

possibilities implemented by historical implementations when checking superuser access for X\_OK.

New implementations are discouraged from returning X\_OK unless at least one execution permission bit is set.

The purpose of the *faccessat()* function is to enable the checking of the accessibility of files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *access()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *faccessat()* function it can be guaranteed that the file tested for accessibility is located relative to the desired directory.

#### FUTURE DIRECTIONS

These functions may be formally deprecated (for example, by shading them OB) in a future version of this standard.

#### SEE ALSO

*chmod()*, *fstatat()*

XBD Section 4.5 (on page 108), *<fcntl.h>*, *<unistd.h>*

#### CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

#### Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

#### Issue 7

Austin Group Interpretations 1003.1-2001 #046 and #143 are applied.

The *faccessat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0019 [461], XSH/TC1-2008/0020 [324], XSH/TC1-2008/0021 [278], XSH/TC1-2008/0022 [278], and XSH/TC1-2008/0023 [291] are applied.

20062 **NAME**

20063       acos, acosf, acosl — arc cosine functions

20064 **SYNOPSIS**

```
20065       #include <math.h>
20066       double acos(double x);
20067       float acosf(float x);
20068       long double acosl(long double x);
```

20069 **DESCRIPTION**

20070 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 20071       conflict between the requirements described here and the ISO C standard is unintentional. This  
 20072       volume of POSIX.1-2008 defers to the ISO C standard.

20073       These functions shall compute the principal value of the arc cosine of their argument  $x$ . The  
 20074       value of  $x$  should be in the range  $[-1,1]$ .

20075       An application wishing to check for error situations should set *errno* to zero and call  
 20076       *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 20077       *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 20078       zero, an error has occurred.

20079 **RETURN VALUE**

20080       Upon successful completion, these functions shall return the arc cosine of  $x$ , in the range  $[0,\pi]$   
 20081       radians.

20082 MX       For finite values of  $x$  not in the range  $[-1,1]$ , a domain error shall occur, and either a NaN (if  
 20083       supported), or an implementation-defined value shall be returned.

20084 MX       If  $x$  is NaN, a NaN shall be returned.

20085       If  $x$  is  $+1$ ,  $+0$  shall be returned.

20086       If  $x$  is  $\pm\text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

20087 **ERRORS**

20088       These functions shall fail if:

20089 MX       Domain Error     The  $x$  argument is finite and is not in the range  $[-1,1]$ , or is  $\pm\text{Inf}$ .

20090       If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 20091       then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 20092       & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 20093       shall be raised.

20094 **EXAMPLES**

20095       None.

20096 **APPLICATION USAGE**

20097       On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 20098       MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

20099 **RATIONALE**

20100       None.

20101 **FUTURE DIRECTIONS**

20102       None.

20103 **SEE ALSO**20104 *cos()*, *feclearexcept()*, *fetestexcept()*, *isnan()*20105 XBD Section 4.20 (on page 117), **<math.h>**20106 **CHANGE HISTORY**

20107 First released in Issue 1. Derived from Issue 1 of the SVID.

20108 **Issue 5**20109 The DESCRIPTION is updated to indicate how an application should check for an error. This  
20110 text was previously published in the APPLICATION USAGE section.20111 **Issue 6**20112 The *acosf()* and *acosl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.20113 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
20114 revised to align with the ISO/IEC 9899:1999 standard.20115 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
20116 marked.20117 **Issue 7**

20118 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0024 [320] is applied.

20119 **NAME**

20120 acosh, acoshf, acoshl — inverse hyperbolic cosine functions

20121 **SYNOPSIS**

```
20122 #include <math.h>
20123 double acosh(double x);
20124 float acoshf(float x);
20125 long double acoshl(long double x);
```

20126 **DESCRIPTION**

20127 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 20128 conflict between the requirements described here and the ISO C standard is unintentional. This  
 20129 volume of POSIX.1-2008 defers to the ISO C standard.

20130 These functions shall compute the inverse hyperbolic cosine of their argument  $x$ .

20131 An application wishing to check for error situations should set *errno* to zero and call  
 20132 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 20133 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 20134 zero, an error has occurred.

20135 **RETURN VALUE**

20136 Upon successful completion, these functions shall return the inverse hyperbolic cosine of their  
 20137 argument.

20138 MX For finite values of  $x < 1$ , a domain error shall occur, and either a NaN (if supported), or an  
 20139 implementation-defined value shall be returned.

20140 MX If  $x$  is NaN, a NaN shall be returned.

20141 If  $x$  is +1, +0 shall be returned.

20142 If  $x$  is +Inf, +Inf shall be returned.

20143 If  $x$  is -Inf, a domain error shall occur, and a NaN shall be returned.

20144 **ERRORS**

20145 These functions shall fail if:

20146 MX Domain Error The  $x$  argument is finite and less than +1.0, or is -Inf.

20147 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 20148 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 20149 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 20150 shall be raised.

20151 **EXAMPLES**

20152 None.

20153 **APPLICATION USAGE**

20154 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 20155 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

20156 **RATIONALE**

20157 None.

20158 **FUTURE DIRECTIONS**

20159 None.

20160 **SEE ALSO**20161 *cosh()*, *feclearexcept()*, *fetestexcept()*20162 XBD Section 4.20 (on page 117), **<math.h>**20163 **CHANGE HISTORY**

20177 **NAME**

20178       acosl — arc cosine functions

20179 **SYNOPSIS**

20180       #include &lt;math.h&gt;

20181       long double acosl(long double x);

20182 **DESCRIPTION**20183       Refer to *acos()*.

**NAME**

aio\_cancel — cancel an asynchronous I/O request

**SYNOPSIS**

```
#include <aio.h>
```

```
int aio_cancel(int fildes, struct aiocb *aiocbp);
```

**DESCRIPTION**

The *aio\_cancel()* function shall attempt to cancel one or more asynchronous I/O requests currently outstanding against file descriptor *fildes*. The *aiocbp* argument points to the asynchronous I/O control block for a particular request to be canceled. If *aiocbp* is NULL, then all outstanding cancelable asynchronous I/O requests against *fildes* shall be canceled.

Normal asynchronous notification shall occur for asynchronous I/O operations that are successfully canceled. If there are requests that cannot be canceled, then the normal asynchronous completion process shall take place for those requests when they are completed.

For requested operations that are successfully canceled, the associated error status shall be set to [ECANCELED] and the return status shall be -1. For requested operations that are not successfully canceled, the *aiocbp* shall not be modified by *aio\_cancel()*.

If *aiocbp* is not NULL, then if *fildes* does not have the same value as the file descriptor with which the asynchronous operation was initiated, unspecified results occur.

Which operations are cancelable is implementation-defined.

**RETURN VALUE**

The *aio\_cancel()* function shall return the value AIO\_CANCELED if the requested operation(s) were canceled. The value AIO\_NOTCANCELED shall be returned if at least one of the requested operation(s) cannot be canceled because it is in progress. In this case, the state of the other operations, if any, referenced in the call to *aio\_cancel()* is not indicated by the return value of *aio\_cancel()*. The application may determine the state of affairs for these operations by using *aio\_error()*. The value AIO\_ALLDONE is returned if all of the operations have already completed. Otherwise, the function shall return -1 and set *errno* to indicate the error.

**ERRORS**

The *aio\_cancel()* function shall fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

20225 **CHANGE HISTORY**

20226 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

20227 **Issue 6**

20228 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
20229 implementation does not support the Asynchronous Input and Output option.

20230 The APPLICATION USAGE section is added.

20231 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/10 is applied, removing the words “to the  
20232 calling process” in the RETURN VALUE section. The term was unnecessary and precluded  
20233 threads.

20234 **Issue 7**

20235 The *aio\_cancel()* function is moved from the Asynchronous Input and Output option to the Base.

**NAME**

aio\_error — retrieve errors status for an asynchronous I/O operation

**SYNOPSIS**

```
#include <aio.h>
```

```
int aio_error(const struct aiocb *aiocbp);
```

**DESCRIPTION**

The *aio\_error()* function shall return the error status associated with the **aiocb** structure referenced by the *aiocbp* argument. The error status for an asynchronous I/O operation is the *errno* value that would be set by the corresponding *read()*, *write()*, *fdatasync()*, or *fsync()* operation. If the operation has not yet completed, then the error status shall be equal to [EINPROGRESS].

If the **aiocb** structure pointed to by *aiocbp* is not associated with an operation that has been scheduled, the results are undefined.

**RETURN VALUE**

If the asynchronous I/O operation has completed successfully, then 0 shall be returned. If the asynchronous operation has completed unsuccessfully, then the error status, as described for *read()*, *write()*, *fdatasync()*, and *fsync()*, shall be returned. If the asynchronous I/O operation has not yet completed, then [EINPROGRESS] shall be returned.

If the *aio\_error()* function fails, it shall return -1 and set *errno* to indicate the error.

**ERRORS**

The *aio\_error()* function may fail if:

[EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose return status has not yet been retrieved.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

20280 The *aio\_error()* function is moved from the Asynchronous Input and Output option to the Base.

## NAME

**aiio\_fsync** — asynchronous file synchronization

## SYNOPSIS

```
#include <aiio.h>

int aiio_fsync(int op, struct aiocb *aiocbp);
```

## DESCRIPTION

The *aiio\_fsync()* function shall asynchronously perform a file synchronization operation, as specified by the *op* argument, for I/O operations associated with the file indicated by the file descriptor *aiio\_fildes* member of the **aiocb** structure referenced by the *aiocbp* argument and queued at the time of the call to *aiio\_fsync()*. The function call shall return when the synchronization request has been initiated or queued to the file or device (even when the data cannot be synchronized immediately).

If *op* is *O\_DSYNC*, all currently queued I/O operations shall be completed as if by a call to *fdatsync()*; that is, as defined for synchronized I/O data integrity completion.

If *op* is *O\_SYNC*, all currently queued I/O operations shall be completed as if by a call to *fsync()*; that is, as defined for synchronized I/O file integrity completion. If the *aiio\_fsync()* function fails, or if the operation queued by *aiio\_fsync()* fails, then outstanding I/O operations are not guaranteed to have been completed.

If *aiio\_fsync()* succeeds, then it is only the I/O that was queued at the time of the call to *aiio\_fsync()* that is guaranteed to be forced to the relevant completion state. The completion of subsequent I/O on the file descriptor is not guaranteed to be completed in a synchronized fashion.

The *aiocbp* argument refers to an asynchronous I/O control block. The *aiocbp* value may be used as an argument to *aiio\_error()* and *aiio\_return()* in order to determine the error status and return status, respectively, of the asynchronous operation while it is proceeding. When the request is queued, the error status for the operation is *[EINPROGRESS]*. When all data has been successfully transferred, the error status shall be reset to reflect the success or failure of the operation. If the operation does not complete successfully, the error status for the operation shall be set to indicate the error. The *aiio\_sigevent* member determines the asynchronous notification to occur as specified in [Section 2.4.1](#) (on page 488) when all operations have achieved synchronized I/O completion. All other members of the structure referenced by *aiocbp* are ignored. If the control block referenced by *aiocbp* becomes an illegal address prior to asynchronous I/O completion, then the behavior is undefined.

If the *aiio\_fsync()* function fails or *aiocbp* indicates an error condition, data is not guaranteed to have been successfully transferred.

## RETURN VALUE

The *aiio\_fsync()* function shall return the value 0 if the I/O operation is successfully queued; otherwise, the function shall return the value -1 and set *errno* to indicate the error.

## ERRORS

The *aiio\_fsync()* function shall fail if:

**[EAGAIN]** The requested asynchronous operation was not queued due to temporary resource limitations.

**[EBADF]** The *aiio\_fildes* member of the **aiocb** structure referenced by the *aiocbp* argument is not a valid file descriptor.

20325 SIO [EINVAL] This implementation does not support synchronized I/O for this file.

20326 FSC [EINVAL] The *aio\_fildes* member of the **aio\_cb** structure refers to a file on which an *fsync()*  
20327 operation is not possible.

20328 [EINVAL] A value of *op* other than O\_DSYNC or O\_SYNC was specified, or O\_DSYNC  
20329 was specified and the implementation does not provide runtime support for  
20330 the Synchronized Input and Output option, or O\_SYNC was specified and the  
20331 implementation does not provide runtime support for the File  
20332 Synchronization option.

20333 In the event that any of the queued I/O operations fail, *aio\_fsync()* shall return the error  
20334 condition defined for *read()* and *write()*. The error is returned in the error status for the  
20335 asynchronous operation, which can be retrieved using *aio\_error()*.

**EXAMPLES**

None.

**APPLICATION USAGE**

Note that even if the file descriptor is not open for writing, if there are any pending write  
requests on the underlying file, then that I/O will be completed prior to the return of a call to  
*aio\_error()* or *aio\_return()* indicating that the operation has completed.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO***aio\_error()*, *aio\_return()*, *fcntl()*, *fdatasync()*, *fsync()*, *open()*, *read()*, *write()*

XBD &lt;aio.h&gt;

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

The [ENOSYS] error condition has been removed as stubs need not be provided if an  
implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/11 is applied, removing the words “to the  
calling process” in the RETURN VALUE section. The term was unnecessary and precluded  
threads.

**Issue 7**

The *aio\_fsync()* function is moved from the Asynchronous Input and Output option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0026 [98] and XSH/TC1-2008/0027  
[98] are applied.

20362 **NAME**

20363 aio\_read — asynchronous read from a file

20364 **SYNOPSIS**

20365 #include <aio.h>

20366 int aio\_read(struct aiocb \*aiocbp);

20367 **DESCRIPTION**

20368 The *aio\_read()* function shall read *aiocbp->aio\_nbytes* from the file associated with  
20369 *aiocbp->aio\_fildes* into the buffer pointed to by *aiocbp->aio\_buf*. The function call shall return  
20370 when the read request has been initiated or queued to the file or device (even when the data  
20371 cannot be delivered immediately).

20372 PIO

If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted  
at a priority equal to a base scheduling priority minus *aiocbp->aio\_reqprio*. If Thread Execution  
Scheduling is not supported, then the base scheduling priority is that of the calling process;

20375 PIO TPS

otherwise, the base scheduling priority is that of the calling thread.

20376 The *aiocbp* value may be used as an argument to *aio\_error()* and *aio\_return()* in order to  
20377 determine the error status and return status, respectively, of the asynchronous operation while it  
20378 is proceeding. If an error condition is encountered during queuing, the function call shall return  
20379 without having initiated or queued the request. The requested operation takes place at the  
20380 absolute position in the file as given by *aio\_offset*, as if *lseek()* were called immediately prior to  
20381 the operation with an *offset* equal to *aio\_offset* and a *whence* equal to *SEEK\_SET*. After a  
20382 successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file  
20383 is unspecified.

20384 The *aio\_sigevent* member specifies the notification which occurs when the request is completed.

20385 The *aiocbp->aio\_lio\_opcode* field shall be ignored by *aio\_read()*.

20386 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio\_buf* or  
20387 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O  
20388 completion, then the behavior is undefined.

20389 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

20390 SIO

If synchronized I/O is enabled on the file associated with *aiocbp->aio\_fildes*, the behavior of this  
function shall be according to the definitions of synchronized I/O data integrity completion and  
synchronized I/O file integrity completion.

20393 For any system action that changes the process memory space while an asynchronous I/O is  
20394 outstanding to the address range being changed, the result of that action is undefined.

20395 For regular files, no data transfer shall occur past the offset maximum established in the open  
20396 file description associated with *aiocbp->aio\_fildes*.

20397 **RETURN VALUE**

20398 The *aio\_read()* function shall return the value zero if the I/O operation is successfully queued;  
20399 otherwise, the function shall return the value -1 and set *errno* to indicate the error.

20400 **ERRORS**

20401 The *aio\_read()* function shall fail if:

20402 [EAGAIN] The requested asynchronous I/O operation was not queued due to system  
20403 resource limitations.

20404 Each of the following conditions may be detected synchronously at the time of the call to  
20405 *aio\_read()*, or asynchronously. If any of the conditions below are detected synchronously, the

20406 *aio\_read()* function shall return `-1` and set *errno* to the corresponding value. If any of the  
 20407 conditions below are detected asynchronously, the return status of the asynchronous operation  
 20408 is set to `-1`, and the error status of the asynchronous operation is set to the corresponding value.

20409 [EBADF] The *aiocbp*→*aio\_fildes* argument is not a valid file descriptor open for reading.

20410 [EINVAL] The file offset value implied by *aiocbp*→*aio\_offset* would be invalid,  
 20411 PIO *aiocbp*→*aio\_reqprio* is not a valid value, or *aiocbp*→*aio\_nbytes* is an invalid  
 20412 value.

20413 In the case that the *aio\_read()* successfully queues the I/O operation but the operation is  
 20414 subsequently canceled or encounters an error, the return status of the asynchronous operation is  
 20415 one of the values normally returned by the *read()* function call. In addition, the error status of  
 20416 the asynchronous operation is set to one of the error statuses normally set by the *read()* function  
 20417 call, or one of the following values:

20418 [EBADF] The *aiocbp*→*aio\_fildes* argument is not a valid file descriptor open for reading.

20419 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit  
 20420 *aio\_cancel()* request.

20421 [EINVAL] The file offset value implied by *aiocbp*→*aio\_offset* would be invalid.

20422 The following condition may be detected synchronously or asynchronously:

20423 [EOVERFLOW] The file is a regular file, *aiocbp*→*aio\_nbytes* is greater than 0, and the starting  
 20424 offset in *aiocbp*→*aio\_offset* is before the end-of-file and is at or beyond the  
 20425 offset maximum in the open file description associated with *aiocbp*→*aio\_fildes*.

## 20438 CHANGE HISTORY

20439 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

20440 Large File Summit extensions are added.

## 20441 Issue 6

20442 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 20443 implementation does not support the Asynchronous Input and Output option.

20444 The APPLICATION USAGE section is added.

20445 The following new requirements on POSIX implementations derive from alignment with the  
20446 Single UNIX Specification:

- 20447 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open  
20448 file description. This change is to support large files.
- 20449 • In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support  
20450 large files.

20451 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/12 is applied, rewording the  
20452 DESCRIPTION when prioritized I/O is supported to account for threads, and removing the  
20453 words “to the calling process” in the RETURN VALUE section.

20454 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/13 is applied, updating the [EINVAL]  
20455 error, so that detection of an [EINVAL] error for an invalid value of *aiocbp*→*aio\_reqprio* is only  
20456 required if the Prioritized Input and Output option is supported.

20457 **Issue 7**

20458 Austin Group Interpretation 1003.1-2001 #082 is applied.

20459 The *aio\_read()* function is moved from the Asynchronous Input and Output option to the Base.

20460 **NAME**

20461 aio\_return — retrieve return status of an asynchronous I/O operation

20462 **SYNOPSIS**

```
20463 #include <aio.h>
20464 ssize_t aio_return(struct aiocb *aiocbp);
```

20465 **DESCRIPTION**

20466 The *aio\_return()* function shall return the return status associated with the **aiocb** structure  
 20467 referenced by the *aiocbp* argument. The return status for an asynchronous I/O operation is the  
 20468 value that would be returned by the corresponding *read()*, *write()*, or *fsync()* function call. If the  
 20469 error status for the operation is equal to [EINPROGRESS], then the return status for the  
 20470 operation is undefined. The *aio\_return()* function may be called exactly once to retrieve the  
 20471 return status of a given asynchronous operation; thereafter, if the same **aiocb** structure is used in  
 20472 a call to *aio\_return()* or *aio\_error()*, an error may be returned. When the **aiocb** structure referred  
 20473 to by *aiocbp* is used to submit another asynchronous operation, then *aio\_return()* may be  
 20474 successfully used to retrieve the return status of that operation.

20475 **RETURN VALUE**

20476 If the asynchronous I/O operation has completed, then the return status, as described for *read()*,  
 20477 *write()*, and *fsync()*, shall be returned. If the asynchronous I/O operation has not yet completed,  
 20478 the results of *aio\_return()* are undefined.

20479 If the *aio\_return()* function fails, it shall return  $-1$  and set *errno* to indicate the error.

20480 **ERRORS**

20481 The *aio\_return()* function may fail if:

20482 [EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose  
 20483 return status has not yet been retrieved.

20484 **EXAMPLES**

20485 None.

20486 **APPLICATION USAGE**

20487 None.

20488 **RATIONALE**

20489 None.

20490 **FUTURE DIRECTIONS**

20491 None.

20492 **SEE ALSO**

20495 XBD <aio.h>

20496 **CHANGE HISTORY**

20497 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

20498 **Issue 6**

20499 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 20500 implementation does not support the Asynchronous Input and Output option.

20501 The APPLICATION USAGE section is added.

20502 The [EINVAL] error condition is made optional. This is for consistency with the DESCRIPTION.

20503 **Issue 7**

20504 SD5-XSH-ERN-148 is applied.

20505 The *aio\_return()* function is moved from the Asynchronous Input and Output option to the Base.

**NAME**

aio\_suspend — wait for an asynchronous I/O request

**SYNOPSIS**

```
#include <aio.h>

int aio_suspend(const struct aiocb *const list[], int nent,
               const struct timespec *timeout);
```

**DESCRIPTION**

The *aio\_suspend()* function shall suspend the calling thread until at least one of the asynchronous I/O operations referenced by the *list* argument has completed, until a signal interrupts the function, or, if *timeout* is not NULL, until the time interval specified by *timeout* has passed. If any of the **aiocb** structures in the list correspond to completed asynchronous I/O operations (that is, the error status for the operation is not equal to [EINPROGRESS]) at the time of the call, the function shall return without suspending the calling thread. The *list* argument is an array of pointers to asynchronous I/O control blocks. The *nent* argument indicates the number of elements in the array. Each **aiocb** structure pointed to has been used in initiating an asynchronous I/O request via *aio\_read()*, *aio\_write()*, or *lio\_listio()*. This array may contain null pointers, which are ignored. If this array contains pointers that refer to **aiocb** structures that have not been used in submitting asynchronous I/O, the effect is undefined.

If the time interval indicated in the **timespec** structure pointed to by *timeout* passes before any of the I/O operations referenced by *list* are completed, then *aio\_suspend()* shall return with an error.

MON If the Monotonic Clock option is supported, the clock that shall be used to measure this time interval shall be the CLOCK\_MONOTONIC clock.

**RETURN VALUE**

If the *aio\_suspend()* function returns after one or more asynchronous I/O operations have completed, the function shall return zero. Otherwise, the function shall return a value of -1 and set *errno* to indicate the error.

The application may determine which asynchronous I/O completed by scanning the associated error and return status using *aio\_error()* and *aio\_return()*, respectively.

**ERRORS**

The *aio\_suspend()* function shall fail if:

[EAGAIN] No asynchronous I/O indicated in the list referenced by *list* completed in the time interval indicated by *timeout*.

[EINTR] A signal interrupted the *aio\_suspend()* function. Note that, since each asynchronous I/O operation may possibly provoke a signal when it completes, this error return may be caused by the completion of one (or more) of the very I/O operations being awaited.

20552 XBD *<aio.h>*

20553 **CHANGE HISTORY**

20554 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

20555 **Issue 6**

20556 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
20557 implementation does not support the Asynchronous Input and Output option.

20558 The APPLICATION USAGE section is added.

20559 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the  
20560 CLOCK\_MONOTONIC clock, if supported, is used.

20561 **Issue 7**

20562 The *aio\_suspend()* function is moved from the Asynchronous Input and Output option to the  
20563 Base.

20564 **NAME**

20565 aio\_write — asynchronous write to a file

20566 **SYNOPSIS**

20567 #include &lt;aio.h&gt;

20568 int aio\_write(struct aiocb \*aiocbp);

20569 **DESCRIPTION**

20570 The *aio\_write()* function shall write *aiocbp->aio\_nbytes* to the file associated with  
 20571 *aiocbp->aio\_fildes* from the buffer pointed to by *aiocbp->aio\_buf*. The function shall return when  
 20572 the write request has been initiated or, at a minimum, queued to the file or device.

20573 PIO If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted  
 20574 at a priority equal to a base scheduling priority minus *aiocbp->aio\_reqprio*. If Thread Execution  
 20575 Scheduling is not supported, then the base scheduling priority is that of the calling process;  
 20576 PIO TPS otherwise, the base scheduling priority is that of the calling thread.

20577 The *aiocbp* argument may be used as an argument to *aio\_error()* and *aio\_return()* in order to  
 20578 determine the error status and return status, respectively, of the asynchronous operation while it  
 20579 is proceeding.

20580 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio\_buf* or  
 20581 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O  
 20582 completion, then the behavior is undefined.

20583 If O\_APPEND is not set for the file descriptor *aio\_fildes*, then the requested operation shall take  
 20584 place at the absolute position in the file as given by *aio\_offset*, as if *lseek()* were called  
 20585 immediately prior to the operation with an *offset* equal to *aio\_offset* and a *whence* equal to  
 20586 SEEK\_SET. If O\_APPEND is set for the file descriptor, or if *aio\_fildes* is associated with a device  
 20587 that is incapable of seeking, write operations append to the file in the same order as the calls  
 20588 were made, except under circumstances described in Section 2.8.2. After a successful call to  
 20589 enqueue an asynchronous I/O operation, the value of the file offset for the file is unspecified.

20590 The *aio\_sigevent* member specifies the notification which occurs when the request is completed.

20591 The *aiocbp->aio\_lio\_opcode* field shall be ignored by *aio\_write()*.

20592 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

20593 SIO If synchronized I/O is enabled on the file associated with *aiocbp->aio\_fildes*, the behavior of this  
 20594 function shall be according to the definitions of synchronized I/O data integrity completion, and  
 20595 synchronized I/O file integrity completion.

20596 For any system action that changes the process memory space while an asynchronous I/O is  
 20597 outstanding to the address range being changed, the result of that action is undefined.

20598 For regular files, no data transfer shall occur past the offset maximum established in the open  
 20599 file description associated with *aiocbp->aio\_fildes*.

20600 **RETURN VALUE**

20601 The *aio\_write()* function shall return the value zero if the I/O operation is successfully queued;  
 20602 otherwise, the function shall return the value -1 and set *errno* to indicate the error.

20603 **ERRORS**

20604 The *aio\_write()* function shall fail if:

20605 [EAGAIN] The requested asynchronous I/O operation was not queued due to system  
 20606 resource limitations.

20607 Each of the following conditions may be detected synchronously at the time of the call to

20608 *aio\_write()*, or asynchronously. If any of the conditions below are detected synchronously, the  
 20609 *aio\_write()* function shall return `-1` and set *errno* to the corresponding value. If any of the  
 20610 conditions below are detected asynchronously, the return status of the asynchronous operation  
 20611 shall be set to `-1`, and the error status of the asynchronous operation is set to the corresponding  
 20612 value.

20613 [EBADF] The *aioctx->aio\_fildes* argument is not a valid file descriptor open for writing.

20614 [EINVAL] The file offset value implied by *aioctx->aio\_offset* would be invalid,  
 20615 PIO *aioctx->aio\_reqprio* is not a valid value, or *aioctx->aio\_nbytes* is an invalid  
 20616 value.

20617 In the case that the *aio\_write()* successfully queues the I/O operation, the return status of the  
 20618 asynchronous operation shall be one of the values normally returned by the *write()* function call.  
 20619 If the operation is successfully queued but is subsequently canceled or encounters an error, the  
 20620 error status for the asynchronous operation contains one of the values normally set by the  
 20621 *write()* function call, or one of the following:

20622 [EBADF] The *aioctx->aio\_fildes* argument is not a valid file descriptor open for writing.

20623 [EINVAL] The file offset value implied by *aioctx->aio\_offset* would be invalid.

20624 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit  
 20625 *aio\_cancel()* request.

20626 The following condition may be detected synchronously or asynchronously:

20627 [EFBIG] The file is a regular file, *aioctx->aio\_nbytes* is greater than 0, and the starting  
 20628 offset in *aioctx->aio\_offset* is at or beyond the offset maximum in the open file  
 20629 description associated with *aioctx->aio\_fildes*.

## 20642 CHANGE HISTORY

20643 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

20644 Large File Summit extensions are added.

## 20645 Issue 6

20646 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 20647 implementation does not support the Asynchronous Input and Output option.

20648 The APPLICATION USAGE section is added.

20649 The following new requirements on POSIX implementations derive from alignment with the

- 20650 Single UNIX Specification:
- 20651 • In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs
  - 20652 past the offset maximum established in the open file description associated with
  - 20653 *aiocbp*→*aio\_fildes*.
  - 20654 • The [EFBIG] error is added as part of the large file support extensions.
- 20655 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/14 is applied, rewording the
- 20656 DESCRIPTION when prioritized I/O is supported to account for threads, and removing the
- 20657 words “to the calling process” in the RETURN VALUE section.
- 20658 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/15 is applied, updating the [EINVAL]
- 20659 error, so that detection of an [EINVAL] error for an invalid value of *aiocbp*→*aio\_reqprio* is only
- 20660 required if the Prioritized Input and Output option is supported.
- 20661 **Issue 7**
- 20662 Austin Group Interpretation 1003.1-2001 #082 is applied.
- 20663 The *aio\_write()* function is moved from the Asynchronous Input and Output option to the Base.
- 20664 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0028 [317] is applied.

20665 **NAME**

20666 alarm — schedule an alarm signal

20667 **SYNOPSIS**

20668 #include &lt;unistd.h&gt;

20669 unsigned alarm(unsigned *seconds*);20670 **DESCRIPTION**

20671 The *alarm()* function shall cause the system to generate a SIGALRM signal for the process after  
20672 the number of realtime seconds specified by *seconds* have elapsed. Processor scheduling delays  
20673 may prevent the process from handling the signal as soon as it is generated.

20674 If *seconds* is 0, a pending alarm request, if any, is canceled.

20675 Alarm requests are not stacked; only one SIGALRM generation can be scheduled in this manner.  
20676 If the SIGALRM signal has not yet been generated, the call shall result in rescheduling the time  
20677 at which the SIGALRM signal is generated.

20678 XSI Interactions between *alarm()* and *setitimer()* are unspecified.

20679 **RETURN VALUE**

20680 If there is a previous *alarm()* request with time remaining, *alarm()* shall return a non-zero value  
20681 that is the number of seconds until the previous request would have generated a SIGALRM  
20682 signal. Otherwise, *alarm()* shall return 0.

20683 **ERRORS**

20684 The *alarm()* function is always successful, and no return value is reserved to indicate an error.

20685 **EXAMPLES**

20686 None.

20687 **APPLICATION USAGE**

20688 The *fork()* function clears pending alarms in the child process. A new process image created by  
20689 one of the *exec* functions inherits the time left to an alarm signal in the image of the old process.

20690 Application developers should note that the type of the argument *seconds* and the return value of  
20691 *alarm()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces  
20692 Application cannot pass a value greater than the minimum guaranteed value for {UINT\_MAX},  
20693 which the ISO C standard sets as 65 535, and any application passing a larger value is restricting  
20694 its portability. A different type was considered, but historical implementations, including those  
20695 with a 16-bit **int** type, consistently use either **unsigned** or **int**.

20696 Application developers should be aware of possible interactions when the same process uses  
20697 both the *alarm()* and *sleep()* functions.

20698 **RATIONALE**

20699 Many historical implementations (including Version 7 and System V) allow an alarm to occur up  
20700 to a second early. Other implementations allow alarms up to half a second or one clock tick  
20701 early or do not allow them to occur early at all. The latter is considered most appropriate, since it  
20702 gives the most predictable behavior, especially since the signal can always be delayed for an  
20703 indefinite amount of time due to scheduling. Applications can thus choose the *seconds* argument  
20704 as the minimum amount of time they wish to have elapse before the signal.

20705 The term “realtime” here and elsewhere (*sleep()*, *times()*) is intended to mean “wall clock” time  
20706 as common English usage, and has nothing to do with “realtime operating systems”. It is in  
20707 contrast to *virtual time*, which could be misinterpreted if just *time* were used.

20708 In some implementations, including 4.3 BSD, very large values of the *seconds* argument are  
20709 silently rounded down to an implementation-specific maximum value. This maximum is large

20710 enough (to the order of several months) that the effect is not noticeable.

20711 There were two possible choices for alarm generation in multi-threaded applications: generation  
20712 for the calling thread or generation for the process. The first option would not have been  
20713 particularly useful since the alarm state is maintained on a per-process basis and the alarm that  
20714 is established by the last invocation of *alarm()* is the only one that would be active.

20715 Furthermore, allowing generation of an asynchronous signal for a thread would have  
20716 introduced an exception to the overall signal model. This requires a compelling reason in order  
20717 to be justified.

#### 20718 FUTURE DIRECTIONS

20719 None.

#### 20720 SEE ALSO

20721 *alarm()*, *exec*, *fork()*, *getitimer()*, *pause()*, *sigaction()*, *sleep()*

20722 XBD [\*<signal.h>\*](#), [\*<unistd.h>\*](#)

#### 20723 CHANGE HISTORY

20724 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 20725 Issue 6

20726 The following new requirements on POSIX implementations derive from alignment with the  
20727 Single UNIX Specification:

- 20728 • The DESCRIPTION is updated to indicate that interactions with the *setitimer()*, *ualarm()*,  
20729 and *usleep()* functions are unspecified.

20730 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/16 is applied, replacing “an  
20731 implementation-defined maximum value” with “an implementation-specific maximum value”  
20732 in the RATIONALE.

**NAME**

alphasort, scandir — scan a directory

**SYNOPSIS**

```
#include <dirent.h>

int alphasort(const struct dirent **d1, const struct dirent **d2);
int scandir(const char *dir, struct dirent ***namelist,
            int (*sel)(const struct dirent *),
            int (*compar)(const struct dirent **, const struct dirent **));
```

**DESCRIPTION**

The *alphasort()* function can be used as the comparison function for the *scandir()* function to sort the directory entries, *d1* and *d2*, into alphabetical order. Sorting happens as if by calling the *strcoll()* function on the *d\_name* element of the **dirent** structures passed as the two parameters. If the *strcoll()* function fails, the return value of *alphasort()* is unspecified.

The *alphasort()* function shall not change the setting of *errno* if successful. Since no return value is reserved to indicate an error, an application wishing to check for error situations should set *errno* to 0, then call *alphasort()*, then check *errno*.

The *scandir()* function shall scan the directory *dir*, calling the function referenced by *sel* on each directory entry. Entries for which the function referenced by *sel* returns non-zero shall be stored in strings allocated as if by a call to *malloc()*, and sorted as if by a call to *qsort()* with the comparison function *compar*, except that *compar* need not provide total ordering. The strings are collected in array *namelist* which shall be allocated as if by a call to *malloc()*. If *sel* is a null pointer, all entries shall be selected. If the comparison function *compar* does not provide total ordering, the order in which the directory entries are stored is unspecified.

**RETURN VALUE**

Upon successful completion, the *alphasort()* function shall return an integer greater than, equal to, or less than 0, according to whether the name of the directory entry pointed to by *d1* is lexically greater than, equal to, or less than the directory pointed to by *d2* when both are interpreted as appropriate to the current locale. There is no return value reserved to indicate an error.

Upon successful completion, the *scandir()* function shall return the number of entries in the array and a pointer to the array through the parameter *namelist*. Otherwise, the *scandir()* function shall return -1.

**ERRORS**

The *scandir()* function shall fail if:

- |                |  |
|----------------|--|
| [EACCES]       | Search permission is denied for the component of the path prefix of <i>dir</i> or read permission is denied for <i>dir</i> . |
| [ELOOP]        | A loop exists in symbolic links encountered during resolution of the <i>dir</i> argument.                                    |
| [ENAMETOOLONG] | The length of a component of a pathname is longer than {NAME_MAX}.   |
| [ENOENT]       | A component of <i>dir</i> does not name an existing directory or <i>dir</i> is an empty string.                              |
| [ENOMEM]       | Insufficient storage space is available.   |

20776	[ENOTDIR]	A component of <i>dir</i> names an existing file that is neither a directory nor a symbolic link to a directory.
20777		
20778	[EOVERFLOW]	One of the values to be returned or passed to a callback function cannot be represented correctly.
20779		
20780	The <i>scandir()</i> function may fail if:	
20781	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>dir</i> argument.
20782		
20783	[EMFILE]	All file descriptors available to the process are currently open.
20784	[ENAMETOOLONG]	
20785		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
20786		
20787		
20788	[ENFILE]	Too many files are currently open in the system.

**EXAMPLES**

An example to print the files in the current directory:

```
#include <dirent.h>
#include <stdio.h>
#include <stdlib.h>
...
struct dirent **namelist;
int i,n;

n = scandir(".", &namelist, 0, alphasort);
if (n < 0)
    perror("scandir");
else {
    for (i = 0; i < n; i++) {
        printf("%s\n", namelist[i]->d_name);
        free(namelist[i]);
    }
    free(namelist);
}
```

**APPLICATION USAGE**

If *dir* contains filenames that do not form character strings, or which contain characters outside the domain of the collating sequence of the current locale, the *alphasort()* function need not provide a total ordering. This condition is not possible if all filenames within the directory consist only of characters from the portable filename character set.

The *scandir()* function may allocate dynamic storage during its operation. If *scandir()* is forcibly terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *sel* or *compar*, or by an interrupt routine, *scandir()* does not have a chance to free that storage, so it remains permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has occurred, then wait until *scandir()* returns to act on the interrupt.

For functions that allocate memory as if by *malloc()*, the application should release such memory when it is no longer required by a call to *free()*. For *scandir()*, this is *namelist* (including all of the individual strings in *namelist*).

20821 **RATIONALE**

20822 None.

20823 **FUTURE DIRECTIONS**

20824 None.

20825 **SEE ALSO**20826 *qsort()*, *strcoll()*

20827 XBD &lt;dirent.h&gt;

20828 **CHANGE HISTORY**

20829 First released in Issue 7.

20830 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0029 [324], XSH/TC1-2008/0030 [404],  
20831 XSH/TC1-2008/0031 [393], and XSH/TC1-2008/0032 [291] are applied.

20832 **NAME**

20833 asctime, asctime\_r — convert date and time to a string

20834 **SYNOPSIS**

```
20835 OB      #include <time.h>
20836         char *asctime(const struct tm *timeptr);
20837 OB CX    char *asctime_r(const struct tm *restrict tm, char *restrict buf);
```

20838 **DESCRIPTION**

20839 CX For *asctime()*: The functionality described on this reference page is aligned with the ISO C  
 20840 standard. Any conflict between the requirements described here and the ISO C standard is  
 20841 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

20842 The *asctime()* function shall convert the broken-down time in the structure pointed to by *timeptr*  
 20843 into a string in the form:

20844 Sun Sep 16 01:03:52 1973\n\0

20845 using the equivalent of the following algorithm:

```
20846 char *asctime(const struct tm *timeptr)
20847 {
20848     static char wday_name[7][3] = {
20849         "Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"
20850     };
20851     static char mon_name[12][3] = {
20852         "Jan", "Feb", "Mar", "Apr", "May", "Jun",
20853         "Jul", "Aug", "Sep", "Oct", "Nov", "Dec"
20854     };
20855     static char result[26];
20856     sprintf(result, "%.3s %.3s%3d %.2d:%.2d:%.2d %d\n",
20857         wday_name[timeptr->tm_wday],
20858         mon_name[timeptr->tm_mon],
20859         timeptr->tm_mday, timeptr->tm_hour,
20860         timeptr->tm_min, timeptr->tm_sec,
20861         1900 + timeptr->tm_year);
20862     return result;
20863 }
```

20864 However, the behavior is undefined if *timeptr->tm\_wday* or *timeptr->tm\_mon* are not within the  
 20865 normal ranges as defined in **<time.h>**, or if *timeptr->tm\_year* exceeds {INT\_MAX}-1990, or if the  
 20866 above algorithm would attempt to generate more than 26 bytes of output (including the  
 20867 terminating null).

20868 The **tm** structure is defined in the **<time.h>** header.

20869 CX The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static  
 20870 objects: a broken-down time structure and an array of type **char**. Execution of any of the  
 20871 functions may overwrite the information returned in either of these objects by any of the other  
 20872 functions.

20873 The *asctime()* function need not be thread-safe.

20874 The *asctime\_r()* function shall convert the broken-down time in the structure pointed to by *tm*  
 20875 into a string (of the same form as that returned by *asctime()*, and with the same undefined  
 20876 behavior when input or output is out of range) that is placed in the user-supplied buffer pointed

20877 to by *buf* (which shall contain at least 26 bytes) and then return *buf*.

#### 20878 RETURN VALUE

20879 CX Upon successful completion, *asctime()* shall return a pointer to the string. If the function is  
20880 unsuccessful, it shall return NULL.

20881 Upon successful completion, *asctime\_r()* shall return a pointer to a character string containing  
20882 the date and time. This string is pointed to by the argument *buf*. If the function is unsuccessful,  
20883 it shall return NULL.

#### 20884 ERRORS

20885 No errors are defined.

#### 20886 EXAMPLES

20887 None.

#### 20888 APPLICATION USAGE

20889 These functions are included only for compatibility with older implementations. They have  
20890 undefined behavior if the resulting string would be too long, so the use of these functions  
20891 should be discouraged. On implementations that do not detect output string length overflow, it  
20892 is possible to overflow the output buffers in such a way as to cause applications to fail, or  
20893 possible system security violations. Also, these functions do not support localized date and time  
20894 formats. To avoid these problems, applications should use *strftime()* to generate strings from  
20895 broken-down times.

20896 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.

20897 The *asctime\_r()* function is thread-safe and shall return values in a user-supplied buffer instead  
20898 of possibly using a static data area that may be overwritten by each call.

#### 20899 RATIONALE

20900 The standard developers decided to mark the *asctime()* and *asctime\_r()* functions obsolescent  
20901 even though *asctime()* is in the ISO C standard due to the possibility of buffer overflow. The  
20902 ISO C standard also provides the *strftime()* function which can be used to avoid these problems.

#### 20903 FUTURE DIRECTIONS

20904 These functions may be removed in a future version.

#### 20905 SEE ALSO

20906 *clock()*, *ctime()*, *difftime()*, *gmtime()*, *localtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*, *utime()*

20907 XBD <time.h>

#### 20908 CHANGE HISTORY

20909 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 20910 Issue 5

20911 Normative text previously in the APPLICATION USAGE section is moved to the  
20912 DESCRIPTION.

20913 The *asctime\_r()* function is included for alignment with the POSIX Threads Extension.

20914 A note indicating that the *asctime()* function need not be reentrant is added to the  
20915 DESCRIPTION.

#### 20916 Issue 6

20917 The *asctime\_r()* function is marked as part of the Thread-Safe Functions option.

20918 Extensions beyond the ISO C standard are marked.

20919 The APPLICATION USAGE section is updated to include a note on the thread-safe function and

- 20920 its avoidance of possibly using a static data area.
- 20921 The DESCRIPTION of *asctime\_r()* is updated to describe the format of the string returned.
- 20922 The **restrict** keyword is added to the *asctime\_r()* prototype for alignment with the  
20923 ISO/IEC 9899:1999 standard
- 20924 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/17 is applied, adding the CX extension in  
20925 the RETURN VALUE section requiring that if the *asctime()* function is unsuccessful it returns  
20926 NULL.
- 20927 **Issue 7**
- 20928 Austin Group Interpretation 1003.1-2001 #053 is applied, marking these functions obsolescent.
- 20929 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 20930 The *asctime\_r()* function is moved from the Thread-Safe Functions option to the Base.
- 20931 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0033 [86,429] is applied.

20932 **NAME**

20933 asin, asinf, asinl — arc sine function

20934 **SYNOPSIS**

```
20935 #include <math.h>
20936 double asin(double x);
20937 float asinf(float x);
20938 long double asinl(long double x);
```

20939 **DESCRIPTION**

20940 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 20941 conflict between the requirements described here and the ISO C standard is unintentional. This  
 20942 volume of POSIX.1-2008 defers to the ISO C standard.

20943 These functions shall compute the principal value of the arc sine of their argument  $x$ . The value  
 20944 of  $x$  should be in the range  $[-1,1]$ .

20945 An application wishing to check for error situations should set *errno* to zero and call  
 20946 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 20947 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 20948 zero, an error has occurred.

20949 **RETURN VALUE**

20950 Upon successful completion, these functions shall return the arc sine of  $x$ , in the range  
 20951  $[-\pi/2, \pi/2]$  radians.

20952 MX For finite values of  $x$  not in the range  $[-1,1]$ , a domain error shall occur, and either a NaN (if  
 20953 supported), or an implementation-defined value shall be returned.

20954 MX If  $x$  is NaN, a NaN shall be returned.

20955 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

20956 If  $x$  is  $\pm \text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

20957 If  $x$  is subnormal, a range error may occur

20958 MXX and  $x$  should be returned.

20959 MX If  $x$  is not returned, *asin()*, *asinf()*, and *asinl()* shall return an implementation-defined value no  
 20960 greater in magnitude than DBL\_MIN, FLT\_MIN, and LDBL\_MIN, respectively.

20961 **ERRORS**

20962 These functions shall fail if:

20963 MX Domain Error The  $x$  argument is finite and is not in the range  $[-1,1]$ , or is  $\pm \text{Inf}$ .

20964 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 20965 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 20966 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 20967 shall be raised.

20968 These functions may fail if:

20969 MX Range Error The value of  $x$  is subnormal.

20970 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 20971 then *errno* shall be set to [ERANGE]. If the integer expression  
 20972 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 20973 floating-point exception shall be raised.

20974 **EXAMPLES**

20975 None.

20976 **APPLICATION USAGE**

20977 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 20978 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

20979 **RATIONALE**

20980 None.

20981 **FUTURE DIRECTIONS**

20982 None.

20983 **SEE ALSO**20984 *feclearexcept()*, *fetestexcept()*, *isnan()*, *sin()*20985 XBD Section 4.20 (on page 117), **<math.h>**20986 **CHANGE HISTORY**

20987 First released in Issue 1. Derived from Issue 1 of the SVID.

20988 **Issue 5**

20989 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 20990 text was previously published in the APPLICATION USAGE section.

20991 **Issue 6**20992 The *asinf()* and *asinl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

20993 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 20994 revised to align with the ISO/IEC 9899:1999 standard.

20995 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 20996 marked.

20997 **Issue 7**

20998 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0034 [320] and XSH/TC1-2008/0035  
 20999 [68] are applied.

21000 **NAME**

21001 asinh, asinhf, asinhl — inverse hyperbolic sine functions

21002 **SYNOPSIS**

```
21003 #include <math.h>
21004 double asinh(double x);
21005 float asinhf(float x);
21006 long double asinhl(long double x);
```

21007 **DESCRIPTION**

21008 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 21009 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21010 volume of POSIX.1-2008 defers to the ISO C standard.

21011 These functions shall compute the inverse hyperbolic sine of their argument  $x$ .

21012 An application wishing to check for error situations should set *errno* to zero and call  
 21013 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 21014 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 21015 zero, an error has occurred.

21016 **RETURN VALUE**

21017 Upon successful completion, these functions shall return the inverse hyperbolic sine of their  
 21018 argument.

21019 MX If  $x$  is NaN, a NaN shall be returned.

21020 If  $x$  is  $\pm 0$ , or  $\pm \text{Inf}$ ,  $x$  shall be returned.

21021 If  $x$  is subnormal, a range error may occur

21022 MXX and  $x$  should be returned.

21023 MX If  $x$  is not returned, *asinh*(), *asinhf*(), and *asinhl*() shall return an implementation-defined value  
 21024 no greater in magnitude than DBL\_MIN, FLT\_MIN, and LDBL\_MIN, respectively.

21025 **ERRORS**

21026 These functions may fail if:

21027 MX **Range Error** The value of  $x$  is subnormal.

21028 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 21029 then *errno* shall be set to [ERANGE]. If the integer expression  
 21030 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 21031 floating-point exception shall be raised.

21032 **EXAMPLES**

21033 None.

21034 **APPLICATION USAGE**

21035 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 21036 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

21037 **RATIONALE**

21038 None.

21039 **FUTURE DIRECTIONS**

21040 None.

21041 **SEE ALSO**21042 *feclearexcept()*, *fetestexcept()*, *sinh()*21043 XBD Section 4.20 (on page 117), **<math.h>**21044 **CHANGE HISTORY**

21045 First released in Issue 4, Version 2.

21046 **Issue 5**

21047 Moved from X/OPEN UNIX extension to BASE.

21048 **Issue 6**21049 The *asinh()* function is no longer marked as an extension.21050 The *asinhf()* and *asinhll()* functions are added for alignment with the ISO/IEC 9899:1999  
21051 standard.21052 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
21053 revised to align with the ISO/IEC 9899:1999 standard.21054 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
21055 marked.21056 **Issue 7**

21057 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0036 [68] is applied.

21058 **NAME**

21059        asinl — arc sine function

21060 **SYNOPSIS**21061        `#include <math.h>`21062        `long double asinl(long double x);`21063 **DESCRIPTION**21064        Refer to *asin()*.

21065 **NAME**

21066       assert — insert program diagnostics

21067 **SYNOPSIS**

21068       #include &lt;assert.h&gt;

21069       void assert(scalar expression);

21070 **DESCRIPTION**

21071 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 21072 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21073 volume of POSIX.1-2008 defers to the ISO C standard.

21074       The *assert()* macro shall insert diagnostics into programs; it shall expand to a **void** expression.  
 21075 When it is executed, if *expression* (which shall have a **scalar** type) is false (that is, compares equal  
 21076 to 0), *assert()* shall write information about the particular call that failed on *stderr* and shall call  
 21077 *abort()*.

21078       The information written about the call that failed shall include the text of the argument, the  
 21079 name of the source file, the source file line number, and the name of the enclosing function; the  
 21080 latter are, respectively, the values of the preprocessing macros `__FILE__` and `__LINE__` and of  
 21081 the identifier `__func__`.

21082       Forcing a definition of the name `NDEBUG`, either from the compiler command line or with the  
 21083 preprocessor control statement **#define** `NDEBUG` ahead of the **#include** `<assert.h>` statement,  
 21084 shall stop assertions from being compiled into the program.

21085 **RETURN VALUE**21086       The *assert()* macro shall not return a value.21087 **ERRORS**

21088       No errors are defined.

21089 **EXAMPLES**

21090       None.

21091 **APPLICATION USAGE**

21092       None.

21093 **RATIONALE**

21094       None.

21095 **FUTURE DIRECTIONS**

21096       None.

21097 **SEE ALSO**21098       *abort()*, *stdin*21099       XBD `<assert.h>`21100 **CHANGE HISTORY**

21101       First released in Issue 1. Derived from Issue 1 of the SVID.

21102 **Issue 6**

21103       The prototype for the *expression* argument to *assert()* is changed from **int** to **scalar** for alignment  
 21104 with the ISO/IEC 9899:1999 standard.

21105       The DESCRIPTION of *assert()* is updated for alignment with the ISO/IEC 9899:1999 standard.

21106 **NAME**

21107 atan, atanf, atanl — arc tangent function

21108 **SYNOPSIS**

```
21109 #include <math.h>
21110 double atan(double x);
21111 float atanf(float x);
21112 long double atanl(long double x);
```

21113 **DESCRIPTION**

21114 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 21115 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21116 volume of POSIX.1-2008 defers to the ISO C standard.

21117 These functions shall compute the principal value of the arc tangent of their argument  $x$ .

21118 An application wishing to check for error situations should set *errno* to zero and call  
 21119 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 21120 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 21121 zero, an error has occurred.

21122 **RETURN VALUE**

21123 Upon successful completion, these functions shall return the arc tangent of  $x$  in the range  
 21124  $[-\pi/2, \pi/2]$  radians.

21125 MX If  $x$  is NaN, a NaN shall be returned.

21126 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

21127 If  $x$  is  $\pm \text{Inf}$ ,  $\pm \pi/2$  shall be returned.

21128 If  $x$  is subnormal, a range error may occur

21129 MXX and  $x$  should be returned.

21130 MX If  $x$  is not returned, *atan()*, *atanf()*, and *atanl()* shall return an implementation-defined value no  
 21131 greater in magnitude than DBL\_MIN, FLT\_MIN, and LDBL\_MIN, respectively.

21132 **ERRORS**

21133 These functions may fail if:

21134 MX **Range Error** The value of  $x$  is subnormal.

21135 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 21136 then *errno* shall be set to [ERANGE]. If the integer expression  
 21137 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 21138 floating-point exception shall be raised.

21139 **EXAMPLES**

21140 None.

21141 **APPLICATION USAGE**

21142 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 21143 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

21144 **RATIONALE**

21145 None.

21146 **FUTURE DIRECTIONS**

21147 None.

21152 First released in Issue 1. Derived from Issue 1 of the SVID.

21153 **Issue 5**21154 The DESCRIPTION is updated to indicate how an application should check for an error. This  
21155 text was previously published in the APPLICATION USAGE section.21156 **Issue 6**21157 The *atanf()* and *atanl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.21158 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
21159 revised to align with the ISO/IEC 9899:1999 standard.21160 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
21161 marked.21162 **Issue 7**

21163 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0037 [68] is applied.

21164 **NAME**

21165 atan2, atan2f, atan2l — arc tangent functions

21166 **SYNOPSIS**

```
21167 #include <math.h>
21168 double atan2(double y, double x);
21169 float atan2f(float y, float x);
21170 long double atan2l(long double y, long double x);
```

21171 **DESCRIPTION**

21172 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 21173 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21174 volume of POSIX.1-2008 defers to the ISO C standard.

21175 These functions shall compute the principal value of the arc tangent of  $y/x$ , using the signs of  
 21176 both arguments to determine the quadrant of the return value.

21177 An application wishing to check for error situations should set *errno* to zero and call  
 21178 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 21179 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 21180 zero, an error has occurred.

21181 **RETURN VALUE**

21182 Upon successful completion, these functions shall return the arc tangent of  $y/x$  in the range  
 21183  $[-\pi, \pi]$  radians.

21184 If  $y$  is  $\pm 0$  and  $x$  is  $< 0$ ,  $\pm\pi$  shall be returned.

21185 If  $y$  is  $\pm 0$  and  $x$  is  $> 0$ ,  $\pm 0$  shall be returned.

21186 If  $y$  is  $< 0$  and  $x$  is  $\pm 0$ ,  $-\pi/2$  shall be returned.

21187 If  $y$  is  $> 0$  and  $x$  is  $\pm 0$ ,  $\pi/2$  shall be returned.

21188 If  $x$  is 0, a pole error shall not occur.

21189 MX If either  $x$  or  $y$  is NaN, a NaN shall be returned.

21190 If the correct value would cause underflow, a range error may occur, and *atan*(), *atan2f*(), and  
 21191 *atan2l*() shall return an implementation-defined value no greater in magnitude than DBL\_MIN,  
 21192 FLT\_MIN, and LDBL\_MIN, respectively.

21193 MXX If the IEC 60559 Floating-Point option is supported,  $y/x$  should be returned.

21194 MX If  $y$  is  $\pm 0$  and  $x$  is  $-0$ ,  $\pm\pi$  shall be returned.

21195 If  $y$  is  $\pm 0$  and  $x$  is  $+0$ ,  $\pm 0$  shall be returned.

21196 For finite values of  $\pm y > 0$ , if  $x$  is  $-\text{Inf}$ ,  $\pm\pi$  shall be returned.

21197 For finite values of  $\pm y > 0$ , if  $x$  is  $+\text{Inf}$ ,  $\pm 0$  shall be returned.

21198 For finite values of  $x$ , if  $y$  is  $\pm\text{Inf}$ ,  $\pm\pi/2$  shall be returned.

21199 If  $y$  is  $\pm\text{Inf}$  and  $x$  is  $-\text{Inf}$ ,  $\pm 3\pi/4$  shall be returned.

21200 If  $y$  is  $\pm\text{Inf}$  and  $x$  is  $+\text{Inf}$ ,  $\pm\pi/4$  shall be returned.

21201 If both arguments are 0, a domain error shall not occur.

21202 **ERRORS**

21203 These functions may fail if:

21204 MX **Range Error** The result underflows.

21205 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 21206 then *errno* shall be set to [ERANGE]. If the integer expression  
 21207 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 21208 floating-point exception shall be raised.

21209 **EXAMPLES**21210 **Converting Cartesian to Polar Coordinates System**

21211 The function below uses *atan2()* to convert a 2d vector expressed in cartesian coordinates (*x,y*) to  
 21212 the polar coordinates (*rho,theta*). There are other ways to compute the angle *theta*, using *asin()*  
 21213 *acos()*, or *atan()*. However, *atan2()* presents here two advantages:

- 21214 • The angle's quadrant is automatically determined.
- 21215 • The singular cases (0,*y*) are taken into account.

21216 Finally, this example uses *hypot()* rather than *sqrt()* since it is better for special cases; see *hypot()*  
 21217 for more information.

```
21218 #include <math.h>
21219 void
21220 cartesian_to_polar(const double x, const double y,
21221                  double *rho, double *theta
21222                  )
21223 {
21224     *rho    = hypot (x,y); /* better than sqrt(x*x+y*y) */
21225     *theta  = atan2 (y,x);
21226 }
```

21227 **APPLICATION USAGE**

21228 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 21229 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

21230 **RATIONALE**

21231 None.

21232 **FUTURE DIRECTIONS**

21233 None.

21234 **SEE ALSO**21235 *acos()*, *asin()*, *atan()*, *feclearexcept()*, *fetestexcept()*, *hypot()*, *isnan()*, *sqrt()*, *tan()*21236 XBD Section 4.20 (on page 117), **<math.h>**21237 **CHANGE HISTORY**

21238 First released in Issue 1. Derived from Issue 1 of the SVID.

21239 **Issue 5**

21240 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 21241 text was previously published in the APPLICATION USAGE section.

21242 **Issue 6**

21243 The *atan2f()* and *atan2l()* functions are added for alignment with the ISO/IEC 9899:1999  
21244 standard.

21245 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
21246 revised to align with the ISO/IEC 9899:1999 standard, and the IEC 60559:1989 standard  
21247 floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

21248 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/18 is applied, adding to the EXAMPLES  
21249 section.

21250 **Issue 7**

21251 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0038 [68,428] is applied.

21252 **NAME**

21253       atanf — arc tangent function

21254 **SYNOPSIS**

21255       #include &lt;math.h&gt;

21256       float atanf(float x);

21257 **DESCRIPTION**21258       Refer to *atan()*.

21259 **NAME**

21260 atanh, atanhf, atanhf — inverse hyperbolic tangent functions

21261 **SYNOPSIS**

```
21262 #include <math.h>
21263 double atanh(double x);
21264 float atanhf(float x);
21265 long double atanhf(long double x);
```

21266 **DESCRIPTION**

21267 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 21268 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21269 volume of POSIX.1-2008 defers to the ISO C standard.

21270 These functions shall compute the inverse hyperbolic tangent of their argument  $x$ .

21271 An application wishing to check for error situations should set *errno* to zero and call  
 21272 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 21273 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 21274 zero, an error has occurred.

21275 **RETURN VALUE**

21276 Upon successful completion, these functions shall return the inverse hyperbolic tangent of their  
 21277 argument.

21278 If  $x$  is  $\pm 1$ , a pole error shall occur, and *atanh*(), *atanhf*(), and *atanf*() shall return the value of the  
 21279 macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively, with the same sign as the  
 21280 correct value of the function.

21281 MX For finite  $|x| > 1$ , a domain error shall occur, and either a NaN (if supported), or an  
 21282 implementation-defined value shall be returned.

21283 MX If  $x$  is NaN, a NaN shall be returned.

21284 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

21285 If  $x$  is  $\pm \text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

21286 If  $x$  is subnormal, a range error may occur

21287 MXX and  $x$  should be returned.

21288 MX If  $x$  is not returned, *atanh*(), *atanhf*(), and *atanf*() shall return an implementation-defined value  
 21289 no greater in magnitude than DBL\_MIN, FLT\_MIN, and LDBL\_MIN, respectively.

21290 **ERRORS**

21291 These functions shall fail if:

21292 MX Domain Error The  $x$  argument is finite and not in the range  $[-1, 1]$ , or is  $\pm \text{Inf}$ .

21293 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 21294 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 21295 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 21296 shall be raised.

21297 Pole Error The  $x$  argument is  $\pm 1$ .

21298 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 21299 then *errno* shall be set to [ERANGE]. If the integer expression  
 21300 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 21301 floating-point exception shall be raised.

21302 These functions may fail if:

21303	MX	<b>Range Error</b>	The value of $x$ is subnormal.
21304			If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
21305			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
21306			$(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the underflow
21307			floating-point exception shall be raised.

#### 21308 EXAMPLES

21309 None.

#### 21310 APPLICATION USAGE

21311 On error, the expressions  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  and  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$  are independent of each other, but at least one of them must be non-zero.

#### 21313 RATIONALE

21314 None.

#### 21315 FUTURE DIRECTIONS

21316 None.

#### 21317 SEE ALSO

21318 *feclearexcept()*, *fetestexcept()*, *tanh()*

21319 XBD Section 4.20 (on page 117), **<math.h>**

#### 21320 CHANGE HISTORY

21321 First released in Issue 4, Version 2.

#### 21322 Issue 5

21323 Moved from X/OPEN UNIX extension to BASE.

#### 21324 Issue 6

21325 The *atanh()* function is no longer marked as an extension.

21326 The *atanhf()* and *atanhl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

21328 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

21330 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

#### 21332 Issue 7

21333 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0039 [320] and XSH/TC1-2008/0040 [680] are applied.

21335 **NAME**

21336       atanl — arc tangent function

21337 **SYNOPSIS**

21338       #include &lt;math.h&gt;

21339       long double atanl(long double x);

21340 **DESCRIPTION**21341       Refer to *atan()*.

21342 **NAME**

21343       atexit — register a function to run at process termination

21344 **SYNOPSIS**

21345       #include &lt;stdlib.h&gt;

21346       int atexit(void (\*func)(void));

21347 **DESCRIPTION**

21348 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 21349 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21350 volume of POSIX.1-2008 defers to the ISO C standard.

21351       The *atexit()* function shall register the function pointed to by *func*, to be called without  
 21352 arguments at normal program termination. At normal program termination, all functions  
 21353 registered by the *atexit()* function shall be called, in the reverse order of their registration, except  
 21354 that a function is called after any previously registered functions that had already been called at  
 21355 the time it was registered. Normal termination occurs either by a call to *exit()* or a return from  
 21356 *main()*.

21357       At least 32 functions can be registered with *atexit()*.

21358 CX       After a successful call to any of the *exec* functions, any functions previously registered by *atexit()*  
 21359 shall no longer be registered.

21360 **RETURN VALUE**21361       Upon successful completion, *atexit()* shall return 0; otherwise, it shall return a non-zero value.21362 **ERRORS**

21363       No errors are defined.

21364 **EXAMPLES**

21365       None.

21366 **APPLICATION USAGE**21367       The functions registered by a call to *atexit()* must return to ensure that all registered functions  
 21368 are called.

21369       The application should call *sysconf()* to obtain the value of {ATEXIT\_MAX}, the number of  
 21370 functions that can be registered. There is no way for an application to tell how many functions  
 21371 have already been registered with *atexit()*.

21372       Since the behavior is undefined if the *exit()* function is called more than once, portable  
 21373 applications calling *atexit()* must ensure that the *exit()* function is not called at normal process  
 21374 termination when all functions registered by the *atexit()* function are called.

21375       All functions registered by the *atexit()* function are called at normal process termination, which  
 21376 occurs by a call to the *exit()* function or a return from *main()* or on the last thread termination,  
 21377 when the behavior is as if the implementation called *exit()* with a zero argument at thread  
 21378 termination time.

21379       If, at normal process termination, a function registered by the *atexit()* function is called and a  
 21380 portable application needs to stop further *exit()* processing, it must call the *\_exit()* function or  
 21381 the *\_Exit()* function or one of the functions which cause abnormal process termination.

21382 **RATIONALE**

21383       None.

21384 **FUTURE DIRECTIONS**

21385 None.

21386 **SEE ALSO**21387 *exec, exit(), sysconf()*

21388 XBD &lt;stdlib.h&gt;

21389 **CHANGE HISTORY**

21390 First released in Issue 4. Derived from the ANSI C standard.

21391 **Issue 6**

21392 Extensions beyond the ISO C standard are marked.

21393 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

21394 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/19 is applied, adding further clarification  
21395 to the APPLICATION USAGE section.

21396 **NAME**

21397        atof — convert a string to a double-precision number

21398 **SYNOPSIS**

21399        #include &lt;stdlib.h&gt;

21400        double atof(const char \*str);

21401 **DESCRIPTION**

21402 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 21403 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21404 volume of POSIX.1-2008 defers to the ISO C standard.

21405        The call *atof(str)* shall be equivalent to:

21406        strtod(str, (char \*\*)NULL),

21407 except that the handling of errors may differ. If the value cannot be represented, the behavior is  
 21408 undefined.

21409 **RETURN VALUE**21410        The *atof()* function shall return the converted value if the value can be represented.21411 **ERRORS**

21412        No errors are defined.

21413 **EXAMPLES**

21414        None.

21415 **APPLICATION USAGE**

21416        The *atof()* function is subsumed by *strtod()* but is retained because it is used extensively in  
 21417 existing code. If the number is not known to be in range, *strtod()* should be used because *atof()*  
 21418 is not required to perform any error checking.

21419 **RATIONALE**

21420        None.

21421 **FUTURE DIRECTIONS**

21422        None.

21423 **SEE ALSO**21424        *strtod()*

21425        XBD &lt;stdlib.h&gt;

21426 **CHANGE HISTORY**

21427        First released in Issue 1. Derived from Issue 1 of the SVID.

21428 **NAME**

21429       atoi — convert a string to an integer

21430 **SYNOPSIS**

21431       #include &lt;stdlib.h&gt;

21432       int atoi(const char \*str);

21433 **DESCRIPTION**

21434 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
21435       conflict between the requirements described here and the ISO C standard is unintentional. This  
21436       volume of POSIX.1-2008 defers to the ISO C standard.

21437       The call *atoi(str)* shall be equivalent to:

21438       (int) strtol(str, (char \*\*)NULL, 10)

21439       except that the handling of errors may differ. If the value cannot be represented, the behavior is  
21440       undefined.

21441 **RETURN VALUE**21442       The *atoi()* function shall return the converted value if the value can be represented.21443 **ERRORS**

21444       No errors are defined.

21445 **EXAMPLES**21446       **Converting an Argument**

21447       The following example checks for proper usage of the program. If there is an argument and the  
21448       decimal conversion of this argument (obtained using *atoi()*) is greater than 0, then the program  
21449       has a valid number of minutes to wait for an event.

```
21450       #include <stdlib.h>
21451       #include <stdio.h>
21452       ...
21453       int minutes_to_event;
21454       ...
21455       if (argc < 2 || ((minutes_to_event = atoi (argv[1]))) <= 0) {
21456           fprintf(stderr, "Usage: %s minutes\n", argv[0]); exit(1);
21457       }
21458       ...
```

21459 **APPLICATION USAGE**

21460       The *atoi()* function is subsumed by *strtol()* but is retained because it is used extensively in  
21461       existing code. If the number is not known to be in range, *strtol()* should be used because *atoi()* is  
21462       not required to perform any error checking.

21463 **RATIONALE**

21464       None.

21465 **FUTURE DIRECTIONS**

21466       None.

21467 **SEE ALSO**21468       *strtol()*

21469       XBD &lt;stdlib.h&gt;

21470	<b>CHANGE HISTORY</b>
21471	First released in Issue 1. Derived from Issue 1 of the SVID.

21472 **NAME**21473        `atol`, `atoll` — convert a string to a long integer21474 **SYNOPSIS**21475        `#include <stdlib.h>`21476        `long atol(const char *nptr);` |21477        `long long atoll(const char *nptr);`21478 **DESCRIPTION**

21479 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
 21480        conflict between the requirements described here and the ISO C standard is unintentional. This  
 21481        volume of POSIX.1-2008 defers to the ISO C standard.

21482        Except as noted below, the call `atol(nptr)` shall be equivalent to: |21483        `strtol(nptr, (char **)NULL, 10)` |21484        Except as noted below, the call to `atoll(nptr)` shall be equivalent to: |21485        `strtoll(nptr, (char **)NULL, 10)`

21486        The handling of errors may differ. If the value cannot be represented, the behavior is undefined. |

21487 **RETURN VALUE**

21488        These functions shall return the converted value if the value can be represented.

21489 **ERRORS**

21490        No errors are defined.

21491 **EXAMPLES**

21492        None.

21493 **APPLICATION USAGE**

21494        If the number is not known to be in range, `strtol()` or `strtoll()` should be used because `atol()` and |  
 21495        `atoll()` are not required to perform any error checking.

21496 **RATIONALE**

21497        None.

21498 **FUTURE DIRECTIONS**

21499        None.

21500 **SEE ALSO**21501        [\*strtol\(\)\*](#)21502        XBD [\*<stdlib.h>\*](#)21503 **CHANGE HISTORY**

21504        First released in Issue 1. Derived from Issue 1 of the SVID.

21505 **Issue 6**21506        The `atoll()` function is added for alignment with the ISO/IEC 9899:1999 standard.21507 **Issue 7**21508        SD5-XSH-ERN-61 is applied, correcting the DESCRIPTION of `atoll()`.

21509 **NAME**21510        **basename** — return the last component of a pathname21511 **SYNOPSIS**

```
21512 XSI      #include <libgen.h>
21513          char *basename(char *path);
```

21514 **DESCRIPTION**

21515        The *basename()* function shall take the pathname pointed to by *path* and return a pointer to the  
 21516        final component of the pathname, deleting any trailing '/' characters.

21517        If the string pointed to by *path* consists entirely of the '/' character, *basename()* shall return a  
 21518        pointer to the string "/". If the string pointed to by *path* is exactly "/", it is implementation-  
 21519        defined whether '/' or "/" is returned.

21520        If *path* is a null pointer or points to an empty string, *basename()* shall return a pointer to the  
 21521        string ".".

21522        The *basename()* function may modify the string pointed to by *path*, and may return a pointer to |  
 21523        internal storage. The returned pointer might be invalidated or the storage might be overwritten |  
 21524        by a subsequent call to *basename()*. The returned pointer might also be invalidated if the calling +  
 21525        thread is terminated.

21526        The *basename()* function need not be thread-safe.

21527 **RETURN VALUE**

21528        The *basename()* function shall return a pointer to the final component of *path*.

21529 **ERRORS**

21530        No errors are defined.

21531 **EXAMPLES**21532        **Using basename()**

21533        The following program fragment returns a pointer to the value *lib*, which is the base name of  
 21534        */usr/lib*.

```
21535      #include <libgen.h>
21536      ...
21537      char name[] = "/usr/lib";
21538      char *base;

21539      base = basename(name);
21540      ...
```

21541        **Sample Input and Output Strings for the basename() and dirname() Functions and the**  
 21542        **basename and dirname Utilities**

XCU *basename***CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

**Issue 6**

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/20 is applied, changing the DESCRIPTION to make it clear that the string referenced is the string pointed to by *path*.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #156 is applied.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0041 [75] is applied.

21582 **NAME**

21583 bind — bind a name to a socket

21584 **SYNOPSIS**

21585 #include &lt;sys/socket.h&gt;

```
21586 int bind(int socket, const struct sockaddr *address,
21587         socklen_t address_len);
```

21588 **DESCRIPTION**

21589 The *bind()* function shall assign a local socket address *address* to a socket identified by descriptor  
 21590 *socket* that has no local socket address assigned. Sockets created with the *socket()* function are  
 21591 initially unnamed; they are identified only by their address family.

21592 The *bind()* function takes the following arguments:

21593 *socket* Specifies the file descriptor of the socket to be bound.

21594 *address* Points to a **sockaddr** structure containing the address to be bound to the  
 21595 socket. The length and format of the address depend on the address family of  
 21596 the socket.

21597 *address\_len* Specifies the length of the **sockaddr** structure pointed to by the *address*  
 21598 argument.

21599 The socket specified by *socket* may require the process to have appropriate privileges to use the  
 21600 *bind()* function.

21601 If the address family of the socket is AF\_UNIX and the pathname in *address* names a symbolic  
 21602 link, *bind()* shall fail and set *errno* to [EADDRINUSE].

21603 If the socket address cannot be assigned immediately and O\_NONBLOCK is set for the file  
 21604 descriptor for the socket, *bind()* shall fail and set *errno* to [EINPROGRESS], but the assignment  
 21605 request shall not be aborted, and the assignment shall be completed asynchronously. Subsequent  
 21606 calls to *bind()* for the same socket, before the assignment is completed, shall fail and set *errno* to  
 21607 [EALREADY].

21608 When the assignment has been performed asynchronously, *pselect()*, *select()*, and *poll()* shall  
 21609 indicate that the file descriptor for the socket is ready for reading and writing.

21610 **RETURN VALUE**

21611 Upon successful completion, *bind()* shall return 0; otherwise, -1 shall be returned and *errno* set  
 21612 to indicate the error.

21613 **ERRORS**

21614 The *bind()* function shall fail if:

21615 [EADDRINUSE] The specified address is already in use.

21616 [EADDRNOTAVAIL]

21617 The specified address is not available from the local machine.

21618 [EAFNOSUPPORT]

21619 The specified address is not a valid address for the address family of the  
 21620 specified socket.

21621 [EALREADY] An assignment request is already in progress for the specified socket.

21622 [EBADF] The *socket* argument is not a valid file descriptor.

21623	[EINPROGRESS]	O_NONBLOCK is set for the file descriptor for the socket and the assignment cannot be immediately performed; the assignment shall be performed asynchronously.
21624		
21625		
21626	[EINVAL]	The socket is already bound to an address, and the protocol does not support binding to a new address; or the socket has been shut down.
21627		
21628	[ENOBUFS]	Insufficient resources were available to complete the call.
21629	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
21630	[EOPNOTSUPP]	The socket type of the specified socket does not support binding to an address.
21631	If the address family of the socket is AF_UNIX, then <i>bind()</i> shall fail if:	
21632	[EACCES]	A component of the path prefix denies search permission, or the requested name requires writing in a directory with a mode that denies write permission.
21633		
21634		
21635	[EDESTADDRREQ] or [EISDIR]	
21636		The <i>address</i> argument is a null pointer.
21637	[EIO]	An I/O error occurred.
21638	[ELOOP]	A loop exists in symbolic links encountered during resolution of the pathname in <i>address</i> .
21639		
21640	[ENAMETOOLONG]	
21641		The length of a component of a pathname is longer than {NAME_MAX}.
21642	[ENOENT]	A component of the path prefix of the pathname in <i>address</i> does not name an existing file or the pathname is an empty string.
21643		
21644	[ENOENT] or [ENOTDIR]	
21645		The pathname in <i>address</i> contains at least one non- <i>&lt;slash&gt;</i> character and ends with one or more trailing <i>&lt;slash&gt;</i> characters. If the pathname without the trailing <i>&lt;slash&gt;</i> characters would name an existing file, an [ENOENT] error shall not occur.
21646		
21647		
21648		
21649	[ENOTDIR]	A component of the path prefix of the pathname in <i>address</i> names an existing file that is neither a directory nor a symbolic link to a directory, or the pathname in <i>address</i> contains at least one non- <i>&lt;slash&gt;</i> character and ends with one or more trailing <i>&lt;slash&gt;</i> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.
21650		
21651		
21652		
21653		
21654		
21655	[EROFS]	The name would reside on a read-only file system.
21656	The <i>bind()</i> function may fail if:	
21657	[EACCES]	The specified address is protected and the current user does not have permission to bind to it.
21658		
21659	[EINVAL]	The <i>address_len</i> argument is not a valid length for the address family.
21660	[EISCONN]	The socket is already connected.
21661	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in <i>address</i> .
21662		

21663 [ENAMETOOLONG]  
 21664 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 21665 symbolic link produced an intermediate result with a length that exceeds  
 21666 {PATH\_MAX}.

## 21667 EXAMPLES

21668 The following code segment shows how to create a socket and bind it to a name in the AF\_UNIX  
 21669 domain.

```
21670 #define MY_SOCKET_PATH "/somepath"
21671 int sfd;
21672 struct sockaddr_un my_addr;
21673 sfd = socket(AF_UNIX, SOCK_STREAM, 0);
21674 if (sfd == -1)
21675     /* Handle error */;
21676 memset(&my_addr, '\0', sizeof(struct sockaddr_un));
21677     /* Clear structure */
21678 my_addr.sun_family = AF_UNIX;
21679 strncpy(my_addr.sun_path, MY_SOCKET_PATH, sizeof(my_addr.sun_path) - 1);
21680 if (bind(sfd, (struct sockaddr *) &my_addr,
21681         sizeof(struct sockaddr_un)) == -1)
21682     /* Handle error */;
```

## 21683 APPLICATION USAGE

21684 An application program can retrieve the assigned socket name with the *getsockname()* function.

## 21685 RATIONALE

21686 None.

## 21687 FUTURE DIRECTIONS

21688 None.

## 21689 SEE ALSO

21690 *connect()*, *getsockname()*, *listen()*, *socket()*

21691 XBD <sys/socket.h>

## 21692 CHANGE HISTORY

21693 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

### 21694 Issue 7

21695 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [ENOBUFFS]  
 21696 error to become a “shall fail” error.

21697 Austin Group Interpretation 1003.1-2001 #143 is applied.

21698 SD5-XSH-ERN-185 is applied.

21699 An example is added.

21700 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0042 [146], XSH/TC1-2008/0043 [146],  
 21701 and XSH/TC1-2008/0044 [324] are applied.

## NAME

bsearch — binary search a sorted table

## SYNOPSIS

```
#include <stdlib.h>
```

```
void *bsearch(const void *key, const void *base, size_t nel,
             size_t width, int (*compar)(const void *, const void *));
```

## DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The `bsearch()` function shall search an array of *nel* objects, the initial element of which is pointed to by *base*, for an element that matches the object pointed to by *key*. The size of each element in the array is specified by *width*. If the *nel* argument has the value zero, the comparison function pointed to by *compar* shall not be called and no match shall be found.

The comparison function pointed to by *compar* shall be called with two arguments that point to the *key* object and to an array element, in that order.

The application shall ensure that the comparison function pointed to by *compar* does not alter the contents of the array. The implementation may reorder elements of the array between calls to the comparison function, but shall not alter the contents of any individual element.

The implementation shall ensure that the first argument is always a pointer to the key.

When the same objects (consisting of width bytes, irrespective of their current positions in the array) are passed more than once to the comparison function, the results shall be consistent with one another. That is, the same object shall always compare the same way with the key.

The application shall ensure that the function returns an integer less than, equal to, or greater than 0 if the *key* object is considered, respectively, to be less than, to match, or to be greater than the array element. The application shall ensure that the array consists of all the elements that compare less than, all the elements that compare equal to, and all the elements that compare greater than the *key* object, in that order.

## RETURN VALUE

The *bsearch()* function shall return a pointer to a matching member of the array, or a null pointer if no match is found. If two or more members compare equal, which member is returned is unspecified.

## ERRORS

No errors are defined.

## EXAMPLES

The example below searches a table containing pointers to nodes consisting of a string and its length. The table is ordered alphabetically on the string in the node pointed to by each entry.

The code fragment below reads in strings and either finds the corresponding node and prints out the string and its length, or prints an error message.

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
```

```
#define TABSIZE 1000
```

[illegible]

```

21746     char *string;
21747     int length;
21748 };
21749 struct node table[TABSIZE];    /* Table to be searched. */
21750     .
21751     .
21752     .
21753 {
21754     struct node *node_ptr, node;
21755     /* Routine to compare 2 nodes. */
21756     int node_compare(const void *, const void *);
21757     .
21758     .
21759     .
21760     while (scanf("%ms", &node.string) != EOF) {
21761         node_ptr = (struct node *)bsearch((void *)&node,
21762             (void *)table, TABSIZE,
21763             sizeof(struct node), node_compare);
21764         if (node_ptr != NULL) {
21765             (void)printf("string = %20s, length = %d\n",
21766                 node_ptr->string, node_ptr->length);
21767         } else {
21768             (void)printf("not found: %s\n", node.string);
21769         }
21770         free(node.string);
21771     }
21772 }
21773 /*
21774     This routine compares two nodes based on an
21775     alphabetical ordering of the string field.
21776 */
21777 int
21778 node_compare(const void *node1, const void *node2)
21779 {
21780     return strcoll(((const struct node *)node1)->string,
21781         ((const struct node *)node2)->string);
21782 }

```

## APPLICATION USAGE

The pointers to the key and the element at the base of the table should be of type pointer-to-element.

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

In practice, the array is usually sorted according to the comparison function.

## RATIONALE

The requirement that the second argument (hereafter referred to as *p*) to the comparison function is a pointer to an element of the array implies that for every call all of the following expressions are non-zero:

```

21793 ( (char *)p - (char *)base ) % width == 0
21794 (char *)p >= (char *)base

```

21795           (char \*)p < (char \*)base + nel \* width

21796 **FUTURE DIRECTIONS**

21797           None.

21800           XBD <stdlib.h>

21801 **CHANGE HISTORY**

21802           First released in Issue 1. Derived from Issue 1 of the SVID.

21803 **Issue 6**

21804           The normative text is updated to avoid use of the term “must” for application requirements.

21805           IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/11 is applied, adding to the  
21806           DESCRIPTION the last sentence of the first non-shaded paragraph, and the following three  
21807           paragraphs. The RATIONALE section is also updated. These changes are for alignment with the  
21808           ISO C standard.

21809 **Issue 7**

21810           The EXAMPLES section is revised.

21811 **NAME**

21812       btowc — single byte to wide character conversion

21813 **SYNOPSIS**

21814       #include &lt;stdio.h&gt;

21815       #include &lt;wchar.h&gt;

21816       wint\_t btowc(int c);

21817 **DESCRIPTION**

21818 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 21819       conflict between the requirements described here and the ISO C standard is unintentional. This  
 21820       volume of POSIX.1-2008 defers to the ISO C standard.

21821       The *btowc()* function shall determine whether *c* constitutes a valid (one-byte) character in the  
 21822       initial shift state.

21823       The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.

21824 **RETURN VALUE**

21825       The *btowc()* function shall return WEOF if *c* has the value EOF or if (**unsigned char**) *c* does not  
 21826       constitute a valid (one-byte) character in the initial shift state. Otherwise, it shall return the  
 21827       wide-character representation of that character.

21828 CX       In the POSIX locale, *btowc()* shall not return WEOF if *c* has a value in the range 0 to 255 +  
 21829       inclusive.

21830 **ERRORS**

21831       No errors are defined.

21832 **EXAMPLES**

21833       None.

21834 **APPLICATION USAGE**

21835       None.

21836 **RATIONALE**

21837       None.

21838 **FUTURE DIRECTIONS**

21839       None.

21936 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21937 **NAME**

21938       cacosl — complex arc cosine functions

21939 **SYNOPSIS**

21940       #include &lt;complex.h&gt;

21941       long double complex cacosl(long double complex z);

21942 **DESCRIPTION**21943       Refer to *acos()*.

21944 **NAME**

21945        calloc — a memory allocator

21946 **SYNOPSIS**

21947        #include &lt;stdlib.h&gt;

21948        void \*calloc(size\_t *nelem*, size\_t *elsize*);21949 **DESCRIPTION**

21950 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
 21951        conflict between the requirements described here and the ISO C standard is unintentional. This  
 21952        volume of POSIX.1-2008 defers to the ISO C standard.

21953        The *calloc()* function shall allocate unused space for an array of *nelem* elements each of whose  
 21954        size in bytes is *elsize*. The space shall be initialized to all bits 0.

21955        The order and contiguity of storage allocated by successive calls to *calloc()* is unspecified. The  
 21956        pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to  
 21957        a pointer to any type of object and then used to access such an object or an array of such objects  
 21958        in the space allocated (until the space is explicitly freed or reallocated). Each such allocation shall  
 21959        yield a pointer to an object disjoint from any other object. The pointer returned shall point to the  
 21960        start (lowest byte address) of the allocated space. If the space cannot be allocated, a null pointer  
 21961        shall be returned. If the size of the space requested is 0, the behavior is implementation-defined:  
 21962        either a null pointer shall be returned, or the behavior shall be as if the size were some non-zero  
 21963        value, except that the behavior is undefined if the returned pointer is used to access an object.

21964 **RETURN VALUE**

21965        Upon successful completion with both *nelem* and *elsize* non-zero, *calloc()* shall return a pointer to  
 21966        the allocated space. If either *nelem* or *elsize* is 0, then either:

- 21967 CX        • A null pointer shall be returned and *errno* may be set to an implementation-defined value,  
 21968                or
- 21969        • A pointer to the allocated space shall be returned. The application shall ensure that the  
 21970        pointer is not used to access an object.

21971 CX        Otherwise, it shall return a null pointer and set *errno* to indicate the error.

21972 **ERRORS**21973        The *calloc()* function shall fail if:

21974 CX        [ENOMEM]        Insufficient memory is available.

21975 **EXAMPLES**

21976        None.

21977 **APPLICATION USAGE**

21978        There is now no requirement for the implementation to support the inclusion of &lt;malloc.h&gt;.

21979 **RATIONALE**

21980        None.

21981 **FUTURE DIRECTIONS**

21982        None.

21983 **SEE ALSO**21984        *free()*, *malloc()*, *realloc()*

21985        XBD &lt;stdlib.h&gt;

21986 **CHANGE HISTORY**

21987 First released in Issue 1. Derived from Issue 1 of the SVID.

21988 **Issue 6**

21989 Extensions beyond the ISO C standard are marked.

21990 The following new requirements on POSIX implementations derive from alignment with the  
21991 Single UNIX Specification:

- 21992
- The setting of *errno* and the [ENOMEM] error condition are mandatory if an insufficient
- 
- 21993 memory condition occurs.

21994 **NAME**

21995       carg, cargf, cargl — complex argument functions

21996 **SYNOPSIS**

21997       #include &lt;complex.h&gt;

21998       double carg(double complex z);

21999       float cargf(float complex z);

22000       long double cargl(long double complex z);

22001 **DESCRIPTION**

22002 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
22003       conflict between the requirements described here and the ISO C standard is unintentional. This  
22004       volume of POSIX.1-2008 defers to the ISO C standard.

22005       These functions shall compute the argument (also called phase angle) of  $z$ , with a branch cut  
22006       along the negative real axis.

22007 **RETURN VALUE**22008       These functions shall return the value of the argument in the interval  $[-\pi, +\pi]$ .22009 **ERRORS**

22056       c sinh, c sinh f, c sinh l — complex arc hyperbolic sine functions

22057 **SYNOPSIS**

22058       #include &lt;complex.h&gt;

22059       double complex c sinh(double complex z);

22060       float complex c sinh f(float complex z);

22061       long double complex c sinh l(long double complex z);

22062 **DESCRIPTION**

22063 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
22064       conflict between the requirements described here and the ISO C standard is unintentional. This  
22065       volume of POSIX.1-2008 defers to the ISO C standard.

22066       These functions shall compute the complex arc hyperbolic sine of  $z$ , with branch cuts outside the  
22067       interval  $[-i, +i]$  along the imaginary axis.

22068 **RETURN VALUE**

22069       These functions shall return the complex arc hyperbolic sine value, in the range of a strip  
22070       mathematically unbounded along the real axis and in the interval  $[-i\pi/2, +i\pi/2]$  along the  
22071       imaginary axis.

22072 **ERRORS**

22073       No errors are defined.

22074 **EXAMPLES**

22075       None.

22076 **APPLICATION USAGE**

22077       None.

22078 **RATIONALE**

22079       None.

22080 **FUTURE DIRECTIONS**

22081       None.

22085 **CHANGE HISTORY**

22086       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

22087 **NAME**

22088        casinl — complex arc sine functions

22089 **SYNOPSIS**22090        `#include <complex.h>`22091        `long double complex casinl(long double complex z);`22092 **DESCRIPTION**22093        Refer to *casin()*.

22094 **NAME**

22095       catan, catanf, catanl — complex arc tangent functions

22096 **SYNOPSIS**

```
22097       #include <complex.h>
22098       double complex catan(double complex z);
22099       float complex catanf(float complex z);
22100       long double complex catanl(long double complex z);
```

22101 **DESCRIPTION**

22102 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
22103       conflict between the requirements described here and the ISO C standard is unintentional. This  
22104       volume of POSIX.1-2008 defers to the ISO C standard.

22105       These functions shall compute the complex arc tangent of  $z$ , with branch cuts outside the  
22106       interval  $[-i, +i]$  along the imaginary axis.

22107 **RETURN VALUE**

22108       These functions shall return the complex arc tangent value, in the range of a strip  
22109       mathematically unbounded along the imaginary axis and in the interval  $[-\pi/2, +\pi/2]$  along the  
22110       real axis.

22111 **ERRORS**

22112       No errors are defined.

22113 **EXAMPLES**

22114       None.

22115 **APPLICATION USAGE**

22116       None.

22156 **CHANGE HISTORY**

22157       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

22158 **NAME**

22159       catanl — complex arc tangent functions

22160 **SYNOPSIS**

22161       #include &lt;complex.h&gt;

22162       long double complex catanl(long double complex z);

22163 **DESCRIPTION**22164       Refer to *catan()*.

22165 **NAME**

22166 catclose — close a message catalog descriptor

22167 **SYNOPSIS**

22168 #include &lt;nl\_types.h&gt;

22169 int catclose(nl\_catd catd);

22170 **DESCRIPTION**

22171 The *catclose()* function shall close the message catalog identified by *catd*. If a file descriptor is  
22172 used to implement the type **nl\_catd**, that file descriptor shall be closed.

22173 **RETURN VALUE**

22174 Upon successful completion, *catclose()* shall return 0; otherwise, -1 shall be returned, and *errno*  
22175 set to indicate the error.

22176 **ERRORS**22177 The *catclose()* function may fail if:

22178 [EBADF] The catalog descriptor is not valid.

22179 [EINTR] The *catclose()* function was interrupted by a signal.22180 **EXAMPLES**

22181 None.

22182 **APPLICATION USAGE**

22183 None.

22184 **RATIONALE**

22185 None.

22186 **FUTURE DIRECTIONS**

22187 None.

22188 **SEE ALSO**22189 *catgets()*, *catopen()*

22190 XBD &lt;nl\_types.h&gt;

22191 **CHANGE HISTORY**

22192 First released in Issue 2.

22193 **Issue 7**22194 The *catclose()* function is moved from the XSI option to the Base.

22195 **NAME**

22196 catgets — read a program message

22197 **SYNOPSIS**

22198 #include &lt;nl\_types.h&gt;

22199 char \*catgets(nl\_catd catd, int set\_id, int msg\_id, const char \*s);

22200 **DESCRIPTION**

22201 The *catgets()* function shall attempt to read message *msg\_id*, in set *set\_id*, from the message  
22202 catalog identified by *catd*. The *catd* argument is a message catalog descriptor returned from an  
22203 earlier call to *catopen()*. The results are undefined if *catd* is not a value returned by *catopen()* for  
22204 a message catalog still open in the process. The *s* argument points to a default message string  
22205 which shall be returned by *catgets()* if it cannot retrieve the identified message.

22206 The *catgets()* function need not be thread-safe.22207 **RETURN VALUE**

22208 If the identified message is retrieved successfully, *catgets()* shall return a pointer to an internal  
22209 buffer area containing the null-terminated message string. If the call is unsuccessful for any  
22210 reason, *s* shall be returned and *errno* shall be set to indicate the error.

22211 **ERRORS**22212 The *catgets()* function shall fail if:

22213 [EINTR] The read operation was terminated due to the receipt of a signal, and no data  
22214 was transferred.

22215 [ENOMSG] The message identified by *set\_id* and *msg\_id* is not in the message catalog.

22216 The *catgets()* function may fail if:

22217 [EBADF] The *catd* argument is not a valid message catalog descriptor open for reading.

22218 [EBADMSG] The message identified by *set\_id* and *msg\_id* in the specified message catalog  
22219 did not satisfy implementation-defined security criteria.

22220 [EINVAL] The message catalog identified by *catd* is corrupted.

22221 **EXAMPLES**

22222 None.

22223 **APPLICATION USAGE**

22224 None.

22225 **RATIONALE**

22226 None.

22227 **FUTURE DIRECTIONS**

22228 None.

22229 **SEE ALSO**22230 *catclose()*, *catopen()*

22231 XBD &lt;nl\_types.h&gt;

22232 **CHANGE HISTORY**

22233 First released in Issue 2.

22234 **Issue 5**

22235 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

22236 **Issue 6**

22237 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

22238 **Issue 7**

22239 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [EINTR] and  
22240 [ENOMSG] errors to become “shall fail” errors, updating the RETURN VALUE section, and  
22241 updating the DESCRIPTION to note that: “The results are undefined if *catd* is not a value  
22242 returned by *catopen()* for a message catalog still open in the process.

22243 Austin Group Interpretation 1003.1-2001 #148 is applied, adding

22244 The *catgets()* function is moved from the XSI option to the Base.

22245 **NAME**

22246 catopen — open a message catalog

22247 **SYNOPSIS**

22248 #include &lt;nl\_types.h&gt;

22249 nl\_catd catopen(const char \*name, int oflag);

22250 **DESCRIPTION**

22251 The *catopen()* function shall open a message catalog and return a message catalog descriptor.  
 22252 The *name* argument specifies the name of the message catalog to be opened. If *name* contains a  
 22253 `'/'`, then *name* specifies a pathname for the message catalog. Otherwise, the environment  
 22254 variable *NLSPATH* is used with *name* substituted for the `%N` conversion specification (see XBD  
 22255 Chapter 8, on page 173); if *NLSPATH* exists in the environment when the process starts, then if  
 22256 the process has appropriate privileges, the behavior of *catopen()* is undefined. If *NLSPATH* does  
 22257 not exist in the environment, or if a message catalog cannot be found in any of the components  
 22258 specified by *NLSPATH*, then an implementation-defined default path shall be used. This default  
 22259 may be affected by the setting of *LC\_MESSAGES* if the value of *oflag* is *NL\_CAT\_LOCALE*, or  
 22260 the *LANG* environment variable if *oflag* is 0.

22261 A message catalog descriptor shall remain valid in a process until that process closes it, or a  
 22262 successful call to one of the *exec* functions. A change in the setting of the *LC\_MESSAGES*  
 22263 category may invalidate existing open catalogs.

22264 If a file descriptor is used to implement message catalog descriptors, the *FD\_CLOEXEC* flag  
 22265 shall be set; see <fcntl.h>.

22266 If the value of the *oflag* argument is 0, the *LANG* environment variable is used to locate the  
 22267 catalog without regard to the *LC\_MESSAGES* category. If the *oflag* argument is  
 22268 *NL\_CAT\_LOCALE*, the *LC\_MESSAGES* category is used to locate the message catalog (see XBD  
 22269 Section 8.2, on page 174).

22270 **RETURN VALUE**

22271 Upon successful completion, *catopen()* shall return a message catalog descriptor for use on  
 22272 subsequent calls to *catgets()* and *catclose()*. Otherwise, *catopen()* shall return (*nl\_catd*) -1 and set  
 22273 *errno* to indicate the error.

22274 **ERRORS**22275 The *catopen()* function may fail if:

22276 [EACCES] Search permission is denied for the component of the path prefix of the  
 22277 message catalog or read permission is denied for the message catalog.

22278 [EMFILE] All file descriptors available to the process are currently open.

22279 [ENAMETOOLONG]  
 22280 The length of a component of a pathname is longer than {NAME\_MAX}.

22281 [ENAMETOOLONG]  
 22282 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 22283 symbolic link produced an intermediate result with a length that exceeds  
 22284 {PATH\_MAX}.

22285 [ENFILE] Too many files are currently open in the system.

22286 [ENOENT] The message catalog does not exist or the *name* argument points to an empty  
 22287 string.

22288 [ENOMEM] Insufficient storage space is available.

22289 [ENOTDIR] A component of the path prefix of the message catalog names an existing file  
 22290 that is neither a directory nor a symbolic link to a directory, or the pathname  
 22291 of the message catalog contains at least one non-`<slash>` character and ends  
 22292 with one or more trailing `<slash>` characters and the last pathname  
 22293 component names an existing file that is neither a directory nor a symbolic  
 22294 link to a directory.

**EXAMPLES**

22295 None.  
 22296

**APPLICATION USAGE**

22298 Some implementations of `catopen()` use `malloc()` to allocate space for internal buffer areas. The  
 22299 `catopen()` function may fail if there is insufficient storage space available to accommodate these  
 22300 buffers.

22301 Conforming applications must assume that message catalog descriptors are not valid after a call  
 22302 to one of the `exec` functions.

22303 Application developers should be aware that guidelines for the location of message catalogs  
 22304 have not yet been developed. Therefore they should take care to avoid conflicting with catalogs  
 22305 used by other applications and the standard utilities.

22306 To be sure that messages produced by an application running with appropriate privileges cannot +  
 22307 be used by an attacker setting an unexpected value for `NLSPATH` in the environment to confuse +  
 22308 a system administrator, such applications should use pathnames containing a `' / '` to get defined +  
 22309 behavior when using `catopen()` to open a message catalog.

**RATIONALE**

22310 None.  
 22311

**FUTURE DIRECTIONS**

22312 None.  
 22313

**SEE ALSO**

22422 **NAME**

22423       ccosl — complex cosine functions

22424 **SYNOPSIS**

22425       #include &lt;complex.h&gt;

22426       long double complex ccosl(long double complex z);

22427 **DESCRIPTION**22428       Refer to *ccos()*.

22429 **NAME**

22430       ceil, ceilf, ceill — ceiling value function

22431 **SYNOPSIS**

```
22432       #include <math.h>
22433       double ceil(double x);
22434       float ceilf(float x);
22435       long double ceill(long double x);
```

22436 **DESCRIPTION**

22437 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 22438       conflict between the requirements described here and the ISO C standard is unintentional. This  
 22439       volume of POSIX.1-2008 defers to the ISO C standard.

22440       These functions shall compute the smallest integral value not less than *x*.22441 **RETURN VALUE**22442 MX       The result shall have the same sign as *x*.

22443       Upon successful completion, *ceil()*, *ceilf()*, and *ceill()* shall return the smallest integral value not  
 22444       less than *x*, expressed as a type **double**, **float**, or **long double**, respectively.

22445 MX       If *x* is NaN, a NaN shall be returned.22446       If *x* is  $\pm 0$  or  $\pm \text{Inf}$ , *x* shall be returned.22447 **ERRORS**

22448       No errors are defined.

22449 **EXAMPLES**

22450       None.

22451 **APPLICATION USAGE**

22452       The integral value returned by these functions need not be expressible as an **intmax\_t**. The  
 22453       return value should be tested before assigning it to an integer type to avoid the undefined  
 22454       results of an integer overflow.

22455       These functions may raise the inexact floating-point exception if the result differs in value from  
 22456       the argument.

22457 **RATIONALE**

22458       None.

22459 **FUTURE DIRECTIONS**

22460       None.

22501 **SEE ALSO**22502 [clog\(\)](#)22503 XBD [<complex.h>](#)22504 **CHANGE HISTORY**

22505 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

22506 **NAME**

22507 cfgetispeed — get input baud rate

22508 **SYNOPSIS**

22509 #include &lt;termios.h&gt;

22510 speed\_t cfgetispeed(const struct termios \*termios\_p);

22511 **DESCRIPTION**22512 The *cfgetispeed()* function shall extract the input baud rate from the **termios** structure to which  
22513 the *termios\_p* argument points.22514 This function shall return exactly the value in the **termios** data structure, without interpretation.22515 **RETURN VALUE**22516 Upon successful completion, *cfgetispeed()* shall return a value of type **speed\_t** representing the  
22517 input baud rate.22518 **ERRORS**

22519 No errors are defined.

22520 **EXAMPLES**

22521 None.

22522 **APPLICATION USAGE**

22523 None.

22524 **RATIONALE**22525 The term “baud” is used historically here, but is not technically correct. This is properly “bits per  
22526 second”, which may not be the same as baud. However, the term is used because of the  
22527 historical usage and understanding.22528 The *cfgetispeed()*, *cfsetispeed()*, *cfsetospeed()*, and *cfsetispeed()* functions do not take arguments as  
22529 numbers, but rather as symbolic names. There are two reasons for this:

- 22530 1. Historically, numbers were not used because of the way the rate was stored in the data
- 
- 22531 structure. This is retained even though a function is now used.
- 
- 22532 2. More importantly, only a limited set of possible rates is at all portable, and this constrains
- 
- 22533 the application to that set.

22534 There is nothing to prevent an implementation accepting as an extension a number (such as 126),  
22535 and since the encoding of the Bxxx symbols is not specified, this can be done to avoid  
22536 introducing ambiguity.22537 Setting the input baud rate to zero was a mechanism to allow for split baud rates. Clarifications  
22538 in this volume of POSIX.1-2008 have made it possible to determine whether split rates are  
22539 supported and to support them without having to treat zero as a special case. Since this  
22540 functionality is also confusing, it has been declared obsolescent. The 0 argument referred to is  
22541 the literal constant 0, not the symbolic constant B0. This volume of POSIX.1-2008 does not  
22542 preclude B0 from being defined as the value 0; in fact, implementations would likely benefit  
22543 from the two being equivalent. This volume of POSIX.1-2008 does not fully specify whether the  
22544 previous *cfsetispeed()* value is retained after a *tcgetattr()* as the actual value or as zero. Therefore,  
22545 conforming applications should always set both the input speed and output speed when setting  
22546 either.22547 In historical implementations, the baud rate information is traditionally kept in **c\_cflag**.  
22548 Applications should be written to presume that this might be the case (and thus not blindly copy  
22549 **c\_cflag**), but not to rely on it in case it is in some other field of the structure. Setting the **c\_cflag**  
22550 field absolutely after setting a baud rate is a non-portable action because of this. In general, the

22551 unused parts of the flag fields might be used by the implementation and should not be blindly  
22552 copied from the descriptions of one terminal device to another.

22553 **FUTURE DIRECTIONS**

22657 **Issue 6**22658 The following new requirements on POSIX implementations derive from alignment with the  
22659 Single UNIX Specification:

- 22660
- The optional setting of *errno* and the [EINVAL] error conditions are added.

22661 **NAME**

22662 chdir — change working directory

22663 **SYNOPSIS**

22664 #include &lt;unistd.h&gt;

22665 int chdir(const char \*path);

22666 **DESCRIPTION**

22667 The *chdir()* function shall cause the directory named by the pathname pointed to by the *path*  
22668 argument to become the current working directory; that is, the starting point for path searches  
22669 for pathnames not beginning with '/ '.

22670 **RETURN VALUE**

22671 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned, the current  
22672 working directory shall remain unchanged, and *errno* shall be set to indicate the error.

22673 **ERRORS**22674 The *chdir()* function shall fail if:

22675 [EACCES] Search permission is denied for any component of the pathname.

22676 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
22677 argument.

22678 [ENAMETOOLONG]

22679 The length of a component of a pathname is longer than {NAME\_MAX}.

22680 [ENOENT] A component of *path* does not name an existing directory or *path* is an empty  
22681 string.

22682 [ENOTDIR] A component of the pathname names an existing file that is neither a directory  
22683 nor a symbolic link to a directory.

22684 The *chdir()* function may fail if:

22685 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
22686 resolution of the *path* argument.

22687 [ENAMETOOLONG]

22688 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
22689 symbolic link produced an intermediate result with a length that exceeds  
22690 {PATH\_MAX}.

22691 **EXAMPLES**22692 **Changing the Current Working Directory**

22693 The following example makes the value pointed to by **directory**, **/tmp**, the current working  
22694 directory.

22695 #include &lt;unistd.h&gt;

22696 ...

22697 char \*directory = "/tmp";

22698 int ret;

22699 ret = chdir (directory);

22700 **APPLICATION USAGE**

22701 None.

22702 **RATIONALE**22703 The *chdir()* function only affects the working directory of the current process.22704 **FUTURE DIRECTIONS**

22705 None.

22706 **SEE ALSO**22707 *getcwd()*

22708 XBD &lt;unistd.h&gt;

22709 **CHANGE HISTORY**

22710 First released in Issue 1. Derived from Issue 1 of the SVID.

22711 **Issue 6**

22712 The APPLICATION USAGE section is added.

22713 The following new requirements on POSIX implementations derive from alignment with the  
22714 Single UNIX Specification:

- 22715 • The [ELOOP] mandatory error condition is added.
- 22716 • A second [ENAMETOOLONG] is added as an optional error condition.

22717 The following changes were made to align with the IEEE P1003.1a draft standard:

- 22718 • The [ELOOP] optional error condition is added.

22719 **Issue 7**

22720 Austin Group Interpretation 1003.1-2001 #143 is applied.

22721 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0047 [324] is applied.

22722 **NAME**

22723 chmod, fchmodat — change mode of a file |

22724 **SYNOPSIS**

22725 #include &lt;sys/stat.h&gt;

22726 int chmod(const char \*path, mode\_t mode);

22727 OH #include &lt;fcntl.h&gt; +

22728 int fchmodat(int fd, const char \*path, mode\_t mode, int flag);

22729 **DESCRIPTION**

22730 XSI The *chmod()* function shall change S\_ISUID, S\_ISGID, S\_ISVTX, and the file permission bits of  
 22731 the file named by the pathname pointed to by the *path* argument to the corresponding bits in the  
 22732 *mode* argument. The application shall ensure that the effective user ID of the process matches the  
 22733 owner of the file or the process has appropriate privileges in order to do this.

22734 XSI S\_ISUID, S\_ISGID, S\_ISVTX, and the file permission bits are described in <sys/stat.h>.

22735 If the calling process does not have appropriate privileges, and if the group ID of the file does  
 22736 not match the effective group ID or one of the supplementary group IDs and if the file is a  
 22737 regular file, bit S\_ISGID (set-group-ID on execution) in the file's mode shall be cleared upon  
 22738 successful return from *chmod()*.

22739 Additional implementation-defined restrictions may cause the S\_ISUID and S\_ISGID bits in  
 22740 *mode* to be ignored.

22741 Upon successful completion, *chmod()* shall mark for update the last file status change timestamp  
 22742 of the file.

22743 The *fchmodat()* function shall be equivalent to the *chmod()* function except in the case where *path*  
 22744 specifies a relative path. In this case the file to be changed is determined relative to the directory  
 22745 associated with the file descriptor *fd* instead of the current working directory. If the access mode  
 22746 of the open file description associated with the file descriptor is not O\_SEARCH, the function  
 22747 shall check whether directory searches are permitted using the current permissions of the  
 22748 directory underlying the file descriptor. If the access mode is O\_SEARCH, the function shall not  
 22749 perform the check.

22750 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 22751 in <fcntl.h>:

22752 AT\_SYMLINK\_NOFOLLOW

22753 If *path* names a symbolic link, then the mode of the symbolic link is changed.

22754 If *fchmodat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 22755 directory shall be used. If also *flag* is zero, the behavior shall be identical to a call to *chmod()*.

22756 **RETURN VALUE**

22757 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 22758 return -1 and set *errno* to indicate the error. If -1 is returned, no change to the file mode occurs.

22759 **ERRORS**

22760 These functions shall fail if:

22761 [EACCES] Search permission is denied on a component of the path prefix.

22762 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 22763 argument.

22764	[ENAMETOOLONG]	
22765		The length of a component of a pathname is longer than {NAME_MAX}.
22766	[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
22767	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>path</i> argument contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.
22768		
22769		
22770		
22771		
22772	[EPERM]	The effective user ID does not match the owner of the file and the process does not have appropriate privileges.
22773		
22774	[EROFS]	The named file resides on a read-only file system.
22775	The <i>fchmodat()</i> function shall fail if:	
22776	[EACCES]	The access mode of the open file description associated with <i>fd</i> is not O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit directory searches.
22777		
22778		
22779	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.
22780		
22781	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is a file descriptor associated with a non-directory file.
22782		
22783	These functions may fail if:	
22784	[EINTR]	A signal was caught during execution of the function.
22785	[EINVAL]	The value of the <i>mode</i> argument is invalid.
22786	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
22787		
22788	[ENAMETOOLONG]	
22789		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
22790		
22791		
22792	The <i>fchmodat()</i> function may fail if:	
22793	[EINVAL]	The value of the <i>flag</i> argument is invalid.
22794	[EOPNOTSUPP]	The AT_SYMLINK_NOFOLLOW bit is set in the <i>flag</i> argument, <i>path</i> names a symbolic link, and the system does not support changing the mode of a symbolic link.
22795		
22796		

## 22797 EXAMPLES

**Setting Read Permissions for User, Group, and Others**

The following example sets read permissions for the owner, group, and others.

```
#include <sys/stat.h>
const char *path;
...
chmod(path, S_IRUSR|S_IRGRP|S_IROTH);
```

**Setting Read, Write, and Execute Permissions for the Owner Only**

The following example sets read, write, and execute permissions for the owner, and no permissions for group and others.

```
#include <sys/stat.h>
const char *path;
...
chmod(path, S_IRWXU);
```

**Setting Different Permissions for Owner, Group, and Other**

The following example sets owner permissions for `CHANGEFILE` to read, write, and execute, group permissions to read and execute, and other permissions to read.

```
#include <sys/stat.h>
#define CHANGEFILE "/etc/myfile"
...
chmod(CHANGEFILE, S_IRWXU|S_IRGRP|S_IXGRP|S_IROTH);
```

**Setting and Checking File Permissions**

The following example sets the file permission bits for a file named `/home/cnd/mod1`, then calls the `stat()` function to verify the permissions.

```
#include <sys/types.h>
#include <sys/stat.h>
int status;
struct stat buffer
...
chmod("/home/cnd/mod1", S_IRWXU|S_IRWXG|S_IROTH|S_IWOTH);
status = stat("/home/cnd/mod1", &buffer);
```

**APPLICATION USAGE**

In order to ensure that the `S_ISUID` and `S_ISGID` bits are set, an application requiring this should use `stat()` after a successful `chmod()` to verify this.

Any file descriptors currently open by any process on the file could possibly become invalid if the mode of the file is changed to a value which would deny access to that process. One situation where this could occur is on a stateless file system. This behavior will not occur in a conforming environment.

**RATIONALE**

This volume of POSIX.1-2008 specifies that the S\_ISGID bit is cleared by *chmod()* on a regular file under certain conditions. This is specified on the assumption that regular files may be executed, and the system should prevent users from making executable *setgid()* files perform with privileges that the caller does not have. On implementations that support execution of other file types, the S\_ISGID bit should be cleared for those file types under the same circumstances.

Implementations that use the S\_ISUID bit to indicate some other function (for example, mandatory record locking) on non-executable files need not clear this bit on writing. They should clear the bit for executable files and any other cases where the bit grants special powers to processes that change the file contents. Similar comments apply to the S\_ISGID bit.

The purpose of the *fchmodat()* function is to enable changing the mode of files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *chmod()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *fchmodat()* function it can be guaranteed that the changed file is located relative to the desired directory. Some implementations might allow changing the mode of symbolic links. This is not supported by the interfaces in the POSIX specification. Systems with such support provide an interface named *lchmod()*. To support such implementations *fchmodat()* has a *flag* parameter.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*access()*, *chown()*, *exec*, *fstatat()*, *fstatvfs()*, *mkdir()*, *mkfifo()*, *mknod()*, *open()*

XBD [\*<fcntl.h>\*](#), [\*<sys/stat.h>\*](#), [\*<sys/types.h>\*](#)

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include [\*<sys/types.h>\*](#) has been removed. Although [\*<sys/types.h>\*](#) was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EINVAL] and [EINTR] optional error conditions are added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term “must” for application requirements.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *fchmodat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a

22878            pathname exists but is not a directory or a symbolic link to a directory.

22879            POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0048 [300], XSH/TC1-2008/0049 [461],

22880            XSH/TC1-2008/0050 [324], XSH/TC1-2008/0051 [278], and XSH/TC1-2008/0052 [278] are

22881            applied.

## 22882 NAME

22883 chown, fchownat — change owner and group of a file |

## 22884 SYNOPSIS

22885 #include &lt;unistd.h&gt;

22886 int chown(const char \*path, uid\_t owner, gid\_t group);

22887 OH #include &lt;fcntl.h&gt; +

22888 +

22889 int fchownat(int fd, const char \*path, uid\_t owner, gid\_t group,  
22890 int flag);

## 22891 DESCRIPTION

22892 The *chown()* function shall change the user and group ownership of a file.22893 The *path* argument points to a pathname naming a file. The user ID and group ID of the named  
22894 file shall be set to the numeric values contained in *owner* and *group*, respectively.22895 Only processes with an effective user ID equal to the user ID of the file or with appropriate  
22896 privileges may change the ownership of a file. If `_POSIX_CHOWN_RESTRICTED` is in effect for  
22897 *path*:

- 22898
- Changing the user ID is restricted to processes with appropriate privileges.
  - Changing the group ID is permitted to a process with an effective user ID equal to the user  
22899 ID of the file, but without appropriate privileges, if and only if *owner* is equal to the file's  
22900 user ID or `(uid_t)-1` and *group* is equal either to the calling process' effective group ID or to  
22901 one of its supplementary group IDs.

22903 If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of  
22904 the file mode are set, and the process does not have appropriate privileges, the set-user-ID  
22905 (`S_ISUID`) and set-group-ID (`S_ISGID`) bits of the file mode shall be cleared upon successful  
22906 return from *chown()*. If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`,  
22907 or `S_IXOTH` bits of the file mode are set, and the process has appropriate privileges, it is  
22908 implementation-defined whether the set-user-ID and set-group-ID bits are altered. If the *chown()*  
22909 function is successfully invoked on a file that is not a regular file and one or more of the  
22910 `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of the file mode are set, the set-user-ID and set-group-ID  
22911 bits may be cleared.22912 If *owner* or *group* is specified as `(uid_t)-1` or `(gid_t)-1`, respectively, the corresponding ID of the  
22913 file shall not be changed. -22914 Upon successful completion, *chown()* shall mark for update the last file status change timestamp |  
22915 of the file, except that if *owner* is `(uid_t)-1` and *group* is `(gid_t)-1`, the file status change |  
22916 timestamp need not be marked for update.22917 The *fchownat()* function shall be equivalent to the *chown()* and *lchown()* functions except in the  
22918 case where *path* specifies a relative path. In this case the file to be changed is determined relative  
22919 to the directory associated with the file descriptor *fd* instead of the current working directory. If |  
22920 the access mode of the open file description associated with the file descriptor is not |  
22921 `O_SEARCH`, the function shall check whether directory searches are permitted using the current |  
22922 permissions of the directory underlying the file descriptor. If the access mode is `O_SEARCH`, the |  
22923 function shall not perform the check.22924 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
22925 in `<fcntl.h>`:

22926 AT\_SYMLINK\_NOFOLLOW

22927 If *path* names a symbolic link, ownership of the symbolic link is changed.

22928 If *fchownat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
22929 directory shall be used and the behavior shall be identical to a call to *chown()* or *lchown()*  
22930 respectively, depending on whether or not the AT\_SYMLINK\_NOFOLLOW bit is set in the *flag*  
22931 argument.

## 22932 RETURN VALUE

22933 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
22934 return -1 and set *errno* to indicate the error. If -1 is returned, no changes are made in the user ID  
22935 and group ID of the file.

## 22936 ERRORS

22937 These functions shall fail if:

22938 [EACCES] Search permission is denied on a component of the path prefix.

22939 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
22940 argument.

22941 [ENAMETOOLONG]

22942 The length of a component of a pathname is longer than {NAME\_MAX}.

22943 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

22944 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
22945 directory nor a symbolic link to a directory, or the *path* argument contains at  
22946 least one non-*<slash>* character and ends with one or more trailing *<slash>*  
22947 characters and the last pathname component names an existing file that is  
22948 neither a directory nor a symbolic link to a directory.

22949 [EPERM] The effective user ID does not match the owner of the file, or the calling  
22950 process does not have appropriate privileges and  
22951 \_POSIX\_CHOWN\_RESTRICTED indicates that such privilege is required.

22952 [EROFS] The named file resides on a read-only file system.

22953 The *fchownat()* function shall fail if:

22954 [EACCES] The access mode of the open file description associated with *fd* is not  
22955 O\_SEARCH and the permissions of the directory underlying *fd* do not permit  
22956 directory searches.

22957 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
22958 neither AT\_FDCWD nor a valid file descriptor open for reading or searching.

22959 [ENOTDIR] The *path* argument is not an absolute path and *fd* is a file descriptor associated  
22960 with a non-directory file.

22961 These functions may fail if:

22962 [EIO] An I/O error occurred while reading or writing to the file system.

22963 [EINTR] The *chown()* function was interrupted by a signal which was caught.

22964 [EINVAL] The owner or group ID supplied is not a value supported by the  
22965 implementation.

22966 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 22967 resolution of the *path* argument.

22968 [ENAMETOOLONG]  
 22969 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 22970 symbolic link produced an intermediate result with a length that exceeds  
 22971 {PATH\_MAX}.

22972 The *fchownat()* function may fail if:

22973 [EINVAL] The value of the *flag* argument is not valid.

## 22974 EXAMPLES

22975 None.

## 22976 APPLICATION USAGE

22977 Although *chown()* can be used on some implementations by the file owner to change the owner  
 22978 and group to any desired values, the only portable use of this function is to change the group of  
 22979 a file to the effective GID of the calling process or to a member of its group set.

## 22980 RATIONALE

22981 System III and System V allow a user to give away files; that is, the owner of a file may change  
 22982 its user ID to anything. This is a serious problem for implementations that are intended to meet  
 22983 government security regulations. Version 7 and 4.3 BSD permit only the superuser to change the  
 22984 user ID of a file. Some government agencies (usually not ones concerned directly with security)  
 22985 find this limitation too confining. This volume of POSIX.1-2008 uses *may* to permit secure  
 22986 implementations while not disallowing System V.

22987 System III and System V allow the owner of a file to change the group ID to anything. Version 7  
 22988 permits only the superuser to change the group ID of a file. 4.3 BSD permits the owner to  
 22989 change the group ID of a file to its effective group ID or to any of the groups in the list of  
 22990 supplementary group IDs, but to no others.

22991 The POSIX.1-1990 standard requires that the *chown()* function invoked by a non-appropriate  
 22992 privileged process clear the S\_ISGID and the S\_ISUID bits for regular files, and permits them to  
 22993 be cleared for other types of files. This is so that changes in accessibility do not accidentally  
 22994 cause files to become security holes. Unfortunately, requiring these bits to be cleared on non-  
 22995 executable data files also clears the mandatory file locking bit (shared with S\_ISGID), which is  
 22996 an extension on many implementations (it first appeared in System V). These bits should only be  
 22997 required to be cleared on regular files that have one or more of their execute bits set.

22998 The purpose of the *fchownat()* function is to enable changing ownership of files in directories  
 22999 other than the current working directory without exposure to race conditions. Any part of the  
 23000 path of a file could be changed in parallel to a call to *chown()* or *lchown()*, resulting in  
 23001 unspecified behavior. By opening a file descriptor for the target directory and using the  
 23002 *fchownat()* function it can be guaranteed that the changed file is located relative to the desired  
 23003 directory.

## 23004 FUTURE DIRECTIONS

23005 None.

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The wording describing the optional dependency on `_POSIX_CHOWN_RESTRICTED` is restored.
- The `[EPERM]` error is restored as an error dependent on `_POSIX_CHOWN_RESTRICTED`. This is since its operand is a pathname and applications should be aware that the error may not occur for that pathname if the file system does not support `_POSIX_CHOWN_RESTRICTED`.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The value for *owner* of `(uid_t)-1` allows the use of `-1` by the owner of a file to change the group ID only. A corresponding change is made for group.
- The `[ELOOP]` mandatory error condition is added.
- The `[EIO]` and `[EINTR]` optional error conditions are added.
- A second `[ENAMETOOLONG]` is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that the `S_ISUID` and `S_ISGID` bits do not need to be cleared when the process has appropriate privileges.
- The `[ELOOP]` optional error condition is added.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #143 is applied.

The `fchownat()` function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

The `[ENOTDIR]` error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0053 [461], XSH/TC1-2008/0054 [324], XSH/TC1-2008/0055 [278], and XSH/TC1-2008/0056 [278] are applied.

23043 **NAME**

23044 cimag, cimagf, cimagl — complex imaginary functions

23045 **SYNOPSIS**

```
23046 #include <complex.h>
23047 double cimag(double complex z);
23048 float cimagf(float complex z);
23049 long double cimagl(long double complex z);
```

23050 **DESCRIPTION**

23051 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 23052 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23053 volume of POSIX.1-2008 defers to the ISO C standard.

23054 These functions shall compute the imaginary part of *z*.23055 **RETURN VALUE**

23056 These functions shall return the imaginary part value (as a real).

23057 **ERRORS**

23058 No errors are defined.

23099 **CHANGE HISTORY**

23100 First released in Issue 1. Derived from Issue 1 of the SVID.

23101 **Issue 7**

23102 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0057 [401] is applied.

23103 **NAME**

23104 clock — report CPU time used

23105 **SYNOPSIS**

23106 #include &lt;time.h&gt;

23107 clock\_t clock(void);

23108 **DESCRIPTION**

23109 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 23110 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23111 volume of POSIX.1-2008 defers to the ISO C standard.

23112 The *clock()* function shall return the implementation's best approximation to the processor time  
 23113 used by the process since the beginning of an implementation-defined era related only to the  
 23114 process invocation.

23115 **RETURN VALUE**

23116 To determine the time in seconds, the value returned by *clock()* should be divided by the value  
 23117 XSI of the macro `CLOCKS_PER_SEC`. `CLOCKS_PER_SEC` is defined to be one million in `<time.h>`.  
 23118 If the processor time used is not available or its value cannot be represented, the function shall  
 23119 return the value `(clock_t)-1`.

23120 **ERRORS**

23121 No errors are defined.

23122 **EXAMPLES**

23123 None.

23124 **APPLICATION USAGE**

23125 In programming environments where `clock_t` is a 32-bit integer type and `CLOCKS_PER_SEC` is  
 23126 one million, *clock()* will start failing in less than 36 minutes of processor time for signed `clock_t`,  
 23127 or 72 minutes for unsigned `clock_t`. Applications intended to be portable to such environments  
 23128 should use *times()* instead (or *clock\_gettime()* with `CLOCK_PROCESS_CPUTIME_ID`, if  
 23129 supported). +

23130 In order to measure the time spent in a program, *clock()* should be called at the start of the  
 23131 program and its return value subtracted from the value returned by subsequent calls. The value  
 23132 returned by *clock()* is defined for compatibility across systems that have clocks with different  
 23133 resolutions. The resolution on any particular system need not be to microsecond accuracy. -

23134 **RATIONALE**

23135 None.

23136 **FUTURE DIRECTIONS**

23137 None.

23141 XBD `<time.h>`23142 **CHANGE HISTORY**

23143 First released in Issue 1. Derived from Issue 1 of the SVID.

23144 **NAME**23145 clock\_getcpuclockid — access a process CPU-time clock (**ADVANCED REALTIME**)23146 **SYNOPSIS**

```
23147 CPT    #include <time.h>
23148      int clock_getcpuclockid(pid_t pid, clockid_t *clock_id);
```

23149 **DESCRIPTION**

23150 The *clock\_getcpuclockid()* function shall return the clock ID of the CPU-time clock of the process  
 23151 specified by *pid*. If the process described by *pid* exists and the calling process has permission, the  
 23152 clock ID of this clock shall be returned in *clock\_id*.

23153 If *pid* is zero, the *clock\_getcpuclockid()* function shall return the clock ID of the CPU-time clock of  
 23154 the process making the call, in *clock\_id*.

23155 The conditions under which one process has permission to obtain the CPU-time clock ID of  
 23156 other processes are implementation-defined.

23157 **RETURN VALUE**

23158 Upon successful completion, *clock\_getcpuclockid()* shall return zero; otherwise, an error number  
 23159 shall be returned to indicate the error.

23160 **ERRORS**

23161 The *clock\_getcpuclockid()* function shall fail if:

23162 [EPERM] The requesting process does not have permission to access the CPU-time clock  
 23163 for the process.

23164 The *clock\_getcpuclockid()* function may fail if:

23165 [ESRCH] No process can be found corresponding to the process specified by *pid*.

23166 **EXAMPLES**

23167 None.

23168 **APPLICATION USAGE**

23169 The *clock\_getcpuclockid()* function is part of the Process CPU-Time Clocks option and need not be  
 23170 provided on all implementations.

23171 **RATIONALE**

23172 None.

23173 **FUTURE DIRECTIONS**

23174 None.

23175 **SEE ALSO**

23176 *clock\_getres()*, *timer\_create()*

23177 XBD **<time.h>**

23178 **CHANGE HISTORY**

23179 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

23180 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

23181 **NAME**

23182 clock\_getres, clock\_gettime, clock\_settime — clock and timer functions

23183 **SYNOPSIS**

```

23184 CX    #include <time.h>

23185    int clock_getres(clockid_t clock_id, struct timespec *res);
23186    int clock_gettime(clockid_t clock_id, struct timespec *tp);
23187    int clock_settime(clockid_t clock_id, const struct timespec *tp);

```

23188 **DESCRIPTION**

23189 The *clock\_getres()* function shall return the resolution of any clock. Clock resolutions are  
 23190 implementation-defined and cannot be set by a process. If the argument *res* is not NULL, the  
 23191 resolution of the specified clock shall be stored in the location pointed to by *res*. If *res* is NULL,  
 23192 the clock resolution is not returned. If the *time* argument of *clock\_settime()* is not a multiple of *res*,  
 23193 then the value is truncated to a multiple of *res*.

23194 The *clock\_gettime()* function shall return the current value *tp* for the specified clock, *clock\_id*.

23195 The *clock\_settime()* function shall set the specified clock, *clock\_id*, to the value specified by *tp*.  
 23196 Time values that are between two consecutive non-negative integer multiples of the resolution of  
 23197 the specified clock shall be truncated down to the smaller multiple of the resolution.

23198 A clock may be system-wide (that is, visible to all processes) or per-process (measuring time that  
 23199 is meaningful only within a process). All implementations shall support a *clock\_id* of  
 23200 CLOCK\_REALTIME as defined in **<time.h>**. This clock represents the clock measuring real time  
 23201 for the system. For this clock, the values returned by *clock\_gettime()* and specified by  
 23202 *clock\_settime()* represent the amount of time (in seconds and nanoseconds) since the Epoch. An  
 23203 implementation may also support additional clocks. The interpretation of time values for these  
 23204 clocks is unspecified.

23205 If the value of the CLOCK\_REALTIME clock is set via *clock\_settime()*, the new value of the clock  
 23206 shall be used to determine the time of expiration for absolute time services based upon the  
 23207 CLOCK\_REALTIME clock. This applies to the time at which armed absolute timers expire. If the  
 23208 absolute time requested at the invocation of such a time service is before the new value of the  
 23209 clock, the time service shall expire immediately as if the clock had reached the requested time  
 23210 normally.

23211 Setting the value of the CLOCK\_REALTIME clock via *clock\_settime()* shall have no effect on  
 23212 threads that are blocked waiting for a relative time service based upon this clock, including the  
 23213 *nanosleep()* function; nor on the expiration of relative timers based upon this clock.  
 23214 Consequently, these time services shall expire when the requested relative interval elapses,  
 23215 independently of the new or old value of the clock.

23216 MON If the Monotonic Clock option is supported, all implementations shall support a *clock\_id* of  
 23217 CLOCK\_MONOTONIC defined in **<time.h>**. This clock represents the monotonic clock for the  
 23218 system. For this clock, the value returned by *clock\_gettime()* represents the amount of time (in  
 23219 seconds and nanoseconds) since an unspecified point in the past (for example, system start-up  
 23220 time, or the Epoch). This point does not change after system start-up time. The value of the  
 23221 CLOCK\_MONOTONIC clock cannot be set via *clock\_settime()*. This function shall fail if it is  
 23222 invoked with a *clock\_id* argument of CLOCK\_MONOTONIC.

23223 The effect of setting a clock via *clock\_settime()* on armed per-process timers associated with a  
 23224 clock other than CLOCK\_REALTIME is implementation-defined.

23225 If the value of the CLOCK\_REALTIME clock is set via *clock\_settime()*, the new value of the clock  
 23226 shall be used to determine the time at which the system shall awaken a thread blocked on an

absolute *clock\_nanosleep()* call based upon the `CLOCK_REALTIME` clock. If the absolute time requested at the invocation of such a time service is before the new value of the clock, the call shall return immediately as if the clock had reached the requested time normally.

Setting the value of the `CLOCK_REALTIME` clock via *clock\_settime()* shall have no effect on any thread that is blocked on a relative *clock\_nanosleep()* call. Consequently, the call shall return when the requested relative interval elapses, independently of the new or old value of the clock.

Appropriate privileges to set a particular clock are implementation-defined.

CPT If `_POSIX_CPUTIME` is defined, implementations shall support clock ID values obtained by invoking *clock\_getcpuclockid()*, which represent the CPU-time clock of a given process. Implementations shall also support the special `clockid_t` value `CLOCK_PROCESS_CPUTIME_ID`, which represents the CPU-time clock of the calling process when invoking one of the *clock\_\**() or *timer\_\**() functions. For these clock IDs, the values returned by *clock\_gettime()* and specified by *clock\_settime()* represent the amount of execution time of the process associated with the clock. Changing the value of a CPU-time clock via *clock\_settime()* shall have no effect on the behavior of the sporadic server scheduling policy (see [Scheduling Policies](#)).

TCT If `_POSIX_THREAD_CPUTIME` is defined, implementations shall support clock ID values obtained by invoking *pthread\_getcpuclockid()*, which represent the CPU-time clock of a given thread. Implementations shall also support the special `clockid_t` value `CLOCK_THREAD_CPUTIME_ID`, which represents the CPU-time clock of the calling thread when invoking one of the *clock\_\**() or *timer\_\**() functions. For these clock IDs, the values returned by *clock\_gettime()* and specified by *clock\_settime()* shall represent the amount of execution time of the thread associated with the clock. Changing the value of a CPU-time clock via *clock\_settime()* shall have no effect on the behavior of the sporadic server scheduling policy (see [Scheduling Policies](#)).

## RETURN VALUE

A return value of 0 shall indicate that the call succeeded. A return value of `-1` shall indicate that an error occurred, and *errno* shall be set to indicate the error.

## ERRORS

The *clock\_getres()*, *clock\_gettime()*, and *clock\_settime()* functions shall fail if:

[EINVAL] The *clock\_id* argument does not specify a known clock.

The *clock\_gettime()* function shall fail if:

[EOVERFLOW] The number of seconds will not fit in an object of type `time_t`.

The *clock\_settime()* function shall fail if:

[EINVAL] The *tp* argument to *clock\_settime()* is outside the range for the given clock ID.

[EINVAL] The *tp* argument specified a nanosecond value less than zero or greater than or equal to 1 000 million.

MON [EINVAL] The value of the *clock\_id* argument is `CLOCK_MONOTONIC`.

The *clock\_settime()* function may fail if:

[EPERM] The requesting process does not have appropriate privileges to set the specified clock.

**EXAMPLES**

None.

**APPLICATION USAGE**

Note that the absolute value of the monotonic clock is meaningless (because its origin is arbitrary), and thus there is no need to set it. Furthermore, realtime applications can rely on the fact that the value of this clock is never set and, therefore, that time intervals measured with this clock will not be affected by calls to *clock\_settime()*.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

XBD **<time.h>**

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

The APPLICATION USAGE section is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added of the effect of resetting the clock resolution.

CPU-time clocks and the *clock\_getcpuclockid()* function are added for alignment with IEEE Std 1003.1d-1999.

The following changes are added for alignment with IEEE Std 1003.1j-2000:

- The DESCRIPTION is updated as follows:
  - The value returned by *clock\_gettime()* for CLOCK\_MONOTONIC is specified.
  - The *clock\_settime()* function failing for CLOCK\_MONOTONIC is specified.
  - The effects of *clock\_settime()* on the *clock\_nanosleep()* function with respect to CLOCK\_REALTIME are specified.
- An [EINVAL] error is added to the ERRORS section, indicating that *clock\_settime()* fails for CLOCK\_MONOTONIC.
- The APPLICATION USAGE section notes that the CLOCK\_MONOTONIC clock need not and shall not be set by *clock\_settime()* since the absolute value of the CLOCK\_MONOTONIC clock is meaningless.
- The *clock\_nanosleep()*, *mq\_timedreceive()*, *mq\_timedsend()*, *pthread\_mutex\_timedlock()*, *sem\_timedwait()*, *timer\_create()*, and *timer\_settime()* functions are added to the SEE ALSO section.

23308 **Issue 7**

23309       Functionality relating to the Clock Selection option is moved to the Base.

23310       The *clock\_getres()*, *clock\_gettime()*, and *clock\_settime()* functions are moved from the Timers  
23311       option to the Base.

23312       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0058 [106] is applied.

23313 **NAME**

23314 clock\_nanosleep — high resolution sleep with specifiable clock

23315 **SYNOPSIS**

```
23316 CX      #include <time.h>
23317
23317      int clock_nanosleep(clockid_t clock_id, int flags,
23318                          const struct timespec *rqtp, struct timespec *rmtp);
```

23319 **DESCRIPTION**

23320 If the flag `TIMER_ABSTIME` is not set in the *flags* argument, the *clock\_nanosleep()* function shall  
23321 cause the current thread to be suspended from execution until either the time interval specified  
23322 by the *rqtp* argument has elapsed, or a signal is delivered to the calling thread and its action is to  
23323 invoke a signal-catching function, or the process is terminated. The clock used to measure the  
23324 time shall be the clock specified by *clock\_id*.

23325 If the flag `TIMER_ABSTIME` is set in the *flags* argument, the *clock\_nanosleep()* function shall  
23326 cause the current thread to be suspended from execution until either the time value of the clock  
23327 specified by *clock\_id* reaches the absolute time specified by the *rqtp* argument, or a signal is  
23328 delivered to the calling thread and its action is to invoke a signal-catching function, or the  
23329 process is terminated. If, at the time of the call, the time value specified by *rqtp* is less than or  
23330 equal to the time value of the specified clock, then *clock\_nanosleep()* shall return immediately  
23331 and the calling process shall not be suspended.

23332 The suspension time caused by this function may be longer than requested because the  
23333 argument value is rounded up to an integer multiple of the sleep resolution, or because of the  
23334 scheduling of other activity by the system. But, except for the case of being interrupted by a  
23335 signal, the suspension time for the relative *clock\_nanosleep()* function (that is, with the  
23336 `TIMER_ABSTIME` flag not set) shall not be less than the time interval specified by *rqtp*, as  
23337 measured by the corresponding clock. The suspension for the absolute *clock\_nanosleep()* function  
23338 (that is, with the `TIMER_ABSTIME` flag set) shall be in effect at least until the value of the  
23339 corresponding clock reaches the absolute time specified by *rqtp*, except for the case of being  
23340 interrupted by a signal.

23341 The use of the *clock\_nanosleep()* function shall have no effect on the action or blockage of any  
23342 signal.

23343 The *clock\_nanosleep()* function shall fail if the *clock\_id* argument refers to the CPU-time clock of  
23344 the calling thread. It is unspecified whether *clock\_id* values of other CPU-time clocks are allowed.

23345 **RETURN VALUE**

23346 If the *clock\_nanosleep()* function returns because the requested time has elapsed, its return value  
23347 shall be zero.

23348 If the *clock\_nanosleep()* function returns because it has been interrupted by a signal, it shall  
23349 return the corresponding error value. For the relative *clock\_nanosleep()* function, if the *rmtp*  
23350 argument is non-NULL, the **timespec** structure referenced by it shall be updated to contain the  
23351 amount of time remaining in the interval (the requested time minus the time actually slept). The  
23352 *rqtp* and *rmtp* arguments can point to the same object. If the *rmtp* argument is NULL, the  
23353 remaining time is not returned. The absolute *clock\_nanosleep()* function has no effect on the  
23354 structure referenced by *rmtp*.

23355 If *clock\_nanosleep()* fails, it shall return the corresponding error value.

**ERRORS**

The *clock\_nanosleep()* function shall fail if:

- [EINTR] The *clock\_nanosleep()* function was interrupted by a signal.
- [EINVAL] The *rqtp* argument specified a nanosecond value less than zero or greater than or equal to 1 000 million; or the `TIMER_ABSTIME` flag was specified in *flags* and the *rqtp* argument is outside the range for the clock specified by *clock\_id*; or the *clock\_id* argument does not specify a known clock, or specifies the CPU-time clock of the calling thread.
- [ENOTSUP] The *clock\_id* argument specifies a clock for which *clock\_nanosleep()* is not supported, such as a CPU-time clock.

**EXAMPLES**

None.

**APPLICATION USAGE**

Calling *clock\_nanosleep()* with the value `TIMER_ABSTIME` not set in the *flags* argument and with a *clock\_id* of `CLOCK_REALTIME` is equivalent to calling *nanosleep()* with the same *rqtp* and *rmtpt* arguments.

**RATIONALE**

The *nanosleep()* function specifies that the system-wide clock `CLOCK_REALTIME` is used to measure the elapsed time for this time service. However, with the introduction of the monotonic clock `CLOCK_MONOTONIC` a new relative sleep function is needed to allow an application to take advantage of the special characteristics of this clock.

There are many applications in which a process needs to be suspended and then activated multiple times in a periodic way; for example, to poll the status of a non-interrupting device or to refresh a display device. For these cases, it is known that precise periodic activation cannot be achieved with a relative *sleep()* or *nanosleep()* function call. Suppose, for example, a periodic process that is activated at time  $T_0$ , executes for a while, and then wants to suspend itself until time  $T_0+T$ , the period being  $T$ . If this process wants to use the *nanosleep()* function, it must first call *clock\_gettime()* to get the current time, then calculate the difference between the current time and  $T_0+T$  and, finally, call *nanosleep()* using the computed interval. However, the process could be preempted by a different process between the two function calls, and in this case the interval computed would be wrong; the process would wake up later than desired. This problem would not occur with the absolute *clock\_nanosleep()* function, since only one function call would be necessary to suspend the process until the desired time. In other cases, however, a relative sleep is needed, and that is why both functionalities are required.

Although it is possible to implement periodic processes using the timers interface, this implementation would require the use of signals, and the reservation of some signal numbers. In this regard, the reasons for including an absolute version of the *clock\_nanosleep()* function in POSIX.1-2008 are the same as for the inclusion of the relative *nanosleep()*.

It is also possible to implement precise periodic processes using *pthread\_cond\_timedwait()*, in which an absolute timeout is specified that takes effect if the condition variable involved is never signaled. However, the use of this interface is unnatural, and involves performing other operations on mutexes and condition variables that imply an unnecessary overhead. Furthermore, *pthread\_cond\_timedwait()* is not available in implementations that do not support threads.

Although the interface of the relative and absolute versions of the new high resolution sleep service is the same *clock\_nanosleep()* function, the *rmtpt* argument is only used in the relative sleep. This argument is needed in the relative *clock\_nanosleep()* function to reissue the function

23403 call if it is interrupted by a signal, but it is not needed in the absolute *clock\_nanosleep()* function  
23404 call; if the call is interrupted by a signal, the absolute *clock\_nanosleep()* function can be invoked  
23405 again with the same *rqtp* argument used in the interrupted call.

#### 23406 FUTURE DIRECTIONS

23407 None.

#### 23408 SEE ALSO

#### 23411 CHANGE HISTORY

23412 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

#### 23413 Issue 7

23414 The *clock\_nanosleep()* function is moved from the Clock Selection option to the Base.

23415 **NAME**

23416 clock\_gettime — clock and timer functions

23417 **SYNOPSIS**

```
23418 CX      #include <time.h>
23419      int clock_gettime(clockid_t clock_id, const struct timespec *tp);
```

23420 **DESCRIPTION**

23421 Refer to *clock\_getres()*.

23422 **NAME**

23423 clog, clogf, clogl — complex natural logarithm functions

23424 **SYNOPSIS**

```
23425 #include <complex.h>
23426 double complex clog(double complex z);
23427 float complex clogf(float complex z);
23428 long double complex clogl(long double complex z);
```

23429 **DESCRIPTION**

23430 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 23431 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23432 volume of POSIX.1-2008 defers to the ISO C standard.

23433 These functions shall compute the complex natural (base  $e$ ) logarithm of  $z$ , with a branch cut  
 23434 along the negative real axis.

23435 **RETURN VALUE**

23436 These functions shall return the complex natural logarithm value, in the range of a strip  
 23437 mathematically unbounded along the real axis and in the interval  $[-i\pi, +i\pi]$  along the imaginary  
 23438 axis.

23439 **ERRORS**

23454 **NAME**

23455 close — close a file descriptor

23456 **SYNOPSIS**

23457 #include &lt;unistd.h&gt;

23458 int close(int *fildes*);23459 **DESCRIPTION**

23460 The *close()* function shall deallocate the file descriptor indicated by *fildes*. To deallocate means to  
 23461 make the file descriptor available for return by subsequent calls to *open()* or other functions that  
 23462 allocate file descriptors. All outstanding record locks owned by the process on the file associated  
 23463 with the file descriptor shall be removed (that is, unlocked).

23464 If *close()* is interrupted by a signal that is to be caught, it shall return  $-1$  with *errno* set to [EINTR]  
 23465 and the state of *fildes* is unspecified. If an I/O error occurred while reading from or writing to  
 23466 the file system during *close()*, it may return  $-1$  with *errno* set to [EIO]; if this error is returned, the  
 23467 state of *fildes* is unspecified.

23468 When all file descriptors associated with a pipe or FIFO special file are closed, any data  
 23469 remaining in the pipe or FIFO shall be discarded.

23470 When all file descriptors associated with an open file description have been closed, the open file  
 23471 description shall be freed.

23472 If the link count of the file is 0, when all file descriptors associated with the file are closed, the  
 23473 space occupied by the file shall be freed and the file shall no longer be accessible.

23474 OB XSR If a STREAMS-based *fildes* is closed and the calling process was previously registered to receive  
 23475 a SIGPOLL signal for events associated with that STREAM, the calling process shall be  
 23476 unregistered for events associated with the STREAM. The last *close()* for a STREAM shall cause  
 23477 the STREAM associated with *fildes* to be dismantled. If O\_NONBLOCK is not set and there have  
 23478 been no signals posted for the STREAM, and if there is data on the module's write queue, *close()*  
 23479 shall wait for an unspecified time (for each module and driver) for any output to drain before  
 23480 dismantling the STREAM. The time delay can be changed via an I\_SETCLTIME *ioctl()* request. If  
 23481 the O\_NONBLOCK flag is set, or if there are any pending signals, *close()* shall not wait for  
 23482 output to drain, and shall dismantle the STREAM immediately.

23483 If the implementation supports STREAMS-based pipes, and *fildes* is associated with one end of a  
 23484 pipe, the last *close()* shall cause a hangup to occur on the other end of the pipe. In addition, if the  
 23485 other end of the pipe has been named by *fattach()*, then the last *close()* shall force the named end  
 23486 to be detached by *fdetach()*. If the named end has no open file descriptors associated with it and  
 23487 gets detached, the STREAM associated with that end shall also be dismantled.

23488 XSI If *fildes* refers to the master side of a pseudo-terminal, and this is the last close, a SIGHUP signal  
 23489 shall be sent to the controlling process, if any, for which the slave side of the pseudo-terminal is  
 23490 the controlling terminal. It is unspecified whether closing the master side of the pseudo-terminal  
 23491 flushes all queued input and output.

23492 OB XSR If *fildes* refers to the slave side of a STREAMS-based pseudo-terminal, a zero-length message  
 23493 may be sent to the master.

23494 When there is an outstanding cancelable asynchronous I/O operation against *fildes* when *close()*  
 23495 is called, that I/O operation may be canceled. An I/O operation that is not canceled completes  
 23496 as if the *close()* operation had not yet occurred. All operations that are not canceled shall  
 23497 complete as if the *close()* blocked until the operations completed. The *close()* operation itself  
 23498 need not block awaiting such I/O completion. Whether any I/O operation is canceled, and  
 23499 which I/O operation may be canceled upon *close()*, is implementation-defined.

23500 SHM If a memory mapped file or a shared memory object remains referenced at the last close (that is,  
 23501 a process has it mapped), then the entire contents of the memory object shall persist until the  
 23502 SHM memory object becomes unreferenced. If this is the last close of a memory mapped file or a  
 23503 shared memory object and the close results in the memory object becoming unreferenced, and  
 23504 the memory object has been unlinked, then the memory object shall be removed.

23505 If *fildest* refers to a socket, *close()* shall cause the socket to be destroyed. If the socket is in  
 23506 connection-mode, and the *SO\_LINGER* option is set for the socket with non-zero linger time,  
 23507 and the socket has untransmitted data, then *close()* shall block for up to the current linger  
 23508 interval until all data is transmitted.

#### 23509 RETURN VALUE

23510 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
 23511 indicate the error.

#### 23512 ERRORS

23513 The *close()* function shall fail if:

23514 [EBADF] The *fildest* argument is not a open file descriptor.

23515 [EINTR] The *close()* function was interrupted by a signal.

23516 The *close()* function may fail if:

23517 [EIO] An I/O error occurred while reading from or writing to the file system.

#### 23518 EXAMPLES

##### 23519 Reassigning a File Descriptor

23520 The following example closes the file descriptor associated with standard output for the current  
 23521 process, re-assigns standard output to a new file descriptor, and closes the original file descriptor  
 23522 to clean up. This example assumes that the file descriptor 0 (which is the descriptor for standard  
 23523 input) is not closed.

```
23524 #include <unistd.h>
23525 ...
23526 int pfd;
23527 ...
23528 close(1);
23529 dup(pfd);
23530 close(pfd);
23531 ...
```

23532 Incidentally, this is exactly what could be achieved using:

```
23533 dup2(pfd, 1);
23534 close(pfd);
```

## Closing a File Descriptor

In the following example, *close()* is used to close a file descriptor after an unsuccessful attempt is made to associate that file descriptor with a stream.

```
#include <stdio.h>
#include <unistd.h>
#include <stdlib.h>

#define LOCKFILE "/etc/ptmp"
...
int pfd;
FILE *fpfd;
...
if ((fpfd = fdopen (pfd, "w")) == NULL) {
    close(pfd);
    unlink(LOCKFILE);
    exit(1);
}
...
```

## APPLICATION USAGE

An application that had used the *stdio* routine *fopen()* to open a file should use the corresponding *fclose()* routine rather than *close()*. Once a file is closed, the file descriptor no longer exists, since the integer corresponding to it no longer refers to a file.

Implementations may use file descriptors that must be inherited into child processes for the child process to remain conforming, such as for message catalog or tracing purposes. Therefore, an application that calls *close()* on an arbitrary integer risks non-conforming behavior, and *close()* can only portably be used on file descriptor values that the application has obtained through explicit actions, as well as the three file descriptors corresponding to the standard file streams. In multi-threaded parent applications, the practice of calling *close()* in a loop after *fork()* and before an *exec* call in order to avoid a race condition of leaking an unintended file descriptor into a child process, is therefore unsafe, and the race should instead be combatted by opening all file descriptors with the *FD\_CLOEXEC* bit set unless the file descriptor is intended to be inherited across *exec*.

Usage of *close()* on file descriptors *STDIN\_FILENO*, *STDOUT\_FILENO*, or *STDERR\_FILENO* + should immediately be followed by an operation to reopen these file descriptors. Unexpected + behavior will result if any of these file descriptors is left in a closed state (for example, an + [EBADF] error from *perror()*) or if an unrelated *open()* or similar call later in the application + accidentally allocates a file to one of these well-known file descriptors. Furthermore, a *close()* + followed by a reopen operation (e.g., *open()*, *dup()*, etc.) is not atomic; *dup2()* should be used to + change standard file descriptors.

## RATIONALE

The use of interruptible device close routines should be discouraged to avoid problems with the implicit closes of file descriptors by *exec* and *exit()*. This volume of POSIX.1-2008 only intends to permit such behavior by specifying the [EINTR] error condition.

Note that the requirement for *close()* on a socket to block for up to the current linger interval is not conditional on the *O\_NONBLOCK* setting.

The standard developers rejected a proposal to add *closefrom()* to the standard. Because the standard permits implementations to use inherited file descriptors as a means of providing a conforming environment for the child process, it is not possible to standardize an interface that

23582 closes arbitrary file descriptors above a certain value while still guaranteeing a conforming  
23583 environment.

#### 23584 FUTURE DIRECTIONS

23585 None.

23589 XBD <unistd.h>

#### 23590 CHANGE HISTORY

23591 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 23592 Issue 5

23593 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

#### 23594 Issue 6

23595 The DESCRIPTION related to a STREAMS-based file or pseudo-terminal is marked as part of  
23596 the XSI STREAMS Option Group.

23597 The following new requirements on POSIX implementations derive from alignment with the  
23598 Single UNIX Specification:

- 23599 • The [EIO] error condition is added as an optional error.
- 23600 • The DESCRIPTION is updated to describe the state of the *fildev* file descriptor as  
23601 unspecified if an I/O error occurs and an [EIO] error condition is returned.

23602 Text referring to sockets is added to the DESCRIPTION.

23603 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
23604 shared memory objects and memory mapped files (and not typed memory objects) are the types  
23605 of memory objects to which the paragraph on last closes applies.

23606 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/12 is applied, correcting the XSH shaded  
23607 text relating to the master side of a pseudo-terminal. The reason for the change is that the  
23608 behavior of pseudo-terminals and regular terminals should be as much alike as possible in this  
23609 case; the change achieves that and matches historical behavior.

#### 23610 Issue 7

23611 Functionality relating to the XSI STREAMS option is marked obsolescent.

23612 Functionality relating to the Asynchronous Input and Output and Memory Mapped Files  
23613 options is moved to the Base.

23614 Austin Group Interpretation 1003.1-2001 #139 is applied, clarifying that the requirement for  
23615 *close()* on a socket to block for up to the current linger interval is not conditional on the  
23616 O\_NONBLOCK setting.

23617 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0059 [419], XSH/TC1-2008/0060 [149],  
23618 and XSH/TC1-2008/0061 [149] are applied.

23619 **NAME**

23620       closedir — close a directory stream

23621 **SYNOPSIS**

23622       #include &lt;dirent.h&gt;

23623       int closedir(DIR \*dirp);

23624 **DESCRIPTION**

23625       The *closedir()* function shall close the directory stream referred to by the argument *dirp*. Upon  
23626       return, the value of *dirp* may no longer point to an accessible object of the type **DIR**. If a file  
23627       descriptor is used to implement type **DIR**, that file descriptor shall be closed.

23628 **RETURN VALUE**

23629       Upon successful completion, *closedir()* shall return 0; otherwise, -1 shall be returned and *errno*  
23630       set to indicate the error.

23631 **ERRORS**23632       The *closedir()* function may fail if:23633       [EBADF]       The *dirp* argument does not refer to an open directory stream.23634       [EINTR]       The *closedir()* function was interrupted by a signal.23635 **EXAMPLES**23636       **Closing a Directory Stream**23637       The following program fragment demonstrates how the *closedir()* function is used.

```
23638       ...
23639       DIR *dir;
23640       struct dirent *dp;
23641       ...
23642       if ((dir = opendir(".")) == NULL) {
23643       ...
23644       }
23645       while ((dp = readdir (dir)) != NULL) {
23646       ...
23647       }
23648       closedir(dir);
23649       ...
```

23650 **APPLICATION USAGE**

23651       None.

23652 **RATIONALE**

23653       None.

23654 **FUTURE DIRECTIONS**

23655       None.

23656 **SEE ALSO**23657       *dirfd()*, *fdopendir()*

23658       XBD &lt;dirent.h&gt;

23659 **CHANGE HISTORY**

23660 First released in Issue 2.

23661 **Issue 6**23662 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.23663 The following new requirements on POSIX implementations derive from alignment with the  
23664 Single UNIX Specification:

- 23665 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
23666 required for conforming implementations of previous POSIX specifications, it was not  
23667 required for UNIX applications.
- 23668 • The [EINTR] error condition is added as an optional error condition.

23669 **NAME**

23670 closelog, openlog, setlogmask, syslog — control system log

23671 **SYNOPSIS**

```

23672 XSI #include <syslog.h>
23673
23673 void closelog(void);
23674 void openlog(const char *ident, int logopt, int facility);
23675 int setlogmask(int maskpri);
23676 void syslog(int priority, const char *message, ... /* arguments */);

```

23677 **DESCRIPTION**

23678 The *syslog()* function shall send a message to an implementation-defined logging facility, which  
 23679 may log it in an implementation-defined system log, write it to the system console, forward it to  
 23680 a list of users, or forward it to the logging facility on another host over the network. The logged  
 23681 message shall include a message header and a message body. The message header contains at  
 23682 least a timestamp and a tag string.

23683 The message body is generated from the *message* and following arguments in the same manner  
 23684 as if these were arguments to *printf()*, except that the additional conversion specification *%m*  
 23685 shall be recognized; it shall convert no arguments, shall cause the output of the error message  
 23686 string associated with the value of *errno* on entry to *syslog()*, and may be mixed with argument  
 23687 specifications of the "*%n\$*" form. If a complete conversion specification with the *m* conversion  
 23688 specifier character is not just *%m*, the behavior is undefined. A trailing <newline> may be added  
 23689 if needed.

23690 Values of the *priority* argument are formed by OR'ing together a severity-level value and an  
 23691 optional facility value. If no facility value is specified, the current default facility value is used.

23692 Possible values of severity level include:

23693	LOG_EMERG	A panic condition.
23694	LOG_ALERT	A condition that should be corrected immediately, such as a corrupted system
23695		database.
23696	LOG_CRIT	Critical conditions, such as hard device errors.
23697	LOG_ERR	Errors.
23698	LOG_WARNING	
23699		Warning messages.
23700	LOG_NOTICE	Conditions that are not error conditions, but that may require special
23701		handling.
23702	LOG_INFO	Informational messages.
23703	LOG_DEBUG	Messages that contain information normally of use only when debugging a
23704		program.

23705 The facility indicates the application or system component generating the message. Possible  
 23706 facility values include:

23707	LOG_USER	Messages generated by arbitrary processes. This is the default facility
23708		identifier if none is specified.
23709	LOG_LOCAL0	Reserved for local use.

23710	LOG_LOCAL1	Reserved for local use.
23711	LOG_LOCAL2	Reserved for local use.
23712	LOG_LOCAL3	Reserved for local use.
23713	LOG_LOCAL4	Reserved for local use.
23714	LOG_LOCAL5	Reserved for local use.
23715	LOG_LOCAL6	Reserved for local use.
23716	LOG_LOCAL7	Reserved for local use.

23717 The *openlog()* function shall set process attributes that affect subsequent calls to *syslog()*. The  
 23718 *ident* argument is a string that is prepended to every message. The *logopt* argument indicates  
 23719 logging options. Values for *logopt* are constructed by a bitwise-inclusive OR of zero or more of  
 23720 the following:

23721	LOG_PID	Log the process ID with each message. This is useful for identifying specific
23722		processes.
23723	LOG_CONS	Write messages to the system console if they cannot be sent to the logging
23724		facility. The <i>syslog()</i> function ensures that the process does not acquire the
23725		console as a controlling terminal in the process of writing the message.
23726	LOG_NDELAY	Open the connection to the logging facility immediately. Normally the open is
23727		delayed until the first message is logged. This is useful for programs that need
23728		to manage the order in which file descriptors are allocated.
23729	LOG_ODELAY	Delay open until <i>syslog()</i> is called.
23730	LOG_NOWAIT	Do not wait for child processes that may have been created during the course
23731		of logging the message. This option should be used by processes that enable
23732		notification of child termination using SIGCHLD, since <i>syslog()</i> may
23733		otherwise block waiting for a child whose exit status has already been
23734		collected.

23735 The *facility* argument encodes a default facility to be assigned to all messages that do not have an  
 23736 explicit facility already encoded. The initial default facility is LOG\_USER.

23737 The *openlog()* and *syslog()* functions may allocate a file descriptor. It is not necessary to call  
 23738 *openlog()* prior to calling *syslog()*.

23739 The *closelog()* function shall close any open file descriptors allocated by previous calls to  
 23740 *openlog()* or *syslog()*.

23741 The *setlogmask()* function shall set the log priority mask for the current process to *maskpri* and  
 23742 return the previous mask. If the *maskpri* argument is 0, the current log mask is not modified.  
 23743 Calls by the current process to *syslog()* with a priority not set in *maskpri* shall be rejected. The  
 23744 default log mask allows all priorities to be logged. A call to *openlog()* is not required prior to  
 23745 calling *setlogmask()*.

23746 Symbolic constants for use as values of the *logopt*, *facility*, *priority*, and *maskpri* arguments are  
 23747 defined in the **<syslog.h>** header.

## 23748 RETURN VALUE

23749 The *setlogmask()* function shall return the previous log priority mask. The *closelog()*, *openlog()*,  
 23750 and *syslog()* functions shall not return a value.

23751 **ERRORS**

23752       No errors are defined.

23753 **EXAMPLES**23754       **Using openlog()**

23755       The following example causes subsequent calls to *syslog()* to log the process ID with each  
23756       message, and to write messages to the system console if they cannot be sent to the logging  
23757       facility.

```
23758       #include <syslog.h>

23759       char *ident = "Process demo";
23760       int logopt = LOG_PID | LOG_CONS;
23761       int facility = LOG_USER;
23762       ...
23763       openlog(ident, logopt, facility);
```

23764       **Using setlogmask()**

23765       The following example causes subsequent calls to *syslog()* to accept error messages, and to reject  
23766       all other messages.

```
23767       #include <syslog.h>

23768       int result;
23769       int mask = LOG_MASK (LOG_ERR);
23770       ...
23771       result = setlogmask(mask);
```

23772       **Using syslog**

23773       The following example sends the message "This is a message" to the default logging  
23774       facility, marking the message as an error message generated by random processes.

```
23775       #include <syslog.h>

23776       char *message = "This is a message";
23777       int priority = LOG_ERR | LOG_USER;
23778       ...
23779       syslog(priority, message);
```

23780 **APPLICATION USAGE**

23781       None.

23782 **RATIONALE**

23783       None.

23784 **FUTURE DIRECTIONS**

23785       None.

**CHANGE HISTORY**

23789 First released in Issue 4, Version 2.

**Issue 5**

23791 Moved from X/OPEN UNIX extension to BASE.

**Issue 6**

23793 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/13 is applied, correcting the EXAMPLES  
23794 section.  
23795

23796 **NAME**

23797 confstr — get configurable variables

23798 **SYNOPSIS**

23799 #include &lt;unistd.h&gt;

23800 size\_t confstr(int name, char \*buf, size\_t len);

23801 **DESCRIPTION**

23802 The *confstr()* function shall return configuration-defined string values. Its use and purpose are  
 23803 similar to *sysconf()*, but it is used where string values rather than numeric values are returned.

23804 The *name* argument represents the system variable to be queried. The implementation shall  
 23805 support the following name values, defined in <unistd.h>. It may support others:

23806 \_CS\_PATH  
 23807 \_CS\_POSIX\_V7\_ILP32\_OFF32\_CFLAGS  
 23808 \_CS\_POSIX\_V7\_ILP32\_OFF32\_LDFLAGS  
 23809 \_CS\_POSIX\_V7\_ILP32\_OFF32\_LIBS  
 23810 \_CS\_POSIX\_V7\_ILP32\_OFFBIG\_CFLAGS  
 23811 \_CS\_POSIX\_V7\_ILP32\_OFFBIG\_LDFLAGS  
 23812 \_CS\_POSIX\_V7\_ILP32\_OFFBIG\_LIBS  
 23813 \_CS\_POSIX\_V7\_LP64\_OFF64\_CFLAGS  
 23814 \_CS\_POSIX\_V7\_LP64\_OFF64\_LDFLAGS  
 23815 \_CS\_POSIX\_V7\_LP64\_OFF64\_LIBS  
 23816 \_CS\_POSIX\_V7\_LPBIG\_OFFBIG\_CFLAGS  
 23817 \_CS\_POSIX\_V7\_LPBIG\_OFFBIG\_LDFLAGS  
 23818 \_CS\_POSIX\_V7\_LPBIG\_OFFBIG\_LIBS  
 23819 \_CS\_POSIX\_V7\_THREADS\_CFLAGS  
 23820 \_CS\_POSIX\_V7\_THREADS\_LDFLAGS  
 23821 \_CS\_POSIX\_V7\_WIDTH\_RESTRICTED\_ENVS  
 23822 \_CS\_V7\_ENV  
 23823 OB \_CS\_POSIX\_V6\_ILP32\_OFF32\_CFLAGS  
 23824 \_CS\_POSIX\_V6\_ILP32\_OFF32\_LDFLAGS  
 23825 \_CS\_POSIX\_V6\_ILP32\_OFF32\_LIBS  
 23826 \_CS\_POSIX\_V6\_ILP32\_OFFBIG\_CFLAGS  
 23827 \_CS\_POSIX\_V6\_ILP32\_OFFBIG\_LDFLAGS  
 23828 \_CS\_POSIX\_V6\_ILP32\_OFFBIG\_LIBS  
 23829 \_CS\_POSIX\_V6\_LP64\_OFF64\_CFLAGS  
 23830 \_CS\_POSIX\_V6\_LP64\_OFF64\_LDFLAGS  
 23831 \_CS\_POSIX\_V6\_LP64\_OFF64\_LIBS  
 23832 \_CS\_POSIX\_V6\_LPBIG\_OFFBIG\_CFLAGS  
 23833 \_CS\_POSIX\_V6\_LPBIG\_OFFBIG\_LDFLAGS  
 23834 \_CS\_POSIX\_V6\_LPBIG\_OFFBIG\_LIBS  
 23835 \_CS\_POSIX\_V6\_WIDTH\_RESTRICTED\_ENVS  
 23836 \_CS\_V6\_ENV

23837 If *len* is not 0, and if *name* has a configuration-defined value, *confstr()* shall copy that value into  
 23838 the *len*-byte buffer pointed to by *buf*. If the string to be returned is longer than *len* bytes,  
 23839 including the terminating null, then *confstr()* shall truncate the string to *len*–1 bytes and null-  
 23840 terminate the result. The application can detect that the string was truncated by comparing the  
 23841 value returned by *confstr()* with *len*.

23842 If *len* is 0 and *buf* is a null pointer, then *confstr()* shall still return the integer value as defined  
 23843 below, but shall not return a string. If *len* is 0 but *buf* is not a null pointer, the result is

23844 unspecified.

23845 After a call to:

23846 `confstr(_CS_V7_ENV, buf, sizeof(buf))`

23847 the string stored in *buf* shall contain a <space>-separated list of the variable=value environment  
23848 variable pairs an implementation requires as part of specifying a conforming environment, as  
23849 described in the implementations' conformance documentation.

23850 If the implementation supports the POSIX shell option, the string stored in *buf* after a call to:

23851 `confstr(_CS_PATH, buf, sizeof(buf))`

23852 can be used as a value of the *PATH* environment variable that accesses all of the standard  
23853 utilities of POSIX.1-2008, that are provided in a manner accessible via the *exec* family of  
23854 functions, if the return value is less than or equal to *sizeof(buf)*.

## 23855 RETURN VALUE

23856 If *name* has a configuration-defined value, *confstr()* shall return the size of buffer that would be  
23857 needed to hold the entire configuration-defined value including the terminating null. If this  
23858 return value is greater than *len*, the string returned in *buf* is truncated.

23859 If *name* is invalid, *confstr()* shall return 0 and set *errno* to indicate the error.

23860 If *name* does not have a configuration-defined value, *confstr()* shall return 0 and leave *errno*  
23861 unchanged.

## 23862 ERRORS

23863 The *confstr()* function shall fail if:

23864 [EINVAL] The value of the *name* argument is invalid.

## 23865 EXAMPLES

23866 None.

## 23867 APPLICATION USAGE

23868 An application can distinguish between an invalid *name* parameter value and one that  
23869 corresponds to a configurable variable that has no configuration-defined value by checking if  
23870 *errno* is modified. This mirrors the behavior of *sysconf()*.

23871 The original need for this function was to provide a way of finding the configuration-defined  
23872 default value for the environment variable *PATH*. Since *PATH* can be modified by the user to  
23873 include directories that could contain utilities replacing the standard utilities in the Shell and  
23874 Utilities volume of POSIX.1-2008, applications need a way to determine the system-supplied  
23875 *PATH* environment variable value that contains the correct search path for the standard utilities.

23876 An application could use:

23877 `confstr(name, (char *)NULL, (size_t)0)`

23878 to find out how big a buffer is needed for the string value; use *malloc()* to allocate a buffer to  
23879 hold the string; and call *confstr()* again to get the string. Alternately, it could allocate a fixed,  
23880 static buffer that is big enough to hold most answers (perhaps 512 or 1024 bytes), but then use  
23881 *malloc()* to allocate a larger buffer if it finds that this is too small.

## 23882 RATIONALE

23883 Application developers can normally determine any configuration variable by means of reading  
23884 from the stream opened by a call to:

23885 `popen("command -p getconf variable", "r");`

The *confstr()* function with a *name* argument of `_CS_PATH` returns a string that can be used as a *PATH* environment variable setting that will reference the standard shell and utilities as described in the Shell and Utilities volume of POSIX.1-2008.

The *confstr()* function copies the returned string into a buffer supplied by the application instead of returning a pointer to a string. This allows a cleaner function in some implementations (such as those with lightweight threads) and resolves questions about when the application must copy the string returned.

#### FUTURE DIRECTIONS

None.

XBD `<unistd.h>`

XCUI *c99*

#### CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

##### Issue 5

A table indicating the permissible values of *name* is added to the DESCRIPTION. All those marked EX are new in this version.

##### Issue 6

The Open Group Corrigendum U033/7 is applied. The return value for the case returning the size of the buffer now explicitly states that this includes the terminating null.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated with new arguments which can be used to determine configuration strings for C compiler flags, linker/loader flags, and libraries for each different supported programming environment. This is a change to support data size neutrality.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The DESCRIPTION is updated to include text describing how `_CS_PATH` can be used to obtain a *PATH* to access the standard utilities.

The macros associated with the *c89* programming models are marked LEGACY and new equivalent macros associated with *c99* are introduced.

##### Issue 7

Austin Group Interpretation 1003.1-2001 #047 is applied, adding the `_CS_V7_ENV` variable.

Austin Group Interpretations 1003.1-2001 #166 is applied to permit an additional compiler flag to enable threads.

The V6 variables for the supported programming environments are marked obsolescent.

The variables for the supported programming environments are updated to be V7.

The LEGACY variables and obsolescent values are removed.

## NAME

connect — connect a socket

## SYNOPSIS

```
#include <sys/socket.h>

int connect(int socket, const struct sockaddr *address,
            socklen_t address_len);
```

## DESCRIPTION

The *connect()* function shall attempt to make a connection on a connection-mode socket or to set or reset the peer address of a connectionless-mode socket. The function takes the following arguments:

<i>socket</i>	Specifies the file descriptor associated with the socket.
<i>address</i>	Points to a <b>sockaddr</b> structure containing the peer address. The length and format of the address depend on the address family of the socket.
<i>address_len</i>	Specifies the length of the <b>sockaddr</b> structure pointed to by the <i>address</i> argument.

If the socket has not already been bound to a local address, *connect()* shall bind it to an address which, unless the socket's address family is AF\_UNIX, is an unused local address.

If the initiating socket is not connection-mode, then *connect()* shall set the socket's peer address, and no connection is made. For SOCK\_DGRAM sockets, the peer address identifies where all datagrams are sent on subsequent *send()* functions, and limits the remote sender for subsequent *recv()* functions. If the *sa\_family* member of *address* is AF\_UNSPEC, the socket's peer address shall be reset. Note that despite no connection being made, the term "connected" is used to describe a connectionless-mode socket for which a peer address has been set.

If the initiating socket is connection-mode, then *connect()* shall attempt to establish a connection to the address specified by the *address* argument. If the connection cannot be established immediately and O\_NONBLOCK is not set for the file descriptor for the socket, *connect()* shall block for up to an unspecified timeout interval until the connection is established. If the timeout interval expires before the connection is established, *connect()* shall fail and the connection attempt shall be aborted. If *connect()* is interrupted by a signal that is caught while blocked waiting to establish a connection, *connect()* shall fail and set *errno* to [EINTR], but the connection request shall not be aborted, and the connection shall be established asynchronously.

If the connection cannot be established immediately and O\_NONBLOCK is set for the file descriptor for the socket, *connect()* shall fail and set *errno* to [EINPROGRESS], but the connection request shall not be aborted, and the connection shall be established asynchronously. Subsequent calls to *connect()* for the same socket, before the connection is established, shall fail and set *errno* to [EALREADY].

When the connection has been established asynchronously, *pselect()*, *select()*, and *poll()* shall indicate that the file descriptor for the socket is ready for writing.

The socket in use may require the process to have appropriate privileges to use the *connect()* function.

## RETURN VALUE

Upon successful completion, *connect()* shall return 0; otherwise, -1 shall be returned and *errno* set to indicate the error.

23998 **ERRORS**23999 The *connect()* function shall fail if:

24000 [EADDRNOTAVAIL]

24001 The specified address is not available from the local machine.

24002 [EAFNOSUPPORT]

24003 The specified address is not a valid address for the address family of the  
24004 specified socket.

24005 [EALREADY] A connection request is already in progress for the specified socket.

24006 [EBADF] The *socket* argument is not a valid file descriptor.

24007 [ECONNREFUSED]

24008 The target address was not listening for connections or refused the connection  
24009 request.24010 [EINPROGRESS] O\_NONBLOCK is set for the file descriptor for the socket and the connection  
24011 cannot be immediately established; the connection shall be established  
24012 asynchronously.24013 [EINTR] The attempt to establish a connection was interrupted by delivery of a signal  
24014 that was caught; the connection shall be established asynchronously.

24015 [EISCONN] The specified socket is connection-mode and is already connected.

24016 [ENETUNREACH]

24017 No route to the network is present.

24018 [ENOTSOCK] The *socket* argument does not refer to a socket.24019 [EPROTOTYPE] The specified address has a different type than the socket bound to the  
24020 specified peer address.

24021 [ETIMEDOUT] The attempt to connect timed out before a connection was made.

24022 If the address family of the socket is AF\_UNIX, then *connect()* shall fail if:

24023 [EIO] An I/O error occurred while reading from or writing to the file system.

24024 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname  
24025 in *address*.

24026 [ENAMETOOLONG]

24027 The length of a component of a pathname is longer than {NAME\_MAX}.

24028 [ENOENT] A component of the pathname does not name an existing file or the pathname  
24029 is an empty string.24030 [ENOTDIR] A component of the path prefix of the pathname in *address* names an existing  
24031 file that is neither a directory nor a symbolic link to a directory, or the  
24032 pathname in *address* contains at least one non-*<slash>* character and ends with  
24033 one or more trailing *<slash>* characters and the last pathname component  
24034 names an existing file that is neither a directory nor a symbolic link to a  
24035 directory.24036 The *connect()* function may fail if:24037 [EACCES] Search permission is denied for a component of the path prefix; or write access  
24038 to the named socket is denied.

24039	[EADDRINUSE]	Attempt to establish a connection that uses addresses that are already in use.
24040	[ECONNRESET]	Remote host reset the connection request.
24041	[EHOSTUNREACH]	
24042		The destination host cannot be reached (probably because the host is down or
24043		a remote router cannot reach it).
24044	[EINVAL]	The <i>address_len</i> argument is not a valid length for the address family; or
24045		invalid address family in the <b>sockaddr</b> structure.
24046	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during
24047		resolution of the pathname in <i>address</i> .
24048	[ENAMETOOLONG]	
24049		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
24050		symbolic link produced an intermediate result with a length that exceeds
24051		{PATH_MAX}.
24052	[ENETDOWN]	The local network interface used to reach the destination is down.
24053	[ENOBUFS]	No buffer space is available.
24054	[EOPNOTSUPP]	The socket is listening and cannot be connected.

#### 24055 EXAMPLES

24056 None.

#### 24057 APPLICATION USAGE

24058 If *connect()* fails, the state of the socket is unspecified. Conforming applications should close the  
24059 file descriptor and create a new socket before attempting to reconnect.

#### 24060 RATIONALE

24061 None.

#### 24062 FUTURE DIRECTIONS

24063 None.

#### 24064 SEE ALSO

24065 *accept()*, *bind()*, *close()*, *getsockname()*, *poll()*, *pselect()*, *send()*, *shutdown()*, *socket()*

24066 XBD <sys/socket.h>

#### 24067 CHANGE HISTORY

24068 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

24069 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
24070 [ELOOP] error condition is added.

#### 24071 Issue 7

24072 Austin Group Interpretation 1003.1-2001 #035 is applied, clarifying the description of connected  
24073 sockets.

24074 Austin Group Interpretation 1003.1-2001 #143 is applied.

24075 Austin Group Interpretation 1003.1-2001 #188 is applied, changing the method used to reset a  
24076 peer address for a datagram socket.

24077 SD5-XSH-ERN-185 is applied.

24078 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0062 [324] is applied.

24079 **NAME**

24080 copysign, copysignf, copysignl — number manipulation function

24081 **SYNOPSIS**

24082 #include &lt;math.h&gt;

24083 double copysign(double x, double y);

24084 float copysignf(float x, float y);

24085 long double copysignl(long double x, long double y);

24086 **DESCRIPTION**

24087 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24088 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24089 volume of POSIX.1-2008 defers to the ISO C standard.

24090 These functions shall produce a value with the magnitude of *x* and the sign of *y*. On  
 24091 implementations that represent a signed zero but do not treat negative zero consistently in  
 24092 arithmetic operations, these functions regard the sign of zero as positive.

24093 **RETURN VALUE**

24094 Upon successful completion, these functions shall return a value with the magnitude of *x* and  
 24095 the sign of *y*.

24096 **ERRORS**

24097 No errors are defined.

24098 **EXAMPLES**

24099 None.

24100 **APPLICATION USAGE**

24101 None.

24102 **RATIONALE**

24103 None.

24104 **FUTURE DIRECTIONS**

24105 None.

24106 **SEE ALSO**24107 [signbit\(\)](#)24108 XBD [<math.h>](#)24109 **CHANGE HISTORY**

24110 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

24111 **NAME**

24112 cos, cosf, cosl — cosine function

24113 **SYNOPSIS**

```
24114 #include <math.h>
24115 double cos(double x);
24116 float cosf(float x);
24117 long double cosl(long double x);
```

24118 **DESCRIPTION**

24119 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24120 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24121 volume of POSIX.1-2008 defers to the ISO C standard.

24122 These functions shall compute the cosine of their argument  $x$ , measured in radians.

24123 An application wishing to check for error situations should set *errno* to zero and call  
 24124 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 24125 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 24126 zero, an error has occurred.

24127 **RETURN VALUE**

24128 Upon successful completion, these functions shall return the cosine of  $x$ .

24129 MX If  $x$  is NaN, a NaN shall be returned.

24130 If  $x$  is  $\pm 0$ , the value 1.0 shall be returned.

24131 If  $x$  is  $\pm \text{Inf}$ , a domain error shall occur, and a NaN shall be returned.

24132 **ERRORS**

24133 These functions shall fail if:

24134 MX **Domain Error** The  $x$  argument is  $\pm \text{Inf}$ .

24135 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 24136 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 24137 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 24138 shall be raised.

24139 **EXAMPLES**24140 **Taking the Cosine of a 45-Degree Angle**

```
24141 #include <math.h>
24142 ...
24143 double radians = 45 * M_PI / 180;
24144 double result;
24145 ...
24146 result = cos(radians);
```

24147 **APPLICATION USAGE**

24148 These functions may lose accuracy when their argument is near an odd multiple of  $\pi/2$  or is far  
 24149 from 0.

24150 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 24151 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

24152 **RATIONALE**

24153 None.

24154 **FUTURE DIRECTIONS**

24155 None.

24156 **SEE ALSO**24157 *acos()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *sin()*, *tan()*24158 XBD Section 4.20 (on page 117), **<math.h>**24159 **CHANGE HISTORY**

24160 First released in Issue 1. Derived from Issue 1 of the SVID.

24161 **Issue 5**24162 The DESCRIPTION is updated to indicate how an application should check for an error. This  
24163 text was previously published in the APPLICATION USAGE section.24164 **Issue 6**24165 The *cosf()* and *cosl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.24166 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
24167 revised to align with the ISO/IEC 9899:1999 standard.24168 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
24169 marked.24170 **Issue 7**

24171 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0063 [320] is applied.

24172 **NAME**

24173 cosh, coshf, coshl — hyperbolic cosine functions

24174 **SYNOPSIS**

```
24175 #include <math.h>
24176 double cosh(double x);
24177 float coshf(float x);
24178 long double coshl(long double x);
```

24179 **DESCRIPTION**

24180 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24181 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24182 volume of POSIX.1-2008 defers to the ISO C standard.

24183 These functions shall compute the hyperbolic cosine of their argument  $x$ .

24184 An application wishing to check for error situations should set *errno* to zero and call  
 24185 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 24186 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 24187 zero, an error has occurred.

24188 **RETURN VALUE**

24189 Upon successful completion, these functions shall return the hyperbolic cosine of  $x$ .

24190 If the correct value would cause overflow, a range error shall occur and *cosh()*, *coshf()*, and  
 24191 *coshl()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 24192 respectively.

24193 MX If  $x$  is NaN, a NaN shall be returned.

24194 If  $x$  is  $\pm 0$ , the value 1.0 shall be returned.

24195 If  $x$  is  $\pm \text{Inf}$ ,  $+\text{Inf}$  shall be returned.

24196 **ERRORS**

24197 These functions shall fail if:

24198 Range Error The result would cause an overflow.

24199 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 24200 then *errno* shall be set to [ERANGE]. If the integer expression  
 24201 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 24202 floating-point exception shall be raised.

24203 **EXAMPLES**

24204 None.

24205 **APPLICATION USAGE**

24206 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 24207 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero. -

**24226 NAME**

24227 cosl — cosine function

**24228 SYNOPSIS**

24229 #include <math.h>

24230 long double cosl(long double x);

**24231 DESCRIPTION**

24232 Refer to *cos()*.

24233 **NAME**

24234 cpow, cpowf, cpowl — complex power functions

24235 **SYNOPSIS**

```
24236 #include <complex.h>
24237 double complex cpow(double complex x, double complex y);
24238 float complex cpowf(float complex x, float complex y);
24239 long double complex cpowl(long double complex x,
24240 long double complex y);
```

24241 **DESCRIPTION**

24242 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24243 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24244 volume of POSIX.1-2008 defers to the ISO C standard.

24245 These functions shall compute the complex power function  $x^y$ , with a branch cut for the first  
 24246 parameter along the negative real axis.

24247 **RETURN VALUE**

24248 These functions shall return the complex power function value.

24249 **ERRORS**

24250 No errors are defined.

24251 **EXAMPLES**

24252 None.

24253 **APPLICATION USAGE**

24254 None.

24255 **RATIONALE**

24256 None.

24257 **FUTURE DIRECTIONS**

24258 None.

24259 **SEE ALSO**24260 *cabs()*, *csqrt()*24261 XBD **<complex.h>**24262 **CHANGE HISTORY**

24263 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

24264 **NAME**

24265 cproj, cprojf, cprojl — complex projection functions

24266 **SYNOPSIS**

```
24267 #include <complex.h>
24268 double complex cproj(double complex z);
24269 float complex cprojf(float complex z);
24270 long double complex cprojl(long double complex z);
```

24271 **DESCRIPTION**

24272 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
24273 conflict between the requirements described here and the ISO C standard is unintentional. This  
24274 volume of POSIX.1-2008 defers to the ISO C standard.

24275 These functions shall compute a projection of *z* onto the Riemann sphere: *z* projects to *z*, except  
24276 that all complex infinities (even those with one infinite part and one NaN part) project to  
24277 positive infinity on the real axis. If *z* has an infinite part, then *cproj(z)* shall be equivalent to:

```
24278 INFINITY + I * copysign(0.0, cimag(z))
```

24279 **RETURN VALUE**

24280 These functions shall return the value of the projection onto the Riemann sphere.

24281 **ERRORS**

24282 No errors are defined.

24283 **EXAMPLES**

24284 None.

24285 **APPLICATION USAGE**

24286 None.

24287 **RATIONALE**

24288 Two topologies are commonly used in complex mathematics: the complex plane with its  
24289 continuum of infinities, and the Riemann sphere with its single infinity. The complex plane is  
24290 better suited for transcendental functions, the Riemann sphere for algebraic functions. The  
24291 complex types with their multiplicity of infinities provide a useful (though imperfect) model for  
24292 the complex plane. The *cproj()* function helps model the Riemann sphere by mapping all  
24293 infinities to one, and should be used just before any operation, especially comparisons, that  
24294 might give spurious results for any of the other infinities. Note that a complex value with one  
24295 infinite part and one NaN part is regarded as an infinity, not a NaN, because if one part is  
24296 infinite, the complex value is infinite independent of the value of the other part. For the same  
24297 reason, *cabs()* returns an infinity if its argument has an infinite part and a NaN part.

24298 **FUTURE DIRECTIONS**

24299 None.

24300 **SEE ALSO**24301 *carg()*, *cimag()*, *conj()*, *creal()*24302 XBD **<complex.h>**24303 **CHANGE HISTORY**

24304 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

24305 **NAME**

24306 creal, crealf, creall — complex real functions

24307 **SYNOPSIS**

```
24308     #include <complex.h>
24309     double creal(double complex z);
24310     float crealf(float complex z);
24311     long double creall(long double complex z);
```

24312 **DESCRIPTION**

24313 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24314 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24315 volume of POSIX.1-2008 defers to the ISO C standard.

24316 These functions shall compute the real part of *z*.24317 **RETURN VALUE**

24318 These functions shall return the real part value.

24319 **ERRORS**

24320 No errors are defined.

24321 **EXAMPLES**

24322 None.

24323 **APPLICATION USAGE**24324 For a variable *z* of type **complex**:24325 `z == creal(z) + cimag(z)*I`24326 **RATIONALE**

24327 None.

24328 **FUTURE DIRECTIONS**

24329 None.

24330 **SEE ALSO**24331 *carg()*, *cimag()*, *conj()*, *cproj()*24332 XBD **<complex.h>**24333 **CHANGE HISTORY**

24334 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

24335 **NAME**

24336 creat — create a new file or rewrite an existing one

24337 **SYNOPSIS**24338 OH `#include <sys/stat.h>`24339 `#include <fcntl.h>`24340 `int creat(const char *path, mode_t mode);`24341 **DESCRIPTION**24342 The *creat()* function shall behave as if it is implemented as follows:24343 `int creat(const char *path, mode_t mode)`24344 `{`24345  `return open(path, O_WRONLY|O_CREAT|O_TRUNC, mode);`24346 `}`24347 **RETURN VALUE**24348 Refer to *open()*.24349 **ERRORS**24350 Refer to *open()*.24351 **EXAMPLES**24352 **Creating a File**24353 The following example creates the file */tmp/file* with read and write permissions for the file  
24354 owner and read permission for group and others. The resulting file descriptor is assigned to the  
24355 *fd* variable.24356 `#include <fcntl.h>`24357 `...`24358 `int fd;`24359 `mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;`24360 `char *pathname = "/tmp/file";`24361 `...`24362 `fd = creat(pathname, mode);`24363 `...`24364 **APPLICATION USAGE**

24365 None.

24366 **RATIONALE**24367 The *creat()* function is redundant. Its services are also provided by the *open()* function. It has  
24368 been included primarily for historical purposes since many existing applications depend on it. It  
24369 is best considered a part of the C binding rather than a function that should be provided in other  
24370 languages.24371 **FUTURE DIRECTIONS**

24372 None.

24373 **SEE ALSO**24374 *mknod()*, *open()*24375 XBD *<fcntl.h>*, *<sys/stat.h>*, *<sys/types.h>*

24376 **CHANGE HISTORY**

24377 First released in Issue 1. Derived from Issue 1 of the SVID.

24378 **Issue 6**24379 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.24380 The following new requirements on POSIX implementations derive from alignment with the  
24381 Single UNIX Specification:

- 24382
- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
24383 required for conforming implementations of previous POSIX specifications, it was not  
24384 required for UNIX applications.

24385 **Issue 7**

24386 SD5-XSH-ERN-186 is applied.

24387 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0064 [291] is applied.

24388 **NAME**24389 crypt — string encoding function (**CRYPT**)24390 **SYNOPSIS**

```
24391 XSI    #include <unistd.h>
24392        char *crypt(const char *key, const char *salt);
```

24393 **DESCRIPTION**24394 The *crypt()* function is a string encoding function. The algorithm is implementation-defined.24395 The *key* argument points to a string to be encoded. The *salt* argument shall be a string of at least  
24396 two bytes in length not including the null character chosen from the set:

```
24397 a b c d e f g h i j k l m n o p q r s t u v w x y z
24398 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
24399 0 1 2 3 4 5 6 7 8 9 . /
```

24400 The first two bytes of this string may be used to perturb the encoding algorithm.

24401 The return value of *crypt()* points to static data that is overwritten by each call.24402 The *crypt()* function need not be thread-safe.24403 **RETURN VALUE**

24404 Upon successful completion, *crypt()* shall return a pointer to the encoded string. The first two  
24405 bytes of the returned value shall be those of the *salt* argument. Otherwise, it shall return a null  
24406 pointer and set *errno* to indicate the error.

24407 **ERRORS**24408 The *crypt()* function shall fail if:

24409 [ENOSYS] The functionality is not supported on this implementation.

24410 **EXAMPLES**24411 **Encoding Passwords**

24412 The following example finds a user database entry matching a particular user name and changes  
24413 the current password to a new password. The *crypt()* function generates an encoded version of  
24414 each password. The first call to *crypt()* produces an encoded version of the old password; that  
24415 encoded password is then compared to the password stored in the user database. The second  
24416 call to *crypt()* encodes the new password before it is stored.

24417 The *putpwent()* function, used in the following example, is not part of POSIX.1-2008.

```
24418 #include <unistd.h>
24419 #include <pwd.h>
24420 #include <string.h>
24421 #include <stdio.h>
24422 ...
24423 int valid_change;
24424 int pfd; /* Integer for file descriptor returned by open(). */
24425 FILE *fpfd; /* File pointer for use in putpwent(). */
24426 struct passwd *p;
24427 char user[100];
24428 char oldpasswd[100];
24429 char newpasswd[100];
24430 char savepasswd[100];
```

```

24431     ...
24432     valid_change = 0;
24433     while ((p = getpwent()) != NULL) {
24434         /* Change entry if found. */
24435         if (strcmp(p->pw_name, user) == 0) {
24436             if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
24437                 strcpy(savepasswd, crypt(newpasswd, user));
24438                 p->pw_passwd = savepasswd;
24439                 valid_change = 1;
24440             }
24441             else {
24442                 fprintf(stderr, "Old password is not valid\n");
24443             }
24444         }
24445         /* Put passwd entry into ptmp. */
24446         putpwent(p, fpfd);
24447     }

```

#### 24448 APPLICATION USAGE

24449 The values returned by this function need not be portable among XSI-conformant systems.

24450 Several implementations offer extensions via characters outside of the set specified for the *salt* +  
 24451 argument for specifying alternative algorithms; while not portable, these extensions may offer +  
 24452 better security. The use of *crypt()* for anything other than password hashing is not +  
 24453 recommended.

24526       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

24527 **NAME**

24528       csinl — complex sine functions

24529 **SYNOPSIS**

24530       #include &lt;complex.h&gt;

24531       long double complex csinl(long double complex z);

24532 **DESCRIPTION**24533       Refer to *csin()*.

24534 **NAME**

24535 csqrt, csqrtf, csqrtl — complex square root functions

24536 **SYNOPSIS**

24537 #include &lt;complex.h&gt;

24538 double complex csqrt(double complex z);

24539 float complex csqrtf(float complex z);

24540 long double complex csqrtl(long double complex z);

24541 **DESCRIPTION**

24542 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24543 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24544 volume of POSIX.1-2008 defers to the ISO C standard.

24545 These functions shall compute the complex square root of *z*, with a branch cut along the negative  
 24546 real axis.

24547 **RETURN VALUE**

24548 These functions shall return the complex square root value, in the range of the right half-plane  
 24549 (including the imaginary axis).

24550 **ERRORS**

24551 No errors are defined.

24552 **EXAMPLES**

24553 None.

24554 **APPLICATION USAGE**

24555 None.

24556 **RATIONALE**

24622 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

24623 **NAME**

24624       ctanl — complex tangent functions

24625 **SYNOPSIS**

24626       #include &lt;complex.h&gt;

24627       long double complex ctanl(long double complex z);

24628 **DESCRIPTION**24629       Refer to *ctan()*.

24630 **NAME**

24631 ctermid — generate a pathname for the controlling terminal

24632 **SYNOPSIS**

```
24633 CX      #include <stdio.h>
24634      char *ctermid(char *s);
```

24635 **DESCRIPTION**

24636 The *ctermid()* function shall generate a string that, when used as a pathname, refers to the  
 24637 current controlling terminal for the current process. If *ctermid()* returns a pathname, access to the  
 24638 file is not guaranteed.

24639 The *ctermid()* function need not be thread-safe if called with a NULL parameter.

24640 **RETURN VALUE**

24641 If *s* is a null pointer, the string shall be generated in an area that may be static, the address of  
 24642 which shall be returned. The application shall not modify the string returned. The returned  
 24643 pointer might be invalidated or the string content might be overwritten by a subsequent call to  
 24644 *ctermid()*. The returned point might also be invalidated if the calling thread is terminated. If *s* is +  
 24645 not a null pointer, *s* is assumed to point to a character array of at least L\_ctermid bytes; the string  
 24646 is placed in this array and the value of *s* shall be returned. The symbolic constant L\_ctermid is  
 24647 defined in <stdio.h>, and shall have a value greater than 0.

24648 The *ctermid()* function shall return an empty string if the pathname that would refer to the  
 24649 controlling terminal cannot be determined, or if the function is unsuccessful.

24650 **ERRORS**

24651 No errors are defined.

24652 **EXAMPLES**24653 **Determining the Controlling Terminal for the Current Process**

24654 The following example returns a pointer to a string that identifies the controlling terminal for the  
 24655 current process. The pathname for the terminal is stored in the array pointed to by the *ptr*  
 24656 argument, which has a size of L\_ctermid bytes, as indicated by the *term* argument.

```
24657 #include <stdio.h>
24658 ...
24659 char term[L_ctermid];
24660 char *ptr;
24661 ptr = ctermid(term);
```

24662 **APPLICATION USAGE**

24663 The difference between *ctermid()* and *ttyname()* is that *ttyname()* must be handed a file  
 24664 descriptor and return a path of the terminal associated with that file descriptor, while *ctermid()*  
 24665 returns a string (such as "/dev/tty") that refers to the current controlling terminal if used as a  
 24666 pathname.

24667 **RATIONALE**

24668 L\_ctermid must be defined appropriately for a given implementation and must be greater than  
 24669 zero so that array declarations using it are accepted by the compiler. The value includes the  
 24670 terminating null byte.

24671 Conforming applications that use multiple threads cannot call *ctermid()* with NULL as the  
 24672 parameter. If *s* is not NULL, the *ctermid()* function generates a string that, when used as a

24673 pathname, refers to the current controlling terminal for the current process. If *s* is NULL, the  
24674 return value of *ctermid()* is undefined.

24675 There is no additional burden on the programmer—changing to use a hypothetical thread-safe  
24676 version of *ctermid()* along with allocating a buffer is more of a burden than merely allocating a  
24677 buffer. Application code should not assume that the returned string is short, as some  
24678 implementations have more than two pathname components before reaching a logical device  
24679 name.

#### 24680 FUTURE DIRECTIONS

24681 None.

#### 24682 SEE ALSO

24683 *ttynname()*

24684 XBD <stdio.h>

#### 24685 CHANGE HISTORY

24686 First released in Issue 1. Derived from Issue 1 of the SVID.

##### 24687 Issue 5

24688 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

##### 24689 Issue 6

24690 The normative text is updated to avoid use of the term “must” for application requirements.

##### 24691 Issue 7

24692 Austin Group Interpretation 1003.1-2001 #148 is applied, updating the RATIONALE.

24693 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0065 [75,428] is applied.

24694 **NAME**

24695 ctime, ctime\_r — convert a time value to a date and time string

24696 **SYNOPSIS**

```
24697 OB      #include <time.h>
24698          char *ctime(const time_t *clock);
24699 OB CX    char *ctime_r(const time_t *clock, char *buf);
```

24700 **DESCRIPTION**

24701 CX For *ctime()*: The functionality described on this reference page is aligned with the ISO C  
 24702 standard. Any conflict between the requirements described here and the ISO C standard is  
 24703 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

24704 The *ctime()* function shall convert the time pointed to by *clock*, representing time in seconds  
 24705 since the Epoch, to local time in the form of a string. It shall be equivalent to:

```
24706 asctime(localtime(clock))
```

24707 CX The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static  
 24708 objects: a broken-down time structure and an array of **char**. Execution of any of the functions  
 24709 may overwrite the information returned in either of these objects by any of the other functions.

24710 The *ctime()* function need not be thread-safe.

24711 The *ctime\_r()* function shall convert the calendar time pointed to by *clock* to local time in exactly  
 24712 the same form as *ctime()* and put the string into the array pointed to by *buf* (which shall be at  
 24713 least 26 bytes in size) and return *buf*.

24714 If *ctime\_r()* sets *tzname*, it shall also set *daylight* and *timezone*. If *ctime\_r()* does not set *tzname*, it  
 24715 shall not set *daylight* and shall not set *timezone*.

24716 **RETURN VALUE**

24717 The *ctime()* function shall return the pointer returned by *asctime()* with that broken-down time  
 24718 as an argument.

24719 CX Upon successful completion, *ctime\_r()* shall return a pointer to the string pointed to by *buf*.  
 24720 When an error is encountered, a null pointer shall be returned.

24721 **ERRORS**

24722 No errors are defined.

24723 **EXAMPLES**

24724 None.

24725 **APPLICATION USAGE**

24726 These functions are included only for compatibility with older implementations. They have  
 24727 undefined behavior if the resulting string would be too long, so the use of these functions  
 24728 should be discouraged. On implementations that do not detect output string length overflow, it  
 24729 is possible to overflow the output buffers in such a way as to cause applications to fail, or  
 24730 possible system security violations. Also, these functions do not support localized date and time  
 24731 formats. To avoid these problems, applications should use *strftime()* to generate strings from  
 24732 broken-down times.

24733 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.

24734 The *ctime\_r()* function is thread-safe and shall return values in a user-supplied buffer instead of  
 24735 possibly using a static data area that may be overwritten by each call.

24736 Attempts to use *ctime()* or *ctime\_r()* for times before the Epoch or for times beyond the year 9999

24737 produce undefined results. Refer to *asctime()* (on page 599).

#### 24738 RATIONALE

24739 The standard developers decided to mark the *ctime()* and *ctime\_r()* functions obsolescent even  
24740 though they are in the ISO C standard due to the possibility of buffer overflow. The ISO C  
24741 standard also provides the *strftime()* function which can be used to avoid these problems.

#### 24742 FUTURE DIRECTIONS

24743 These functions may be removed in a future version.

#### 24744 SEE ALSO

24745 *asctime()*, *clock()*, *difftime()*, *gmtime()*, *localtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*, *utime()*

#### 24747 CHANGE HISTORY

24748 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 24749 Issue 5

24750 Normative text previously in the APPLICATION USAGE section is moved to the  
24751 DESCRIPTION.

24752 The *ctime\_r()* function is included for alignment with the POSIX Threads Extension.

24753 A note indicating that the *ctime()* function need not be reentrant is added to the DESCRIPTION.

#### 24754 Issue 6

24755 Extensions beyond the ISO C standard are marked.

24756 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

24757 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
24758 its avoidance of possibly using a static data area.

#### 24759 Issue 7

24760 Austin Group Interpretation 1003.1-2001 #156 is applied.

24761 SD5-XSH-ERN-25 is applied, updating the APPLICATION USAGE.

24762 Austin Group Interpretation 1003.1-2001 #053 is applied, marking these functions obsolescent.

24763 The *ctime\_r()* function is moved from the Thread-Safe Functions option to the Base.

24764 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0066 [321,428] is applied.

24765 **NAME**

24766 daylight — daylight savings time flag

24767 **SYNOPSIS**

```
24768 XSI      #include <time.h>  
24769      extern int daylight;
```

24770 **DESCRIPTION**24771 Refer to *tzset()*.

## NAME

dbm\_clearerr, dbm\_close, dbm\_delete, dbm\_error, dbm\_fetch, dbm\_firstkey, dbm\_nextkey, dbm\_open, dbm\_store — database functions

## SYNOPSIS

```
XSI
#include <ndbm.h>

int dbm_clearerr(DBM *db);
void dbm_close(DBM *db);
int dbm_delete(DBM *db, datum key);
int dbm_error(DBM *db);
datum dbm_fetch(DBM *db, datum key);
datum dbm_firstkey(DBM *db);
datum dbm_nextkey(DBM *db);
DBM *dbm_open(const char *file, int open_flags, mode_t file_mode);
int dbm_store(DBM *db, datum key, datum content, int store_mode);
```

## DESCRIPTION

These functions create, access, and modify a database.

A **datum** consists of at least two members, *dptr* and *dsize*. The *dptr* member points to an object that is *dsize* bytes in length. Arbitrary binary data, as well as character strings, may be stored in the object pointed to by *dptr*.

A database shall be stored in one or two files. When one file is used, the name of the database file shall be formed by appending the suffix **.db** to the *file* argument given to *dbm\_open()*. When two files are used, the names of the database files shall be formed by appending the suffixes **.dir** and **.pag** respectively to the *file* argument.

The *dbm\_open()* function shall open a database. The *file* argument to the function is the pathname of the database. The *open\_flags* argument has the same meaning as the *flags* argument of *open()* except that a database opened for write-only access opens the files for read and write access and the behavior of the **O\_APPEND** flag is unspecified. The *file\_mode* argument has the same meaning as the third argument of *open()*.

The *dbm\_open()* function need not accept pathnames longer than {PATH\_MAX}–4 bytes (including the terminating null), or pathnames with a last component longer than {NAME\_MAX}–4 bytes (excluding the terminating null).

The *dbm\_close()* function shall close a database. The application shall ensure that argument *db* is a pointer to a **dbm** structure that has been returned from a call to *dbm\_open()*.

These database functions shall support an internal block size large enough to support key/content pairs of at least 1 023 bytes.

The *dbm\_fetch()* function shall read a record from a database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm\_open()*. The argument *key* is a **datum** that has been initialized by the application to the value of the key that matches the key of the record the program is fetching.

The *dbm\_store()* function shall write a record to a database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm\_open()*. The argument *key* is a **datum** that has been initialized by the application to the value of the key that identifies (for subsequent reading, writing, or deleting) the record the application is writing. The argument *content* is a **datum** that has been initialized by the application to the value of the record the program is writing. The argument *store\_mode* controls whether *dbm\_store()* replaces any pre-existing record that has the same key that is specified by the *key* argument. The application shall

set *store\_mode* to either DBM\_INSERT or DBM\_REPLACE. If the database contains a record that matches the *key* argument and *store\_mode* is DBM\_REPLACE, the existing record shall be replaced with the new record. If the database contains a record that matches the *key* argument and *store\_mode* is DBM\_INSERT, the existing record shall be left unchanged and the new record ignored. If the database does not contain a record that matches the *key* argument and *store\_mode* is either DBM\_INSERT or DBM\_REPLACE, the new record shall be inserted in the database.

If the sum of a key/content pair exceeds the internal block size, the result is unspecified. Moreover, the application shall ensure that all key/content pairs that hash together fit on a single block. The *dbm\_store()* function shall return an error in the event that a disk block fills with inseparable data.

The *dbm\_delete()* function shall delete a record and its key from the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm\_open()*. The argument *key* is a **datum** that has been initialized by the application to the value of the key that identifies the record the program is deleting.

The *dbm\_firstkey()* function shall return the first key in the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm\_open()*.

The *dbm\_nextkey()* function shall return the next key in the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm\_open()*. The application shall ensure that the *dbm\_firstkey()* function is called before calling *dbm\_nextkey()*. Subsequent calls to *dbm\_nextkey()* return the next key until all of the keys in the database have been returned.

The *dbm\_error()* function shall return the error condition of the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm\_open()*.

The *dbm\_clearerr()* function shall clear the error condition of the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm\_open()*.

The *dptr* pointers returned by these functions may point into static storage that may be changed by subsequent calls.

These functions need not be thread-safe.

## RETURN VALUE

The *dbm\_store()* and *dbm\_delete()* functions shall return 0 when they succeed and a negative value when they fail.

The *dbm\_store()* function shall return 1 if it is called with a *flags* value of DBM\_INSERT and the function finds an existing record with the same key.

The *dbm\_error()* function shall return 0 if the error condition is not set and return a non-zero value if the error condition is set.

The return value of *dbm\_clearerr()* is unspecified.

The *dbm\_firstkey()* and *dbm\_nextkey()* functions shall return a key **datum**. When the end of the database is reached, the *dptr* member of the key is a null pointer. If an error is detected, the *dptr* member of the key shall be a null pointer and the error condition of the database shall be set.

The *dbm\_fetch()* function shall return a content **datum**. If no record in the database matches the key or if an error condition has been detected in the database, the *dptr* member of the content shall be a null pointer.

The *dbm\_open()* function shall return a pointer to a database structure. If an error is detected during the operation, *dbm\_open()* shall return a (DBM \*)0.

## ERRORS

No errors are defined.

## EXAMPLES

None.

## APPLICATION USAGE

The following code can be used to traverse the database:

```
for(key = dbm_firstkey(db); key.dptr != NULL; key = dbm_nextkey(db))
```

The *dbm\_\** functions provided in this library should not be confused in any way with those of a general-purpose database management system. These functions do not provide for multiple search keys per entry, they do not protect against multi-user access (in other words they do not lock records or files), and they do not provide the many other useful database functions that are found in more robust database management systems. Creating and updating databases by use of these functions is relatively slow because of data copies that occur upon hash collisions. These functions are useful for applications requiring fast lookup of relatively static information that is to be indexed by a single key.

Note that a strictly conforming application is extremely limited by these functions: since there is no way to determine that the keys in use do not all hash to the same value (although that would be rare), a strictly conforming application cannot be guaranteed that it can store more than one block's worth of data in the database. As long as a key collision does not occur, additional data may be stored, but because there is no way to determine whether an error is due to a key collision or some other error condition (*dbm\_error()* being effectively a Boolean), once an error is detected, the application is effectively limited to guessing what the error might be if it wishes to continue using these functions.

The *dbm\_delete()* function need not physically reclaim file space, although it does make it available for reuse by the database.

After calling *dbm\_store()* or *dbm\_delete()* during a pass through the keys by *dbm\_firstkey()* and *dbm\_nextkey()*, the application should reset the database by calling *dbm\_firstkey()* before again calling *dbm\_nextkey()*. The contents of these files are unspecified and may not be portable.

Applications should take care that database pathname arguments specified to *dbm\_open()* are not prefixes of unrelated files. This might be done, for example, by placing databases in a separate directory.

Since some implementations use three characters for a suffix and others use four characters for a suffix, applications should ensure that the maximum portable pathname length passed to *dbm\_open()* is no greater than {PATH\_MAX}-4 bytes, with the last component of the pathname no greater than {NAME\_MAX}-4 bytes.

## RATIONALE

Previously the standard required the database to be stored in two files, one file being a directory containing a bitmap of keys and having **.dir** as its suffix. The second file containing all data and having **.pag** as its suffix. This has been changed not to specify the use of the files and to allow newer implementations of the Berkeley DB interface using a single file that have evolved while remaining compatible with the application programming interface. The standard developers considered removing the specific suffixes altogether but decided to retain them so as not to pollute the application file name space more than necessary and to allow for portable backups of the database.

24950 **CHANGE HISTORY**

24951 First released in Issue 4. Derived from the ISO C standard.

24952 **NAME**

24953 dirfd — extract the file descriptor used by a DIR stream

24954 **SYNOPSIS**

```
24955 #include <dirent.h>
24956 int dirfd(DIR *dirp);
```

24957 **DESCRIPTION**

24958 The *dirfd()* function shall return a file descriptor referring to the same directory as the *dirp*  
 24959 argument. This file descriptor shall be closed by a call to *closedir()*. If any attempt is made to  
 24960 close the file descriptor, or to modify the state of the associated description, other than by means  
 24961 XSI of *closedir()*, *readdir()*, *readdir\_r()*, *rewinddir()*, or *seekdir()*, the behavior is undefined.

24962 **RETURN VALUE**

24963 Upon successful completion, the *dirfd()* function shall return an integer which contains a file  
 24964 descriptor for the stream pointed to by *dirp*. Otherwise, it shall return *-1* and shall set *errno* to  
 24965 indicate the error.

24966 **ERRORS**24967 The *dirfd()* function may fail if:

24968 [EINVAL] The *dirp* argument does not refer to a valid directory stream. -

24969 **EXAMPLES**

24970 None.

24971 **APPLICATION USAGE**

24972 The *dirfd()* function is intended to be a mechanism by which an application may obtain a file  
 24973 descriptor to use for the *fchdir()* function.

24974 **RATIONALE**

24975 This interface was introduced because the Base Definitions volume of POSIX.1-2008 does not  
 24976 make public the **DIR** data structure. Applications tend to use the *fchdir()* function on the file  
 24977 descriptor returned by this interface, and this has proven useful for security reasons; in  
 24978 particular, it is a better technique than others where directory names might change.

24979 The description uses the term “a file descriptor” rather than “the file descriptor”. The  
 24980 implication intended is that an implementation that does not use an *fd* for *opendir()* could still  
 24981 *open()* the directory to implement the *dirfd()* function. Such a descriptor must be closed later  
 24982 during a call to *closedir()*.

24983 If it is necessary to allocate an *fd* to be returned by *dirfd()*, it should be done at the time of a call -  
 24984 to *opendir()*.

24985 **FUTURE DIRECTIONS**

24986 None.

24987 **SEE ALSO**24988 *closedir()*, *fchdir()*, *fdopendir()*, *fileno()*, *open()*, *readdir()*

24989 XBD &lt;dirent.h&gt;

24990 **CHANGE HISTORY**

24991 First released in Issue 7.

24992 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0067 [422] is applied.

24993 **NAME**

24994       dirname — report the parent directory name of a file pathname

24995 **SYNOPSIS**

```
24996 XSI      #include <libgen.h>
24997      char *dirname(char *path);
```

24998 **DESCRIPTION**

24999       The *dirname()* function shall take a pointer to a character string that contains a pathname, and  
 25000       return a pointer to a string that is a pathname of the parent directory of that file. The *dirname()* |  
 25001       function shall not perform pathname resolution; the result shall not be affected by whether or |  
 25002       not *path* exists or by its file type. Trailing ' / ' characters in the path that are not also leading ' / ' |  
 25003       characters shall not be counted as part of the path.

25004       If *path* does not contain a ' / ', then *dirname()* shall return a pointer to the string " . ". If *path* is a  
 25005       null pointer or points to an empty string, *dirname()* shall return a pointer to the string " . ".

25006       The *dirname()* function may modify the string pointed to by *path*, and may return a pointer to +  
 25007       static storage that may then be overwritten by a subsequent call to *dirname()*. +

25008       The *dirname()* function need not be thread-safe.

25009 **RETURN VALUE**

25010       The *dirname()* function shall return a pointer to a string as described above. |

25011       The *dirname()* function may modify the string pointed to by *path*, and may return a pointer to |  
 25012       internal storage. The returned pointer might be invalidated or the storage might be overwritten |  
 25013       by a subsequent call to *dirname()*. The returned pointer might also be invalidated if the calling +  
 25014       thread is terminated.

25015 **ERRORS**

25016       No errors are defined.

25017 **EXAMPLES**

25018       The following code fragment reads a pathname, changes the current working directory to the  
 25019       parent directory, and opens the file.

```
25020      char *path = NULL, *pathcopy;
25021      size_t buflen = 0;
25022      ssize_t linelen = 0;
25023      int fd;
25024
25025      linelen = getline(&path, &buflen, stdin);
25026
25027      path[linelen-1] = 0;
25028      pathcopy = strdup(path);
25029      if (chdir(dirname(pathcopy)) < 0) {
25030          ...
25031      }
25032      if ((fd = open(basename(path), O_RDONLY)) >= 0) {
25033          ...
25034          close (fd);
25035      }
25036      free (pathcopy);
25037      free (path);
```

25037 The EXAMPLES section of the *basename()* function (see *basename()*) includes a table showing |  
 25038 examples of the results of processing several sample pathnames by the *basename()* and *dirname()* |  
 25039 functions and by the *basename* and *dirname* utilities.

#### 25040 APPLICATION USAGE

25041 The *dirname()* and *basename()* functions together yield a complete pathname. The expression  
 25042 *dirname(path)* obtains the pathname of the directory where *basename(path)* is found.

25043 Since the meaning of the leading "/" is implementation-defined, *dirname("//foo")* may return  
 25044 either "/" or "/" (but nothing else).

#### 25045 RATIONALE

25046 None.

#### 25047 FUTURE DIRECTIONS

25048 None.

#### 25053 CHANGE HISTORY

25054 First released in Issue 4, Version 2.

#### 25055 Issue 5

25056 Moved from X/OPEN UNIX extension to BASE.

25057 Normative text previously in the APPLICATION USAGE section is moved to the  
 25058 DESCRIPTION.

25059 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

#### 25060 Issue 7

25061 Austin Group Interpretation 1003.1-2001 #156 is applied.

25062 The EXAMPLES section is revised.

25063 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0068 [75] is applied.

25064 **NAME**

25065 div — compute the quotient and remainder of an integer division

25066 **SYNOPSIS**

25067 #include &lt;stdlib.h&gt;

25068 div\_t div(int *numer*, int *denom*);25069 **DESCRIPTION**

25070 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
25071 conflict between the requirements described here and the ISO C standard is unintentional. This  
25072 volume of POSIX.1-2008 defers to the ISO C standard.

25073 The *div()* function shall compute the quotient and remainder of the division of the numerator  
25074 *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the integer  
25075 of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be  
25076 represented, the behavior is undefined; otherwise, *quot\*denom+rem* shall equal *numer*.

25077 **RETURN VALUE**

25078 The *div()* function shall return a structure of type **div\_t**, comprising both the quotient and the  
25079 remainder. The structure includes the following members, in any order:

```
25080 int quot; /* quotient */  
25081 int rem; /* remainder */
```

25082 **ERRORS**

25083 No errors are defined.

25084 **EXAMPLES**

25085 None.

25086 **APPLICATION USAGE**

25087 None.

25088 **RATIONALE**

25089 None.

25090 **FUTURE DIRECTIONS**

25091 None.

25092 **SEE ALSO**25093 *ldiv()*

25094 XBD &lt;stdlib.h&gt;

25095 **CHANGE HISTORY**

25096 First released in Issue 4. Derived from the ISO C standard.

25097 **NAME**

25098       dlclose — close a symbol table handle

25099 **SYNOPSIS**

25100       #include &lt;dlfcn.h&gt;

25101       int dlclose(void \*handle);

25102 **DESCRIPTION**

25103       The *dlclose()* function shall inform the system that the symbol table handle specified by *handle* is  
 25104       no longer needed by the application.

25105       An application writer may use *dlclose()* to make a statement of intent on the part of the process,  
 25106       but this statement does not create any requirement upon the implementation. When the symbol  
 25107       table handle is closed, the implementation may unload the executable object files that were  
 25108       loaded by *dlopen()* when the symbol table handle was opened and those that were loaded by  
 25109       *dlsym()* when using the symbol table handle identified by *handle*.

25110       Once a symbol table handle has been closed, an application should assume that any symbols  
 25111       (function identifiers and data object identifiers) made visible using *handle*, are no longer  
 25112       available to the process.

25113       Although a *dlclose()* operation is not required to remove any functions or data objects from the  
 25114       address space, neither is an implementation prohibited from doing so. The only restriction on  
 25115       such a removal is that no function nor data object shall be removed to which references have  
 25116       been relocated, until or unless all such references are removed. For instance, an executable object  
 25117       file that had been loaded with a *dlopen()* operation specifying the RTLD\_GLOBAL flag might  
 25118       provide a target for dynamic relocations performed in the processing of other relocatable  
 25119       objects—in such environments, an application may assume that no relocation, once made, shall  
 25120       be undone or remade unless the executable object file containing the relocated object has itself  
 25121       been removed.

25122 **RETURN VALUE**

25123       If the referenced symbol table handle was successfully closed, *dlclose()* shall return 0. If *handle*  
 25124       does not refer to an open symbol table handle or if the symbol table handle could not be closed,  
 25125       *dlclose()* shall return a non-zero value. More detailed diagnostic information shall be available  
 25126       through *dLError()*.

25127 **ERRORS**

25128       No errors are defined.

25129 **EXAMPLES**25130       The following example illustrates use of *dlopen()* and *dlclose()*:

```

25131       #include <dlfcn.h>
25132       int eret;
25133       void *mylib;
25134       ...
25135       /* Open a dynamic library and then close it ... */
25136       mylib = dlopen("mylib.so", RTLD_LOCAL | RTLD_LAZY);
25137       ...
25138       eret = dlclose(mylib);
25139       ...
```

**APPLICATION USAGE**

A conforming application should employ a symbol table handle returned from a *dlopen()* invocation only within a given scope bracketed by a *dlopen()* operation and the corresponding *dlclose()* operation. Implementations are free to use reference counting or other techniques such that multiple calls to *dlopen()* referencing the same executable object file may return a pointer to the same data object as the symbol table handle.

Implementations are also free to re-use a handle. For these reasons, the value of a handle must be treated as an opaque data type by the application, used only in calls to *dlsym()* and *dlclose()*.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*dlerror()*, *dlopen()*, *dlsym()*

XBD <dlfcn.h>

**CHANGE HISTORY**

First released in Issue 5.

**Issue 6**

The DESCRIPTION is updated to say that the referenced object is closed “if this is the last reference to it”.

**Issue 7**

The *dlopen()* function is moved from the XSI option to Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0069 [74] is applied.

**25163 NAME**

25164 **dlderror** — get diagnostic information

**25165 SYNOPSIS**

```
25166 #include <dldfcn.h>
25167 char *dlderror(void);
```

**25168 DESCRIPTION**

25169 The *dlderror()* function shall return a null-terminated character string (with no trailing  
25170 <newline>) that describes the last error that occurred during dynamic linking processing. If no  
25171 dynamic linking errors have occurred since the last invocation of *dlderror()*, *dlderror()* shall return  
25172 NULL. Thus, invoking *dlderror()* a second time, immediately following a prior invocation, shall  
25173 result in NULL being returned.

25174 It is implementation-defined whether or not the *dlderror()* function is thread-safe. A thread-safe  
25175 implementation shall return only errors that occur on the current thread.

**25176 RETURN VALUE**

25177 If successful, *dlderror()* shall return a null-terminated character string; otherwise, NULL shall be  
25178 returned.

25179 The application shall not modify the string returned. The returned pointer might be invalidated  
25180 or the string content might be overwritten by a subsequent call to *dlderror()* in the same thread (if  
25181 *dlderror()* is thread-safe) or in any thread (if *dlderror()* is not thread-safe). The returned pointer  
25182 might also be invalidated if the calling thread is terminated.

**25183 ERRORS**

25184 No errors are defined.

**25185 EXAMPLES**

25186 The following example prints out the last dynamic linking error:

```
25187 ...
25188 #include <dldfcn.h>
25189 char *errstr;
25190 errstr = dlderror();
25191 if (errstr != NULL)
25192     printf ("A dynamic linking error occurred: (%s)\n", errstr);
25193 ...
```

**25194 APPLICATION USAGE**

25195 Depending on the application environment with respect to asynchronous execution events, such  
25196 as signals or other asynchronous computation sharing the address space, conforming  
25197 applications should use a critical section to retrieve the error pointer and buffer.

**25198 RATIONALE**

25199 None.

**25200 FUTURE DIRECTIONS**

25201 None.

**NAME**

dlopen — open a symbol table handle

**SYNOPSIS**

```
#include <dlfcn.h>
```

```
void *dlopen(const char *file, int mode);
```

**DESCRIPTION**

The *dlopen()* function shall make the symbols (function identifiers and data object identifiers) in the executable object file specified by *file* available to the calling program.

The class of executable object files eligible for this operation and the manner of their construction are implementation-defined, though typically such files are shared libraries or programs.

Implementations may permit the construction of embedded dependencies in executable object files. In such cases, a *dlopen()* operation shall load those dependencies in addition to the executable object file specified by *file*. Implementations may also impose specific constraints on the construction of programs that can employ *dlopen()* and its related services.

A successful *dlopen()* shall return a symbol table handle which the caller may use on subsequent calls to *dlsym()* and *dlclose()*.

The value of this symbol table handle should not be interpreted in any way by the caller.

The *file* argument is used to construct a pathname to the executable object file. If *file* contains a <slash> character, the *file* argument is used as the pathname for the file. Otherwise, *file* is used in an implementation-defined manner to yield a pathname.

If *file* is a null pointer, *dlopen()* shall return a global symbol table handle for the currently running process image. This symbol table handle shall provide access to the symbols from an ordered set of executable object files consisting of the original program image file, any executable object files loaded at program start-up as specified by that process file (for example, shared libraries), and the set of executable object files loaded using *dlopen()* operations with the RTLD\_GLOBAL flag. As the latter set of executable object files can change during execution, the set of symbols made available by this symbol table handle can also change dynamically.

Only a single copy of an executable object file shall be brought into the address space, even if *dlopen()* is invoked multiple times in reference to the executable object file, and even if different pathnames are used to reference the executable object file.

The *mode* parameter describes how *dlopen()* shall operate upon *file* with respect to the processing of relocations and the scope of visibility of the symbols provided within *file*. When an executable object file is brought into the address space of a process, it may contain references to symbols whose addresses are not known until the executable object file is loaded.

These references shall be relocated before the symbols can be accessed. The *mode* parameter governs when these relocations take place and may have the following values:

RTLD_LAZY	Relocations shall be performed at an implementation-defined time, ranging from the time of the <i>dlopen()</i> call until the first reference to a given symbol occurs. Specifying RTLD_LAZY should improve performance on implementations supporting dynamic symbol binding since a process might not reference all of the symbols in an executable object file. And, for systems supporting dynamic symbol resolution for normal process execution, this behavior mimics the normal handling of process execution.
-----------	--

RTLD\_NOW All necessary relocations shall be performed when the executable object file is first loaded. This may waste some processing if relocations are performed for symbols that are never referenced. This behavior may be useful for applications that need to know that all symbols referenced during execution will be available before *dlopen()* returns.

Any executable object file loaded by *dlopen()* that requires relocations against global symbols can reference the symbols in the original process image file, any executable object files loaded at program start-up, from the initial process image itself, from any other executable object file included in the same *dlopen()* invocation, and any executable object files that were loaded in any *dlopen()* invocation and which specified the RTLD\_GLOBAL flag. To determine the scope of visibility for the symbols loaded with a *dlopen()* invocation, the *mode* parameter should be a bitwise-inclusive OR with one of the following values:

RTLD\_GLOBAL The executable object file's symbols shall be made available for relocation processing of any other executable object file. In addition, symbol lookup using *dlopen(NULL,mode)* and an associated *dlsym()* allows executable object files loaded with this mode to be searched.

RTLD\_LOCAL The executable object file's symbols shall not be made available for relocation processing of any other executable object file.

If neither RTLD\_GLOBAL nor RTLD\_LOCAL is specified, the default behavior is unspecified.

If an executable object file is specified in multiple *dlopen()* invocations, *mode* is interpreted at each invocation.

If RTLD\_NOW has been specified, all relocations shall have been completed rendering further RTLD\_NOW operations redundant and any further RTLD\_LAZY operations irrelevant.

If RTLD\_GLOBAL has been specified, the executable object file shall maintain the RTLD\_GLOBAL status regardless of any previous or future specification of RTLD\_LOCAL, as long as the executable object file remains in the address space (see *dlclose()*).

Symbols introduced into the process image through calls to *dlopen()* may be used in relocation activities. Symbols so introduced may duplicate symbols already defined by the program or previous *dlopen()* operations. To resolve the ambiguities such a situation might present, the resolution of a symbol reference to symbol definition is based on a symbol resolution order. Two such resolution orders are defined: load order and dependency order. Load order establishes an ordering among symbol definitions, such that the first definition loaded (including definitions from the process image file and any dependent executable object files loaded with it) has priority over executable object files added later (by *dlopen()*). Load ordering is used in relocation processing. Dependency ordering uses a breadth-first order starting with a given executable object file, then all of its dependencies, then any dependents of those, iterating until all dependencies are satisfied. With the exception of the global symbol table handle obtained via a *dlopen()* operation with a null pointer as the *file* argument, dependency ordering is used by the *dlsym()* function. Load ordering is used in *dlsym()* operations upon the global symbol table handle.

When an executable object file is first made accessible via *dlopen()*, it and its dependent executable object files are added in dependency order. Once all the executable object files are added, relocations are performed using load order. Note that if an executable object file or its dependencies had been previously loaded, the load and dependency orders may yield different resolutions.

The symbols introduced by *dlopen()* operations and available through *dlsym()* are at a minimum those which are exported as identifiers of global scope by the executable object file. Typically,

25305 such identifiers shall be those that were specified in (for example) C source code as having  
 25306 **extern** linkage. The precise manner in which an implementation constructs the set of exported  
 25307 symbols for an executable object file is implementation-defined.

#### 25308 **RETURN VALUE**

25309 Upon successful completion, *dlopen()* shall return a symbol table handle. If *file* cannot be found,  
 25310 cannot be opened for reading, is not of an appropriate executable object file format for  
 25311 processing by *dlopen()*, or if an error occurs during the process of loading *file* or relocating its  
 25312 symbolic references, *dlopen()* shall return a null pointer. More detailed diagnostic information  
 25313 shall be available through *dlderror()*.

#### 25314 **ERRORS**

#### 25327 **CHANGE HISTORY**

25328 First released in Issue 5.

#### 25329 **Issue 6**

25330 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/21 is applied, changing the default  
 25331 behavior in the DESCRIPTION when neither RTLD\_GLOBAL nor RTLD\_LOCAL are specified  
 25332 from implementation-defined to unspecified.

#### 25333 **Issue 7**

25334 The *dlopen()* function is moved from the XSI option to the Base.

25335 The EXAMPLES section is updated to refer to *dlsym()*.

25336 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0073 [74] is applied.

**NAME**

dlsym — get the address of a symbol from a symbol table handle

**SYNOPSIS**

```
#include <dlfcn.h>
```

```
void *dlsym(void *restrict handle, const char *restrict name);
```

**DESCRIPTION**

The *dlsym()* function shall obtain the address of a symbol (a function identifier or a data object identifier) defined in the symbol table identified by the *handle* argument. The *handle* argument is a symbol table handle returned from a call to *dlopen()* (and which has not since been released by a call to *dlclose()*), and *name* is the symbol's name as a character string. The return value from *dlsym()*, cast to a pointer to the type of the named symbol, can be used to call (in the case of a function) or access the contents of (in the case of a data object) the named symbol.

The *dlsym()* function shall search for the named symbol in the symbol table referenced by *handle*. If the symbol table was created with lazy loading (see *RTLD\_LAZY* in *dlopen()*), load ordering shall be used in *dlsym()* operations to relocate executable object files needed to resolve the symbol. The symbol resolution algorithm used shall be dependency order as described in *dlopen()*.

The *RTLD\_DEFAULT* and *RTLD\_NEXT* symbolic constants (which may be defined in *<dlfcn.h>*) are reserved for future use as special values that applications may be allowed to use for *handle*.

**RETURN VALUE**

Upon successful completion, if *name* names a function identifier, *dlsym()* shall return the address of the function converted from type pointer to function to type pointer to **void**; otherwise, *dlsym()* shall return the address of the data object associated with the data object identifier named by *name* converted from a pointer to the type of the data object to a pointer to **void**. If *handle* does not refer to a valid symbol table handle or if the symbol named by *name* cannot be found in the symbol table associated with *handle*, *dlsym()* shall return a null pointer.

More detailed diagnostic information shall be available through *dLError()*.

**ERRORS**

No errors are defined.

**EXAMPLES**

The following example shows how *dlopen()* and *dlsym()* can be used to access either a function or a data object. For simplicity, error checking has been omitted.

```
void *handle;
int (*fptr)(int), *iptr, result;
/* open the needed symbol table */
handle = dlopen("/usr/home/me/libfoo.so", RTLD_LOCAL | RTLD_LAZY);
/* find the address of the function my_function */
fptr = (int (*)(int))dlsym(handle, "my_function");
/* find the address of the data object my_object */
iptr = (int *)dlsym(handle, "my_OBJ");
/* invoke my_function, passing the value of my_OBJ as the parameter */
result = (*fptr)(*iptr);
```

**APPLICATION USAGE**

The following special purpose values for *handle* are reserved for future use and have the indicated meanings:

**RTLD\_DEFAULT** The identifier lookup happens in the normal global scope; that is, a search for an identifier using *handle* would find the same definition as a direct use of this identifier in the program code.

**RTLD\_NEXT** Specifies the next executable object file after this one that defines *name*. This one refers to the executable object file containing the invocation of *dlsym()*. The next executable object file is the one found upon the application of a load order symbol resolution algorithm (see *dlopen()*). The next symbol is either one of global scope (because it was introduced as part of the original process image or because it was added with a *dlopen()* operation including the **RTLD\_GLOBAL** flag), or is in an executable object file that was included in the same *dlopen()* operation that loaded this one.

The **RTLD\_NEXT** flag is useful to navigate an intentionally created hierarchy of multiply-defined symbols created through interposition. For example, if a program wished to create an implementation of *malloc()* that embedded some statistics gathering about memory allocations, such an implementation could use the real *malloc()* definition to perform the memory allocation — and itself only embed the necessary logic to implement the statistics gathering function.

Note that conversion from a **void \*** pointer to a function pointer as in:

```
fptr = (int (*)(int))dlsym(handle, "my_function");
```

is not defined by the ISO C standard. This standard requires this conversion to work correctly on conforming implementations.

**RATIONALE**

**CHANGE HISTORY**

First released in Issue 5.

**Issue 6**

The **restrict** keyword is added to the *dlsym()* prototype for alignment with the ISO/IEC 9899:1999 standard.

The **RTLD\_DEFAULT** and **RTLD\_NEXT** flags are reserved for future use.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/14 is applied, correcting an example, and adding text to the **RATIONALE** describing issues related to conversion of pointers to functions and back again.

**Issue 7**

The *dlsym()* function is moved from the XSI option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0074 [74] is applied.

## 25422 NAME

25423 dprintf — print formatted output

## 25424 SYNOPSIS

```
25425 CX #include <stdio.h>
25426 int dprintf(int fil-des, const char *restrict format, ...);
```

## 25427 DESCRIPTION

25428 Refer to *fprintf()*.

**NAME**

drand48, erand48, jrand48, lcong48, lrand48, mrand48, nrand48, seed48, srand48 — generate uniformly distributed pseudo-random numbers

**SYNOPSIS**

```
XSI #include <stdlib.h>

double drand48(void);
double erand48(unsigned short xsubi[3]);
long jrand48(unsigned short xsubi[3]);
void lcong48(unsigned short param[7]);
long lrand48(void);
long mrand48(void);
long nrand48(unsigned short xsubi[3]);
unsigned short *seed48(unsigned short seed16v[3]);
void srand48(long seedval);
```

**DESCRIPTION**

This family of functions shall generate pseudo-random numbers using a linear congruential algorithm and 48-bit integer arithmetic.

The *drand48()* and *erand48()* functions shall return non-negative, double-precision, floating-point values, uniformly distributed over the interval [0.0,1.0).

The *lrnd48()* and *nrnd48()* functions shall return non-negative, long integers, uniformly distributed over the interval  $[0, 2^{31})$ .

The *mrnd48()* and *jrnd48()* functions shall return signed long integers uniformly distributed over the interval  $[-2^{31}, 2^{31})$ .

The *srand48()*, *seed48()*, and *lcong48()* functions are initialization entry points, one of which should be invoked before either *drand48()*, *lrnd48()*, or *mrnd48()* is called. (Although it is not recommended practice, constant default initializer values shall be supplied automatically if *drand48()*, *lrnd48()*, or *mrnd48()* is called without a prior call to an initialization entry point.) The *erand48()*, *nrnd48()*, and *jrnd48()* functions do not require an initialization entry point to be called first.

All the routines work by generating a sequence of 48-bit integer values,  $X_i$ , according to the linear congruential formula:

$$X_{n+1} = (aX_n + c)_{\text{mod } m} \quad n \geq 0$$

The parameter  $m = 2^{48}$ ; hence 48-bit integer arithmetic is performed. Unless *lcong48()* is invoked, the multiplier value  $a$  and the addend value  $c$  are given by:

$$a = 5\text{DEECE66D}_{16} = 273673163155_8$$

$$c = \text{B}_{16} = 13_8$$

The value returned by any of the *drand48()*, *erand48()*, *jrnd48()*, *lrnd48()*, *mrnd48()*, or *nrnd48()* functions is computed by first generating the next 48-bit  $X_i$  in the sequence. Then the appropriate number of bits, according to the type of data item to be returned, are copied from the high-order (leftmost) bits of  $X_i$  and transformed into the returned value.

The *drand48()*, *lrnd48()*, and *mrnd48()* functions store the last 48-bit  $X_i$  generated in an internal buffer; that is why the application shall ensure that these are initialized prior to being invoked. The *erand48()*, *nrnd48()*, and *jrnd48()* functions require the calling program to

provide storage for the successive  $X_i$  values in the array specified as an argument when the functions are invoked. That is why these routines do not have to be initialized; the calling program merely has to place the desired initial value of  $X_i$  into the array and pass it as an argument. By using different arguments, *erand48()*, *rand48()*, and *jrand48()* allow separate modules of a large program to generate several *independent* streams of pseudo-random numbers; that is, the sequence of numbers in each stream shall *not* depend upon how many times the routines are called to generate numbers for the other streams.

The initializer function *srand48()* sets the high-order 32 bits of  $X_i$  to the low-order 32 bits contained in its argument. The low-order 16 bits of  $X_i$  are set to the arbitrary value  $330E_{16}$ .

The initializer function *seed48()* sets the value of  $X_i$  to the 48-bit value specified in the argument array. The low-order 16 bits of  $X_i$  are set to the low-order 16 bits of *seed16v*[0]. The mid-order 16 bits of  $X_i$  are set to the low-order 16 bits of *seed16v*[1]. The high-order 16 bits of  $X_i$  are set to the low-order 16 bits of *seed16v*[2]. In addition, the previous value of  $X_i$  is copied into a 48-bit internal buffer, used only by *seed48()*, and a pointer to this buffer is the value returned by *seed48()*. This returned pointer, which can just be ignored if not needed, is useful if a program is to be restarted from a given point at some future time—use the pointer to get at and store the last  $X_i$  value, and then use this value to reinitialize via *seed48()* when the program is restarted.

The initializer function *lcong48()* allows the user to specify the initial  $X_i$ , the multiplier value  $a$ , and the addend value  $c$ . Argument array elements *param*[0-2] specify  $X_i$ , *param*[3-5] specify the multiplier  $a$ , and *param*[6] specifies the 16-bit addend  $c$ . After *lcong48()* is called, a subsequent call to either *srand48()* or *seed48()* shall restore the standard multiplier and addend values,  $a$  and  $c$ , specified above.

The *drand48()*, *lrand48()*, and *mrand48()* functions need not be thread-safe.

#### RETURN VALUE

As described in the DESCRIPTION above.

#### ERRORS

No errors are defined.

#### EXAMPLES

None.

#### APPLICATION USAGE

These functions should be avoided whenever non-trivial requirements (including safety) have to be fulfilled.

#### CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

25513 **Issue 5**

25514 A note indicating that the *drand48()*, *lrand48()*, and *mrnd48()* functions need not be reentrant is  
25515 added to the DESCRIPTION.

25516 **Issue 6**

25517 The normative text is updated to avoid use of the term “must” for application requirements.

25518 **Issue 7**

25519 Austin Group Interpretation 1003.1-2001 #156 is applied.

25520 **NAME**

25521 dup, dup2 — duplicate an open file descriptor

25522 **SYNOPSIS**

```
25523 #include <unistd.h>
25524 int dup(int fildes);
25525 int dup2(int fildes, int fildes2);
```

25526 **DESCRIPTION**

25527 The *dup()* function provides an alternative interface to the service provided by *fcntl()* using the  
 25528 F\_DUPFD command. The call *dup(filde)s* shall be equivalent to:

```
25529 fcntl(fildes, F_DUPFD, 0);
```

25530 The *dup2()* function shall cause the file descriptor *filde*s2 to refer to the same open file  
 25531 description as the file descriptor *filde*s and to share any locks, and shall return *filde*s2. If *filde*s2 is  
 25532 already a valid open file descriptor, it shall be closed first, unless *filde*s is equal to *filde*s2 in which  
 25533 case *dup2()* shall return *filde*s2 without closing it. If the close operation fails to close *filde*s2,  
 25534 *dup2()* shall return -1 without changing the open file description to which *filde*s2 refers. If *filde*s  
 25535 is not a valid file descriptor, *dup2()* shall return -1 and shall not close *filde*s2. If *filde*s2 is less than  
 25536 0 or greater than or equal to {OPEN\_MAX}, *dup2()* shall return -1 with *errno* set to [EBADF].

25537 Upon successful completion, if *filde*s is not equal to *filde*s2, the FD\_CLOEXEC flag associated  
 25538 with *filde*s2 shall be cleared. If *filde*s is equal to *filde*s2, the FD\_CLOEXEC flag associated with  
 25539 *filde*s2 shall not be changed.

25540 TYM If *filde*s refers to a typed memory object, the result of the *dup2()* function is unspecified.

25541 **RETURN VALUE**

25542 Upon successful completion a non-negative integer, namely the file descriptor, shall be returned;  
 25543 otherwise, -1 shall be returned and *errno* set to indicate the error.

25544 **ERRORS**

25545 The *dup()* function shall fail if:

25546 [EBADF] The *filde*s argument is not a valid open file descriptor.

25547 [EMFILE] All file descriptors available to the process are currently open.

25548 The *dup2()* function shall fail if:

25549 [EBADF] The *filde*s argument is not a valid open file descriptor or the argument *filde*s2 is  
 25550 negative or greater than or equal to {OPEN\_MAX}.

25551 [EINTR] The *dup2()* function was interrupted by a signal.

25552 The *dup2()* function may fail if:

25553 [EIO] An I/O error occurred while attempting to close *filde*s2.

25554 **EXAMPLES**25555 **Redirecting Standard Output to a File**

25556 The following example closes standard output for the current processes, re-assigns standard  
 25557 output to go to the file referenced by *pdf*, and closes the original file descriptor to clean up.

```
25558 #include <unistd.h>
25559 ...
25560 int pdf;
25561 ...
```

```

25562     close(1);
25563     dup(pfd);
25564     close(pfd);
25565     ...

```

### 25566 Redirecting Error Messages

25567 The following example redirects messages from *stderr* to *stdout*.

```

25568     #include <unistd.h>
25569     ...
25570     dup2(1, 2);
25571     ...

```

### 25572 APPLICATION USAGE

25573 Implementations may use file descriptors that must be inherited into child processes for the  
 25574 child process to remain conforming, such as for message catalog or tracing purposes. Therefore,  
 25575 an application that calls *dup2()* with an arbitrary integer for *filides2* risks non-conforming  
 25576 behavior, and *dup2()* can only portably be used to overwrite file descriptor values that the  
 25577 application has obtained through explicit actions, or for the three file descriptors corresponding  
 25578 to the standard file streams. In order to avoid a race condition of leaking an unintended file  
 25579 descriptor into a child process, an application should consider opening all file descriptors with  
 25580 the FD\_CLOEXEC bit set unless the file descriptor is intended to be inherited across *exec*.

### 25581 RATIONALE

25582 The *dup()* function is redundant. Its services are also provided by the *fcntl()* function. It has been  
 25583 included in this volume of POSIX.1-2008 primarily for historical reasons, since many existing  
 25584 applications use it. On the other hand, the *dup2()* function provides unique services, as no other  
 25585 interface is able to atomically replace an existing file descriptor.

25586 The *dup2()* function is not marked obsolescent because it presents a type-safe version of  
 25587 functionality provided in a type-unsafe version by *fcntl()*. It is used in the POSIX Ada binding.

25588 The *dup2()* function is not intended for use in critical regions as a synchronization mechanism.

25589 In the description of [EBADF], the case of *filides* being out of range is covered by the given case of  
 25590 *filides* not being valid. The descriptions for *filides* and *filides2* are different because the only kind of  
 25591 invalidity that is relevant for *filides2* is whether it is out of range; that is, it does not matter  
 25592 whether *filides2* refers to an open file when the *dup2()* call is made.

### 25593 FUTURE DIRECTIONS

25594 None.

### 25595 SEE ALSO

25596 *close()*, *fcntl()*, *open()*

25597 XBD <unistd.h>

### 25598 CHANGE HISTORY

25599 First released in Issue 1. Derived from Issue 1 of the SVID.

### 25600 Issue 7

25601 SD5-XSH-ERN-187 is applied.

25602 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0075 [149,428] and  
 25603 XSH/TC1-2008/0076 [149] are applied.

25604 **NAME**

25605 duplocale — duplicate a locale object

25606 **SYNOPSIS**

```
25607 CX    #include <locale.h>
25608        locale_t duplocale(locale_t locobj);
```

25609 **DESCRIPTION**

25610 The *duplocale()* function shall create a duplicate copy of the locale object referenced by the *locobj*  
25611 argument.

25612 If the *locobj* argument is *LC\_GLOBAL\_LOCALE*, *duplocale()* shall create a new locale object  
25613 containing a copy of the global locale determined by the *setlocale()* function.

25614 The behavior is undefined if the *locobj* argument is not a valid locale object handle.

25615 **RETURN VALUE**

25616 Upon successful completion, the *duplocale()* function shall return a handle for a new locale  
25617 object. Otherwise, *duplocale()* shall return **(locale\_t)0** and set *errno* to indicate the error.

25618 **ERRORS**

25619 The *duplocale()* function shall fail if:

25620 [ENOMEM] There is not enough memory available to create the locale object or load the  
25621 locale data.

25622 **EXAMPLES**25623 **Constructing an Altered Version of an Existing Locale Object**

25624 The following example shows a code fragment to create a slightly altered version of an existing  
25625 locale object. The function takes a locale object and a locale name and it replaces the *LC\_TIME*  
25626 category data in the locale object with that from the named locale.

```
25627 #include <locale.h>
25628 ...
25629 locale_t
25630 with_changed_lc_time (locale_t obj, const char *name)
25631 {
25632     locale_t retval = duplocale (obj);
25633     if (retval != (locale_t) 0)
25634     {
25635         locale_t changed = newlocale (LC_TIME_MASK, name, retval);
25636         if (changed == (locale_t) 0)
25637             /* An error occurred. Free all allocated resources. */
25638             freelocale (retval);
25639         retval = changed;
25640     }
25641     return retval;
25642 }
```

**APPLICATION USAGE**

The use of the *duplocale()* function is recommended for situations where a locale object is being used in multiple places, and it is possible that the lifetime of the locale object might end before all uses are finished. Another reason to duplicate a locale object is if a slightly modified form is needed. This can be achieved by a call to *newlocale()* following the *duplocale()* call.

As with the *newlocale()* function, handles for locale objects created by the *duplocale()* function should be released by a corresponding call to *freelocale()*.

The *duplocale()* function can also be used in conjunction with *uselocale((locale\_t)0)*. This returns the locale in effect for the calling thread, but can have the value LC\_GLOBAL\_LOCALE. Passing LC\_GLOBAL\_LOCALE to functions such as *isalnum\_l()* results in undefined behavior, but applications can convert it into a usable locale object by using *duplocale()*.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*freelocale()*, *newlocale()*, *uselocale()*

XBD <locale.h>

**CHANGE HISTORY**

First released in Issue 7.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0077 [283,301], XSH/TC1-2008/0078 [283], and XSH/TC1-2008/0079 [301] are applied.

25665 **NAME**25666       encrypt — encoding function (**CRYPT**)25667 **SYNOPSIS**

```
25668 XSI      #include <unistd.h>
25669          void encrypt(char block[64], int edflag);
```

25670 **DESCRIPTION**

25671       The *encrypt()* function shall provide access to an implementation-defined encoding algorithm.  
25672       The key generated by *setkey()* is used to encrypt the string *block* with *encrypt()*.

25673       The *block* argument to *encrypt()* shall be an array of length 64 bytes containing only the bytes  
25674       with values of 0 and 1. The array is modified in place to a similar array using the key set by  
25675       *setkey()*. If *edflag* is 0, the argument is encoded. If *edflag* is 1, the argument may be decoded (see  
25676       the APPLICATION USAGE section); if the argument is not decoded, *errno* shall be set to  
25677       [ENOSYS].

25678       The *encrypt()* function shall not change the setting of *errno* if successful. An application wishing  
25679       to check for error situations should set *errno* to 0 before calling *encrypt()*. If *errno* is non-zero on  
25680       return, an error has occurred.

25681       The *encrypt()* function need not be thread-safe.

25682 **RETURN VALUE**

25683       The *encrypt()* function shall not return a value.

25684 **ERRORS**

25685       The *encrypt()* function shall fail if:

25686       [ENOSYS]       The functionality is not supported on this implementation.

25687 **EXAMPLES**

25688       None.

25689 **APPLICATION USAGE**

25690       Historical implementations of the *encrypt()* function used a rather primitive encoding algorithm.

25691       In some environments, decoding might not be implemented. This is related to some Government  
25692       restrictions on encryption and decryption routines. Historical practice has been to ship a  
25693       different version of the encryption library without the decryption feature in the routines  
25694       supplied. Thus the exported version of *encrypt()* does encoding but not decoding.

25695 **RATIONALE**

25696       None.

25697 **FUTURE DIRECTIONS**

25698       A future version of the standard may mark this interface as obsolete or remove it altogether. |

25699 **SEE ALSO**

25700       *crypt()*, *setkey()*

25701       XBD <unistd.h>

25702 **CHANGE HISTORY**

25703       First released in Issue 1. Derived from Issue 1 of the SVID.

25704 **Issue 5**

25705 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

25706 **Issue 6**

25707 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

25708 **Issue 7**

25709 Austin Group Interpretation 1003.1-2001 #156 is applied.

25710 **NAME**

25711 endgrent, getgrent, setgrent — group database entry functions

25712 **SYNOPSIS**

```

25713 XSI      #include <grp.h>
25714          void endgrent(void);
25715          struct group *getgrent(void);
25716          void setgrent(void);

```

25717 **DESCRIPTION**

25718 The *getgrent()* function shall return a pointer to a structure containing the broken-out fields of an  
 25719 entry in the group database. If the group database is not already open, *getgrent()* shall open it  
 25720 and return a pointer to a **group** structure containing the first entry in the database. Thereafter, it  
 25721 shall return a pointer to a **group** structure containing the next group structure in the group  
 25722 database, so successive calls may be used to search the entire database.

25723 An implementation that provides extended security controls may impose further  
 25724 implementation-defined restrictions on accessing the group database. In particular, the system  
 25725 may deny the existence of some or all of the group database entries associated with groups other  
 25726 than those groups associated with the caller and may omit users other than the caller from the  
 25727 list of members of groups in database entries that are returned.

25728 The *setgrent()* function shall rewind the group database so that the next *getgrent()* call returns  
 25729 the first entry, allowing repeated searches.

25730 The *endgrent()* function shall close the group database.

25731 The *setgrent()* and *endgrent()* functions shall not change the setting of *errno* if successful.

25732 On error, the *setgrent()* and *endgrent()* functions shall set *errno* to indicate the error.

25733 Since no value is returned by the *setgrent()* and *endgrent()* functions, an application wishing to  
 25734 check for error situations should set *errno* to 0, then call the function, then check *errno*.

25735 These functions need not be thread-safe.

25736 **RETURN VALUE**

25737 On successful completion, *getgrent()* shall return a pointer to a group structure. On end-of-file,  
 25738 *getgrent()* shall return a null pointer and shall not change the setting of *errno*. On error,  
 25739 *getgrent()* shall return a null pointer and *errno* shall be set to indicate the error.

25740 The application shall not modify the structure to which the return value points, nor any storage  
 25741 areas pointed to by pointers within the structure. The returned pointer, and pointers within the  
 25742 structure, might be invalidated or the structure or the storage areas might be overwritten by a  
 25743 subsequent call to *getgrgid()*, *getgrnam()*, or *getgrent()*. The returned pointer, and pointers  
 25744 within the structure, might also be invalidated if the calling thread is terminated.

25745 **ERRORS**

25746 These functions may fail if:

25747 [EINTR] A signal was caught during the operation.

25748 [EIO] An I/O error has occurred.

25749 In addition, the *getgrent()* and *setgrent()* functions may fail if:

25750 [EMFILE] All file descriptors available to the process are currently open.

25751 [ENFILE] The maximum allowable number of files is currently open in the system.

25752 **EXAMPLES**

25753 None.

25754 **APPLICATION USAGE**

25755 These functions are provided due to their historical usage. Applications should avoid

25756 dependencies on fields in the group database, whether the database is a single file, or where in

25757 the file system name space the database resides. Applications should use *getgrnam()* and

25758 *getgrgid()* whenever possible because it avoids these dependencies.

25759 **RATIONALE**

25760 None.

25761 **FUTURE DIRECTIONS**

25762 None.

25766 **CHANGE HISTORY**

25767 First released in Issue 4, Version 2.

25768 **Issue 5**

25769 Moved from X/OPEN UNIX extension to BASE.

25770 Normative text previously in the APPLICATION USAGE section is moved to the RETURN

25771 VALUE section.

25772 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

25773 **Issue 6**

25774 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

25775 **Issue 7**

25776 Austin Group Interpretation 1003.1-2001 #156 is applied.

25777 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

25778 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0080 [75] is applied.

25779 **NAME**

25780 endhostent, gethostent, sethostent — network host database functions

25781 **SYNOPSIS**

```
25782 #include <netdb.h>
25783 void endhostent(void);
25784 struct hostent *gethostent(void);
25785 void sethostent(int stayopen);
```

25786 **DESCRIPTION**

25787 These functions shall retrieve information about hosts. This information is considered to be  
25788 stored in a database that can be accessed sequentially or randomly. The implementation of this  
25789 database is unspecified.

25790 **Note:** In many cases this database is implemented by the Domain Name System, as documented in  
25791 RFC 1034, RFC 1035, and RFC 1886.

25792 The *sethostent()* function shall open a connection to the database and set the next entry for  
25793 retrieval to the first entry in the database. If the *stayopen* argument is non-zero, the connection  
25794 shall not be closed by a call to *gethostent()*, and the implementation may maintain an open file  
25795 descriptor.

25796 The *gethostent()* function shall read the next entry in the database, opening and closing a  
25797 connection to the database as necessary.

25798 Entries shall be returned in **hostent** structures.

25799 The *endhostent()* function shall close the connection to the database, releasing any open file  
25800 descriptor.

25801 These functions need not be thread-safe.

25802 **RETURN VALUE**

25803 Upon successful completion, the *gethostent()* function shall return a pointer to a **hostent**  
25804 structure if the requested entry was found, and a null pointer if the end of the database was  
25805 reached or the requested entry was not found.

25806 The application shall not modify the structure to which the return value points, nor any storage  
25807 areas pointed to by pointers within the structure. The returned pointer, and pointers within the  
25808 structure, might be invalidated or the structure or the storage areas might be overwritten by a  
25809 subsequent call to *gethostent()*. The returned pointer, and pointers within the structure, might  
25810 also be invalidated if the calling thread is terminated. +

25811 **ERRORS**

25812 No errors are defined for *endhostent()*, *gethostent()*, and *sethostent()*.

25813 **EXAMPLES**

25814 None.

25815 **APPLICATION USAGE**

25816 None.

25817 **RATIONALE**

25818 None.

25825 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

25826 **Issue 7**

25827 Austin Group Interpretation 1003.1-2001 #156 is applied.

25828 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0081 [75,428] and  
25829 XSH/TC1-2008/0082 [75] are applied.

**NAME**

endnetent, getnetbyaddr, getnetbyname, getnetent, setnetent — network database functions

**SYNOPSIS**

```
#include <netdb.h>

void endnetent(void);
struct netent *getnetbyaddr(uint32_t net, int type);
struct netent *getnetbyname(const char *name);
struct netent *getnetent(void);
void setnetent(int stayopen);
```

**DESCRIPTION**

These functions shall retrieve information about networks. This information is considered to be stored in a database that can be accessed sequentially or randomly. The implementation of this database is unspecified.

The *setnetent()* function shall open and rewind the database. If the *stayopen* argument is non-zero, the connection to the *net* database shall not be closed after each call to *getnetent()* (either directly, or indirectly through one of the other *getnet\*()* functions), and the implementation may maintain an open file descriptor to the database.

The *getnetent()* function shall read the next entry of the database, opening and closing a connection to the database as necessary.

The *getnetbyaddr()* function shall search the database from the beginning, and find the first entry for which the address family specified by *type* matches the *n\_addrtype* member and the network number *net* matches the *n\_net* member, opening and closing a connection to the database as necessary. The *net* argument shall be the network number in host byte order.

The *getnetbyname()* function shall search the database from the beginning and find the first entry for which the network name specified by *name* matches the *n\_name* member, opening and closing a connection to the database as necessary.

The *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* functions shall each return a pointer to a **netent** structure, the members of which shall contain the fields of an entry in the network database.

The *endnetent()* function shall close the database, releasing any open file descriptor.

These functions need not be thread-safe.

**RETURN VALUE**

Upon successful completion, *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* shall return a pointer to a **netent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer shall be returned.

The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *getnetbyaddr()*, *getnetbyname()*, or *getnetent()*. The returned pointer, and pointers within the structure, might also be invalidated if the calling thread is terminated.

**ERRORS**

No errors are defined.

25873 **EXAMPLES**

25874 None.

25875 **APPLICATION USAGE**

25876 None.

25877 **RATIONALE**

25878 None.

25886 Austin Group Interpretation 1003.1-2001 #156 is applied.

25887 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0083 [75] and XSH/TC1-2008/0084  
25888 [75] are applied.

## NAME

endprotoent, getprotobyname, getprotobynumber, getprotoent, setprotoent — network protocol database functions

## SYNOPSIS

```
#include <netdb.h>

void endprotoent(void);
struct protoent *getprotobyname(const char *name);
struct protoent *getprotobynumber(int proto);
struct protoent *getprotoent(void);
void setprotoent(int stayopen);
```

## DESCRIPTION

These functions shall retrieve information about protocols. This information is considered to be stored in a database that can be accessed sequentially or randomly. The implementation of this database is unspecified.

The *setprotoent()* function shall open a connection to the database, and set the next entry to the first entry. If the *stayopen* argument is non-zero, the connection to the network protocol database shall not be closed after each call to *getprotoent()* (either directly, or indirectly through one of the other *getproto\**(*)* functions), and the implementation may maintain an open file descriptor for the database.

The *getprotobyname()* function shall search the database from the beginning and find the first entry for which the protocol name specified by *name* matches the *p\_name* member, opening and closing a connection to the database as necessary.

The *getprotobynumber()* function shall search the database from the beginning and find the first entry for which the protocol number specified by *proto* matches the *p\_proto* member, opening and closing a connection to the database as necessary.

The *getprotoent()* function shall read the next entry of the database, opening and closing a connection to the database as necessary.

The *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* functions shall each return a pointer to a **protoent** structure, the members of which shall contain the fields of an entry in the network protocol database.

The *endprotoent()* function shall close the connection to the database, releasing any open file descriptor.

These functions need not be thread-safe.

## RETURN VALUE

Upon successful completion, *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* return a pointer to a **protoent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer is returned.

The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *getprotobyname()*, *getprotobynumber()*, or *getprotoent()*. The returned pointer, and pointers within the structure, might also be invalidated if the calling thread is terminated.

**25932 ERRORS**

25933 No errors are defined.

**25944 CHANGE HISTORY**

25945 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

**25946 Issue 7**

25947 Austin Group Interpretation 1003.1-2001 #156 is applied.

25948 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0085 [75] and XSH/TC1-2008/0086  
25949 [75] are applied.

**NAME**

endpwent, getpwent, setpwent — user database functions

**SYNOPSIS**

```
XSI    #include <pwd.h>
      void endpwent(void);
      struct passwd *getpwent(void);
      void setpwent(void);
```

**DESCRIPTION**

These functions shall retrieve information about users.

The *getpwent()* function shall return a pointer to a structure containing the broken-out fields of an entry in the user database. Each entry in the user database contains a **passwd** structure. If the user database is not already open, *getpwent()* shall open it and return a pointer to a **passwd** structure containing the first entry in the database. Thereafter, it shall return a pointer to a **passwd** structure containing the next entry in the user database. Successive calls can be used to search the entire user database.

If an end-of-file or an error is encountered on reading, *getpwent()* shall return a null pointer.

An implementation that provides extended security controls may impose further implementation-defined restrictions on accessing the user database. In particular, the system may deny the existence of some or all of the user database entries associated with users other than the caller.

The *setpwent()* function shall rewind the user database so that the next *getpwent()* call returns the first entry, allowing repeated searches.

The *endpwent()* function shall close the user database.

The *setpwent()* and *endpwent()* functions shall not change the setting of *errno* if successful.

On error, the *setpwent()* and *endpwent()* functions shall set *errno* to indicate the error.

Since no value is returned by the *setpwent()* and *endpwent()* functions, an application wishing to check for error situations should set *errno* to 0, then call the function, then check *errno*.

These functions need not be thread-safe.

**RETURN VALUE**

On successful completion, *getpwent()* shall return a pointer to a **passwd** structure. On end-of-file, *getpwent()* shall return a null pointer and shall not change the setting of *errno*. On error, *getpwent()* shall return a null pointer and *errno* shall be set to indicate the error.

The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *getpwuid()*, *getpwnam()*, or *getpwent()*. The returned pointer, and pointers within the structure, might also be invalidated if the calling thread is terminated.

**ERRORS**

These functions may fail if:

[EINTR] A signal was caught during the operation.

[EIO] An I/O error has occurred.

In addition, *getpwent()* and *setpwent()* may fail if:

- 25992 [EMFILE] All file descriptors available to the process are currently open.
- 25993 [ENFILE] The maximum allowable number of files is currently open in the system.

## 25994 EXAMPLES

### 25995 Searching the User Database

25996 The following example uses the *getpwent()* function to get successive entries in the user  
 25997 database, returning a pointer to a **passwd** structure that contains information about each user.  
 25998 The call to *endpwent()* closes the user database and cleans up.

```
25999 #include <pwd.h>
26000 #include <stdio.h>

26001 void printname(uid_t uid)
26002 {
26003     struct passwd *pwd;
26004     setpwent();
26005     while((pwd = getpwent()) != NULL) {
26006         if (pwd->pw_uid == uid) {
26007             printf("name=%s\n", pwd->pw_name);
26008             break;
26009         }
26010     }
26011     endpwent();
26012 }
```

## 26013 APPLICATION USAGE

26014 These functions are provided due to their historical usage. Applications should avoid  
 26015 dependencies on fields in the password database, whether the database is a single file, or where  
 26016 in the file system name space the database resides. Applications should use *getpwuid()*  
 26017 whenever possible because it avoids these dependencies.

## 26018 RATIONALE

26019 None.

## 26020 FUTURE DIRECTIONS

26021 None.

## 26022 SEE ALSO

## 26025 CHANGE HISTORY

26026 First released in Issue 4, Version 2.

### 26027 Issue 5

26028 Moved from X/OPEN UNIX extension to BASE.

26029 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
 26030 VALUE section.

26031 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

26032 **Issue 6**

26033 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

26034 **Issue 7**

26035 Austin Group Interpretation 1003.1-2001 #156 is applied.

26036 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

26037 The EXAMPLES section is revised.

26038 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0087 [75] is applied.

**NAME**

endservent, getservbyname, getservbyport, getservent, setservent — network services database functions

**SYNOPSIS**

```
#include <netdb.h>

void endservent(void);
struct servent *getservbyname(const char *name, const char *proto);
struct servent *getservbyport(int port, const char *proto);
struct servent *getservent(void);
void setservent(int stayopen);
```

**DESCRIPTION**

These functions shall retrieve information about network services. This information is considered to be stored in a database that can be accessed sequentially or randomly. The implementation of this database is unspecified.

The *setservent()* function shall open a connection to the database, and set the next entry to the first entry. If the *stayopen* argument is non-zero, the *net* database shall not be closed after each call to the *getservent()* function (either directly, or indirectly through one of the other *getserv\*()* functions), and the implementation may maintain an open file descriptor for the database.

The *getservent()* function shall read the next entry of the database, opening and closing a connection to the database as necessary.

The *getservbyname()* function shall search the database from the beginning and find the first entry for which the service name specified by *name* matches the *s\_name* member and the protocol name specified by *proto* matches the *s\_proto* member, opening and closing a connection to the database as necessary. If *proto* is a null pointer, any value of the *s\_proto* member shall be matched.

The *getservbyport()* function shall search the database from the beginning and find the first entry for which the port specified by *port* matches the *s\_port* member and the protocol name specified by *proto* matches the *s\_proto* member, opening and closing a connection to the database as necessary. If *proto* is a null pointer, any value of the *s\_proto* member shall be matched. The *port* argument shall be a value obtained by converting a **uint16\_t** in network byte order to **int**.

The *getservbyname()*, *getservbyport()*, and *getservent()* functions shall each return a pointer to a **servent** structure, the members of which shall contain the fields of an entry in the network services database.

The *endservent()* function shall close the database, releasing any open file descriptor.

These functions need not be thread-safe.

**RETURN VALUE**

Upon successful completion, *getservbyname()*, *getservbyport()*, and *getservent()* return a pointer to a **servent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer is returned.

The application shall not modify the structure to which the return value points, nor any storage areas pointed to by pointers within the structure. The returned pointer, and pointers within the structure, might be invalidated or the structure or the storage areas might be overwritten by a subsequent call to *getservbyname()*, *getservbyport()*, or *getservent()*. The returned pointer, and pointers within the structure, might also be invalidated if the calling thread is terminated.

26083 **ERRORS**

26084 No errors are defined.

26085 **EXAMPLES**

26086 None.

26087 **APPLICATION USAGE**26088 The *port* argument of *getservbyport()* need not be compatible with the port values of all address  
26089 families.26090 **RATIONALE**

26091 None.

26092 **FUTURE DIRECTIONS**

26093 None.

26094 **SEE ALSO**26095 *endhostent()*, *endprotoent()*, *htonl()*, *inet\_addr()*

26096 XBD &lt;netdb.h&gt;

26097 **CHANGE HISTORY**

26098 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

26099 **Issue 7**

26100 Austin Group Interpretation 1003.1-2001 #156 is applied.

26101 SD5-XBD-ERN-14 is applied.

26102 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0088 [75] and XSH/TC1-2008/0089  
26103 [75] are applied.

26104 **NAME**

26105 endutxent, getutxent, getutxid, getutxline, pututxline, setutxent — user accounting database  
 26106 functions

26107 **SYNOPSIS**

```
26108 XSI      #include <utmpx.h>
26109
26109 void endutxent(void);
26110 struct utmpx *getutxent(void);
26111 struct utmpx *getutxid(const struct utmpx *id);
26112 struct utmpx *getutxline(const struct utmpx *line);
26113 struct utmpx *pututxline(const struct utmpx *utmpx);
26114 void setutxent(void);
```

26115 **DESCRIPTION**

26116 These functions shall provide access to the user accounting database.

26117 The *getutxent()* function shall read the next entry from the user accounting database. If the  
 26118 database is not already open, it shall open it. If it reaches the end of the database, it shall fail.

26119 The *getutxid()* function shall search forward from the current point in the database. If the  
 26120 *ut\_type* value of the **utmpx** structure pointed to by *id* is *BOOT\_TIME*, *OLD\_TIME*, or  
 26121 *NEW\_TIME*, then it shall stop when it finds an entry with a matching *ut\_type* value. If the  
 26122 *ut\_type* value is *INIT\_PROCESS*, *LOGIN\_PROCESS*, *USER\_PROCESS*, or *DEAD\_PROCESS*,  
 26123 then it shall stop when it finds an entry whose type is one of these four and whose *ut\_id* member  
 26124 matches the *ut\_id* member of the **utmpx** structure pointed to by *id*. If the end of the database is  
 26125 reached without a match, *getutxid()* shall fail.

26126 The *getutxline()* function shall search forward from the current point in the database until it  
 26127 finds an entry of the type *LOGIN\_PROCESS* or *USER\_PROCESS* which also has a *ut\_line* value  
 26128 matching that in the **utmpx** structure pointed to by *line*. If the end of the database is reached  
 26129 without a match, *getutxline()* shall fail.

26130 The *getutxid()* or *getutxline()* function may cache data. For this reason, to use *getutxline()* to  
 26131 search for multiple occurrences, the application shall zero out the static data after each success,  
 26132 or *getutxline()* may return a pointer to the same **utmpx** structure.

26133 There is one exception to the rule about clearing the structure before further reads are done. The  
 26134 implicit read done by *pututxline()* (if it finds that it is not already at the correct place in the user  
 26135 accounting database) shall not modify the static structure returned by *getutxent()*, *getutxid()*, or  
 26136 *getutxline()*, if the application has modified this structure and passed the pointer back to  
 26137 *pututxline()*.

26138 For all entries that match a request, the *ut\_type* member indicates the type of the entry. Other  
 26139 members of the entry shall contain meaningful data based on the value of the *ut\_type* member as  
 26140 follows:

ut_type Member	Other Members with Meaningful Data
EMPTY	No others
BOOT_TIME	<i>ut_tv</i>
OLD_TIME	<i>ut_tv</i>
NEW_TIME	<i>ut_tv</i>
USER_PROCESS	<i>ut_id</i> , <i>ut_user</i> (login name of the user), <i>ut_line</i> , <i>ut_pid</i> , <i>ut_tv</i>
INIT_PROCESS	<i>ut_id</i> , <i>ut_pid</i> , <i>ut_tv</i>
LOGIN_PROCESS	<i>ut_id</i> , <i>ut_user</i> (implementation-defined name of the login process), <i>ut_line</i> , <i>ut_pid</i> , <i>ut_tv</i>
DEAD_PROCESS	<i>ut_id</i> , <i>ut_pid</i> , <i>ut_tv</i>

An implementation that provides extended security controls may impose implementation-defined restrictions on accessing the user accounting database. In particular, the system may deny the existence of some or all of the user accounting database entries associated with users other than the caller.

If the process has appropriate privileges, the *pututxline()* function shall write out the structure into the user accounting database. It shall search for a record as if by *getutxid()* that satisfies the request. If this search succeeds, then the entry shall be replaced. Otherwise, a new entry shall be made at the end of the user accounting database.

The *endutxent()* function shall close the user accounting database.

The *setutxent()* function shall reset the input to the beginning of the database. This should be done before each search for a new entry if it is desired that the entire database be examined.

These functions need not be thread-safe.

## RETURN VALUE

Upon successful completion, *getutxent()*, *getutxid()*, and *getutxline()* shall return a pointer to a **utmpx** structure containing a copy of the requested entry in the user accounting database. Otherwise, a null pointer shall be returned.

The return value may point to a static area which is overwritten by a subsequent call to *getutxid()* or *getutxline()*.

Upon successful completion, *pututxline()* shall return a pointer to a **utmpx** structure containing a copy of the entry added to the user accounting database. Otherwise, a null pointer shall be returned.

The *endutxent()* and *setutxent()* functions shall not return a value.

## ERRORS

No errors are defined for the *endutxent()*, *getutxent()*, *getutxid()*, *getutxline()*, and *setutxent()* functions.

The *pututxline()* function may fail if:

[EPERM]           The process does not have appropriate privileges.

26202        environ — array of character pointers to the environment strings

26203 **SYNOPSIS**

26204        extern char \*\*environ;

26205 **DESCRIPTION**26206        Refer to *exec* and XBD [Chapter 8](#) (on page 173).

26207 **NAME**

26208       erand48 — generate uniformly distributed pseudo-random numbers

26209 **SYNOPSIS**

26210 XSI       #include &lt;stdlib.h&gt;

26211       double erand48(unsigned short xsubi[3]);

26212 **DESCRIPTION**26213       Refer to *drand48()*.

26214 **NAME**

26215 erf, erff, erfl — error functions

26216 **SYNOPSIS**

```
26217 #include <math.h>
26218 double erf(double x);
26219 float erff(float x);
26220 long double erfl(long double x);
```

26221 **DESCRIPTION**

26222 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 26223 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26224 volume of POSIX.1-2008 defers to the ISO C standard.

26225 These functions shall compute the error function of their argument  $x$ , defined as:

$$26226 \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$$

26227 An application wishing to check for error situations should set *errno* to zero and call  
 26228 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 26229 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 26230 zero, an error has occurred.

26231 **RETURN VALUE**

26232 Upon successful completion, these functions shall return the value of the error function.

26233 MX If  $x$  is NaN, a NaN shall be returned.

26234 If  $x$  is  $\pm 0$ ,  $\pm 0$  shall be returned.

26235 If  $x$  is  $\pm \text{Inf}$ ,  $\pm 1$  shall be returned.

26236 If the correct value would cause underflow, a range error may occur, and *erf()*, *erff()*, and *erfl()*  
 26237 shall return an implementation-defined value no greater in magnitude than DBL\_MIN,  
 26238 FLT\_MIN, and LDBL\_MIN, respectively.

26239 MXX If the IEC 60559 Floating-Point option is supported,  $2 * x / \sqrt{\pi}$  should be returned.

26240 **ERRORS**

26241 These functions may fail if:

26242 MX **Range Error** The result underflows.

26243 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 26244 then *errno* shall be set to [ERANGE]. If the integer expression  
 26245 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 26246 floating-point exception shall be raised.

26247 **EXAMPLES**26248 **Computing the Probability for a Normal Variate**

26249 This example shows how to use *erf()* to compute the probability that a normal variate assumes a  
 26250 value in the range  $[x_1, x_2]$  with  $x_1 \leq x_2$ .

26251 This example uses the constant `M_SQRT1_2` which is part of the XSI option.

```
26252 #include <math.h>
26253
26254 double
26255 Phi(const double x1, const double x2)
26256 {
26257     return ( erf(x2*M_SQRT1_2) - erf(x1*M_SQRT1_2) ) / 2;
```

26258 **APPLICATION USAGE**

26259 Underflow occurs when  $|x| < \text{DBL\_MIN} * (\sqrt{\pi}/2)$ .

26260 On error, the expressions *(math\_errhandling & MATH\_ERRNO)* and *(math\_errhandling &*  
 26261 *MATH\_ERREXCEPT)* are independent of each other, but at least one of them must be non-zero.

26262 **RATIONALE**

26263 None.

26264 **FUTURE DIRECTIONS**

26265 None.

26266 **SEE ALSO**

26267 *erfc()*, *feclearexcept()*, *fetestexcept()*, *isnan()*

26268 XBD [Section 4.20](#) (on page 117), *<math.h>*

26269 **CHANGE HISTORY**

26270 First released in Issue 1. Derived from Issue 1 of the SVID.

26271 **Issue 5**

26272 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 26273 text was previously published in the APPLICATION USAGE section.

26274 **Issue 6**

26275 The *erf()* function is no longer marked as an extension.

26276 The *erfc()* function is split out onto its own reference page.

26277 The *erff()* and *erfl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

26278 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 26279 revised to align with the ISO/IEC 9899:1999 standard.

26280 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 26281 marked.

26282 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/22 is applied, adding the example to the  
 26283 EXAMPLES section.

26284 **Issue 7**

26285 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0092 [68] is applied.

26286 **NAME**

26287       erfc, erfcf, erfcl — complementary error functions

26288 **SYNOPSIS**

26289       #include &lt;math.h&gt;

26290       double erfc(double x);

26291       float erfcf(float x);

26292       long double erfcl(long double x);

26293 **DESCRIPTION**

26294 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 26295 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26296 volume of POSIX.1-2008 defers to the ISO C standard.

26297       These functions shall compute the complementary error function  $1.0 - \operatorname{erf}(x)$ .

26298       An application wishing to check for error situations should set *errno* to zero and call  
 26299 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 26300 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 26301 zero, an error has occurred.

26302 **RETURN VALUE**

26303       Upon successful completion, these functions shall return the value of the complementary error  
 26304 function.

26305 MXX       If the correct value would cause underflow, and is not representable, a range error may occur,  
 26306 MXX       and *erfc*(), *erfcf*(), and *erfcl*() shall return 0.0, or (if the IEC 60559 Floating-Point option is not  
 26307 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
 26308 FLT\_MIN, and LDBL\_MIN, respectively.

26309 MX       If *x* is NaN, a NaN shall be returned.26310       If *x* is  $\pm 0$ , +1 shall be returned.26311       If *x* is  $-\infty$ , +2 shall be returned.26312       If *x* is  $+\infty$ , +0 shall be returned.

26313 MXX       If the correct value would cause underflow and is representable, a range error may occur and  
 26314 the correct value shall be returned.

26315 **ERRORS**

26316       These functions may fail if:

26317       Range Error       The result underflows.

26318       If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 26319 then *errno* shall be set to [ERANGE]. If the integer expression  
 26320 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 26321 floating-point exception shall be raised.

26322 **EXAMPLES**

26323 None.

26324 **APPLICATION USAGE**

26325 The *erfc()* function is provided because of the extreme loss of relative accuracy if *erf(x)* is called  
 26326 for large *x* and the result subtracted from 1.0.

26327 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* & -  
 26328 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

26329 **RATIONALE**

26330 None.

26331 **FUTURE DIRECTIONS**

26332 None.

26333 **SEE ALSO**26334 *erf()*, *feclearexcept()*, *fetestexcept()*, *isnan()*26335 XBD Section 4.20 (on page 117), **<math.h>**26336 **CHANGE HISTORY**

26337 First released in Issue 1. Derived from Issue 1 of the SVID.

26338 **Issue 5**

26339 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 26340 text was previously published in the APPLICATION USAGE section.

26341 **Issue 6**26342 The *erfc()* function is no longer marked as an extension.26343 These functions are split out from the *erf()* reference page.

26344 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 26345 revised to align with the ISO/IEC 9899:1999 standard.

26346 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 26347 marked.

26348 **Issue 7**

26349 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0093 [68] and XSH/TC1-2008/0094  
 26350 [68] are applied.

26351 **NAME**26352 `erff, erfl` — error functions26353 **SYNOPSIS**26354 `#include <math.h>`26355 `float erff(float x);`26356 `long double erfl(long double x);`26357 **DESCRIPTION**26358 Refer to *erf()*.

26359 **NAME**26360 `errno` — error return value26361 **SYNOPSIS**26362 `#include <errno.h>`26363 **DESCRIPTION**26364 The lvalue *errno* is used by many functions to return error values.

26365 Many functions provide an error number in *errno*, which has type **int** and is defined in  
 26366 **<errno.h>**. The value of *errno* shall be defined only after a call to a function for which it is  
 26367 explicitly stated to be set and until it is changed by the next function call or if the application  
 26368 assigns it a value. The value of *errno* should only be examined when it is indicated to be valid by  
 26369 a function's return value. Applications shall obtain the definition of *errno* by the inclusion of  
 26370 **<errno.h>**. No function in this volume of POSIX.1-2008 shall set *errno* to 0. The setting of *errno*  
 26371 after a successful call to a function is unspecified unless the description of that function specifies  
 26372 that *errno* shall not be modified.

26373 It is unspecified whether *errno* is a macro or an identifier declared with external linkage. If a  
 26374 macro definition is suppressed in order to access an actual object, or a program defines an  
 26375 identifier with the name *errno*, the behavior is undefined.

26376 The symbolic values stored in *errno* are documented in the ERRORS sections on all relevant  
 26377 pages.

26378 **RETURN VALUE**

26379 None.

26380 **ERRORS**

26381 None.

26382 **EXAMPLES**

26383 None.

26384 **APPLICATION USAGE**

26385 Previously both POSIX and X/Open documents were more restrictive than the ISO C standard  
 26386 in that they required *errno* to be defined as an external variable, whereas the ISO C standard  
 26387 required only that *errno* be defined as a modifiable lvalue with type **int**.

26388 An application that needs to examine the value of *errno* to determine the error should set it to 0  
 26389 before a function call, then inspect it before a subsequent function call.

26390 **RATIONALE**

26391 None.

26392 **FUTURE DIRECTIONS**

26393 None.

26394 **SEE ALSO**26395 [Section 2.3](#)26396 XBD **<errno.h>**26397 **CHANGE HISTORY**

26398 First released in Issue 1. Derived from Issue 1 of the SVID.

26399 **Issue 5**

26400 The following sentence is deleted from the DESCRIPTION: “The value of *errno* is 0 at program  
 26401 start-up, but is never set to 0 by any XSI function”.

26402 The DESCRIPTION also no longer states that conforming implementations may support the  
26403 declaration:

26404 `extern int errno;`

26405 **Issue 6**

26406 Obsolescent text regarding defining *errno* as:

26407 `extern int errno`

26408 is removed.

26409 Text regarding no function setting *errno* to zero to indicate an error is changed to no function  
26410 shall set *errno* to zero. This is for alignment with the ISO/IEC 9899:1999 standard.

26411 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/23 is applied, adding text to the  
26412 DESCRIPTION stating that the setting of *errno* after a successful call to a function is unspecified  
26413 unless the description of the function requires that it will not be modified.

**NAME**

environ, execl, execlx, execlp, execv, execve, execvp, fexecve — execute a file

**SYNOPSIS**

```
#include <unistd.h>

extern char **environ;

int execl(const char *path, const char *arg0, ... /*, (char *)0 */);
int execlx(const char *path, const char *arg0, ... /*,
    (char *)0, char *const envp[] */);
int execlp(const char *file, const char *arg0, ... /*, (char *)0 */);
int execv(const char *path, char *const argv[]);
int execve(const char *path, char *const argv[], char *const envp[]);
int execvp(const char *file, char *const argv[]);
int fexecve(int fd, char *const argv[], char *const envp[]);
```

**DESCRIPTION**

The *exec* family of functions shall replace the current process image with a new process image. The new image shall be constructed from a regular, executable file called the *new process image file*. There shall be no return from a successful *exec*, because the calling process image is overlaid by the new process image.

The *fexecve()* function shall be equivalent to the *execve()* function except that the file to be executed is determined by the file descriptor *fd* instead of a pathname. The file offset of *fd* is ignored.

When a C-language program is executed as a result of a call to one of the *exec* family of functions, it shall be entered as a C-language function call as follows:

```
int main (int argc, char *argv[]);
```

where *argc* is the argument count and *argv* is an array of character pointers to the arguments themselves. In addition, the following variable, which must be declared by the user if it is to be used directly:

```
extern char **environ;
```

is initialized as a pointer to an array of character pointers to the environment strings. The *argv* and *environ* arrays are each terminated by a null pointer. The null pointer terminating the *argv* array is not counted in *argc*.

Applications can change the entire environment in a single operation by assigning the *environ* variable to point to an array of character pointers to the new environment strings. After assigning a new value to *environ*, applications should not rely on the new environment strings remaining part of the environment, as a call to *getenv()*, *putenv()*, *setenv()*, *unsetenv()*, or any function that is dependent on an environment variable may, on noticing that *environ* has changed, copy the environment strings to a new array and assign *environ* to point to it.

XSI

Any application that directly modifies the pointers to which the *environ* variable points has undefined behavior.

Conforming multi-threaded applications shall not use the *environ* variable to access or modify any environment variable while any other thread is concurrently modifying any environment variable. A call to any function dependent on any environment variable shall be considered a use of the *environ* variable to access that environment variable.

The arguments specified by a program with one of the *exec* functions shall be passed on to the new process image in the corresponding *main()* arguments.

26459 The argument *path* points to a pathname that identifies the new process image file.

26460 The argument *file* is used to construct a pathname that identifies the new process image file. If  
26461 the *file* argument contains a <slash> character, the *file* argument shall be used as the pathname  
26462 for this file. Otherwise, the path prefix for this file is obtained by a search of the directories  
26463 passed as the environment variable *PATH* (see XBD Chapter 8, on page 173). If this environment  
26464 variable is not present, the results of the search are implementation-defined.

26465 There are two distinct ways in which the contents of the process image file may cause the  
26466 execution to fail, distinguished by the setting of *errno* to either [ENOEXEC] or [EINVAL] (see the  
26467 ERRORS section). In the cases where the other members of the *exec* family of functions would  
26468 fail and set *errno* to [ENOEXEC], the *execlp()* and *execvp()* functions shall execute a command  
26469 interpreter and the environment of the executed command shall be as if the process invoked the  
26470 *sh* utility using *execl()* as follows:

26471 `execl(<shell path>, arg0, file, arg1, ..., (char *)0);`

26472 where <shell path> is an unspecified pathname for the *sh* utility, *file* is the process image file, and  
26473 for *execvp()*, where *arg0*, *arg1*, and so on correspond to the values passed to *execvp()* in *argv*[0],  
26474 *argv*[1], and so on.

26475 The arguments represented by *arg0*,... are pointers to null-terminated character strings. These  
26476 strings shall constitute the argument list available to the new process image. The list is  
26477 terminated by a null pointer. The argument *arg0* should point to a filename string that is  
26478 associated with the process being started by one of the *exec* functions.

26479 The argument *argv* is an array of character pointers to null-terminated strings. The application  
26480 shall ensure that the last member of this array is a null pointer. These strings shall constitute the  
26481 argument list available to the new process image. The value in *argv*[0] should point to a filename  
26482 string that is associated with the process being started by one of the *exec* functions.

26483 The argument *envp* is an array of character pointers to null-terminated strings. These strings  
26484 shall constitute the environment for the new process image. The *envp* array is terminated by a  
26485 null pointer.

26486 For those forms not containing an *envp* pointer (*execl()*, *execv()*, *execlp()*, and *execvp()*), the  
26487 environment for the new process image shall be taken from the external variable *environ* in the  
26488 calling process.

26489 The number of bytes available for the new process' combined argument and environment lists is  
26490 {ARG\_MAX}. It is implementation-defined whether null terminators, pointers, and/or any  
26491 alignment bytes are included in this total.

26492 File descriptors open in the calling process image shall remain open in the new process image,  
26493 except for those whose close-on-exec flag FD\_CLOEXEC is set. For those file descriptors that  
26494 remain open, all attributes of the open file description remain unchanged. For any file descriptor  
26495 that is closed for this reason, file locks are removed as a result of the close as described in *close()*.  
26496 Locks that are not removed by closing of file descriptors remain unchanged.

26497 If file descriptor 0, 1, or 2 would otherwise be closed after a successful call to one of the *exec*  
26498 family of functions, implementations may open an unspecified file for the file descriptor in the  
26499 new process image. If a standard utility or a conforming application is executed with file  
26500 descriptor 0 not open for reading or with file descriptor 1 or 2 not open for writing, the  
26501 environment in which the utility or application is executed shall be deemed non-conforming,  
26502 and consequently the utility or application might not behave as described in this standard.

26503 Directory streams open in the calling process image shall be closed in the new process image.

26504		The state of the floating-point environment in the initial thread of the new process image shall
26505		be set to the default.
26506		The state of conversion descriptors and message catalog descriptors in the new process image is
26507		undefined.
26508		For the new process image, the equivalent of:
26509		<code>setlocale(LC_ALL, "C")</code>
26510		shall be executed at start-up.
26511		Signals set to the default action (SIG_DFL) in the calling process image shall be set to the default
26512		action in the new process image. Except for SIGCHLD, signals set to be ignored (SIG_IGN) by
26513		the calling process image shall be set to be ignored by the new process image. Signals set to be
26514		caught by the calling process image shall be set to the default action in the new process image
26515		(see <signal.h>).
26516		If the SIGCHLD signal is set to be ignored by the calling process image, it is unspecified whether
26517		the SIGCHLD signal is set to be ignored or to the default action in the new process image.
26518	XSI	After a successful call to any of the <i>exec</i> functions, alternate signal stacks are not preserved and
26519		the SA_ONSTACK flag shall be cleared for all signals.
26520		After a successful call to any of the <i>exec</i> functions, any functions previously registered by the
26521		<i>atexit()</i> or <i>pthread_atfork()</i> functions are no longer registered.
26522	XSI	If the ST_NOSUID bit is set for the file system containing the new process image file, then the
26523		effective user ID, effective group ID, saved set-user-ID, and saved set-group-ID are unchanged
26524		in the new process image. Otherwise, if the set-user-ID mode bit of the new process image file is
26525		set, the effective user ID of the new process image shall be set to the user ID of the new process
26526		image file. Similarly, if the set-group-ID mode bit of the new process image file is set, the
26527		effective group ID of the new process image shall be set to the group ID of the new process
26528		image file. The real user ID, real group ID, and supplementary group IDs of the new process
26529		image shall remain the same as those of the calling process image. The effective user ID and
26530		effective group ID of the new process image shall be saved (as the saved set-user-ID and the
26531		saved set-group-ID) for use by <i>setuid()</i> .
26532	XSI	Any shared memory segments attached to the calling process image shall not be attached to the
26533		new process image.
26534		Any named semaphores open in the calling process shall be closed as if by appropriate calls to
26535		<i>sem_close()</i> .
26536	TYM	Any blocks of typed memory that were mapped in the calling process are unmapped, as if
26537		<i>munmap()</i> was implicitly called to unmap them.
26538	ML	Memory locks established by the calling process via calls to <i>mlockall()</i> or <i>mlock()</i> shall be
26539		removed. If locked pages in the address space of the calling process are also mapped into the
26540		address spaces of other processes and are locked by those processes, the locks established by the
26541		other processes shall be unaffected by the call by this process to the <i>exec</i> function. If the <i>exec</i>
26542		function fails, the effect on memory locks is unspecified.
26543		Memory mappings created in the process are unmapped before the address space is rebuilt for
26544		the new process image.
26545	SS	When the calling process image does not use the SCHED_FIFO, SCHED_RR, or
26546		SCHED_SPORADIC scheduling policies, the scheduling policy and parameters of the new
26547		process image and the initial thread in that new process image are implementation-defined.

26548	PS	When the calling process image uses the SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC scheduling policies, the process policy and scheduling parameter settings shall not be changed
26549		by a call to an <i>exec</i> function. The initial thread in the new process image shall inherit the process
26550	TPS	scheduling policy and parameters. It shall have the default system contention scope, but shall
26551		inherit its allocation domain from the calling process image.
26552		
26553		Per-process timers created by the calling process shall be deleted before replacing the current
26554		process image with the new process image.
26555	MSG	All open message queue descriptors in the calling process shall be closed, as described in
26556		<i>mq_close()</i> .
26557		Any outstanding asynchronous I/O operations may be canceled. Those asynchronous I/O
26558		operations that are not canceled shall complete as if the <i>exec</i> function had not yet occurred, but
26559		any associated signal notifications shall be suppressed. It is unspecified whether the <i>exec</i>
26560		function itself blocks awaiting such I/O completion. In no event, however, shall the new process
26561		image created by the <i>exec</i> function be affected by the presence of outstanding asynchronous I/O
26562		operations at the time the <i>exec</i> function is called. Whether any I/O is canceled, and which I/O
26563		may be canceled upon <i>exec</i> , is implementation-defined.
26564	CPT	The new process image shall inherit the CPU-time clock of the calling process image. This
26565		inheritance means that the process CPU-time clock of the process being <i>exec</i> -ed shall not be
26566		reinitialized or altered as a result of the <i>exec</i> function other than to reflect the time spent by the
26567		process executing the <i>exec</i> function itself.
26568	TCT	The initial value of the CPU-time clock of the initial thread of the new process image shall be set
26569		to zero.
26570	OB TRC	If the calling process is being traced, the new process image shall continue to be traced into the
26571		same trace stream as the original process image, but the new process image shall not inherit the
26572		mapping of trace event names to trace event type identifiers that was defined by calls to the
26573		<i>posix_trace_eventid_open()</i> or the <i>posix_trace_trid_eventid_open()</i> functions in the calling process
26574		image.
26575		If the calling process is a trace controller process, any trace streams that were created by the
26576		calling process shall be shut down as described in the <i>posix_trace_shutdown()</i> function.
26577		The thread ID of the initial thread in the new process image is unspecified.
26578		The size and location of the stack on which the initial thread in the new process image runs is
26579		unspecified.
26580		The initial thread in the new process image shall have its cancellation type set to
26581		PTHREAD_CANCEL_DEFERRED and its cancellation state set to
26582		PTHREAD_CANCEL_ENABLED.
26583		The initial thread in the new process image shall have all thread-specific data values set to
26584		NULL and all thread-specific data keys shall be removed by the call to <i>exec</i> without running
26585		destructors.
26586		The initial thread in the new process image shall be joinable, as if created with the <i>detachstate</i>
26587		attribute set to PTHREAD_CREATE_JOINABLE.
26588		The new process shall inherit at least the following attributes from the calling process image:
26589	XSI	<ul style="list-style-type: none"> <li>Nice value (see <i>nice()</i>)</li> </ul>

26590	XSI	<ul style="list-style-type: none"> <li>• <i>semadj</i> values (see <i>semop()</i>)</li> </ul>
26591		<ul style="list-style-type: none"> <li>• Process ID</li> </ul>
26592		<ul style="list-style-type: none"> <li>• Parent process ID</li> </ul>
26593		<ul style="list-style-type: none"> <li>• Process group ID</li> </ul>
26594		<ul style="list-style-type: none"> <li>• Session membership</li> </ul>
26595		<ul style="list-style-type: none"> <li>• Real user ID</li> </ul>
26596		<ul style="list-style-type: none"> <li>• Real group ID</li> </ul>
26597		<ul style="list-style-type: none"> <li>• Supplementary group IDs</li> </ul>
26598		<ul style="list-style-type: none"> <li>• Time left until an alarm clock signal (see <i>alarm()</i>)</li> </ul>
26599		<ul style="list-style-type: none"> <li>• Current working directory</li> </ul>
26600		<ul style="list-style-type: none"> <li>• Root directory</li> </ul>
26601		<ul style="list-style-type: none"> <li>• File mode creation mask (see <i>umask()</i>)</li> </ul>
26602	XSI	<ul style="list-style-type: none"> <li>• File size limit (see <i>getrlimit()</i> and <i>setrlimit()</i>)</li> </ul>
26603		<ul style="list-style-type: none"> <li>• Process signal mask (see <i>pthread_sigmask()</i>)</li> </ul>
26604		<ul style="list-style-type: none"> <li>• Pending signal (see <i>sigpending()</i>)</li> </ul>
26605		<ul style="list-style-type: none"> <li>• <i>tms_utime</i>, <i>tms_stime</i>, <i>tms_cutime</i>, and <i>tms_cstime</i> (see <i>times()</i>)</li> </ul>
26606	XSI	<ul style="list-style-type: none"> <li>• Resource limits</li> </ul>
26607		<ul style="list-style-type: none"> <li>• Controlling terminal</li> </ul>
26608	XSI	<ul style="list-style-type: none"> <li>• Interval timers</li> </ul>
26609		The initial thread of the new process shall inherit at least the following attributes from the
26610		calling thread:
26611		<ul style="list-style-type: none"> <li>• Signal mask (see <i>sigprocmask()</i> and <i>pthread_sigmask()</i>)</li> </ul>
26612		<ul style="list-style-type: none"> <li>• Pending signals (see <i>sigpending()</i>)</li> </ul>
26613		All other process attributes defined in this volume of POSIX.1-2008 shall be inherited in the new
26614		process image from the old process image. All other thread attributes defined in this volume of
26615		POSIX.1-2008 shall be inherited in the initial thread in the new process image from the calling
26616		thread in the old process image. The inheritance of process or thread attributes not defined by
26617		this volume of POSIX.1-2008 is implementation-defined.
26618		A call to any <i>exec</i> function from a process with more than one thread shall result in all threads
26619		being terminated and the new executable image being loaded and executed. No destructor
26620		functions or cleanup handlers shall be called.
26621		Upon successful completion, the <i>exec</i> functions shall mark for update the last data access
26622		timestamp of the file. If an <i>exec</i> function failed but was able to locate the process image file,
26623		whether the last data access timestamp is marked for update is unspecified. Should the <i>exec</i>
26624		function succeed, the process image file shall be considered to have been opened with <i>open()</i> .
26625		The corresponding <i>close()</i> shall be considered to occur at a time after this open, but before
26626		process termination or successful completion of a subsequent call to one of the <i>exec</i> functions,
26627		<i>posix_spawn()</i> , or <i>posix_spawnnp()</i> . The <i>argv[]</i> and <i>envp[]</i> arrays of pointers and the strings to
26628		which those arrays point shall not be modified by a call to one of the <i>exec</i> functions, except as a
26629		consequence of replacing the process image.

26630 XSI The saved resource limits in the new process image are set to be a copy of the process'  
26631 corresponding hard and soft limits.

## 26632 RETURN VALUE

26633 If one of the *exec* functions returns to the calling process image, an error has occurred; the return  
26634 value shall be -1, and *errno* shall be set to indicate the error.

## 26635 ERRORS

26636 The *exec* functions shall fail if:

26637 [E2BIG] The number of bytes used by the new process image's argument list and  
26638 environment list is greater than the system-imposed limit of {ARG\_MAX}  
26639 bytes.

26640 [EACCES] The new process image file is not a regular file and the implementation does  
26641 not support execution of files of its type.

26642 [EINVAL] The new process image file has appropriate privileges and has a recognized  
26643 executable binary format, but the system does not support execution of a file  
26644 with this format.

26645 The *exec* functions, except for *fexecve()*, shall fail if:

26646 [EACCES] Search permission is denied for a directory listed in the new process image  
26647 file's path prefix, or the new process image file denies execution permission.

26648 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* or *file*  
26649 argument.

26650 [ENAMETOOLONG]

26651 The length of a component of a pathname is longer than {NAME\_MAX}.

26652 [ENOENT] A component of *path* or *file* does not name an existing file or *path* or *file* is an  
26653 empty string.

26654 [ENOTDIR] A component of the new process image file's path prefix names an existing file  
26655 that is neither a directory nor a symbolic link to a directory, or the new process  
26656 image file's pathname contains at least one non-*<slash>* character and ends  
26657 with one or more trailing *<slash>* characters and the last pathname  
26658 component names an existing file that is neither a directory nor a symbolic  
26659 link to a directory.

26660 The *exec* functions, except for *execlp()* and *execvp()*, shall fail if:

26661 [ENOEXEC] The new process image file has the appropriate access permission but has an  
26662 unrecognized format.

26663 The *fexecve()* function shall fail if:

26664 [EBADF] The *fd* argument is not a valid file descriptor open for executing.

26665 The *exec* functions may fail if:

26666 [ENOMEM] The new process image requires more memory than is allowed by the  
26667 hardware or system-imposed memory management constraints.

26668 The *exec* functions, except for *fexecve()*, may fail if:

26669 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
26670 resolution of the *path* or *file* argument.

26671 [ENAMETOOLONG]  
 26672 The length of the *path* argument or the length of the pathname constructed  
 26673 from the *file* argument exceeds {PATH\_MAX}, or pathname resolution of a  
 26674 symbolic link produced an intermediate result with a length that exceeds  
 26675 {PATH\_MAX}.

26676 [ETXTBSY] The new process image file is a pure procedure (shared text) file that is  
 26677 currently open for writing by some process.

## 26678 EXAMPLES

### 26679 Using `execl()`

26680 The following example executes the *ls* command, specifying the pathname of the executable  
 26681 (*/bin/ls*) and using arguments supplied directly to the command to produce single-column  
 26682 output.

```
26683 #include <unistd.h>
26684 int ret;
26685 ...
26686 ret = execl ("/bin/ls", "ls", "-l", (char *)0);
```

### 26687 Using `execle()`

26688 The following example is similar to [Using `execl\(\)`](#). In addition, it specifies the environment for  
 26689 the new process image using the *env* argument.

```
26690 #include <unistd.h>
26691 int ret;
26692 char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
26693 ...
26694 ret = execle ("/bin/ls", "ls", "-l", (char *)0, env);
```

### 26695 Using `execlp()`

26696 The following example searches for the location of the *ls* command among the directories  
 26697 specified by the *PATH* environment variable.

```
26698 #include <unistd.h>
26699 int ret;
26700 ...
26701 ret = execlp ("ls", "ls", "-l", (char *)0);
```

### 26702 Using `execv()`

26703 The following example passes arguments to the *ls* command in the *cmd* array.

```
26704 #include <unistd.h>
26705 int ret;
26706 char *cmd[] = { "ls", "-l", (char *)0 };
26707 ...
26708 ret = execv ("/bin/ls", cmd);
```

### Using `execve()`

The following example passes arguments to the `ls` command in the `cmd` array, and specifies the environment for the new process image using the `env` argument.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", (char *)0 };
char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
...
ret = execve ("/bin/ls", cmd, env);
```

### Using `execvp()`

The following example searches for the location of the `ls` command among the directories specified by the `PATH` environment variable, and passes arguments to the `ls` command in the `cmd` array.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", (char *)0 };
...
ret = execvp ("ls", cmd);
```

## APPLICATION USAGE

As the state of conversion descriptors and message catalog descriptors in the new process image is undefined, conforming applications should not rely on their use and should close them prior to calling one of the `exec` functions.

Applications that require other than the default POSIX locale as the global locale in the new process image should call `setlocale()` with the appropriate parameters.

When assigning a new value to the `environ` variable, applications should ensure that the environment to which it will point contains at least the following:

1. Any implementation-defined variables required by the implementation to provide a conforming environment. See the `_CS_V7_ENV` entry in `<unistd.h>` and `confstr()` for details.
2. A value for `PATH` which finds conforming versions of all standard utilities before any other versions.

The same constraint applies to the `envp` array passed to `execle()` or `execve()`, in order to ensure that the new process image is invoked in a conforming environment.

Applications should not execute programs with file descriptor 0 not open for reading or with file descriptor 1 or 2 not open for writing, as this might cause the executed program to misbehave. In order not to pass on these file descriptors to an executed program, applications should not just close them but should reopen them on, for example, `/dev/null`. Some implementations may reopen them automatically, but applications should not rely on this being done.

If an application wants to perform a checksum test of the file being executed before executing it, the file will need to be opened with read permission to perform the checksum test.

Since execute permission is checked by `fexecve()`, the file description `fd` need not have been opened with the `O_EXEC` flag. However, if the file to be executed denies read and write permission for the process preparing to do the `exec`, the only way to provide the `fd` to `fexecve()`

will be to use the `O_EXEC` flag when opening *fd*. In this case, the application will not be able to perform a checksum test since it will not be able to read the contents of the file.

Note that when a file descriptor is opened with `O_RDONLY`, `O_RDWR`, or `O_WRONLY` mode, the file descriptor can be used to read, read and write, or write the file, respectively, even if the mode of the file changes after the file was opened. Using the `O_EXEC` open mode is different; *fexecve()* will ignore the mode that was used when the file descriptor was opened and the *exec* will fail if the mode of the file associated with *fd* does not grant execute permission to the calling process at the time *fexecve()* is called.

## RATIONALE

Early proposals required that the value of *argc* passed to *main()* be “one or greater”. This was driven by the same requirement in drafts of the ISO C standard. In fact, historical implementations have passed a value of zero when no arguments are supplied to the caller of the *exec* functions. This requirement was removed from the ISO C standard and subsequently removed from this volume of POSIX.1-2008 as well. The wording, in particular the use of the word *should*, requires a Strictly Conforming POSIX Application to pass at least one argument to the *exec* function, thus guaranteeing that *argc* be one or greater when invoked by such an application. In fact, this is good practice, since many existing applications reference *argv[0]* without first checking the value of *argc*.

The requirement on a Strictly Conforming POSIX Application also states that the value passed as the first argument be a filename string associated with the process being started. Although some existing applications pass a pathname rather than a filename string in some circumstances, a filename string is more generally useful, since the common usage of *argv[0]* is in printing diagnostics. In some cases the filename passed is not the actual filename of the file; for example, many implementations of the *login* utility use a convention of prefixing a <hyphen-minus> (‘-’) to the actual filename, which indicates to the command interpreter being invoked that it is a “login shell”.

Also, note that the *test* and *[* utilities require specific strings for the *argv[0]* argument to have deterministic behavior across all implementations. +

Historically, there have been two ways that implementations can *exec* shell scripts. +

One common historical implementation is that the *execl()*, *execv()*, *execle()*, and *execve()* functions return an `[ENOEXEC]` error for any file not recognizable as executable, including a shell script. When the *execlp()* and *execvp()* functions encounter such a file, they assume the file to be a shell script and invoke a known command interpreter to interpret such files. This is now required by POSIX.1-2008. These implementations of *execvp()* and *execlp()* only give the `[ENOEXEC]` error in the rare case of a problem with the command interpreter’s executable file. Because of these implementations, the `[ENOEXEC]` error is not mentioned for *execlp()* or *execvp()*, although implementations can still give it.

Another way that some historical implementations handle shell scripts is by recognizing the first two bytes of the file as the character string “#!” and using the remainder of the first line of the file as the name of the command interpreter to execute.

One potential source of confusion noted by the standard developers is over how the contents of a process image file affect the behavior of the *exec* family of functions. The following is a description of the actions taken:

1. If the process image file is a valid executable (in a format that is executable and valid and having appropriate privileges) for this system, then the system executes the file.

2. If the process image file has appropriate privileges and is in a format that is executable but not valid for this system (such as a recognized binary for another architecture), then this is an error and *errno* is set to [EINVAL] (see later RATIONALE on [EINVAL]).
3. If the process image file has appropriate privileges but is not otherwise recognized:
  - a. If this is a call to *execlp()* or *execvp()*, then they invoke a command interpreter assuming that the process image file is a shell script.
  - b. If this is not a call to *execlp()* or *execvp()*, then an error occurs and *errno* is set to [ENOEXEC].

Applications that do not require to access their arguments may use the form:

```
main(void)
```

as specified in the ISO C standard. However, the implementation will always provide the two arguments *argc* and *argv*, even if they are not used.

Some implementations provide a third argument to *main()* called *envp*. This is defined as a pointer to the environment. The ISO C standard specifies invoking *main()* with two arguments, so implementations must support applications written this way. Since this volume of POSIX.1-2008 defines the global variable *environ*, which is also provided by historical implementations and can be used anywhere that *envp* could be used, there is no functional need for the *envp* argument. Applications should use the *getenv()* function rather than accessing the environment directly via either *envp* or *environ*. Implementations are required to support the two-argument calling sequence, but this does not prohibit an implementation from supporting *envp* as an optional third argument.

This volume of POSIX.1-2008 specifies that signals set to SIG\_IGN remain set to SIG\_IGN, and that the new process image inherits the signal mask of the thread that called *exec* in the old process image. This is consistent with historical implementations, and it permits some useful functionality, such as the *nohup* command. However, it should be noted that many existing applications wrongly assume that they start with certain signals set to the default action and/or unblocked. In particular, applications written with a simpler signal model that does not include blocking of signals, such as the one in the ISO C standard, may not behave properly if invoked with some signals blocked. Therefore, it is best not to block or ignore signals across *execs* without explicit reason to do so, and especially not to block signals across *execs* of arbitrary (not closely cooperating) programs.

The *exec* functions always save the value of the effective user ID and effective group ID of the process at the completion of the *exec*, whether or not the set-user-ID or the set-group-ID bit of the process image file is set.

The statement about *argv[]* and *envp[]* being constants is included to make explicit to future writers of language bindings that these objects are completely constant. Due to a limitation of the ISO C standard, it is not possible to state that idea in standard C. Specifying two levels of *const-qualification* for the *argv[]* and *envp[]* parameters for the *exec* functions may seem to be the natural choice, given that these functions do not modify either the array of pointers or the characters to which the function points, but this would disallow existing correct code. Instead, only the array of pointers is noted as constant. The table of assignment compatibility for *dst=src* derived from the ISO C standard summarizes the compatibility:

<i>dst:</i>	<b>char *[]</b>	<b>const char *[]</b>	<b>char *const[]</b>	<b>const char *const[]</b>
<i>src:</i>				
<b>char *[]</b>	VALID	—	VALID	—
<b>const char *[]</b>	—	VALID	—	VALID
<b>char * const []</b>	—	—	VALID	—
<b>const char *const[]</b>	—	—	—	VALID

Since all existing code has a source type matching the first row, the column that gives the most valid combinations is the third column. The only other possibility is the fourth column, but using it would require a cast on the *argv* or *envp* arguments. It is unfortunate that the fourth column cannot be used, because the declaration a non-expert would naturally use would be that in the second row.

The ISO C standard and this volume of POSIX.1-2008 do not conflict on the use of *environ*, but some historical implementations of *environ* may cause a conflict. As long as *environ* is treated in the same way as an entry point (for example, *fork()*), it conforms to both standards. A library can contain *fork()*, but if there is a user-provided *fork()*, that *fork()* is given precedence and no problem ensues. The situation is similar for *environ*: the definition in this volume of POSIX.1-2008 is to be used if there is no user-provided *environ* to take precedence. At least three implementations are known to exist that solve this problem.

[E2BIG] The limit {ARG\_MAX} applies not just to the size of the argument list, but to the sum of that and the size of the environment list.

[EFAULT] Some historical systems return [EFAULT] rather than [ENOEXEC] when the new process image file is corrupted. They are non-conforming.

[EINVAL] This error condition was added to POSIX.1-2008 to allow an implementation to detect executable files generated for different architectures, and indicate this situation to the application. Historical implementations of shells, *execvp()*, and *execlp()* that encounter an [ENOEXEC] error will execute a shell on the assumption that the file is a shell script. This will not produce the desired effect when the file is a valid executable for a different architecture. An implementation may now choose to avoid this problem by returning [EINVAL] when a valid executable for a different architecture is encountered. Some historical implementations return [EINVAL] to indicate that the *path* argument contains a character with the high order bit set. The standard developers chose to deviate from historical practice for the following reasons:

1. The new utilization of [EINVAL] will provide some measure of utility to the user community.
2. Historical use of [EINVAL] is not acceptable in an internationalized operating environment.

[ENAMETOOLONG]

Since the file pathname may be constructed by taking elements in the *PATH* variable and putting them together with the filename, the [ENAMETOOLONG] error condition could also be reached this way.

[ETXTBSY] System V returns this error when the executable file is currently open for writing by some process. This volume of POSIX.1-2008 neither requires nor prohibits this behavior.

Other systems (such as System V) may return [EINTR] from *exec*. This is not addressed by this volume of POSIX.1-2008, but implementations may have a window between the call to *exec* and

the time that a signal could cause one of the *exec* calls to return with [EINTR].

An explicit statement regarding the floating-point environment (as defined in the `<fenv.h>` header) was added to make it clear that the floating-point environment is set to its default when a call to one of the *exec* functions succeeds. The requirements for inheritance or setting to the default for other process and thread start-up functions is covered by more generic statements in their descriptions and can be summarized as follows:

*posix\_spawn()* Set to default.

*fork()* Inherit.

*pthread\_create()* Inherit.

The purpose of the *fexecve()* function is to enable executing a file which has been verified to be the intended file. It is possible to actively check the file by reading from the file descriptor and be sure that the file is not exchanged for another between the reading and the execution. Alternatively, a function like *openat()* can be used to open a file which has been found by reading the content of a directory using *readdir()*.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

### Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

### Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, behavior is defined for when the process image file is not a valid executable.
- In this version, `_POSIX_SAVED_IDS` is mandated, thus the effective user ID and effective group ID of the new process image shall be saved (as the saved set-user-ID and the saved set-group-ID) for use by the *setuid()* function.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [EINVAL] mandatory error condition is added.
- The [ELOOP] optional error condition is added.

The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for typed memory.

The normative text is updated to avoid use of the term “must” for application requirements.

The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

IEEE PASC Interpretation 1003.1 #132 is applied.

The DESCRIPTION is updated to make it explicit that the floating-point environment in the new process image is set to the default.

The DESCRIPTION and RATIONALE are updated to include clarifications of how the contents of a process image file affect the behavior of the *exec* functions.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/15 is applied, adding a new paragraph to the DESCRIPTION and text to the end of the APPLICATION USAGE section. This change addresses a security concern, where implementations may want to reopen file descriptors 0, 1, and 2 for programs with the set-user-id or set-group-id file mode bits calling the *exec* family of functions.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/24 is applied, applying changes to the DESCRIPTION, addressing which attributes are inherited by threads, and behavioral requirements for threads attributes.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/25 is applied, updating text in the RATIONALE from “the process signal mask be unchanged across an *exec*” to “the new process image inherits the signal mask of the thread that called *exec* in the old process image”.

## Issue 7

Austin Group Interpretation 1003.1-2001 #047 is applied, adding the description of `_CS_V7_ENV` to the APPLICATION USAGE.

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *fexecve()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, Threads, and Timers options is moved to the Base.

Changes are made related to support for finegrained timestamps.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0095 [386], XSH/TC1-2008/0096 [167], XSH/TC1-2008/0097 [291], XSH/TC1-2008/0098 [173], XSH/TC1-2008/0099 [296], XSH/TC1-2008/00100 [324], XSH/TC1-2008/00101 [296], XSH/TC1-2008/00102 [302], XSH/TC1-2008/00103 [167], XSH/TC1-2008/00104 [173], and XSH/TC1-2008/00105 [291,429] are applied.

26964 **NAME**

26965 exit — terminate a process

26966 **SYNOPSIS**

26967 #include &lt;stdlib.h&gt;

26968 void exit(int status);

26969 **DESCRIPTION**

26970 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 26971 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26972 volume of POSIX.1-2008 defers to the ISO C standard.

26973 CX The value of *status* may be 0, EXIT\_SUCCESS, EXIT\_FAILURE, or any other value, though only  
 26974 the least significant 8 bits (that is, *status* & 0377) shall be available from *wait()* and *waitpid()*; the  
 26975 full value shall be available from *waitid()* and in the **siginfo\_t** passed to a signal handler for  
 26976 SIGCHLD.

26977 The *exit()* function shall first call all functions registered by *atexit()*, in the reverse order of their  
 26978 registration, except that a function is called after any previously registered functions that had  
 26979 already been called at the time it was registered. Each function is called as many times as it was  
 26980 registered. If, during the call to any such function, a call to the *longjmp()* function is made that  
 26981 would terminate the call to the registered function, the behavior is undefined.

26982 If a function registered by a call to *atexit()* fails to return, the remaining registered functions shall  
 26983 not be called and the rest of the *exit()* processing shall not be completed. If *exit()* is called more  
 26984 than once, the behavior is undefined.

26985 The *exit()* function shall then flush all open streams with unwritten buffered data and close all  
 26986 CX open streams. Finally, the process shall be terminated with the same consequences as described  
 26987 in [Consequences of Process Termination](#) (on page 553).

26988 **RETURN VALUE**26989 The *exit()* function does not return.26990 **ERRORS**

26991 No errors are defined.

26992 **EXAMPLES**

26993 None.

26994 **APPLICATION USAGE**

26995 None.

26996 **RATIONALE**26997 See *\_Exit()*.26998 **FUTURE DIRECTIONS**

26999 None.

27000 **SEE ALSO**27001 [\\_Exit\(\)](#), [atexit\(\)](#), [exec](#), [longjmp\(\)](#), [tmpfile\(\)](#), [wait\(\)](#), [waitid\(\)](#)27002 XBD [<stdlib.h>](#)27003 **CHANGE HISTORY**

27004 **Issue 7**

27005 Austin Group Interpretation 1003.1-2001 #031 is applied, separating the `_Exit()` and `_exit()`  
27006 functions from the `exit()` function.

27007 Austin Group Interpretation 1003.1-2001 #085 is applied.

27008 **NAME**27009 `exp`, `expf`, `expl` — exponential function27010 **SYNOPSIS**

```
27011 #include <math.h>
27012 double exp(double x);
27013 float expf(float x);
27014 long double expl(long double x);
```

27015 **DESCRIPTION**

27016 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 27017 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27018 volume of POSIX.1-2008 defers to the ISO C standard.

27019 These functions shall compute the base-*e* exponential of *x*.

27020 An application wishing to check for error situations should set *errno* to zero and call  
 27021 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 27022 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 27023 zero, an error has occurred.

27024 **RETURN VALUE**

27025 Upon successful completion, these functions shall return the exponential value of *x*.

27026 If the correct value would cause overflow, a range error shall occur and *exp()*, *expf()*, and *expl()*  
 27027 shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively.

27028 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 27029 MXX and *exp()*, *expf()*, and *expl()* shall return 0.0, or (if the IEC 60559 Floating-Point option is not  
 27030 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
 27031 FLT\_MIN, and LDBL\_MIN, respectively.

27032 MX If *x* is NaN, a NaN shall be returned.

27033 If *x* is  $\pm 0$ , 1 shall be returned.

27034 If *x* is  $-\text{Inf}$ , +0 shall be returned.

27035 If *x* is  $+\text{Inf}$ , *x* shall be returned.

27036 MXX If the correct value would cause underflow, and is representable, a range error may occur and  
 27037 the correct value shall be returned.

27038 **ERRORS**

27039 These functions shall fail if:

27040 Range Error The result overflows.

27041 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 27042 then *errno* shall be set to [ERANGE]. If the integer expression  
 27043 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 27044 floating-point exception shall be raised.

27045 These functions may fail if:

27046 Range Error The result underflows.

27047 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 27048 then *errno* shall be set to [ERANGE]. If the integer expression  
 27049 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 27050 floating-point exception shall be raised.

27051 **EXAMPLES**27052 **Computing the Density of the Standard Normal Distribution**

27053 This function shows an implementation for the density of the standard normal distribution  
 27054 using `exp()`. This example uses the constant `M_PI` which is part of the XSI option.

```
27055 #include <math.h>
27056 double
27057 normal_density (double x)
27058 {
27059     return exp(-x*x/2) / sqrt (2*M_PI);
27060 }
```

27061 **APPLICATION USAGE**

27062 On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling & -`  
 27063 `MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

27064 **RATIONALE**

27065 None.

27066 **FUTURE DIRECTIONS**

27067 None.

27071 **CHANGE HISTORY**

27072 First released in Issue 1. Derived from Issue 1 of the SVID.

27073 **Issue 5**

27074 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 27075 text was previously published in the APPLICATION USAGE section.

27076 **Issue 6**

27077 The `expf()` and `expl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.

27078 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 27079 revised to align with the ISO/IEC 9899:1999 standard.

27080 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 27081 marked.

27082 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/26 is applied, adding the example to the  
 27083 EXAMPLES section.

27084 **Issue 7**

27085 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0106 [68] and XSH/TC1-2008/0107  
 27086 [68] are applied.

27087 **NAME**

27088 exp2, exp2f, exp2l — exponential base 2 functions

27089 **SYNOPSIS**

```
27090 #include <math.h>
27091 double exp2(double x);
27092 float exp2f(float x);
27093 long double exp2l(long double x);
```

27094 **DESCRIPTION**

27095 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 27096 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27097 volume of POSIX.1-2008 defers to the ISO C standard.

27098 These functions shall compute the base-2 exponential of  $x$ .

27099 An application wishing to check for error situations should set *errno* to zero and call  
 27100 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 27101 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 27102 zero, an error has occurred.

27103 **RETURN VALUE**

27104 Upon successful completion, these functions shall return  $2^x$ .

27105 If the correct value would cause overflow, a range error shall occur and *exp2()*, *exp2f()*, and  
 27106 *exp2l()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 27107 respectively.

27108 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 27109 MXX and *exp2()*, *exp2f()*, and *exp2l()* shall return 0.0, or (if the IEC 60559 Floating-Point option is not  
 27110 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
 27111 FLT\_MIN, and LDBL\_MIN, respectively.

27112 MX If  $x$  is NaN, a NaN shall be returned.

27113 If  $x$  is  $\pm 0$ , 1 shall be returned.

27114 If  $x$  is  $-\text{Inf}$ , +0 shall be returned.

27115 If  $x$  is  $+\text{Inf}$ ,  $x$  shall be returned.

27116 MXX If the correct value would cause underflow, and is representable, a range error may occur and  
 27117 the correct value shall be returned.

27118 **ERRORS**

27119 These functions shall fail if:

27120 Range Error The result overflows.

27121 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 27122 then *errno* shall be set to [ERANGE]. If the integer expression  
 27123 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 27124 floating-point exception shall be raised.

27125 These functions may fail if:

27126 Range Error The result underflows.

27127 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 27128 then *errno* shall be set to [ERANGE]. If the integer expression  
 27129 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow

27130 floating-point exception shall be raised.

27131 **EXAMPLES**

27132 None.

27133 **APPLICATION USAGE**

27134 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* & -  
27135 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

27145 **Issue 7**

27146 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0108 [68] and XSH/TC1-2008/0109  
27147 [68] are applied.

27148 **NAME**

27149 expm1, expm1f, expm1l — compute exponential functions

27150 **SYNOPSIS**

```
27151 #include <math.h>
27152 double expm1(double x);
27153 float expm1f(float x);
27154 long double expm1l(long double x);
```

27155 **DESCRIPTION**

27156 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 27157 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27158 volume of POSIX.1-2008 defers to the ISO C standard.

27159 These functions shall compute  $e^x - 1.0$ .

27160 An application wishing to check for error situations should set *errno* to zero and call  
 27161 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 27162 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 27163 zero, an error has occurred.

27164 **RETURN VALUE**27165 Upon successful completion, these functions return  $e^x - 1.0$ .

27166 If the correct value would cause overflow, a range error shall occur and *expm1()*, *expm1f()*, and  
 27167 *expm1l()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 27168 respectively.

27169 MX If *x* is NaN, a NaN shall be returned.27170 If *x* is  $\pm 0$ ,  $\pm 0$  shall be returned.27171 If *x* is  $-\text{Inf}$ ,  $-1$  shall be returned.27172 If *x* is  $+\text{Inf}$ , *x* shall be returned.

27173 If *x* is subnormal, a range error may occur  
 27174 MXX and *x* should be returned.

27175 MX If *x* is not returned, *expm1()*, *expm1f()*, and *expm1l()* shall return an implementation-defined  
 27176 value no greater in magnitude than DBL\_MIN, FLT\_MIN, and LDBL\_MIN, respectively.

27177 **ERRORS**

27178 These functions shall fail if:

27179 Range Error The result overflows.

27180 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 27181 then *errno* shall be set to [ERANGE]. If the integer expression  
 27182 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 27183 floating-point exception shall be raised.

27184 These functions may fail if:

27185 MX Range Error The value of *x* is subnormal.

27186 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 27187 then *errno* shall be set to [ERANGE]. If the integer expression  
 27188 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 27189 floating-point exception shall be raised.

**EXAMPLES**

None.

**APPLICATION USAGE**

The value of  $\text{expm1}(x)$  may be more accurate than  $\exp(x)-1.0$  for small values of  $x$ .

The  $\text{expm1}()$  and  $\log1p()$  functions are useful for financial calculations of  $((1+x)^n-1)/x$ , namely:

$\text{expm1}(n * \log1p(x)) / x$

when  $x$  is very small (for example, when calculating small daily interest rates). These functions also simplify writing accurate inverse hyperbolic functions.

On error, the expressions  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  and  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$  are independent of each other, but at least one of them must be non-zero.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

**Issue 6**

The  $\text{expm1f}()$  and  $\text{expm1l}()$  functions are added for alignment with the ISO/IEC 9899:1999 standard.

The  $\text{expm1}()$  function is no longer marked as an extension.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

**Issue 7**

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0110 [68] is applied.

27221 **NAME**

27222 fabs, fabsf, fabsl — absolute value function

27223 **SYNOPSIS**

```
27224 #include <math.h>
27225 double fabs(double x);
27226 float fabsf(float x);
27227 long double fabsl(long double x);
```

27228 **DESCRIPTION**

27229 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 27230 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27231 volume of POSIX.1-2008 defers to the ISO C standard.

27232 These functions shall compute the absolute value of their argument  $x$ ,  $|x|$ .

27233 **RETURN VALUE**

27234 Upon successful completion, these functions shall return the absolute value of  $x$ .

27235 MX If  $x$  is NaN, a NaN shall be returned.

27236 If  $x$  is  $\pm 0$ ,  $+0$  shall be returned.

27237 If  $x$  is  $\pm \text{Inf}$ ,  $+\text{Inf}$  shall be returned.

27238 **ERRORS**

27239 No errors are defined.

27240 **EXAMPLES**27241 **Computing the 1-Norm of a Floating-Point Vector**

27242 This example shows the use of *fabs()* to compute the 1-norm of a vector defined as follows:

```
27243 norm1(v) = |v[0]| + |v[1]| + ... + |v[n-1]|
```

27244 where  $|x|$  denotes the absolute value of  $x$ ,  $n$  denotes the vector's dimension  $v[i]$  denotes the  $i$ -th  
 27245 component of  $v$  ( $0 \leq i < n$ ).

```
27246 #include <math.h>
27247 double
27248 norm1(const double v[], const int n)
27249 {
27250     int    i;
27251     double nl_v; /* 1-norm of v */
27252     nl_v = 0;
27253     for (i=0; i<n; i++) {
27254         nl_v += fabs (v[i]);
27255     }
27256     return nl_v;
27257 }
```

 27279 EXAMPLES section.

27280 **NAME**

27281        faccessat — determine accessibility of a file relative to directory file descriptor

27282 **SYNOPSIS**27283        `#include <unistd.h>`27284        `int faccessat(int fd, const char *path, int amode, int flag);`27285 **DESCRIPTION**27286        Refer to *access()*.

**NAME**

fattach — attach a STREAMS-based file descriptor to a file in the file system name space (STREAMS)

**SYNOPSIS**

```
#include <stropts.h>

int fattach(int fildes, const char *path);
```

**DESCRIPTION**

The *fattach()* function shall attach a STREAMS-based file descriptor to a file, effectively associating a pathname with *fildes*. The application shall ensure that the *fildes* argument is a valid open file descriptor associated with a STREAMS file. The *path* argument points to a pathname of an existing file. The application shall have appropriate privileges or be the owner of the file named by *path* and have write permission. A successful call to *fattach()* shall cause all pathnames that name the file named by *path* to name the STREAMS file associated with *fildes*, until the STREAMS file is detached from the file. A STREAMS file can be attached to more than one file and can have several pathnames associated with it.

The attributes of the named STREAMS file shall be initialized as follows: the permissions, user ID, group ID, and times are set to those of the file named by *path*, the number of links is set to 1, and the size and device identifier are set to those of the STREAMS file associated with *fildes*. If any attributes of the named STREAMS file are subsequently changed (for example, by *chmod()*), neither the attributes of the underlying file nor the attributes of the STREAMS file to which *fildes* refers shall be affected.

File descriptors referring to the underlying file, opened prior to an *fattach()* call, shall continue to refer to the underlying file.

**RETURN VALUE**

Upon successful completion, *fattach()* shall return 0. Otherwise,  $-1$  shall be returned and *errno* set to indicate the error.

**ERRORS**

The *fattach()* function shall fail if:

- |                |   |
|----------------|---|
| [EACCES]       | Search permission is denied for a component of the path prefix, or the process is the owner of <i>path</i> but does not have write permissions on the file named by <i>path</i> .   |
| [EBADF]        | The <i>fildes</i> argument is not a valid open file descriptor.   |
| [EBUSY]        | The file named by <i>path</i> is currently a mount point or has a STREAMS file attached to it.  |
| [ELOOP]        | A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.  |
| [ENAMETOOLONG] | The length of a component of a pathname is longer than {NAME_MAX}.  |
| [ENOENT]       | A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.  |
| [ENOTDIR]      | A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>path</i> argument contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters. |

27330 [EPERM] The effective user ID of the process is not the owner of the file named by *path*  
 27331 and the process does not have appropriate privileges.

27332 The *fattach()* function may fail if:

27333 [EINVAL] The *fildev* argument does not refer to a STREAMS file.

27334 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 27335 resolution of the *path* argument.

27336 [ENAMETOOLONG]

27337 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 27338 symbolic link produced an intermediate result with a length that exceeds  
 27339 {PATH\_MAX}.

27340 [EXDEV] A link to a file on another file system was attempted.

## 27341 EXAMPLES

### 27342 Attaching a File Descriptor to a File

27343 In the following example, *fd* refers to an open STREAMS file. The call to *fattach()* associates this  
 27344 STREAM with the file **/tmp/named-STREAM**, such that any future calls to open **/tmp/named-**  
 27345 **STREAM**, prior to breaking the attachment via a call to *fdetach()*, will instead create a new file  
 27346 handle referring to the STREAMS file associated with *fd*.

```
27347 #include <stropts.h>
27348 ...
27349     int fd;
27350     char *pathname = "/tmp/named-STREAM";
27351     int ret;
27352
27353     ret = fattach(fd, pathname);
```

## 27353 APPLICATION USAGE

27354 The *fattach()* function behaves similarly to the traditional *mount()* function in the way a file is  
 27355 temporarily replaced by the root directory of the mounted file system. In the case of *fattach()*, the  
 27356 replaced file need not be a directory and the replacing file is a STREAMS file.

## 27357 RATIONALE

27358 The file attributes of a file which has been the subject of an *fattach()* call are specifically set  
 27359 because of an artifact of the original implementation. The internal mechanism was the same as  
 27360 for the *mount()* function. Since *mount()* is typically only applied to directories, the effects when  
 27361 applied to a regular file are a little surprising, especially as regards the link count which rigidly  
 27362 remains one, even if there were several links originally and despite the fact that all original links  
 27363 refer to the STREAM as long as the *fattach()* remains in effect.

## 27364 FUTURE DIRECTIONS

27365 The *fattach()* function may be removed in a future version.

## 27366 SEE ALSO

27367 *fdetach()*, *isastream()*

## 27369 CHANGE HISTORY

27370 First released in Issue 4, Version 2.

27371 **Issue 5**

27372 Moved from X/OPEN UNIX extension to BASE.

27373 The [EXDEV] error is added to the list of optional errors in the ERRORS section.

27374 **Issue 6**

27375 This function is marked as part of the XSI STREAMS Option Group.

27376 The normative text is updated to avoid use of the term “must” for application requirements.

27377 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
27378 [ELOOP] error condition is added.27379 **Issue 7**

27380 Austin Group Interpretation 1003.1-2001 #143 is applied.

27381 The *fattach()* function is marked obsolescent.27382 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
27383 pathname exists but is not a directory or a symbolic link to a directory.27384 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0111 [146,324] and  
27385 XSH/TC1-2008/0112 [291] are applied.

27386 **NAME**

27387 fchdir — change working directory

27388 **SYNOPSIS**

27389 #include &lt;unistd.h&gt;

27390 int fchdir(int *fildev*);27391 **DESCRIPTION**27392 The *fchdir()* function shall be equivalent to *chdir()* except that the directory that is to be the new  
27393 current working directory is specified by the file descriptor *fildev*.27394 A conforming application can obtain a file descriptor for a file of type directory using *open()*,  
27395 provided that the file status flags and access modes do not contain O\_WRONLY or O\_RDWR.27396 **RETURN VALUE**27397 Upon successful completion, *fchdir()* shall return 0. Otherwise, it shall return -1 and set *errno* to  
27398 indicate the error. On failure the current working directory shall remain unchanged.27399 **ERRORS**27400 The *fchdir()* function shall fail if:27401 [EACCES] Search permission is denied for the directory referenced by *fildev*.27402 [EBADF] The *fildev* argument is not an open file descriptor.27403 [ENOTDIR] The open file descriptor *fildev* does not refer to a directory.27404 The *fchdir()* may fail if:27405 [EINTR] A signal was caught during the execution of *fchdir()*.

27406 [EIO] An I/O error occurred while reading from or writing to the file system.

27407 **EXAMPLES**

27408 None.

27409 **APPLICATION USAGE**

27410 None.

27411 **RATIONALE**

27412 None.

27418 **CHANGE HISTORY**

27419 First released in Issue 4, Version 2.

27420 **Issue 5**

27421 Moved from X/OPEN UNIX extension to BASE.

27422 **Issue 7**27423 The *fchdir()* function is moved from the XSI option to the Base.

27424 **NAME**

27425 fchmod — change mode of a file

27426 **SYNOPSIS**

27427 #include &lt;sys/stat.h&gt;

27428 int fchmod(int *fildes*, mode\_t *mode*);27429 **DESCRIPTION**27430 The *fchmod()* function shall be equivalent to *chmod()* except that the file whose permissions are  
27431 changed is specified by the file descriptor *fildes*.27432 SHM If *fildes* references a shared memory object, the *fchmod()* function need only affect the S\_IRUSR,  
27433 S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits.27434 TYM If *fildes* references a typed memory object, the behavior of *fchmod()* is unspecified.27435 If *fildes* refers to a socket, the behavior of *fchmod()* is unspecified.27436 OB XSR If *fildes* refers to a STREAM (which is *fattach()*-ed into the file system name space) the call  
27437 returns successfully, doing nothing.27438 **RETURN VALUE**27439 Upon successful completion, *fchmod()* shall return 0. Otherwise, it shall return -1 and set *errno* to  
27440 indicate the error.27441 **ERRORS**27442 The *fchmod()* function shall fail if:27443 [EBADF] The *fildes* argument is not an open file descriptor.27444 [EPERM] The effective user ID does not match the owner of the file and the process does  
27445 not have appropriate privileges.27446 [EROFS] The file referred to by *fildes* resides on a read-only file system.27447 The *fchmod()* function may fail if:27448 XSI [EINTR] The *fchmod()* function was interrupted by a signal.27449 XSI [EINVAL] The value of the *mode* argument is invalid.27450 [EINVAL] The *fildes* argument refers to a pipe and the implementation disallows  
27451 execution of *fchmod()* on a pipe.27452 **EXAMPLES**27453 **Changing the Current Permissions for a File**27454 The following example shows how to change the permissions for a file named */home/cnd/mod1*  
27455 so that the owner and group have read/write/execute permissions, but the world only has  
27456 read/write permissions.

27457 #include &lt;sys/stat.h&gt;

27458 #include &lt;fcntl.h&gt;

27459 mode\_t mode;

27460 int fildes;

27461 ...

27462 fildes = open("/home/cnd/mod1", O\_RDWR);

27463 fchmod(fildes, S\_IRWXU | S\_IRWXG | S\_IROTH | S\_IWOTH);

27464 **APPLICATION USAGE**

27465 None.

27466 **RATIONALE**

27467 None.

27468 **FUTURE DIRECTIONS**

27469 None.

27470 **SEE ALSO**27471 *chmod()*, *chown()*, *creat()*, *fcntl()*, *fstatat()*, *fstatvfs()*, *mknod()*, *open()*, *read()*, *write()*

27472 XBD &lt;sys/stat.h&gt;

27473 **CHANGE HISTORY**

27474 First released in Issue 4, Version 2.

27475 **Issue 5**

27476 Moved from X/OPEN UNIX extension to BASE and aligned with *fchmod()* in the POSIX  
27477 Realtime Extension. Specifically, the second paragraph of the DESCRIPTION is added and a  
27478 second instance of [EINVAL] is defined in the list of optional errors.

27479 **Issue 6**

27480 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by stating that *fchmod()*  
27481 behavior is unspecified for typed memory objects.

27482 **NAME**

27483 fchmodat — change mode of a file relative to directory file descriptor

27484 **SYNOPSIS**

27485 #include &lt;sys/stat.h&gt;

27486 int fchmodat(int *fd*, const char \**path*, mode\_t *mode*, int *flag*);27487 **DESCRIPTION**27488 Refer to *chmod()*.

27489 **NAME**

27490 fchown — change owner and group of a file

27491 **SYNOPSIS**

27492 #include &lt;unistd.h&gt;

27493 int fchown(int *fildev*, uid\_t *owner*, gid\_t *group*);27494 **DESCRIPTION**27495 The *fchown()* function shall be equivalent to *chown()* except that the file whose owner and group  
27496 are changed is specified by the file descriptor *fildev*.27497 **RETURN VALUE**27498 Upon successful completion, *fchown()* shall return 0. Otherwise, it shall return -1 and set *errno* to  
27499 indicate the error.27500 **ERRORS**27501 The *fchown()* function shall fail if:27502 [EBADF] The *fildev* argument is not an open file descriptor.27503 [EPERM] The effective user ID does not match the owner of the file or the process does  
27504 not have appropriate privileges and \_POSIX\_CHOWN\_RESTRICTED  
27505 indicates that such privilege is required.27506 [EROFS] The file referred to by *fildev* resides on a read-only file system.27507 The *fchown()* function may fail if:27508 [EINVAL] The owner or group ID is not a value supported by the implementation. The  
27509 OB XSR *fildev* argument refers to a pipe or socket or an *fattach()*-ed STREAM and the  
27510 implementation disallows execution of *fchown()* on a pipe.

27511 [EIO] A physical I/O error has occurred.

27512 [EINTR] The *fchown()* function was interrupted by a signal which was caught.27513 **EXAMPLES**27514 **Changing the Current Owner of a File**27515 The following example shows how to change the owner of a file named */home/cnd/mod1* to  
27516 "jones" and the group to "cnd".27517 The numeric value for the user ID is obtained by extracting the user ID from the user database  
27518 entry associated with "jones". Similarly, the numeric value for the group ID is obtained by  
27519 extracting the group ID from the group database entry associated with "cnd". This example  
27520 assumes the calling program has appropriate privileges.

27521 #include &lt;sys/types.h&gt;

27522 #include &lt;unistd.h&gt;

27523 #include &lt;fcntl.h&gt;

27524 #include &lt;pwd.h&gt;

27525 #include &lt;grp.h&gt;

27526 struct passwd \*pwd;

27527 struct group \*grp;

27528 int fildev;

27529 ...

27530 fildev = open("/home/cnd/mod1", O\_RDWR);

27531 pwd = getpwnam("jones");

```

27532         grp = getgrnam("cnd");
27533         fchown(fildes, pwd->pw_uid, grp->gr_gid);

```

#### 27534 APPLICATION USAGE

27535 None.

#### 27536 RATIONALE

27537 None.

#### 27538 FUTURE DIRECTIONS

27539 None.

#### 27540 SEE ALSO

#### 27543 CHANGE HISTORY

27544 First released in Issue 4, Version 2.

#### 27545 Issue 5

27546 Moved from X/OPEN UNIX extension to BASE.

#### 27547 Issue 6

27548 The following changes were made to align with the IEEE P1003.1a draft standard:

- 27549 • Clarification is added that a call to *fchown()* may not be allowed on a pipe.

27550 The *fchown()* function is defined as mandatory.

#### 27551 Issue 7

27552 Functionality relating to XSI STREAMS is marked obsolescent.

27553 **NAME**

27554       fchownat — change owner and group of a file relative to directory file descriptor

27555 **SYNOPSIS**

27556       #include &lt;unistd.h&gt;

27557       int fchownat(int *fd*, const char \**path*, uid\_t *owner*, gid\_t *group*,  
27558                   int *flag*);27559 **DESCRIPTION**27560       Refer to *chown()*.

27561 **NAME**

27562       fclose — close a stream

27563 **SYNOPSIS**

27564       #include &lt;stdio.h&gt;

27565       int fclose(FILE \**stream*);27566 **DESCRIPTION**

27567 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 27568 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27569 volume of POSIX.1-2008 defers to the ISO C standard.

27570       The *fclose()* function shall cause the stream pointed to by *stream* to be flushed and the associated  
 27571 file to be closed. Any unwritten buffered data for the stream shall be written to the file; any  
 27572 unread buffered data shall be discarded. Whether or not the call succeeds, the stream shall be  
 27573 disassociated from the file and any buffer set by the *setbuf()* or *setvbuf()* function shall be  
 27574 disassociated from the stream. If the associated buffer was automatically allocated, it shall be  
 27575 deallocated.

27576 CX       If the file is not already at EOF, and the file is one capable of seeking, the file offset of the  
 27577 underlying open file description shall be set to the file position of the stream if the stream is the  
 27578 active handle to the underlying file description.

27579       The *fclose()* function shall mark for update the last data modification and last file status change  
 27580 timestamps of the underlying file, if the stream was writable, and if buffered data remains that  
 27581 has not yet been written to the file. The *fclose()* function shall perform the equivalent of a *close()*  
 27582 on the file descriptor that is associated with the stream pointed to by *stream*.

27583       After the call to *fclose()*, any use of *stream* results in undefined behavior.

27584 **RETURN VALUE**

27585 CX       Upon successful completion, *fclose()* shall return 0; otherwise, it shall return EOF and set *errno*  
 27586 to indicate the error.

27587 **ERRORS**

27588       The *fclose()* function shall fail if:

27589 CX       [EAGAIN]       The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and  
 27590 the thread would be delayed in the write operation.

27591 CX       [EBADF]       The file descriptor underlying stream is not valid.

27592 CX       [EFBIG]       An attempt was made to write a file that exceeds the maximum file size.

27593 XSI       [EFBIG]       An attempt was made to write a file that exceeds the file size limit of the  
 27594 process.

27595 CX       [EFBIG]       The file is a regular file and an attempt was made to write at or beyond the  
 27596 offset maximum associated with the corresponding stream.

27597 CX       [EINTR]       The *fclose()* function was interrupted by a signal.

27598 CX       [EIO]        The process is a member of a background process group attempting to write to  
 27599 its controlling terminal, TOSTOP is set, the calling thread is not blocking  
 27600 SIGTTOU, the process is not ignoring SIGTTOU, and the process group of the  
 27601 process is orphaned. This error may also be returned under implementation-  
 27602 defined conditions.

27603 CX [ENOMEM] The underlying stream was created by *open\_memstream()* or  
 27604 *open\_wmemstream()* and insufficient memory is available.

27605 CX [ENOSPC] There was no free space remaining on the device containing the file or in the  
 27606 buffer used by the *fmemopen()* function.

27607 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by  
 27608 any process. A SIGPIPE signal shall also be sent to the thread.

27609 The *fclose()* function may fail if:

27610 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
 27611 capabilities of the device.

## 27612 EXAMPLES

27613 None.

## 27614 APPLICATION USAGE

27615 Since after the call to *fclose()* any use of stream results in undefined behavior, *fclose()* should not  
 27616 be used on *stdin*, *stdout*, or *stderr* except immediately before process termination (see XBD  
 27617 Section 3.303, on page 82), so as to avoid triggering undefined behavior in other standard  
 27618 interfaces that rely on these streams. If there are any *atexit()* handlers registered by the  
 27619 application, such a call to *fclose()* should not occur until the last handler is finishing. Once  
 27620 *fclose()* has been used to close *stdin*, *stdout*, or *stderr*, there is no standard way to reopen any of  
 27621 these streams.

27622 Use of *freopen()* to change *stdin*, *stdout*, or *stderr* instead of closing them avoids the danger of a  
 27623 file unexpectedly being opened as one of the special file descriptors *STDIN\_FILENO*,  
 27624 *STDOUT\_FILENO*, or *STDERR\_FILENO* at a later time in the application.

## 27625 RATIONALE

27626 None.

## 27627 FUTURE DIRECTIONS

27628 None.

## 27629 SEE ALSO

27630 Section 2.5 (on page 495), *atexit()*, *close()*, *fmemopen()*, *fopen()*, *freopen()*, *getrlimit()*,  
 27631 *open\_memstream()*, *ulimit()*

27632 XBD <stdio.h>

## 27633 CHANGE HISTORY

27634 First released in Issue 1. Derived from Issue 1 of the SVID.

### 27635 Issue 5

27636 Large File Summit extensions are added.

### 27637 Issue 6

27638 Extensions beyond the ISO C standard are marked.

27639 The following new requirements on POSIX implementations derive from alignment with the  
 27640 Single UNIX Specification:

- 27641 • The [EFBIG] error is added as part of the large file support extensions.
- 27642 • The [ENXIO] optional error condition is added.

27643 The DESCRIPTION is updated to note that the stream and any buffer are disassociated whether  
 27644 or not the call succeeds. This is for alignment with the ISO/IEC 9899:1999 standard.

27645 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/28 is applied, updating the [EAGAIN]  
27646 error in the ERRORS section from “the process would be delayed” to “the thread would be  
27647 delayed”.

27648 **Issue 7**

27649 Austin Group Interpretation 1003.1-2001 #002 is applied, clarifying the interaction of file  
27650 descriptors and streams.

27651 The [ENOSPC] error condition is updated and the [ENOMEM] error is added from The Open  
27652 Group Technical Standard, 2006, Extended API Set Part 1.

27653 Changes are made related to support for finegrained timestamps.

27654 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0113 [87], XSH/TC1-2008/0114 [79],  
27655 and XSH/TC1-2008/0115 [14] are applied.

## 27656 NAME

27657 fcntl — file control

## 27658 SYNOPSIS

27659 #include &lt;fcntl.h&gt;

27660 int fcntl(int *fildes*, int *cmd*, ...);

## 27661 DESCRIPTION

27662 The *fcntl()* function shall perform the operations described below on open files. The *fildes*  
 27663 argument is a file descriptor.

27664 The available values for *cmd* are defined in <fcntl.h> and are as follows:

27665 F\_DUPFD Return a new file descriptor which shall be allocated as described in |  
 27666 Section 2.14 (on page 549), except that it shall be the lowest numbered |  
 27667 available file descriptor greater than or equal to the third argument, *arg*,  
 27668 taken as an integer of type **int**. The new file descriptor shall refer to the  
 27669 same open file description as the original file descriptor, and shall share  
 27670 any locks. The FD\_CLOEXEC flag associated with the new file descriptor  
 27671 shall be cleared to keep the file open across calls to one of the *exec*  
 27672 functions.

27673 F\_DUPFD\_CLOEXEC

27674 Like F\_DUPFD, but the FD\_CLOEXEC flag associated with the new file  
 27675 descriptor shall be set.

27676 F\_GETFD

27677 Get the file descriptor flags defined in <fcntl.h> that are associated with  
 27678 the file descriptor *fildes*. File descriptor flags are associated with a single  
 27679 file descriptor and do not affect other file descriptors that refer to the  
 same file.

27680 F\_SETFD

27681 Set the file descriptor flags defined in <fcntl.h>, that are associated with  
 27682 *fildes*, to the third argument, *arg*, taken as type **int**. If the FD\_CLOEXEC  
 27683 flag in the third argument is 0, the file descriptor shall remain open across  
 27684 the *exec* functions; otherwise, the file descriptor shall be closed upon  
 successful execution of one of the *exec* functions.

27685 F\_GETFL

27686 Get the file status flags and file access modes, defined in <fcntl.h>, for the  
 27687 file description associated with *fildes*. The file access modes can be  
 27688 extracted from the return value using the mask O\_ACCMODE, which is  
 27689 defined in <fcntl.h>. File status flags and file access modes are associated  
 27690 with the file description and do not affect other file descriptors that refer  
 27691 to the same file with different open file descriptions. The flags returned  
 27692 may include non-standard file status flags which the application did not  
 27693 set, provided that these additional flags do not alter the behavior of a  
 conforming application.

27694 F\_SETFL

27695 Set the file status flags, defined in <fcntl.h>, for the file description  
 27696 associated with *fildes* from the corresponding bits in the third argument,  
 27697 *arg*, taken as type **int**. Bits corresponding to the file access mode and the  
 27698 file creation flags, as defined in <fcntl.h>, that are set in *arg* shall be  
 27699 ignored. If any bits in *arg* other than those mentioned here are changed by  
 27700 the application, the result is unspecified. If *fildes* does not support non-  
 27701 blocking operations, it is unspecified whether the O\_NONBLOCK flag  
 will be ignored.

27702	F_GETOWN	If <i>fildest</i> refers to a socket, get the process ID or process group ID specified	
27703		to receive SIGURG signals when out-of-band data is available. Positive	
27704		values shall indicate a process ID; negative values, other than -1, shall	
27705		indicate a process group ID; the value zero shall indicate that no SIGURG	
27706		signals are to be sent. If <i>fildest</i> does not refer to a socket, the results are	
27707		unspecified.	
27708	F_SETOWN	If <i>fildest</i> refers to a socket, set the process ID or process group ID specified	
27709		to receive SIGURG signals when out-of-band data is available, using the	
27710		value of the third argument, <i>arg</i> , taken as type <b>int</b> . Positive values shall	
27711		indicate a process ID; negative values, other than -1, shall indicate a	
27712		process group ID; the value zero shall indicate that no SIGURG signals	
27713		are to be sent. Each time a SIGURG signal is sent to the specified process	
27714		or process group, permission checks equivalent to those performed by	
27715		<i>kill()</i> shall be performed, as if <i>kill()</i> were called by a process with the	
27716		same real user ID, effective user ID, and privileges that the process calling	
27717		<i>fcntl()</i> has at the time of the call; if the <i>kill()</i> call would fail, no signal shall	
27718		be sent.	
27719		These permission checks may also be performed by the <i>fcntl()</i> call. If the	
27720		process specified by <i>arg</i> later terminates, or the process group specified by	
27721		<i>arg</i> later becomes empty, while still being specified to receive SIGURG	
27722		signals when out-of-band data is available from <i>fildest</i> , then no signals	
27723		shall be sent to any subsequently created process that has the same	
27724		process ID or process group ID, regardless of permission; it is unspecified	
27725		whether this is achieved by the equivalent of a <i>fcntl(fildest, F_SETOWN, 0)</i>	
27726		call at the time the process terminates or is waited for or the process	
27727		group becomes empty, or by other means. If <i>fildest</i> does not refer to a	
27728		socket, the results are unspecified.	
27729	The following values for <i>cmd</i> are available for advisory record locking. Record locking shall be		
27730	supported for regular files, and may be supported for other files.		
27731	F_GETLK	Get any lock which blocks the lock description pointed to by the third	
27732		argument, <i>arg</i> , taken as a pointer to type <b>struct flock</b> , defined in	
27733		<b>&lt;fcntl.h&gt;</b> . The information retrieved shall overwrite the information	
27734		passed to <i>fcntl()</i> in the structure <b>flock</b> . If no lock is found that would	
27735		prevent this lock from being created, then the structure shall be left	
27736		unchanged except for the lock type which shall be set to F_UNLCK.	
27737	F_SETLK	Set or clear a file segment lock according to the lock description pointed	
27738		to by the third argument, <i>arg</i> , taken as a pointer to type <b>struct flock</b> ,	
27739		defined in <b>&lt;fcntl.h&gt;</b> . F_SETLK can establish shared (or read) locks	
27740		(F_RDLCK) or exclusive (or write) locks (F_WRLCK), as well as to	
27741		remove either type of lock (F_UNLCK). F_RDLCK, F_WRLCK, and	
27742		F_UNLCK are defined in <b>&lt;fcntl.h&gt;</b> . If a shared or exclusive lock cannot	
27743		be set, <i>fcntl()</i> shall return immediately with a return value of -1.	
27744	F_SETLKW	This command shall be equivalent to F_SETLK except that if a shared or	
27745		exclusive lock is blocked by other locks, the thread shall wait until the	
27746		request can be satisfied. If a signal that is to be caught is received while	
27747		<i>fcntl()</i> is waiting for a region, <i>fcntl()</i> shall be interrupted. Upon return	
27748		from the signal handler, <i>fcntl()</i> shall return -1 with <i>errno</i> set to [EINTR],	
27749		and the lock operation shall not be done.	

27750 Additional implementation-defined values for *cmd* may be defined in `<fcntl.h>`. Their names  
27751 shall start with `F_`.

27752 When a shared lock is set on a segment of a file, other processes shall be able to set shared locks  
27753 on that segment or a portion of it. A shared lock prevents any other process from setting an  
27754 exclusive lock on any portion of the protected area. A request for a shared lock shall fail if the  
27755 file descriptor was not opened with read access.

27756 An exclusive lock shall prevent any other process from setting a shared lock or an exclusive lock  
27757 on any portion of the protected area. A request for an exclusive lock shall fail if the file  
27758 descriptor was not opened with write access.

27759 The structure **lock** describes the type (*l\_type*), starting offset (*l\_whence*), relative offset (*l\_start*),  
27760 size (*l\_len*), and process ID (*l\_pid*) of the segment of the file to be affected.

27761 The value of *l\_whence* is `SEEK_SET`, `SEEK_CUR`, or `SEEK_END`, to indicate that the relative  
27762 offset *l\_start* bytes shall be measured from the start of the file, current position, or end of the file,  
27763 respectively. The value of *l\_len* is the number of consecutive bytes to be locked. The value of *l\_len*  
27764 may be negative (where the definition of **off\_t** permits negative values of *l\_len*). The *l\_pid* field  
27765 is only used with `F_GETLK` to return the process ID of the process holding a blocking lock. After  
27766 a successful `F_GETLK` request, when a blocking lock is found, the values returned in the **lock**  
27767 structure shall be as follows:

27768 *l\_type*           Type of blocking lock found.

27769 *l\_whence*       `SEEK_SET`.

27770 *l\_start*          Start of the blocking lock.

27771 *l\_len*           Length of the blocking lock.

27772 *l\_pid*           Process ID of the process that holds the blocking lock.

27773 If the command is `F_SETLK` and the process must wait for another process to release a lock,  
27774 then the range of bytes to be locked shall be determined before the *fcntl()* function blocks. If the  
27775 file size or file descriptor seek offset change while *fcntl()* is blocked, this shall not affect the  
27776 range of bytes locked.

27777 If *l\_len* is positive, the area affected shall start at *l\_start* and end at *l\_start+l\_len-1*. If *l\_len* is  
27778 negative, the area affected shall start at *l\_start+l\_len* and end at *l\_start-1*. Locks may start and  
27779 extend beyond the current end of a file, but shall not extend before the beginning of the file. A  
27780 lock shall be set to extend to the largest possible value of the file offset for that file by setting  
27781 *l\_len* to 0. If such a lock also has *l\_start* set to 0 and *l\_whence* is set to `SEEK_SET`, the whole file  
27782 shall be locked.

27783 There shall be at most one type of lock set for each byte in the file. Before a successful return  
27784 from an `F_SETLK` or an `F_SETLKW` request when the calling process has previously existing  
27785 locks on bytes in the region specified by the request, the previous lock type for each byte in the  
27786 specified region shall be replaced by the new lock type. As specified above under the  
27787 descriptions of shared locks and exclusive locks, an `F_SETLK` or an `F_SETLKW` request  
27788 (respectively) shall fail or block when another process has existing locks on bytes in the specified  
27789 region and the type of any of those locks conflicts with the type specified in the request.

27790 All locks associated with a file for a given process shall be removed when a file descriptor for  
27791 that file is closed by that process or the process holding that file descriptor terminates. Locks are  
27792 not inherited by a child process.

27793 A potential for deadlock occurs if a process controlling a locked region is put to sleep by  
27794 attempting to lock the locked region of another process. If the system detects that sleeping until

27795 a locked region is unlocked would cause a deadlock, *fcntl()* shall fail with an [EDEADLK] error.

27796 An unlock (F\_UNLCK) request in which *l\_len* is non-zero and the offset of the last byte of the  
 27797 requested segment is the maximum value for an object of type **off\_t**, when the process has an  
 27798 existing lock in which *l\_len* is 0 and which includes the last byte of the requested segment, shall  
 27799 be treated as a request to unlock from the start of the requested segment with an *l\_len* equal to 0.  
 27800 Otherwise, an unlock (F\_UNLCK) request shall attempt to unlock only the requested segment.

27801 SHM When the file descriptor *fildev* refers to a shared memory object, the behavior of *fcntl()* shall be  
 27802 the same as for a regular file except the effect of the following values for the argument *cmd* shall  
 27803 be unspecified: F\_SETFL, F\_GETLK, F\_SETLK, and F\_SETLKW.

27804 TYM If *fildev* refers to a typed memory object, the result of the *fcntl()* function is unspecified.

## 27805 RETURN VALUE

27806 Upon successful completion, the value returned shall depend on *cmd* as follows:

27807 F\_DUPFD A new file descriptor.

27808 F\_DUPFD\_CLOEXEC

27809 A new file descriptor.

27810 F\_GETFD Value of flags defined in **<fcntl.h>**. The return value shall not be negative.

27811 F\_SETFD Value other than -1.

27812 F\_GETFL Value of file status flags and access modes. The return value is not negative.

27813 F\_SETFL Value other than -1.

27814 F\_GETLK Value other than -1.

27815 F\_SETLK Value other than -1.

27816 F\_SETLKW Value other than -1.

27817 F\_GETOWN Value of the socket owner process or process group; this will not be -1.

27818 F\_SETOWN Value other than -1.

27819 Otherwise, -1 shall be returned and *errno* set to indicate the error.

## 27820 ERRORS

27821 The *fcntl()* function shall fail if:

27822 [EACCES] or [EAGAIN]

27823 The *cmd* argument is F\_SETLK; the type of lock (*l\_type*) is a shared (F\_RDLCK)  
 27824 or exclusive (F\_WRLCK) lock and the segment of a file to be locked is already  
 27825 exclusive-locked by another process, or the type is an exclusive lock and some  
 27826 portion of the segment of a file to be locked is already shared-locked or  
 27827 exclusive-locked by another process.

27828 [EBADF] The *fildev* argument is not a valid open file descriptor, or the argument *cmd* is  
 27829 F\_SETLK or F\_SETLKW, the type of lock, *l\_type*, is a shared lock (F\_RDLCK),  
 27830 and *fildev* is not a valid file descriptor open for reading, or the type of lock,  
 27831 *l\_type*, is an exclusive lock (F\_WRLCK), and *fildev* is not a valid file descriptor  
 27832 open for writing.

27833 [EINTR] The *cmd* argument is F\_SETLKW and the function was interrupted by a signal.

27834	[EINVAL]	The <i>cmd</i> argument is invalid, or the <i>cmd</i> argument is F_DUPFD or F_DUPFD_CLOEXEC and <i>arg</i> is negative or greater than or equal to {OPEN_MAX}, or the <i>cmd</i> argument is F_GETLK, F_SETLK, or F_SETLKW and the data pointed to by <i>arg</i> is not valid, or <i>fildev</i> refers to a file that does not support locking.	
27835			
27836			
27837			
27838			
27839	[EMFILE]	The argument <i>cmd</i> is F_DUPFD or F_DUPFD_CLOEXEC and all file descriptors available to the process are currently open, or no file descriptors greater than or equal to <i>arg</i> are available.	
27840			
27841			
27842	[ENOLCK]	The argument <i>cmd</i> is F_SETLK or F_SETLKW and satisfying the lock or unlock request would result in the number of locked regions in the system exceeding a system-imposed limit.	
27843			
27844			
27845	[EOVERFLOW]	One of the values to be returned cannot be represented correctly.	
27846	[EOVERFLOW]	The <i>cmd</i> argument is F_GETLK, F_SETLK, or F_SETLKW and the smallest or, if <i>l_len</i> is non-zero, the largest offset of any byte in the requested segment cannot be represented correctly in an object of type <b>off_t</b> .	
27847			
27848			
27849	[ESRCH]	The <i>cmd</i> argument is F_SETOWN and no process or process group can be found corresponding to that specified by <i>arg</i> .	+
27850			
27851	The <i>fcntl()</i> function may fail if:		
27852	[EDEADLK]	The <i>cmd</i> argument is F_SETLKW, the lock is blocked by a lock from another process, and putting the calling process to sleep to wait for that lock to become free would cause a deadlock.	
27853			
27854			
27855	[EINVAL]	The <i>cmd</i> argument is F_SETOWN and the value of the argument is not valid as a process or process group identifier.	+
27856			+
27857	[EPERM]	The <i>cmd</i> argument is F_SETOWN and the calling process does not have permission to send a SIGURG signal to any process specified by <i>arg</i> .	+
27858			

## EXAMPLES

### Locking and Unlocking a File

The following example demonstrates how to place a lock on bytes 100 to 109 of a file and then later remove it. F\_SETLK is used to perform a non-blocking lock request so that the process does not have to wait if an incompatible lock is held by another process; instead the process can take some other action.

```
#include <stdlib.h>
#include <unistd.h>
#include <fcntl.h>
#include <errno.h>
#include <stdio.h>

int
main(int argc, char *argv[])
{
    int fd;
    struct flock fl;

    fd = open("testfile", O_RDWR);
    if (fd == -1)
        /* Handle error */;
```

```

27878      /* Make a non-blocking request to place a write lock
27879         on bytes 100-109 of testfile */

27880      fl.l_type = F_WRLCK;
27881      fl.l_whence = SEEK_SET;
27882      fl.l_start = 100;
27883      fl.l_len = 10;

27884      if (fcntl(fd, F_SETLK, &fl) == -1) {
27885          if (errno == EACCES || errno == EAGAIN) {
27886              printf("Already locked by another process\n");
27887              /* We can't get the lock at the moment */
27888          } else {
27889              /* Handle unexpected error */;
27890          }
27891      } else { /* Lock was granted... */

27892          /* Perform I/O on bytes 100 to 109 of file */

27893          /* Unlock the locked bytes */

27894          fl.l_type = F_UNLCK;
27895          fl.l_whence = SEEK_SET;
27896          fl.l_start = 100;
27897          fl.l_len = 10;
27898          if (fcntl(fd, F_SETLK, &fl) == -1)
27899              /* Handle error */;
27900      }
27901      exit(EXIT_SUCCESS);
27902  } /* main */

```

### 27903 Setting the Close-on-Exec Flag

27904 The following example demonstrates how to set the close-on-exec flag for the file descriptor *fd*.

```

27905 #include <unistd.h>
27906 #include <fcntl.h>
27907 ...
27908     int flags;

27909     flags = fcntl(fd, F_GETFD);
27910     if (flags == -1)
27911         /* Handle error */;
27912     flags |= FD_CLOEXEC;
27913     if (fcntl(fd, F_SETFD, flags) == -1)
27914         /* Handle error */;

```

### 27915 APPLICATION USAGE

27916 The *arg* values to F\_GETFD, F\_SETFD, F\_GETFL, and F\_SETFL all represent flag values to allow  
27917 for future growth. Applications using these functions should do a read-modify-write operation  
27918 on them, rather than assuming that only the values defined by this volume of POSIX.1-2008 are  
27919 valid. It is a common error to forget this, particularly in the case of F\_SETFD. Some  
27920 implementations set additional file status flags to advise the application of default behavior,  
27921 even though the application did not request these flags.

On systems which do not perform permission checks at the time of an *fcntl()* call with *F\_SETOWN*, if the permission checks performed at the time the signal is sent disallow sending the signal to any process, the process that called *fcntl()* has no way of discovering that this has happened. A call to *kill()* with signal 0 can be used as a prior check of permissions, although this is no guarantee that permission will be granted at the time a signal is sent, since the target process(es) could change user IDs or privileges in the meantime.

## RATIONALE

The ellipsis in the SYNOPSIS is the syntax specified by the ISO C standard for a variable number of arguments. It is used because System V uses pointers for the implementation of file locking functions.

This volume of POSIX.1-2008 permits concurrent read and write access to file data using the *fcntl()* function; this is a change from the 1984 /usr/group standard and early proposals. Without concurrency controls, this feature may not be fully utilized without occasional loss of data.

Data losses occur in several ways. One case occurs when several processes try to update the same record, without sequencing controls; several updates may occur in parallel and the last writer “wins”. Another case is a bit-tree or other internal list-based database that is undergoing reorganization. Without exclusive use to the tree segment by the updating process, other reading processes chance getting lost in the database when the index blocks are split, condensed, inserted, or deleted. While *fcntl()* is useful for many applications, it is not intended to be overly general and does not handle the bit-tree example well.

This facility is only required for regular files because it is not appropriate for many devices such as terminals and network connections.

Since *fcntl()* works with “any file descriptor associated with that file, however it is obtained”, the file descriptor may have been inherited through a *fork()* or *exec* operation and thus may affect a file that another process also has open.

The use of the open file description to identify what to lock requires extra calls and presents problems if several processes are sharing an open file description, but there are too many implementations of the existing mechanism for this volume of POSIX.1-2008 to use different specifications.

Another consequence of this model is that closing any file descriptor for a given file (whether or not it is the same open file description that created the lock) causes the locks on that file to be relinquished for that process. Equivalently, any close for any file/process pair relinquishes the locks owned on that file for that process. But note that while an open file description may be shared through *fork()*, locks are not inherited through *fork()*. Yet locks may be inherited through one of the *exec* functions.

The identification of a machine in a network environment is outside the scope of this volume of POSIX.1-2008. Thus, an *l\_sysid* member, such as found in System V, is not included in the locking structure.

Changing of lock types can result in a previously locked region being split into smaller regions.

Mandatory locking was a major feature of the 1984 /usr/group standard.

For advisory file record locking to be effective, all processes that have access to a file must cooperate and use the advisory mechanism before doing I/O on the file. Enforcement-mode record locking is important when it cannot be assumed that all processes are cooperating. For example, if one user uses an editor to update a file at the same time that a second user executes another process that updates the same file and if only one of the two processes is using advisory

locking, the processes are not cooperating. Enforcement-mode record locking would protect against accidental collisions.

Secondly, advisory record locking requires a process using locking to bracket each I/O operation with lock (or test) and unlock operations. With enforcement-mode file and record locking, a process can lock the file once and unlock when all I/O operations have been completed. Enforcement-mode record locking provides a base that can be enhanced; for example, with sharable locks. That is, the mechanism could be enhanced to allow a process to lock a file so other processes could read it, but none of them could write it.

Mandatory locks were omitted for several reasons:

1. Mandatory lock setting was done by multiplexing the set-group-ID bit in most implementations; this was confusing, at best.
2. The relationship to file truncation as supported in 4.2 BSD was not well specified.
3. Any publicly readable file could be locked by anyone. Many historical implementations keep the password database in a publicly readable file. A malicious user could thus prohibit logins. Another possibility would be to hold open a long-distance telephone line.
4. Some demand-paged historical implementations offer memory mapped files, and enforcement cannot be done on that type of file.

Since sleeping on a region is interrupted with any signal, *alarm()* may be used to provide a timeout facility in applications requiring it. This is useful in deadlock detection. Since implementation of full deadlock detection is not always feasible, the [EDEADLK] error was made optional.

## FUTURE DIRECTIONS

None.

## CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

### Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

### Issue 6

In the SYNOPSIS, the optional include of the *<sys/types.h>* header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include *<sys/types.h>* has been removed. Although *<sys/types.h>* was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the DESCRIPTION, sentences describing behavior when *l\_len* is negative are now mandated, and the description of unlock (F\_UNLOCK) when *l\_len* is non-negative is mandated.

- In the ERRORS section, the [EINVAL] error condition has the case mandated when the *cmd* is invalid, and two [EOVERFLOW] error conditions are added.

The F\_GETOWN and F\_SETOWN values are added for sockets.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that the extent of the bytes locked is determined prior to the blocking action.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *fcntl()* results are unspecified for typed memory objects.

The normative text is updated to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/29 is applied, adding the example to the EXAMPLES section.

#### Issue 7

Austin Group Interpretation 1003.1-2001 #150 is applied, clarifying the file status flags returned when *cmd* is F\_GETFL.

Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the FD\_CLOEXEC flag atomically at *open()*, and adding the F\_DUPFD\_CLOEXEC flag.

The optional **<unistd.h>** header is removed from this function, since **<fcntl.h>** now defines SEEK\_SET, SEEK\_CUR, and SEEK\_END as part of the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0116 [141] is applied.

28029 **NAME**28030 `fdatasync` — synchronize the data of a file (**REALTIME**)28031 **SYNOPSIS**

```
28032 SIO      #include <unistd.h>
28033          int fdatasync(int fildes);
```

28034 **DESCRIPTION**

28035 The `fdatasync()` function shall force all currently queued I/O operations associated with the file  
 28036 indicated by file descriptor *fil*des to the synchronized I/O completion state.

28037 The functionality shall be equivalent to `fsync()` with the symbol `_POSIX_SYNCHRONIZED_IO`  
 28038 defined, with the exception that all I/O operations shall be completed as defined for  
 28039 synchronized I/O data integrity completion.

28040 **RETURN VALUE**

28041 If successful, the `fdatasync()` function shall return the value 0; otherwise, the function shall return  
 28042 the value `-1` and set *errno* to indicate the error. If the `fdatasync()` function fails, outstanding I/O  
 28043 operations are not guaranteed to have been completed.

28044 **ERRORS**

28045 The `fdatasync()` function shall fail if:

28046 [EBADF]           The *fil*des argument is not a valid file descriptor. |

28047 [EINVAL]          This implementation does not support synchronized I/O for this file.

28048 In the event that any of the queued I/O operations fail, `fdatasync()` shall return the error  
 28049 conditions defined for `read()` and `write()`.

28050 **EXAMPLES**

28051 None.

28052 **APPLICATION USAGE**

28053 Note that even if the file descriptor is not open for writing, if there are any pending write |  
 28054 requests on the underlying file, then that I/O will be completed prior to the return of `fdatasync()`.

28055 **RATIONALE**

28056 None.

28057 **FUTURE DIRECTIONS**

28058 None.

28059 **SEE ALSO**

28060 [`aio\_fsync\(\)`](#), [`fcntl\(\)`](#), [`fsync\(\)`](#), [`open\(\)`](#), [`read\(\)`](#), [`write\(\)`](#)

28061 XBD [`<unistd.h>`](#)

28062 **CHANGE HISTORY**

28063 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

28064 **Issue 6**

28065 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 28066 implementation does not support the Synchronized Input and Output option.

28067 The `fdatasync()` function is marked as part of the Synchronized Input and Output option.

28068 **NAME**28069 fdetach — detach a name from a STREAMS-based file descriptor (**STREAMS**)28070 **SYNOPSIS**

```
28071 OB XSR #include <stropts.h>
28072 int fdetach(const char *path);
```

28073 **DESCRIPTION**

28074 The *fdetach()* function shall detach a STREAMS-based file from the file to which it was attached  
28075 by a previous call to *fattach()*. The *path* argument points to the pathname of the attached  
28076 STREAMS file. The process shall have appropriate privileges or be the owner of the file. A  
28077 successful call to *fdetach()* shall cause all pathnames that named the attached STREAMS file to  
28078 again name the file to which the STREAMS file was attached. All subsequent operations on *path*  
28079 shall operate on the underlying file and not on the STREAMS file.

28080 All open file descriptions established while the STREAMS file was attached to the file referenced  
28081 by *path* shall still refer to the STREAMS file after the *fdetach()* has taken effect.

28082 If there are no open file descriptors or other references to the STREAMS file, then a successful  
28083 call to *fdetach()* shall be equivalent to performing the last *close()* on the attached file.

28084 **RETURN VALUE**

28085 Upon successful completion, *fdetach()* shall return 0; otherwise, it shall return -1 and set *errno* to  
28086 indicate the error.

28087 **ERRORS**

28088 The *fdetach()* function shall fail if:

- |       |                |   |
|-------|----------------|---|
| 28089 | [EACCES]       | Search permission is denied on a component of the path prefix.  |
| 28090 | [EINVAL]       | The <i>path</i> argument names a file that is not currently attached.   |
| 28091 | [ELOOP]        | A loop exists in symbolic links encountered during resolution of the <i>path</i><br>28092 argument.   |
| 28093 | [ENAMETOOLONG] | The length of a component of a pathname is longer than {NAME_MAX}.  |
| 28094 |                |   |
| 28095 | [ENOENT]       | A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.  |
| 28096 | [ENOTDIR]      | A component of the path prefix names an existing file that is neither a<br>directory nor a symbolic link to a directory, or the <i>path</i> argument contains at<br>least one non- <i>&lt;slash&gt;</i> character and ends with one or more trailing <i>&lt;slash&gt;</i><br>characters and the last pathname component names an existing file that is<br>neither a directory nor a symbolic link to a directory. |
| 28097 |                |   |
| 28098 |                |   |
| 28099 |                |   |
| 28100 |                |   |
| 28101 | [EPERM]        | The effective user ID is not the owner of <i>path</i> and the process does not have<br>28102 appropriate privileges.  |

28103 The *fdetach()* function may fail if:

- |       |                |   |
|-------|----------------|---|
| 28104 | [ELOOP]        | More than {SYMLOOP_MAX} symbolic links were encountered during<br>28105 resolution of the <i>path</i> argument.   |
| 28106 |                |   |
| 28107 | [ENAMETOOLONG] | The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a<br>symbolic link produced an intermediate result with a length that exceeds<br>{PATH_MAX}. |
| 28108 |                |   |
| 28109 |                |   |

28110 **EXAMPLES**28111 **Detaching a File**

28112 The following example detaches the STREAMS-based file **/tmp/named-STREAM** from the file to  
28113 which it was attached by a previous, successful call to *fattach()*. Subsequent calls to open this  
28114 file refer to the underlying file, not to the STREAMS file.

```
28115 #include <stropts.h>
28116 ...
28117     char *pathname = "/tmp/named-STREAM";
28118     int ret;
28119     ret = fdetach(pathname);
```

28120 **APPLICATION USAGE**

28121 None.

28122 **RATIONALE**

28123 None.

28124 **FUTURE DIRECTIONS**

28125 The *fdetach()* function may be removed in a future version.

28126 **SEE ALSO**

28127 *fattach()*

28128 XBD <stropts.h>

28129 **CHANGE HISTORY**

28130 First released in Issue 4, Version 2.

28131 **Issue 5**

28132 Moved from X/OPEN UNIX extension to BASE.

28133 **Issue 6**

28134 The normative text is updated to avoid use of the term “must” for application requirements.

28135 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
28136 [ELOOP] error condition is added.

28137 **Issue 7**

28138 Austin Group Interpretation 1003.1-2001 #143 is applied.

28139 The *fdetach()* function is marked obsolescent.

28140 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
28141 pathname exists but is not a directory or a symbolic link to a directory.

28142 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0117 [324] and XSH/TC1-2008/0118  
28143 [291] are applied.

28144 **NAME**

28145 fdim, fdimf, fdiml — compute positive difference between two floating-point numbers

28146 **SYNOPSIS**

```
28147 #include <math.h>
28148 double fdim(double x, double y);
28149 float fdimf(float x, float y);
28150 long double fdiml(long double x, long double y);
```

28151 **DESCRIPTION**

28152 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 28153 conflict between the requirements described here and the ISO C standard is unintentional. This  
 28154 volume of POSIX.1-2008 defers to the ISO C standard.

28155 These functions shall determine the positive difference between their arguments. If  $x$  is greater  
 28156 than  $y$ ,  $x-y$  is returned. If  $x$  is less than or equal to  $y$ , +0 is returned.

28157 An application wishing to check for error situations should set *errno* to zero and call  
 28158 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 28159 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 28160 zero, an error has occurred.

28161 **RETURN VALUE**

28162 Upon successful completion, these functions shall return the positive difference value.

28163 If  $x-y$  is positive and overflows, a range error shall occur and *fdim*(), *fdimf*(), and *fdiml*() shall  
 28164 return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively.

28165 If the correct value would cause underflow, a range error may occur, and *fdim*(), *fdimf*(), and  
 28166 MXX *fdiml*() shall return the correct value, or (if the IEC 60559 Floating-Point option is not  
 28167 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
 28168 FLT\_MIN, and LDBL\_MIN, respectively.

28169 MX If  $x$  or  $y$  is NaN, a NaN shall be returned.

28170 **ERRORS**

28171 The *fdim*() function shall fail if:

28172 Range Error The result overflows.

28173 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 28174 then *errno* shall be set to [ERANGE]. If the integer expression  
 28175 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 28176 floating-point exception shall be raised.

28177 The *fdim*() function may fail if:

28178 Range Error The result underflows.

28179 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 28180 then *errno* shall be set to [ERANGE]. If the integer expression  
 28181 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 28182 floating-point exception shall be raised.

**28183 EXAMPLES**

28184       None.

**28185 APPLICATION USAGE**

28186       On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
28187       MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**28188 RATIONALE**

28189       None.

**28190 FUTURE DIRECTIONS**

28191       None.

**28195 CHANGE HISTORY**

28196       First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

**28197 Issue 7**

28198       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0119 [68,428] and  
28199       XSH/TC1-2008/0120 [68,428] are applied.

28200 **NAME**

28201 fdopen — associate a stream with a file descriptor

28202 **SYNOPSIS**

```
28203 CX      #include <stdio.h>
28204      FILE *fdopen(int fil-des, const char *mode);
```

28205 **DESCRIPTION**28206 The *fdopen()* function shall associate a stream with a file descriptor.28207 The *mode* argument is a character string having one of the following values:28208 *r* or *rb* Open a file for reading.28209 *w* or *wb* Open a file for writing.28210 *a* or *ab* Open a file for writing at end-of-file.28211 *r+* or *rb+* or *r+b* Open a file for update (reading and writing).28212 *w+* or *wb+* or *w+b* Open a file for update (reading and writing).28213 *a+* or *ab+* or *a+b* Open a file for update (reading and writing) at end-of-file.

28214 The meaning of these flags is exactly as specified in *fopen()*, except that modes beginning with *w*  
 28215 shall not cause truncation of the file.

28216 Additional values for the *mode* argument may be supported by an implementation.

28217 The application shall ensure that the mode of the stream as expressed by the *mode* argument is  
 28218 allowed by the file access mode of the open file description to which *fil-des* refers. The file  
 28219 position indicator associated with the new stream is set to the position indicated by the file offset  
 28220 associated with the file descriptor.

28221 The error and end-of-file indicators for the stream shall be cleared. The *fdopen()* function may  
 28222 cause the last data access timestamp of the underlying file to be marked for update.

28223 SHM If *fil-des* refers to a shared memory object, the result of the *fdopen()* function is unspecified.28224 TYM If *fil-des* refers to a typed memory object, the result of the *fdopen()* function is unspecified.

28225 The *fdopen()* function shall preserve the offset maximum previously set for the open file  
 28226 description corresponding to *fil-des*.

28227 **RETURN VALUE**

28228 Upon successful completion, *fdopen()* shall return a pointer to a stream; otherwise, a null pointer  
 28229 shall be returned and *errno* set to indicate the error.

28230 **ERRORS**28231 The *fdopen()* function shall fail if:

28232 [EMFILE] {STREAM\_MAX} streams are currently open in the calling process.

28233 The *fdopen()* function may fail if:28234 [EBADF] The *fil-des* argument is not a valid file descriptor.28235 [EINVAL] The *mode* argument is not a valid mode.

28236 [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

28237 [ENOMEM] Insufficient space to allocate a buffer.

## 28238 EXAMPLES

28239 None.

## 28240 APPLICATION USAGE

28241 File descriptors are obtained from calls like *open()*, *dup()*, *creat()*, or *pipe()*, which open files but  
28242 do not return streams.

## 28243 RATIONALE

28244 The file descriptor may have been obtained from *open()*, *creat()*, *pipe()*, *dup()*, *fcntl()*, or *socket()*;  
28245 inherited through *fork()*, *posix\_spawn()*, or *exec*; or perhaps obtained by other means.

28246 The meanings of the *mode* arguments of *fdopen()* and *fopen()* differ. With *fdopen()*, open for write  
28247 (*w* or *w+*) does not truncate, and append (*a* or *a+*) cannot create for writing. The *mode* argument  
28248 formats that include a *b* are allowed for consistency with the ISO C standard function *fopen()*.  
28249 The *b* has no effect on the resulting stream. Although not explicitly required by this volume of  
28250 POSIX.1-2008, a good implementation of append (*a*) mode would cause the O\_APPEND flag to  
28251 be set.

## 28252 FUTURE DIRECTIONS

28253 None.

## 28254 SEE ALSO

28255 [Section 2.5.1](#) (on page 497), *fclose()*, *fnemopen()*, *fopen()*, *open()*, *open\_memstream()*,

## 28258 CHANGE HISTORY

28259 First released in Issue 1. Derived from Issue 1 of the SVID.

### 28260 Issue 5

28261 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

28262 Large File Summit extensions are added.

### 28263 Issue 6

28264 The following new requirements on POSIX implementations derive from alignment with the  
28265 Single UNIX Specification:

- 28266 • In the DESCRIPTION, the use and setting of the *mode* argument are changed to include  
28267 binary streams.
- 28268 • In the DESCRIPTION, text is added for large file support to indicate setting of the offset  
28269 maximum in the open file description.
- 28270 • All errors identified in the ERRORS section are added.
- 28271 • In the DESCRIPTION, text is added that the *fdopen()* function may cause *st\_atime* to be  
28272 updated.

28273 The following changes were made to align with the IEEE P1003.1a draft standard:

- 28274 • Clarification is added that it is the responsibility of the application to ensure that the mode  
28275 is compatible with the open file descriptor.

28276 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
28277 *fdopen()* results are unspecified for typed memory objects.

- 28278 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/30 is applied, making corrections to the  
28279 RATIONALE.
- 28280 **Issue 7**
- 28281 SD5-XSH-ERN-149 is applied, adding the {STREAM\_MAX} [EMFILE] error condition.
- 28282 Changes are made related to support for finegrained timestamps.
- 28283 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0121 [409] is applied.

28284 **NAME**

28285 fdopendir, opendir — open directory associated with file descriptor

28286 **SYNOPSIS**

28287 #include &lt;dirent.h&gt;

28288 DIR \*fdopendir(int *fd*);28289 DIR \*opendir(const char \**dirname*);28290 **DESCRIPTION**

28291 The *fdopendir()* function shall be equivalent to the *opendir()* function except that the directory is  
 28292 specified by a file descriptor rather than by a name. The file offset associated with the file  
 28293 descriptor at the time of the call determines which entries are returned.

28294 Upon successful return from *fdopendir()*, the file descriptor is under the control of the system,  
 28295 and if any attempt is made to close the file descriptor, or to modify the state of the associated  
 28296 XSI description, other than by means of *closedir()*, *readdir()*, *readdir\_r()*, *rewinddir()*, or *seekdir()*, the  
 28297 behavior is undefined. Upon calling *closedir()* the file descriptor shall be closed.

28298 It is unspecified whether the FD\_CLOEXEC flag will be set on the file descriptor by a successful  
 28299 call to *fdopendir()*.

28300 The *opendir()* function shall open a directory stream corresponding to the directory named by  
 28301 the *dirname* argument. The directory stream is positioned at the first entry. If the type **DIR** is  
 28302 implemented using a file descriptor, applications shall only be able to open up to a total of  
 28303 {OPEN\_MAX} files and directories.

28304 If the type **DIR** is implemented using a file descriptor, the descriptor shall be obtained as if the  
 28305 O\_DIRECTORY flag was passed to *open()*.

28306 **RETURN VALUE**

28307 Upon successful completion, these functions shall return a pointer to an object of type **DIR**.  
 28308 Otherwise, these functions shall return a null pointer and set *errno* to indicate the error.

28309 **ERRORS**28310 The *fdopendir()* function shall fail if:28311 [EBADF] The *fd* argument is not a valid file descriptor open for reading.28312 [ENOTDIR] The descriptor *fd* is not associated with a directory.28313 The *opendir()* function shall fail if:

28314 [EACCES] Search permission is denied for the component of the path prefix of *dirname* or  
 28315 read permission is denied for *dirname*.

28316 [ELOOP] A loop exists in symbolic links encountered during resolution of the *dirname*  
 28317 argument.

28318 [ENAMETOOLONG]  
 28319 The length of a component of a pathname is longer than {NAME\_MAX}.

28320 [ENOENT] A component of *dirname* does not name an existing directory or *dirname* is an  
 28321 empty string.

28322 [ENOTDIR] A component of *dirname* names an existing file that is neither a directory nor a  
 28323 symbolic link to a directory.

28324 The *opendir()* function may fail if:

28325 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
28326 resolution of the *dirname* argument.

28327 [EMFILE] All file descriptors available to the process are currently open.

28328 [ENAMETOOLONG]  
28329 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
28330 symbolic link produced an intermediate result with a length that exceeds  
28331 {PATH\_MAX}.

28332 [ENFILE] Too many files are currently open in the system.

## 28333 EXAMPLES

### 28334 Open a Directory Stream

28335 The following program fragment demonstrates how the *opendir()* function is used.

```
28336 #include <dirent.h>
28337 ...
28338     DIR *dir;
28339     struct dirent *dp;
28340 ...
28341     if ((dir = opendir(".")) == NULL) {
28342         perror("Cannot open .");
28343         exit(1);
28344     }
28345     while ((dp = readdir(dir)) != NULL) {
28346 ...
```

### 28347 Find And Open a File

28348 The following program searches through a given directory looking for files whose name does  
28349 not begin with a dot and whose size is larger than 1 MiB.

```
28350 #include <stdio.h>
28351 #include <dirent.h>
28352 #include <fcntl.h>
28353 #include <sys/stat.h>
28354 #include <stdint.h>
28355 #include <stdlib.h>
28356 #include <unistd.h>
28357
28358 int
28359 main(int argc, char *argv[])
28360 {
28361     struct stat statbuf;
28362     DIR *d;
28363     struct dirent *dp;
28364     int dfd, ffd;
28365
28366     if ((d = fdopendir((dfd = open("./tmp", O_RDONLY))) == NULL) {
28367         fprintf(stderr, "Cannot open ./tmp directory\n");
28368         exit(1);
28369     }
```

```

28367     }
28368     while ((dp = readdir(d)) != NULL) {
28369         if (dp->d_name[0] == '.')
28370             continue;
28371         /* there is a possible race condition here as the file
28372          * could be renamed between the readdir and the open */
28373         if ((ffd = openat(dfd, dp->d_name, O_RDONLY)) == -1) {
28374             perror(dp->d_name);
28375             continue;
28376         }
28377         if (fstat(ffd, &statbuf) == 0 && statbuf.st_size > (1024*1024)) {
28378             /* found it ... */
28379             printf("%s: %jdK\n", dp->d_name,
28380                 (intmax_t)(statbuf.st_size / 1024));
28381         }
28382         close(ffd);
28383     }
28384     closedir(d); // note this implicitly closes dfd
28385     return 0;
28386 }

```

## APPLICATION USAGE

The *opendir()* function should be used in conjunction with *readdir()*, *closedir()*, and *rewinddir()* to examine the contents of the directory (see the EXAMPLES section in *readdir()*). This method is recommended for portability.

## RATIONALE

The purpose of the *fdopendir()* function is to enable opening files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *opendir()*, resulting in unspecified behavior.

Based on historical implementations, the rules about file descriptors apply to directory streams as well. However, this volume of POSIX.1-2008 does not mandate that the directory stream be implemented using file descriptors. The description of *closedir()* clarifies that if a file descriptor is used for the directory stream, it is mandatory that *closedir()* deallocate the file descriptor. When a file descriptor is used to implement the directory stream, it behaves as if the *FD\_CLOEXEC* had been set for the file descriptor.

The directory entries for dot and dot-dot are optional. This volume of POSIX.1-2008 does not provide a way to test *a priori* for their existence because an application that is portable must be written to look for (and usually ignore) those entries. Writing code that presumes that they are the first two entries does not always work, as many implementations permit them to be other than the first two entries, with a “normal” entry preceding them. There is negligible value in providing a way to determine what the implementation does because the code to deal with dot and dot-dot must be written in any case and because such a flag would add to the list of those flags (which has proven in itself to be objectionable) and might be abused.

Since the structure and buffer allocation, if any, for directory operations are defined by the implementation, this volume of POSIX.1-2008 imposes no portability requirements for erroneous program constructs, erroneous data, or the use of unspecified values such as the use or referencing of a *dirp* value or a **dirent** structure value after a directory stream has been closed or after a *fork()* or one of the *exec* function calls.

28414 **FUTURE DIRECTIONS**

28415 None.

28416 **SEE ALSO**28417 *closedir()*, *dirfd()*, *fstatat()*, *open()*, *readdir()*, *rewinddir()*, *symlink()*28418 XBD **<dirent.h>**, **<sys/types.h>**28419 **CHANGE HISTORY**

28420 First released in Issue 2.

28421 **Issue 6**28422 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.28423 The following new requirements on POSIX implementations derive from alignment with the  
28424 Single UNIX Specification:

- 28425 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was  
28426 required for conforming implementations of previous POSIX specifications, it was not  
28427 required for UNIX applications.
- 28428 • The [ELOOP] mandatory error condition is added.
- 28429 • A second [ENAMETOOLONG] is added as an optional error condition.

28430 The following changes were made to align with the IEEE P1003.1a draft standard:

- 28431 • The [ELOOP] optional error condition is added.

28432 **Issue 7**

28433 Austin Group Interpretation 1003.1-2001 #143 is applied.

28434 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

28435 The *fdopendir()* function is added from The Open Group Technical Standard, 2006, Extended API  
28436 Set Part 2.

28437 An additional example is added.

28438 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0122 [422] and XSH/TC1-2008/0123  
28439 [324] are applied.

28440 **NAME**28441        `feclearexcept` — clear floating-point exception28442 **SYNOPSIS**28443        `#include <fenv.h>`28444        `int feclearexcept(int excepts);`28445 **DESCRIPTION**

28446 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
28447 conflict between the requirements described here and the ISO C standard is unintentional. This  
28448 volume of POSIX.1-2008 defers to the ISO C standard.

28449        The `feclearexcept()` function shall attempt to clear the supported floating-point exceptions  
28450 represented by *excepts*.

28451 **RETURN VALUE**

28452        If the argument is zero or if all the specified exceptions were successfully cleared, `feclearexcept()`  
28453 shall return zero. Otherwise, it shall return a non-zero value.

28454 **ERRORS**

28455        No errors are defined.

28456 **EXAMPLES**

28457        None.

28458 **APPLICATION USAGE**

28459        None.

28460 **RATIONALE**

28461        None.

28462 **FUTURE DIRECTIONS**

28463        None.

28464 **SEE ALSO**28465        [\*fegetexceptflag\(\)\*](#), [\*feraiseexcept\(\)\*](#), [\*fetestexcept\(\)\*](#)28466        XBD [\*<fenv.h>\*](#)28467 **CHANGE HISTORY**

28468        First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

28469        ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

28470 **NAME**

28471 fegetenv, fesetenv — get and set current floating-point environment

28472 **SYNOPSIS**

```
28473 #include <fenv.h>
28474 int fegetenv(fenv_t *envp);
28475 int fesetenv(const fenv_t *envp);
```

28476 **DESCRIPTION**

28477 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
28478 conflict between the requirements described here and the ISO C standard is unintentional. This  
28479 volume of POSIX.1-2008 defers to the ISO C standard.

28480 The *fegetenv()* function shall attempt to store the current floating-point environment in the object  
28481 pointed to by *envp*.

28482 The *fesetenv()* function shall attempt to establish the floating-point environment represented by  
28483 the object pointed to by *envp*. The argument *envp* shall point to an object set by a call to  
28484 *fegetenv()* or *fehldexcept()*, or equal a floating-point environment macro. The *fesetenv()* function  
28485 does not raise floating-point exceptions, but only installs the state of the floating-point status  
28486 flags represented through its argument.

28487 **RETURN VALUE**

28488 If the representation was successfully stored, *fegetenv()* shall return zero. Otherwise, it shall  
28489 return a non-zero value. If the environment was successfully established, *fesetenv()* shall return  
28490 zero. Otherwise, it shall return a non-zero value.

28491 **ERRORS**

28492 No errors are defined.

28493 **EXAMPLES**

28494 None.

28495 **APPLICATION USAGE**

28496 None.

28497 **RATIONALE**

28498 None.

28499 **FUTURE DIRECTIONS**

28500 None.

28501 **SEE ALSO**28502 *fehldexcept()*, *feupdateenv()*28503 XBD **<fenv.h>**28504 **CHANGE HISTORY**

28505 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

28506 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

28507 **NAME**

28508 fegetexceptflag, fesetexceptflag — get and set floating-point status flags

28509 **SYNOPSIS**

28510 #include &lt;fenv.h&gt;

28511 int fegetexceptflag(fexcept\_t \*flagp, int excepts);

28512 int fesetexceptflag(const fexcept\_t \*flagp, int excepts);

28513 **DESCRIPTION**

28514 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 28515 conflict between the requirements described here and the ISO C standard is unintentional. This  
 28516 volume of POSIX.1-2008 defers to the ISO C standard.

28517 The *fegetexceptflag()* function shall attempt to store an implementation-defined representation of  
 28518 the states of the floating-point status flags indicated by the argument *excepts* in the object  
 28519 pointed to by the argument *flagp*.

28520 The *fesetexceptflag()* function shall attempt to set the floating-point status flags indicated by the  
 28521 argument *excepts* to the states stored in the object pointed to by *flagp*. The value pointed to by  
 28522 *flagp* shall have been set by a previous call to *fegetexceptflag()* whose second argument  
 28523 represented at least those floating-point exceptions represented by the argument *excepts*. This  
 28524 function does not raise floating-point exceptions, but only sets the state of the flags.

28525 **RETURN VALUE**

28526 If the representation was successfully stored, *fegetexceptflag()* shall return zero. Otherwise, it  
 28527 shall return a non-zero value. If the *excepts* argument is zero or if all the specified exceptions  
 28528 were successfully set, *fesetexceptflag()* shall return zero. Otherwise, it shall return a non-zero  
 28529 value.

28530 **ERRORS**

28531 No errors are defined.

28532 **EXAMPLES**

28533 None.

28534 **APPLICATION USAGE**

28535 None.

28536 **RATIONALE**

28537 None.

28538 **FUTURE DIRECTIONS**

28539 None.

28540 **SEE ALSO**28541 *feclearexcept()*, *feraiseexcept()*, *fetestexcept()*

28542 XBD &lt;fenv.h&gt;

28543 **CHANGE HISTORY**

28544 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

28545 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

**NAME**

fegetround, fesetround — get and set current rounding direction

**SYNOPSIS**

```
#include <fenv.h>

int fegetround(void);
int fesetround(int round);
```

**DESCRIPTION**

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *fegetround()* function shall get the current rounding direction.

The *fesetround()* function shall establish the rounding direction represented by its argument *round*. If the argument is not equal to the value of a rounding direction macro, the rounding direction is not changed.

**RETURN VALUE**

The *fegetround()* function shall return the value of the rounding direction macro representing the current rounding direction or a negative value if there is no such rounding direction macro or the current rounding direction is not determinable.

The *fesetround()* function shall return a zero value if and only if the requested rounding direction was established.

**ERRORS**

No errors are defined.

**EXAMPLES**

The following example saves, sets, and restores the rounding direction, reporting an error and aborting if setting the rounding direction fails:

```
#include <fenv.h>
#include <assert.h>
void f(int round_dir)
{
    #pragma STDC FENV_ACCESS ON
    int save_round;
    int setround_ok;
    save_round = fegetround();
    setround_ok = fesetround(round_dir);
    assert(setround_ok == 0);
    /* ... */
    fesetround(save_round);
    /* ... */
}
```

**APPLICATION USAGE**

None.

**RATIONALE**

None.

28589 **FUTURE DIRECTIONS**

28590 None.

28591 **SEE ALSO**

28592 XBD &lt;fenv.h&gt;

28593 **CHANGE HISTORY**

28594 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

28595 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

28596 **NAME**

28597 feholdexcept — save current floating-point environment

28598 **SYNOPSIS**

28599 #include <fenv.h>

28600 int feholdexcept(fenv\_t \*envp);

28601 **DESCRIPTION**

28602 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
28603 conflict between the requirements described here and the ISO C standard is unintentional. This  
28604 volume of POSIX.1-2008 defers to the ISO C standard.

28605 The *feholdexcept()* function shall save the current floating-point environment in the object  
28606 pointed to by *envp*, clear the floating-point status flags, and then install a non-stop (continue on  
28607 floating-point exceptions) mode, if available, for all floating-point exceptions.

28608 **RETURN VALUE**

28609 The *feholdexcept()* function shall return zero if and only if non-stop floating-point exception  
28610 handling was successfully installed.

28611 **ERRORS**

28612 No errors are defined.

28613 **EXAMPLES**

28614 None.

28615 **APPLICATION USAGE**

28616 None.

28617 **RATIONALE**

28618 The *feholdexcept()* function should be effective on typical IEC 60559:1989 standard  
28619 implementations which have the default non-stop mode and at least one other mode for trap  
28620 handling or aborting. If the implementation provides only the non-stop mode, then installing the  
28621 non-stop mode is trivial.

28622 **FUTURE DIRECTIONS**

28623 None.

28624 **SEE ALSO**

28625 *fegetenv()*, *feupdateenv()*

28626 XBD <fenv.h>

28627 **CHANGE HISTORY**

28628 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

28629 **NAME**

28630 feof — test end-of-file indicator on a stream

28631 **SYNOPSIS**

28632 #include &lt;stdio.h&gt;

28633 int feof(FILE \*stream);

28634 **DESCRIPTION**

28635 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 28636 conflict between the requirements described here and the ISO C standard is unintentional. This  
 28637 volume of POSIX.1-2008 defers to the ISO C standard.

28638 The *feof()* function shall test the end-of-file indicator for the stream pointed to by *stream*.28639 CX The *feof()* function shall not change the setting of *errno* if *stream* is valid.28640 **RETURN VALUE**28641 The *feof()* function shall return non-zero if and only if the end-of-file indicator is set for *stream*.28642 **ERRORS**

28643 No errors are defined.

28644 **EXAMPLES**

28645 None.

28646 **APPLICATION USAGE**

28647 None.

28648 **RATIONALE**

28649 None.

28650 **FUTURE DIRECTIONS**

28651 None.

28652 **SEE ALSO**28653 *clearerr()*, *ferror()*, *fopen()*

28654 XBD &lt;stdio.h&gt;

28655 **CHANGE HISTORY**

28656 First released in Issue 1. Derived from Issue 1 of the SVID.

28657 **Issue 7**

28658 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0124 [401] is applied.

28659 **NAME**

28660         feraiseexcept — raise floating-point exception

28661 **SYNOPSIS**

28662         #include <fenv.h>

28663         int feraiseexcept(int *excepts*);

28664 **DESCRIPTION**

28665 CX         The functionality described on this reference page is aligned with the ISO C standard. Any  
 28666         conflict between the requirements described here and the ISO C standard is unintentional. This  
 28667         volume of POSIX.1-2008 defers to the ISO C standard.

28668         The *feraiseexcept()* function shall attempt to raise the supported floating-point exceptions  
 28669         represented by the *excepts* argument. The order in which these floating-point exceptions are  
 28670 MX         raised is unspecified, except that if the *excepts* argument represents IEC 60559 valid coincident  
 28671         floating-point exceptions for atomic operations (namely overflow and inexact, or underflow and  
 28672         inexact), then overflow or underflow shall be raised before inexact. Whether the *feraiseexcept()*  
 28673         function additionally raises the inexact floating-point exception whenever it raises the overflow  
 28674         or underflow floating-point exception is implementation-defined.

28675 **RETURN VALUE**

28676         If the argument is zero or if all the specified exceptions were successfully raised, *feraiseexcept()*  
 28677         shall return zero. Otherwise, it shall return a non-zero value.

28678 **ERRORS**

28679         No errors are defined.

28680 **EXAMPLES**

28681         None.

28682 **APPLICATION USAGE**

28683         The effect is intended to be similar to that of floating-point exceptions raised by arithmetic  
 28684         operations. Hence, enabled traps for floating-point exceptions raised by this function are taken.

28685 **RATIONALE**

28686         Raising overflow or underflow is allowed to also raise inexact because on some architectures the  
 28687         only practical way to raise an exception is to execute an instruction that has the exception as a  
 28688         side-effect. The function is not restricted to accept only valid coincident expressions for atomic  
 28689         operations, so the function can be used to raise exceptions accrued over several operations.

28690 **FUTURE DIRECTIONS**

28691         None.

28692 **SEE ALSO**

28696         First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

28697         ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

28698 **NAME**

28699       ferror — test error indicator on a stream

28700 **SYNOPSIS**

28701       #include &lt;stdio.h&gt;

28702       int ferror(FILE \**stream*);28703 **DESCRIPTION**

28704 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 28705       conflict between the requirements described here and the ISO C standard is unintentional. This  
 28706       volume of POSIX.1-2008 defers to the ISO C standard.

28707       The *ferror()* function shall test the error indicator for the stream pointed to by *stream*.28708 CX       The *ferror()* function shall not change the setting of *errno* if *stream* is valid.28709 **RETURN VALUE**28710       The *ferror()* function shall return non-zero if and only if the error indicator is set for *stream*.28711 **ERRORS**

28712       No errors are defined.

28713 **EXAMPLES**

28714       None.

28715 **APPLICATION USAGE**

28716       None.

28717 **RATIONALE**

28718       None.

28719 **FUTURE DIRECTIONS**

28720       None.

28721 **SEE ALSO**28722       *clearerr()*, *feof()*, *fopen()*

28723       XBD &lt;stdio.h&gt;

28724 **CHANGE HISTORY**

28725       First released in Issue 1. Derived from Issue 1 of the SVID.

28726 **Issue 7**

28727       POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0125 [401] is applied.

28728 **NAME**

28729       fesetenv — set current floating-point environment

28730 **SYNOPSIS**

28731       #include &lt;fenv.h&gt;

28732       int fesetenv(const fenv\_t \*envp);

28733 **DESCRIPTION**28734       Refer to *fegetenv()*.

28735 **NAME**

28736 fesetexceptflag — set floating-point status flags

28737 **SYNOPSIS**

28738 #include &lt;fenv.h&gt;

28739 int fesetexceptflag(const fexcept\_t \*flagp, int excepts);

28740 **DESCRIPTION**28741 Refer to *fegetexceptflag()*.

28742 **NAME**

28743       fesetround — set current rounding direction

28744 **SYNOPSIS**

28745       #include <fenv.h>

28746       int fesetround(int round);

28747 **DESCRIPTION**

28748       Refer to *fegetround()*.

28749 **NAME**

28750 fetestexcept — test floating-point exception flags

28751 **SYNOPSIS**

28752 #include &lt;fenv.h&gt;

28753 int fetestexcept(int *excepts*);28754 **DESCRIPTION**

28755 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
28756 conflict between the requirements described here and the ISO C standard is unintentional. This  
28757 volume of POSIX.1-2008 defers to the ISO C standard.

28758 The *fetestexcept()* function shall determine which of a specified subset of the floating-point  
28759 exception flags are currently set. The *excepts* argument specifies the floating-point status flags to  
28760 be queried.

28761 **RETURN VALUE**

28762 The *fetestexcept()* function shall return the value of the bitwise-inclusive OR of the floating-point  
28763 exception macros corresponding to the currently set floating-point exceptions included in  
28764 *excepts*.

28765 **ERRORS**

28766 No errors are defined.

28767 **EXAMPLES**

28768 The following example calls function *f()* if an invalid exception is set, and then function *g()* if an  
28769 overflow exception is set:

```
28770 #include <fenv.h>
28771 /* ... */
28772 {
28773     #pragma STDC FENV_ACCESS ON
28774     int set_excepts;
28775     feclearexcept(FE_INVALID | FE_OVERFLOW);
28776     // maybe raise exceptions
28777     set_excepts = fetestexcept(FE_INVALID | FE_OVERFLOW);
28778     if (set_excepts & FE_INVALID) f();
28779     if (set_excepts & FE_OVERFLOW) g();
28780     /* ... */
28781 }
```

28782 **APPLICATION USAGE**

28783 None.

28784 **RATIONALE**

28785 None.

28786 **FUTURE DIRECTIONS**

28787 None.

28788 **SEE ALSO**28789 *feclearexcept()*, *fegetexceptflag()*, *feraiseexcept()*

28790 XBD &lt;fenv.h&gt;

## 28791

28792

28793 **NAME**

28794 feupdateenv — update floating-point environment

28795 **SYNOPSIS**

28796 #include &lt;fenv.h&gt;

28797 int feupdateenv(const fenv\_t \*envp);

28798 **DESCRIPTION**

28799 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
28800 conflict between the requirements described here and the ISO C standard is unintentional. This  
28801 volume of POSIX.1-2008 defers to the ISO C standard.

28802 The *feupdateenv()* function shall attempt to save the currently raised floating-point exceptions in  
28803 its automatic storage, attempt to install the floating-point environment represented by the object  
28804 pointed to by *envp*, and then attempt to raise the saved floating-point exceptions. The argument  
28805 *envp* shall point to an object set by a call to *feholdexcept()* or *fegetenv()*, or equal a floating-point  
28806 environment macro.

28807 **RETURN VALUE**

28808 The *feupdateenv()* function shall return a zero value if and only if all the required actions were  
28809 successfully carried out.

28810 **ERRORS**

28811 No errors are defined.

28812 **EXAMPLES**

28813 The following example shows sample code to hide spurious underflow floating-point  
28814 exceptions:

```
28815 #include <fenv.h>
28816 double f(double x)
28817 {
28818     #pragma STDC FENV_ACCESS ON
28819     double result;
28820     fenv_t save_env;
28821     feholdexcept(&save_env);
28822     // compute result
28823     if (/* test spurious underflow */)
28824         feclearexcept(FE_UNDERFLOW);
28825     feupdateenv(&save_env);
28826     return result;
28827 }
```

28828 **APPLICATION USAGE**

28829 None.

28830 **RATIONALE**

28831 None.

28832 **FUTURE DIRECTIONS**

28833 None.

28834 **SEE ALSO**28835 *fegetenv()*, *feholdexcept()*

28836 XBD &lt;fenv.h&gt;

28837

CHANGE HISTORY

28838

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

28839

ISO/IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.

28840 **NAME**

28841 fexecve — execute a file

28842 **SYNOPSIS**

28843 #include &lt;unistd.h&gt;

28844 int fexecve(int *fd*, char \*const *argv*[], char \*const *envp*[]);28845 **DESCRIPTION**28846 Refer to *exec*.

28847 **NAME**

28848 fflush — flush a stream

28849 **SYNOPSIS**

28850 #include &lt;stdio.h&gt;

28851 int fflush(FILE \*stream);

28852 **DESCRIPTION**

28853 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 28854 conflict between the requirements described here and the ISO C standard is unintentional. This  
 28855 volume of POSIX.1-2008 defers to the ISO C standard.

28856 If *stream* points to an output stream or an update stream in which the most recent operation was  
 28857 CX not input, *fflush()* shall cause any unwritten data for that stream to be written to the file, and the  
 28858 last data modification and last file status change timestamps of the underlying file shall be  
 28859 marked for update.

28860 For a stream open for reading with an underlying file description, if the file is not already at +  
 28861 EOF, and the file is one capable of seeking, the file offset of the underlying open file description +  
 28862 shall be set to the file position of the stream, and any characters pushed back onto the stream by +  
 28863 *ungetc()* or *ungetwc()* that have not subsequently been read from the stream shall be discarded +  
 28864 (without further changing the file offset).

28865 If *stream* is a null pointer, *fflush()* shall perform this flushing action on all streams for which the  
 28866 behavior is defined above. -

28867 **RETURN VALUE**

28868 Upon successful completion, *fflush()* shall return 0; otherwise, it shall set the error indicator for  
 28869 CX the stream, return EOF, and set *errno* to indicate the error.

28870 **ERRORS**28871 The *fflush()* function shall fail if:

28872 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and  
 28873 the thread would be delayed in the write operation.

28874 CX [EBADF] The file descriptor underlying *stream* is not valid.

28875 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

28876 XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the  
 28877 process.

28878 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the  
 28879 offset maximum associated with the corresponding stream.

28880 CX [EINTR] The *fflush()* function was interrupted by a signal.

28881 CX [EIO] The process is a member of a background process group attempting to write to  
 28882 its controlling terminal, TOSTOP is set, the calling thread is not blocking  
 28883 SIGTTOU, the process is not ignoring SIGTTOU, and the process group of the  
 28884 process is orphaned. This error may also be returned under implementation-  
 28885 defined conditions.

28886 CX [ENOMEM] The underlying stream was created by *open\_memstream()* or  
 28887 *open\_wmemstream()* and insufficient memory is available.

28888 CX [ENOSPC] There was no free space remaining on the device containing the file or in the  
 28889 buffer used by the *fmemopen()* function.

28890 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by  
 28891 any process. A SIGPIPE signal shall also be sent to the thread.

28892 The *fflush()* function may fail if:

28893 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
 28894 capabilities of the device.

## 28895 EXAMPLES

### 28896 Sending Prompts to Standard Output

28897 The following example uses *printf()* calls to print a series of prompts for information the user  
 28898 must enter from standard input. The *fflush()* calls force the output to standard output. The  
 28899 *fflush()* function is used because standard output is usually buffered and the prompt may not  
 28900 immediately be printed on the output or terminal. The *getline()* function calls read strings from  
 28901 standard input and place the results in variables, for use later in the program.

```

28902 char *user;
28903 char *oldpasswd;
28904 char *newpasswd;
28905 ssize_t llen;
28906 size_t blen;
28907 struct termios term;
28908 tcflag_t saveflag;

28909 printf("User name: ");
28910 fflush(stdout);
28911 blen = 0;
28912 llen = getline(&user, &blen, stdin);
28913 user[llen-1] = 0;
28914 tcgetattr(fileno(stdin), &term);
28915 saveflag = term.c_lflag;
28916 term.c_lflag &= ~ECHO;
28917 tcsetattr(fileno(stdin), TCSANOW, &term);
28918 printf("Old password: ");
28919 fflush(stdout);
28920 blen = 0;
28921 llen = getline(&oldpasswd, &blen, stdin);
28922 oldpasswd[llen-1] = 0;

28923 printf("\nNew password: ");
28924 fflush(stdout);
28925 blen = 0;
28926 llen = getline(&newpasswd, &blen, stdin);
28927 newpasswd[llen-1] = 0;
28928 term.c_lflag = saveflag;
28929 tcsetattr(fileno(stdin), TCSANOW, &term);
28930 free(user);
28931 free(oldpasswd);
28932 free(newpasswd);

```

**28933 APPLICATION USAGE**

28934 None.

**28935 RATIONALE**

28936 Data buffered by the system may make determining the validity of the position of the current  
28937 file descriptor impractical. Thus, enforcing the repositioning of the file descriptor after *fflush()*  
28938 on streams open for *read()* is not mandated by POSIX.1-2008.

**28939 FUTURE DIRECTIONS**

28940 None.

**28941 SEE ALSO**

**28944 CHANGE HISTORY**

28945 First released in Issue 1. Derived from Issue 1 of the SVID.

**28946 Issue 5**

28947 Large File Summit extensions are added.

**28948 Issue 6**

28949 Extensions beyond the ISO C standard are marked.

28950 The following new requirements on POSIX implementations derive from alignment with the  
28951 Single UNIX Specification:

- 28952 • The [EFBIG] error is added as part of the large file support extensions.
- 28953 • The [ENXIO] optional error condition is added.

28954 The RETURN VALUE section is updated to note that the error indicator shall be set for the  
28955 stream. This is for alignment with the ISO/IEC 9899:1999 standard.

28956 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/31 is applied, updating the [EAGAIN]  
28957 error in the ERRORS section from “the process would be delayed” to “the thread would be  
28958 delayed”.

**28959 Issue 7**

28960 Austin Group Interpretation 1003.1-2001 #002 is applied, clarifying the interaction of file  
28961 descriptors and streams.

28962 The [ENOSPC] error condition is updated and the [ENOMEM] error is added from The Open  
28963 Group Technical Standard, 2006, Extended API Set Part 1.

28964 The EXAMPLES section is revised.

28965 Changes are made related to support for finegrained timestamps.

28966 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0126 [87], XSH/TC1-2008/0127 [79],  
28967 and XSH/TC1-2008/0128 [14] are applied.

28968 **NAME**

28969       ffs — find first set bit

28970 **SYNOPSIS**

```
28971 XSI      #include <strings.h>
28972          int ffs(int i);
```

28973 **DESCRIPTION**

28974       The `ffs()` function shall find the first bit set (beginning with the least significant bit) in *i*, and  
 28975       return the index of that bit. Bits are numbered starting at one (the least significant bit).

28976 **RETURN VALUE**

28977       The `ffs()` function shall return the index of the first bit set. If *i* is 0, then `ffs()` shall return 0.

28978 **ERRORS**

28979       No errors are defined.

28980 **EXAMPLES**

28981       None.

28982 **APPLICATION USAGE**

28983       None.

28984 **RATIONALE**

28985       None.

28986 **FUTURE DIRECTIONS**

28987       None.

28988 **SEE ALSO**

28989       XBD [<strings.h>](#)

28990 **CHANGE HISTORY**

28991       First released in Issue 4, Version 2.

28992 **Issue 5**

28993       Moved from X/OPEN UNIX extension to BASE.

28994 **NAME**

28995       fgetc — get a byte from a stream

28996 **SYNOPSIS**

28997       #include &lt;stdio.h&gt;

28998       int fgetc(FILE \*stream);

28999 **DESCRIPTION**

29000 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 29001 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29002 volume of POSIX.1-2008 defers to the ISO C standard.

29003       If the end-of-file indicator for the input stream pointed to by *stream* is not set and a next byte is  
 29004 present, the *fgetc()* function shall obtain the next byte as an **unsigned char** converted to an **int**,  
 29005 from the input stream pointed to by *stream*, and advance the associated file position indicator for  
 29006 the stream (if defined). Since *fgetc()* operates on bytes, reading a character consisting of multiple  
 29007 bytes (or “a multi-byte character”) may require multiple calls to *fgetc()*.

29008 CX       The *fgetc()* function may mark the last data access timestamp of the file associated with *stream*  
 29009 for update. The last data access timestamp shall be marked for update by the first successful  
 29010 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, or  
 29011 *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

29012 **RETURN VALUE**

29013       Upon successful completion, *fgetc()* shall return the next byte from the input stream pointed to  
 29014 by *stream*. If the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the  
 29015 end-of-file indicator for the stream shall be set and *fgetc()* shall return EOF. If a read error occurs,  
 29016 CX       the error indicator for the stream shall be set, *fgetc()* shall return EOF, and shall set *errno* to  
 29017 indicate the error.

29018 **ERRORS**29019       The *fgetc()* function shall fail if data needs to be read and:

29020 CX       [EAGAIN]       The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and  
 29021 the thread would be delayed in the *fgetc()* operation.

29022 CX       [EBADF]       The file descriptor underlying *stream* is not a valid file descriptor open for  
 29023 reading.

29024 CX       [EINTR]       The read operation was terminated due to the receipt of a signal, and no data  
 29025 was transferred.

29026 CX       [EIO]        A physical I/O error has occurred, or the process is in a background process  
 29027 group attempting to read from its controlling terminal, and either the calling  
 29028 thread is blocking SIGTIN or the process is ignoring SIGTIN or the process  
 29029 group of the process is orphaned. This error may also be generated for  
 29030 implementation-defined reasons.

29031 CX       [EOVERFLOW]   The file is a regular file and an attempt was made to read at or beyond the  
 29032 offset maximum associated with the corresponding stream.

29033       The *fgetc()* function may fail if:

29034 CX       [ENOMEM]       Insufficient storage space is available.

29035 CX       [ENXIO]        A request was made of a nonexistent device, or the request was outside the  
 29036 capabilities of the device.

**EXAMPLES**

None.

**APPLICATION USAGE**

If the integer value returned by *fgetc()* is stored into a variable of type **char** and then compared against the integer constant EOF, the comparison may never succeed, because sign-extension of a variable of type **char** on widening to integer is implementation-defined.

The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an end-of-file condition.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

Section 2.5 (on page 495), *feof()*, *ferror()*, *fgets()*, *fread()*, *fscanf()*, *getchar()*, *getc()*, *gets()*, *ungetc()*

XBD <stdio.h>

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

Large File Summit extensions are added.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- The [ENOMEM] and [ENXIO] optional error conditions are added.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The DESCRIPTION is updated to clarify the behavior when the end-of-file indicator for the input stream is not set.
- The RETURN VALUE section is updated to note that the error indicator shall be set for the stream.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/32 is applied, updating the [EAGAIN] error in the ERRORS section from “the process would be delayed” to “the thread would be delayed”.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #051 is applied, updating the list of functions that mark the last data access timestamp for update.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0129 [79] and XSH/TC1-2008/0130 [14] are applied.

29075 **NAME**29076 `fgetpos` — get current file position information29077 **SYNOPSIS**29078 `#include <stdio.h>`29079 `int fgetpos(FILE *restrict stream, fpos_t *restrict pos);`29080 **DESCRIPTION**

29081 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29082 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29083 volume of POSIX.1-2008 defers to the ISO C standard.

29084 The `fgetpos()` function shall store the current values of the parse state (if any) and file position  
 29085 indicator for the stream pointed to by `stream` in the object pointed to by `pos`. The value stored  
 29086 contains unspecified information usable by `fsetpos()` for repositioning the stream to its position  
 29087 at the time of the call to `fgetpos()`.

29088 The `fgetpos()` function shall not change the setting of `errno` if successful.

29089 **RETURN VALUE**

29090 Upon successful completion, `fgetpos()` shall return 0; otherwise, it shall return a non-zero value  
 29091 and set `errno` to indicate the error.

29092 **ERRORS**

29093 The `fgetpos()` function shall fail if:

29094 CX [EBADF] The file descriptor underlying `stream` is not valid.

29095 CX [EOVERFLOW] The current value of the file position cannot be represented correctly in an  
 29096 object of type `fpos_t`.

29097 CX [ESPIPE] The file descriptor underlying `stream` is associated with a pipe, FIFO, or socket.

29098 **EXAMPLES**

29099 None.

29100 **APPLICATION USAGE**

29101 None.

29102 **RATIONALE**

29103 None.

29104 **FUTURE DIRECTIONS**

29105 None.

29106 **SEE ALSO**

29109 **CHANGE HISTORY**

29110 First released in Issue 4. Derived from the ISO C standard.

29111 **Issue 5**

29112 Large File Summit extensions are added.

29113 **Issue 6**

29114 Extensions beyond the ISO C standard are marked.

29115 The following new requirements on POSIX implementations derive from alignment with the  
29116 Single UNIX Specification:

- 29117 • The [EBADF] and [ESPIPE] optional error conditions are added.

29118 An additional [ESPIPE] error condition is added for sockets.

29119 The prototype for *fgetpos()* is changed for alignment with the ISO/IEC 9899:1999 standard.

29120 **Issue 7**

29121 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0131 [105], XSH/TC1-2008/0132 [122],  
29122 and XSH/TC1-2008/0133 [14] are applied.

29123 **NAME**

29124       fgets — get a string from a stream

29125 **SYNOPSIS**

29126       #include &lt;stdio.h&gt;

29127       char \*fgets(char \*restrict s, int n, FILE \*restrict stream);

29128 **DESCRIPTION**

29129 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 29130 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29131 volume of POSIX.1-2008 defers to the ISO C standard.

29132       The *fgets()* function shall read bytes from *stream* into the array pointed to by *s* until *n*–1 bytes are  
 29133 read, or a <newline> is read and transferred to *s*, or an end-of-file condition is encountered. A  
 29134 null byte shall be written immediately after the last byte read into the array. If the end-of-file  
 29135 condition is encountered before any bytes are read, the contents of the array pointed to by *s* shall  
 29136 not be changed.

29137 CX       The *fgets()* function may mark the last data access timestamp of the file associated with *stream*  
 29138 for update. The last data access timestamp shall be marked for update by the first successful  
 29139 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, or  
 29140 *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

29141 **RETURN VALUE**

29142       Upon successful completion, *fgets()* shall return *s*. If the stream is at end-of-file, the end-of-file  
 29143 indicator for the stream shall be set and *fgets()* shall return a null pointer. If a read error occurs,  
 29144 CX       the error indicator for the stream shall be set, *fgets()* shall return a null pointer, and shall set  
 29145 *errno* to indicate the error.

29146 **ERRORS**29147       Refer to *fgetc()*.29148 **EXAMPLES**29149       **Reading Input**

29150       The following example uses *fgets()* to read lines of input. It assumes that the file it is reading is a  
 29151 text file and that lines in this text file are no longer than 16384 (or {LINE\_MAX} if it is less than  
 29152 16384 on the implementation where it is running) bytes long. (Note that the standard utilities  
 29153 have no line length limit if *sysconf*(\_SC\_LINE\_MAX) returns –1 without setting *errno*. This  
 29154 example assumes that *sysconf*(\_SC\_LINE\_MAX) will not fail.)

```

29155 #include <limits.h>
29156 #include <stdio.h>
29157 #include <unistd.h>
29158 #define MYLIMIT 16384

29159 char *line;
29160 int line_max;
29161 if (LINE_MAX >= MYLIMIT) {
29162     // Use maximum line size of MYLIMIT. If LINE_MAX is
29163     // bigger than our limit, sysconf() can't report a
29164     // smaller limit.
29165     line_max = MYLIMIT;
29166 } else {
29167     long limit = sysconf(_SC_LINE_MAX);
29168     line_max = (limit < 0 || limit > MYLIMIT) ? MYLIMIT : (int)limit;

```

```

29169     }
29170     // line_max + 1 leaves room for the null byte added by fgets().
29171     line = malloc(line_max + 1);
29172     if (line == NULL) {
29173         // out of space
29174         ...
29175         return error;
29176     }
29177     while (fgets(line, line_max + 1, fp) != NULL) {
29178         // Verify that a full line has been read ...
29179         // If not, report an error or prepare to treat the
29180         // next time through the loop as a read of a
29181         // continuation of the current line.
29182         ...
29183         // Process line ...
29184         ...
29185     }
29186     free(line);
29187     ...

```

29188 **APPLICATION USAGE**

29189 None.

29190 **RATIONALE**

29191 None.

29198 **CHANGE HISTORY**

29199 First released in Issue 1. Derived from Issue 1 of the SVID.

29200 **Issue 6**

29201 Extensions beyond the ISO C standard are marked.

29202 The prototype for `fgets()` is changed for alignment with the ISO/IEC 9899:1999 standard.

29203 **Issue 7**

29204 Austin Group Interpretation 1003.1-2001 #051 is applied, updating the list of functions that mark  
29205 the last data access timestamp for update.

29206 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0134 [182] and XSH/TC1-2008/0135  
29207 [14] are applied.

29208 **NAME**

29209 fgetwc — get a wide-character code from a stream

29210 **SYNOPSIS**

29211 #include &lt;stdio.h&gt;

29212 #include &lt;wchar.h&gt;

29213 wint\_t fgetwc(FILE \*stream);

29214 **DESCRIPTION**

29215 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29216 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29217 volume of POSIX.1-2008 defers to the ISO C standard.

29218 The *fgetwc()* function shall obtain the next character (if present) from the input stream pointed to  
 29219 by *stream*, convert that to the corresponding wide-character code, and advance the associated file  
 29220 position indicator for the stream (if defined).

29221 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

29222 CX The *fgetwc()* function may mark the last data access timestamp of the file associated with *stream*  
 29223 for update. The last data access timestamp shall be marked for update by the first successful  
 29224 execution of *fgetwc()*, *fgetws()*, *fwscanf()*, *getwc()*, *getwchar()*, *vfwscanf()*, *vfwscanf()*, or *wscanf()*  
 29225 using *stream* that returns data not supplied by a prior call to *ungetwc()*.

29226 The *fgetwc()* function shall not change the setting of *errno* if successful.

29227 **RETURN VALUE**

29228 Upon successful completion, the *fgetwc()* function shall return the wide-character code of the  
 29229 character read from the input stream pointed to by *stream* converted to a type **wint\_t**. If the end-  
 29230 of-file indicator for the stream is set, or if the stream is at end-of-file, the end-of-file indicator for  
 29231 the stream shall be set and *fgetwc()* shall return WEOF. If a read error occurs, the error indicator  
 29232 CX for the stream shall be set, *fgetwc()* shall return WEOF, and shall set *errno* to indicate the error. If  
 29233 an encoding error occurs, the error indicator for the stream shall be set, *fgetwc()* shall return  
 29234 WEOF, and shall set *errno* to indicate the error.

29235 **ERRORS**

29236 The *fgetwc()* function shall fail if data needs to be read and:

29237 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and  
 29238 the thread would be delayed in the *fgetwc()* operation.

29239 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for  
 29240 reading.

29241 [EILSEQ] The data obtained from the input stream does not form a valid character.

29242 CX [EINTR] The read operation was terminated due to the receipt of a signal, and no data  
 29243 was transferred.

29244 CX [EIO] A physical I/O error has occurred, or the process is in a background process  
 29245 group attempting to read from its controlling terminal, and either the calling  
 29246 thread is blocking SIGTTIN or the process is ignoring SIGTTIN or the process  
 29247 group of the process is orphaned. This error may also be generated for  
 29248 implementation-defined reasons.

29249 CX [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the  
 29250 offset maximum associated with the corresponding stream.

29251 The *fgetwc()* function may fail if:

29252 CX [ENOMEM] Insufficient storage space is available.

29253 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
29254 capabilities of the device.

## 29255 EXAMPLES

29256 None.

## 29257 APPLICATION USAGE

29258 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an  
29259 end-of-file condition.

## 29260 RATIONALE

29261 None.

## 29262 FUTURE DIRECTIONS

29263 None.

## 29267 CHANGE HISTORY

29268 First released in Issue 4. Derived from the MSE working draft.

### 29269 Issue 5

29270 The Optional Header (OH) marking is removed from [<stdio.h>](#).

29271 Large File Summit extensions are added.

### 29272 Issue 6

29273 Extensions beyond the ISO C standard are marked.

29274 The following new requirements on POSIX implementations derive from alignment with the  
29275 Single UNIX Specification:

- 29276 • The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- 29277 • The [ENOMEM] and [ENXIO] optional error conditions are added.

29278 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/33 is applied, updating the [EAGAIN]  
29279 error in the ERRORS section from “the process would be delayed” to “the thread would be  
29280 delayed”.

### 29281 Issue 7

29282 Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.

29283 Changes are made related to support for finegrained timestamps.

29284 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0136 [105], XSH/TC1-2008/0137 [79],  
29285 and XSH/TC1-2008/0138 [14] are applied.

29286 **NAME**

29287 fgetws — get a wide-character string from a stream

29288 **SYNOPSIS**

29289 #include &lt;stdio.h&gt;

29290 #include &lt;wchar.h&gt;

29291 wchar\_t \*fgetws(wchar\_t \*restrict ws, int n,

29292 FILE \*restrict stream);

29293 **DESCRIPTION**

29294 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29295 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29296 volume of POSIX.1-2008 defers to the ISO C standard.

29297 The *fgetws()* function shall read characters from the *stream*, convert these to the corresponding  
 29298 wide-character codes, place them in the **wchar\_t** array pointed to by *ws*, until *n*–1 characters are  
 29299 read, or a <newline> is read, converted, and transferred to *ws*, or an end-of-file condition is  
 29300 encountered. The wide-character string, *ws*, shall then be terminated with a null wide-character  
 29301 code.

29302 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

29303 CX The *fgetws()* function may mark the last data access timestamp of the file associated with *stream*  
 29304 for update. The last data access timestamp shall be marked for update by the first successful  
 29305 execution of *fgetwc()*, *fgetws()*, *fwscanf()*, *getwc()*, *getwchar()*, *vfwscanf()*, *vwscanf()*, or *wscanf()*  
 29306 using *stream* that returns data not supplied by a prior call to *ungetwc()*.

29307 **RETURN VALUE**

29308 Upon successful completion, *fgetws()* shall return *ws*. If the end-of-file indicator for the stream is  
 29309 set, or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and  
 29310 *fgetws()* shall return a null pointer. If a read error occurs, the error indicator for the stream shall  
 29311 CX be set, *fgetws()* shall return a null pointer, and shall set *errno* to indicate the error.

29312 **ERRORS**29313 Refer to *fgetwc()*.29314 **EXAMPLES**

29315 None.

29316 **APPLICATION USAGE**

29317 None.

29318 **RATIONALE**

29319 None.

29320 **FUTURE DIRECTIONS**

29321 None.

29322 **SEE ALSO**29323 Section 2.5 (on page 495), *fopen()*, *fread()*

29324 XBD &lt;stdio.h&gt;, &lt;wchar.h&gt;

29325 **CHANGE HISTORY**

29326 First released in Issue 4. Derived from the MSE working draft.

29327 **Issue 5**

29328 The Optional Header (OH) marking is removed from `<stdio.h>`.

29329 **Issue 6**

29330 Extensions beyond the ISO C standard are marked.

29331 The prototype for `fgetws()` is changed for alignment with the ISO/IEC 9899:1999 standard.

29332 **Issue 7**

29333 Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.

29334 Changes are made related to support for finegrained timestamps.

29335 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0139 [14] is applied.

## NAME

fileno — map a stream pointer to a file descriptor

## SYNOPSIS

```
CX      #include <stdio.h>
29340    int fileno(FILE *stream);
```

## DESCRIPTION

The *fileno()* function shall return the integer file descriptor associated with the stream pointed to by *stream*.

## RETURN VALUE

Upon successful completion, *fileno()* shall return the integer value of the file descriptor associated with *stream*. Otherwise, the value  $-1$  shall be returned and *errno* set to indicate the error.

## ERRORS

29348	The <i>fileno()</i> function shall fail if:	
29349		
29350	[EBADF]           The stream is not associated with a file.	+
29351	The <i>fileno()</i> function may fail if:	+
29352	[EBADF]           The file descriptor underlying <i>stream</i> is not a valid file descriptor.	

## EXAMPLES

None.

## APPLICATION USAGE

None.

## RATIONALE

Without some specification of which file descriptors are associated with these streams, it is impossible for an application to set up the streams for another application it starts with *fork()* and *exec*. In particular, it would not be possible to write a portable version of the *sh* command interpreter (although there may be other constraints that would prevent that portability).

## FUTURE DIRECTIONS

None.

## SEE ALSO

Section 2.5.1 (on page 497), *dirfd()*, *fdopen()*, *fopen()*, *stdin*  
XBD *<stdio.h>*

## CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

### Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EBADF] optional error condition is added.

### Issue 7

SD5-XBD-ERN-99 is applied, changing the definition of the [EBADF] error.

29375 **NAME**

29376 flockfile, ftrylockfile, funlockfile — stdio locking functions

29377 **SYNOPSIS**

```
29378 CX      #include <stdio.h>
29379          void flockfile(FILE *file);
29380          int ftrylockfile(FILE *file);
29381          void funlockfile(FILE *file);
```

29382 **DESCRIPTION**

29383 These functions shall provide for explicit application-level locking of stdio (**FILE \***) objects.  
 29384 These functions can be used by a thread to delineate a sequence of I/O statements that are  
 29385 executed as a unit.

29386 The *flockfile()* function shall acquire for a thread ownership of a (**FILE \***) object.

29387 The *ftrylockfile()* function shall acquire for a thread ownership of a (**FILE \***) object if the object is  
 29388 available; *ftrylockfile()* is a non-blocking version of *flockfile()*.

29389 The *funlockfile()* function shall relinquish the ownership granted to the thread. The behavior is  
 29390 undefined if a thread other than the current owner calls the *funlockfile()* function.

29391 The functions shall behave as if there is a lock count associated with each (**FILE \***) object. This  
 29392 count is implicitly initialized to zero when the (**FILE \***) object is created. The (**FILE \***) object is  
 29393 unlocked when the count is zero. When the count is positive, a single thread owns the (**FILE \***)  
 29394 object. When the *flockfile()* function is called, if the count is zero or if the count is positive and  
 29395 the caller owns the (**FILE \***) object, the count shall be incremented. Otherwise, the calling thread  
 29396 shall be suspended, waiting for the count to return to zero. Each call to *funlockfile()* shall  
 29397 decrement the count. This allows matching calls to *flockfile()* (or successful calls to *ftrylockfile()*)  
 29398 and *funlockfile()* to be nested.

29399 All functions that reference (**FILE \***) objects, except those with names ending in *\_unlocked*, shall  
 29400 behave as if they use *flockfile()* and *funlockfile()* internally to obtain ownership of these (**FILE \***)  
 29401 objects.

29402 **RETURN VALUE**

29403 None for *flockfile()* and *funlockfile()*.

29404 The *ftrylockfile()* function shall return zero for success and non-zero to indicate that the lock  
 29405 cannot be acquired.

29406 **ERRORS**

29407 No errors are defined.

29408 **EXAMPLES**

29409 None.

29410 **APPLICATION USAGE**

29411 Applications using these functions may be subject to priority inversion, as discussed in XBD  
 29412 [Section 3.291](#) (on page 80).

29413 A call to *exit()* can block until locked streams are unlocked because a thread having ownership +  
 29414 of a (**FILE\***) object blocks all function calls that reference that (**FILE\***) object (except those with +  
 29415 names ending in *\_unlocked*) from other threads, including calls to *exit()*.

**RATIONALE**

The *flockfile()* and *funlockfile()* functions provide an orthogonal mutual-exclusion lock for each **FILE**. The *ftrylockfile()* function provides a non-blocking attempt to acquire a file lock, analogous to *pthread\_mutex\_trylock()*.

These locks behave as if they are the same as those used internally by *stdio* for thread-safety. This both provides thread-safety of these functions without requiring a second level of internal locking and allows functions in *stdio* to be implemented in terms of other *stdio* functions.

Application developers and implementors should be aware that there are potential deadlock problems on **FILE** objects. For example, the line-buffered flushing semantics of *stdio* (requested via `{_IOLBF}`) require that certain input operations sometimes cause the buffered contents of implementation-defined line-buffered output streams to be flushed. If two threads each hold the lock on the other's **FILE**, deadlock ensues. This type of deadlock can be avoided by acquiring **FILE** locks in a consistent order. In particular, the line-buffered output stream deadlock can typically be avoided by acquiring locks on input streams before locks on output streams if a thread would be acquiring both.

In summary, threads sharing *stdio* streams with other threads can use *flockfile()* and *funlockfile()* to cause sequences of I/O performed by a single thread to be kept bundled. The only case where the use of *flockfile()* and *funlockfile()* is required is to provide a scope protecting uses of the *\*\_unlocked* functions/macros. This moves the cost/performance tradeoff to the optimal point.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*exit()*, *getc\_unlocked()*

XBD Section 3.291 (on page 80), `<stdio.h>`

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

These functions are marked as part of the Thread-Safe Functions option.

**Issue 7**

The *flockfile()*, *ftrylockfile()*, and *funlockfile()* functions are moved from the Thread-Safe Functions option to the Base.

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0140 [118] is applied.

29448 **NAME**

29449 floor, floorf, floorl — floor function

29450 **SYNOPSIS**

```
29451 #include <math.h>
29452 double floor(double x);
29453 float floorf(float x);
29454 long double floorl(long double x);
```

29455 **DESCRIPTION**

29456 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29457 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29458 volume of POSIX.1-2008 defers to the ISO C standard.

29459 These functions shall compute the largest integral value not greater than  $x$ .29460 **RETURN VALUE**29461 MX The result shall have the same sign as  $x$ .

29462 Upon successful completion, these functions shall return the largest integral value not greater  
 29463 than  $x$ , expressed as a **double**, **float**, or **long double**, as appropriate for the return type of the  
 29464 function.

29465 MX If  $x$  is NaN, a NaN shall be returned.29466 If  $x$  is  $\pm 0$  or  $\pm \text{Inf}$ ,  $x$  shall be returned.29467 **ERRORS**

29468 No errors are defined.

29469 **EXAMPLES**

29470 None.

29471 **APPLICATION USAGE**

29472 The integral value returned by these functions might not be expressible as an **intmax\_t**. The  
 29473 return value should be tested before assigning it to an integer type to avoid the undefined  
 29474 results of an integer overflow.

29475 These functions may raise the inexact floating-point exception if the result differs in value from  
 29476 the argument.

29477 **RATIONALE**

29478 None.

29479 **FUTURE DIRECTIONS**

29480 None.

29481 **SEE ALSO**29482 [ceil\(\)](#), [feclearexcept\(\)](#), [fetestexcept\(\)](#), [isnan\(\)](#)29483 [Section 4.20](#) (on page 117), [<math.h>](#)29484 **CHANGE HISTORY**

29485 First released in Issue 1. Derived from Issue 1 of the SVID.

29486 **Issue 5**

29487 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 29488 text was previously published in the APPLICATION USAGE section.

29489 **Issue 6**

29490 The *floorf()* and *floorl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

29491 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
29492 revised to align with the ISO/IEC 9899:1999 standard.

29493 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
29494 marked.

29495 **Issue 7**

29496 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0141 [346] is applied.

29497 **NAME**

29498 fma, fmaf, fmal — floating-point multiply-add

29499 **SYNOPSIS**

```
29500 #include <math.h>
29501 double fma(double x, double y, double z);
29502 float fmaf(float x, float y, float z);
29503 long double fmal(long double x, long double y, long double z);
```

29504 **DESCRIPTION**

29505 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29506 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29507 volume of POSIX.1-2008 defers to the ISO C standard.

29508 These functions shall compute  $(x * y) + z$ , rounded as one ternary operation: they shall compute  
 29509 the value (as if) to infinite precision and round once to the result format, according to the  
 29510 rounding mode characterized by the value of FLT\_ROUNDS.

29511 An application wishing to check for error situations should set *errno* to zero and call  
 29512 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 29513 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 29514 zero, an error has occurred.

29515 **RETURN VALUE**

29516 Upon successful completion, these functions shall return  $(x * y) + z$ , rounded as one ternary  
 29517 operation.

29518 MX If the result overflows or underflows, a range error may occur. On systems that support the IEC  
 29519 60559 Floating-Point option, if the result overflows a range error shall occur.

29520 If *x* or *y* are NaN, a NaN shall be returned.

29521 If *x* multiplied by *y* is an exact infinity and *z* is also an infinity but with the opposite sign, a  
 29522 domain error shall occur, and either a NaN (if supported), or an implementation-defined value  
 29523 shall be returned.

29524 If one of *x* and *y* is infinite, the other is zero, and *z* is not a NaN, a domain error shall occur, and  
 29525 either a NaN (if supported), or an implementation-defined value shall be returned.

29526 If one of *x* and *y* is infinite, the other is zero, and *z* is a NaN, a NaN shall be returned and a  
 29527 domain error may occur.

29528 If  $x*y$  is not  $0*\text{Inf}$  nor  $\text{Inf}*0$  and *z* is a NaN, a NaN shall be returned.

29529 **ERRORS**

29530 These functions shall fail if:

29531	MX	<b>Domain Error</b>	The value of $x*y+z$ is invalid, or the value $x*y$ is invalid and <i>z</i> is not a NaN.  If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero, then <i>errno</i> shall be set to [EDOM]. If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the invalid floating-point exception shall be raised.
-------	----	---------------------	---

29536	MX	<b>Range Error</b>	The result overflows.  If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero, then <i>errno</i> shall be set to [ERANGE]. If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the overflow floating-point exception shall be raised.
-------	----	--------------------	--

29541 These functions may fail if:

29542	MX	<b>Domain Error</b>	The value $x*y$ is invalid and $z$ is a NaN.
29543			If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
29544			then <i>errno</i> shall be set to [EDOM]. If the integer expression $(\text{math\_errhandling}$
29545			$\ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the invalid floating-point exception
29546			shall be raised.
29547		<b>Range Error</b>	The result underflows.
29548			If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
29549			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
29550			$(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the underflow
29551			floating-point exception shall be raised.
29552		<b>Range Error</b>	The result overflows.
29553			If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
29554			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
29555			$(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the overflow
29556			floating-point exception shall be raised.

## 29557 EXAMPLES

29558 None.

## 29559 APPLICATION USAGE

29560 On error, the expressions  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$  and  $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$  are independent of each other, but at least one of them must be non-zero.

## 29562 RATIONALE

29563 In many cases, clever use of floating (*fused*) multiply-add leads to much improved code; but its  
 29564 unexpected use by the compiler can undermine carefully written code. The FP\_CONTRACT  
 29565 macro can be used to disallow use of floating multiply-add; and the *fma()* function guarantees  
 29566 its use where desired. Many current machines provide hardware floating multiply-add  
 29567 instructions; software implementation can be used for others.

## 29568 FUTURE DIRECTIONS

29569 None.

## 29570 SEE ALSO

29571 *feclearexcept()*, *fetestexcept()*

29572 XBD Section 4.20 (on page 117), **<math.h>**

## 29573 CHANGE HISTORY

29574 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

## 29575 Issue 7

29576 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #57 (SD5-XSH-ERN-69) is applied,  
 29577 adding a “may fail” range error for non-MX systems.

29578 **NAME**

29579 fmax, fmaxf, fmaxl — determine maximum numeric value of two floating-point numbers

29580 **SYNOPSIS**

```
29581 #include <math.h>
29582 double fmax(double x, double y);
29583 float fmaxf(float x, float y);
29584 long double fmaxl(long double x, long double y);
```

29585 **DESCRIPTION**

29586 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29587 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29588 volume of POSIX.1-2008 defers to the ISO C standard.

29589 MX These functions shall determine the maximum numeric value of their arguments. NaN  
 29590 arguments shall be treated as missing data: if one argument is a NaN and the other numeric,  
 29591 then these functions shall choose the numeric value.

29592 **RETURN VALUE**

29593 Upon successful completion, these functions shall return the maximum numeric value of their  
 29594 arguments.

29595 MX If just one argument is a NaN, the other argument shall be returned.

29596 If *x* and *y* are NaN, a NaN shall be returned.

29597 **ERRORS**

29598 No errors are defined.

29599 **EXAMPLES**

29600 None.

29601 **APPLICATION USAGE**

29602 None.

29603 **RATIONALE**

29604 None.

29605 **FUTURE DIRECTIONS**

29606 None.

29607 **SEE ALSO**

29608 *fdim()*, *fmin()*

29609 XBD <math.h>

29610 **CHANGE HISTORY**

29611 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

29612 **Issue 7**

29613 Austin Group Interpretation 1003.1-2001 #007 is applied.

29614 **NAME**

29615 fmemopen — open a memory buffer stream

29616 **SYNOPSIS**

```
29617 CX    #include <stdio.h>
29618      FILE *fmemopen(void *restrict buf, size_t size,
29619                    const char *restrict mode);
```

29620 **DESCRIPTION**

29621 The *fmemopen()* function shall associate the buffer given by the *buf* and *size* arguments with a  
 29622 stream. The *buf* argument shall be either a null pointer or point to a buffer that is at least *size*  
 29623 bytes long.

29624 The *mode* argument points to a string. If the string is one of the following, the stream shall be  
 29625 opened in the indicated mode. Otherwise, the behavior is undefined.

- |       |           |  |
|-------|-----------|--|
| 29626 | <i>r</i>  | Open the stream for reading.   |
| 29627 | <i>w</i>  | Open the stream for writing.   |
| 29628 | <i>a</i>  | Append; open the stream for writing at the first null byte.                              |
| 29629 | <i>r+</i> | Open the stream for update (reading and writing).  |
| 29630 | <i>w+</i> | Open the stream for update (reading and writing). Truncate the buffer contents.          |
| 29631 | <i>a+</i> | Append; open the stream for update (reading and writing); the initial position is at the |
| 29632 |           | first null byte.   |

29633 Implementations shall accept all mode strings allowed by *fopen()*, but the use of the character  
 29634 'b' shall produce implementation-defined results, where the resulting **FILE \*** need not behave  
 29635 the same as if 'b' were omitted.

29636 If a null pointer is specified as the *buf* argument, *fmemopen()* shall allocate *size* bytes of memory  
 29637 as if by a call to *malloc()*. This buffer shall be automatically freed when the stream is closed.  
 29638 Because this feature is only useful when the stream is opened for updating (because there is no  
 29639 way to get a pointer to the buffer) the *fmemopen()* call may fail if the *mode* argument does not  
 29640 include a '+'.

29641 The stream shall maintain a current position in the buffer. This position shall be initially set to  
 29642 either the beginning of the buffer (for *r* and *w* modes) or to the first null byte in the buffer (for *a*  
 29643 modes). If no null byte is found in append mode, the initial position shall be set to one byte after  
 29644 the end of the buffer.

29645 If *buf* is a null pointer, the initial position shall always be set to the beginning of the buffer.

29646 The stream shall also maintain the size of the current buffer contents; use of *fseek()* or *fseeko()* on  
 29647 the stream with *SEEK\_END* shall seek relative to this size. For modes *r* and *r+* the size shall be  
 29648 set to the value given by the *size* argument. For modes *w* and *w+* the initial size shall be zero and  
 29649 for modes *a* and *a+* the initial size shall be:

- |       |  |  |
|-------|--|--|
| 29650 | • Zero, if <i>buf</i> is a null pointer  |  |
| 29651 | • The position of the first null byte in the buffer, if one is found                                   |  |
| 29652 | • The value of the <i>size</i> argument, if <i>buf</i> is not a null pointer and no null byte is found |  |

29653 A read operation on the stream shall not advance the current buffer position beyond the current  
 29654 buffer size. Reaching the buffer size in a read operation shall count as “end-of-file”. Null bytes in  
 29655 the buffer shall have no special meaning for reads. The read operation shall start at the current

29656 buffer position of the stream.

29657 A write operation shall start either at the current position of the stream (if *mode* has not specified  
29658 'a' as the first character) or at the current size of the stream (if *mode* had 'a' as the first  
29659 character). If the current position at the end of the write is larger than the current buffer size, the  
29660 current buffer size shall be set to the current position. A write operation on the stream shall not  
29661 advance the current buffer size beyond the size given in the *size* argument.

29662 When a stream open for writing is flushed or closed, a null byte shall be written at the current  
29663 position or at the end of the buffer, depending on the size of the contents. If a stream open for  
29664 update is flushed or closed and the last write has advanced the current buffer size, a null byte  
29665 shall be written at the end of the buffer if it fits.

29666 An attempt to seek a memory buffer stream to a negative position or to a position larger than the  
29667 buffer size given in the *size* argument shall fail.

## 29668 RETURN VALUE

29669 Upon successful completion, *fmemopen()* shall return a pointer to the object controlling the  
29670 stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

## 29671 ERRORS

29672 The *fmemopen()* function shall fail if:

29673 [EMFILE] {STREAM\_MAX} streams are currently open in the calling process. |

29674 The *fmemopen()* function may fail if:

29675 [EINVAL] The value of the *mode* argument is not valid.

29676 [EINVAL] The *buf* argument is a null pointer and the *mode* argument does not include a  
29677 '+' character.

29678 [EINVAL] The *size* argument specifies a buffer size of zero and the implementation does +  
29679 not support this.

29680 [ENOMEM] The *buf* argument is a null pointer and the allocation of a buffer of length *size*  
29681 has failed.

29682 [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

## 29683 EXAMPLES

```
29684 #include <stdio.h>
29685 #include <string.h>
29686 static char buffer[] = "foobar";
29687 int
29688 main (void)
29689 {
29690     int ch;
29691     FILE *stream;
29692     stream = fmemopen(buffer, strlen (buffer), "r");
29693     if (stream == NULL)
29694         /* handle error */;
29695     while ((ch = fgetc(stream)) != EOF)
29696         printf("Got %c\n", ch);
29697     fclose(stream);
```

```
29698         return (0);
29699     }
```

29700 This program produces the following output:

```
29701     Got f
29702     Got o
29703     Got o
29704     Got b
29705     Got a
29706     Got r
```

#### 29707 APPLICATION USAGE

29708 None.

#### 29709 RATIONALE

29710 This interface has been introduced to eliminate many of the errors encountered in the  
29711 construction of strings, notably overflowing of strings. This interface prevents overflow.

#### 29712 FUTURE DIRECTIONS

29713 A future version of this standard may mandate specific behavior when the *mode* argument |  
29714 includes 'b'.

29715 A future version of this standard may require support of zero-length buffer streams explicitly. +

29724 XSH/TC1-2008/0150 [396] are applied.

29725 **NAME**

29726 fmin, fminf, fminl — determine minimum numeric value of two floating-point numbers

29727 **SYNOPSIS**

29728 #include &lt;math.h&gt;

29729 double fmin(double x, double y);

29730 float fminf(float x, float y);

29731 long double fminl(long double x, long double y);

29732 **DESCRIPTION**

29733 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29734 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29735 volume of POSIX.1-2008 defers to the ISO C standard.

29736 MX These functions shall determine the minimum numeric value of their arguments. NaN  
 29737 arguments shall be treated as missing data: if one argument is a NaN and the other numeric,  
 29738 then these functions shall choose the numeric value.

29739 **RETURN VALUE**

29740 Upon successful completion, these functions shall return the minimum numeric value of their  
 29741 arguments.

29742 MX If just one argument is a NaN, the other argument shall be returned.

29743 If *x* and *y* are NaN, a NaN shall be returned.

29744 **ERRORS**

29745 No errors are defined.

29746 **EXAMPLES**

29747 None.

29748 **APPLICATION USAGE**

29749 None.

29750 **RATIONALE**

29751 None.

29752 **FUTURE DIRECTIONS**

29753 None.

29757 **CHANGE HISTORY**

29758 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

29759 **Issue 7**

29760 Austin Group Interpretation 1003.1-2001 #008 is applied.

29761 **NAME**

29762 fmod, fmodf, fmodl — floating-point remainder value function

29763 **SYNOPSIS**

```
29764 #include <math.h>
29765 double fmod(double x, double y);
29766 float fmodf(float x, float y);
29767 long double fmodl(long double x, long double y);
```

29768 **DESCRIPTION**

29769 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29770 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29771 volume of POSIX.1-2008 defers to the ISO C standard.

29772 These functions shall return the floating-point remainder of the division of  $x$  by  $y$ .

29773 An application wishing to check for error situations should set *errno* to zero and call  
 29774 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 29775 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 29776 zero, an error has occurred.

29777 **RETURN VALUE**

29778 These functions shall return the value  $x - i * y$ , for some integer  $i$  such that, if  $y$  is non-zero, the  
 29779 result has the same sign as  $x$  and magnitude less than the magnitude of  $y$ .

29780 MXX If the correct value would cause underflow, and is not representable, a range error may occur,  
 29781 MXX and *fmod*(), *modf*(), and *fmodl*() shall return 0.0, or (if the IEC 60559 Floating-Point option is not  
 29782 supported) an implementation-defined value no greater in magnitude than DBL\_MIN,  
 29783 FLT\_MIN, and LDBL\_MIN, respectively.

29784 MX If  $x$  or  $y$  is NaN, a NaN shall be returned, and none of the conditions below shall be considered.

29785 If  $y$  is zero, a domain error shall occur, and a NaN shall be returned.

29786 If  $x$  is infinite, a domain error shall occur, and a NaN shall be returned.

29787 If  $x$  is  $\pm 0$  and  $y$  is not zero,  $\pm 0$  shall be returned.

29788 If  $x$  is not infinite and  $y$  is  $\pm \text{Inf}$ ,  $x$  shall be returned.

29789 MXX If the correct value would cause underflow, and is representable, a range error may occur and  
 29790 the correct value shall be returned.

29791 **ERRORS**

29792 These functions shall fail if:

29793 MX **Domain Error** The  $x$  argument is infinite or  $y$  is zero.

29794 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 29795 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 29796 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 29797 shall be raised.

29798 These functions may fail if:

29799 **Range Error** The result underflows.

29800 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 29801 then *errno* shall be set to [ERANGE]. If the integer expression  
 29802 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 29803 floating-point exception shall be raised.

29804 **EXAMPLES**

29805 None.

29806 **APPLICATION USAGE**

29807 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 29808 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

29809 **RATIONALE**

29810 None.

29811 **FUTURE DIRECTIONS**

29812 None.

29813 **SEE ALSO**29814 *feclearexcept()*, *fetestexcept()*, *isnan()*

29816 **CHANGE HISTORY**

29817 First released in Issue 1. Derived from Issue 1 of the SVID.

29818 **Issue 5**

29819 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 29820 text was previously published in the APPLICATION USAGE section.

29821 **Issue 6**29822 The behavior for when the *y* argument is zero is now defined.

29823 The *fmodf()* and *fmodl()* functions are added for alignment with the ISO/IEC 9899:1999  
 29824 standard.

29825 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 29826 revised to align with the ISO/IEC 9899:1999 standard.

29827 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 29828 marked.

29829 **Issue 7**

29830 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0151 [68], XSH/TC1-2008/0152 [320],  
 29831 and XSH/TC1-2008/0153 [68] are applied.

29832 **NAME**

29833       fmtmsg — display a message in the specified format on standard error and/or a system console

29834 **SYNOPSIS**

```

29835 XSI      #include <fmtmsg.h>
29836
29837      int fmtmsg(long classification, const char *label, int severity,
                const char *text, const char *action, const char *tag);

```

29838 **DESCRIPTION**

29839       The *fmtmsg()* function shall display messages in a specified format instead of the traditional  
 29840       *printf()* function.

29841       Based on a message's classification component, *fmtmsg()* shall write a formatted message either  
 29842       to standard error, to the console, or to both.

29843       A formatted message consists of up to five components as defined below. The component  
 29844       *classification* is not part of a message displayed to the user, but defines the source of the message  
 29845       and directs the display of the formatted message.

29846       *classification*       Contains the sum of identifying values constructed from the constants defined  
 29847       below. Any one identifier from a subclass may be used in combination with a  
 29848       single identifier from a different subclass. Two or more identifiers from the  
 29849       same subclass should not be used together, with the exception of identifiers  
 29850       from the display subclass. (Both display subclass identifiers may be used so  
 29851       that messages can be displayed to both standard error and the system  
 29852       console.)

29853       **Major Classifications**

29854               Identifies the source of the condition. Identifiers are: MM\_HARD  
 29855               (hardware), MM\_SOFT (software), and MM\_FIRM (firmware).

29856       **Message Source Subclassifications**

29857               Identifies the type of software in which the problem is detected.  
 29858               Identifiers are: MM\_APPL (application), MM\_UTIL (utility), and  
 29859               MM\_OPSYS (operating system).

29860       **Display Subclassifications**

29861               Indicates where the message is to be displayed. Identifiers are:  
 29862               MM\_PRINT to display the message on the standard error stream,  
 29863               MM\_CONSOLE to display the message on the system console. One or  
 29864               both identifiers may be used.

29865       **Status Subclassifications**

29866               Indicates whether the application can recover from the condition.  
 29867               Identifiers are: MM\_RECOVER (recoverable) and MM\_NRECOV (non-  
 29868               recoverable).

29869       An additional identifier, MM\_NULLMC, indicates that no classification  
 29870       component is supplied for the message.

29871       *label*               Identifies the source of the message. The format is two fields separated by a  
 29872       <colon>. The first field is up to 10 bytes, the second is up to 14 bytes.

29873       *severity*           Indicates the seriousness of the condition. Identifiers for the levels of *severity*  
 29874       are:

29875		MM_HALT	Indicates that the application has encountered a severe fault and is halting. Produces the string "HALT".
29876			
29877		MM_ERROR	Indicates that the application has detected a fault. Produces the string "ERROR".
29878			
29879		MM_WARNING	Indicates a condition that is out of the ordinary, that might be a problem, and should be watched. Produces the string "WARNING".
29880			
29881			
29882		MM_INFO	Provides information about a condition that is not in error. Produces the string "INFO".
29883			
29884		MM_NOSEV	Indicates that no severity level is supplied for the message.
29885	<i>text</i>		Describes the error condition that produced the message. The character string is not limited to a specific size. If the character string is empty, then the text produced is unspecified.
29886			
29887			
29888	<i>action</i>		Describes the first step to be taken in the error-recovery process. The <i>fmtmsg()</i> function precedes the action string with the prefix: "TO FIX:". The <i>action</i> string is not limited to a specific size.
29889			
29890			
29891	<i>tag</i>		An identifier that references on-line documentation for the message. Suggested usage is that <i>tag</i> includes the <i>label</i> and a unique identifying number. A sample <i>tag</i> is "XSI:cat:146".
29892			
29893			

29894 The *MSGVERB* environment variable (for message verbosity) shall determine for *fmtmsg()*  
 29895 which message components it is to select when writing messages to standard error. The value of  
 29896 *MSGVERB* shall be a <colon>-separated list of optional keywords. Valid keywords are: *label*,  
 29897 *severity*, *text*, *action*, and *tag*. If *MSGVERB* contains a keyword for a component and the  
 29898 component's value is not the component's null value, *fmtmsg()* shall include that component in  
 29899 the message when writing the message to standard error. If *MSGVERB* does not include a  
 29900 keyword for a message component, that component shall not be included in the display of the  
 29901 message. The keywords may appear in any order. If *MSGVERB* is not defined, if its value is the  
 29902 null string, if its value is not of the correct format, or if it contains keywords other than the valid  
 29903 ones listed above, *fmtmsg()* shall select all components.

29904 *MSGVERB* shall determine which components are selected for display to standard error. All  
 29905 message components shall be included in console messages.

## 29906 RETURN VALUE

29907 The *fmtmsg()* function shall return one of the following values:

29908	MM_OK	The function succeeded.
29909	MM_NOTOK	The function failed completely.
29910	MM_NOMSG	The function was unable to generate a message on standard error, but otherwise succeeded.
29911		
29912	MM_NOCON	The function was unable to generate a console message, but otherwise succeeded.
29913		

## 29914 ERRORS

29915 None.

29916 **EXAMPLES**29917 1. The following example of *fmtmsg()*:29918 `fmtmsg(MM_PRINT, "XSI:cat", MM_ERROR, "illegal option",`  
29919 `"refer to cat in user's reference manual", "XSI:cat:001")`

29920 produces a complete message in the specified message format:

29921 `XSI:cat: ERROR: illegal option`29922 `TO FIX: refer to cat in user's reference manual XSI:cat:001`29923 2. When the environment variable *MSGVERB* is set as follows:29924 `MSGVERB=severity:text:action`29925 and Example 1 is used, *fmtmsg()* produces:29926 `ERROR: illegal option`29927 `TO FIX: refer to cat in user's reference manual`29928 **APPLICATION USAGE**29929 One or more message components may be systematically omitted from messages generated by  
29930 an application by using the null value of the argument for that component.29931 **RATIONALE**

29932 None.

29933 **FUTURE DIRECTIONS**

29934 None.

29938 **CHANGE HISTORY**

29939 First released in Issue 4, Version 2.

29940 **Issue 5**

29941 Moved from X/OPEN UNIX extension to BASE.

**NAME**

fnmatch — match a filename string or a pathname

**SYNOPSIS**

```
#include <fnmatch.h>
```

```
int fnmatch(const char *pattern, const char *string, int flags);
```

**DESCRIPTION**

The *fnmatch()* function shall match patterns as described in XCU [Section 2.13.1](#) (on page 2372) and [Section 2.13.2](#) (on page 2373). It checks the string specified by the *string* argument to see if it matches the pattern specified by the *pattern* argument.

The *flags* argument shall modify the interpretation of *pattern* and *string*. It is the bitwise-inclusive OR of zero or more of the flags defined in **<fnmatch.h>**. If the FNM\_PATHNAME flag is set in *flags*, then a <slash> character ( ' / ' ) in *string* shall be explicitly matched by a <slash> in *pattern*; it shall not be matched by either the <asterisk> or <question-mark> special characters, nor by a bracket expression. If the FNM\_PATHNAME flag is not set, the <slash> character shall be treated as an ordinary character.

If FNM\_NOESCAPE is not set in *flags*, a <backslash> character in *pattern* followed by any other character shall match that second character in *string*. In particular, "\\\" shall match a <backslash> in *string*. If *pattern* ends with an unescaped <backslash>, *fnmatch()* shall return a non-zero value (indicating either no match or an error). If FNM\_NOESCAPE is set, a <backslash> character shall be treated as an ordinary character.

If FNM\_PERIOD is set in *flags*, then a leading <period> ( ' . ' ) in *string* shall match a <period> in *pattern*; as described by rule 2 in XCU [Section 2.13.3](#) (on page 2373) where the location of “leading” is indicated by the value of FNM\_PATHNAME:

- If FNM\_PATHNAME is set, a <period> is “leading” if it is the first character in *string* or if it immediately follows a <slash>.
- If FNM\_PATHNAME is not set, a <period> is “leading” only if it is the first character of *string*.

If FNM\_PERIOD is not set, then no special restrictions are placed on matching a period.

**RETURN VALUE**

If *string* matches the pattern specified by *pattern*, then *fnmatch()* shall return 0. If there is no match, *fnmatch()* shall return FNM\_NOMATCH, which is defined in **<fnmatch.h>**. If an error occurs, *fnmatch()* shall return another non-zero value.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

The *fnmatch()* function has two major uses. It could be used by an application or utility that needs to read a directory and apply a pattern against each entry. The *find* utility is an example of this. It can also be used by the *pax* utility to process its *pattern* operands, or by applications that need to match strings in a similar manner.

The name *fnmatch()* is intended to imply *filename* match, rather than *pathname* match. The default action of this function is to match filename strings, rather than pathnames, since it gives no special significance to the <slash> character. With the FNM\_PATHNAME flag, *fnmatch()* does match pathnames, but without tilde expansion, parameter expansion, or special treatment for a

29987 <period> at the beginning of a filename.

#### 29988 **RATIONALE**

29989 This function replaced the REG\_FILENAME flag of *regcomp()* in early proposals of this volume  
29990 of POSIX.1-2008. It provides virtually the same functionality as the *regcomp()* and *regexec()*  
29991 functions using the REG\_FILENAME and REG\_FSLASH flags (the REG\_FSLASH flag was  
29992 proposed for *regcomp()*, and would have had the opposite effect from FNM\_PATHNAME), but  
29993 with a simpler function and less system overhead.

#### 29994 **FUTURE DIRECTIONS**

29995 None.

30005 [291] are applied.

30006 **NAME**

30007       fopen — open a stream

30008 **SYNOPSIS**

30009       #include &lt;stdio.h&gt;

30010       FILE \*fopen(const char \*restrict pathname, const char \*restrict mode);

30011 **DESCRIPTION**

30012 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 30013 conflict between the requirements described here and the ISO C standard is unintentional. This  
 30014 volume of POSIX.1-2008 defers to the ISO C standard.

30015       The *fopen()* function shall open the file whose pathname is the string pointed to by *pathname*,  
 30016 and associates a stream with it.

30017       The *mode* argument points to a string. If the string is one of the following, the file shall be opened  
 30018 in the indicated mode. Otherwise, the behavior is undefined.

30019	<i>r</i> or <i>rb</i>	Open file for reading.
30020	<i>w</i> or <i>wb</i>	Truncate to zero length or create file for writing.
30021	<i>a</i> or <i>ab</i>	Append; open or create file for writing at end-of-file.
30022	<i>r+</i> or <i>rb+</i> or <i>r+b</i>	Open file for update (reading and writing).
30023	<i>w+</i> or <i>wb+</i> or <i>w+b</i>	Truncate to zero length or create file for update.
30024	<i>a+</i> or <i>ab+</i> or <i>a+b</i>	Append; open or create file for update, writing at end-of-file.

30025 CX       The character 'b' shall have no effect, but is allowed for ISO C standard conformance. Opening  
 30026 a file with read mode (*r* as the first character in the *mode* argument) shall fail if the file does not  
 30027 exist or cannot be read.

30028       Opening a file with append mode (*a* as the first character in the *mode* argument) shall cause all  
 30029 subsequent writes to the file to be forced to the then current end-of-file, regardless of intervening  
 30030 calls to *fseek()*.

30031       When a file is opened with update mode ('+' as the second or third character in the *mode*  
 30032 argument), both input and output may be performed on the associated stream. However, the  
 30033 application shall ensure that output is not directly followed by input without an intervening call  
 30034 to *fflush()* or to a file positioning function (*fseek()*, *fsetpos()*, or *rewind()*), and input is not directly  
 30035 followed by output without an intervening call to a file positioning function, unless the input  
 30036 operation encounters end-of-file.

30037       When opened, a stream is fully buffered if and only if it can be determined not to refer to an  
 30038 interactive device. The error and end-of-file indicators for the stream shall be cleared.

30039 CX       If *mode* is *w*, *wb*, *a*, *ab*, *w+*, *wb+*, *w+b*, *a+*, *ab+*, or *a+b*, and the file did not previously exist, upon  
 30040 successful completion, *fopen()* shall mark for update the last data access, last data modification,  
 30041 and last file status change timestamps of the file and the last file status change and last data  
 30042 modification timestamps of the parent directory.

30043       If *mode* is *w*, *wb*, *a*, *ab*, *w+*, *wb+*, *w+b*, *a+*, *ab+*, or *a+b*, and the file did not previously exist, the  
 30044 *fopen()* function shall create a file as if it called the *creat()* function with a value appropriate for  
 30045 the *path* argument interpreted from *pathname* and a value of S\_IRUSR | S\_IWUSR | S\_IRGRP |  
 30046 S\_IWGRP | S\_IROTH | S\_IWOTH for the *mode* argument.

30047       If *mode* is *w*, *wb*, *w+*, *wb+*, or *w+b*, and the file did previously exist, upon successful completion,  
 30048 *fopen()* shall mark for update the last data modification and last file status change timestamps of

the file.

After a successful call to the *fopen()* function, the orientation of the stream shall be cleared, the encoding rule shall be cleared, and the associated **mbstate\_t** object shall be set to describe an initial conversion state.

The file descriptor associated with the opened stream shall be allocated and opened as if by a call to *open()* with the following flags:

<i>fopen()</i> Mode	<i>open()</i> Flags
<i>r</i> or <i>rb</i>	O_RDONLY
<i>w</i> or <i>wb</i>	O_WRONLY O_CREAT O_TRUNC
<i>a</i> or <i>ab</i>	O_WRONLY O_CREAT O_APPEND
<i>r+</i> or <i>rb+</i> or <i>r+b</i>	O_RDWR
<i>w+</i> or <i>wb+</i> or <i>w+b</i>	O_RDWR O_CREAT O_TRUNC
<i>a+</i> or <i>ab+</i> or <i>a+b</i>	O_RDWR O_CREAT O_APPEND

## RETURN VALUE

Upon successful completion, *fopen()* shall return a pointer to the object controlling the stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

## ERRORS

The *fopen()* function shall fail if:

**[EACCES]** Search permission is denied on a component of the path prefix, or the file exists and the permissions specified by *mode* are denied, or the file does not exist and write permission is denied for the parent directory of the file to be created.

**[EINTR]** A signal was caught during *fopen()*.

**[EISDIR]** The named file is a directory and *mode* requires write access.

**[ELOOP]** A loop exists in symbolic links encountered during resolution of the *path* argument.

**[EMFILE]** All file descriptors available to the process are currently open.

**[EMFILE]** {STREAM\_MAX} streams are currently open in the calling process.

**[ENAMETOOLONG]** The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH\_MAX}.

**[ENFILE]** The maximum allowable number of files is currently open in the system.

**[ENOENT]** The *mode* string begins with 'r' and a component of *pathname* does not name an existing file, or *mode* begins with 'w' or 'a' and a component of the path prefix of *pathname* does not name an existing file, or *pathname* is an empty string.

**[ENOENT] or [ENOTDIR]** The *pathname* argument contains at least one non-*<slash>* character and ends with one or more trailing *<slash>* characters. If *pathname* without the trailing *<slash>* characters would name an existing file, an [ENOENT] error shall not occur.

30091	CX	[ENOSPC]	The directory or file system that would contain the new file cannot be expanded, the file does not exist, and the file was to be created.
30092			
30093	CX	[ENOTDIR]	A component of the path prefix names an existing file that is neither a directory nor a symbolic link to a directory, or the <i>pathname</i> argument contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.
30094			
30095			
30096			
30097			
30098	CX	[ENXIO]	The named file is a character special or block special file, and the device associated with this special file does not exist.
30099			
30100	CX	[EOVERFLOW]	The named file is a regular file and the size of the file cannot be represented correctly in an object of type <code>off_t</code> .
30101			
30102	CX	[EROFS]	The named file resides on a read-only file system and <i>mode</i> requires write access.
30103			
30104			The <i>fopen()</i> function may fail if:
30105	CX	[EINVAL]	The value of the <i>mode</i> argument is not valid.
30106	CX	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
30107			
30108	CX	[EMFILE]	{FOPEN_MAX} streams are currently open in the calling process.
30109	CX	[ENAMETOOLONG]	
30110			The length of a component of a pathname is longer than {NAME_MAX}.
30111	CX	[ENOMEM]	Insufficient storage space is available.
30112	CX	[ETXTBSY]	The file is a pure procedure (shared text) file that is being executed and <i>mode</i> requires write access.
30113			

## 30114 EXAMPLES

### 30115 Opening a File

30116 The following example tries to open the file named **file** for reading. The *fopen()* function returns  
 30117 a file pointer that is used in subsequent *fgets()* and *fclose()* calls. If the program cannot open the  
 30118 file, it just ignores it.

```

30119 #include <stdio.h>
30120 ...
30121 FILE *fp;
30122 ...
30123 void rgrep(const char *file)
30124 {
30125     ...
30126     if ((fp = fopen(file, "r")) == NULL)
30127         return;
30128     ...
30129 }
```

**APPLICATION USAGE**

XBD <stdio.h>

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

Large File Summit extensions are added.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [Eoverflow] condition is added. This change is to support large files.
- The [ELOOP] mandatory error condition is added.
- The [EINVAL], [EMFILE], [ENAMETOOLONG], [ENOMEM], and [ETXTBSY] optional error conditions are added.

The normative text is updated to avoid use of the term “must” for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototype for *fopen()* is updated.
- The DESCRIPTION is updated to note that if the argument *mode* points to a string other than those listed, then the behavior is undefined.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #025 is applied, clarifying the file creation mode.

Austin Group Interpretation 1003.1-2001 #143 is applied.

Austin Group Interpretation 1003.1-2001 #159 is applied, clarifying requirements for the flags set on the open file description.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-149 is applied, changing the {STREAM\_MAX} [EMFILE] error condition from a “may fail” to a “shall fail”.

Changes are made related to support for finegrained timestamps.

30170  
30171

POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0156 [291,433], XSH/TC1-2008/0157 [146,433], XSH/TC1-2008/0158 [324], and XSH/TC1-2008/0159 [14] are applied.

30172 **NAME**

30173 fork — create a new process

30174 **SYNOPSIS**

30175 #include &lt;unistd.h&gt;

30176 pid\_t fork(void);

30177 **DESCRIPTION**

30178 The *fork()* function shall create a new process. The new process (child process) shall be an exact  
 30179 copy of the calling process (parent process) except as detailed below:

- 30180 • The child process shall have a unique process ID.
- 30181 • The child process ID also shall not match any active process group ID.
- 30182 • The child process shall have a different parent process ID, which shall be the process ID of  
 30183 the calling process.
- 30184 • The child process shall have its own copy of the parent's file descriptors. Each of the  
 30185 child's file descriptors shall refer to the same open file description with the corresponding  
 30186 file descriptor of the parent.
- 30187 • The child process shall have its own copy of the parent's open directory streams. Each  
 30188 open directory stream in the child process may share directory stream positioning with the  
 30189 corresponding directory stream of the parent.
- 30190 • The child process shall have its own copy of the parent's message catalog descriptors.
- 30191 • The child process values of *tms\_utime*, *tms\_stime*, *tms\_cutime*, and *tms\_cstime* shall be set to  
 30192 0.
- 30193 • The time left until an alarm clock signal shall be reset to zero, and the alarm, if any, shall be  
 30194 canceled; see *alarm()*.
- 30195 XSI • All *semadj* values shall be cleared.
- 30196 • File locks set by the parent process shall not be inherited by the child process.
- 30197 • The set of signals pending for the child process shall be initialized to the empty set.
- 30198 XSI • Interval timers shall be reset in the child process.
- 30199 • Any semaphores that are open in the parent process shall also be open in the child process.
- 30200 ML • The child process shall not inherit any address space memory locks established by the  
 30201 parent process via calls to *mlockall()* or *mlock()*.
- 30202 • Memory mappings created in the parent shall be retained in the child process.  
 30203 MAP\_PRIVATE mappings inherited from the parent shall also be MAP\_PRIVATE  
 30204 mappings in the child, and any modifications to the data in these mappings made by the  
 30205 parent prior to calling *fork()* shall be visible to the child. Any modifications to the data in  
 30206 MAP\_PRIVATE mappings made by the parent after *fork()* returns shall be visible only to  
 30207 the parent. Modifications to the data in MAP\_PRIVATE mappings made by the child shall  
 30208 be visible only to the child.
- 30209 PS • For the SCHED\_FIFO and SCHED\_RR scheduling policies, the child process shall inherit  
 30210 the policy and priority settings of the parent process during a *fork()* function. For other  
 30211 scheduling policies, the policy and priority settings on *fork()* are implementation-defined.

- 30212 • Per-process timers created by the parent shall not be inherited by the child process.
- 30213 MSG • The child process shall have its own copy of the message queue descriptors of the parent.
- 30214 Each of the message descriptors of the child shall refer to the same open message queue
- 30215 description as the corresponding message descriptor of the parent.
- 30216 • No asynchronous input or asynchronous output operations shall be inherited by the child
- 30217 process. Any use of asynchronous control blocks created by the parent produces undefined
- 30218 behavior.
- 30219 • A process shall be created with a single thread. If a multi-threaded process calls *fork()*, the
- 30220 new process shall contain a replica of the calling thread and its entire address space,
- 30221 possibly including the states of mutexes and other resources. Consequently, to avoid
- 30222 errors, the child process may only execute async-signal-safe operations until such time as
- 30223 one of the *exec* functions is called.

30224 When the application calls *fork()* from a signal handler and any of the fork handlers  
 30225 registered by *pthread\_atfork()* calls a function that is not async-signal-safe, the behavior is  
 30226 undefined.

- 30227 OB TRC TRI • If the Trace option and the Trace Inherit option are both supported:
- 30228 If the calling process was being traced in a trace stream that had its inheritance policy set
- 30229 to *POSIX\_TRACE\_INHERITED*, the child process shall be traced into that trace stream,
- 30230 and the child process shall inherit the parent's mapping of trace event names to trace event
- 30231 type identifiers. If the trace stream in which the calling process was being traced had its
- 30232 inheritance policy set to *POSIX\_TRACE\_CLOSE\_FOR\_CHILD*, the child process shall not
- 30233 be traced into that trace stream. The inheritance policy is set by a call to the
- 30234 *posix\_trace\_attr\_setinherited()* function.

- 30235 OB TRC • If the Trace option is supported, but the Trace Inherit option is not supported:
- 30236 The child process shall not be traced into any of the trace streams of its parent process.

- 30237 OB TRC • If the Trace option is supported, the child process of a trace controller process shall not
- 30238 control the trace streams controlled by its parent process.

- 30239 CPT • The initial value of the CPU-time clock of the child process shall be set to zero.
- 30240 TCT • The initial value of the CPU-time clock of the single thread of the child process shall be set
- 30241 to zero.

30242 All other process characteristics defined by POSIX.1-2008 shall be the same in the parent and  
 30243 child processes. The inheritance of process characteristics not defined by POSIX.1-2008 is  
 30244 unspecified by POSIX.1-2008.

30245 After *fork()*, both the parent and the child processes shall be capable of executing independently  
 30246 before either one terminates.

## 30247 RETURN VALUE

30248 Upon successful completion, *fork()* shall return 0 to the child process and shall return the  
 30249 process ID of the child process to the parent process. Both processes shall continue to execute  
 30250 from the *fork()* function. Otherwise, -1 shall be returned to the parent process, no child process  
 30251 shall be created, and *errno* shall be set to indicate the error.

## 30252 ERRORS

30253 The *fork()* function shall fail if:

30254 [EAGAIN] The system lacked the necessary resources to create another process, or the  
 30255 system-imposed limit on the total number of processes under execution  
 30256 system-wide or by a single user {CHILD\_MAX} would be exceeded.

30257 The *fork()* function may fail if:

30258 [ENOMEM] Insufficient storage space is available.

#### 30259 EXAMPLES

30260 None.

#### 30261 APPLICATION USAGE

30262 None.

#### 30263 RATIONALE

30264 Many historical implementations have timing windows where a signal sent to a process group  
 30265 (for example, an interactive SIGINT) just prior to or during execution of *fork()* is delivered to the  
 30266 parent following the *fork()* but not to the child because the *fork()* code clears the child's set of  
 30267 pending signals. This volume of POSIX.1-2008 does not require, or even permit, this behavior.  
 30268 However, it is pragmatic to expect that problems of this nature may continue to exist in  
 30269 implementations that appear to conform to this volume of POSIX.1-2008 and pass available  
 30270 verification suites. This behavior is only a consequence of the implementation failing to make  
 30271 the interval between signal generation and delivery totally invisible. From the application's  
 30272 perspective, a *fork()* call should appear atomic. A signal that is generated prior to the *fork()*  
 30273 should be delivered prior to the *fork()*. A signal sent to the process group after the *fork()* should  
 30274 be delivered to both parent and child. The implementation may actually initialize internal data  
 30275 structures corresponding to the child's set of pending signals to include signals sent to the  
 30276 process group during the *fork()*. Since the *fork()* call can be considered as atomic from the  
 30277 application's perspective, the set would be initialized as empty and such signals would have  
 30278 arrived after the *fork()*; see also <signal.h>.

30279 One approach that has been suggested to address the problem of signal inheritance across *fork()*  
 30280 is to add an [EINTR] error, which would be returned when a signal is detected during the call.  
 30281 While this is preferable to losing signals, it was not considered an optimal solution. Although it  
 30282 is not recommended for this purpose, such an error would be an allowable extension for an  
 30283 implementation.

30284 The [ENOMEM] error value is reserved for those implementations that detect and distinguish  
 30285 such a condition. This condition occurs when an implementation detects that there is not enough  
 30286 memory to create the process. This is intended to be returned when [EAGAIN] is inappropriate  
 30287 because there can never be enough memory (either primary or secondary storage) to perform  
 30288 the operation. Since *fork()* duplicates an existing process, this must be a condition where there is  
 30289 sufficient memory for one such process, but not for two. Many historical implementations  
 30290 actually return [ENOMEM] due to temporary lack of memory, a case that is not generally  
 30291 distinct from [EAGAIN] from the perspective of a conforming application.

30292 Part of the reason for including the optional error [ENOMEM] is because the SVID specifies it  
 30293 and it should be reserved for the error condition specified there. The condition is not applicable  
 30294 on many implementations.

30295 IEEE Std 1003.1-1988 neglected to require concurrent execution of the parent and child of *fork()*.  
 30296 A system that single-threads processes was clearly not intended and is considered an  
 30297 unacceptable "toy implementation" of this volume of POSIX.1-2008. The only objection  
 30298 anticipated to the phrase "executing independently" is testability, but this assertion should be  
 30299 testable. Such tests require that both the parent and child can block on a detectable action of the  
 30300 other, such as a write to a pipe or a signal. An interactive exchange of such actions should be

possible for the system to conform to the intent of this volume of POSIX.1-2008.

The [EAGAIN] error exists to warn applications that such a condition might occur. Whether it occurs or not is not in any practical sense under the control of the application because the condition is usually a consequence of the user's use of the system, not of the application's code. Thus, no application can or should rely upon its occurrence under any circumstances, nor should the exact semantics of what concept of "user" is used be of concern to the application developer. Validation writers should be cognizant of this limitation.

There are two reasons why POSIX programmers call *fork()*. One reason is to create a new thread of control within the same program (which was originally only possible in POSIX by creating a new process); the other is to create a new process running a different program. In the latter case, the call to *fork()* is soon followed by a call to one of the *exec* functions.

The general problem with making *fork()* work in a multi-threaded world is what to do with all of the threads. There are two alternatives. One is to copy all of the threads into the new process. This causes the programmer or implementation to deal with threads that are suspended on system calls or that might be about to execute system calls that should not be executed in the new process. The other alternative is to copy only the thread that calls *fork()*. This creates the difficulty that the state of process-local resources is usually held in process memory. If a thread that is not calling *fork()* holds a resource, that resource is never released in the child process because the thread whose job it is to release the resource does not exist in the child process.

When a programmer is writing a multi-threaded program, the first described use of *fork()*, creating new threads in the same program, is provided by the *pthread\_create()* function. The *fork()* function is thus used only to run new programs, and the effects of calling functions that require certain resources between the call to *fork()* and the call to an *exec* function are undefined.

The addition of the *forkall()* function to the standard was considered and rejected. The *forkall()* function lets all the threads in the parent be duplicated in the child. This essentially duplicates the state of the parent in the child. This allows threads in the child to continue processing and allows locks and the state to be preserved without explicit *pthread\_atfork()* code. The calling process has to ensure that the threads processing state that is shared between the parent and child (that is, file descriptors or MAP\_SHARED memory) behaves properly after *forkall()*. For example, if a thread is reading a file descriptor in the parent when *forkall()* is called, then two threads (one in the parent and one in the child) are reading the file descriptor after the *forkall()*. If this is not desired behavior, the parent process has to synchronize with such threads before calling *forkall()*.

While the *fork()* function is async-signal-safe, there is no way for an implementation to determine whether the fork handlers established by *pthread\_atfork()* are async-signal-safe. The fork handlers may attempt to execute portions of the implementation that are not async-signal-safe, such as those that are protected by mutexes, leading to a deadlock condition. It is therefore undefined for the fork handlers to execute functions that are not async-signal-safe when *fork()* is called from a signal handler.

When *forkall()* is called, threads, other than the calling thread, that are in functions that can return with an [EINTR] error may have those functions return [EINTR] if the implementation cannot ensure that the function behaves correctly in the parent and child. In particular, *pthread\_cond\_wait()* and *pthread\_cond\_timedwait()* need to return in order to ensure that the condition has not changed. These functions can be awakened by a spurious condition wakeup rather than returning [EINTR].

**FUTURE DIRECTIONS**

None.

XBD Section 4.12 (on page 111), *<sys/types.h>*, *<unistd.h>*

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

The DESCRIPTION is changed for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

**Issue 6**

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include *<sys/types.h>* has been removed. Although *<sys/types.h>* was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effect of *fork()* on a pending alarm call in the child process is clarified.

The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/17 is applied, adding text to the DESCRIPTION and RATIONALE relating to fork handlers registered by the *pthread\_atfork()* function and async-signal safety.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #080 is applied, clarifying the status of asynchronous input and asynchronous output operations and asynchronous control lists in the DESCRIPTION.

Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, Timers, and Threads options is moved to the Base.

Functionality relating to message catalog descriptors is moved from the XSI option to the Base.

**NAME**

fpathconf, pathconf — get configurable pathname variables

**SYNOPSIS**

```
#include <unistd.h>
```

```
long fpathconf(int fildes, int name);
```

```
long pathconf(const char *path, int name);
```

**DESCRIPTION**

The *fpathconf()* and *pathconf()* functions shall determine the current value of a configurable limit or option (*variable*) that is associated with a file or directory.

For *pathconf()*, the *path* argument points to the pathname of a file or directory.

For *fpathconf()*, the *fildes* argument is an open file descriptor.

The *name* argument represents the variable to be queried relative to that file or directory. Implementations shall support all of the variables listed in the following table and may support others. The variables in the following table come from **<limits.h>** or **<unistd.h>** and the symbolic constants, defined in **<unistd.h>**, are the corresponding values used for *name*.

Variable	Value of <i>name</i>	Requirements
{FILESIZEBITS}	_PC_FILESIZEBITS	4,7
{LINK_MAX}	_PC_LINK_MAX	1
{MAX_CANON}	_PC_MAX_CANON	2
{MAX_INPUT}	_PC_MAX_INPUT	2
{NAME_MAX}	_PC_NAME_MAX	3,4
{PATH_MAX}	_PC_PATH_MAX	4,5
{PIPE_BUF}	_PC_PIPE_BUF	6
{POSIX2_SYMLINKS}	_PC_2_SYMLINKS	4
{POSIX_ALLOC_SIZE_MIN}	_PC_ALLOC_SIZE_MIN	10
{POSIX_REC_INCR_XFER_SIZE}	_PC_REC_INCR_XFER_SIZE	10
{POSIX_REC_MAX_XFER_SIZE}	_PC_REC_MAX_XFER_SIZE	10
{POSIX_REC_MIN_XFER_SIZE}	_PC_REC_MIN_XFER_SIZE	10
{POSIX_REC_XFER_ALIGN}	_PC_REC_XFER_ALIGN	10
{SYMLINK_MAX}	_PC_SYMLINK_MAX	4,9
_POSIX_CHOWN_RESTRICTED	_PC_CHOWN_RESTRICTED	7
_POSIX_NO_TRUNC	_PC_NO_TRUNC	3,4
_POSIX_VDISABLE	_PC_VDISABLE	2
_POSIX_ASYNC_IO	_PC_ASYNC_IO	8
_POSIX_PRIO_IO	_PC_PRIO_IO	8
_POSIX_SYNC_IO	_PC_SYNC_IO	8
_POSIX_TIMESTAMP_RESOLUTION	_PC_TIMESTAMP_RESOLUTION	1

**Requirements**

1. If *path* or *fildes* refers to a directory, the value returned shall apply to the directory itself.
2. If *path* or *fildes* does not refer to a terminal file, it is unspecified whether an implementation supports an association of the variable name with the specified file.
3. If *path* or *fildes* refers to a directory, the value returned shall apply to filenames within the directory.

4. If *path* or *fildes* does not refer to a directory, it is unspecified whether an implementation supports an association of the variable name with the specified file.
5. If *path* or *fildes* refers to a directory, the value returned shall be the maximum length of a relative pathname that would not cross any mount points when the specified directory is the working directory.
6. If *path* refers to a FIFO, or *fildes* refers to a pipe or FIFO, the value returned shall apply to the referenced object. If *path* or *fildes* refers to a directory, the value returned shall apply to any FIFO that exists or can be created within the directory. If *path* or *fildes* refers to any other type of file, it is unspecified whether an implementation supports an association of the variable name with the specified file.
7. If *path* or *fildes* refers to a directory, the value returned shall apply to any files, other than directories, that exist or can be created within the directory.
8. If *path* or *fildes* refers to a directory, it is unspecified whether an implementation supports an association of the variable name with the specified file.
9. If *path* or *fildes* refers to a directory, the value returned shall be the maximum length of the string that a symbolic link in that directory can contain.
10. If *path* or *fildes* does not refer to a regular file, it is unspecified whether an implementation supports an association of the variable name with the specified file. If an implementation supports such an association for other than a regular file, the value returned is unspecified.

#### RETURN VALUE

If *name* is an invalid value, both *pathconf()* and *fpathconf()* shall return `-1` and set *errno* to indicate the error.

If the variable corresponding to *name* is described in `<limits.h>` as a maximum or minimum value and the variable has no limit for the path or file descriptor, both *pathconf()* and *fpathconf()* shall return `-1` without changing *errno*. Note that indefinite limits do not imply infinite limits; see `<limits.h>`.

If the implementation needs to use *path* to determine the value of *name* and the implementation does not support the association of *name* with the file specified by *path*, or if the process did not have appropriate privileges to query the file specified by *path*, or *path* does not exist, *pathconf()* shall return `-1` and set *errno* to indicate the error.

If the implementation needs to use *fildes* to determine the value of *name* and the implementation does not support the association of *name* with the file specified by *fildes*, or if *fildes* is an invalid file descriptor, *fpathconf()* shall return `-1` and set *errno* to indicate the error.

Otherwise, *pathconf()* or *fpathconf()* shall return the current variable value for the file or directory without changing *errno*. The value returned shall not be more restrictive than the corresponding value available to the application when it was compiled with the implementation's `<limits.h>` or `<unistd.h>`.

If the variable corresponding to *name* is dependent on an unsupported option, the results are unspecified.

#### ERRORS

The *pathconf()* function shall fail if:

[EINVAL]           The value of *name* is not valid.

- 30462 [EOVERFLOW] The value of *name* is `_PC_TIMESTAMP_RESOLUTION` and the resolution is  
 30463 larger than `{LONG_MAX}`.
- 30464 The *pathconf()* function may fail if:
- 30465 [EACCES] Search permission is denied for a component of the path prefix.
- 30466 [EINVAL] The implementation does not support an association of the variable *name* with  
 30467 the specified file.
- 30468 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* +  
 30469 argument. +
- 30470 [ELOOP] More than `{SYMLOOP_MAX}` symbolic links were encountered during  
 30471 resolution of the *path* argument.
- 30472 [ENAMETOOLONG]  
 30473 The length of a component of a pathname is longer than `{NAME_MAX}`.
- 30474 [ENAMETOOLONG]  
 30475 The length of a pathname exceeds `{PATH_MAX}`, or pathname resolution of a  
 30476 symbolic link produced an intermediate result with a length that exceeds  
 30477 `{PATH_MAX}`.
- 30478 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- 30479 [ENOTDIR] A component of the path prefix names an existing file that is neither a  
 30480 directory nor a symbolic link to a directory, or the *path* argument contains at  
 30481 least one non-`<slash>` character and ends with one or more trailing `<slash>`  
 30482 characters and the last pathname component names an existing file that is  
 30483 neither a directory nor a symbolic link to a directory.
- 30484 The *fpathconf()* function shall fail if:
- 30485 [EINVAL] The value of *name* is not valid.
- 30486 [EOVERFLOW] The value of *name* is `_PC_TIMESTAMP_RESOLUTION` and the resolution is  
 30487 larger than `{LONG_MAX}`.
- 30488 The *fpathconf()* function may fail if:
- 30489 [EBADF] The *fildev* argument is not a valid file descriptor.
- 30490 [EINVAL] The implementation does not support an association of the variable *name* with  
 30491 the specified file.

**EXAMPLES**

30492 None.

**APPLICATION USAGE**

30495 Application developers should check whether an option, such as `_POSIX_ADVISORY_INFO`, is  
 30496 supported prior to obtaining and using values for related variables such as  
 30497 `{POSIX_ALLOC_SIZE_MIN}`.

**RATIONALE**

30499 The *pathconf()* function was proposed immediately after the *sysconf()* function when it was  
 30500 realized that some configurable values may differ across file system, directory, or device  
 30501 boundaries.

30502 For example, `{NAME_MAX}` frequently changes between System V and BSD-based file systems;  
 30503 System V uses a maximum of 14, BSD 255. On an implementation that provides both types of file

systems, an application would be forced to limit all pathname components to 14 bytes, as this would be the value specified in `<limits.h>` on such a system.

Therefore, various useful values can be queried on any pathname or file descriptor, assuming that appropriate privileges are in place.

The value returned for the variable `{PATH_MAX}` indicates the longest relative pathname that could be given if the specified directory is the current working directory of the process. A process may not always be able to generate a name that long and use it if a subdirectory in the pathname crosses into a more restrictive file system. Note that implementations are allowed to accept pathnames longer than `{PATH_MAX}` bytes long, but are not allowed to return pathnames longer than this unless the user specifies a larger buffer using a function that provides a buffer size argument.

The value returned for the variable `_POSIX_CHOWN_RESTRICTED` also applies to directories that do not have file systems mounted on them. The value may change when crossing a mount point, so applications that need to know should check for each directory. (An even easier check is to try the `chown()` function and look for an error in case it happens.)

Unlike the values returned by `sysconf()`, the pathname-oriented variables are potentially more volatile and are not guaranteed to remain constant throughout the lifetime of the process. For example, in between two calls to `pathconf()`, the file system in question may have been unmounted and remounted with different characteristics.

Also note that most of the errors are optional. If one of the variables always has the same value on an implementation, the implementation need not look at *path* or *fildev* to return that value and is, therefore, not required to detect any of the errors except the meaning of `[EINVAL]` that indicates that the value of *name* is not valid for that variable, and the `[EOVERFLOW]` error that indicates the value to be returned is larger than `{LONG_MAX}`.

If the value of any of the limits is unspecified (logically infinite), they will not be defined in `<limits.h>` and the `pathconf()` and `fpathconf()` functions return `-1` without changing `errno`. This can be distinguished from the case of giving an unrecognized *name* argument because `errno` is set to `[EINVAL]` in this case.

Since `-1` is a valid return value for the `pathconf()` and `fpathconf()` functions, applications should set `errno` to zero before calling them and check `errno` only if the return value is `-1`.

For the case of `{SYMLINK_MAX}`, since both `pathconf()` and `open()` follow symbolic links, there is no way that *path* or *fildev* could refer to a symbolic link.

It was the intention of IEEE Std 1003.1d-1999 that the following variables:

```
{POSIX_ALLOC_SIZE_MIN}
{POSIX_REC_INCR_XFER_SIZE}
{POSIX_REC_MAX_XFER_SIZE}
{POSIX_REC_MIN_XFER_SIZE}
{POSIX_REC_XFER_ALIGN}
```

only applied to regular files, but Note 10 also permits implementation of the advisory semantics on other file types unique to an implementation (for example, a character special device).

The `[EOVERFLOW]` error for `_PC_TIMESTAMP_RESOLUTION` cannot occur on POSIX-compliant file systems because POSIX requires a timestamp resolution no larger than one second. Even on 32-bit systems, this can be represented without overflow.

**FUTURE DIRECTIONS**

None.

XCU *getconf*

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 5**

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

**Issue 6**

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to include {FILESIZEBITS}.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The \_PC\_SYMLINK\_MAX entry is added to the table in the DESCRIPTION.

The following *pathconf()* variables and their associated names are added for alignment with IEEE Std 1003.1d-1999:

```
{POSIX_ALLOC_SIZE_MIN}
{POSIX_REC_INCR_XFER_SIZE}
{POSIX_REC_MAX_XFER_SIZE}
{POSIX_REC_MIN_XFER_SIZE}
{POSIX_REC_XFER_ALIGN}
```

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/18 is applied, changing the fourth paragraph of the DESCRIPTION and removing shading and margin markers from the table. This change is needed since implementations are required to support all of these symbols.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/34 is applied, adding the table entry for POSIX2\_SYMLINKS in the DESCRIPTION.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/35 is applied, updating the DESCRIPTION and RATIONALE sections to clarify behavior for the following variables:

```
{POSIX_ALLOC_SIZE_MIN}
{POSIX_REC_INCR_XFER_SIZE}
{POSIX_REC_MAX_XFER_SIZE}
{POSIX_REC_MIN_XFER_SIZE}
{POSIX_REC_XFER_ALIGN}
```

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/36 is applied, updating the RETURN VALUE and APPLICATION USAGE sections to state that the results are unspecified if a variable is dependent on an unsupported option, and advising application developers to check for

30588 supported options prior to obtaining and using such values.

30589 **Issue 7**

30590 Austin Group Interpretations 1003.1-2001 #143 and #160 are applied.

30591 Changes are made related to support for finegrained timestamps.

30592 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
30593 pathname exists but is not a directory or a symbolic link to a directory.

30594 POSIX.1-2008, Technical Corrigendum 1, XSH/TC1-2008/0160 [256,428], XSH/TC1-2008/0161  
30595 [256,428], and XSH/TC1-2008/0162 [324] are applied.

30596 **NAME**

30597 fpclassify — classify real floating type

30598 **SYNOPSIS**

30599 #include &lt;math.h&gt;

30600 int fpclassify(real-floating x);

30601 **DESCRIPTION**

30602 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
30603 conflict between the requirements described here and the ISO C standard is unintentional. This  
30604 volume of POSIX.1-2008 defers to the ISO C standard.

30605 The *fpclassify()* macro shall classify its argument value as NaN, infinite, normal, subnormal,  
30606 zero, or into another implementation-defined category. First, an argument represented in a  
30607 format wider than its semantic type is converted to its semantic type. Then classification is based  
30608 on the type of the argument.

30609 **RETURN VALUE**

30610 The *fpclassify()* macro shall return the value of the number classification macro appropriate to  
30611 the value of its argument.

30612 **ERRORS**

30613 No errors are defined.

30614 **EXAMPLES**

30615 None.

30616 **APPLICATION USAGE**

30617 None.

30618 **RATIONALE**

30619 None.

30620 **FUTURE DIRECTIONS**

30621 None.

30622 **SEE ALSO**30623 *isfinite()*, *isinf()*, *isnan()*, *isnormal()*, *signbit()*

30624 XBD &lt;math.h&gt;

30625 **CHANGE HISTORY**

30626 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**NAME**

dprintf, fprintf, printf, snprintf, sprintf — print formatted output

**SYNOPSIS**

```
#include <stdio.h>
```

CX

```
int dprintf(int filides, const char *restrict format, ...);
int fprintf(FILE *restrict stream, const char *restrict format, ...);
int printf(const char *restrict format, ...);
int snprintf(char *restrict s, size_t n,
             const char *restrict format, ...);
int sprintf(char *restrict s, const char *restrict format, ...);
```

**DESCRIPTION**

CX

Excluding *dprintf()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

The *fprintf()* function shall place output on the named output *stream*. The *printf()* function shall place output on the standard output stream *stdout*. The *sprintf()* function shall place output followed by the null byte, '\0', in consecutive bytes starting at *s*; it is the user's responsibility to ensure that enough space is available.

CX

The *dprintf()* function shall be equivalent to the *fprintf()* function, except that *dprintf()* shall write output to the file associated with the file descriptor specified by the *filides* argument rather than place output on a stream.

The *snprintf()* function shall be equivalent to *sprintf()*, with the addition of the *n* argument which states the size of the buffer referred to by *s*. If *n* is zero, nothing shall be written and *s* may be a null pointer. Otherwise, output bytes beyond the *n*-1st shall be discarded instead of being written to the array, and a null byte is written at the end of the bytes actually written into the array.

If copying takes place between objects that overlap as a result of a call to *sprintf()* or *snprintf()*, the results are undefined.

Each of these functions converts, formats, and prints its arguments under control of the *format*. The *format* is a character string, beginning and ending in its initial shift state, if any. The *format* is composed of zero or more directives: *ordinary characters*, which are simply copied to the output stream, and *conversion specifications*, each of which shall result in the fetching of zero or more arguments. The results are undefined if there are insufficient arguments for the *format*. If the *format* is exhausted while arguments remain, the excess arguments shall be evaluated but are otherwise ignored.

CX

Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than to the next unused argument. In this case, the conversion specifier character % (see below) is replaced by the sequence "%*n*\$", where *n* is a decimal integer in the range [1,{NL\_ARGMAX}], giving the position of the argument in the argument list. This feature provides for the definition of format strings that select arguments in an order appropriate to specific languages (see the EXAMPLES section).

The *format* can contain either numbered argument conversion specifications (that is, "%*n*\$" and "%*m*\$"), or unnumbered argument conversion specifications (that is, % and \*), but not both. The only exception to this is that %% can be mixed with the "%*n*\$" form. The results of mixing numbered and unnumbered argument specifications in a *format* string are undefined. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the (*N*-1)th, are specified in the format string.

- 30674 In format strings containing the "%n\$" form of conversion specification, numbered arguments  
 30675 in the argument list can be referenced from the format string as many times as required.
- 30676 In format strings containing the % form of conversion specification, each conversion specification  
 30677 uses the first unused argument in the argument list.
- 30678 CX All forms of the *fprintf()* functions allow for the insertion of a language-dependent radix  
 30679 character in the output string. The radix character is defined in the current locale (category  
 30680 LC\_NUMERIC). In the POSIX locale, or in a locale where the radix character is not defined, the  
 30681 radix character shall default to a <period> ('.').
- 30682 CX Each conversion specification is introduced by the '%' character or by the character sequence  
 30683 "%n\$", after which the following appear in sequence:
- 30684 • Zero or more *flags* (in any order), which modify the meaning of the conversion  
 30685 specification.
  - 30686 • An optional minimum *field width*. If the converted value has fewer bytes than the field  
 30687 width, it shall be padded with <space> characters by default on the left; it shall be padded  
 30688 on the right if the left-adjustment flag ('-'), described below, is given to the field width.  
 30689 The field width takes the form of an <asterisk> ('\*'), described below, or a decimal  
 30690 integer.
  - 30691 • An optional *precision* that gives the minimum number of digits to appear for the d, i, o, u,  
 30692 x, and X conversion specifiers; the number of digits to appear after the radix character for  
 30693 the a, A, e, E, f, and F conversion specifiers; the maximum number of significant digits for  
 30694 the g and G conversion specifiers; or the maximum number of bytes to be printed from a  
 30695 XSI string in the s and S conversion specifiers. The precision takes the form of a <period>  
 30696 ('.') followed either by an <asterisk> ('\*'), described below, or an optional decimal digit  
 30697 string, where a null digit string is treated as zero. If a precision appears with any other  
 30698 conversion specifier, the behavior is undefined.
  - 30699 • An optional length modifier that specifies the size of the argument.
  - 30700 • A *conversion specifier* character that indicates the type of conversion to be applied.
- 30701 A field width, or precision, or both, may be indicated by an <asterisk> ('\*'). In this case an  
 30702 argument of type **int** supplies the field width or precision. Applications shall ensure that  
 30703 arguments specifying field width, or precision, or both appear in that order before the argument,  
 30704 if any, to be converted. A negative field width is taken as a '-' flag followed by a positive field  
 30705 CX width. A negative precision is taken as if the precision were omitted. In *format* strings  
 30706 containing the "%n\$" form of a conversion specification, a field width or precision may be  
 30707 indicated by the sequence "%m\$", where *m* is a decimal integer in the range [1,{NL\_ARGMAX}]  
 30708 giving the position in the argument list (after the *format* argument) of an integer argument  
 30709 containing the field width or precision, for example:
- ```
30710 printf("%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```
- 30711 The flag characters and their meanings are:
- 30712 CX ' (The <apostrophe>.) The integer portion of the result of a decimal conversion (%i, %d,  
 30713 %u, %f, %F, %g, or %G) shall be formatted with thousands' grouping characters. For  
 30714 other conversions the behavior is undefined. The non-monetary grouping character is  
 30715 used.
  - 30716 – The result of the conversion shall be left-justified within the field. The conversion is  
 30717 right-justified if this flag is not specified.

30718 + The result of a signed conversion shall always begin with a sign ('+' or '-'). The  
 30719 conversion shall begin with a sign only when a negative value is converted if this flag is  
 30720 not specified.

30721 <space> If the first character of a signed conversion is not a sign or if a signed conversion results  
 30722 in no characters, a <space> shall be prefixed to the result. This means that if the  
 30723 <space> and '+' flags both appear, the <space> flag shall be ignored.

30724 # Specifies that the value is to be converted to an alternative form. For o conversion, it  
 30725 shall increase the precision, if and only if necessary, to force the first digit of the result  
 30726 to be a zero (if the value and precision are both 0, a single 0 is printed). For x or X  
 30727 conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For a, A, e,  
 30728 E, f, F, g, and G conversion specifiers, the result shall always contain a radix character,  
 30729 even if no digits follow the radix character. Without this flag, a radix character appears  
 30730 in the result of these conversions only if a digit follows it. For g and G conversion  
 30731 specifiers, trailing zeros shall *not* be removed from the result as they normally are. For  
 30732 other conversion specifiers, the behavior is undefined.

30733 0 For d, i, o, u, x, X, a, A, e, E, f, F, g, and G conversion specifiers, leading zeros  
 30734 (following any indication of sign or base) are used to pad to the field width rather than  
 30735 performing space padding, except when converting an infinity or NaN. If the '0' and  
 30736 '-' flags both appear, the '0' flag is ignored. For d, i, o, u, x, and X conversion  
 30737 CX specifiers, if a precision is specified, the '0' flag shall be ignored. If the '0' and  
 30738 <apostrophe> flags both appear, the grouping characters are inserted before zero  
 30739 padding. For other conversions, the behavior is undefined.

30740 The length modifiers and their meanings are:

30741 hh Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **signed char**  
 30742 or **unsigned char** argument (the argument will have been promoted according to the  
 30743 integer promotions, but its value shall be converted to **signed char** or **unsigned char**  
 30744 before printing); or that a following n conversion specifier applies to a pointer to a  
 30745 **signed char** argument.

30746 h Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **short** or  
 30747 **unsigned short** argument (the argument will have been promoted according to the  
 30748 integer promotions, but its value shall be converted to **short** or **unsigned short** before  
 30749 printing); or that a following n conversion specifier applies to a pointer to a **short**  
 30750 argument.

30751 l (ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long** or  
 30752 **unsigned long** argument; that a following n conversion specifier applies to a pointer to  
 30753 a **long** argument; that a following c conversion specifier applies to a **wint\_t** argument;  
 30754 that a following s conversion specifier applies to a pointer to a **wchar\_t** argument; or  
 30755 has no effect on a following a, A, e, E, f, F, g, or G conversion specifier.

30756 ll (ell-ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long long**  
 30757 or **unsigned long long** argument; or that a following n conversion specifier applies to a  
 30758 pointer to a **long long** argument.

30760 j Specifies that a following d, i, o, u, x, or X conversion specifier applies to an **intmax\_t**  
 30761 or **uintmax\_t** argument; or that a following n conversion specifier applies to a pointer  
 30762 to an **intmax\_t** argument.

|       |                                                                                                        |                                                                                                       |
|-------|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| 30763 | z                                                                                                      | Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>size_t</b> or the |
| 30764 |                                                                                                        | corresponding signed integer type argument; or that a following n conversion specifier                |
| 30765 |                                                                                                        | applies to a pointer to a signed integer type corresponding to a <b>size_t</b> argument.              |
| 30766 | t                                                                                                      | Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>ptrdiff_t</b> or  |
| 30767 |                                                                                                        | the corresponding <b>unsigned</b> type argument; or that a following n conversion specifier           |
| 30768 |                                                                                                        | applies to a pointer to a <b>ptrdiff_t</b> argument.                                                  |
| 30769 | L                                                                                                      | Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to a <b>long</b>    |
| 30770 |                                                                                                        | <b>double</b> argument.                                                                               |
| 30771 | If a length modifier appears with any conversion specifier other than as specified above, the          |                                                                                                       |
| 30772 | behavior is undefined.                                                                                 |                                                                                                       |
| 30773 | The conversion specifiers and their meanings are:                                                      |                                                                                                       |
| 30774 | d, i                                                                                                   | The <b>int</b> argument shall be converted to a signed decimal in the style "[−]dddd". The            |
| 30775 |                                                                                                        | precision specifies the minimum number of digits to appear; if the value being                        |
| 30776 |                                                                                                        | converted can be represented in fewer digits, it shall be expanded with leading zeros.                |
| 30777 |                                                                                                        | The default precision is 1. The result of converting zero with an explicit precision of               |
| 30778 |                                                                                                        | zero shall be no characters.                                                                          |
| 30779 | o                                                                                                      | The <b>unsigned</b> argument shall be converted to unsigned octal format in the style                 |
| 30780 |                                                                                                        | "dddd". The precision specifies the minimum number of digits to appear; if the value                  |
| 30781 |                                                                                                        | being converted can be represented in fewer digits, it shall be expanded with leading                 |
| 30782 |                                                                                                        | zeros. The default precision is 1. The result of converting zero with an explicit precision           |
| 30783 |                                                                                                        | of zero shall be no characters.                                                                       |
| 30784 | u                                                                                                      | The <b>unsigned</b> argument shall be converted to unsigned decimal format in the style               |
| 30785 |                                                                                                        | "dddd". The precision specifies the minimum number of digits to appear; if the value                  |
| 30786 |                                                                                                        | being converted can be represented in fewer digits, it shall be expanded with leading                 |
| 30787 |                                                                                                        | zeros. The default precision is 1. The result of converting zero with an explicit precision           |
| 30788 |                                                                                                        | of zero shall be no characters.                                                                       |
| 30789 | x                                                                                                      | The <b>unsigned</b> argument shall be converted to unsigned hexadecimal format in the style           |
| 30790 |                                                                                                        | "dddd"; the letters "abcdef" are used. The precision specifies the minimum number                     |
| 30791 |                                                                                                        | of digits to appear; if the value being converted can be represented in fewer digits, it              |
| 30792 |                                                                                                        | shall be expanded with leading zeros. The default precision is 1. The result of                       |
| 30793 |                                                                                                        | converting zero with an explicit precision of zero shall be no characters.                            |
| 30794 | X                                                                                                      | Equivalent to the x conversion specifier, except that letters "ABCDEF" are used instead               |
| 30795 |                                                                                                        | of "abcdef".                                                                                          |
| 30796 | f, F                                                                                                   | The <b>double</b> argument shall be converted to decimal notation in the style                        |
| 30797 |                                                                                                        | "[−]ddd.ddd", where the number of digits after the radix character is equal to the                    |
| 30798 |                                                                                                        | precision specification. If the precision is missing, it shall be taken as 6; if the precision        |
| 30799 |                                                                                                        | is explicitly zero and no '#' flag is present, no radix character shall appear. If a radix            |
| 30800 |                                                                                                        | character appears, at least one digit appears before it. The low-order digit shall be                 |
| 30801 |                                                                                                        | rounded in an implementation-defined manner.                                                          |
| 30802 | A <b>double</b> argument representing an infinity shall be converted in one of the styles              |                                                                                                       |
| 30803 | "[−]inf" or "[−]infinity"; which style is implementation-defined. A <b>double</b>                      |                                                                                                       |
| 30804 | argument representing a NaN shall be converted in one of the styles "[−]nan( <i>n-char-sequence</i> )" |                                                                                                       |
| 30805 | or "[−]nan"; which style, and the meaning of any <i>n-char-sequence</i> ,                              |                                                                                                       |
| 30806 | is implementation-defined. The F conversion specifier produces "INF", "INFINITY",                      |                                                                                                       |
| 30807 | or "NAN" instead of "inf", "infinity", or "nan", respectively.                                         |                                                                                                       |

| 30808 | e, E | The <b>double</b> argument shall be converted in the style " <code>[-]d.ddde±dd</code> ", where there is one digit before the radix character (which is non-zero if the argument is non-zero) and the number of digits after it is equal to the precision; if the precision is missing, it shall be taken as 6; if the precision is zero and no <code>'#'</code> flag is present, no radix character shall appear. The low-order digit shall be rounded in an implementation-defined manner. The <code>E</code> conversion specifier shall produce a number with <code>'E'</code> instead of <code>'e'</code> introducing the exponent. The exponent shall always contain at least two digits. If the value is zero, the exponent shall be zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
